## ENGINE - 2.7L DOHC - SERVICE INFORMATION

### DESCRIPTION

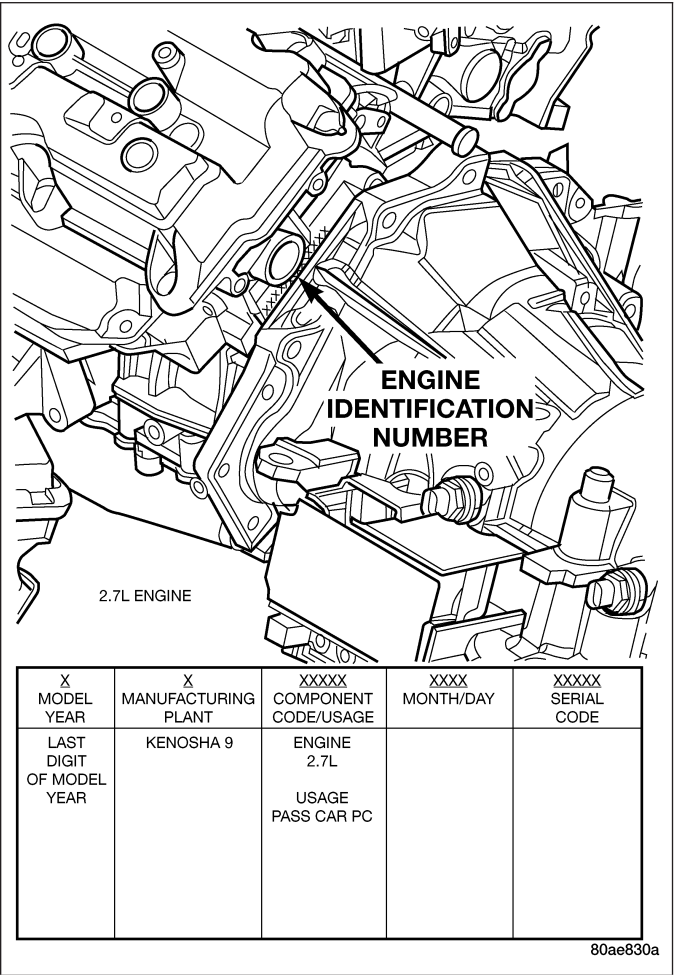

The 2.7 Liter (167 Cubic Inches) 60 degree V-6 engine is a double overhead camshaft design with hydraulic lifters and four valves per cylinder. The engine does not have provisions for a free wheeling valve train.

The cylinders are numbered from front to rear, with the right bank odd numbered, and the left bank even numbered. The firing order is 1-2-3-4-5-6.

The engine identification number is located on the rear of the cylinder block just below the left cylinder head

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to Service Diagnosis—Mechanical Chart and Service Diagnosis—Performance Chart, for possible causes and corrections of malfunctions. Refer to FUEL SYSTEM for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Misaligned or deteriorated gaskets. 2. Loose fastener, broken or porous metal part. 3. Misaligned or deteriorated cup or threaded plug.	1. Replace gasket(s). 2. Tighten, repair or replace the part. 3. Replace as necessary.
OIL CONSUMPTION OR SPARK PLUGS FOULED	1. PCV system malfunction. 2. Worn, scuffed or broken rings. 3. Carbon in oil ring slots. 4. Rings fitted too tightly in grooves. 5. Worn valve guide(s). 6. Valve stem seal(s) worn or damaged.	1. Check system and repair as necessary. (Refer to Appropriate Diagnostic Manual) 2. Hone cylinder bores. Install new rings. 3. Clean pistons and install new rings. 4. Remove rings and check grooves. If groove is not proper width, replace piston. 5. Replace cylinder head(s). 6. Replace seal(s).

## CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Check engine oil level and add oil if necessary.
2. Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.
3. Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
4. Remove the Auto Shutdown (ASD) relay from the PDC.
5. Be sure throttle blade is fully open during the compression check.
6. Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
7. Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.
8. Repeat the previous step for all remaining cylinders.
9. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
10. If one or more cylinders have abnormally low compression pressures, repeat the compression test.
11. If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

## CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

**WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

**FOR EXAMPLE:** At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

## ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil level indicator to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.
5. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:
  - Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
  - Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
  - Attach an air hose with pressure gauge and regulator to the oil level indicator tube.

**CAUTION: Do not subject the engine assembly to more than 20.6 kpa (3 PSI) of test pressure.**

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
  - If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
6. If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.

7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

**Note:** If oil leakage is observed at the oil level indicator tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

## INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.
  - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
  - b. Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.
4. If no leaks are detected, pressurize the crankcase as previously described.

**CAUTION:** Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION:** Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.
7. After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

## STANDARD PROCEDURE

### REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

**CAUTION:** Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

## HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

**CAUTION:** DO NOT use starter motor to rotate the engine, severe damage may occur.

1. Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
2. Remove negative battery cable.
3. Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.

4. With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
5. Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).
6. Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
7. Repair engine or components as necessary to prevent this problem from re-occurring.

**CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.**

8. Install new spark plugs.
9. Drain engine oil and remove oil filter.
10. Install a new oil filter.
11. Fill engine with specified amount of approved oil.
12. Connect negative battery cable.
13. Start engine and check for any leaks.

## FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

**MOPAR® ENGINE RTV GEN II** is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® ATF RTV** is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® GASKET MAKER** is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

**MOPAR® BED PLATE SEALANT** is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

**MOPAR® GASKET SEALANT** is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

## SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.)

drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

## ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

**Never** use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush

**Note: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow)

**CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.**

## ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift and a hammer, strike the bottom edge of the cup plug. With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug.

**CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.**

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

## REMOVAL - ENGINE ASSEMBLY

1. Remove hood.
2. Release fuel pressure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
3. Disconnect negative battery cable (1) located in the trunk.

4. Disconnect intake air temperature sensor electrical connector.
5. Remove air cleaner housing assembly (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

6. Remove accessory drive belt (5)(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
7. Disconnect lines from power steering pump (3).
8. Remove power steering pump attaching bolts and set pump aside (3).
9. Recover A/C system using a suitable refrigerant recovery machine(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
10. Disconnect A/C compressor (4) electrical connectors.
11. Remove A/C compressor (4)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - REMOVAL).

12. Raise vehicle.
13. Remove lower splash shield bolts (1) and remove splash shield (2).
14. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

15. Drain the engine oil (5) and remove the oil filter (3).
16. Disconnect down stream oxygen sensor connectors.
17. Disconnect exhaust pipes at the manifolds.

18. Disconnect starter (2) electrical connectors.
19. Remove starter (2) bolts and set starter aside.

20. Disconnect coolant pipe (1) near starter from hose.
21. Disconnect crankshaft position sensor electrical connector and remove sensor (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL).
22. Disconnect ground strap.

23. Disconnect oil pressure sensor (1) electrical connector.

24. Remove 4 engine mount nuts (1).
25. Remove engine mount studs (1) from mount.

26. Remove steering gear mounting bolts (1) and lower steering gear (2) for clearance.

27. Using a block of wood and a suitable lifting device under the oil pan, raise the engine.
28. Remove structural collar bolts (2 & 4).
29. Remove structural collar (3).
30. Remove lower bell housing bolts.
31. Lower engine and remove jack stand.
32. Mark flex plate to torque converter location.
33. Remove torque converter bolts.
34. Lower vehicle.

35. Remove wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).
36. Remove wiper cowl (1)(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).
37. Remove strut tower support (2).

38. Reposition purge solenoid (5).

- 39. Remove the intake manifold (2)(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
- 40. Disconnect all vacuum lines and electrical connectors.
- 41. Disconnect all ground straps attaching to the engine.

- 42. Disconnect fuel line at fuel rail (1).
- 43. Disconnect coil, injector (2), capacitor, and knock sensor connectors.
- 44. Remove egr valve and tube assembly(Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - REMOVAL).
- 45. Remove upper bellhousing bolts and reposition electrical harness.

812c55c8

46. Attach special tool #8342A (1).
  - a. Attach special tool #8342A to the front of the left cylinder head (2).
  - b. Attach special tool #8342A to the rear of the right cylinder head (3).
47. Support transmission with a block of wood and floor jack.
48. Hoist engine from engine compartment.

**INSTALLATION - ENGINE ASSEMBLY**

812c55c8

1. Attach special tool #8342A engine lifting fixture (1).
  - a. Attach special tool #8342A to the front of the left cylinder head (2).
  - b. Attach special tool #8342A to the rear of the right cylinder head (3).
2. Lower engine into engine compartment.
3. Remove special tool #8342A (1).

**CAUTION:** Do not tighten the transmission case to engine block bolts until all bolts have been hand started, and the two mating surfaces are completely joined together, as damage to cylinder block or transmission could occur.

4. Install bell housing to cylinder block bolts and tighten to 68 N·m (50 ft. lbs.).
5. Install egr valve and tube assembly(Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/ VALVE - INSTALLATION).
6. Connect coil, injector (2), capacitor, and knock sensor connectors.
7. Connect the fuel line (1).
8. Install upper intake manifold(Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

9. Install purge solenoid (5).
10. Connect all ground straps.
11. Connect all vacuum lines and electrical connectors.

12. Raise vehicle.
13. Align flexplate and torque converter.

**Note: Make sure all four bolts are installed finger tight before torquing bolts.**

14. Tighten torque converter bolts to 75N·m (55 ft. lbs.).
15. Using a block of wood and a suitable lifting device under the oil pan, raise the engine.
16. Install the structural collar (3) and position in place.

**Note: Make sure that structural collar (3) is flush with the oil pan (1) and the transmission bell housing.**

17. Finger tighten all bolts (2&4).
  18. Tighten the structural collar to oil pan bolts (2) to 55 N·m (40 ft. lbs.).
  19. Tighten structural collar to transmission bolts (4) to 55 N·m (40 ft. lbs.).
20. Install the power steering pump (3).
  21. Install the A/C compressor (4)(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

22. Install the crankshaft position sensor and connect electrical connector(Refer to 14 - FUEL SYSTEM/ FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION).
23. Connect oil pressure sensor (1) electrical connector.

24. Install starter (2), tighten bolts to 41N·m (30 ft. lbs.)
25. Connect electrical connectors at starter.

26. Connect the coolant pipe (1) to coolant hose.
27. Connect the exhaust pipes to the manifolds.
28. Connect the down stream oxygen sensor connectors.
29. Connect A/C compressor electrical connectors.

30. Install new oil filter (3).

31. Install lower splash shield (2) and tighten retaining bolts (1).
32. Lower vehicle.

33. Install power steering pump (3)(Refer to 19 - STEERING/PUMP - INSTALLATION).
34. Connect lines to power steering pump (3).
35. Install accessory drive belt (5)(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

36. Install air cleaner housing assembly (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
37. Connect intake air temperature sensor connector.

38. Connect negative battery (1) cable.

39. Fill coolant system(Refer to 7 - COOLING - STANDARD PROCEDURE).
40. Fill engine with correct grade of oil (5).
41. Install strut tower support (2).
42. Install cowl screen (1).
43. Install wiper arms(Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).
44. Install the hood.

45. Fill and bleed power steering system(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
46. Evacuate and charge A/C system(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
47. Start engine and check for leaks.

## AIR CLEANER HOUSING

### REMOVAL

1. Disconnect negative battery cable.
2. Disconnect mass airflow sensor electrical connector.
3. Remove clean air duct between throttle body and air filter housing.
4. Remove vent tube.
5. Remove mounting bolt.
6. Remove air filter housing.
7. Raise vehicle.
8. Partially remove front fascia to gain access to air filter resonator (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
9. Remove mounting bolt.
10. Remove air cleaner resonator.

### INSTALLATION

1. Position air cleaner resonator assembly in vehicle.
2. Install mounting bolt. Tighten bolt to 10 N·m (89 in. lbs.).
3. Install front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
4. Position air filter assembly in vehicle.
5. Install mounting bolt. Tighten to 10 N·m (89 in. lbs.).
6. Install vent tube.
7. Install clean air duct between air filter housing and throttle body.

## CYLINDER HEAD

### DESCRIPTION

The cylinder heads (7) are made of an aluminum alloy. The cylinder head features four valves (5&6) per cylinder with pressed in powdered metal valve guides. The cylinder heads provide enclosures for the timing chain drive, necessitating a unique right and left cylinder head.

### DIAGNOSIS AND TESTING

#### CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

## CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

## CYLINDER-TO-WATER JACKET LEAKAGE TEST

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.**

### VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

### COOLING SYSTEM TESTER METHOD

**WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).**

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

### CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

## STANDARD PROCEDURE - Cylinder Head Oil Gallery Cup Plug Service

**Note: DETERMINE WHICH CUP PLUG IS LEAKING BEFORE PERFORMING THIS PROCEDURE. IF NECESSARY, PERFORM AN ENGINE OIL LEAK DYE TEST.**

Each cylinder head on a 2.7L engine has 6 external oil gallery cup plugs. It is not necessary to remove the original cup plug to install a new cup plug. The cup plug bore is deep enough to allow for two plugs. If it becomes necessary to service an oil gallery cup plug, perform the Repair Procedure.

**Note: INSPECT THE CUP PLUG BORE IN QUESTION FOR THE PRESENCE OF TWO CUP PLUGS. IF THE CUP PLUG FLANGE IS JUST INSIDE (1–2 MM) THE CHAMFERED EDGE OF THE BORE TWO CUP PLUGS ARE ALREADY IN PLACE AND THE CYLINDER HEAD CANNOT BE REPAIRED.**

## Repair Procedure

1. Remove component(s) necessary to gain access to the oil gallery cup plug requiring service.

**Note: SOME OF THE OIL GALLERY CUP PLUGS ARE SERVICEABLE WITH THE HEAD INSTALLED ON THE ENGINE AND THE ENGINE IN THE VEHICLE, WHILE OTHERS REQUIRE REMOVING THE AFFECTED CYLINDER HEAD FROM THE ENGINE. IN EITHER CASE ONLY REPLACE THE CUP PLUG REQUIRING SERVICE.**

2. Clean the cup plug bore with brake cleaner and compressed air. It is not necessary to remove the existing cup plug.
3. Lightly coat the new cup plug with sealer; p/n 04318083.
4. Using an appropriate installation tool drive the new cup plug into the bore until the flanged edge of the plug is just inside (1-2 mm) the chamfered edge of the bore.
5. Allow the sealant to cure for at least 20 minutes.
6. Assemble any components removed in step # 1 as necessary.

## REMOVAL

1. Perform fuel pressure release procedure **before attempting any repairs.** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
2. Disconnect negative cable from battery (1).
3. Raise vehicle on hoist.
4. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

5. Remove accessory drive belt (5). (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
6. Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
7. Disconnect camshaft position sensor (2), and coolant temperature sensor (1) connectors.
8. Remove upper intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

9. Disconnect coils (3), capacitors, and injector connectors (2).
10. Reposition harness out of the way.

11. Disconnect fuel feed line (1)(Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
12. Remove lower intake manifold.
13. Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).

14. Remove coolant outlet (3) (Refer to 7 - COOLING/ENGINE/COOLANT OUTLET HOUSING - REMOVAL).
15. Remove timing chain cover (4) (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).

16. Rotate crankshaft until crankshaft sprocket timing mark aligns with timing mark on oil pump housing (2).

17. Remove primary timing chain (7)(Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - REMOVAL).
18. Remove upper primary timing chain guides (10).
19. Remove camshaft bearing caps **gradually** in the sequence shown.

20. Remove camshafts (3 & 10) and valvetrain components from cylinder head. Note component locations for re-installation in original locations.
21. For left cylinder head removal:
  - Remove fastener securing engine oil dipstick tube to cylinder head. Remove engine oil dipstick tube.
  - Remove generator.
22. For right cylinder head removal:

- Remove cylinder head ground strap.
- Disconnect EGR valve electrical connector and remove EGR valve from head(Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/VALVE - REMOVAL).

**CAUTION:** Ensure cylinder head bolts 1 - 3 are removed before attempting the removal of cylinder head, as damage to cylinder head and/or block may occur.

23. Remove cylinder left head bolts (2) and right head bolts (1) in sequence shown.
24. Remove cylinder head(s).
25. Remove and discard cylinder head gasket.
26. Clean cylinder head and block sealing surfaces-(Refer to 9 - ENGINE/CYLINDER HEAD - CLEANING).

## CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

**Note:** Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

## INSPECTION

1. Before cleaning, check for leaks, damage and cracks.
2. Clean cylinder head and oil passages.
3. Check cylinder head for flatness .
4. Cylinder head must be flat within:
  - Standard dimension = less than 0.05 mm (0.002 inch.)
  - Service Limit = 0.2 mm (0.008 inch.)
  - Grinding Limit = Maximum of 0.2 mm (0.008 inch.) is permitted.

**CAUTION:** 0.20 mm (0.008 in.) MAX is a combined total dimension of the stock removal limit from cylinder head and block top surface (Deck) together.

## INSTALLATION

**Note:** The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced

Necking can be checked by holding a straight edge against the threads (3). If all the threads do not contact the scale (2), the bolt must be replaced.

**CAUTION:** When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

1. Clean sealing surfaces of cylinder head and block(Refer to 9 - ENGINE - STANDARD PROCEDURE).
2. Install new head gasket over locating dowels.
3. Install cylinder head to block, assuring head is properly positioned over locating dowels.

4. Lubricate bolt threads with clean engine oil and install bolts.

5. Tighten bolts in sequence shown for left head (2) and right head (1), using the following steps and torque values:

- Step 1: Bolts 1–8 to 48 N·m (35 ft. lbs.)
- Step 2: Bolts 1–8 to 75 N·m (55 ft. lbs.)
- Step 3: Bolts 1–8 to 75 N·m (55 ft. lbs.)
- Step 4: Bolts 1–8 to +90° Turn **Do not use a torque wrench for this step.**
- Step 5: Bolts 9–11 to 28 N·m (250 in. lbs.)

6. For left cylinder head installation:

- Install engine oil dipstick tube.
- Install generator.

7. For right cylinder head Installation:

- Install cylinder head ground strap.
- Install EGR valve (if equipped) (Refer to 25 - EMISSIONS CONTROL/EXHAUST GAS RECIRCULATION/ VALVE - INSTALLATION).

8. Install all valvetrain components and camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAM-SHAFT(S) - INSTALLATION). Tighten camshaft bearing caps in sequence shown to 12 N·m (105 in. lbs.).

9. Install primary timing chain (7), guides (2,5,10) and sprockets (9)(Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - INSTALLATION).

10. Install coolant outlet (3) (Refer to 7 - COOLING/ENGINE/COOLANT OUTLET HOUSING - INSTALLATION).

11. Install lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
12. Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
13. Connect camshaft position sensor (2) and coolant temperature sensor (1) connectors.
14. Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER(S) - INSTALLATION).
15. Install crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
16. Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

17. Connect oil pressure sensor (1) connector.

18. Install accessory drive belt (5)(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
19. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

20. Connect negative battery (1) cable.
21. Start engine and check for leaks.

## CAMSHAFT(S)

### DESCRIPTION

The assembled fabricated camshafts are composed of five bearing journals machined onto a hollow steel tube. The camshafts are secured in the cylinder head (6) by the camshaft bearing caps (1&2). Six steel lobes, a secondary timing drive sprocket, and a primary sprocket/thrust flange are pressed onto the camshaft tube using a unique assembly process. Camshaft end play is controlled by the primary camshaft sprocket attachment flange on the intake camshafts (7) and by a thrust flange on the exhaust camshafts (3). The intake camshafts are driven by the primary chain. The exhaust camshafts (3) are driven by the intake camshafts (10) through a secondary chain (11). The secondary chain tensioner (7) keeps tension on the secondary chain (11).

## OPERATION

The camshaft has precisely machined (egg shaped) lobes to provide accurate valve timing and duration. The camshaft is driven by the crankshaft via drive sprockets and chains.

## REMOVAL

1. Remove the primary timing chain(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
2. Remove secondary chain tensioner (6) mounting bolts.

**Note:** Camshaft bearing caps have been marked during engine manufacturing. For example, number one exhaust camshaft bearing is marked "1E"

3. Slowly loosen camshaft bearing cap bolts in the order shown.

4. Remove camshaft bearing caps (1).
5. Remove intake camshaft (7), exhaust camshaft (2), secondary timing chain (8), and secondary timing chain tensioner (6) together as an assembly.
6. Remove secondary timing chain tensioner (6) and secondary timing chain (8) from camshafts (2&7).
7. Inspect camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSPECTION).

## INSPECTION

1. Inspect camshaft bearing journals (2) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Inspect camshaft sprockets for excessive wear. Replace camshafts if necessary.
3. Check the cam lobe (5) surfaces for abnormal wear and damage. Replace camshaft if defective. Measure the actual wear and replace, if out of limits—standard value is 0.0254 mm (0.001 in.); wear **limit** is 0.254 mm (0.010 in.).

## INSTALLATION

**CAUTION:** When the timing chain is removed and the cylinder heads are installed, **DO NOT** rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

1. Assemble camshaft chain on the cams. Verify that plated links (1) are facing toward the front. Align the plated links (1) to the dots (4) on the camshaft sprockets.

2. If camshaft chain tensioner is already in the compressed and locked position, proceed to step (4).
3. When the camshaft chain tensioner is removed, it is necessary to compress and lock the tensioner using the following procedures:
  - a. Place tensioner (1) into a soft jaw vise.
  - b. SLOWLY compress tensioner until fabricated lock pin (2) or the equivalent can be inserted into the locking holes.
  - c. Remove compressed and locked tensioner from the vise.

4. Insert the compressed and locked camshaft chain tensioner (2) in-between the camshafts and chain.
5. Rotate the cams so that the plated links (1) and dots (4) are facing the 12:00 O'clock position.
6. Install cams to cylinder head. Verify that rocker arms are correctly seated and in proper positions.

7. Install camshaft bearing caps. Verify that bearing caps are installed in same position as removed.
8. Tighten cam bearing cap bolts gradually in sequence shown in to 12 N·m (105 in. lbs.).

9. Install secondary chain tensioner (2) bolts and tighten to 12 N·m (105 in. lbs.).
10. Remove locking pin (3) from secondary tensioners (2).
11. Measure camshafts end play (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - STANDARD PROCEDURE).
12. Install the primary timing chain(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

## COVER(S)-CYLINDER HEAD

### REMOVAL

#### LEFT

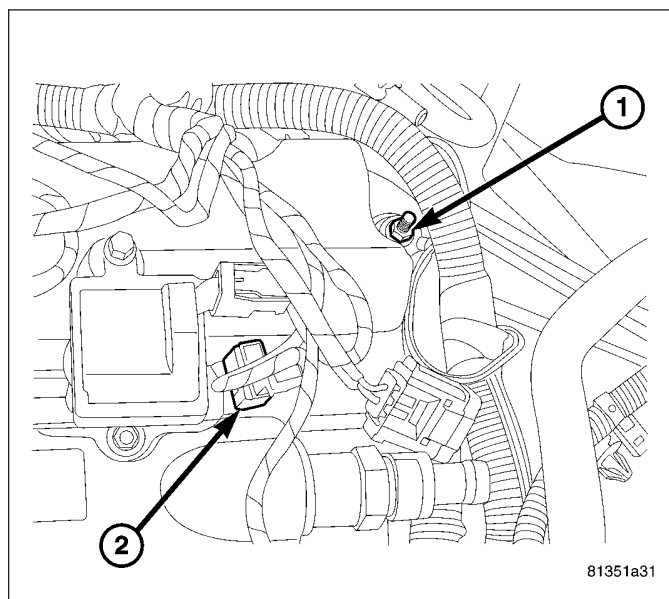

1. Disconnect negative battery (1) cable located in trunk.

2. Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Disconnect electrical connectors from ignition coils (1) and

4. Remove ground strap from cylinder head cover stud (1) and disconnect capacitor connector (2). Reposition electrical harness.
5. Disconnect electrical harness retaining clips from cylinder head cover studs. Reposition electrical harness.

6. Remove make up air hose.
7. Remove fastener attaching ignition coil capacitor.
8. Remove ignition coils (1).

9. Loosen all cylinder head cover fasteners (1&2).

**Note:** Cylinder head cover attaching bolts are captured to the cover.

**CAUTION:** Make certain the double ended studs (1) in the center of the cylinder head cover are loose before attempting to remove cover.

10. Remove cylinder head cover.

**RIGHT**

1. Disconnect negative battery (1) cable.

2. Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Disconnect electrical connectors from ignition coils (1) and

4. Disconnect capacitor electrical connector (2).
5. Remove PCV hose from cylinder head cover grommet.
6. Remove ground strap from cylinder head cover stud (1).
7. Disconnect electrical harness retaining clips from cylinder head cover studs. Reposition electrical harness.
8. Remove fastener attaching ignition coil capacitor.
9. Remove ignition coils.

10. Remove foam insulator (1).

11. Loosen all cylinder head cover fasteners.

**Note:** Cylinder head cover attaching bolts are captured to the cover.

**CAUTION:** Make certain the double ended studs in the center of the cylinder head cover are loose before attempting to remove cover.

12. Remove cylinder head cover.

## INSTALLATION

### LEFT

1. Clean cylinder head cover and both sealing surfaces. Inspect and replace gaskets (1&2) as necessary.

2. Install cylinder head cover and hand start all fasteners. Verify that all double-ended studs are in the correct locations.
3. Tighten cylinder head cover attaching bolts and double-ended studs to 12 N·m (105 in. lbs.).

4. Install ignition coils (1).

5. Install ignition coil capacitor (2) and fastener.
6. Install ground strap (1) to cylinder head cover stud.
7. Connect all electrical connectors and harness clips.
8. Connect make up air hose.
9. Install upper intake manifold (Refer to 9 - ENGINE/  
MANIFOLDS/INTAKE MANIFOLD -  
INSTALLATION).

10. Connect negative battery (1) cable.

**RIGHT**

1. Clean cylinder head cover and both sealing surfaces. Inspect and replace gaskets (1 & 2) as necessary.

2. Install cylinder head cover and hand start all fasteners. Verify that all double-ended studs are in the correct locations.
3. Tighten cylinder head cover attaching bolts and double-ended studs to 12 N·m (105 in. lbs.).

4. Install ignition coils (1).

5. Install ignition coil capacitor (2) and fastener.
6. Connect ground strap (1) to cylinder head cover stud.
7. Connect PCV hose to cylinder head cover grommet.
8. Connect all electrical connectors and harness clips.

9. Install foam insulator (1) on top of cylinder head cover (2).
10. Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

11. Connect negative battery (1) cable.

## VALVES & SEATS-INTAKE/EXHAUST

### DESCRIPTION

812d7dc5

The valves (5&6) are made of heat resistant steel, and have chrome plated stems to prevent scuffing. The four valves per cylinder (two intake (6) and two exhaust (5)) are actuated by roller rocker arms, which pivot on stationary lash adjusters. All valves use three bead lock keepers (1) to retain springs (3) and to promote valve rotation.

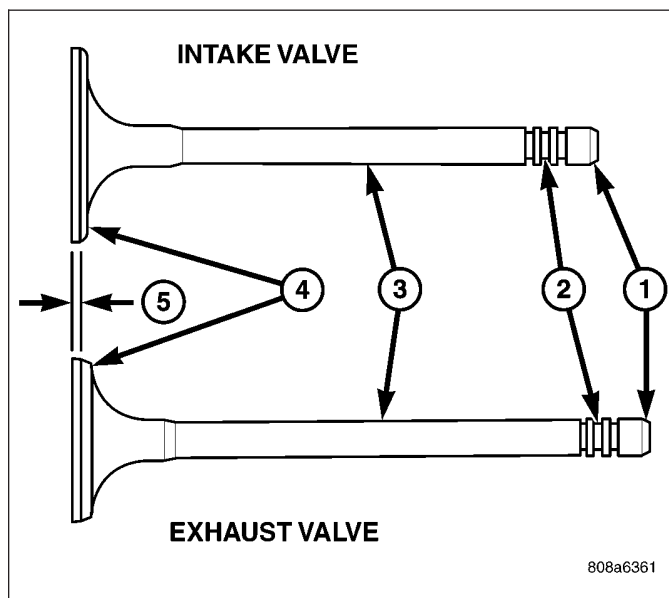

## STANDARD PROCEDURE - VALVE AND VALVE SEAT REFACING

The intake and exhaust valves have a 44.5 to 45 degree face angle (1). The valve seats (2) have a 45 to 45.5 degree face angle.

## VALVES

Inspect the remaining margin (5) after the valves are refaced(Refer to 9 - ENGINE - SPECIFICATIONS).

## VALVE SEATS

**Note:** When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of valve seat using dial indicator. Total runout should not exceed 0.051 mm (0.002 inch.) total indicator reading.
2. Inspect the valve seat (3) with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat (3) **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face (4), contact is satisfactory. If the blue is transferred to top edge of valve face, then lower valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of valve face, then raise valve seat with a 65 degree stone.

**Note:** Valve seats which are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise cylinder head must be replaced.

3. When seat is properly positioned the width of the intake 1.00 to 1.50 mm (0.0394 to 0.0591 in.) and exhaust seats should be 1.25 to 1.75 mm (0.049 to 0.069 in.).
4. Check the valve spring installed height (4) after refacing the valve and seat.

## VALVE AND SPRING INSTALLED HEIGHT

1. Coat valve stems (2) with clean engine oil and insert them in cylinder head.
2. If valves or seats have been refaced, check valve tip height (5). If valve tip height (5) for intake valve is greater than 47.836 mm (1.883 in.) or 47.837 mm (1.883 in.) for exhaust valve, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.
3. Install valve seal/spring seat assembly (8) over valve guides on all valve stems. Ensure that the garter spring (9) is intact around the top of the rubber seal.

4. Position valve springs (3) and retainer (2) on spring seat (4).
5. Compress valve spring with a valve spring compressor.
6. Install retainer locks (1) and release tool.

7. If valves and/or seats are refaced, measure the installed height of springs (4). Measurement is taken from top of spring seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

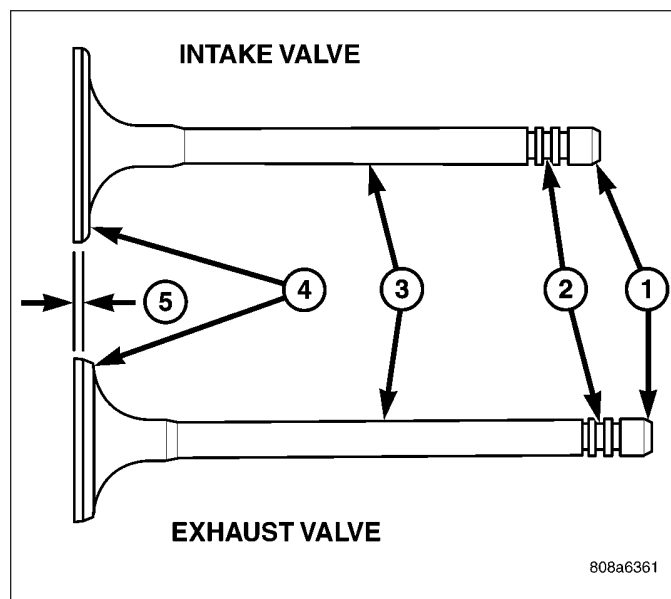

## REMOVAL

1. Remove cylinder head(s)(Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).
2. Remove valve spring (3)(Refer to 9 - ENGINE/ CYLINDER HEAD/VALVE SPRINGS - REMOVAL).

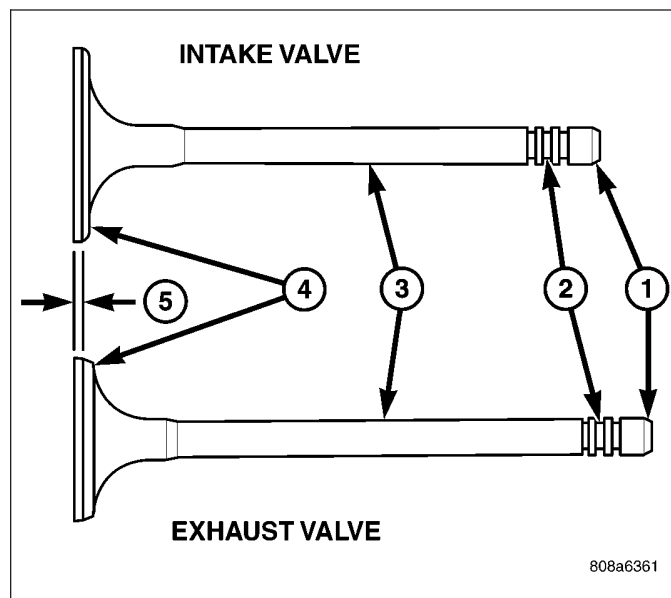

3. Before removing valves (3), **remove any burrs from valve stem retainer lock grooves (2) and stem tip (1) to prevent damage to the valve guides.**
4. Remove valve. Identify each valve to ensure installation in original location.

## INSPECTION

### VALVES

1. Clean and inspect valves thoroughly. Replace burned, warped and cracked valves.
2. Inspect retainer lock grooves for wear or damage (2).
3. Inspect valve face (4) for wear and pitting.
4. Measure valve stems (3) and margins (5) for wear. For valve specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

**Note:** Valve stems (3) are chrome plated and should not be polished.

## VALVE GUIDES

1. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
2. Measure valve stem-to-guide clearance as follows:
3. Install valve (2) into cylinder head so it is 15 mm (0.590 inch.) off the valve seat. A small piece of hose may be used to hold valve in place.
4. Attach dial indicator Tool C-3339 (1) to cylinder head and set it at right angle of valve stem being measured.
5. Move valve to and from the indicator. For clearance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

**Note:** If stem-to-guide clearance exceeds specifications, you must measure valve stem. If valve stem is within specifications or if guide is loose in cylinder head, replace cylinder head.

## INSTALLATION

1. Coat valve stems (2) with clean engine oil and insert them in cylinder head.
2. If valves or seats have been reground, check valve tip height (5). If valve tip height (5) for intake valve is greater than 47.836 mm (1.883 in.) or 47.837 mm (1.883 in.) for exhaust valve, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface (7) to the top of valve stem (2).
3. Install valve stem seals (8) (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - INSTALLATION).
4. After installing valve stem seals, make sure the garter spring (9) is in place.
5. Install valve spring (3) (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION).

## SPRINGS-VALVE

### DESCRIPTION

812d7dc5

The valve springs (3) are made from high strength, chrome-silicon steel. The springs are common for intake and exhaust applications. The valve spring seat is integral with the valve stem seal (4), which incorporates a garter spring to maintain consistent lubrication control to the valve stem.

## REMOVAL

### IN VEHICLE

1. Release fuel pressure **before attempting any repairs** (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Disconnect negative battery (1) cable located in trunk.

3. Remove air cleaner housing (3) and inlet hose (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).

4. Remove upper intake manifold (1)(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
5. Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
6. Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
7. Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
8. Remove timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
9. Remove camshafts and rocker arms(Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - REMOVAL).

10. With air hose attached to spark plug adapter installed in the cylinder being serviced, apply 620.5–689 kPa (90–100 psi) air pressure. This is to hold valves in place while servicing components.
11. Using Special Tool MD 998772A with adapter 6779, compress valve spring and remove valve locks, retainer, and valve spring.
12. Remove valve stem seal (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL).

## OFF VEHICLE

1. With cylinder head removed, compress valve springs (3) using a Special Tool C-3422-D, Valve Spring Compressor.
2. Remove valve retaining locks (1), valve spring retainers (2), valve springs (3).

## INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs (1) should be tested . **As an example;** the compression length of a spring to be tested is 38.00 mm (1.496 in.). Turn the table of Tool C-647 (2) until surface is in line with the 38.00 mm (1.496 in.) mark on the threaded stud and the zero mark on the front. Place spring (1) over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain specified height and allowable tensions (Refer to 9 - ENGINE - SPECIFICATIONS). Replace any springs that do not meet specifications.

## INSTALLATION

### IN VEHICLE

812d7dc5

1. The valve stem seal/valve spring seat (4) should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide. When installing the valve retainer locks (1), compress the spring (3)**only enough** to install locks (1).
2. Follow the same procedure on the remaining cylinders using the firing sequence 1-2-3-4-5-6. **Make sure piston is at TDC on the cylinder that the valve spring is to be removed.**
3. Remove spark plug adapter tool and Special Tool MD 998772A.
4. Install rocker arm(s)(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION).
5. Install camshafts (Refer to 9 - ENGINE/CYLINDER HEAD/CAMSHAFT(S) - INSTALLATION), timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION), and timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
6. Install cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

7. Install upper intake manifold (1)(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

8. Install air cleaner housing (3) and inlet hose(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

9. Connect negative battery (1) cable.

812c49a4

## OFF VEHICLE

812d7dc5

1. If removed, install valve(s) (5&6) (Refer to 9 - ENGINE/CYLINDER HEAD/INTAKE/EXHAUST VALVES & SEATS - INSTALLATION).

2. If valves or seats have been reground, check valve tip height (5). If valve tip height for intake valve is greater than 47.836 mm (1.883 in.) or 47.837 mm (1.883 in.) for exhaust valve, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.

3. Install valve seal/spring seat assembly (4) over valve guides on all valve stems (5).

**Note:** Ensure that the garter spring (9) is intact around the top of the rubber seal. Install valve springs (3) , valve retainers (1).

4. Compress valve springs with a valve spring compressor install locks and release tool. **If valves and/or seats are reground, measure the installed height of springs (4), make sure measurements are taken from top of spring seat (6) to the bottom surface of spring retainer (1).** If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve seal/spring seat (8) to bring spring height back within specification.

## SEALS-VALVE STEM

### REMOVAL

1. Remove valve spring (3) (Refer to 9 - ENGINE/ CYLINDER HEAD/VALVE SPRINGS - REMOVAL).

2. Remove valve stem seal by using a valve seal tool (1).

## INSTALLATION

1. The valve stem seal/valve spring seat (4) should be pushed firmly and squarely over the valve guide using the valve stem (5) as guide. **Do Not Force** seal against top of guide.
2. Install valve spring (3) (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION).

## ADJUSTERS-HYDRAULIC LASH

### DIAGNOSIS AND TESTING

#### HYDRAULIC LASH ADJUSTER NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of a NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to LASH ADJUSTER (TAPPET) NOISE CHART indicating possible lash adjuster (tappet) noise sources and possible sources that could lead to a misdiagnosis.

Refer to LASH ADJUSTER (TAPPET) NOISE CHART for possible causes and correction of a lash adjuster (tappet) type noise.

**LASH ADJUSTER (TAPPET) NOISE CHART**

POSSIBLE CAUSES	CORRECTION
1. Engine oil level—too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct engine oil level.
2. Insufficient running time after rebuilding cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in lash adjuster (after 1 hour run time).	3. See below: (a) Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) If lash adjuster(s) are still spongy, replace with new adjuster/rocker arm assembly.
4. Low oil pressure	4. See below: (a) Check and correct engine oil level. (b) Check engine oil pressure. (c) Check for excessive bearing clearance and correct. (d) Check for worn oil pump.
5. Oil passage to cylinder head(s) plugged with debris.	5. Check cylinder head oil passages and cylinder head gasket restrictor for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Ream guide(s) and replace valve(s) with oversize valves and seal(s).
7. Air ingested into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary.
8. Collapsed lash adjuster due to debris ingestion.	8. Clean debris from engine and replace lash adjuster(s).

**REMOVAL**

1. Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
2. Remove rocker arm(s). (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - REMOVAL)

**CAUTION:** If lash adjusters and rocker arms are to be reused, always mark position for reassembly in their original positions.

3. Remove lash adjuster(s).

**INSTALLATION**

1. Install hydraulic lash adjuster making sure adjusters are at least partially full of oil. This can be verified by little or no plunger travel when lash adjuster is depressed.
2. Install rocker arm(s) (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSTALLATION) and cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## ARMS-ROCKER

### DESCRIPTION

The rocker arms are composed of steel stampings with an integral roller bearing (3). The rocker arms incorporate a 0.5 mm (0.0197 in.) oil hole (2) in the lash adjuster socket (1) for roller/camshaft lobe lubrication.

### REMOVAL

1. Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)

**CAUTION:** Always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

2. Rotate engine until the cam lobe is on its base circle (heel), on the rocker arm being removed.

**CAUTION:** Depress valve spring only enough to remove rocker arm.

3. Using Special Tools 8215 (1) and 8216 Adaptor (2) and a 3/8" ratchet (3), depress valve spring only enough to release tension on rocker arm.
4. Remove rocker arm from cylinder head.

**CAUTION:** If rocker arms are to be reused, identify position of rocker arms for reassembly in their original positions.

5. Repeat procedure for each rocker arm removed.
6. Inspect the rocker arm for wear or damage. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARMS - INSPECTION).

## INSPECTION

Inspect the cam follower assembly for wear or damage. Replace as necessary.

## INSTALLATION

1. Lubricate rocker arms with clean engine oil before installation.
2. Rotate engine until cam lobe is on its base circle (heel) of rocker arm being installed.

3. Using Special Tools 8215-A (1), 8216-A adaptor (2), and a 3/8" Drive Ratchet (3), depress valve spring only enough to install rocker arm.
4. Install rocker arm in original position (if reused) over valve and lash adjuster. Release tension on valve spring.

**Note: Inspect rocker arm for proper engagement into lash adjuster and valve tip.**

5. Repeat procedure for each rocker arm being installed.
6. Install cylinder head cover(s). Refer to procedure in this section.

## ENGINE BLOCK

### DESCRIPTION

The cylinder block (6) is made of heat treated aluminum with cast-in-place iron liners. The block is a closed deck design with the right bank forward. To provide high rigidity and improved NVH, the block has cast-in contours and ribs, along with powdered metal main caps (2) each with 6 bolts 4 vertical (1) and 2 horizontal (5). The engine is equipped with a windage tray mounted to the main caps.

The block design allows coolant flow between the cylinder bores and an internal coolant by-pass to the thermostat.

### STANDARD PROCEDURE - CYLINDER BORE HONING

1. Used carefully, the cylinder bore resizing hone, recommended tool C-823 or equivalent, equipped with 220 grit stones, is the best tool for this honing procedure. In addition to deglazing, it will reduce taper and out-of-round as well as removing light scuffing, scoring or scratches. Usually a few strokes will clean up a bore and maintain the required limits.
2. Deglazing of the cylinder walls may be done using a cylinder surfacing hone, recommended tool C-3501 or equivalent, equipped with 280 grit stones, if the cylinder bore is straight and round. 20–60 strokes depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil. **Do not use engine or transmission oil, mineral spirits or kerosene.** Inspect cylinder walls after each 20 strokes.

3. Honing should be done by moving the hone up and down fast enough to get a cross-hatch pattern (1). When hone marks **intersect** at 40-60 degrees (2), the cross hatch angle is most satisfactory for proper seating of rings.
4. A controlled hone motor speed between 200–300 RPM is necessary to obtain the proper cross-hatch angle. The number of up and down strokes per minute can be regulated to get the desired 40–60 degree angle (2). Faster up and down strokes increase the cross-hatch angle.
5. After honing, it is necessary that the block be cleaned again to remove all traces of abrasive.

**CAUTION:** Ensure all abrasives are removed from engine parts after honing. It is recommended that a solution of soap and hot water be used with a brush and the parts then thoroughly dried. The bore can be considered clean when it can be wiped clean with a white cloth and cloth remains clean. Oil the bores after cleaning to prevent rusting.

## CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

## INSPECTION

### ENGINE BLOCK

1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.
2. If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).
3. Examine block and cylinder bores for cracks or fractures.
4. Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

### CYLINDER BORE

**Note:** The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 or equivalent (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B. Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

## BEARINGS-CONNECTING ROD

### STANDARD PROCEDURE - CONNECTING ROD AND BEARING FITTING

#### CONNECTING ROD BEARING

Fit all connecting rods on one bank until complete.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

**CAUTION:** Do not use a punch to mark rods as rod damage may occur.

**CAUTION:** Care must be taken not to damage the fractured rod and cap joint face surfaces as engine damage may occur.

The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Also, assure that the hole in upper bearing half aligns with oil squirt hole in rod. Install cap with the tangs on the same side as the rod.

**CAUTION:** Assure that hole in upper bearing half aligns with hole in connecting rod as engine damage may occur.

Limits of taper on any crankshaft journals should be held to 0.015 mm (0.0006 in.). Limits of out-of-round on any crankshaft journal should be held to 0.010 mm (0.0004 in.). Bearings are available 0.025 mm (0.001 in.) and 0.250 mm (0.010 in.) undersize. **Install the bearings in pairs. Do not use a new bearing half with an old bearing half. Do not file the rods or bearing caps.**

1. For measuring Main Bearing Clearance and Connecting Rod Bearing Clearance use plastigage. For more information on using plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE). Refer to Engine Specifications for bearing clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

## CONNECTING ROD BOLTS

**Note:** The connecting rod bearing cap bolts must be examined before reuse. If the threads are necked down due to stretching, the bolt(s) must be replaced.

**Note:** Connecting rod bolts are retained in the rod cap with a light press fit. If bolts are to be removed, use a hammer and punch to drive bolts from connecting rod cap using care not to damage fractured cap surface.

1. Examine connecting rod bolt for stretching. Stretching can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt should be replaced.
2. Before installing the bolts, lubricate the threads with engine oil.
3. Install bolts finger tight. Then alternately torque each nut to assemble the cap properly.
4. Tighten the nuts to specification (Refer to 9 - ENGINE - SPECIFICATIONS).

## CONNECTING ROD SIDE CLEARANCE

1. Mount a dial indicator to a stationary point on engine. Locate probe perpendicular to and resting against the connecting rod cap being checked. Move connecting rod all the way to rear of its travel. Zero the dial indicator. Move connecting rod forward to limit of travel and read the dial indicator. Compare measurement to specification listed in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Repeat procedure for each connecting rod. Turn crankshaft for connecting rod accessibility.

## CRANKSHAFT

### DESCRIPTION

The crankshaft (7) is constructed of a forged micro alloy steel. The six throw, nine counterweight crankshaft is supported by four select fit main bearings with the number three serving as the thrust washer location. The select fit identification markings will be on the rear side of the number nine (rearmost) counterweight. The six separate connecting rod throws are an even-firing design which reduces torque fluctuations while a vibration damper is used to control torsional vibration.

The crankshaft oil seals are a one piece design. The front seal is retained by the timing chain cover, and the rear seal is part of a housing that attaches to the cylinder block.

## STANDARD PROCEDURE - CRANKSHAFT END PLAY

1. Mount a dial indicator to a stationary point at front of engine. Locate the probe perpendicular against nose of crankshaft.
2. Move crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move crankshaft all the way to the front and read the dial indicator. For crankshaft end play clearances (Refer to 9 - ENGINE - SPECIFICATIONS).

## REMOVAL

1. Drain engine oil (5) and remove oil filter (3).
2. Remove engine from vehicle (Refer to 9 - ENGINE - REMOVAL).
3. Mount engine on an engine stand.
4. Remove oil pan and oil pick-up tube (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
5. Remove idler pulley bracket for accessory drive belt.
6. Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
7. Remove cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
8. Remove timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - REMOVAL).
9. Remove primary timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - REMOVAL).
10. Remove crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - REMOVAL).
11. Remove oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
12. Remove crankshaft rear oil seal retainer (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - REMOVAL).

13. Remove windage tray (1)(Refer to 9 - ENGINE/ENGINE BLOCK/WINDAGE TRAY / STRUCT SUPPORT - REMOVAL).
14. Turn crankshaft until connecting rod cap to be removed is accessible.

**Note:** Connecting rod bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

**CAUTION:** DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

15. Mark connecting rod bearing cap positions using a permanent ink marker or scribe tool.
16. Remove connecting rod bearing caps. Use care to prevent damage to the crankshaft bearing surfaces.

**CAUTION:** Care should be taken not to damage the fractured rod and cap joint face surfaces or damage to the engine may occur.

17. Remove main bearing cap bolts and tie bolts (1&2).

18. Remove main bearing caps (2).

**CAUTION:** When removing crankshaft, use care not to damage bearing surfaces on the crankshaft.

19. Remove crankshaft (7) from cylinder block (6).

## INSTALLATION

**Note:** Upper and lower bearing halves are NOT interchangeable.

**CAUTION:** Main bearings are select fit (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE).

1. Install the main bearing in the block and main caps making sure the tangs engage the slots in the block and main caps.
2. Lubricate upper main bearing halves with engine oil.

**CAUTION:** When installing crankshaft, use care not to damage bearing surfaces on the crankshaft.

3. Install crankshaft.

**Note:** Make sure that the coated and oil groove side of crankshaft thrust washer faces the crankshaft thrust surface.

4. Push crankshaft forward. Lubricate and install the front thrust washer (1) by rolling the thrust washer onto the machined shelf between the No. 3 upper main bulk head and crankshaft thrust surface.
5. Move crankshaft rearward. Lubricate and install the rear thrust washer by rolling the thrust washer onto the machined shelf between the No. 3 upper main bulk head and crankshaft thrust surface.

6. Lubricate lower main bearings with engine oil.
7. Install main bearings caps.

**Note:** Lubricate main bearing cap bolts with engine oil before installation.

**Note:** The main bearing cap bolts must be tightened in the proper sequence. First the inner main cap bolts, secondly the windage tray bolts, and lastly the main cap tie (horizontal) bolts.

8. Install the inner main bearing cap bolts and tighten to 20 N·m + 1/4 Turn (15 ft. lbs. + 1/4 Turn).

9. Measure crankshaft end play (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE).

10. Install connecting rods and measure side clearance (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSTALLATION) (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

11. Install windage tray (1) with the slots to right side of engine. Lubricate bolts (3) with engine oil and tighten to 27 N·m + 1/4 Turn (20 ft. lbs. + 1/4 turn).

12. Install the main cap tie (horizontal) bolts (1&2) and tighten to 28 N·m (250 in. lbs.).
13. Install rear crankshaft oil seal retainer and oil seal assembly(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - INSTALLATION).

14. Install oil pump assembly (5)(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
15. Install oil pick-up tube (3) and O-ring (2). Tighten bolts (4) to 28 N·m (250 in.lbs.).
16. Install oil pan gasket, oil pan, and oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
17. Install crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - INSTALLATION).
18. Install timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN AND SPROCKETS - INSTALLATION).
19. Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING CHAIN COVER - INSTALLATION).
20. Install cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
21. Install oil dipstick tube.
22. Install engine assembly (Refer to 9 - ENGINE - INSTALLATION).
23. Fill engine crankcase with proper oil to correct level (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).
24. Fill with coolant(Refer to 7 - COOLING - STANDARD PROCEDURE).
25. Start engine and check for leaks.

## BEARINGS-CRANKSHAFT MAIN

### STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING FITTING

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the block and crankshaft have grade identification marks.

The grade marks for the cylinder block main bearing bore grade is located on the pan rail just below the left side engine mount bracket. These marks are read left to right, corresponding to main bore 1, 2, 3, 4.

The grade marks for the crankshaft are located on the rearmost crankshaft counter weight as shown in. The crankshaft journal grade marks are read left to right, corresponding with journal number 1, 2, 3, 4.

#### MAIN BEARING SELECTION CHART—2.7L

		Main Bearing Bore Grade Mark		
		1	2	3
Crankshaft Main Journal Grade Mark	1	(3) standard	(2) +0.003 mm (+0.0001 in.)	(1) +0.006 mm (+0.0002 in.)
	2	(4) -0.003 mm (-0.0001)	(3) standard	(2) +0.003 mm (+0.0001 in.)
	3	(5) -0.006 mm (-0.0002 in.)	(4) -0.003 mm (-0.0001 in.)	(3) standard

Refer to the MAIN BEARING SELECTION CHART—2.7L to properly select the main bearings. For an example, if the main bore grade is 3 and the journal grade is 2, the proper select fit bearing would be (2) +0.003 mm (+0.0002 in.).

**Note:** Service main bearings have a number from 1–5 marked in ink on the bearing surface. For verification, use the **MAIN BEARING SELECTION CHART—2.7L** for number to size identification.

The upper main bearing (2) has a oil feed hole and a center groove (3) to allow lubrication of the main journal and must be properly positioned in the block.

**Note:** Although cylinder bores are graded for size, there is only one piston size.

## SEAL- CRANKSHAFT FRONT OIL REMOVAL

1. Remove crankshaft vibration damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
2. Install Special Tool 8194 (1), Insert into crankshaft nose. Remove seal using Special Tool 6771, Remover.

## INSTALLATION

1. Install new seal (4) using Special Tools 6780-2 Sleeve (1), 6780-1 Installer (3), and 8179 Stud (2).
2. Install crankshaft vibration damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

## SEAL- CRANKSHAFT REAR OIL REMOVAL

The crankshaft rear oil seal is incorporated in the seal adapter (2) and can not be removed from the adapter. The crankshaft rear oil seal/seal adapter (2) are serviced as an assembly.

1. Disconnect negative battery (1) cable.

2. Raise vehicle.
3. Remove splash shield retaining bolts (1) and splash shield (2).
4. Remove the structural collar(Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).
5. Remove transmission(Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - REMOVAL).

6. Remove flex plate attaching bolts (2), backing plate (3), and flex plate (1).

7. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

**Note:** The integrated stamped steel rear crankshaft seal is not interchangeable with the cast aluminum rear seal adapter and seal assembly.

8. Remove seal retainer attaching screws.

9. Remove crankshaft rear oil seal/adapter (2).

## INSTALLATION

**Note:** The integrated rear crankshaft seal (2) is not interchangeable with the cast aluminum rear seal adapter and seal assembly.

1. Clean sealing surfaces.

2. Install seal assembly (2) using special tool 6926-1(1).
3. Install seal retaining bolts finger tight.

**Note:** The following steps must be performed to prevent oil leaks at sealing joints.

4. Attach Special Tools 8225 (1) to pan rail using the oil pan fasteners.

**Note:** Make sure that the “2.7L” stamped on the special tool is facing the cylinder block (flat side of tools against pan rail).

5. While applying firm pressure to the seal assembly (2) against Special Tools 8225 (1), tighten seal assembly screws to 12 N·m (105 in. lbs.).
6. Remove special tool 8225.
7. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

8. Install flex plate (1), backing plate (3), and attaching bolts (2) (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - INSTALLATION).
9. Install transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE -

INSTALLATION).

10. Install lower splash shield retaining bolts (1) and splash shield (2).
11. Lower vehicle.

12. Fill with oil (5).

13. Connect negative battery (1) cable.
14. Start engine and check for leaks.

## PLATE-FLEX

### REMOVAL

1. Remove transmission(Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - REMOVAL).
2. Remove flex plate attaching bolts (2).
3. Remove backing plate (3) and flex plate (1).

## INSTALLATION

1. Install flex plate (1) and backing plate (3).
2. Apply MOPAR® Lock & Seal Adhesive to the flex plate bolts.
3. Install all flex plate bolts (2) finger tight.
4. Tighten flex plate bolts (2) to 95 N·m (70 ft. lbs.).
5. Install transmission(Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION).

## ROD-PISTON & CONNECTING

### DESCRIPTION

The pistons (1) are made of a high strength aluminum alloy with an anodized top ring groove. Piston skirts are coated with a solid lubricant for scuff resistance. The pistons have an "F" cast into the side next to the pin bore that must face towards the front of the engine. The connecting rods are made of powdered metal with a "fractured cap" design. The connecting rod attaches to the piston with a full floating pin retained by lock rings. The piston and connecting rod are serviced as an assembly.

## STANDARD PROCEDURE - FITTING PISTONS

The pistons have been cast and machined to one size and weight. The piston and rod assemblies are matched to weigh the same for engine balance.

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin at size location shown. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line. Refer to Engine Specifications. (Refer to 9 - ENGINE - SPECIFICATIONS) **Pistons and cylinder bores should be measured at normal room temperature, 70°F (21°C).**

## PISTON PINS

The piston pin is full floating and is held in place by lock rings. **Do Not switch pistons with other rods.** Pistons and connecting rods are serviced as an assembly for balance.

## REMOVAL

1. Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so that each connecting rod is centered in cylinder bore.**

**Note:** Connecting rod bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

**CAUTION:** DO NOT use a number stamp or a punch to mark connecting rods. Damage to connecting rod could occur.

2. Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

**CAUTION:** Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

3. Remove connecting rod cap. Install Special Tool 8189 Connecting Rod Guides (1) into the connecting rod being removed. Remove each piston and rod assembly out of cylinder bore.

**Note:** Be careful not to nick crankshaft journals.

4. After removal, install bearing cap on the mating rod to prevent damage to the fractured cap to rod surfaces.

## INSTALLATION

1. Install the piston rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - INSTALLATION).
2. Before installing piston and connecting rod assemblies into the bore, ensure that compression ring gaps (2&5) are staggered so that neither is in line with oil ring gap (1&4).
3. Before installing the ring compressor, make sure the oil ring expander (5) ends are butted and the rail gaps located as shown (1&4).
4. Immerse the piston head and rings in clean engine oil, slide the ring compressor over the piston and tighten with the special wrench. **Ensure position of rings does not change during this operation.**

**CAUTION:** Ensure the hole in bearing half aligns with hole in connecting rod, as damage to engine may occur.

5. Position bearing onto connecting rod. Ensure that hole in bearing half is aligned to hole in connecting rod. Lubricate bearing surface with clean engine oil.
6. Install Special Tools 8189 Connecting Rod Guides (3) into connecting rod.
7. The pistons(1) are marked on top with an arrow and with an "F" (Front) above the pin boss. These marks must be pointing towards the front of engine on both cylinder banks.

80b09a63

8. The connecting rod oil squirt hole (2) faces the major thrust (right) side of the block (1).

9. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

**CAUTION: Do Not interchange piston assemblies bank to bank, as engine damage may occur.**

10. Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.
11. Lubricate rod bolts and bearing surface with engine oil. Install connecting rod cap and bearing. Tighten bolts to 27 N·m (20 ft. lbs.) Plus 1/4 turn.

## RINGS-PISTON

### STANDARD PROCEDURE - PISTON RING FITTING

1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 inch.) from bottom of cylinder bore. Check gap with feeler gauge (1). Refer to (Refer to 9 - ENGINE - SPECIFICATIONS) for clearance measurements.

2. Check piston ring to groove clearance with feeler gauge (1). For clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

## REMOVAL

1. Remove piston and connecting rod(Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL).
2. Remove No. 1 and No.2 piston rings from piston using a ring expander tool.

3. Remove upper oil ring side rail (2).
4. Remove lower oil ring side rail (2).
5. Remove oil ring expander (1).

## INSTALLATION

1. Measure clearance of piston rings to the cylinder bore and piston. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE)

**CAUTION:** Install piston rings in the following order:

- Oil ring expander.
- Lower oil ring side rail.
- Upper oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

2. Install oil ring expander.

Install the side rail by placing one end between the piston ring groove and the oil ring expander. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander during this step.**

3. Install lower side rail first and then the upper side rail.

**Note:** The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston.

**Note:** Be sure to use a ring expander to install piston rings.

4. Install No. 2 piston ring and then No. 1 piston ring.

5. Position oil ring expander gap (5) as shown. Staggering ring gap is important for oil control.
6. Position piston lower side rail end gap (4) as shown.
7. Position piston upper side rail end gap (1) as shown.
8. Position piston ring no. 2 (5) end gap as shown in
9. Position piston ring no. 1 (2) end gap as shown in.

## DAMPER-VIBRATION

### REMOVAL

1. Disconnect negative battery (1) cable located in trunk.
2. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

3. Use special tool 9365 Damper Holder (2) to hold damper (1) while removing attaching bolt (3).

4. Remove damper by using Special Tools 8194 Insert (1) and 8454 Puller (2).

## INSTALLATION

1. Install damper (1) using Special Tools 8179 Screw (3), with Nut and Thrust Bearing from 6792, and 6792-1 Installer (2).

2. Install damper attaching bolt (3). Use special tool 9365 damper holder (2) to hold damper (1) while tightening attaching bolt to 170 N·m (125 ft. lbs.).
3. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

4. Connect negative battery (1) cable located in trunk.

## WINDAGE TRAY

### REMOVAL

1. Disconnect negative battery (1) cable located in the trunk.
2. Raise vehicle.

3. Remove lower splash shield retaining bolts (1) and splash shield (2).

4. Remove oil filter (3).
5. Remove oil pan (4)(Refer to 9 - ENGINE/LUBRI-CATION/OIL PAN - REMOVAL).

6. Remove oil pump pickup tube (2).
7. Remove windage tray/outer main bearing cap bolts (3).
8. Remove windage tray (1).

## INSTALLATION

**Note:** Slots in windage tray should be on the right side of engine. If windage tray is improperly installed, damage to oil pan could result.

1. Install windage tray (1) torque mounting bolts to 27N·m + 1/4 turn (20 Ft. Lbs. + 1/4 turn).
2. Install oil pump pick up tube, torque mounting bolts to 28 N·m (250 In. Lbs.).

3. Install oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
4. Install oil filter (3).

5. Install lower splash shield (2) and retaining bolts (1).
6. Lower vehicle.
7. Fill with correct grade of oil.

8. Connect negative battery (1) cable located in trunk.
9. Start engine and check for leaks.

## COLLAR-STRUCTURAL REMOVAL

1. Disconnect negative battery (1) cable located in trunk.

2. Raise vehicle on hoist.
3. Remove lower splash shield retaining bolts (1) and splash shield (2).

4. Remove transmission mount bolts (2).
5. Place a transmission jack under the transmission pan and raise engine and transmission.

6. Remove bolts attaching structural collar to oil pan (3) and transmission bell housing (4).

7. Move structural collar (1) to the right.
8. Remove structural collar (1) out towards the rear.

## INSTALLATION

1. Install structural collar (1) from the right rear.

**CAUTION:** The structural collar must be tightened using this service procedure, or damage to transmission case and/or oil pan may occur.

2. Position structural collar (3) in place.
3. Finger tighten all bolts (2&4).

**Note:** Make sure that structural collar (3) is flush with the oil pan (1) and the transmission bell housing.

4. Tighten the structural collar to oil pan bolts (2) to 55 N·m (40 ft. lbs.).
5. Tighten structural collar to transmission bolts (4) to 55 N·m (40 ft. lbs.).

6. Install lower splash shield(2) and retaining bolts (1).
7. Lower vehicle.

8. Connect neative battery (1) cable.

## MOUNT-LEFT

### REMOVAL

1. Disconnect negative battery (1) cable located in trunk.

2. Remove air cleaner housing (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Raise vehicle.

4. Remove lower splash shield retaining bolts (1) and splash shield (2).

5. Remove engine mount nuts (1).
6. Remove engine mount studs (1) from the left mount isolater.
7. Place a block of wood under the oil pan (4) and raise engine with suitable jackstand.

8. Remove engine mount isolater (1) to engine mount adapter (2) bolts.

9. Remove engine mount isolater (1).

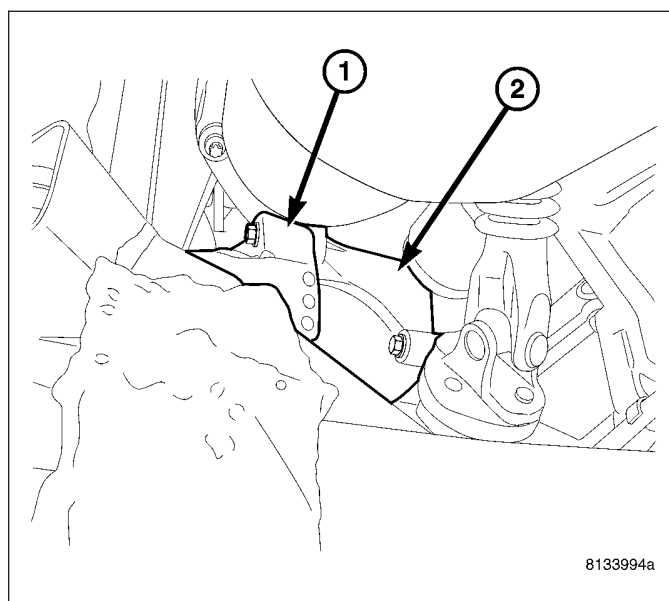

## INSTALLATION

1. Install engine mount isolater (1) in place.

2. Attach left engine mount isolater (1) to engine mount adapter (2). Install bolts and tighten to 75 N·m (55 ft. lbs.).
3. Lower engine but do not let mount contact frame.
4. Install engine mount studs and tighten to 12N·m (106 in. lbs.).

5. Lower engine and remove lifting device.
6. Tighten engine mount isolater nuts (1) to 75 N-m (55 ft. lbs.).

7. Install lower splash sheild (2) and tighten retaining bolts(1).
8. Lower vehicle.

9. Install air cleaner housing assembly (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

10. Connect negative battery (1) cable.

## MOUNT-RIGHT

### REMOVAL

1. Disconnect negative battery (1) cable located in trunk.

2. Remove air cleaner housing (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Raise vehicle.

4. Remove lower splash shield retaining bolts (1) and splash shield (2).

5. Remove engine mount nuts (1).
6. Remove engine mount studs (1) from the right engine mount isolater.
7. Place a block of wood under the oil pan (4) and raise engine with suitable jackstand.

8. Remove engine mount isolater to engine mount adapter bolts (1).
9. Remove engine mount isolater (2).

## INSTALLATION

1. Install right engine mount isolater to engine mount adapter bolts (1). Tighten bolts to 75 N·m (55 ft. lbs.).
2. Lower engine but do not let mount contact frame.

3. Install engine mount studs (1) and tighten to 12N·m (106 in. lbs.).
4. Lower engine and remove lifting device.
5. Tighten engine mount isolater nuts (1) to 75 N·m (55 ft. lbs.).

6. Install lower splash shield (2) and tighten retaining bolts (1).
7. Lower vehicle.

8. Install air cleaner housing assembly (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

9. Connect negative battery (1) cable.

## REAR MOUNT

### REMOVAL

1. Raise vehicle on hoist.
2. Remove cross member to mount bolts (2).
3. Place transmission jack under transmission pan and raise transmission.
4. Remove cross member attaching bolts and remove crossmember (1).

5. Remove mount to transmission bolts (2), remove mount (1).

## INSTALLATION

1. Install mount to transmission bolts (2) and tighten to 47 N·m (35 ft.lbs.).

2. Install cross member (1) and attaching bolts. Tighten bolts to 68 N·m (50 ft.lbs.).
3. Lower transmission so cross member to mount bolts (2) can be started tightened by hand.
4. Lower transmission and remove jack.
5. Tighten mount bolts (2) to 47 N·m (39 ft.lbs.).

## LUBRICATION

### DESCRIPTION

The lubrication system is a full-flow filtration, pressure feed type. The oil pump body is mounted to the engine block. The pump inner rotor is driven by the crankshaft. A windage tray is used to increase power by minimizing oil windage at high engine RPM. An engine oil cooler is used on some models.

OPERATION

Oil from the oil pan is pumped by a gerotor type oil pump (3) directly coupled to the crankshaft. Oil pressure is controlled by a relief valve mounted inside the oil pump housing. Refer to Cylinder Block, Left Cylinder Head or Right Cylinder Head art between the charts for engine oil lubrication circuits.

## DIAGNOSIS AND TESTING

### CHECKING ENGINE OIL PRESSURE

1. Remove the oil pressure switch (1)(Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL).
2. Install oil pressure test gauge assembly, Special Tools C-3292 with 8406 adaptor.
3. Start engine and monitor gauge readings.

**CAUTION:** If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM

4. Oil Pressure (engine at operating temperature):  
**Curb Idle** 34.5 kPa (5 psi) minimum **3000 RPM** 300–724 kPa (45–105 psi).
5. If oil pressure is 0 at idle. Shut off engine, check for pressure relief valve stuck open or a clogged oil pickup screen.
6. Remove oil pressure test gauge assembly, Special Tools C-3292 with 8406 adaptor and install oil pressure switch after testing is completed(Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - INSTALLATION).

## OIL

### DESCRIPTION

For engine oil type and capacity (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL)

### STANDARD PROCEDURE

### ENGINE OIL AND FILTER CHANGE

**WARNING:** NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

Change engine oil and filter at mileage and time intervals described in the Maintenance Schedule (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

### TO CHANGE ENGINE OIL

1. Run engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn engine off.

3. Hoist and support vehicle on safety stands(Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
4. Place a suitable drain pan under crankcase drain (5).
5. Remove drain plug (5) from oil pan and allow oil to drain into pan. Inspect drain plug (5) threads for stretching or other damage. Replace drain plug (5) and gasket if damaged.
6. Remove oil filter (3). Refer to (Refer to 9 - ENGINE/LUBRICATION/OIL FILTER - REMOVAL)
7. Install drain plug (5) in oil pan.
8. Install new oil filter (3)(Refer to 9 - ENGINE/LUBRI-CATION/OIL FILTER - INSTALLATION).

9. Lower vehicle and remove oil fill cap (5). Fill crankcase with specified type and amount of engine oil,. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL) (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).
10. Install oil fill cap (5).
11. Start engine and inspect for leaks.
12. Stop engine and inspect oil level (4).

## OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

## USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

## ENGINE OIL LEVEL CHECK

The best time to check engine oil level is after it has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level (4).

Checking the oil while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil in the oil fill (5) only when the level is at or below the ADD mark.

## OIL COOLER & LINES

### DESCRIPTION

The 2.7L engine oil cooler (if equipped) is an oil-to-coolant type engine oil cooler (4). The cooler (4) is mounted between the oil filter adapter and the oil filter (3). If equipped, the engine will have hose assembly (2). If not equipped, the engine will have hose assembly (1).

## OPERATION

Engine oil travels from the oil cooler (4) and into the oil filter (3). Engine oil then exits the filter into the main gallery. Engine coolant flows from the upper radiator hose to and from the cooler through hoses (2) and back to the upper radiator hose.

## REMOVAL

1. Drain cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Raise vehicle on hoist.
3. Disconnect coolant hoses (2) from oil cooler (4).
4. Remove oil filter (3).
5. Remove oil cooler attaching fastener from center of oil cooler (4).
6. Remove oil cooler (4).

## INSTALLATION

1. Install oil cooler (4).
2. Install oil cooler (4) attaching fastener and tighten to 54 N·m (40 ft. lbs.).
3. Install oil filter (3).
4. Connect coolant hoses (2) to oil cooler (4).
5. Lower vehicle.
6. Fill cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
7. Start engine and check for leaks.
8. Check engine oil and add as needed.

## FILTER-OIL

### REMOVAL

1. Raise vehicle on hoist.
2. Remove lower splash shield retaining bolts (1) and splash shield (2).

3. Position a suitable collecting container under oil filter (3) location.
4. Remove oil filter (3) using a suitable oil filter wrench. Dispose of oil filter (3) following environmental guidelines.

## INSTALLATION

1. Wipe filter base clean, then inspect gasket sealing surface.
2. Lubricate gasket of new filter with clean engine oil.
3. Install oil filter (3) and tighten to 16 N·m (9 ft. lbs.) of torque after gasket contacts base. Use filter wrench if necessary.

4. Install lower splash shield (2) and retaining bolts (1).

5. Fill crankcase with proper engine oil to correct level. Start engine and check for leaks.
6. Check engine oil level on dipstick (4) and fill as needed (5).

## PAN-OIL

### REMOVAL

1. Disconnect negative battery cable (1) located in trunk.

2. Remove engine oil dipstick (4) and tube.
3. Raise vehicle on hoist.

4. Remove lower splash shield retaining bolts (1) and splash shield (2).

5. Drain engine oil (5) and remove oil filter (3).

6. Remove the steering coupler bolt (4) and separate coupler (1) from rack (3).

7. Disconnect power steering pressure switch electrical connector (1).

8. Remove steering rack mounting bolts (1).

9. Remove power steering line support (2) from frame.

10. Reposition rack out of the way.

11. Remove structural collar (Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL).

12. Remove generator mounting bracket to oil pan lower bolt (1).
13. Remove A/C compressor bracket to oil pan lower bolt (2).

14. Remove lower timing chain cover to oil pan bolts (1).

**CAUTION:** Assure removal of the four lower timing cover bolts, as damage to the timing cover and/or oil pan may occur.

15. Remove oil pan attaching bolts. Remove oil pan and gasket.

## INSTALLATION

1. Clean oil pan and sealing surfaces. Inspect timing chain cover gaskets. Replace as necessary.
2. Apply an 1/8 inch bead of Mopar® Engine RTV GEN II to the front T-joints (1) (oil pan gasket to timing cover gasket interface) and the rear T-joints (2) (oil pan gasket to crankshaft rear oil seal retainer gasket interface).
3. Install oil pan gasket to block.

**Note:** To prevent oil leaks at oil pan to timing chain cover, the following tightening sequence procedure must be performed.

4. Install oil pan and fasteners using the following tightening sequence:
  - a. Install oil pan bolts and nuts **finger tight only—just tight enough to compress the gasket's rubber seal. Line up front of oil pan to be flush with front face of block.**
  - b. Install lower timing chain cover bolts (1) and tighten to 12 N·m (105 in. lbs.).
  - c. Tighten oil pan bolts to 28 N·m (250 in. lbs.).
  - d. Tighten oil pan nuts to 12 N·m (105 in. lbs.).

5. Install lower bolt attaching the A/C compressor to oil pan (2). Tighten bolt to 28 N·m (21 ft. lbs.).
6. Install lower bolt attaching the alternator bracket to oil pan (1). Tighten bolt to 28 N·m (21 ft. lbs.).

7. Install oil filter (3) and drain plug (5).
8. Install structural collar(Refer to 9 - ENGINE/ENGINE BLOCK/STRUCTURAL COVER - INSTALLATION).

9. Position steering gear (2) in place and install mounting bolts (1). Tighten bolts (1) to 70 N·m (95 ft. lbs.).

10. Install the steering coupling (2) lower pinch bolt (1) at the gear (3) **using a new bolt (1)**. Tighten to 30 N·m (22 ft.lbs.)(Refer to 19 - STEERING/COLUMN/STEERING COUPLING - INSTALLATION).

11. Connect electrical connector (1) to steering gear (2).

12. Install power steering line support (2) and tighten.

13. Install lower splash shield (2) and retaining bolts (1).
14. Lower vehicle.

15. Install engine oil dipstick and tube (4).
16. Fill engine crankcase (5) with proper oil to correct level.

17. Connect negative battery (1) cable.
18. Start engine and check for leaks.

## SWITCH-OIL PRESSURE

### DESCRIPTION

The engine oil pressure switch (1) is located on the right side of the engine block. The switch screws into the engine main oil gallery. The normally closed switch provides an input through a single wire to the low pressure indicator light on the instrument cluster.

## REMOVAL

1. Raise vehicle on hoist.
2. Remove lower splash shield.
3. Disconnect oil pressure switch (1) electrical connector.
4. Position an oil collecting container under switch location.
5. Remove switch by unscrewing from the engine block.

## INSTALLATION

1. Apply Mopar® Thread Sealant to the switch threads.
2. Install oil pressure switch (1).
3. Connect electrical connector.
4. Lower vehicle.
5. Start engine and check for leaks.
6. Check engine oil level and adjust as necessary.

## PUMP-OIL

### REMOVAL

1. Remove crankshaft vibration damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
2. Remove timing chain cover (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
3. Remove timing chain and sprockets(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
4. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
5. Remove oil pick-up tube (3) and O-ring (2).

6. Ensure that crankshaft position is at 60° ATDC of No.1 cylinder, or crankshaft sprocket mark aligns with mark on oil pump (1). This position will properly locate oil pump upon installation.

7. Remove oil pump attaching bolts (1).
8. Remove oil pump (5).

## DISASSEMBLY

**Note:** DO NOT remove oil pressure relief valve. If the oil pressure relief valve is suspect, replace the oil pump assembly.

1. Remove oil pump cover screws (2) and lift off oil pump cover (1).
2. Remove inner pump rotor (3) and outer pump rotor (5).
3. Wash all parts in a suitable solvent.
4. Inspect components carefully for damage or wear. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSPECTION).

## CLEANING

1. Clean all parts thoroughly in a suitable solvent.

## INSPECTION

**Note:** DO NOT remove oil pressure relief valve. If the oil pressure relief valve is suspect, replace the oil pump assembly.

1. Disassemble the oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - DISASSEMBLY).
2. Clean all oil pump components (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - CLEANING).
3. Inspect mating surface of the oil pump housing and cover. Replace oil pump if deeply scratched or grooved (minor surface scratches and polishing is normal).
4. Lay a straightedge (1) across the pump cover (3) surface. If a 0.025 mm (0.001 in.) feeler gauge (2) can be inserted between cover and straight edge, cover should be replaced.

5. Measure thickness and diameter of outer rotor. If outer rotor thickness measures 9.474 mm (0.373 in.) or less, or if the diameter is 89.174 mm (3.5108 in.) or less, replace outer rotor.

6. Measure the inner rotor, if inner rotor measures 9.474 mm (0.373 in.) or less replace inner rotor.

7. Slide outer rotor into body, press to one side with fingers and measure clearance between rotor and body (2). If measurement is 0.39 mm (0.015 in.) or more, replace body only if outer rotor is in specifications.

8. Install inner rotor (3) into body. If clearance between inner rotor (3) and outer rotor (1) is 0.20 mm (0.008 in.) or more, replace both rotors.

9. Place a straightedge (1) across the face of the body, between bolt holes. If a feeler gauge (2) of 0.077 mm (0.003 in.) or more can be inserted between rotors and the straightedge, replace pump assembly **ONLY** if rotors are in specification.
10. Assemble oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - ASSEMBLY).

## ASSEMBLY

1. Assemble pump using new parts as required.
2. Tighten cover screws (2) to 12 N·m (105 in. lbs.).
3. Prime oil pump before installation by filling rotor cavity with engine oil.

## INSTALLATION

**CAUTION:** Crankshaft position must be at 60° ATDC of No.1 cylinder before installing oil pump (1). This position will properly locate oil pump. If not properly located, severe damage to oil pump can occur.

1. Prime oil pump before installation by filling rotor cavity with engine oil.
2. If crankshaft has been rotated, it must be repositioned to 60° ATDC of No.1 cylinder (1) prior to oil pump installation.

3. Install oil pump (5) carefully over crankshaft and into position.
4. Install oil pump attaching bolts (1). Tighten bolts to 28 N·m (250 in. lbs.).
5. Install oil pick-up tube (3) with new O-ring (2). Lubricate O-ring (2) with clean engine oil before installation. Tighten attaching bolts (1) to 28 N·m (250 in. lbs.).
6. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
7. Install timing chain and sprockets(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
8. Install timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
9. Install crankshaft vibration damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
10. Fill crankcase with engine oil to correct level.

## MANIFOLD-INTAKE

### DIAGNOSIS AND TESTING

#### INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.**

1. Start the engine.
2. Spray a small stream of water (Spray Bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

#### STANDARD PROCEDURE - INTAKE MANIFOLD VACUUM PORT REPAIR

The composite intake manifold vacuum ports can be repaired. Although, if the manifold plenum chamber is damaged or cracked, the manifold must be replaced.

To repair a broken or damaged vacuum nipple (port) on the composite intake manifold, perform the following procedure:

PARTS REQUIRED	TOOLS REQUIRED
Brass Nipple – 3/8" O.D. x 1/4" pipe thread (Speed Control Port)	Pipe Tap – 1/4" - 18 NPT
Brass Nibble – 1/2" O.D. x 1/4" pipe thread (Brake Booster Port)	Drill Bit – 7/16"
	File/Sand Paper

**Note:** While performing this procedure, avoid getting the manifold material residue into the plenum chamber.

1. File or sand the remaining port back until a flat surface is obtained (plane normal to nipple (port) axis).
2. Drill out the nipple port (2) base using a 7/16" drill bit.
3. Using a 1/4"-18 NPT pipe tap (1), cut internal threads. Use caution to start tap in a axis same as original nipple.
4. Apply Mopar® Thread Sealant to threads of repair nipple(s).
5. Install repair nipple(s). Do not over torque repair nipple(s).

## REMOVAL

### INTAKE MANIFOLD UPPER

1. Disconnect negative battery (1) cable.

2. Remove throttle body air inlet hose and air cleaner housing assembly (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect electrical connectors from the following components:
  - Manifold Absolute Pressure (MAP) Sensor
  - Electronic Throttle Control
  - Manifold Tuning Valve
4. Disconnect Vapor Purge hose, Brake Booster hose, Positive Crankcase Ventilation (PCV) hose.

5. Remove manifold support brackets (1).

6. Remove manifold attaching bolts.

- 7. Remove upper manifold (2).
- 8. Remove foam insulator (3).
- 9. Inspect manifold (2) (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSPECTION).

## REMOVAL - INTAKE MANIFOLD LOWER

1. Release fuel system pressure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Disconnect negative battery (1) cable located in trunk.
3. Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

4. Disconnect injector electrical connectors (2).
5. Disconnect fuel supply hose (1) from fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE).

6. Remove bolts attaching fuel rail (1 - 4).
7. Remove fuel rail and injectors as an assembly.
8. Remove manifold attaching bolts.
9. Remove lower manifold.
10. Inspect manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSPECTION).

## INSPECTION

### INTAKE MANIFOLD UPPER

Check manifold for:

- Damage and cracks
- Gasket surface damage or warpage
- Damaged or clogged EGR ports

If the manifold exhibits any damaged or warped conditions, replace the manifold. Clean EGR ports as necessary.

If a vacuum port is damaged, a repair procedure can be performed (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - STANDARD PROCEDURE).

### INSPECTION - INTAKE MANIFOLD LOWER

Check manifold for:

- Damage and cracks
- Gasket surface damage or warpage
- Damaged fuel injector ports

If the manifold exhibits any of these conditions, replace the manifold.

## INSTALLATION

### INTAKE MANIFOLD UPPER

1. Clean and inspect sealing surfaces. Gaskets can be reused, if free of cuts or tears.

**Note:** Make sure fuel injectors and wiring harnesses are in correct position to not interfere with upper manifold installation.

2. Install upper manifold gasket.
3. Position upper manifold onto lower manifold.
4. Install manifold attaching bolts and tighten in sequence shown in to 12 N·m (105 in. lbs.).
5. Connect PCV , brake booster, and vapor purge hoses.
6. Connect electrical connectors to the following components:
  - Manifold Absolute Pressure (MAP) Sensor
  - Electronic Throttle Control
  - Manifold Tuning Valve
7. Install throttle body air inlet hose and air cleaner housing assembly(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION) .

8. Connect negative battery (1) cable.

## INTAKE MANIFOLD LOWER

1. Clean and inspect sealing surfaces of cylinder head and manifold. Gaskets can be reused provided they are free of cuts or tears.
2. Install lower manifold gasket.
3. Position manifold on cylinder head surfaces.

**Note:** For ease of installing upper intake manifold, install a bolt 2 – 3 turns to the rearmost attaching hole of intake. This will properly position lower manifold.

4. Install fuel rail with injectors and start bolts (1 - 4).
5. Install manifold attaching bolts and tighten in sequence shown in to 12 N·m (105 in. lbs.). Remove bolt used for aligning manifold.

6. Connect the fuel injector electrical connectors (2).

**Note:** Make sure fuel injectors are located in the correct location and position, as upper intake manifold interference could occur.

7. Connect fuel supply hose (1) to fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)
8. Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

## MANIFOLD-EXHAUST

### REMOVAL

#### LEFT EXHAUST MANIFOLD

1. Disconnect negative battery (1) cable located in trunk.

2. Disconnect intake air temperature sensor connector.
3. Remove air cleaner housing assembly (3)(Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove oil dipstick tube (4).

5. Disconnect and remove oxygen sensor (2).
6. Remove upper heat shield (1) and lower heat shield (4).
7. Raise vehicle on hoist.
8. Disconnect down stream oxygen sensor connector.
9. Remove exhaust pipe from manifold(Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - REMOVAL).
10. Remove exhaust manifold attaching bolts and remove manifold.

## RIGHT EXHAUST MANIFOLD

1. Disconnect negative battery (1) cable located in trunk.

2. Disconnect and remove upstream oxygen sensor (5).
3. Raise vehicle.
4. Remove EGR tube at EGR valve (1).
5. Remove EGR tube at manifold (1).
6. Disconnect down stream oxygen sensor electrical connector.
7. Disconnect exhaust pipe from manifold (4)(Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - REMOVAL).
8. Remove upper heat shield (2) and lower heat shield (3).
9. Remove manifold attaching bolts and remove manifold.

## INSPECTION

1. Inspect exhaust manifolds for damage or cracks.
2. Check manifold flatness.
3. Inspect the exhaust manifold gasket for obvious discoloration or distortion.
4. Check distortion of the cylinder head mounting surface with a straightedge and thickness gauge.

## INSTALLATION

### LEFT EXHAUST MANIFOLD

1. Disconnect negative battery (1) cable.

2. Raise vehicle on hoist.
3. Install exhaust manifold gasket (3) and manifold (4). Tighten bolts starting at the center working outward to 23 N·m (200 in. lbs.).
4. Install manifold lower heat shield (6) and upper heat shield (1). Tighten fasteners to 28 N·m (250 in. lbs.).
5. Install exhaust pipes to manifolds(Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSTALLATION).
6. Connect down stream oxygen sensor connectors.
7. Lower vehicle.

8. Install oxygen sensor (2) and connect electrical connector.

9. Connect negative battery (1) cable.

## RIGHT EXHAUST MANIFOLD

1. Install exhaust manifold gasket and manifold (4). Tighten bolts working from center outwards to 23 N·m (200 in. lbs.).
2. Install exhaust pipe to manifold (Refer to 11 - EXHAUST SYSTEM/CATALYTIC CONVERTER - INSTALLATION).
3. Install lower heat shield (3) and upper heat shield (2).
4. Install oxygen sensor (5) and connect electrical connector.
5. Connect down stream oxygen sensor electrical connector.
6. Lower vehicle.
7. Install EGR tube (1) using new gaskets. Tighten screws to 11 N·m (95 in. lbs.).

8. Connect negative battery (1) cable.

## VALVE TIMING

### DESCRIPTION

The timing drive system has been designed to provide quiet performance and reliability to support a **NON** free-wheeling engine. The system consists of a primary (5) drive chain and a secondary chain drive.

The **primary** timing chain (5) is a double-flexure, inverted tooth type chain. The primary chain drives both of the intake camshafts directly from a sprocket mounted on the crankshaft. In addition, the water pump is driven by the "back side" of the primary chain, necessitating the double-flexure type chain.

The chain is controlled by three fixed chain guides (2,7,11) and a pivoting tensioner arm (8). These guides utilize low-friction and long wearing nylon plastic wear faces. To tension the primary chain, a fully automatic spring-loaded, engine oil-fed, hydraulic tensioner (9) is used. The tensioner (9) is mounted in the right cylinder head with the plunger contacting the pivoting tensioner arm. A mechanical ratchet mechanism inside the tensioner prevents excessive chain slack upon engine start-up as the chain wears. The tensioner is designed with an internal oil reservoir to assure noise-free performance, even during engine start-up before oil pressure reaches the tensioner.

For lubrication the primary chain utilizes oil leakage from the front of the oil pump. This oil spills on the crankshaft sprocket, which is then carried by the chain throughout the primary drive.

80bdb7a

The **secondary** timing chain (11) drive system uses two conventional roller-type chains, one at each cylinder bank. The purpose of the secondary chain (11) is to provide a mechanical driven connection between the intake and exhaust camshafts. The intake camshafts drive the exhaust camshafts. The sprockets for both intake and exhaust camshafts are a press-fit and are only serviced as an assembly with the camshafts.

To tension the secondary chain a spring-loaded, hydraulic tensioners (7) are used at each bank and attaches to each cylinder head between the intake and exhaust camshafts. The tensioner (7) incorporates upper and lower chain guide faces. The lower guide face is attached directly to the tensioner's hydraulic plunger. Also, the tensioner uses an internal oil reservoir design to prevent engine start-up noise. The secondary chains are lubricated via an oil passage through the upper guide face on each tensioner.

## STANDARD PROCEDURE

### ENGINE TIMING - VERIFICATION

Correct timing is critical for the NON free-wheeling designed, 2.7L engine. Engine timing can be verified by using the following procedures:

1. Remove cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
2. Rotate engine until number one cylinder is at TDC on the EXHAUST stroke.
3. View the intake camshaft sprocket timing mark. The mark should be 90° from the cylinder head cover sealing surface on both right and left cylinder banks.
4. Count chain pins from the mark on the intake camshaft towards the exhaust camshaft (1&3). Engine is timed correctly when there are 12 chain pins between the timing marks (2) on the intake camshaft and exhaust camshaft.
5. If marks are not correctly aligned, proceed to Timing Chain and Sprockets for service procedures(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

## COVER-TIMING CHAIN

### REMOVAL

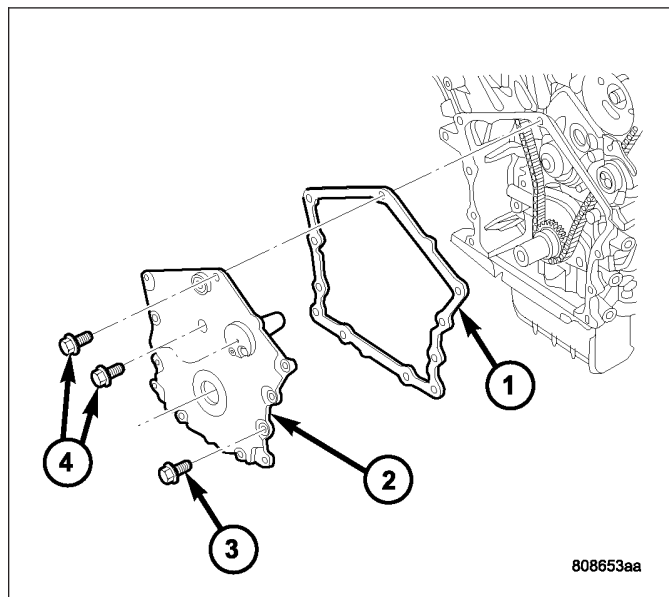

1. Disconnect negative battery (1) cable.
2. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
3. Remove coolant pressure container (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY PRESS CONTAINER - REMOVAL).

4. Raise vehicle on hoist.
5. Remove lower splash shield retaining bolts (1) and splash shield (2).
6. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
7. Remove crankshaft vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
8. Lower vehicle.

9. Remove timing chain cover bolts (3&4).
10. Remove timing chain cover (2).
11. Discard timing chain cover gasket (1). Remove front crankshaft oil seal from cover (2).

## INSTALLATION

1. Inspect and clean timing chain cover sealing surfaces.
2. Before installing timing cover gasket apply a 1/8 inch bead of Mopar® Engine RTV GEN II to the parting lines between the oil pan and cylinder block (1).

3. Install timing cover (2) and gasket (1). Tighten M10 cover bolts (4) to 54 N·m (40 ft. lbs.) and M6 bolts (3) to 12 N·m (105 in. lbs.).
4. Install front crankshaft oil seal using Special Tool 6780-2 sleeve and 6780-1 installer(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).
5. Install crankshaft vibration damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
6. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

7. Install lower splash shield (2) and retaining bolts (1).

8. Lower vehicle.
9. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
10. Connect negative battery (1) cable.

## CHAIN AND SPROCKETS-TIMING

### REMOVAL

#### TIMING CHAIN

1. Disconnect negative battery (1)cable.
2. Drain cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).
3. Remove upper intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
4. Remove cylinder head covers, crankshaft vibration damper, and timing chain cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

**CAUTION:** When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

5. Align crankshaft sprocket timing mark to mark on oil pump housing (2). The mark on oil pump housing is 60° ATDC of #1 cylinder.

**CAUTION:** When the timing chain is removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

6. Remove primary timing chain tensioner retainer cap (2) and tensioner (1) from right cylinder head.

7. Disconnect and remove camshaft position sensor (4) from left cylinder head.
8. Remove timing chain guide access plugs (3) from cylinder heads.

**Note: When camshaft sprocket bolts are removed, the camshafts will rotate in a clockwise direction.**

9. Starting with the right camshaft sprocket, remove the sprocket attaching bolts. Remove camshaft damper (1) (if equipped) and sprocket.
10. Remove left side camshaft sprocket attaching bolts and remove sprocket.
11. Remove lower chain guide (7) and tensioner arm (8).
12. Remove the primary timing chain (5).
13. For removal of crankshaft sprocket (6), (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - REMOVAL).

## REMOVAL - CRANKSHAFT SPROCKET

1. Remove primary timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

**CAUTION:** Use care not to turn crankshaft while removing crankshaft sprocket, as damage to valves and or pistons could occur.

2. Remove crankshaft sprocket by first installing the crankshaft damper bolt. Apply grease or equivalent to damper bolt head and position Special Tools 5048-1(3), 5048-6 (2), and 8539 (1) on sprocket and crankshaft nose. Remove sprocket using care not to rotate the crankshaft.

## INSTALLATION

### TIMING CHAIN

1. Inspect all sprockets (4,9,11) and chain guides (2,5,10). Replace if worn.
2. For crankshaft sprocket installation procedures (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - INSTALLATION).
3. If removed, install right and left side short chain guides (11). Tighten attaching bolts to 28 N-m (250 in. lbs.).
4. Align crankshaft sprocket timing mark to the mark on oil pump housing(3).

**Note:** Lubricate timing chain and guides with engine oil before installation.

5. Place left side primary chain sprocket onto the chain so that the timing mark is located in-between the two (plated) timing links (1).

808653bc

6. Lower the primary chain with left side sprocket through the left cylinder head opening.

**Note: The camshaft sprockets can be allowed to float on the camshaft hub during installation.**

7. Loosely position left side camshaft sprocket over camshaft hub.
8. Align timing (plated) link to the crankshaft sprocket timing mark (3).
9. Position primary chain onto water pump drive sprocket (10).
10. Align right camshaft sprocket timing mark to the timing (plated) link on the timing chain (8) and loosely position over camshaft hub.
11. Verify that all chain timing (plated) links are properly aligned to the timing marks on all sprockets.
12. Install left side lower chain guide (2) and tensioner arm (5). Tighten attaching bolts to 28 N·m (250 in. lbs.).

**Note: Inspect O-ring on chain guide access plugs before installing. Replace O-ring as necessary.**

13. Install chain guide access plugs to cylinder heads. Tighten plugs to 20 N·m (15 ft. lbs.).

**Note: To reset the primary timing chain tensioner, engine oil will first need to be purged from the tensioner.**

14. Purge oil from timing chain tensioner using the following procedure:

- a. Place the check ball (2) end of tensioner into the shallow end of Special Tool 8186 (3).
- b. Using hand pressure, slowly depress tensioner until oil is purged from tensioner.

15. Reset timing chain tensioner using the following procedure:

- Position cylinder plunger (4) into the deeper end of Special Tool 8186 (3).
- Apply a downward force until tensioner is reset.

**Note:** If oil was not first purged from the tensioner, use slight finger pressure to assist the center arm pin of Special Tool 8186 to unseat the tensioner's check ball.

**CAUTION:** Ensure the tensioner is properly reset. The tensioner body (4) must bottom against the top edge of Special Tool 8186 (3). Failure to properly perform the resetting procedure may cause tensioner jamming.

**Note:** Inspect the tensioner o-ring (2) for nicks or cuts and make sure the snap ring (1) is correctly installed, replace as necessary.

16. Install the reset chain tensioner (1) into the right cylinder head.
17. Position tensioner retaining plate (2) and tighten bolts (3) to 12 N·m (105 in. lbs.).

18. Starting at the right cylinder bank, first position the camshaft damper (1) (if equipped) on camshaft hub, then insert a 3/8" square drive extension with a breaker bar into intake camshaft drive hub. Rotate camshaft until the camshaft hub aligns to the camshaft sprocket and damper attaching holes. Install the sprocket attaching bolts and tighten to 28 N·m (250 in. lbs.).
19. Turn the left side camshaft by inserting a 3/8" square drive extension with a breaker bar into intake camshaft drive hub and rotate camshaft until the sprocket attaching bolts can be installed. Tighten sprocket bolts to 28 N·m (250 in. lbs.).
20. Rotate engine slightly clockwise to remove timing chain slack, if necessary.

21. Activate the timing chain tensioner by using a flat bladed pry tool to gently pry tensioner arm towards the tensioner slightly. Then release the tensioner arm. Verify the tensioner is activated (extends).

22. Install camshaft position sensor (2) and connect electrical connector.
23. Install the timing chain cover, crankshaft vibration damper, and cylinder head covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)
24. Install upper intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

**Note:** After installation of a reset tensioner, engine noise will occur after initial start-up. This noise will normally disappear within 5–10 seconds.

25. Fill cooling system (Refer to 7 - COOLING/ENGINE - STANDARD PROCEDURE).

26. Connect negative battery (1) cable.

## INSTALLATION - CRANKSHAFT SPROCKET

1. Install crankshaft sprocket using Special Tools 6780-1(1) and 8179 (2) until sprocket bottoms against crankshaft step flange. Use care not to rotate crankshaft.

2. Verify that crankshaft sprocket is installed to proper depth by measuring from sprocket outer face to end of crankshaft. Measurement should read:  $39.05 \pm 0.50$  mm ( $1.5374 \pm 0.020$  in.).
3. Install primary timing chain(Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

## TENSIONER-TIMING CHAIN

### REMOVAL

1. Disconnect negative battery (1) cable.
2. Remove timing chain cover(Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

3. Align timing marks (1,3,8)(Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).

4. Remove timing chain tensioner cover (2).

5. Remove timing chain tensioner (1).

## INSTALLATION

### RESETTING TENSIONER

The timing chain tensioner is a spring loaded hydraulic tensioner. To reset the timing chain tensioner, the following procedure must be followed.

1. Purge oil from timing chain tensioner using the following procedure:
  - a. Place the check ball end of tensioner (1) into the shallow end of Special Tool 8186 (3).
  - b. Using hand pressure, slowly depress tensioner (1) until all of the oil is purged out.

**Note:** To reset the primary timing chain tensioner, engine oil will first need to be purged from the tensioner.

2. Reset timing chain tensioner (4) using the following procedure:

- a. Position cylinder plunger into the deeper end of Special Tool 8186 (3).
- b. Apply a downward force until tensioner (4) is reset.

**Note:** If oil was not first purged from the tensioner, use slight finger pressure to assist the center arm pin of Special Tool 8186 (3) to unseat the tensioner's check ball.

**Note:** Inspect the tensioner o-ring (2) for nicks or cuts and make sure the snap ring (1) is correctly installed, replace as necessary.

## TENSIONER-TIMING CHAIN

**Note:** Verify proper timing alignment prior to tensioner installation(Refer to 9 - ENGINE/VALVE TIMING - STANDARD PROCEDURE).

1. Reset tensioner(Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - INSTALLATION).

**Note:** Inspect tensioner o-ring and snap ring, replace as necessary.

2. Install tensioner (1) in cylinder head.

**Note:** Tensioner retaining plate dowel pin (3) must be aligned with hole in cylinder head for proper installation.

3. Inspect tensioner retaining plate o-ring (2) and replace as necessary.

4. Install tensioner retaining plate (2) and attaching bolts (3). Tighten bolts to 12 N·m (105 in. lbs.).

**ENGINE - 3.5L - SERVICE INFORMATION**

**DESCRIPTION**

The 3.5 Liter (214 Cubic Inches) 60 degree V-6 engine is a single overhead camshaft design with hydraulic lifters and four valves per cylinder. The engine does not have provisions for a free wheeling valve train.

The cylinders are numbered from front to rear, with the right bank odd numbered, and the left bank even numbered. The firing order is 1-2-3-4-5-6.

The engine identification number is located on the rear of engine block just below the left cylinder head..

## DIAGNOSIS AND TESTING

### DIAGNOSIS AND TESTING - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

Refer to Service Diagnosis—Mechanical Chart and Service Diagnosis—Performance Chart, for possible causes and corrections of malfunctions. Refer to FUEL SYSTEM for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test
- Cylinder Combustion Pressure Leakage Test
- Cylinder Head Gasket Failure Diagnosis
- Intake Manifold Leakage Diagnosis
- Lash Adjuster (Tappet) Noise Diagnosis
- Engine Oil Leak Inspection

## DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Check engine oil level and add oil if necessary.
2. Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.
3. Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
4. Remove the Auto Shutdown (ASD) relay from the PDC.
5. Be sure throttle blade is fully open during the compression check.
6. Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0–500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the DRBIII®. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).
7. Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.
8. Repeat the previous step for all remaining cylinders.
9. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
10. If one or more cylinders have abnormally low compression pressures, repeat the compression test.
11. If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

## DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

**WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

Check the coolant level and fill as required. DO NOT install the pressure cap.

Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.

Clean spark plug recesses with compressed air.

Remove the spark plugs.

Remove the oil filler cap.

Remove the air cleaner.

Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.

Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.

All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.

**FOR EXAMPLE:** At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

## ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil level indicator to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.
5. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method as follows:
  - Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
  - Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
  - Attach an air hose with pressure gauge and regulator to the oil level indicator tube.

**CAUTION:** Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
  - If the leakage occurs at the crankshaft rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
6. If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.
  7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

**Note:** If oil leakage is observed at the oil level indicator tube to block location; remove the tube, clean and reseal using Mopar® Stud & Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

## INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.

2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.
  - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
  - b. Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See proper repair procedures for these items.
4. If no leaks are detected, pressurize the crankcase as previously described.

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.**

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.
7. After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

## STANDARD PROCEDURE

### STANDARD PROCEDURE - FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

**MOPAR® ENGINE RTV GEN II** is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® ATF RTV** is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

**MOPAR® GASKET MAKER** is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

**MOPAR® BED PLATE SEALANT** is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bedplate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

**MOPAR® GASKET SEALANT** is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

## SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

## STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

**Never** use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush.

**Note: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper.
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow).

**CAUTION:** Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

## STANDARD PROCEDURE - REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

**CAUTION:** Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

## STANDARD PROCEDURE - HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem, the following steps should be used.

**CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.**

1. Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
2. Remove negative battery cable.
3. Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.
4. With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
5. Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).
6. Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
7. Repair engine or components as necessary to prevent this problem from re-occurring.

**CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.**

8. Install new spark plugs.
9. Drain engine oil and remove oil filter.
10. Install a new oil filter.
11. Fill engine with specified amount of approved oil.
12. Connect negative battery cable.
13. Start engine and check for any leaks.

## STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS

Using a blunt tool such as a drift (3) and a hammer, strike the bottom edge of the cup plug (5). With the cup plug rotated, grasp firmly with pliers (2) or other suitable tool and remove plug (5).

**CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.**

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant.

The cooling system can be refilled and the vehicle placed in service immediately.

## REMOVAL - ENGINE ASSEMBLY

**Note:** Capture and store any residual fluid drainage, or leakage from ancillary components, in the appropriately marked containers.

1. Perform the fuel pressure release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Center and secure the steering wheel.
3. Disconnect negative battery cable.
4. Evacuate the air conditioning system(Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE).
5. Remove the hood.
6. Remove the windshield cowl assembly.
7. Raise and support the vehicle.
8. Remove the lower engine close out panel.
9. Drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
10. Disconnect the lower radiator hose (2).
11. Disconnect the generator electrical connectors (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).
12. Separate the steering column coupling (1) from the steering gear (3).

13. Remove the starter and spacer plate (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).
14. Disconnect the oil cooler hose at the oil cooler (3) and remove the cooler hose retainer at the transmission.
15. Disconnect the transmission line bracket at the A/C compressor and allow the bolt to rest on the cradle.

16. Disconnect the ground strap (3) at the right transmission housing.
17. Disconnect the engine block heater wiring connector (4) and set aside (if equipped).
18. Remove the crankshaft position sensor (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL).

19. Disconnect the left #2 oxygen sensor (3) electrical connector and separate the exhaust manifold from the left exhaust pipe (2).

20. Disconnect the right #2 oxygen sensor (2) electrical connector and separate the exhaust manifold from the right exhaust pipe (1).

21. Remove the flex plate inspection cover and torque converter bolts (3).

22. Remove the transmission housing to engine mounting bolts (2) accessible.
23. Remove the engine mounting to cradle fasteners.

24. Lower the vehicle.
25. Remove the upper intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
26. Disconnect the heater hose (2) and coolant reservoir hose (3) from the rear coolant pipe (1).

27. Disconnect the oxygen sensor connector and the ground wire on the left cylinder head cover.
28. Disconnect the coolant temperature, cam position, oil pressure sensor electrical connectors.
29. Disconnect the left ignition coil (2) and fuel injector harness connectors and position the wiring harness (3) aside.

30. Remove the right intake manifold support braces.
31. Disconnect the capacitor and ground strap from the right cylinder head cover.
32. Disconnect the oxygen sensor, knock, EGR, injector and ignition coil harness connectors and position the wiring harness aside.
33. Disconnect the engine wiring harness from the transmission housing and remove the remaining transmission housing bolts.

34. Connect the engine lifting bracket (2) from special tool kit 8534B to the right rear of the cylinder head outer most bolt access hole (5).
35. Install a bolt into the inner most bolt access hole (5) next to the engine lift bracket to assure lifting bracket positioning.

36. Connect a engine hoisting chain (1) to the left timing chain cover (2) engine lifting point and engine lift bracket.

**CAUTION:** While slowly separating the engine from the vehicle, constant checks must be made to assure proper positioning and that no damage to other components or wiring harnesses occur during separation.

**Note:** As the engine is hoisted from the engine bay area, remove the loosened A/C compressor bolt retaining the transmission cooler lines and direct the lines aside.

37. Carefully remove the engine from the engine bay area.

## INSTALLATION - ENGINE ASSEMBLY

**CAUTION:** Care must be taken when installing the engine to prevent pinching the power steering rack sensor with the left engine mount.

1. Install special tool #8534B, engine lifting bracket (2) to the right rear of the cylinder head and install a bolt into the inner most bolt hole (5) next to the bracket (5).

2. Connect a engine hoisting chain (1) to the left timing chain cover (2) lifting point and the engine lifting bracket (3).

**CAUTION:** Care must be taken when installing the engine to prevent pinching the power steering rack sensor with the left engine mount. Constantly check to assure proper positioning and no damage occurs to other components or harnesses until union is made.

**Note:** As the engine is lowered into the engine bay area, install and hand tighten the A/C compressor bolt retaining the transmission cooler lines.

3. Carefully install the engine into the engine bay area and complete the union with the transmission.
4. Properly route the engine wiring harness behind the engine and tighten the accessible transmission bolts to 68N·m (50 ft.lbs.).

5. Properly position the right engine harness (4) and connect the oxygen sensor, knock sensor, EGR, fuel injector and ignition coil harness connectors.
6. Connect the capacitor (3) and ground strap (3) to the right cylinder head cover.
7. Install the right intake manifold support braces.

8. Properly position the left engine harness (3) and connect the ignition coil (2) and fuel injector harness connectors.
9. Connect the coolant temperature, cam position, oil pressure sensor harness connectors.
10. Connect the oxygen sensor, and the ground wire, to the left cylinder head cover.

11. Connect the heater hose (2) and coolant reservoir hose (3) to the rear coolant pipe (1).
12. Install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
13. Connect the upper radiator hose.

14. Raise and support the vehicle.
15. Install the engine mounting nuts and tighten to 101 N·m (75 lbs.ft.).
16. Install the remaining transmission housing bolts and tighten to 68 N·m (50 ft.lbs.).

17. Install the torque converter bolts (3). Tighten bolts to 75 N·m (55 lbs.ft.).
18. Install the flywheel inspection cover. Tighten bolts to 12 N·m (105 lbs. in.)

19. Connect the right exhaust pipe to the exhaust manifold (1) and connect the oxygen sensor (2).

20. Connect the left exhaust pipe to the exhaust manifold (2) and connect the oxygen sensor (3)
21. Install the crankshaft position sensor (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION).

22. Connect the engine block heater (4) (if equipped).
23. Connect the ground strap (3) at the right transmission housing.

24. Tighten the transmission line bracket at the A/C compressor.
25. Connect the oil cooler hose at the cooler (3) and secure the cooler hose retainer at the transmission.
26. Connect the lower radiator hose (2).
27. Install the starter and spacer plate (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).

28. Align and connect the steering column coupler (1) to the steering gear (3).
29. Connect the generator electrical connectors (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).
30. Install new oil filter.
31. Install the lower engine close out panel.
32. Lower the vehicle.
33. Fill the cooling system to the proper level using the appropriate coolant (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
34. Fill engine crankcase with proper oil to correct level (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).
35. Evacuate and recharge air conditioning.
36. Install the windshield wiper cowl assembly.
37. Install the hood.
38. Connect the negative battery cable.
39. Start engine and run until operating temperature is reached and radiator fans cycle.
40. Check all fluid levels and properly fill.

## AIR CLEANER ELEMENT

### REMOVAL

1. Disconnect the CCV hose (4) at the housing cover (2).
2. Release the housing cover tabs (3)

3. Lift the cover (1) and pull toward the front of the vehicle to release the rear cover to housing alignment tabs.
4. Remove the element (2).

## INSTALLATION

1. Install the air filter element (2) into air box.
2. Position the cover (1) so that the rear locking tabs insert into the lower housing.
3. Seat cover (1) onto element housing and assure that the front locking tabs engage.
4. Reconnect the CCV hose (3)

## AIR CLEANER HOUSING

### REMOVAL

1. Separate the air inlet duct (5) at the element housing (6).
2. Disconnect the CCV hose (2) at the element housing (6).
3. Remove the housing retaining bolt (1).
4. Pull housing up and off of the locating pin.
5. Remove element housing (6) from vehicle

## INSTALLATION

1. Align the housing (6) with the lower air inlet duct and alignment grommet in the wheel housing.
2. Properly fit the housing (6) and install housing retaining bolt (1).
3. Connect the inlet air duct (5) to the housing (6) and tighten clamp.
4. Connect the CCV hose (2) to housing

## CYLINDER HEAD(S)

### DESCRIPTION

The aluminum alloy cylinder heads feature cross- flow type intake and exhaust ports. Valve guides and seat inserts are powdered metal. Valves are arranged in a "V", with each camshaft on center. To improve combustion speed the chambers are a compact spherical design with a squish area of approximately 30 percent of the piston top area. The cylinder heads are common to either cylinder bank by reversing the direction of installation.

### DIAGNOSIS AND TESTING—CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

### CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING). An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

## CYLINDER-TO-WATER JACKET LEAKAGE TEST

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.**

### VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

### COOLING SYSTEM TESTER METHOD

**WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).**

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

### CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

## REMOVAL - CYLINDER HEAD(S)

### RIGHT CYLINDER HEAD

1. Perform the fuel relief procedure.
2. Disconnect the negative battery cable.
3. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
4. Remove the upper intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
5. Remove the lower intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
6. Remove accessory drive belt (6).
7. Remove accessory drive belt idler pulley.
8. Remove the power steering mounting bolts (2) and set the pump aside(Refer to 19 - STEERING/ PUMP - REMOVAL).
9. Raise the vehicle.
10. Remove crankshaft damper (4) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
11. Remove lower outer timing belt cover bolts.

12. Remove front exhaust pipe to exhaust manifold mounting nuts (1).
13. Disconnect both oxygen sensor (2) harness connectors on each side.
14. Lower vehicle.
15. Remove the remaining outer timing belt cover bolts and cover.

16. Rotate the engine to TDC and align timing belt marks (1,8,9).
17. Remove the timing belt tensioner (12) and reset the tensioner (Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL).
18. Remove the timing belt (4) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

19. Remove the right cylinder head cover to cylinder head ground strap and capacitor (3).
20. Remove the EGR valve and tube assembly.
21. Remove the right cylinder head cover.

22. Remove the right rocker arm assembly (2).

23. Remove the right rear camshaft thrust plate (1).

24. Counterhold the cam gear and remove the right cam gear retaining bolt.

25. Push the camshaft (5) out of the back of the cylinder head approximately 3.5 inches and remove the right cam gear.

26. Remove the inner timing cover to cylinder head retaining bolts.  
27. Remove the cylinder head bolts in REVERSE of tightening sequence.  
28. Remove the cylinder head.  
29. Clean and inspect all mating surfaces.

**LEFT CYLINDER HEAD**

1. Perform the fuel relief procedure.
2. Disconnect the negative battery cable.
3. Drain cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
4. Remove the upper intake manifold.
5. Remove the lower intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
6. Remove the accessory drive belt (6).
7. Remove the belt tensioner (1).
8. Remove the accessory drive idler pulley.
9. Remove the power steering mounting bolts and set pump (2) aside.
10. Remove the crankshaft damper (4) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
11. Remove the lower outer timing belt cover.
12. Raise and support the vehicle.

13. Remove the front exhaust pipe to exhaust manifold mounting nuts(2).
14. Disconnect both oxygen sensor harness connectors(1,2).

8136ff76

15. Lower the vehicle.
16. Remove the outer timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
17. Rotate the engine to TDC and align the timing marks (1,8,9).
18. Remove the timing belt tensioner (12), timing belt (4), then reset tensioner.(Refer to 9 - ENGINE/VALVE TIMING/TMNG BELT/CHAIN TENSIONER&PULLEY - REMOVAL)
19. Remove the left cylinder head cover to cylinder head ground strap (3).
20. Remove the left cylinder head cover.

8134b4b5

21. Remove the left rocker arm assembly (2).

22. Remove the left camshaft thrust plate (1).

23. Counterhold the left cam gear and remove the cam gear retaining bolt.(Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
24. Push the camshaft out of the back of the cylinder head approximately 3.5 inches and remove the cam gear.Remove the front timing belt housing to cylinder head bolts.

25. Remove the cylinder head bolts in REVERSE of tightening sequence.
26. Remove the cylinder head.
27. Clean and inspect all mating surfaces.

## CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

**Note: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Remove all gasket material from cylinder head and block (Refer to 9 - ENGINE - STANDARD PROCEDURE). Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

## INSPECTION

1. Before cleaning, check for leaks, damage and cracks.
2. Clean cylinder head and oil passages.
3. Check cylinder head for flatness.
4. Cylinder head must be flat within:
  - Standard dimension = less than 0.05 mm (0.002 inch.)
  - Service Limit = 0.2 mm (0.008 inch.)
  - Grinding Limit = Maximum of 0.2 mm (0.008 inch.) is permitted.

**CAUTION: 0.20 mm (0.008 in.) MAX is a combined total dimension of the stock removal limit from cylinder head and block top surface (Deck) together.**

## INSTALLATION - CYLINDER HEAD(S)

### RIGHT CYLINDER HEAD

**CAUTION: THE CYLINDER HEAD GASKETS ARE NOT INTERCHANGEABLE BETWEEN CYLINDER HEADS AND ARE CLEARLY MARKED RIGHT OR LEFT.**

The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced..

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced.

**CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION).**

1. Clean sealing surfaces of cylinder head and block.

**CAUTION: Ensure that the correct head gaskets are used and are oriented correctly on cylinder block.**

**Note: Before installing the cylinder head bolts, lubricate the threads with clean engine oil.**

2. Install the cylinder head over locating dowels and finger tighten the head bolts.
3. Tighten the cylinder head bolts in the following sequence, using the 4 step torque-turn method. Tighten according to the following torque values:.

- Step 1: All to 61 N·m (45 ft. lbs.)
  - Step 2: All to 88 N·m (65 ft. lbs.)
  - Step 3: All (again) to 88 N·m (65 ft. lbs.)
  - Step 4: + 90° Turn **Do not use a torque wrench for this step.**
4. Bolt torque after 90° turn should be over 122 N·m (90 ft. lbs.) in the tightening direction. If not, replace the bolt.
5. Install the inner timing cover to cylinder head bolts. Tighten bolts to 54 N·m (40 lbs.ft.).
6. Install camshaft sprocket (2) Counterhold the camshaft sprocket gear (2) and tighten the camshaft sprocket bolt to 102 N·m plus a 1/4 turn (75 lbs. ft. plus a 1/4 turn).(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

7. Install the rear camshaft thrust plate (1) and seal (3) and the EGR valve.

8. Rotate the camshaft gear to it's alignment mark (1) and check the left camshaft gear (7) and crankshaft gear timing alignment marks (9)..
9. Install the timing belt (4) and tensioner (12)(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
10. Install the timing belt outer cover (1)(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

11. Install the power steering reservoir (2).
12. Install the vibration damper (4)(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
13. Install the accessory drive belt tensioner (1).
14. Install the accessory drive belt idler pulley.

15. Install the right exhaust manifold (Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).
16. Raise and support the vehicle.
17. Install the front exhaust pipe (1) and connect the oxygen sensors (2).
18. Lower the vehicle.

19. Install the right rocker arm assembly.
20. Install the right cylinder head cover, ground strap (3) and insulator.
21. Install lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
22. Install the fuel rail.
23. Install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
24. Connect the air cleaner element housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
25. Fill the coolant system.
26. Connect the negative battery cable.

## LEFT CYLINDER HEAD

**CAUTION: THE CYLINDER HEAD GASKETS ARE NOT INTERCHANGEABLE BETWEEN CYLINDER HEADS AND ARE CLEARLY MARKED RIGHT OR LEFT.**

The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced..

Necking can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced.

**CAUTION: When cleaning cylinder head and cylinder block surfaces, DO NOT use a metal scraper because the surfaces could be cut or ground. Use ONLY a wooden or plastic scraper (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE GASKET SURFACE PREPARATION).**

1. Clean sealing surfaces of cylinder head and block.

**CAUTION: Ensure that the correct head gaskets are used and are oriented correctly on cylinder block.**

2. Install head gasket over locating dowels. Ensure the gasket is installed on the correct side of engine.

**Note: Before installing the cylinder head bolts, lubricate the threads with engine oil.**

3. Install the cylinder head over locating dowels, insert and finger tighten the head bolts.

4. Tighten the cylinder head bolts in the sequence shown in. Using the 4 step torque-turn method, tighten according to the following torque values:
  - Step 1: All to 61 N·m (45 ft. lbs.)
  - Step 2: All to 88 N·m (65 ft. lbs.)
  - Step 3: All (again) to 88 N·m (65 ft. lbs.)
  - Step 4: + 90° Turn **Do not use a torque wrench for this step.**
5. Bolt torque after 90° turn should be over 122 N·m (90 ft. lbs.) in the tightening direction. If not, replace the bolt.
6. Install the inner timing cover to cylinder head bolts. Tighten bolts to 54 N·m (40 lbs.ft.).
7. Install camshaft sprocket. Counterhold the camshaft sprocket gear and tighten the camshaft sprocket bolt to 102 N·m plus a 1/4 turn (75 lbs. ft. plus a 1/4 turn)

8. Install the rear camshaft thrust plate (1) and seal (3).

8136ff76

9. Rotate the camshaft gear (7) to its alignment mark (8) and check the right camshaft gear (1) and crankshaft gear timing (9) alignment marks.
10. Install the timing belt (4) and tensioner (11)(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
11. Install the timing belt front cover (1)(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

8111998d

12. Install the accessory drive belt tensioner (1).
13. Install the accessory drive belt idler pulley.
14. Install the vibration damper (3) (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).

15. Install the left exhaust manifold.(Refer to 9 - ENGINE/MANIFOLDS/EXHAUST MANIFOLD - INSTALLATION).
16. Raise the vehicle.
17. Connect the left exhaust pipe (2) and connect the oxygen sensor (3).

18. Lower the vehicle.
19. Install the left rocker arm assembly.
20. Install the left cylinder head cover and ground strap..
21. Install lower intake manifold (4)(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
22. Install the fuel rail (1).
23. Install the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
24. Connect the air cleaner element housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
25. Fill the coolant system.
26. Connect the negative battery cable.

8134b4b5

## CAMSHAFT OIL SEAL(S)

### REMOVAL

#### RIGHT CYLINDER HEAD

8136ff76

1. Disconnect the negative battery cable.
2. Remove front timing cover and align the camshaft gear (1,8) and crankshaft gear timing mark (9) to TDC (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

3. Remove timing belt (4).
4. Remove the right camshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).

5. Remove the EGR valve and camshaft thrust plate (1) from the rear of the cylinder head.

6. Remove the cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
7. Remove the rocker arm assembly (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
8. Maneuver the camshaft rearward and out of the cylinder head approximately 3.5 inches.

**Note:** Care must be taken not to damage the cylinder head to seal or camshaft journal surfaces when removing the camshaft seal.

9. Using an appropriate driver carefully remove camshaft oil seal

**LEFT CYLINDER HEAD**

8136ff76

1. Disconnect the negative battery cable.
2. Drain cooling system.
3. Remove front timing cover and align the camshaft gear and crankshaft gear timing marks to TDC (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
4. Remove the rear timing cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
5. Remove the cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
6. Remove the rocker arm assembly (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
7. Remove the camshaft thrust plate (1) from the rear of the cylinder head.
8. Maneuver the camshaft rearward and out of the cylinder head approximately 3.5 inches

8099f226

**Note:** Care must be taken not to damage the cylinder head to seal or camshaft journal surfaces when removing the camshaft seal.

9. Using an appropriate driver (1) carefully remove camshaft oil seal

## INSTALLATION

### RIGHT CYLINDER HEAD

1. Position the camshaft seal into the cylinder head.
2. Using special tool MD-998306 (2) tap the seal into place.

3. Apply light coat of clean engine oil to the camshaft oil seal lip and Special Tool 6788 Seal Protector Sleeve (2).
4. Install oil seal Special Tool 6788 Seal Protector Sleeve (2) onto the camshaft.
5. Slide the camshaft (3) forward, inserting the seal protector (2) through the camshaft seal until the camshaft (3) seats.
6. Remove Special Tool 6788 (2) from the camshaft.

7. Install the camshaft thrust plate (1), and new seal (3) to the rear of the cylinder head.

8. Install the EGR valve (2).

9. Install camshaft sprocket (2) and tighten the camshaft sprocket bolt to 102N·m (75 ft.lbs.).

13. Install the front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
14. Install the vibration damper (4)(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
15. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
16. Connect the negative battery cable.

## LEFT CYLINDER HEAD

1. Position the camshaft seal into the cylinder head (3)
2. Using special tool MD-998306 (2) tap the seal into place.

3. Apply light coat of engine oil to the camshaft oil seal lip (3) and Special Tool 6788 (2) Seal Protector Sleeve.
4. Install oil seal (3) Special Tool 6788 Seal Protector Sleeve (2) onto the camshaft (1)
5. Slide the camshaft (1) forward, inserting the seal protector (2) through the camshaft seal (3) until the camshaft seats.
6. Remove Special Tool 6788 (2) from the camshaft (1).

7. Install the camshaft thrust plate (1) and new seal (3) to the rear of the cylinder head.
8. Install rear timing belt cover(Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

9. Install the camshaft gear (7) and align the timing marks (1,8,9)(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
10. Install the timing belt (4) (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
11. Install the rocker arm assembly (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
12. Install the cylinder head cover.

13. Install the front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
14. Install the vibration damper (4)(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
15. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
16. Connect the negative battery cable.

## CAMSHAFT(S)

### DESCRIPTION

A single overhead camshaft per cylinder head provides valve actuation. The left camshaft accommodates a cam sensor pick-up wheel and is therefore longer. Each camshaft is supported by four bearing journals. A thrust plate attached to the rear of each cylinder head controls camshaft end play. Right and left camshaft driving sprockets support a timing mark, are keyed, and not interchangeable because of the cam sensor pick-up wheel on the left sprocket. Camshaft bearing lubrication is provided via a oil supply passage through each rocker shaft pedestal dowel.

### OPERATION

The camshaft is driven by the crankshaft via drive sprockets and belt. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

## REMOVAL

**Note:** Camshafts are removed from the rear of each cylinder head.

1. Remove the cylinder head(Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL).

**CAUTION:** Care must be taken not to nick or scratch the journals when removing the camshaft.

2. Carefully remove the camshaft (3) from the rear of the cylinder head.

## INSPECTION

1. Inspect camshaft bearing journals (4) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Check the cam lobe (5) and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

**Note:** If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

3. Measure the lobe (5) actual wear and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.)

## INSTALLATION

**Note:** Care must be taken not to scrape or nick the camshaft journals when installing the camshaft into position.

1. Lubricate camshaft (3) bearing journals, camshaft lobes and camshaft seal (4) with clean engine oil and install camshaft (3) into cylinder head.
2. Install the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

## CYLINDER HEAD COVER - LEFT REMOVAL

**WARNING: DO NOT START OR RUN ENGINE WITH CYLINDER HEAD COVER REMOVED FROM THE ENGINE. DAMAGE OR PERSONAL INJURY MAY OCCUR.**

1. Disconnect and isolate the negative battery cable.
2. Remove the upper intake manifold from the engine (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Cover lower intake manifold (4) with a suitable cover during service.
4. Disconnect and remove the three ignition coils (2).
5. Remove the ground strap/resistor retaining bolt from the cylinder head cover.
6. Lift up on the wire harness track (3) retaining tabs.

7. Completely loosen the cylinder head cover retaining bolts and remove the cylinder head cover.

## INSTALLATION

1. Clean cylinder head and cover mating surfaces. Inspect and replace gasket (1) and seals (2) as necessary.

2. To replace spark plug tube seals (2):
  - a. Using a suitable pry tool, carefully remove tube seals (2).
  - b. Position new seal (2) with the part number on seal facing cylinder head cover.
  - c. Install seals using Special Tool MD-998306 (1).

3. Install cylinder head cover (1) and bolts (2). Tighten to 12 N·m (105 in. lbs.).

4. Position the wiring harness (3) on the cylinder head cover.
5. Reclip the wire harness track retaining tabs into the cover.
6. Install the ground strap/resistor retaining bolt onto the cylinder head cover.
7. Install the ignition coils (2). Tighten mounting screws to 6.7 N·m (60 in. lbs.)
8. Connect the ignition coil electrical connectors (2).
9. Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
10. Connect negative battery cable

## CYLINDER HEAD COVER - RIGHT REMOVAL

**WARNING: DO NOT START OR RUN ENGINE WITH CYLINDER HEAD COVER REMOVED FROM THE ENGINE. DAMAGE OR PERSONAL INJURY MAY OCCUR.**

1. Disconnect the negative battery cable.
2. Remove the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Cover lower intake manifold openings during service.
4. Disconnect and remove the three ignition coils (2).
5. Lift up on the wire harness track retaining tabs (4).
6. Remove the ground strap retaining bolt (3) from the cylinder head cover.
7. Completely loosen the cylinder head cover retaining bolts and remove the cylinder head cover

## INSTALLATION

1. Clean cylinder head and cover mating surfaces. Inspect and replace gasket (1) and seals (2) as necessary.

2. To replace spark plug tube seals (2):
  - a. Using a suitable pry tool, carefully remove tube seals (2).
  - b. Position new seal (2) with the part number on seal facing cylinder head cover.
  - c. Install seals using Special Tool MD-99830 (1).

3. Install cylinder head cover bolts and tighten to 12 N·m (105 in. lbs.).
4. Install the ground strap retaining bolt (3) to the cylinder head cover.
5. Install the wire harness track (4).
6. Install the ignition coils (2). Tighten mounting screws to 6.7 N·m (60 in. lbs.).
7. Connect the ignition coil electrical connectors (2).
8. Install upper intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
9. Connect negative battery cable

## INTAKE/EXHAUST VALVES & SEATS

### DESCRIPTION

Valves are made of highly heat-resistant steel and are chrome plated to prevent stem scuffing. The intake valve is a one-piece forging, while the exhaust valve has a forged head with a welded stem for lock groove hardness. The four valves (two intake and two exhaust) employ a three-groove lock design to help facilitate valve rotation.

### OPERATION

The intake valve allows the air/fuel mixture to enter the combustion chamber. The exhaust valve allows the burned air/fuel mixture to exit the combustion chamber. Also, the intake and exhaust valves seal the combustion chamber during the compression and power strokes.

### STANDARD PROCEDURE - VALVE AND VALVE SEAT REFACING

#### VALVES

1. Inspect the remaining margin (1) after the valves are refaced (Refer to 9 - ENGINE - SPECIFICATIONS).

## VALVE SEATS

1. When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.
2. Measure the concentricity of valve seat using dial indicator. Total runout should not exceed 0.051 mm (0.002 inch.) total indicator reading.
3. Inspect the valve seat (3) with Prussian blue to determine where the valve (1) contacts the seat. To do this, coat valve seat (1) **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face (2), contact is satisfactory. If the blue is transferred to top edge of valve face (2), then lower valve seat (3) with a 15 degree stone. If the blue is transferred to the bottom edge of valve face (2), then raise valve seat (3) with a 65 degree stone.

**Note: Valve seats (1) which are worn or burned can be reworked, provided that correct angle and seat width (1) are maintained. Otherwise cylinder head must be replaced.**

4. When seat is properly positioned the width of the intake seats should be 0.75 to 1.25 mm (0.0296 to 0.0493 in.) and exhaust seats should be 1.25 to 1.75 mm (0.049 to 0.069 in.).

## VALVE AND SPRING INSTALLED HEIGHT

1. Coat valve stems with clean engine oil and insert them in cylinder head.
2. If valves or seats have been refaced, check valve tip height (A). If valve tip height is greater than 43.65 mm (1.7185 in.) intake or 46.48 mm (1.8299 in.) exhaust, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.
3. Install valve seal/spring seat assembly over valve guides on all valve stem. Ensure that the garter

spring is intact around the top of the rubber seal.

4. Place valve spring (color-coded end facing up ) and valve retainer into position on spring seat.

5. Compress valve springs (4) with valve spring compressor C-3422-D and adapter 6526 (Refer to 9 - ENGINE - SPECIAL TOOLS), install locks (2) and release tool.
6. If valves (1) and/or seats are refaced, measure the installed height of springs. Measurements are taken from top of spring (4) seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

## REMOVAL

1. Remove cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
2. Remove rocker arm assembly (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
3. Remove valve spring(s) (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - REMOVAL).
4. Before removing valve, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides.** Identify valves to insure installation in original location.
5. Remove valve(s) from cylinder head.

## CLEANING

1. Clean all valves thoroughly and discard burned, warped and cracked valves.

## INSPECTION

### INSPECTION - VALVES

1. Measure valve stems for wear approximately 60 mm (2.36 in.) below the valve lock grooves.
2. Compare measurement to specifications,(Refer to 9 - ENGINE - SPECIFICATIONS).

**Note:** Valve stems are chrome plated and should not be polished.

### INSPECTION - VALVE GUIDES

1. Measure valve stem-to-guide clearance as follows:
2. Install valve into cylinder head so it is 15 mm (0.590 inch.) off the valve seat. A small piece of hose may be used to hold valve in place.
3. Attach dial indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured.
4. Move valve to and from the indicator.
5. Note dial indicator reading and compare to engine specifications.(Refer to 9 - ENGINE - SPECIFICATIONS)

**Note:** Replace cylinder head if stem-to-guide clearance exceeds specifications, or if guide is loose in cylinder head.

## INSTALLATION

1. Coat valve stems with clean engine oil and insert them in cylinder head.
2. If valves or seats have been reground, check valve tip height (A). If valve tip height is greater than 43.65 mm (1.7185 in.) intake or 46.48 mm (1.8299 in.) exhaust, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.
3. Install new valve stem seals.
4. Install valve springs(Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION).
5. Install cylinder head(s)(Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

## ROCKER ARM SHAFT/ ROCKER ARM / LASH ADJUSTER

### DESCRIPTION

#### DESCRIPTION - ROCKER ARM

Rocker arms are made of light weight permanent mold aluminum alloy with a roller (3) type follower operating against the camshaft. The valve actuating end of the rocker arms are machined to retain hydraulic lash adjusters, eliminating the need for manual valve lash adjustment.

## DESCRIPTION - ROCKER ARM SHAFTS

The rocker arm shafts are tubular steel and are supported by several forged aluminum alloy pedestals, which are fastened to the cylinder head. Four shafts are used, one for each intake and exhaust rocker arm bank on each cylinder head. The shafts are hollow to provide a duct for lubricating oil flow from the cylinder head to the valve mechanisms. One hollow dowel per pedestal is used to locate the pedestal to the cylinder head, orient the exhaust rocker shaft, and serve as a cam bearing oil feed passage.

## OPERATION

The rocker arm is the pivot point between the camshaft lobe and the valve.

## DIAGNOSIS AND TESTING

### LASH ADJUSTER (TAPPET) NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of a NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to the following chart indicating possible lash adjuster (tappet) noise sources and possible sources that could lead to a misdiagnosis.

Refer to Lash Adjuster (Tappet) Noise Chart for Possible Causes and Correction of a lash adjuster (tappet) type noise.

POSSIBLE NOISE SOURCES	POSSIBLE NOISE MISDIAGNOSIS SOURCES
Spongy/soft/aerated lash adjusters.	Exhaust leak.
Missing lash adjuster swivel contact pads.	Exhaust rocker arm-to-cylinder head cover contact.
Intake rocker-to-camshaft bearing journal contact.	Piston pin bore fit.
Rocker arm bind-up.	Timing drive hydraulic tensioner tick.
Intake rocker arm-to-spark plug tube contact.	Accessory drive belt deterioration.
Excessive cam end play.	Piston-to-bore clearance knock.
Broken valve spring.	Crankshaft bearing noise.
Broken/loose camshaft sprocket bolt.	
Incomplete cam lobe machining.	
Cracked lash adjuster cartridge body.	

**LASH ADJUSTER (TAPPET) NOISE CHART**

POSSIBLE CAUSES	CORRECTION
1. Engine oil level—too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct engine oil level.
2. Insufficient running time after rebuilding cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in lash adjuster (after 1 hour run time).	3. See below: (a) Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) Before proceeding, perform Lash Adjuster Bleeding procedure. (c) If lash adjuster(s) are still spongy, replace with new adjuster/rocker arm assembly*.
4. Low oil pressure	4. See below: (a) Check and correct engine oil level. (b) Check engine oil pressure. (c) Check for excessive bearing clearance and correct. (d) Check for worn oil pump.
5. Oil passage to cylinder head(s) plugged with debris.	5. Check cylinder head oil passages and cylinder head gasket restrictor for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Ream guide(s) and replace valve(s) with oversize valves and seal(s).
7. Air injected into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary.
8. Collapsed lash adjuster due to debris injection.	8. Clean debris from engine and replace lash adjuster/rocker assembly*.
9. Intake rocker arm roller clevis ear(s) contacting camshaft bearing journal(s) on side.	9. Inspect camshaft end play and all valve train components for wear. Replace as necessary.
<b>*Lash adjusters are serviced with the rocker arms—do not disassemble.</b>	

## STANDARD PROCEDURE - HYDRAULIC LASH ADJUSTER BLEEDING

Use this procedure to manually bleed aerated oil from the lash adjuster and remove sponginess.

1. Run the engine, bringing it to operating temperature in order to freshly pressurize and warm the valvetrain system oil supply.
2. Remove cylinder head cover(s).
3. Ensure the rocker arm is positioned on the base circle (1) of the cam. Rotate engine as necessary.

4. For intake rocker arm positions:

- a. Adjust Special Tool 8351 (1) Release Probe's gauge pin to extend approximately 20 mm (0.787 in.). Then, carefully insert the release probe gauge pin into the lash adjuster (6) service access hole (2).

**CAUTION: If probe tip (1) breaks off within the lash adjuster (6), replace the affected rocker arm (3).**

- b. Gently unseat lash adjuster's internal check ball (4).
- c. While the internal check ball (4) is held unseated, press the rocker arm (3) into the valve tip (5), allowing the lash adjuster (6) to fully collapse. Hold this fully collapsed position for about one second, or longer.

- d. Slowly release the rocker arm (3), thereby allowing the lash adjuster (6) to extend, which in turn refills the high pressure chamber with non-aerated oil.
- e. Remove probe to allow check ball (4) to seat.
- f. Recheck for sponginess. If the lash adjuster (6) sponginess is not completely or nearly eliminated, then repeat procedure.
- g. If the spongy condition cannot be removed, replace effected rocker arm(s) (3).

5. For exhaust rocker arm (3) positions:

- a. Adjust Special Tool 8351 (1) Release Probe gauge pin to extend approximately 20 mm (0.787 in.). Then, using two release probes, carefully insert gauge pins into the lash adjuster service access holes.

**CAUTION: If probe tip (1) breaks off within the lash adjuster (6), replace the affected rocker arm (3).**

- b. Gently unseat BOTH lash adjuster's internal check ball (4) at the same time.

- c. While the internal check ball (4) is held unseated, press the rocker arm (6) into the valve tip, allowing the lash adjuster to fully collapse. Hold this fully collapsed position for about one second, or longer.
  - d. Slowly release the rocker arm (3), thereby allowing the lash adjuster (6) to extend, which in turn refills the high pressure chamber with non-aerated oil.
  - e. Remove probes (1) to allow check balls (4) to seat.
  - f. Recheck for sponginess. If the lash adjuster (6) sponginess is not completely or nearly eliminated, then repeat procedure.
  - g. If the spongy condition cannot be removed, replace effected rocker arm(s) (3).
6. Install cylinder head cover(s).

## REMOVAL

**CAUTION:** The rocker arm shafts are hollow and are used as lubrication oil passages. The rocker arm and shaft assembly on the RIGHT side of the engine has an oil passage hole from the cylinder head to the third rocker shaft support. The rocker arm shaft assembly on the LEFT side of the engine has an oil passage hole from the cylinder head to the second rocker shaft support.

1. Remove cylinder head covers. (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
2. Identify the rocker arm assembly and rocker arms before disassembly.
3. Remove rocker arm assembly bolts.
4. Remove rocker arm assembly.

**Note:** To prevent air ingestion into lash adjusters, avoid turning rocker arm assembly upside down.

**CAUTION:** Do not allow rocker arm assembly to rest on lash adjusters, as damage may occur to lash adjusters and/or plastic retainers.

## DISASSEMBLY

1. Remove rocker arm and shafts. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL)
2. Remove dowel pin using a 4 mm screw, nut, spacer, and washer installed into the pin. Thread the screw into the pin, then loosen the nut on the screw. This will pull the dowel out of the shaft support. Do not reuse dowel pins. Remove the rocker arms and pedestals in order.
3. Check the rocker arm mounting portion of the shafts for wear or damage. Replace if damaged or heavily worn.
4. Check shaft oil holes for clogging with small wire, clean as required.

## INSPECTION

The rocker arm shafts are hollow and are used as lubrication oil ducts. The rocker arm and shaft assembly on the **right** side of the engine has an oil passage hole from the cylinder head located at the third rocker shaft support pedestal. The rocker arm and shaft assembly on the **left** side of the engine has an oil passage hole from the cylinder head located at the second rocker shaft support pedestal.

**Note:** To prevent air ingestion into lash adjusters, avoid turning rocker arm assembly upside down.

**CAUTION:** Do not allow rocker arm assembly to rest on lash adjusters, as damage may occur to lash adjuster and plastic retainer.

The intake and exhaust rocker arms are different. They should be identified before disassembling the assembly.

Check rocker arms for wear or damage :

- Roller scuffing or wear
- Shaft bore scuffing or wear
- Swivel pad on lash adjuster missing or broken
- Rocker arm showing signs of fatigue or cracking
- Roller axle protruding from arm

Replace assembly as necessary if any rocker arms shows signs of wear.

**CAUTION:** Do Not remove lash adjuster from rocker arm assembly. Damage to the adjuster and rocker arm will result.

## ASSEMBLY

**CAUTION:** New dowel pins must be installed when reassembling.

1. Install the rocker arms, and pedestals (3) onto the shaft.
2. Install dowel pins (2). Dowel pins (2) pass through the pedestal (3) into the exhaust rocker shafts. Dowel pins (2) should be pressed in until they bottom-out against the rocker shaft in the pedestal (3).

## SPARK PLUG TUBE

### REMOVAL

1. Remove cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
2. Using suitable locking pliers, remove the tube from the cylinder head and discard tube.
3. Clean area around spark plug with Mopar® Parts Cleaner or equivalent.

### INSTALLATION

1. Apply Mopar® Stud and Bearing Mount to a new tube (1) approximately 1 mm (0.039 in.) from the end of tube, in a 3 mm (0.118 in.) wide area.
2. Install sealer end of tube (1) into the cylinder head. Then carefully install the tube (1) using a hardwood block and mallet. Install the tube (1) until it is seated into the bottom of the bore.
3. For spark plug tube (1) seal replacement, (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
4. Install cylinder head cover(s). (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION)

## VALVE STEM SEALS

### REMOVAL

1. Remove valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - REMOVAL)
2. Remove valve stem seals by using a valve stem seal tool.

### INSTALLATION

1. The valve stem seal/valve spring seat should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide. When installing the valve retainer locks, compress the spring **only enough** to install the locks.

**CAUTION:** Do not remove garter spring (2) around the seal at the top of the valve stem seal.

2. Install valve spring. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE SPRINGS - INSTALLATION)

## VALVE SPRINGS

### DESCRIPTION

The valve springs are made from chrome silicon alloy wire and incorporate a "bee-hive" design. Valve spring retainers and locks are common from valve-to-valve. The valve spring seat is integral with the valve stem oil seal, which incorporates a garter spring to maintain consistent lubrication control to the valve stem.

The valve springs are unique for intake compared to exhaust. Both have different lengths and are wound in opposite directions. The valve springs are color coded, intake spring is right hand coil direction with orange dye on the top coils, and the exhaust spring is left hand coil direction with a yellow or white dye on the top coils.

The exhaust spring with the white dye on the top of the coils has an increased open and closed load when compared to the exhaust spring with the yellow dye. A yellow and a white exhaust valve spring **should never** be used on a single forked rocker arm. Color coated exhaust springs should always be used in pairs for a forked exhaust rocker springs.

## OPERATION

The valve spring returns the valve against its seat for a positive seal of the combustion chamber.

## REMOVAL

### REMOVAL - CYLINDER HEAD OFF

1. Compress valve spring with valve spring compressor C-3422-D and adapter 6526 (Refer to 9 - ENGINE - SPECIAL TOOLS).
2. Remove valve retaining locks. Release valve spring compressor. Remove valve spring retainer and valve spring.
3. Remove valve stem seal assembly. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL)

### REMOVAL - CYLINDER HEAD ON

1. Disconnect negative battery cable.
2. Remove upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Remove cylinder head cover(s) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
4. Remove rocker arm and shaft assembly (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
5. Remove spark plugs.
6. Rotate the crankshaft clockwise, until the number 1 piston is at Top Dead Center (TDC) on the compression stroke.
7. With air hose attached to spark plug adapter installed in number 1 spark plug hole, apply 620.5 to 689 kPa (90 to 100 psi) air pressure. This is to hold valves into place while servicing components.
8. Using Tool MD 998772A (1) with adapter 6527 (4) or equivalent, compress valve spring and remove valve locks (5). Release tension on valve spring, remove retainer (5) and valve spring (Refer to 9 - ENGINE - SPECIAL TOOLS).
9. Remove valve stem seal, if required. (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - REMOVAL)
10. Follow the same procedure on the remaining 5 cylinders using the firing sequence 1-2-3-4-5-6. **Make sure piston is at TDC in each cylinder of the valve spring that is being removed.**
11. Remove spark plug adapter tool.

## INSPECTION

When valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. **As an example;** the compression length of the spring to be tested is 38.00 mm (1.496 in.). Turn table of Tool C-647 until surface is in line with the 38.00 mm (1.496 inches.) mark on the threaded stud and the zero mark on the front. Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain specified height and allowable tensions (Refer to 9 - ENGINE - SPECIFICATIONS). Replace springs that do not meet specifications.

## INSTALLATION

### INSTALLATION - CYLINDER HEAD OFF

1. Install valves if removed.
2. Install valve stem seal/spring seat assembly (5) over valve guides on all valve stems. Ensure that the garter spring is intact around the top of the rubber seal.
3. Place valve spring (color-coded end facing up) (4) and valve retainer into position.

4. Compress valve spring with valve spring compressor. Install locks and release tool. **If valve and/or seat are reground, measure the installed height of springs (B), make sure measurements are taken from top of spring seat to the bottom surface of spring retainer.** If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

## INSTALLATION - CYLINDER HEAD ON

1. Install new valve seal(s) if required (Refer to 9 - ENGINE/CYLINDER HEAD/VALVE STEM SEALS - INSTALLATION).
2. Place valve spring (color-coded end facing up) and valve retainer into position.
3. Compress valve spring using Special Tool MD 998772A (1) with Adaptor 6527 (4) only enough to install locks (5).
4. After installing locks, release tension on valve spring and verify proper installation.
5. Remove Special Tool MD 998772A (1) and spark plug adapter tool.
6. Install rocker arm and shaft assembly. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION)
7. Install cylinder head cover(s) (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
8. Install spark plugs.
9. Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
10. Connect negative battery cable.

## ENGINE BLOCK

### DESCRIPTION

The cylinder block is made of heat treated aluminum with cast-in-place iron liners. The block is a closed deck design with the right bank forward. To provide high rigidity and improved noise, vibration and harshness (NVH), the block has cast-in contours and ribs, along with powdered metal 6 bolt main caps (4 vertical, 2 horizontal), with a die cast aluminum structural beam windage tray mounted to the main caps.

813a1637

### CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

### INSPECTION

#### ENGINE BLOCK

1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.
2. If new core plugs are to be installed, (Refer to 9 - ENGINE - STANDARD PROCEDURE - ENGINE CORE AND OIL GALLERY PLUGS).
3. Examine block and cylinder bores for cracks or fractures.
4. Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

## CYLINDER BORE

**Note:** The cylinder bores should be measured at normal room temperature, 21°C (70°F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 cylinder bore gauge, or equivalent (Refer to 9 - ENGINE - SPECIFICATIONS). If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B. Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. (Refer to 9 - ENGINE - SPECIFICATIONS).

## CONNECTING ROD BEARINGS

### STANDARD PROCEDURE - CONNECTING RODS AND BEARINGS

#### CONNECTING ROD BEARINGS

**CAUTION:** The bearing caps are not interchangeable and should be paint marked or scribed at removal to insure correct assembly. **DO NOT** use a metal stanp.

The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Install cap with the tangs on the same side as the rod.

Fit all rods on one bank until complete.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.010 mm (0.0004 in.). Bearings are available in standard, 0.025 mm (0.001 in.), and 0.254 mm (0.010 in.) undersizes. **Install the bearings in pairs. Do not use a new bearing half with an old bearing half. Do not file the rods or bearing caps.**

1. For measuring main bearing clearance and connecting rod bearing clearance use plastigage. For more information on using plastigage (Refer to 9 - ENGINE - STANDARD PROCEDURE). Refer to Engine Specifications for bearing clearance specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

**Note:** The rod bearing bolts should be examined before reuse. If the threads are necked down the bolts must be replaced.

## CONNECTING ROD BOLTS

1. Examine connecting rod bolts for stretching (1). Stretching (1) can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced.
2. Before installing the bolts the threads should be cleaned and inspected.
3. Install clean bolts finger tight. Then alternately torque each bolt to assemble the cap properly.
4. Tighten the connecting rod cap bolts to specification. (Refer to 9 - ENGINE - SPECIFICATIONS).

## CONNECTING ROD SIDE CLEARANCE

1. Mount a dial indicator to a stationary point on engine. Locate probe perpendicular to and resting against the connecting rod cap being checked. Move connecting rod all the way to rear of its travel. Zero the dial indicator. Move connecting rod forward to limit of travel and read the dial indicator. Compare measurement to specification listed in engine specifications (Refer to 9 - ENGINE - SPECIFICATIONS). Repeat procedure for each connecting rod. Turn crankshaft for connecting rod accessibility.

## CRANKSHAFT

### DESCRIPTION

The crankshaft is constructed of a forged micro alloy steel. A six throw, nine counterweight crankshaft is supported by four select fit main bearings with number two serving as the thrust washer location. The six separate connecting rod throws are an even-firing design which reduces torque fluctuations while a torsional vibration damper is used to control torsion caused vibration of the crankshaft. Rubber lipped seals are used at front and rear. The front seal is retained in the oil pump case and the rear seal is retained in a block-mounted housing.

### OPERATION

The crankshaft transfers force generated by combustion within the cylinder to the flywheel or flexplate.

## REMOVAL

1. Remove engine from vehicle (Refer to 9 - ENGINE - REMOVAL).
2. Remove oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
3. Remove oil pickup tube.
4. Remove front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
5. Remove timing belt and tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
6. Remove crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
7. Tap dowel pin out of crankshaft.
8. Remove oil pump assembly (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
9. Remove crankshaft rear oil seal retainer (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - REMOVAL).

**CAUTION:** Connecting rod bearing caps are not interchangeable and should be paint marked or scribed before removal to insure correct assembly. DO NOT use a metal stamp to mark the bearing caps.

10. Remove connecting rod bearing caps..

**WARNING:** Main bearing caps are not interchangeable and should be paint marked or scribed before removal to insure correct assembly. DO NOT use a metal stamp to mark the bearing caps.

11. Remove main bearing caps (1). Main bearing caps (1) are not interchangeable and are marked to insure correct assembly.

12. Remove crankshaft (4) from cylinder block (7).

**Note:** Before installing crankshaft, refer to Fitting Main Bearings and Installation of Connecting Rod Bearings. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE)

## INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring. Limits of taper on any crankshaft journals should be held to 0.015 mm (0.0006 in.). Limits for journal roundness should be 0.010 mm (0.0004 in.). Journal grinding should not exceed 0.254 mm (0.010 in.) under the standard journal diameter. DO NOT grind thrust faces of Number 2 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages.

**CAUTION:** With a forged steel crankshaft it is important that the final paper or cloth polish after any journal regrind be in the same direction as normal rotation in the engine.

## INSTALLATION

**CAUTION:** Main bearings are select fit (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE) for proper bearing size selection.

1. Install crankshaft upper main bearings in cylinder block. Ensure oil holes in bearings line up with oil holes in cylinder block. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)

**Note:** Care must be taken not to damage the journals or bearings during crankshaft installation.

2. Install the crankshaft (4) to cylinder block (7)

3. Move crankshaft forward to limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer (1) onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
4. Move crankshaft rearward to limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

5. Install lower main bearings (3) into main bearing caps (1).
6. Lubricate lower main bearings (3) with clean engine oil.

**Note:** Lubricate main bearing cap bolts (1) with engine oil before installation.

7. Install each main cap (1) and tighten bolts finger tight.

The main bearing cap bolts (2) must be tightened in the proper sequence. First the inner main cap bolts (2), secondly the windage tray bolts, lastly the main cap tie (horizontal) bolts (6).

8. Install the inside main bearing cap bolts (2) and tighten to 20 N·m + 1/4 turn (15 ft. lbs. + 1/4 turn).
9. Measure crankshaft end play. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE)
10. Install connecting rods and measure side clearance. (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE)
11. Install windage tray. Lubricate bolts with engine oil and tighten to 27 N·m + 1/4 turn (20 ft. lbs. + 1/4 turn).

813a1637

12. Install the main cap tie (horizontal) bolts and tighten to 28 N·m (250 in. lbs.).
13. Install rear crankshaft oil seal retainer and oil seal (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - INSTALLATION) and (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - INSTALLATION)
14. Install oil pump assembly (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
15. Install dowel pin in crankshaft (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - FRONT - INSTALLATION).
16. Install crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
17. Install timing belt and tensioner (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
18. Install front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
19. Install oil pickup tube and tighten bolt to 28 N·m (250 in. lbs.).
20. Install oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
21. Install engine assembly (Refer to 9 - ENGINE - INSTALLATION).
22. Fill engine crankcase with proper amount of oil.

## CRANKSHAFT MAIN BEARINGS

### STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING FITTING

The main bearings are a “select fit” to achieve proper oil clearances. For main bearing selection, the block and crankshaft have grade identification marks.

The marks for the cylinder block main bore grade are located on the right front side of the engine block. These grade marks (1, 2, or 3) are read left to right, corresponding to main bore 1, 2, 3, 4. The 5th digit is a check some digit for plant validation during manufacturing.

The grade marks for the crankshaft are located on the rearmost crankshaft counter weight as shown in. The crankshaft journal grade marks (A, B, or C) are read left to right, corresponding with journal number 1, 2, 3, 4.

Refer to the MAIN BEARING SELECTION CHART to properly select the main bearings. For an example, if the main bore grade is 3 and the journal grade is B, the proper select fit bearing would be a (2) +0.003 mm (+0.0002 in.).

**Note:** Service main bearings have a number from (1–5) marked in ink on the bearing surface. For verification, refer to the MAIN BEARING SELECTION CHART for number to size identification.

The upper main bearing (2) has a oil feed hole and a center groove to allow lubrication of the main journal and must be properly positioned in the block.

## REMOVAL

Bearing caps are not interchangeable and are marked to insure correct assembly. Upper and lower bearing halves are NOT interchangeable.

1. Remove oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
2. Remove oil pick-up tube and windage tray.
3. Identify bearing caps before removal.

4. Remove bearing caps one at a time. Remove upper half of bearing by inserting Special Main Bearing Tool C-3059 into the oil hole of crankshaft.
5. Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

## INSTALLATION

Bearing caps are not interchangeable and are marked to insure correct assembly. Upper and lower bearing halves are NOT interchangeable.

**CAUTION:** Main bearings are select fit. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE)

**Note:** Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened.

When installing a new upper bearing shell, slightly chamber the sharp edges from the plain side.

1. Lubricate main bearing (4) with clean engine oil.
2. Start bearing (4) in place, and insert Main Bearing Tool C-3059 (3) into oil hole of crankshaft.
3. Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Special Main Bearing Tool C-3059.

**Note: Lubricate main bearing cap bolts with engine oil before installation.**

4. Lubricate and install lower bearing half and main cap. Tighten bolts finger tight.

5. For installing thrust washers (1) at the No. 2 main bearing location, use the following procedure:
  - a. Move crankshaft forward to limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
  - b. Move crankshaft rearward to limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

The main bearing cap bolts (2) must be tightened in the proper sequence. First the inner main cap bolts, secondly the windage tray bolts, lastly the main cap tie (horizontal) bolts.

6. Install each main bearing cap (1) and tighten inner bolts finger tight.
7. Tighten inner main bearing cap bolts (2) to 20 N·m + 1/4 turn (15 ft. lbs. + 1/4 turn).
8. Measure crankshaft end play. (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT - STANDARD PROCEDURE)
9. Install windage tray. Lubricate bolts with engine oil and tighten to 27 N·m + 1/4 turn (20 ft. lbs. + 1/4 turn).

10. Install the main cap tie (horizontal) bolts and tighten to 28 N·m (250 in. lbs.).
11. Install oil pick-up tube.
12. Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)
13. Fill engine crankcase with proper oil to correct level.

## CRANKSHAFT OIL SEAL - FRONT REMOVAL

1. Remove the crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
2. Tap the dowel pin (2) out of the crankshaft.

3. Remove crankshaft seal using Special Tool 6341A (1).

**CAUTION:** Do not nick shaft seal surface or seal bore.

4. Shaft seal lip surface must be free of varnish, dirt or nicks. Polish with 400 grit paper if necessary.

## INSTALLATION

1. Install crankshaft seal using Special Tool 6342 (1).
2. Install the dowel pin into the crankshaft to 1.2 mm (0.047 in.) protrusion.
3. Install the crankshaft sprocket (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION.)

## CRANKSHAFT OIL SEAL - REAR

### DESCRIPTION

The rear crankshaft oil seal (1) and retainer (3) are molded and serviced as an assembly. This assembly also includes a separate rear crankshaft seal protector (2) that should not be removed before the seal is installed on the engine block. Once the seal protector (2) is separated from the assembly it can not be re-installed on the assembly or reused. The rear crankshaft oil seal (1) is unique to this engine and CAN NOT be used on prior model years.

### REMOVAL

1. Remove the engine oil pan(Refer to 9 - ENGINE/ LUBRICATION/OIL PAN - REMOVAL).
2. Lower the weight of the engine back onto the engine mounts.
3. Remove transmission from vehicle. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42LE - REMOVAL)
4. Remove the flex plate.
5. Remove the rear crankshaft oil seal retainer bolts.
6. Remove the crankshaft oil seal and clean all mating surfaces.

## INSTALLATION

**CAUTION:** If a burr or scratch is present on the crankshaft edge (chamfer), clean surface using 400 grit sand paper to prevent seal damage during installation.

**Note:** The rear crankshaft oil seal and retainer are an assembly. **DO NOT** separate the seal protector from the rear crankshaft oil seal before installation on engine. Damage to the seal lip will occur if the seal protector is removed and installed prior to installation on engine.

1. Carefully position the oil seal, retainer and seal protector on crankshaft and push firmly into place on engine block (the seal protector will be removed from the rear oil seal assembly as a result of installing the rear oil seal). Hand tighten the rear oil seal fasteners.

**Note:** The following steps must be performed to prevent oil leaks at sealing joints.

2. Attach Special Tools 8225 (1) to pan rail using the oil pan fasteners.

**Note:** Special Tools 8225 (1), are use to assist with the fit of the flush mount rear main seal retainer. The notch on tool should be located away the seal retainer.

3. While applying firm pressure to the seal retainer against Special Tools 8225 (1), tighten seal retainer screws to 12 N·m (105 in. lbs.).
4. Remove special tool #8225 (1).
5. Install oil pan. Tighten the 6mm fasteners to 12N·m (105 in.lbs.) and the 8mm fasteners to 28N·m (250 in.lbs.).
6. Install the flex plate and transmission.

## FLEX PLATE

### REMOVAL

1. Remove the transmission.
2. Remove flex plate attaching bolts (2).
3. Remove the flex plate (1).

### INSTALLATION

1. Position flex plate (1) with backing plate (3) on the crankshaft.
2. Apply Mopar® Lock & Seal Adhesive to the flex plate bolts (2).
3. Install flex plate bolts (2). Tighten bolts to 95 N-m (70 ft. lbs.).
4. Install the transmission.

## PISTON & CONNECTING ROD

### DESCRIPTION

The pistons are made of a high strength aluminum alloy. Top land height has been decreased to reduce emissions. Piston skirts are coated with a solid lubricant for scuff resistance. Connecting rod is forged steel with a fractured connecting rod cap design. The connecting rod is also equipped with a squirt hole and attaches to the piston with a full floating pin retained by lock rings.

### OPERATION

The piston and connecting rod assembly is the link between the combustion force and the crankshaft.

## STANDARD PROCEDURE - FITTING PISTONS

The pistons are machined to two different weight specifications and matched to rods based on weight. All piston and rod assemblies weigh the same to maintain engine balance.

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90 degrees to piston pin at size location shown in. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line (Refer to 9 - ENGINE - SPECIFICATIONS). **Pistons and cylinder bores should be measured at normal room temperature, 70°F (21°C).**

## REMOVAL

1. Remove the cylinder heads (Refer to 9 - ENGINE/ CYLINDER HEAD - REMOVAL)
2. Remove the oil pan. (Refer to 9 - ENGINE/LUBRI- CATION/OIL PAN - REMOVAL)
3. Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so that each connecting rod is centered in cylinder bore.**

**CAUTION: DO NOT stamp the connecting rods for cylinder identification**

4. Inspect connecting rods and connecting rod caps for cylinder identification. Identify them with a paint mark or scribe, if necessary.

5. Remove connecting rod cap. Install protectors, special tool 8189, on connecting rod.. Guide each piston and rod assembly out of cylinder bore.

**Note:** Be careful not to nick crankshaft journals.

6. After removal, install bearing cap on the mating rod.

## INSTALLATION

1. Install the piston rings. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - INSTALLATION)

**Note:** The connecting rod bearing cap bolts must be examined before reuse. If the threads are necked down, the bolts must be replaced.

2. Check connecting rod bolts for necking by holding a scale or straight edge against the threads. If all threads do not contact the scale, the bolt must be replaced.

3. Before installing pistons and connecting rod assemblies into the bore, ensure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

4. Immerse the piston head and rings in clean engine oil, slide the ring compressor over the piston and tighten with the special wrench. **Ensure position of rings does not change during this operation.**
5. Install connecting rod bolt protectors, special tool # 8189.
6. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert the rod and piston into cylinder bore and guide the rod over the crankshaft journal.

**CAUTION: Do Not interchange piston assemblies cylinder-to-cylinder or bank-to-bank.**

7. The arrow on top of piston must be pointing toward front of engine.

**CAUTION:** View of connecting rod oil squirt hole is from the front of the engine.

8. The oil squirt hole on connecting rod faces the major thrust (right) side of the cylinder bore.
9. Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

**Note:** Connecting rod bolts must be lubricated with clean engine oil.

10. Install the rod caps. Install cleaned and inspected connecting rod bolts and tighten to 27 N·m (20 ft. lbs.) Plus 1/4 turn.

11. Install the cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)
12. Install the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION.)

## PISTON RINGS

### DESCRIPTION

The piston rings include a moly-filled top ring with a symmetric barrel face. The intermediate piston ring is of the standard chrome design OR Micro-Napier design. The Micro-Napier design has a reduced “hook” on the running face, removes the need for chroming and improves oil economy. The oil control package consists of two steel rails and an expander spacer.

### STANDARD PROCEDURE - PISTON RING FITTING

1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore. Check gap with feeler gauge. For clearance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

2. Check piston ring to groove clearance:. For clearance specifications, (Refer to 9 - ENGINE - SPECIFICATIONS).

## REMOVAL

1. Remove piston and connecting rod. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - REMOVAL)
2. Remove No. 1 and No.2 piston rings from piston using a ring expander tool.

3. Remove upper oil control ring side rail.
4. Remove lower oil control ring side rail.
5. Remove oil control ring expander

## INSTALLATION

1. Measure clearance of piston rings to the cylinder bore and piston. (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE)

The No. 1 and No. 2 piston rings have a different cross section. Insure that which ever design No. 2 ring is installed, it is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - DESCRIPTION).

**CAUTION:** Install piston rings in the following order:

- Oil ring expander.
  - Lower oil control ring side rail.
  - Upper oil control ring side rail.
  - No. 2 Intermediate piston ring.
  - No. 1 Upper piston ring.
2. Install the side rail by placing one end between the piston ring groove and the spacer. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander tool during this step.**

3. Install lower side rail first and then the upper side rail.

The No. 1 and No. 2 piston rings have a different cross section. Insure that which ever design No. 2 ring is installed, it is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - DESCRIPTION).

4. Install No. 2 piston ring and then No. 1 piston ring.

5. Position piston ring end gaps as shown in.
6. Position oil control ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

## VIBRATION DAMPER

### REMOVAL

1. Disconnect negative battery cable.
2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Raise vehicle on hoist.

4. Remove crankshaft damper bolt.
5. Use Special Tool 1023 puller, and insert 9020-R, remove crankshaft damper

## INSTALLATION

1. Install crankshaft damper using Special Tools C-4685-C1 (5.9 in.) Bolt, with Nut and Thrust Bearing from 6792, and 6792-1 Installer.

2. Install crankshaft damper bolt. Torque bolt to 95 N·m (70 ft. lbs.) while holding damper with Special Tool 9365.
3. Lower vehicle.

4. Install accessory drive belt.
5. Connect negative battery cable.

## ENGINE MOUNTING

### DESCRIPTION

The engine mounting system are of molded rubber material and consist of two mounts; right and a left side support the powertrain, and control powertrain torque.

### LEFT MOUNT

#### REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Remove both engine mount to cradle nuts and remove the left engine mount studs.
4. Using a suitable jack and a block of wood under the oil pan, raise the engine until the weight is off of the mounts (approximately 5mm).
5. Remove the engine mount heat shield.

6. Remove the engine mount bolts and remove the mount.

## INSTALLATION

1. Install the left mount (1) to the engine mounting bracket. Hand tighten fasteners.
2. Install and hand tighten the engine mount through studs.
3. Tighten the engine mount to mounting bracket fasteners to 75 N·m ( 55 ft.lbs.).
4. Lower the engine and remove lifting device.
5. Tighten the engine mount through studs to nut to 12 N·m ( 106in.lbs.).

6. Install the engine mount heat shield (2). Tighten fasteners to 11 N·m ( 97 in.lbs.).
7. Install the left engine mount to cradle nuts and tighten both to 75 N·m (55 ft. lbs.).
8. Lower the vehicle.
9. Connect the negative battery cable.

## RIGHT MOUNT

### REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Remove both of the engine mount to cradle nuts.
4. Remove both of the engine mount through studs.
5. Using a suitable jack stand and a block of wood positioned under the oil pan, raise the engine until the weight is off of the mounts (approximately 5 mm.).
6. Remove the right mount heat shield (2) bolts.

7. Remove the engine mount (2).

## INSTALLATION

1. Install the engine mount to the engine bracket and hand tighten.. Tighten bolts to 54 N·m (40 lbs. ft.).
2. Install and hand tighten the engine mount through studs.
3. Tighten the engine mount to engine bracket fasteners to 75 N·m (55 lbs. ft.).

4. Install the engine mount heat shield (2). Tighten the fasteners to 11 N·m (97 in. lbs.).
5. Lower the engine and remove the lifting devise.
6. Tighten the engine mount through studs to 12 N·m (106 in. lbs.).
7. Install the right engine mount to cradle nuts and tighten both engine mount fasteners to 75 N·m (55 lbs. ft.).
8. Lower the vehicle.
9. Connect the negative battery cable.

## REAR MOUNT

### REMOVAL

1. Raise vehicle on hoist.
2. Remove cross member to mount bolts (2).
3. Place transmission jack under transmission pan and raise transmission.
4. Remove cross member attaching bolts and remove cross member (1).

5. Remove mount to transmission bolts (2), remove mount (1).

## INSTALLATION

1. Install mount to transmission bolts (2) and tighten to 47 N·m (35 ft.lbs.).

2. Install cross member (1) and attaching bolts. Tighten bolts to 68 N·m (50 ft.lbs.).
3. Lower transmission so cross member to mount bolts (2) can be started tightened by hand.
4. Lower transmission and remove jack.
5. Tighten mount bolts (2) to 47 N·m (39 ft.lbs.).

## LUBRICATION

The oil lubrication system is a full-flow filtration, pressure feed type. The oil pump body is mounted to the engine block. The pump inner rotor is driven by the crankshaft. A windage tray, increases power by minimizing oil windage at high engine RPM. For increased oil cooling, an oil pan mounted, oil-to-coolant oil cooler is used.

Engine oil stored in the oil pan (5) is drawn in and discharged by a gear rotor type oil pump (2, 3). The oil pump is directly coupled to the crankshaft (1). Oil pressure is regulated by a relief valve (4). The oil is fed through an oil filter and to the crankshaft journals from the oil gallery (8) in the cylinder block. This gallery also feeds oil under pressure to the cylinder heads. Oil flows through each cylinder heads oil passage to the rocker shafts (10, 16). Oil then feeds the camshaft journals (12), rocker arms, and hydraulic lash adjusters.

## DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

Check oil pressure using a gauge at oil pressure switch (1) location.

1. Remove the oil pressure switch (1)(Refer to 9 - ENGINE/LUBRICATION/OIL PRESSURE SENSOR/SWITCH - REMOVAL).
2. Install oil pressure test gauge, Special Tool C-3292 with Adapter 8406. For Special Tool identification, (Refer to 9 - ENGINE - SPECIAL TOOLS).

**CAUTION: If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM.**

3. Warm engine to normal operating temperature.
4. Monitor gauge readings at idle and 3000 rpm. For specifications (Refer to 9 - ENGINE - SPECIFICATIONS).

## OIL

### DESCRIPTION

For engine oil type and capacity (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL)

### STANDARD PROCEDURE

#### ENGINE OIL LEVEL CHECK

The best time to check engine oil level (2) is after the engine has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil (2) while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil (1) only when the level is at, or below, the ADD mark on the indicator (2).

## ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

**WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.**

### TO CHANGE ENGINE OIL

1. Run engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn engine off.
3. Open hood, remove engine oil fill cap (1).

4. Raise vehicle on hoist.
5. Place a suitable drain pan under crankcase drain.
6. Remove oil pan drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
7. Remove oil filter (3).
8. Install drain plug in crankcase. Torque oil pan drain plug to 27 N·m (20 ft. lbs.).
9. Install new oil filter (3).

10. Lower vehicle.
11. Fill crankcase (1) with specified amount and type of engine oil. (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION - ENGINE OIL) (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS)
12. Install oil fill cap (1).
13. Start engine and inspect for leaks.
14. Stop engine and inspect oil level (2).

## OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

## USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING above.

## ENGINE OIL COOLER

### DESCRIPTION

The engine oil cooler (2) is a oil-to-coolant type and is mounted between the oil filter (3) and the oil pan.

### OPERATION

Engine oil travels from the oil cooler and into the oil filter. Engine oil then exits the filter into the main gallery. Engine coolant flows into the cooler from the heater return tube and exits into the water inlet tube.

### REMOVAL

1. Drain cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
2. Raise vehicle on hoist.
3. Disconnect coolant hoses (2) from oil cooler (1).
4. Remove oil filter (3).
5. Remove oil cooler attaching fastener from center of oil cooler (1).
6. Remove oil cooler (1).

## INSTALLATION

1. Position oil cooler to fitting on oil pan.

**Note:** The cut out section of the oil cooler seal retainer flange (top), must be aligned with the tab on the oil pan. The oil cooler must be prevented from turning during the tightening sequence.

2. Install oil cooler (1) attaching fastener and tighten to 75 N·m (55 ft. lbs.).
3. Install oil filter (3).
4. Connect coolant hoses to oil cooler (2).
5. Fill cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

## OIL FILTER

### REMOVAL

**Note:** When servicing the oil filter, avoid deforming the filter can. Install the remove/install tool band strap against the base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

1. Using a suitable oil filter wrench, unscrew filter (3) from base and discard.

## INSTALLATION

1. Wipe base clean, then inspect gasket contact surface.
2. Lubricate gasket of new filter (2) with clean engine oil.
3. Install and tighten filter to 12 N·m (106 in. lbs.) of torque after gasket contacts base. Use filter wrench if necessary.
4. Start engine and check for leaks.

## OIL PAN

### REMOVAL

1. Disconnect negative battery cable.
2. Raise and support the vehicle
3. Drain engine oil and remove the oil filter (Refer to 9 - ENGINE/LUBRICATION/OIL - STANDARD PROCEDURE).
4. Remove the oil filter / oil cooler mounting stud and set oil cooler aside (Refer to 9 - ENGINE/LUBRICATION/OIL COOLER & LINES - REMOVAL).

5. Separate the steering column coupler (1) from the steering gear (3).
6. Remove steering gear (3) to cradle mounting bolts and suspend steering gear (3) aside.

7. Remove the rear oil pan (2) to transmission (3) bolts (1).

8. Remove the flex plate access cover (1).

9. Remove the two rear oil pan bolts (3).

10. Remove the remaining oil pan bolts.  
11. Loosen the engine mount bolts at the cradle.  
12. Raise and support the engine using a suitable floor jack with a block of wood at the transmission housing.  
13. Remove the oil pan.

**Note:** A small amount of oil will remain in the oil pan. Use care when removing the oil pan from the engine.

14. Clean all mating surfaces.

## INSTALLATION

1. Clean oil pan and all gasket surfaces.

**Note:** Assure that the rear face of the oil pan is flush to the transmission bell housing.

2. Apply a 1/8 inch bead of Mopar® Engine RTV GEN II at the parting line of the oil pump housing and the rear seal retainer.

3. Install oil pan gasket to the engine block.

**Note:** Assure that the rear face of the oil pan is flush to the transmission bell housing when installing the oil pan.

4. Install pan and the attaching fasteners finger tight.
5. First tighten the M8 (1, 4) oil pan alignment bolts to 28N·m (250 lbs. in.).
6. Tighten the remaining M6 bolts to 12 N·m (105 in. lbs.) and M8 bolts to 28 N·m (250 in. lbs.).
7. Install the engine oil indicator tube.
8. Lower the engine and remove the lifting fixture. Tighten the engine mount to cradle fasteners to 75 N·m (55 in. ft.).
9. Install the flex plate inspection cover and tighten the fastener to 11 N·m (97 in. lbs.).
10. Install the oil cooler and tighten the stud to 54 N·m (40 ft. lbs.).
11. Install the engine oil filter.
12. Install the steering gear to cradle bolts and tighten the fasteners to 70 N·m (95 ft.lbs.).

13. Connect the steering gear coupler and tighten the fastener to 30 N·m (22 ft. lbs.)
14. Lower the vehicle.
15. Fasten the upper oil indicator tube.
16. Fill engine crankcase with proper oil to correct level.
17. Connect negative battery cable.

## SWITCH-OIL PRESSURE SENSOR

### REMOVAL

1. Raise vehicle on hoist.
2. Position an oil collecting container under switch location.
3. Disconnect electrical connector.
4. Unscrew oil pressure switch (1).

## INSTALLATION

1. Apply Mopar® Thread Sealant to the switch (1) threads.
2. Install oil pressure switch (1) to fitting.
3. Connect electrical connector.
4. Lower vehicle.
5. Start engine and check for leaks.
6. Check engine oil level and adjust as necessary.

## OIL PUMP

### REMOVAL

1. Drain the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
2. Remove the timing belt. (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
3. Remove the crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL)
4. Remove the oil pan. (Refer to 9 - ENGINE/LUBRI- CATION/OIL PAN - REMOVAL).

5. Remove the oil pickup tube.

6. Remove the oil pump fasteners. Remove the oil pump (1) and gasket (2) from engine.

## DISASSEMBLY

1. Remove oil pump cover screws (3) and lift off cover (4).
2. Remove pump rotors (2, 5).
3. Wash all parts in a suitable solvent and inspect carefully for damage or wear.

## CLEANING

1. Clean all parts thoroughly in a suitable solvent.

## INSPECTION

**Note:** DO NOT inspect the oil relief valve assembly. If the oil relief valve is suspect, replace the oil pump.

1. Disassemble oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - DISASSEMBLY)
2. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. Replace pump cover if scratched or grooved.
3. Lay a straightedge (1) across the pump cover (3) surface. If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

4. Measure thickness and diameter of outer rotor. If outer rotor thickness measures 14.299 mm (0.563 in.) or less , or if the diameter is 79.78 mm (3.141 inches.) or less, replace outer rotor.

5. If inner rotor measures 14.299 mm (0.563 in.) or less replace inner rotor.

6. Slide outer rotor (2) into body, press to one side with fingers and measure clearance between rotor and body. If measurement is 0.39 mm (0.015 inch.) or more, replace body only if outer rotor is in specifications.

7. Install inner rotor into body. If clearance between inner (3) and outer rotors (2) is 0.20 mm (0.008 inch.) or more, replace both rotors.

8. Place a straightedge (1) across the face of the body, between bolt holes. If a feeler gauge of 0.077 mm (0.003 in.) or more can be inserted between rotors and the straightedge, replace pump assembly **ONLY** if rotors are in specs.

9. Assemble oil pump. (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - ASSEMBLY)

## ASSEMBLY

1. Assemble oil pump using new parts as required.
2. Tighten cover screws (3) to 12 N·m (105 in. lbs.).
3. Prime oil pump before installation by filling rotor cavity with engine oil.
4. If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

## INSTALLATION

1. Prime oil pump (4) before installation by filling rotor cavity with clean engine oil.
2. Install oil pump (4) and gasket (3) carefully over the crankshaft. Position pump onto block and tighten bolts to 28 N·m (250 in. lbs.).

3. Install new O-ring (3) on oil pickup tube (1).
4. Install oil pickup tube (1).
5. Install oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION)
6. Install crankshaft sprocket. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)
7. Install timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION)
8. Install the timing belt covers. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION)

9. Install the crankshaft vibration damper (4). (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION)
10. Install the accessory drive belt (6). (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)
11. Fill the cooling system. (Refer to 7 - COOLING - STANDARD PROCEDURE)
12. Fill engine crankcase with proper oil to the correct level.

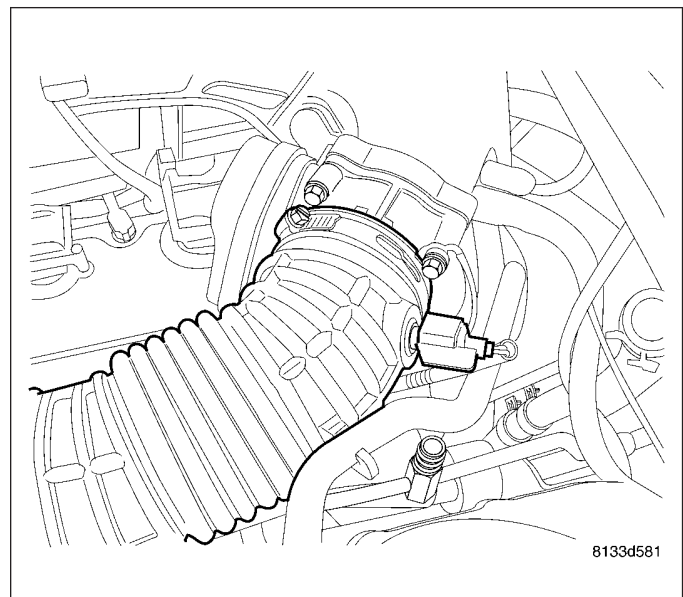

## INTAKE MANIFOLD

### REMOVAL

#### UPPER INTAKE MANIFOLD

1. Disconnect negative battery cable.
2. Disconnect the IAT sensor electrical connector.
3. Remove air inlet hose from the throttle body.

4. Disconnect the MAP sensor electrical connector.

5. Separate the engine electrical harness connectors from the intake manifold.
6. Disconnect the EGR tube, PCV, Purge and power brake booster vacuum hoses from the upper intake manifold.
7. Disconnect the electronic throttle control electrical connector.
8. Remove the throttle bracket (4) fasteners from the throttle body and cylinder head.

9. Disconnect electrical connectors from the Manifold Tuning Valve (MTV) and Short Runner Valve.

10. Remove the right intake manifold support brackets.

11. Remove the upper intake manifold retaining bolts, insulation foam pad and manifold. Clean all gasket sealing surfaces.

## LOWER INTAKE MANIFOLD

1. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE)
2. Drain the cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).
3. Disconnect the upper radiator hose from the thermostat housing.
4. Remove the upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
5. Reposition power steering fluid reservoir and bracket.
6. Disconnect the electrical connectors to fuel injectors and coolant temperature sensor.

7. Disconnect heater hose from the rear intake manifold.
8. Disconnect the coolant container hose at the rear intake manifold.

9. Disconnect the fuel supply hose from fuel rail (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE).
10. Remove the bolts attaching fuel rail.
11. Remove fuel rail and injectors as an assembly.
12. Remove bolts attaching lower intake and remove intake manifold.

## INSTALLATION

### UPPER INTAKE MANIFOLD

1. Clean and inspect gasket sealing surfaces.
2. Position new gasket.
3. Install the upper intake manifold insulator foam.
4. Install the upper intake manifold. Tighten bolts to 12 N·m (105 in.lbs.) starting in the center working outward in a cross sequence pattern.
5. Install the right manifold support brackets. Tighten fasteners to 12 N·m (105 in.lbs.).

6. Install the throttle bracket. Tighten fasteners to 12 N·m (105 in.lbs.) at the throttle body and 28N·m (259 in.lbs.) at the cylinder head.

7. Connect the manifold tuning valve and short runner valve electrical connectors.

8. Connect the electronic throttle control harness connector.
9. Connect the engine electrical connectors to the intake manifold.
10. Connect the EGR tube, PCV, Purge and power brake booster vacuum hoses to the intake manifold.

11. Connect the MAP sensor harness connector.

12. Install the inlet hose and connect the IAT sensor harness connector.
13. Connect negative battery cable.

## LOWER INTAKE MANIFOLD

1. Clean all sealing surfaces.
2. Position new gaskets and intake manifold on cylinder head surfaces.
3. Install intake manifold bolts and gradually tighten in sequence shown until a torque of 28 N·m (250 in. lbs.) is obtained.

4. Install fuel rail and injectors as an assembly, (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/FUEL INJECTOR - INSTALLATION).
5. Connect fuel supply hose to fuel rail. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL LINES - STANDARD PROCEDURE)

6. Connect heater hose to rear lower intake manifold.
7. Connect coolant container hose to the rear lower intake manifold.

8. Connect electrical connectors to fuel injectors and coolant temperature sensor.
9. Install power steering fluid reservoir and bracket.
10. Install upper intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
11. Connect the upper radiator hose to the thermostat housing.
12. Fill the cooling system (Refer to 7 - COOLING/ENGINE/COOLANT - STANDARD PROCEDURE).

## EXHAUST MANIFOLD - LEFT

### REMOVAL

#### LEFT EXHAUST MANIFOLD

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Separate the front exhaust pipe to manifold union (2).

4. Lower the vehicle.
5. Disconnect and remove the oxygen sensor from the exhaust manifold (7)
6. Remove the exhaust manifold shield (5) retaining bolts, exhaust manifold (7) , and discard gasket (1).

### INSPECTION

1. Inspect exhaust manifolds for damage or cracks.
2. Check manifold flatness.

3. Inspect the exhaust manifold gasket for obvious discoloration or distortion.
4. Check distortion of the cylinder head mounting surface with a straightedge and thickness gauge.

## INSTALLATION

### LEFT EXHAUST MANIFOLD

**Note:** If replacing the exhaust manifold, tighten the exhaust outlet studs to manifold to 40N·m (350 in.lbs.).

1. Position the exhaust manifold (7) and gasket (1). Install the retaining bolts (2). Tighten 4 bolts starting at the center working outward to 23 N·m (200 in. lbs.).
2. Install the exhaust manifold heat shields (5,6). Tighten the bolts to 12N·m (105 in. lbs.).
3. Tighten the out most stud nuts to 8N·m (73 in.lbs.).
4. Connect the oxygen sensor.

5. Raise and support the vehicle.
6. Connect the exhaust pipe to manifold union (3). Tighten the exhaust stud nuts to 34N·m (300 in.lbs.).
7. Connect the negative battery cable.

## EXHAUST MANIFOLD - RIGHT

### REMOVAL

#### RIGHT EXHAUST MANIFOLD

1. Disconnect the negative battery cable.
2. Disconnect the upstream oxygen sensor electrical connector.
3. Raise and support the vehicle.
4. Remove the exhaust manifold to exhaust pipe flange retaining bolts (1).

5. Lower the vehicle.
6. Remove the exhaust manifold heat shield and manifold.
7. Remove the oxygen sensor from the exhaust manifold.

## INSTALLATION

### RIGHT EXHAUST MANIFOLD

1. Clean gasket surfaces.

**Note:** If replacing the exhaust manifold, tighten the exhaust outlet studs to 39N·m (350 in.lbs.).

2. Position the exhaust manifold and gasket. Install the retaining bolts. Tighten 4 bolts starting at the center working outward to 23 N·m (200 in. lbs.).
3. Install the heat shields. Tighten the heat shield fasteners to 12 N·m (105 in.lbs.).
4. Tighten the 2 out most nuts to 8 N·m (73 in.lbs.).
5. Connect the oxygen sensor.
6. Raise and support the vehicle.

7. Connect the front exhaust pipe to exhaust manifold. Tighten the fasteners to 34 N·m (300 in. lbs.).
8. Connect the negative battery cable.

## VALVE TIMING

### DESCRIPTION

The timing drive system has been designed to provide quiet performance and reliability to support a **NON** free-wheeling engine.

The timing drive components include a crankshaft sprocket (4), camshaft sprockets, tensioner pulley, hydraulic tensioner and a timing belt (3). The water pump (2) is driven by the back side of the timing belt (3). The right and left camshaft sprockets are keyed and not interchangeable because of the cam sensor pick-up wheel on the left sprocket.

## FRONT TIMING BELT COVER

### REMOVAL

1. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Disconnect negative battery cable.
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove accessory drive belt tensioner.
5. Remove bolts for power steering pump. Reposition power steering pump aside.
6. Raise vehicle on hoist.
7. Remove crankshaft damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
8. Remove the lower front timing belt cover fasteners.

9. Lower the vehicle.
10. Remove the upper timing belt cover bolts and remove front timing belt cover.

## INSTALLATION

1. Exchange the accessory drive belt pulley if necessary. Tighten bolt to 61 N·m (45 ft.lbs.).
2. Install upper front timing belt cover.
3. Install lower timing belt front cover.
4. Tighten the timing cover bolts as follows:
  - M6 bolts - 12N·m (105 in.lbs.)
  - M8 bolts - 28N·m (250 in.lbs.)
  - M10 bolts - 54N·m (40 lbs.ft.)
5. Install power steering pump fasteners. Tighten bolts to 23 N·m (200 lbs. in.).
6. Install crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
7. Install accessory drive belt tensioner (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - INSTALLATION). Torque fastener to 28 N·m (250 in. lbs.).
8. Install accessory drive belt(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
9. Lower vehicle.
10. Connect negative battery cable.

## REAR TIMING BELT COVER

### REMOVAL

**Note:** The rear timing belt cover has O-rings to seal the water pump passages to cylinder block. Do not reuse the O-rings.

1. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Disconnect the negative battery cable.
3. Remove timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
4. Remove camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
5. Remove rear timing belt cover bolts (1, 2, 3).
6. Remove the rear cover.

### INSTALLATION

1. Clean rear timing belt cover O-ring (1) sealing surfaces and grooves. Lubricate new O-rings with Mopar® Dielectric Grease or equivalent to facilitate assembly.
2. Position **NEW** O-rings on cover (2).

3. Install rear timing belt cover (4). Tighten bolts to the following specified torque:
  - M10 (2, 5) - 54 N·m (40 ft. lbs.)
  - M8 (1) - 28 N·m (20 ft. lbs.)
  - M6 (3) - 12 N·m (105 in. lbs.)
4. Install camshaft sprockets (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
5. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

## TIMING BELT AND SPROCKETS

### REMOVAL

#### TIMING BELT

8136ff76

**CAUTION:** The 3.5L is NOT a freewheeling engine. Therefore, loosen the valve train rocker assemblies before servicing the timing drive.

1. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Disconnect negative battery cable.
3. Remove both cylinder head covers and loosen the rocker arm assemblies (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
4. Remove the front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
5. Mark belt running direction, if timing belt is to be reused.

**CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.**

6. Rotate engine clockwise until crankshaft (10) mark aligns with the TDC mark on oil pump housing (9) and the camshaft sprocket (2, 7) timing marks (1, 8) are aligned with the marks on the rear cover.
7. Remove the timing belt tensioner (12) and remove timing belt.
8. Inspect the tensioner for fluid leakage.
9. Inspect the pivot and bolt for free movement, bearing grease leakage, and smooth rotation. If not rotating freely, replace the arm and pulley assembly.

10. When tensioner is removed from the engine it is necessary to compress the plunger into the tensioner body.

**CAUTION: Index the tensioner in the vise the same way it is installed on the engine. This ensures proper pin orientation when tensioner is installed on the engine.**

- a. Place the tensioner into a vise (1) and SLOWLY compress the plunger. Total bleed down of tensioner should take about 5 minutes.
- b. When plunger is compressed into the tensioner body install a pin (2) through the body and plunger to retain plunger in place until tensioner is installed.

## CAMSHAFT SPROCKETS

**CAUTION: The 3.5L engine is NOT a free-wheeling design. Therefore, care should be taken not to rotate the camshafts or crankshaft with the timing belt removed.**

**Note: The camshaft timing gears are keyed to the camshaft.**

1. Perform fuel pressure release procedure. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Remove front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).

3. Position crankshaft sprocket to the TDC mark on the oil pump housing by turning crankshaft in the clockwise direction.
4. Install a dial indicator in number 1 cylinder to check TDC of the piston. Rotate the crankshaft until the piston is at exactly TDC.
5. Remove camshaft retainer/thrust plate (1) from rear of right cylinder head.
6. Remove the right cylinder head cover.
7. Remove the right rocker arm assembly.
8. Remove the timing belt tensioner and timing belt.
9. Hold left camshaft sprocket with a 36 mm (1 7/16 in.) box end wrench.
10. Loosen and remove the camshaft gear retaining bolt and washer. The left bolt is 255 mm (10.0 in.) long.

**Note: The camshaft timing gears are keyed to the camshaft.**

11. Remove the camshaft sprocket.

**CAUTION: The right camshaft must be pushed rearward approximately 3 1/2 inches to remove the camshaft gear retaining bolt and gear. Care must be taken not to scratch or nick the camshaft or cylinder head journals when moving camshaft.**

12. Hold right camshaft sprocket with a 36 mm (1 7/16 in.) box end wrench.
13. Loosen and remove the camshaft gear retaining bolt and washer. The right bolt is 213 mm (8 3/8 in.) long.

**Note: The camshaft timing gears are keyed to the camshaft.**

14. Remove the camshaft sprocket..

## CRANKSHAFT SPROCKET

1. Remove the timing belt (Refer to 9 - ENGINE/ VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
2. Remove crankshaft sprocket using Special Tool L-4407-A (1).

## INSPECTION

### TIMING BELT

1. Remove front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
2. Inspect both sides of the timing belt. Replace belt if any of the following conditions exist :
  - a. Hardening of back rubber back side is glossy without resilience and leaves no indent when pressed with fingernail.
  - b. Cracks (4) on rubber back.
  - c. Cracks or peeling (1) of canvas.
  - d. Cracks on rib root.
  - e. Cracks on belt sides.
  - f. Missing teeth (2).
  - g. Abnormal wear (7) of belt sides. The sides are normal if they are sharp as if cut by a knife.
  - h. Vehicle mileage or time at component maintenance requirement. (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION)

3. If none of the above conditions are seen on the belt, the front timing belt cover can be installed (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

## TIMING VERIFICATION

Remove the outer timing covers. Rotate the crankshaft until the pointer on the crankshaft sprocket (10) aligns the TDC mark on the oil pump (9). Check to determine if the camshaft sprocket (2, 7) timing marks (1, 8) are aligned with the marks on the inner timing cover. It may take an additional full revolution of the crankshaft before the camshaft sprocket marks are aligned.

## INSTALLATION

### TIMING BELT

**CAUTION:** If camshafts have moved from the timing marks, always rotate camshaft towards the direction nearest to the timing marks (DO NOT TURN CAMSHAFTS A FULL REVOLUTION OR DAMAGE to valves and/or pistons could result).

1. Align the crankshaft sprocket (10) with the TDC mark (9) on oil pump cover.
2. Align the camshaft sprockets (2, 7) timing reference marks (1, 8) with the marks on the rear cover.
3. Install the timing belt starting at the crankshaft sprocket (10) going in a counterclockwise direction. Install the belt around the last sprocket. Maintain tension on the belt as it is positioned around the tensioner pulley (11).

**Note:** If the camshaft gears have been removed it is only necessary to have the camshaft gear retaining bolts installed to a snug torque at this time.

4. Holding the tensioner pulley (11) against the belt, install the tensioner into the housing and tighten to 28 N-m (250 in. lbs.). Each camshaft sprocket mark should remain aligned the cover marks.
5. When tensioner is in place pull retaining pin to allow the tensioner to extend to the pulley bracket.
6. Rotate crankshaft sprocket 2 revolutions and check the timing marks on the camshafts and crankshaft. The marks should line up within their respective locations. If marks do not line up, repeat procedure.

**Note:** If camshaft gears have been removed and timing is correct, counterhold and tighten the camshaft gears to final torque specification(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

7. Install the front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
8. Tighten the rocker arm assemblies and install the cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
9. Connect negative battery cable.

## CAMSHAFT SPROCKETS

**CAUTION:** The camshaft sprockets are keyed and not interchangeable from side to side because of the camshaft position sensor pick-up.

8136ff76

1. Install camshaft sprockets onto the camshafts. Install **NEW** sprocket attaching bolts into place. The 255 mm (10 in.) bolt is to be installed in the left camshaft and the 213 mm (8 3/8 in.) bolt is to be installed into the right camshaft. **Do not tighten the bolts; tightened at later step.** Camshaft sprocket (2, 7) marks (1, 8) should be aligned with the marks on the cover at both sprockets.
2. Install the camshaft thrust plates (1) and o-ring (3). Tighten bolts (2) to 28 N·m (250 in. lbs.).
3. Install the timing belt starting first at the crankshaft sprocket (10), then to remaining components in a counterclockwise direction.
4. Install the belt around the last sprocket. Maintain tension on the belt as it is positioned around the tensioner pulley (11). Each camshaft sprockets mark should still be aligned with the rear cover marks.

**Note:** For timing belt tensioner reset procedure, (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - TIMING BELT - REMOVAL).

5. Hold the tensioner pulley against the belt and install the reset (pinned) timing belt tensioner into the housing. Tighten attaching bolts to 28 N·m (250 in. lbs.).
6. Remove tensioner retaining pin to allow the tensioner to extend to the pulley bracket.
7. Using a dial indicator, position the number 1 piston at TDC.
8. Hold the camshaft sprocket hex with a 36 mm (1 7/16 in.) wrench and tighten the camshaft bolts to the following:
  - Right side = 102 N·m (75 ft. lbs.) +90° turn
  - Left side = 102 N·m (75 ft. lbs.) +90° turn
9. Remove dial indicator and install spark plug.
10. Remove Special Tools 6642.

8099f226

11. Install front timing belt cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).

## CRANKSHAFT SPROCKET

**CAUTION:** To ensure proper installation depth of crankshaft sprocket, Special Tool 6641 must be used.

1. Install crankshaft sprocket using Special Tools 6641 (1) and C-4685-C1.
2. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).

## TIMING BELT TENSIONER & PULLEY

### REMOVAL

#### TENSIONER

1. For timing belt tensioner removal procedure (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL - TIMING BELT)

#### TENSIONER PULLEY ASSEMBLY

1. Remove the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - REMOVAL - TIMING BELT)
2. Remove the timing belt tensioner pulley (1) and bracket (3) assembly by unscrewing the pivot bolt (2) from the oil pump housing.

## INSPECTION

### TENSIONER

1. Inspect hydraulic tensioner (2) for fluid loss around the plunger (1) seal. Replace tensioner if leaking.

### TENSIONER PULLEY ASSEMBLY

**Note:** The tensioner pulley (1), bracket (3), and pivot bolt (2) is serviced as an assembly.

1. Inspect pulley (1) for free movement. Replace if pulley is loose, seized, or rough turning.
2. Inspect pulley bearing and seal. Replace if damaged.
3. Inspect pivot bolt (2) for free movement in assembly housing. Replace assembly if seized or excessive looseness.

## INSTALLATION

### TENSIONER PULLEY ASSEMBLY

1. Install the timing belt tensioner pulley (1) assembly. Tighten the pivot bolt (2) to 61 N·m (45 ft. lbs.).
2. Install the timing belt. (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION - TIMING BELT)

### TENSIONER

1. For timing belt tensioner installation procedure (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT AND SPROCKETS - INSTALLATION - TIMING BELT).

## ENGINE - 5.7L SERVICE INFORMATION

### DESCRIPTION

81011d46

The 5.7L engine (345 CID) eight-cylinder engine is a 90° V-Type lightweight, deep skirt cast iron block, aluminum heads, single cam, overhead valve engine with hydraulic roller tappets. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2.

## DIAGNOSIS AND TESTING

### DIAGNOSIS AND TESTING - ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

(Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) - PERFORMANCE and (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)—MECHANICAL for possible causes and corrections of malfunctions. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DIAGNOSIS AND TESTING) and (Refer to 14 - FUEL SYSTEM/FUEL INJECTION - DIAGNOSIS AND TESTING) for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Cylinder Combustion Pressure Leakage Test (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- Engine Cylinder Head Gasket Failure Diagnosis (Refer to 9 - ENGINE/CYLINDER HEAD - DIAGNOSIS AND TESTING).
- Intake Manifold Leakage Diagnosis (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - DIAGNOSIS AND TESTING).

## DIAGNOSIS AND TESTING - CYLINDER COMPRESSION PRESSURE

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs.
3. Disable the fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - DESCRIPTION).
4. Remove the ASD relay (Refer to 8 - ELECTRICAL/IGNITION CONTROL/AUTO SHUT DOWN RELAY - REMOVAL).
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.
7. (Refer to 9 - ENGINE - SPECIFICATIONS) for the correct engine compression pressures.

## DIAGNOSIS AND TESTING - CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
  - Leaks between adjacent cylinders or into water jacket.
  - Any causes for combustion/compression pressure loss.
1. Check the coolant level and fill as required. DO NOT install the radiator cap.
  2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
  3. Remove the spark plugs.
  4. Remove the oil filler cap.
  5. Remove the air cleaner hose.
  6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
  7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression, While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

**FOR EXAMPLE:** At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART .

## STANDARD PROCEDURE

### STANDARD PROCEDURE - REPAIR DAMAGED OR WORN THREADS

**CAUTION:** Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

### STANDARD PROCEDURE - HYDROSTATIC LOCK

**CAUTION:** DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

1. Perform the Fuel Pressure Release Procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
2. Disconnect the negative cable(s) from the battery.
3. Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of foreign material.
4. Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.
5. With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.
6. Identify the fluid in the cylinders (coolant, fuel, oil, etc.).
7. Be sure all fluid has been removed from the cylinders.

8. Repair engine or components as necessary to prevent this problem from occurring again.
9. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.
10. Install new spark plugs. Tighten the spark plugs to 41 N·m (30 ft. lbs.) torque.
11. Drain engine oil. Remove and discard the oil filter.
12. Install the drain plug. Tighten the plug to 34 N·m (25 ft. lbs.) torque.
13. Install a new oil filter.
14. Fill engine crankcase with the specified amount and grade of oil. (Refer to LUBRICATION & MAINTENANCE - SPECIFICATIONS).
15. Connect the negative cable(s) to the battery.
16. Start the engine and check for any leaks.

## REMOVAL - ENGINE

1. Remove the engine cover.
2. Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
3. Disconnect the battery negative cable.
4. Remove the air cleaner resonator and duct work as an assembly.
5. Remove the cowl top panel (Refer to 23 - BODY/ EXTERIOR/COWL GRILLE - REMOVAL).
6. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
7. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
8. Remove radiator fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).

9. Remove the A/C compressor with the lines attached. Secure compressor out of the way.

10. Remove generator assembly (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - REMOVAL).

11. Remove the intake manifold and IAFM as an assembly (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

12. Remove the ground wires from the rear of each cylinder head.

13. Disconnect the heater hoses.

**Note:** It is not necessary to disconnect P/S hoses from pump, for P/S pump removal.

14. Remove the power steering pump and set aside.
15. Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
16. Raise and support the vehicle on a hoist and drain the engine oil.
17. Remove the belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL).
18. Remove engine front mount to frame nuts.
19. Disconnect the transmission oil cooler lines from their retainers at the oil pan bolts.
20. Disconnect exhaust pipe at manifolds.
21. Disconnect the starter wires. Remove starter motor (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL).

22. Remove the torque converter access cover.

23. Remove drive plate to converter bolts.

24. Remove transmission bell housing to engine block bolts.

25. Lower the vehicle.

26. Install engine lift fixture, special tool # 8984 and 8984-UPD.

27. Separate engine from transmission, remove engine from vehicle, and install engine assembly on a repair stand.

## INSTALLATION - ENGINE

1. Install engine lift fixture Special tool # 8984 and 8984-UPD.
2. Position the engine in the engine compartment.
3. Lower engine into compartment and align engine with transmission.

4. Mate engine and transmission and install two transmission to engine block mounting bolts finger tight.
5. Lower engine assembly until engine mount studs rest in frame perches.

6. Install remaining transmission to engine block mounting bolts and tighten.

7. Install and tighten engine mount to frame nuts.

8. Install drive plate to torque converter bolts).

9. Install the torque converter access cover.

10. Install the starter and connect the starter wires (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION).
11. Install exhaust pipe to manifold.
12. Lower the vehicle.
13. Remove engine lift fixture, special tool # 8984 and 8984-UPD.

14. Connect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
15. Reinstall the power steering pump.

16. Connect the heater hoses.

17. Reconnect the ground wires to the rear of each cylinder head.

18. Install the intake manifold. (Refer to 9 - ENGINE/  
MANIFOLDS/INTAKE MANIFOLD -  
INSTALLATION)

19. Install the generator, generator support bracket, and wire connections (Refer to 8 - ELECTRICAL/CHARGING/GENERATOR - INSTALLATION).

20. Install a/c compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C COMPRESSOR - INSTALLATION).

21. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
22. Install the radiator fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
23. Connect the radiator lower hose.
24. Connect the transmission oil cooler lines to the radiator.
25. Connect the radiator upper hose.
26. Install cowl top panel (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).
27. Install the air cleaner resonator and duct work..
28. Add engine oil to crankcase (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - SPECIFICATIONS).

29. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

30. Install the engine cover.

31. Connect battery negative cable.

32. Start engine and inspect for leaks.

33. Install the belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION).

34. Road test vehicle.

## AIR INTAKE SYSTEM

### REMOVAL

#### Filter Element Only

Housing removal is not necessary for element (filter) replacement.

1. Loosen clamp and disconnect air duct at air cleaner cover.
2. Pry over 4 spring clips from housing cover (spring clips retain cover to housing).
3. Release housing cover from locating tabs on housing and remove cover.
4. Remove air cleaner element (filter) from housing.
5. Clean inside of housing before replacing element.

#### Housing Assembly

1. Loosen clamp and disconnect air duct at air cleaner cover.
2. Lift entire housing assembly from 4 locating pins.

### INSTALLATION

1. Install filter element into housing.
2. Position housing cover into housing locating tabs.
3. Pry up 4 spring clips and lock cover to housing.
4. Install air duct to air cleaner cover and tighten hose clamp to 3 N·m (30 in. lbs.) torque.
5. If any other hose clamps were removed from air intake system, tighten them to 3.4 N·m (30 in. lbs.) torque.
6. If any bolts were removed from air resonator housing or air intake tubing, tighten them to 4.5 N·m (40 in. lbs.) torque.

## CYLINDER HEAD

### OPERATION—CYLINDER HEAD

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

### DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:
  - Loss of engine power
  - Engine misfiring
  - Poor fuel economy
- Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:
  - Engine overheating
  - Loss of coolant
  - Excessive steam (white smoke) emitting from exhaust
  - Coolant foaming

### CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this section. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50–70% reduction in compression pressure.

### CYLINDER-TO-WATER JACKET LEAKAGE TEST

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.**

#### VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

#### COOLING SYSTEM TESTER METHOD

**WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).**

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

#### CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

## REMOVAL

1. Perform the Fuel System Pressure Release procedure (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE). Disconnect the fuel supply line (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
2. Disconnect the battery negative cable.
3. Drain cooling system.

4. Remove the air cleaner resonator and duct work.
5. Remove closed crankcase ventilation system.
6. Disconnect the evaporation control system.
7. Disconnect heater hoses.
8. Remove the power steering pump.
9. Remove cylinder head covers and gaskets.
10. Remove intake manifold and throttle body as an assembly.
11. Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL).
12. Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

## CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

## INSPECTION

1. Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.
3. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.
4. Inspect pushrods. Replace worn or bent pushrods.

## INSTALLATION

1. Clean all surfaces of cylinder block and cylinder heads.
2. Clean cylinder block front and rear gasket surfaces using a suitable solvent.

**CAUTION: The head gaskets are not interchangeable between left and right sides. They are marked "L" and "R" to indicate left and right sides.**

3. Position new cylinder head gaskets onto the cylinder block.

**CAUTION: The head gaskets are marked "TOP" to indicate which side goes up.**

4. Position cylinder heads onto head gaskets and cylinder block.

## 5. Tighten the cylinder head bolts in three steps :

- Step 1— Snug tighten M12 cylinder head bolts, in sequence, to 34 N·m (25 ft. lbs.) and M8 bolts to 20 N·m (15 ft. lbs.) torque.
- Step 2— Tighten M12 cylinder head bolts, in sequence, to 54 N·m (40 ft. lbs.) and verify M8 bolts to 20 N·m (15 ft. lbs.) torque..
- Step 3— Turn M12 cylinder head bolts, in sequence, 90 degrees and tighten M8 bolts to 34 N·m (25 ft. lbs.) torque.

8100fa03

6. Install push rods and rocker arm assemblies in their original position, using pushrod retaining plate special tool# 9070. (Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
7. Install the intake manifold and throttle body assembly.
8. If required, adjust spark plugs to specifications. Install the plugs.
9. Connect the heater hoses.
10. Install the fuel supply line.
11. Install the power steering pump.
12. Install the drive belt.
13. Install cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
14. Connect the evaporation control system.
15. Install the air cleaner.
16. Fill cooling system.
17. Connect the negative cable to the battery.
18. Start engine check for leaks.

## COVER(S)-CYLINDER HEAD

### REMOVAL

1. Disconnect battery negative cable.
2. Disconnect coil on plug connectors.

**CAUTION:** The ground straps must be installed in the same location as removed. The covers are machined to accept the ground straps in those locations only.

3. Remove cylinder head cover retaining bolts, and ground straps.
4. Remove cylinder head cover.

**Note:** The gasket may be used again, provided no cuts, tears, or deformation has occurred.

## INSTALLATION

**CAUTION:** Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

**CAUTION:** DO NOT allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

1. Clean cylinder head cover and both sealing surfaces. Inspect and replace gasket as necessary.
2. Install cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location and install left and right ground straps.

**CAUTION:** The ground straps must be installed in the same location as removed. The covers are machined to accept the ground straps in those locations only.

**Note:** The right hand ground strap is located on the front inboard stud. The left hand ground strap is located on the rear inboard stud.

3. Tighten cylinder head cover bolts and double ended studs to 8 N·m (70 in. lbs). Begin torque sequence in the middle of head cover and torque bolts moving outward in a crisscross pattern from top to bottom.
4. Install ignition coil on plug, and torque fasteners to 12 N·m (105 in. lbs)
5. Connect, ignition coil electrical connectors.
6. Install PCV hose.
7. Connect battery negative cable.

## SEATS-INTAKE/EXHAUST VALVES

### DESCRIPTION

#### DESCRIPTION - VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

### DESCRIPTION

Both the intake and exhaust valves are made of steel. The intake valve is 50.93 mm (2.00 inches) in diameter and the exhaust valve is 39.53 mm (1.55 inches) in diameter. All valves use three bead lock keepers to retain the springs and promote valve rotation.

#### STANDARD PROCEDURE - REFACING

**Note:** Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

**Note:** When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in).
2. Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head, while applying light pressure on the valve rotate the valve. Remove the valve and examine the valve face. If the blue is trans-

ferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.

- When the seat is properly positioned the width of the intake seat must be 1.018 - 1.62 mm (0.0464 - 0.0637 in.) and the exhaust seat must be 1.48 - 1.92 mm (0.058 - 0.075 in.).
- Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 46.0 mm (1.81 in.).

#### VALVE FACE AND VALVE SEAT ANGLE CHART

DESCRIPTION	SPECIFICATION
SEAT WIDTH  INTAKE  EXHAUST	1.018 - 1.62 mm (0.0464 - 0.0637 in.)  1.48 - 1.92 mm (0.058 - 0.075 in.)
FACE ANGLE (INT. AND EXT.)	45° - 45½°
SEAT ANGLE (INT. AND EXT.)	44½° - 45°

- The valve seat must maintain an angle of 44.5 – 45.0 degrees angle.
- The valve face must maintain a face angle of 45.0 – 45.5 degrees angle.

## REMOVAL

- Remove the cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
- Compress valve springs using Valve Spring Compressor Tool special tool # C-3422 and adapter 8464.
- Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.
- Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

## INSTALLATION

- Clean valves thoroughly. Discard burned, warped and cracked valves.
- Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

3. Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
4. Coat valve stems with lubrication oil and insert them in cylinder head.
5. If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.
6. Install new seals on all valve guides. Install valve springs and valve retainers.
7. Compress valve springs with Valve Spring Compressor Tool special tool # C- 3422 and adapter 8464, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer.
8. Install cylinder head (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).

## ROCKER ARM

### REMOVAL

1. Remove cylinder head cover.(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL)
2. Loosen the rocker shafts using the following sequence: **Center, center-left, center-right, left, right,.**

**CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with an "I".**

3. Remove the rocker shafts. Note location for reassembly.

**CAUTION: The longer push rods are for the exhaust side, and the shorter push rods are for intake side.**

4. Remove the pushrods. Note pushrod location for reassembly.

### INSTALLATION

**CAUTION: The longer push rods are for the exhaust side, and the shorter push rods are for intake side.**

1. Install the push rods in the same order as removed.

**CAUTION: Verify that pushrod is installed into rocker arm and lifter correctly while installing rocker shaft assembly. Recheck after rocker shaft has been torqued to specification.**

**CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with the letter "I".**

2. Install rocker shaft assemblies in the same order as removed.

**CAUTION: Ensure that hold downs and rocker arms are not overlapped when torquing bolts.**

3. Tighten the rocker shaft bolts to 22 N·m (195 in. lbs.) torque, using the following sequence: **Center, center-right, center-left, right, left.**

**CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).**

4. Install cylinder head cover (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).

## SEALS-VALVE GUIDE

### DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems.

## SPRINGS-VALVE

### REMOVAL

1. Disconnect negative battery cable.
2. Remove air cleaner assembly.
3. Remove air intake resonator.
4. Remove spark plug cables.
5. Remove ignition coil connectors.
6. Remove ignition coils.

7. Remove one spark plug.
8. Remove valve cover.

**CAUTION:** The piston must be at TDC, and both valves closed on the cylinder to be serviced.

**Note:** If removing intake valve spring, install special tool# 9070, pushrod retaining plate, to retain the intake pushrods.

9. Remove exhaust/intake rocker arm shafts.
10. Install spring compressor, special tool# 9065.

**Note:** All valve springs and seals are removed in the same manner.

11. Charge cylinder with air.

**Note:** Tap the top of the valve spring retainer to loosen the spring retainers locks.

12. Compress valve spring and remove valve retainer locks.
13. Release spring compressor and remove valve spring.

**Note:** The valve springs are interchangeable between intake and exhaust.

14. Remove valve seal.

## INSTALLATION

1. Install valve seal.
2. Install valve spring.
3. Using special tool# 9065, compress valve spring and install valve spring retainer and locks.
4. Release air charge in cylinder.
5. Remove spring compressor tool # 9065.

**CAUTION: Verify that the pushrods are fully seated into lifter and rocker arm. Recheck after rocker arm shaft has been torqued to specification.**

6. Install rocker arm shaft and pushrods(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
7. Tighten the rocker shaft bolts to 22 N·m (195 in. lbs.) torque,using the following sequence: **Center, center-right, center-left, right, left.**
8. Remove special tool# 9070, pushrod retaining plate, if used.
9. Install cylinder head cover.
10. Tighten cylinder head cover bolts and double ended studs(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION) .
11. Install spark plugs.
12. Install ignition coil on plug, and torque fasteners to 12 N·m (105 in. lbs)
13. Install ignition coil connectors.
14. Install spark plug cables.
15. Install air intake resonator.
16. Install air cleaner assembly.
17. Connect negative battery cable.

## ENGINE BLOCK

### CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the 1/4 inch NPT plugs to 20 N·m (177 in. lbs.) torque. Tighten the 3/8 inch NPT plugs to 27 N·m (240 in. lbs.) torque.

## INSPECTION

1. It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.
3. Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
4. Determine taper by subtracting the smaller diameter from the larger diameter.
5. Rotate measuring device 90° and repeat steps above.
6. Determine out-of-roundness by comparing the difference between each measurement.
7. If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out-of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

## CAMSHAFT-ENGINE

### REMOVAL

#### REMOVAL - CAMSHAFT CORE HOLE PLUG

**CAUTION:** Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

1. Remove the rear cam bearing core plug.

#### REMOVAL - CAMSHAFT

1. Remove the battery negative cable.
2. Remove the air cleaner assembly.
3. Drain coolant.
4. Remove the accessory drive belt.
5. Remove the generator.
6. Remove the A/C compressor, and set aside
7. Remove the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - REMOVAL).
8. Remove intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
9. Remove cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
10. Remove both left and right cylinder heads(Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
11. Remove the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).

12. Remove timing case cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
13. Remove the oil pick up tube.
14. Remove the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL) .
15. Remove timing chain(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
16. Remove camshaft tensioner/thrust plate assembly.

**Note: Identify lifters to ensure installation in original location.**

17. Remove the lifters and retainer assembly.
18. Install a long bolt into front of camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

## INSPECTION

1. The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason.

## INSTALLATION

### INSTALLATION - CAMSHAFT CORE HOLE PLUG

**CAUTION: The new core hole plug must be installed to the proper depth or camshaft damage could develop. The plug must be installed squarely in the bore.**

1. Clean core hole in block.

**Note: Do not apply adhesive to the new core hole plug. A new plug will have adhesive pre-applied.**

2. Install a new core hole plug at the rear of camshaft, using special tool # 9048. The plug must be fully seated on the cylinder block shoulder.

### INSTALLATION - CAMSHAFT

**CAUTION: The 5.7L LX engine uses a unique camshaft for use with the Multi Displacement System. When installing a new camshaft, the replacement camshaft must be compatible with the Multi Displacement System.**

1. Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft
2. Install camshaft Tensioner plate assembly. Tighten bolts to 28 N·m (250 in. lbs.) torque.
3. Install timing chain and sprockets(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
4. Measure camshaft end play(Refer to 9 - ENGINE - SPECIFICATIONS). If not within limits install a new thrust plate.
5. Install the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
6. Install the oil pick up tube.
7. Each lifter reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the lifters must be replaced.**

**CAUTION: The 5.7L LX engine uses both standard roller tappets and deactivating roller tappets, for use with the Multi Displacement System. The deactivating roller tappets must be used in cylinders 1,4,6,7. The deactivating tappets can be identified by the two holes in the side of the tappet body, for the latching pins.**

8. Install lifters and retaining yoke assembly. (Refer to 9 - ENGINE/ENGINE BLOCK/HYDRAULIC LIFTERS (CAM IN BLOCK) - INSTALLATION).
9. Install both left and right cylinder heads(Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
10. Install pushrods

11. Install rocker arms(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
12. Install timing case cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
13. Install the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
14. Install cylinder head covers(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
15. Install intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
16. Install the A/C compressor, and set aside
17. Install the generator.
18. Install the accessory drive belt.
19. Install the radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).
20. Install the air cleaner assembly.
21. Install the battery negative cable.
22. Refill coolant.
23. Refill engine oil.
24. Start engine and check for leaks.

## CRANKSHAFT

### REMOVAL

1. Remove the vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).
2. Remove the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
3. Remove the oil pump pickup.
4. Remove the windage tray/oil pan gasket.
5. Remove the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
6. Remove the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - REMOVAL).
7. Remove the timing drive(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
8. Identify rod bearing caps before removal. Remove rod bearing caps with bearings.
9. Identify main bearing caps before removal. Remove main bearing caps and bearings one at a time.
10. Remove the thrust washers.
11. Remove the rear oil seal retainer(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - REMOVAL).
12. Remove the crankshaft out of the block.
13. Remove and discard the crankshaft rear oil seal.
14. Remove and discard the front crankshaft oil seal.

### INSTALLATION

1. Select the proper main bearings(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE).
2. Install main bearings in block and caps, and lubricate bearings.
3. Position the crankshaft into the cylinder block.
4. Install the thrust washers.

**Note:** The main cap crossbolts are torqued after final torque of the main cap bolts. Always use a new washer/seal on crossbolts.

5. Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten in two steps using the following sequence.
  - Step 1 – 27 N·m ( 20ft. lbs.) torque.
  - Step 2 – Turn main cap bolts an additional 90°.
6. Install the crossbolts with new washer/gasket. Starting with crossbolt A torque each crossbolt to 28 N·m ( 21ft. lbs.)torque.
7. Repeat crossbolt torque procedure.

8. Measure crankshaft end play(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT MAIN BEARINGS - STANDARD PROCEDURE).
9. Position the connecting rods onto the crankshaft and install the rod bearing caps(Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - INSTALLATION).
10. Install timing drive(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
11. Install oil pump (Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
12. Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
13. Install the rear main seal and retainer(Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT REAR OIL SEAL RETAINER - INSTALLATION).
14. Install the windage tray/oil pan gasket.
15. Install the oil pick up tube.
16. Install the oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
17. Install the vibration damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
18. Install the engine(Refer to 9 - ENGINE - INSTALLATION).

## BEARINGS-CRANKSHAFT MAIN

### STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING - FITTING

#### MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008mm (0.0004 inch.) and maximum out of round is 0.005mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

## CRANKSHAFT MAIN BEARING SELECTION

The main bearings are “select fit” to achieve proper oil clearances. For main bearing selection, the crankshaft counterweight has grade identification marks stamped into it. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4 and 5.

**Note:** Service main bearings are coded. These codes identify what size (grade) the bearing is.

### MAIN BEARING SELECTION CHART - 5.7L

GRADE MARKING	SIZE mm (in.)	FOR USE WITH JOURNAL SIZE
A	0.008 mm U/S (0.0004 in.) U/S	64.988–64.995 mm (2.5585– 2.5588in.)
B	NOMINAL	64.996–65.004 mm (2.5588–2.5592 in.)
C	0.008 mm O/S (0.0004 in.) O/S	65.005–65.012 mm (2.5592–2.5595 in.)

## INSPECTION

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

**Note:** If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

## SEAL-CRANKSHAFT OIL-FRONT

### REMOVAL

1. Disconnect negative cable from battery.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
4. Remove upper radiator hose.
5. Remove radiator shroud attaching fasteners.
6. Remove radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
7. Remove crankshaft damper bolt.
8. Remove damper using Special Tools 8513A Insert and 1023 Three Jaw Puller(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL) .

9. Using Special Tool 9071, remove crankshaft front seal.

## INSTALLATION

**CAUTION:** The front crankshaft seal must be installed dry. Do not apply lubricant to sealing lip or to outer edge.

1. Using Special Tool 8348 and 8512A, install crankshaft front seal.

**CAUTION:** To prevent severe damage to the Crankshaft or Damper, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

2. Install vibration damper (Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION).
3. Install radiator cooling fan and shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
4. Install upper radiator hose.
5. Install accessory drive belt refer (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
6. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
7. Connect negative cable to battery.

## SEAL-CRANKSHAFT OIL-REAR

### DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
  - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
  - b. Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See Engine, for proper repair procedures of these items.

4. If no leaks are detected, pressurized the crankcase as outlined in the section, Inspection (Engine oil Leaks in general)

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.**

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING), under the Oil Leak row, for components inspections on possible causes and corrections.
7. After the oil leak root cause and appropriate corrective action have been identified, (Refer to 9 - ENGINE/ENGINE BLOCK/CRANKSHAFT OIL SEAL - REAR - REMOVAL).

## REMOVAL

**Note: This procedure can be performed in vehicle.**

1. If being performed in vehicle, remove the transmission.
2. Remove the flexplate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL).

**Note: The crankshaft oil seal CAN NOT be reused after removal.**

**Note: The crankshaft rear oil seal remover Special Tool 8506 must be installed deeply into the seal. Continue to tighten the removal tool into the seal until the tool can not be turned farther. Failure to install tool correctly the first time will cause tool to pull free of seal without removing seal from engine.**

3. Using Special Tool 8506, remove the crankshaft rear oil seal.

## INSTALLATION

**CAUTION: The rear seal must be installed dry for proper operation. Do not lubricate the seal lip or outer edge.**

1. Position the plastic seal guide onto the crankshaft rear face. Then position the crankshaft rear oil seal onto the guide.

2. Using Special Tools 8349 Crankshaft Rear Oil Seal Installer and C-4171 Driver Handle, with a hammer, tap the seal into place. Continue to tap on the driver handle until the seal installer seats against the cylinder block crankshaft bore.

3. Install the flexplate.
4. Install the transmission.

## RETAINER-CRANKSHAFT REAR OIL SEAL

### REMOVAL

1. Disconnect negative cable from battery.
2. Remove the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - REMOVAL).
3. Remove the flexplate. (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - REMOVAL).
4. Remove the oil pan. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL)
5. Remove the rear oil seal retainer mounting bolts.
6. Carefully remove the retainer from the engine block.

### INSTALLATION

1. Thoroughly clean all gasket residue from the engine block.
2. Use extreme care and clean all gasket residue from the retainer.
3. Position the gasket onto the retainer.
4. Position the retainer onto the engine block.

5. Install the retainer mounting bolts. Tighten the bolts to 15 N·m (132 in. lbs.) using the procedure shown.

6. Install the oil pan (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
7. Install the flexplate (Refer to 9 - ENGINE/ENGINE BLOCK/FLEX PLATE - INSTALLATION).
8. Install the transmission (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - INSTALLATION).
9. Check and verify engine oil level.
10. Start engine and check for leaks.

## FLEX PLATE

### REMOVAL

1. Remove the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - REMOVAL).
2. Remove the bolts and flexplate.

## INSTALLATION

1. Position the flexplate or flywheel onto the crankshaft and install the bolts hand tight.
2. **For automatic transmissions:** Tighten the flexplate retaining bolts to 95 N·m (70 ft. lbs.).

3. Install the transmission. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - INSTALLATION).

## TAPPETS-HYDRAULIC ROLLER

### DIAGNOSIS AND TESTING - HYDRAULIC TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-70 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

### OIL LEVEL

#### HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

#### LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

## TAPPET NOISE DIAGNOSIS

1. To determine source of tappet noise, crank over engine with cylinder head covers removed.
2. Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

**Note: Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.**

3. Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.
4. The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

## REMOVAL

1. Disconnect the negative cable from the battery.
2. Remove the air cleaner(Refer to 9 - ENGINE/AIR INTAKE SYSTEM - REMOVAL).
3. Remove intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
4. Remove cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
5. Remove rocker arm assembly and push rods(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - REMOVAL). Identify push rods to ensure installation in original location.
6. Remove the cylinder head(Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
7. Remove bolt from tappet guide holder.
8. Remove tappet guide holder.
9. Pull tappet out of bore with a twisting motion. **If all tappets are to be removed and reused, identify tappets to ensure installation in original location.**
10. Check camshaft lobes for abnormal wear.

## INSTALLATION

1. Lubricate tappets.
2. Install tappets in their original positions.

**CAUTION: The 5.7L LX engine uses both standard roller tappets and deactivating roller tappets, for use with the Multi Displacement System. The deactivating roller tappets must be used in cylinders 1,4,6,7. The deactivating tappets can be identified by the two holes in the side of the tappet body, for the latching pins.**

3. Install tappet guide yoke. Install the tappet guide yoke bolt and tighten to 12 N·m (106 in. lbs.) torque.
4. Install cylinder head(Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
5. Install pushrods and rocker arm assembly(Refer to 9 - ENGINE/CYLINDER HEAD/ROCKER ARM / ADJUSTER ASSY - INSTALLATION).
6. Install cylinder head cover(Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
7. Install intake manifold(Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
8. Install the air cleaner(Refer to 9 - ENGINE/AIR INTAKE SYSTEM - INSTALLATION).
9. Connect the negative cable to the battery.

**CAUTION:** To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

10. Road test vehicle and check for leaks.

## PISTON & CONNECTING ROD

### DESCRIPTION

**CAUTION:** Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal, with a "fractured cap" design. A pressed fit piston pin is used to attach the piston and connecting rod.

### STANDARD PROCEDURE - PISTON FITTING

1. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm ( .0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A and then take an additional bore reading 90 degrees to that at point B.
3. The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. The piston-rod assembly is specific for the left cylinder bank ( odd numbered) and the right cylinder bank ( even numbered) and must not be interchanged.

4. The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (.0001 in.) increments is required.
5. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

805dd884

## REMOVAL

1. Disconnect negative cable from battery.
2. Remove the following components:
  - Oil pan and gasket/windage tray (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
  - Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - REMOVAL).
  - Timing chain cover (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
  - Cylinder head(s) (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL) and (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
3. If necessary, remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.** Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so the each connecting rod is centered in cylinder bore.

**CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur**

**Note: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.**

4. Mark connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

**CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.**

5. Remove connecting rod cap. Install Special Tool 8507 Connecting Rod Guides into the connecting rod being removed. Remove piston from cylinder bore. Repeat this procedure for each piston being removed.

**CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur**

6. Immediately after piston and connecting rod removal, install bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
7. Carefully remove piston rings from piston(s), starting from the top ring down.

## CLEANING

**CAUTION: DO NOT use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.**

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

**CAUTION: DO NOT remove the piston pin from the piston and connecting rod assembly.**

## INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring (Refer to 9 - ENGINE/ENGINE BLOCK/CONNECTING ROD BEARINGS - STANDARD PROCEDURE).

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON & CONNECTING ROD - STANDARD PROCEDURE).

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

## INSTALLATION

1. Before installing piston and connecting rod assemblies into the bore, install the piston rings (Refer to 9 - ENGINE/ENGINE BLOCK/PISTON RINGS - STANDARD PROCEDURE).
2. Immerse the piston head and rings in clean engine oil. Position a ring compressor over the piston and rings. Tighten ring compressor. **Ensure position of rings do not change during this operation.**
3. Position bearing onto connecting rod. Lubricate bearing surface with clean engine oil.
4. Install Special Tool 8507 Connecting Rod Guides into connecting rod bolt threads.
5. The pistons are marked on the piston pin bore surface with an raised "F" or arrow on top of piston indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks.
6. Wipe cylinder bore clean and lubricate with engine oil.
7. Rotate crankshaft until connecting rod journal is on the center of cylinder bore. Insert rod and piston into cylinder bore and carefully position connecting rod guides over crankshaft journal.
8. Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

**CAUTION: Connecting Rod Bolts are Torque to Yield Bolts and Must Not Be Reused. Always replace the Rod Bolts whenever they are loosened or removed.**

9. Lubricate rod bolts and bearing surfaces with engine oil. Install connecting rod cap and bearing. Tighten bolts to 21 N·m (15 ft. lbs.) plus a 90° turn.
10. Install the following components:
  - Cylinder head(s). (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION).
  - Cylinder head covers (Refer to 9 - ENGINE/CYLINDER HEAD/CYLINDER HEAD COVER(S) - INSTALLATION).
  - Install the intake manifold.
  - Oil pan and gasket/windage tray. (Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
11. Fill crankcase with proper engine oil to correct level.
12. Connect negative cable to battery.

## RINGS-PISTON

### STANDARD PROCEDURE - PISTON RING FITTING

Before reinstalling used rings or installing new rings, the ring clearances must be checked.

1. Wipe the cylinder bore clean.
2. Insert the ring in the cylinder bore.

**Note:** The ring gap measurement must be made with the ring positioned at least 12mm (0.50 inch.) from bottom of cylinder bore.

3. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.
4. Using a feeler gauge check the ring end gap. Replace any rings not within specification.

#### PISTON RING SIDE CLEARANCE

**Note:** Make sure the piston ring grooves are clean and free of nicks and burrs.

5. Measure the ring side clearance as shown make sure the feeler gauge fits snugly between the ring land and the ring. Replace any ring not within specification.
6. Rotate the ring around the piston, the ring must rotate in the groove with out binding.

**PISTON RING SPECIFICATION CHART**

Ring Position	Ring/Groove Side Clearance	Maximum Clearance
Upper Ring	0.02-0.07mm (0.0008- 0.0028 in.)	0.11mm (0.004 in.)
Intermediate Ring	0.02-0.06 mm (0.0008-0.0023 in.)	0.10mm (0.004 in.)
Ring Position	Ring Gap	Wear Limit
Upper Ring	0.23-0.38mm (0.0090-0.0149 in.)	0.43mm (0.017 in.)
Intermediate Ring	0.35-0.60mm (0.0137-0.0236 in.)	0.74mm (0.029 in.)
Oil Control Ring (Steel Rail)	0.015-0.66mm (0.0059- 0.0259 in.)	0.76mm (0.030 in.)

7. The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

**Note: Piston rings are installed in the following order:**

- Oil ring expander.
- Lower oil ring side rail.
- Upper oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

8. Install the oil ring expander.
9. Install upper side rail by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

10. Install No. 2 intermediate piston ring using a piston ring installer.
11. Install No. 1 upper piston ring using a piston ring installer.

12. Position piston ring end gaps as shown in. It is important that expander ring gap is at least 45° from the side rail gaps, but not on the piston pin center or on the thrust direction.

## DAMPER-CRANKSHAFT

### REMOVAL

1. Disconnect negative cable from battery.
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
4. Remove radiator upper hose.
5. Remove fan shroud (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Remove crankshaft damper bolt.

7. Remove damper using Special Tools 8513A Insert and 1023 Three Jaw Puller.

## INSTALLATION

**CAUTION:** To prevent severe damage to the Crankshaft, Damper or Special Tool 8512-A, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

1. Slide damper onto crankshaft slightly.

**CAUTION:** Special Tool 8512-A, is assembled in a specific sequence. Failure to assemble this tool in this sequence can result in tool failure and severe damage to either the tool or the crankshaft.

2. Assemble Special Tool 8512-A as follows, The nut is threaded onto the shaft first. Then the roller bearing is placed onto the threaded rod (The hardened bearing surface of the bearing **MUST** face the nut). Then the hardened washer slides onto the threaded rod. Once assembled coat the threaded rod's threads with Mopar® Nickel Anti-Seize or (Loctite No. 771).

3. Using Special Tool 8512-A, press damper onto crankshaft.
4. Install then tighten crankshaft damper bolt to 176 N·m (129 ft. lbs.).
5. Install radiator upper hose.
6. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
7. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
8. Connect negative cable to battery.

## COVER-STRUCTURAL

### DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine. The LX uses an integral one piece aluminum oil pan/structural cover.

### OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration. The LX uses an integral structural cover/oil pan.

## SOLENOID-MDS

### DESCRIPTION

The Multi Displacement System selectively deactivates cylinders 1,4,6, and 7, to improve fuel economy. It has two modes of operation :

- 8 cylinders for acceleration and heavy loads.
- 4 cylinders for cruising and city traffic.

The main components of the Multi Displacement System are :

- Unique MDS camshaft.
- Deactivating roller tappets.
- 4 control valves/solenoids.
- control valve/solenoid wiring harness.
- oil temp sensor.

### OPERATION

#### Cylinder Deactivation

- Trap an exhaust charge
- Normal combustion event
- Don't open exhaust valve
- Don't open intake valve
- Piston is an air spring
- Cylinders deactivated in firing sequence

#### Cylinder Reactivation

- Empty the cylinder
- Open exhaust valve
- Open intake valve
- Normal combustion event
- Cylinders reactivated in firing sequence

## DIAGNOSIS AND TESTING

The Multi Displacement System has the following detectible issues:

- Solenoid circuit
- Fail to deactivate a cylinder(s)
- Fail to reactivate a cylinder(s)
- Low oil pressure

CONDITION	POSSIBLE CAUSES	CORRECTION
MDS does not activate	1. Low oil pressure 2. Bad oil temp sensor 3. Malfunctioning MDS Solenoid 4. Malfunctioning MDS Tappet	1. Check for proper oil pressure 2. Replace oil temp sensor 3. Replace Solenoid 4. Replace Tappet
MDS Does Not Deactivate	1. Low oil pressure 2. Bad oil temp sensor 3. Malfunctioning MDS Solenoid 4. Malfunctioning MDS Tappet	1. Check for proper oil pressure 2. Replace oil temp sensor 3. Replace Solenoid 4. Replace Tappet

## REMOVAL

1. Disconnect the negative battery cable.
2. Remove the intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Remove wiring harness connectors from the MDS solenoids.
4. Remove hold down bolt from MDS solenoid.
5. Remove MDS solenoid.

## INSTALLATION

1. Install MDS solenoid fully into block.
2. Install hold down bolt and torque to
3. Reconnect the MDS wiring harness to the solenoids.
4. Install the intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).

## ENGINE MOUNTING-FRONT

### REMOVAL

1. Disconnect negative battery cable.
2. Raise vehicle.

3. Remove the generator support bracket.

4. Remove engine mount nuts, and studs.

5. Raise engine using suitable jack.
6. Remove engine mount to insulator bolts.
7. Remove insulator from engine.

## INSTALLATION

1. Install the engine mount brackets, if removed.

2. Install insulator on the engine. Tighten insulator to bracket fasteners.
3. Install the studs to the insulator.
4. Install the generator support bracket.

5. Lower the engine.
6. Install the nuts on the studs, and tighten.

7. Lower vehicle.
8. Connect negative battery cable.

## MOUNTING-ENGINE REAR

### REMOVAL

1. Raise the vehicle on a hoist.
2. Using a suitable jack, support transmission.
3. Remove the crossmember.

4. Remove the fasteners from the transmission mount to transmission.
5. Remove the mount.

6. Remove the transmission mount bracket, if required.

## INSTALLATION

1. Install the transmission mount bracket, if removed.

2. Position the transmission mount on the transmission mount bracket. Install the bolts that attach the transmission mount to the bracket.
3. Torque the bolts to N·m ( ft.lbs.) torque.

4. Install the crossmember.

## LUBRICATION

### DESCRIPTION

The lubrication system is a full flow filtration pressure feed type.

## DIAGNOSIS AND TESTING

### DIAGNOSIS AND TESTING - CHECKING ENGINE OIL PRESSURE

1. Remove oil pressure sending unit and install gauge assembly C-3292.
2. Run engine until thermostat opens.
3. Oil Pressure:
  - Curb Idle—25 kPa (4 psi) minimum
  - 3000 rpm—170 - 758 kPa (25 - 110 psi)
4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

## DIAGNOSIS AND TESTING - ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service manual instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection. **If the oil leak source is not positively identified at this time**, proceed with the air leak detection test method.

### Air Leak Detection Test Method

1. Remove the PCV valve from the IAFM. Cap or plug the PCV valve grommet.
2. Attach an air hose with pressure gauge and regulator to the dipstick tube.

**CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.**

3. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service manual procedures.
4. If the leakage occurs at the rear oil seal area, refer to the section, Inspection for Rear Seal Area Leak.
5. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve.
6. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

## INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
  - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
  - b. Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in the, Inspection (Engine oil Leaks in general)

**CAUTION: Do not exceed 20.6 kPa (3 psi).**

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

**CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.**

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

## OIL

### STANDARD PROCEDURE - ENGINE OIL SERVICE

The engine oil level indicator is located at the right hand of the engine on the 5.7L engines.

#### CRANKCASE OIL LEVEL INSPECTION

**CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.**

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about ten minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

1. Position vehicle on level surface.
2. With engine OFF, allow approximately five minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
3. Wipe dipstick clean.
4. Install dipstick and verify it is seated in the tube.
5. Remove dipstick, with handle held above the tip, take oil level reading.
6. Add oil only if level is below the ADD mark on dipstick.

#### ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules(Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

Run engine until achieving normal operating temperature.

1. Position the vehicle on a level surface and turn engine off.
2. Remove oil fill cap.
3. Hoist and support vehicle on safety stands.
4. Remove the belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL).
5. Place a suitable drain pan under crankcase drain.
6. Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
7. Install drain plug in crankcase. Torque to 27 N·m ( 20 ft. lbs.).
8. Lower vehicle and fill crankcase with specified type and amount of engine oil described in this section.
9. Install oil fill cap.
10. Start engine and inspect for leaks.
11. Stop engine and inspect oil level.
12. Install the belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION).

**Note: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING at beginning of this section.**

## FILTER-ENGINE OIL

### REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. DaimlerChrysler Corporation recommends a Mopar® or equivalent oil filter be used.

1. Remove belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL) .
2. Position a drain pan under the oil filter.

3. Using a suitable oil filter wrench loosen filter.
4. Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss.
5. When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

**Note: Make sure filter gasket was removed with filter.**

6. With a wiping cloth, clean the gasket sealing surface of oil and grime.

## INSTALLATION

1. Lightly lubricate oil filter gasket with engine oil.
2. Thread filter onto adapter nipple. When gasket makes contact with sealing surface, hand tighten filter one half turn, or 180°, do not over tighten.

3. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.
4. Install belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION).

## PAN-ENGINE OIL

### REMOVAL

1. Disconnect the negative battery cable.
2. Remove the intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Install engine lift fixture special tool # 8984 and adapter # 8984-UPD. **Never use air tools when installing fasteners to engine.**
4. Raise vehicle.
5. Remove the belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL).
6. Remove both left and right side engine mount to frame nuts, and studs.
7. Drain engine oil and remove the oil filter.
8. Unbolt and lower the steering rack from the mounts. **Do not remove P/S hoses, tie rod ends or disconnect steering column.**
9. Remove the engine oil dipstick and tube from the oil pan.
10. Lower the vehicle.
11. Install engine support fixture special tool # 8534. **Do not use the third leg.**
12. Raise engine using special tool # 8534 and #8984 to provide clearance to remove oil pan.

**Note: Do not pry on oil pan or oil pan gasket. Gasket is integral to engine windage tray and does not come out with oil pan.**

**Note: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.**

13. Remove the M10 fasteners (vertical and horizontal) from the rear of the oil pan to the transmission and engine.

14. Remove the oil pan mounting bolts and oil pan.

**Note:** When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed. The old gasket cannot be reused.

15. Discard the integral windage tray and gasket and replace.

## INSTALLATION

1. Clean the oil pan gasket mating surface of the block and oil pan.

**Note:** Mopar® Engine RTV must be applied to the 4 T-joints, (area where front cover, rear retainer, block, and oil pan gasket meet). The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.

2. Apply Mopar® Engine RTV at the 4 T- joints.

**Note:** When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed. The old gasket cannot be reused.

3. Install a new oil pan gasket/windage tray assembly.
4. If removed, reinstall the oil pump pickup tube with new o-ring. Tighten tube to pump fasteners to 28 N·m (250 in. lbs.).

**Note:** The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

5. Align the rear of the oil pan with the rear face of the engine block, and install the M10 and M6 oil pan fasteners finger tight. Using the following torque sequence, torque the M6 mounting bolts to 5 N·m (44 in.lbs.).
6. Using the following torque sequence, torque the M10 oil pan fasteners to 54 N·m (39 ft.lbs.).
7. Using the following torque sequence, torque the M6 oil pan fasteners to 12 N·m (106 in.lbs.).

8. Lower the engine into mounts using special tool # 8534.
9. Install both the left and right side engine mount studs and nuts. Torque the studs and nuts to N·m ( ft. lbs.).
10. Install the engine oil dipstick and tube.
11. Install the steering rack.
12. Remove special tool # 8534.
13. Remove special tool # 8984.
14. Install the intake manifold. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
15. Fill engine oil.
16. Install oil filter, if removed.
17. Reconnect the negative battery cable.
18. Start engine and check for leaks.
19. Install the belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION).

## PUMP-ENGINE OIL

### REMOVAL

1. Remove the oil pan and pick-up tube(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL).
2. Remove the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - REMOVAL).
3. Remove the four bolts, and the oil pump.

### CLEANING

1. Wash all parts in a suitable solvent.

### INSPECTION

**CAUTION:** Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

1. Remove the pump cover.

2. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.
3. Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor and the body. If the measurement is 0.235mm (0.009 in.) or more the oil pump assembly must be replaced.

4. Install the inner rotor into the oil pump body. Measure the clearance between the inner and outer rotors. If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.

5. Place a straight edge across the body of the oil pump (between the bolt holes), if a feeler gauge of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced.

6. Reinstall the pump cover. Torque fasteners to 15 N·m (132 in. lbs.).

**Note:** The 5.7 Oil pump is released as an assembly. There are no DaimlerChrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

## INSTALLATION

1. Position the oil pump onto the crankshaft and install the 4 oil pump retaining bolts.
2. Tighten the oil pump retaining bolts to 28 N·m (250 in. lbs.).
3. Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
4. Install the pick-up tube and oil pan(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).

## INTAKE MANIFOLD

### DESCRIPTION

The intake manifold is made of a composite material and features long runners which maximizes low end torque. The intake manifold uses single plane sealing which consist of eight individual press in place port gaskets to prevent leaks.

### DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

**WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.**

1. Start the engine.
2. Spray a small stream of water at the suspected leak area.
3. If a change in RPM is observed the area of the suspected leak has been found.
4. Repair as required.

### REMOVAL

1. Remove engine cover.
2. Bleed fuel system (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY - STANDARD PROCEDURE).
3. Disconnect negative cable from battery.

4. Remove air inlet hose.
5. Remove ignition wires from on top of intake manifold.
6. Disconnect electrical connectors for the following components:
  - Manifold Absolute Pressure (MAP) Sensor
  - Fuel Injectors
  - ETC ( Electric Throttle Control )
7. Remove wire harness from intake manifold.
8. Disconnect brake booster hose, purge hose, and MUA hose ( Make Up Air Hose ).
9. Remove EGR tube from intake manifold.
10. Remove intake manifold retaining fasteners in a crisscross pattern starting from the outside bolts and ending at the middle bolts.
11. Remove intake manifold as an assembly.

## CLEANING

**Note: There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.**

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

## INSPECTION

1. Inspect the intake sealing surface for cracks, nicks and distortion.
2. Inspect the intake manifold vacuum hose fittings for looseness or blockage.

## INSTALLATION

1. Position intake manifold.
2. Install intake manifold retaining bolts, and tighten in sequence from the middle bolts towards the outside in a crisscross pattern. Torque fasteners to 12 N·m (105 in. lbs.).
3. Install EGR tube.
4. Install wire harness on intake manifold.
5. Connect electrical connectors for the following components:
  - Manifold Absolute Pressure (MAP) Sensor
  - Fuel Injectors
  - ETC ( Electronic Throttle Control )
6. Install ignition wires.
7. Connect Brake booster hose, purge hose, and MUA hose ( Make Up Air hose ).
8. Install air inlet hose.
9. Connect negative cable to battery.

## EXHAUST MANIFOLD

### DESCRIPTION

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A multi-layer stainless steel exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold, with the exception of the nut, which also secures the oil dipstick tube bracket. That nut should not be backed off.

### OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

### REMOVAL

#### EXHAUST MANIFOLD

1. Disconnect negative battery cable.
2. Raise vehicle.
3. Remove exhaust pipe to manifold bolts.
4. Lower vehicle.
5. Install engine support fixture special tool #8534.
6. Raise engine enough to remove manifolds.

**CAUTION: Do not damage engine harness while raising the engine.**

7. Remove heat shield.
8. Remove manifold bolts.
9. Remove manifold and gasket.

### CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

### INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

### INSTALLATION

#### EXHAUST MANIFOLD

1. Install manifold gasket and manifold.
2. Install manifold bolts and tighten to 25 N·m (18 ft. lbs.).
3. Install heat shield and tighten nuts to 8 N·m (70 in. lbs.).
4. Lower engine.

**CAUTION: Do not damage engine harness while lowering the engine.**

5. Remove engine support fixture from engine.
6. Raise vehicle.
7. Tighten right and left side engine mount through bolts.
8. Install exhaust flange to pipe bolts.

9. Lower vehicle.
10. Connect negative battery cable.

## COVER-TIMING CASE

### REMOVAL

1. Disconnect the battery negative cable.
2. Remove air cleaner assembly.
3. Drain cooling system.
4. Remove accessory drive belt.
5. Remove fan and fan drive assembly (Refer to 7 - COOLING/ENGINE/FAN DRIVE VISCOUS CLUTCH - REMOVAL).
6. Remove coolant bottle and washer bottle.
7. Remove fan shroud.

**Note: It is not necessary to disconnect A/C lines or discharge freon.**

8. Remove A/C compressor and set aside.
9. Remove the generator.
10. Remove upper radiator hose.
11. Disconnect both heater hoses at timing cover.
12. Disconnect lower radiator hose at engine.
13. Remove accessory drive belt tensioner and both idler pulleys.
14. Remove crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - REMOVAL).

**Note: Do not remove the hoses from the power steering pump.**

15. Remove power steering pump and set aside.
16. Remove the dipstick support bolt.
17. Drain the engine oil.
18. Remove the oil pan and pick up tube(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - REMOVAL) .

**Note: It is not necessary to remove water pump for timing cover removal.**

19. Remove timing cover bolts and remove cover.

### INSTALLATION

1. Clean timing chain cover and block surface.

**Note: Always install a new gasket on timing cover.**

2. Install cover and new gasket. Tighten fasteners to 28 N·m (250 in. lbs.).

**Note: The large lifting stud is torqued to 55 N·m (40 ft. lbs.).**

3. Install the oil pan and pick up tube(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
4. Install the A/C compressor.
5. Install the generator.
6. Install power steering pump.
7. Install the dipstick support bolt.
8. Install the thermostat housing.
9. Install crankshaft damper(Refer to 9 - ENGINE/ENGINE BLOCK/VIBRATION DAMPER - INSTALLATION) .
10. Install accessory drive belt tensioner assembly and both idler pulleys.

11. Install radiator lower hose.
12. Install both heater hoses.
13. Install radiator fan shroud.
14. Install the fan and fan drive assembly
15. Install the accessory drive belt.
16. Install the coolant bottle and washer bottle.
17. Install the upper radiator hose.
18. Install the air cleaner assembly.
19. Fill cooling system.
20. Refill engine oil.
21. Connect the battery negative cable.

## TIMING/CHAIN AND SPROCKETS

### REMOVAL

1. Disconnect battery negative cable.
2. Drain cooling system.
3. Remove Timing Chain Cover.

**CAUTION:** The camshaft pin and the slot in the cam sprocket must be clocked at 12:00. The crankshaft keyway must be clocked at 2:00. The crankshaft sprocket must be installed so that the dots and or paint marking is at 6:00.

4. Remove oil pump.
5. Re-install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align timing chain sprockets and keyways as shown.

81015542

6. Retract tensioner shoe until hole in shoe lines up with hole in bracket. Slide a suitable pin into the holes.

7. Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.
8. If tensioner assembly is to be replaced, remove the tensioner to block bolts and remove tensioner assembly.

## INSTALLATION

1. If tensioner assembly is being replaced, install tensioner and mounting bolts. Torque bolts to 28 N·m (250 in. lbs.).
2. Retract tensioner if required.

**CAUTION:** The camshaft pin and the slot in the cam sprocket must be clocked at 12:00. The crankshaft keyway must be clocked at 2:00. The crankshaft sprocket must be installed so that the dots and or paint marking is at 6:00.

3. Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

**CAUTION:** The timing chain must be installed with the single plated link aligned with the dot and or paint marking on the camshaft sprocket. The crankshaft sprocket is aligned with the dot and or paint marking on the sprocket between two plated timing chain links.

4. Place timing chain around both sprockets.
5. Lift sprockets and chain (keep sprockets tight against the chain in position as shown).
6. Slide both sprockets evenly over their respective shafts and check alignment of timing marks.

7. Install the camshaft bolt. Tighten the bolt to 122 N·m (90 ft. lbs.) torque.

8. **Remove tensioner pin.** Again, verify alignment of timing marks.

9. Install the oil pump(Refer to 9 - ENGINE/LUBRICATION/OIL PUMP - INSTALLATION).
10. Install the oil pan and pick up(Refer to 9 - ENGINE/LUBRICATION/OIL PAN - INSTALLATION).
11. Install the timing chain cover(Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT / CHAIN COVER(S) - INSTALLATION).
12. Refill engine oil.
13. Fill cooling system(Refer to 7 - COOLING - STANDARD PROCEDURE).
14. Connect battery negative cable.
15. Start engine and check for oil and coolant leaks.

## **TIMING CHAIN/TENSIONER**

### **DESCRIPTION**

The timing chain tensioner is a stamped steel constant tension mechanical design. It is mounted to the front of the engine, behind the timing chain drive.

### **OPERATION**

The timing chain tension is maintained by routing the timing chain through the tensioner assembly. A nylon covered spring steel arm presses on the timing chain maintaining the correct chain tension.

## EXHAUST SYSTEM

### DESCRIPTION

**EXHAUST SYSTEM - V6 SINGLE SYSTEM**

- 1 - BALL FLANGE
- 2 - CATALYTIC CONVERTER
- 3 - FLEX COUPLER
- 4 - BAND CLAMPS
- 5 - RH REAR EXHAUST MODULE
- 6 - REAR BALL FLANGE
- 7 - INSOLATORS
- 8 - LH RESONATOR AND TAILPIPE

The exhaust system consists of two front close coupled catalytic converters, a front exhaust module assembly (5), and on vehicles equipped with duel exhaust, LH resonator and tailpipe assembly (7).

813793e2

**EXHAUST SYSTEM - V8 DUEL SYSTEM**

- 1 - BALL FLANGE
- 2 - CATALYTIC CONVERTER
- 3 - FLEX COUPLER
- 4 - CROSS BRACE
- 5 - BAND CLAMPS
- 6 - REAR EXHAUST MODULE
- 7 - ISOLATOR

Both converters attach directly to the exhaust manifold using studs and nuts. The exhaust down pipes exit the converters and connect into the rear exhaust module assembly (1 and 6). On the 2.7L equipped vehicles, there is a flex coupler directly behind the LH catalytic converter. The upstream oxygen sensors are located in each exhaust manifold. On 3.5L and 5.7L equipped vehicles there is a flex coupler behind both LH and RH catalytic converters. The downstream oxygen sensors are located behind the flex couplers.

For the single exhaust systems, the rear module and tailpipe (1) are one single unit.

### INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

**Note:** Slip joint band clamps are spot/tack welded to exhaust system. If a band clamp must be replaced, the spot/tack weld must be ground off.

### ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, isolators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

1. Loosen clamps and support brackets.
2. Align the exhaust system starting at the front, working rearward.
3. Tighten all clamps and brackets once alignment and clearances are achieved.

## CATALYTIC CONVERTER

### DESCRIPTION

The close coupled, three-way catalytic converter inlets are connected to the exhaust manifolds by the use of ball flange (1). The 2.7L and 3.5L RWD vehicles incorporate a flex joint downstream of the LH catalytic converter to improve NVH. The 5.7L equipped RWD vehicles incorporate a flex joint downstream of the LH and RH catalytic converters. The left (3) and right (2) side converter outlet pipe connects to the exhaust system.

### REMOVAL

#### RH CATALYTIC CONVERTER

**WARNING:** The normal operating temperature of the exhaust system is very high. therefore, never work around or attempt to service any part of the exhaust system until it is cooled. special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

1. Disconnect negative battery cable.
2. Raise vehicle on hoist.
3. Disconnect downstream oxygen sensor (2) connectors.
4. Remove exhaust module (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - REMOVAL).

5. Remove nuts and cross-brace (2).
6. Remove catalytic converter to ball flange nuts (1).
7. Remove catalytic converter (3).

## LH CATALYTIC CONVERTER

1. Raise vehicle on hoist.
2. Hoist vehicle.

**WARNING:** The normal operating temperature of the exhaust system is very high. therefore, never work around or attempt to service any part of the exhaust system until it is cooled. special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

3. Disconnect downstream oxygen sensor electrical connectors.
4. Remove exhaust module (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - REMOVAL).

5. Remove ball flange nuts.
6. Loosen or remove nut attaching left pipe to trans-axle bracket (2).
7. Remove catalytic converter ball fange nut.
8. Remove catalytic converter.

## INSPECTION

**WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.**

Check catalytic converter for a flow restriction. (Refer to 11 - EXHAUST SYSTEM - DIAGNOSIS AND TESTING) Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

**Note: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. (Refer to Appropriate Diagnostic Information) for test procedures.**

## INSTALLATION

### RH CATALYTIC CONVERTER

1. Install catalytic converter (3) onto exhaust manifold ball flange. Only finger tighten nuts at this time.
2. Install exhaust module (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - INSTALLATION).

3. Install bolts and cross brace (3). Tighten bolts to 55 N·m (40 ft. lbs.).
4. Tighten manifold ball flange nut to 12 N·m (106 in. lbs.).
5. Check clearance between exhaust module and fuel tank. Clearance is 14mm (.55 in.) for V8 engine and 16mm (.62 in.) for V6 engine.
6. Check clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 - .78 in.).
7. Adjust clearance as necessary.
8. Tighten ball flange nuts to 34 N·m (25 ft. lbs.).
9. Connect oxygen sensor (2) connectors.
10. Lower vehicle.
11. Connect negative battery cable.
12. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

## LH CATALYTIC CONVERTER

1. Install catalytic converter (3) onto exhaust manifold ball flange. Only finger tighten nuts at this time.
2. Install exhaust module (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - INSTALLATION).
3. Install bolts and cross brace. Tighten bolts to 55 N·m (40 ft. lbs.).
4. Tighten manifold ball flange nut to 12 N·m (106 in. lbs.).
5. Check clearance between exhaust module and fuel tank. Clearance is 14mm (.55 in.) for V8 engine and 16mm (.62 in.) for V6 engine.
6. Check clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 - .78 in.).
7. Adjust clearance as necessary.
8. Tighten ball flange nuts to 34 N·m (25 ft. lbs.).
9. Lower vehicle.
10. Connect negative battery cable.
11. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

## EXHAUST PIPE

### DESCRIPTION

The 5.7L exhaust pipe assembly consists of:

- Front exhaust pipe and resonator module
- Ball flange
- Isolators
- Right rear exhaust module

The exhaust pipe assembly is serviced as an assembly.

The 2.7L/3.5L exhaust pipe assembly consists of:

- Front exhaust module
- Isolators

The exhaust module is serviced as an assembly.

### REMOVAL

1. Raise vehicle.
2. Remove catalytic converter to front exhaust module clamps (2).

3. Remove nuts (1) and tunnel reinforcement (2).

4. 5.7L Engine - Remove LH rear muffler assembly (Refer to 11 - EXHAUST SYSTEM/MUFFLER - REMOVAL).
5. Remove isolators (4).
6. Remove exhaust pipe assembly (5) by twisting/turning while pulling assembly out of catalytic converters.

## INSTALLATION

1. Position front exhaust pipe module clamps (2) on exhaust pipe assembly.
2. Install exhaust pipe assembly into catalytic converters (3 and 4).

**Note:** Isolators will have an approximately 10° forward angle when installed.

3. Install isolators.

4. 5.7L Engine - Install LH rear muffler assembly (Refer to 11 - EXHAUST SYSTEM/MUFFLER - INSTALLATION).

**Note:** Check for proper alignment and clearance to underbody and engine compartment components before tightening clamps.

5. Tighten band clamps to 61 N·m (45 ft. lbs.).

6. Install tunnel reinforcement (2) and nuts (1). Tighten nuts to 25 N·m (215 in. lbs.)
7. Check clearance between exhaust module and fuel tank. Clearance is 14mm (.55 in.) for V8 engine and 16mm (.62 in.) for V6 engine.
8. Check clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 - .78 in.).
9. The tailpipe should be centered in the rear fascia opening.
10. Adjust clearance as necessary.
11. Lower vehicle.
12. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

## HEAT SHIELDS

### REMOVAL

**WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.**

1. Raise vehicle.
2. Remove nuts (2).
3. Remove heat shields (1).

## INSTALLATION

1. Position heat shields (1).
2. Install nuts (2). Tighten nuts to 10 N·m (98 in. lbs.).

## MUFFLER

### REMOVAL

**WARNING: THE NORMAL OPERATING TEMPERATURE OF THE EXHAUST SYSTEM IS VERY HIGH. THEREFORE, NEVER WORK AROUND OR ATTEMPT TO SERVICE ANY PART OF THE EXHAUST SYSTEM UNTIL IT IS COOLED. SPECIAL CARE SHOULD BE TAKEN WHEN WORKING NEAR THE CATALYTIC CONVERTER. THE TEMPERATURE OF THE CONVERTER RISES TO A HIGH LEVEL AFTER A SHORT PERIOD OF ENGINE OPERATION TIME.**

1. Raise vehicle.
2. Remove two nuts (2).
3. Remove isolators (1).
4. Remove LH resonator and tailpipe assembly (5).

**INSTALLATION**

1. Position LH resonator and tailpipe assembly (5) in vehicle.
2. Install isolators (1).
3. install ball flange nuts (2). Tighten nuts finger tight.
4. Check clearance between exhaust module and fuel tank. Clearance is 14mm (.55 in.) for V8 engine and 16mm (.62 in.) for V6 engine.
5. Check clearance at rear tunnel reinforcement. Clearance is 15 - 20mm (.59 - .78 in.).
6. The tailpipe should be centered in the rear fascia opening.
7. Tighten ball flange nuts (2) to 47 N·m (35 ft. lbs.).
8. Lower vehicle.
9. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

## BUMPER-FRONT

### REMOVAL

1. Remove fascia assembly. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FASCIA-FRONT - REMOVAL)
2. Drill out the four spot welds (2 per side) between the bumper bracket and rail end cap (1).
3. Remove the eight screws (4 per side) and remove the bumper.

## INSTALLATION

1. Position the bumper.

**Note:** It is not necessary to spot weld the bumper back into place.

2. Install the bolts and tighten to 28 N·m (21 ft. lbs.).
3. Install the fascia. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FASCIA-FRONT - INSTALLATION)

## BUMPER-REAR

### REMOVAL

1. Remove the fascia assembly. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FASCIA-REAR - REMOVAL)
2. Remove the six nuts and washers and remove the bumper.

## INSTALLATION

1. Position the bumper.
2. Install the nuts and washers and tighten to 28 N-m (21 ft. lbs.).
3. Install the fascia assembly. (Refer to 13 - FRAME & BUMPERS/BUMPERS/FASCIA-REAR - INSTALLATION)

## FASCIA-FRONT

### REMOVAL

1. Remove the wheel house splash shield rivets three per side.

2. Remove the nine belly pan (1) screws (2).

3. Remove the two fascia to fender screw (5), one per side.
4. Open the hood and remove the upper push pin fasteners (2), four per sedan, and six per wagon.
5. Remove the fascia assembly (4) from the vehicle.

6. Disconnect the electrical connectors and remove the fascia.

## INSTALLATION

1. Verify that the clip (1) and the push pin (2) are secured into the fender.

2. Place the fascia into position near the bumper to connect the electrical connector.

3. Install the fascia (4) onto the bumper and slide the open fascia slots over the two push pin fasteners (6).
4. Install the upper push pin fasteners (2) four per sedan and six per wagon.
5. Install the four upper push pin fasteners (2).
6. Install the fascia to fender screws (5) and secure into the fender clip (1).
7. Position the front belly pan (1).
8. Install the nine belly pan fasteners (2).

9. Install the wheel house splash shield rivets.

## FASCIA-REAR

### REMOVAL

1. Remove the wheel house splash shield rivets (1) three per side.

2. Remove the fascia to quarter panel screws.

3. Remove the two deck lid bumper stops (1) sedan only.

4. Remove the fascia push pin fasteners (2), three per sedan and five per wagon.

5. Remove the fascia (5) from the vehicle.

6. Disconnect the electrical connector and remove the fascia assembly.

## INSTALLATION

1. Verify that the clips (1) and the push pins (2) are secured into the fenders.

2. Place the fascia assembly into position near the bumper and connect the electrical connector.

3. Install the fascia (5) onto the bumper and slide the open fascia slots over the for push pin fasteners (2).
4. Install the push pin fasteners (4), three per sedan and five per wagon.
5. Install the two bumper stops (1), sedan only.

6. Install the fascia to quarter panel screws and secure into the quarter pan.

7. Install the wheel house splash shield rivets (2).

## CROSSMEMBER-REAR

### REMOVAL

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

4. On each side of vehicle rear, while a helper applies brakes to keep hub from rotating, remove hub nut (1) from half shaft (2).

5. Remove rear exhaust system (2) (dual-outlet exhaust shown in figure). (Refer to 11 - EXHAUST SYSTEM - REMOVAL)
6. Remove rear axle differential. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 198MM - REMOVAL) (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 210MM - REMOVAL)
7. Slide each axle half shaft from hub and bearing and remove from vehicle.

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (2) at connector (1) to right rear parking brake cable.
9. Remove front parking brake cable (2) from equalizer (4).

## 10. On each rear disc brake:

- While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
- Remove brake caliper (1) from brake adapter (3) and pads.
- Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

**Note:** To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

- Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

12. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

13. Unclip left sensor cable (1) from routing clips (2) along rear of crossmember near rear differential (3).

14. Unclip left sensor cable (2) from routing clip (1) above toe link mount on rear crossmember.

15. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

16. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
17. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

18. Position under-hoist utility jack or transmission jack (2) under center of rear crossmember (1). Raise jack head to contact crossmember and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

**WARNING:** Before opening fuel system, review all Warnings and Cautions.

19. Remove fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - REMOVAL)

**Note:** If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

20. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.

21. **Slowly** lower crossmember several inches using jack.
22. Remove screw (2) fastening front parking brake cable routing bracket (2) to rear crossmember.
23. Continue to lower jack until crossmember is at a comfortable working level to access link and stabilizer bar fasteners.

24. On each end, remove bolt (3) and nut fastening stabilizer bar (4) to stabilizer link (2).
25. Remove bolts (1) fastening each stabilizer bar cushion retainer to crossmember.
26. Remove stabilizer bar (4) with cushions and retainers.

27. Remove coil springs and isolators (1, 2 and 5) from spring links.

28. For each rear parking brake cable, place 14 mm 12-point deep well socket (3) over cable strand (1) onto cable retainer at crossmember bracket as shown to collapse retainer fingers. It may be necessary to wiggle the socket around somewhat to collapse fingers. With socket in place, pull cable (2) from bracket.

**Note:** For installation purposes, when removing fasteners for any rear suspension links, it is important to note which bolt fastens what component and in what direction it is installed in.

29. On each side of crossmember, remove bolt and nut (1) fastening spring link (4) to crossmember.

30. On each side of crossmember, while holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

31. On each side of crossmember, slide cam bolt (2) attaching toe link rearward, out of crossmember and link (1).

32. On each side of crossmember, remove bolt and nut (1) mounting link (3) at crossmember.

33. On each side of crossmember, remove nut and bolt (4) mounting tension link to crossmember (1).
34. On each side of crossmember, remove nut and bolt (2) mounting camber link to crossmember (1).
35. Carefully lift knuckle with links and parking brake cable attached from rear suspension crossmember.
36. Remove crossmember from jack.

## INSTALLATION

1. Install rear crossmember (1) on jack (2) head in same position in which it was removed and secure in place.

2. Carefully place one side knuckle with links and parking brake cable attached as an assembly into mounted position on rear suspension crossmember. Install nut and bolt (2) mounting camber link to crossmember (1) to hold assembly in place. **Do not tighten at this time.**
3. Carefully place opposite side knuckle with links and parking brake cable attached as an assembly into mounted position on rear suspension crossmember. Install nut and bolt (2) mounting camber link to crossmember (1) to hold assembly in place. **Do not tighten at this time.**
4. On each side of crossmember, install nut and bolt (4) mounting each tension link to crossmember (1). **Do not tighten at this time.**

5. On each side of crossmember, Install bolt and nut (1) mounting each compression link (3) at crossmember. **Do not tighten at this time.**

6. On each side of crossmember, slide cam bolt (2) attaching toe link through crossmember and link (1) from rear.

7. On each side of crossmember, while holding toe adjustment cam bolt from rotating, install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten at this time.**

8. On each side of crossmember, install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten at this time.**
9. Install end of each rear parking brake cable into mounting bracket on crossmember. Press retainer through bracket until retainer fingers lock cable into place.

10. Install stabilizer bar (4) with cushions and retainers on crossmember.
11. Install cushion retainer mounting bolts (1). **Do not tighten at this time.**
12. Install bolt (3) and nut fastening stabilizer bar ends to each stabilizer link (2). **Do not tighten at this time.**
13. Tighten cushion retainer mounting bolts (1) to 60 N·m (44 ft. lbs.) torque.

**Note:** Do not install coil springs on spring links at this time.

14. Raise crossmember using jack until there is about 10 inches (250 mm) clearance to the body mounting points.
15. Install screw (2) fastening front parking brake cable routing bracket (1) to rear crossmember.

16. Raise crossmember to body mounting points. As crossmember is raised, align shocks (3) with pockets in spring links. **Do not install bolts at this time.**

**Note:** There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

17. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

18. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

**Note:** Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

19. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

20. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
21. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

22. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

**Note:** There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

23. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
24. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

25. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

**Note:** Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

26. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

27. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
28. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

29. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

**Note:** There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

30. Raise left side of crossmember (1) into mounted position. Install left side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

31. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

32. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

33. Tighten all four crossmember mounting bolts (2 and 3) to 180 N·m (133 ft. lbs.) torque.

34. Remove jack (3) from under rear crossmember.

35. Install fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - INSTALLATION)

36. Clip left rear wheel speed sensor cable (2) to routing clip (1) above toe link mount on rear crossmember.

37. Clip left rear wheel speed sensor cable (1) to routing clips (2) along rear of crossmember near rear differential (3).

38. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

39. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
40. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

41. On each rear disc brake:
  - a. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
  - b. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).

**CAUTION:** Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

- c. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N·m (44 ft. lbs.) torque.
  - d. Make sure brake hose is properly routed and will not come in contact with suspension components.

42. Route parking brake cable above rear crossmember, then slide cable (2) through equalizer (4) above rear differential.

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

43. Connect front parking brake cable (2) at connector (1) to right rear parking brake cable (6).

44. On each side of vehicle, slide an axle half shaft (2) through hub and bearing and install hub nut (1). **Do not tighten hub nuts at this time.**
45. Install rear axle differential. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 198MM - INSTALLATION)(Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 210MM - INSTALLATION)

46. While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N·m (157 ft. lbs.) torque.

47. Install rear exhaust system (2) (dual-outlet exhaust shown in figure). (Refer to 11 - EXHAUST SYSTEM - INSTALLATION)

48. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

49. Tighten camber link bolt (2) at crossmember to 85 N·m (63 ft. lbs.) torque.
50. Tighten tension link bolt nut (2) at crossmember to 85 N·m (63 ft. lbs.) torque.

51. Tighten compression link bolt (2) at crossmember to 85 N·m (63 ft. lbs.) torque.

52. Tighten spring link bolt (1) at crossmember to 108 N·m (80 ft. lbs.) torque.

53. Tighten shock absorber lower mounting bolt nut (4) to 72 N·m (53 ft. lbs.) torque.

54. Tighten stabilizer link bolts (3) to 61 N·m (45 ft. lbs.) torque.

55. Raise vehicle and remove jack stands (3).

56. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)

57. Lower vehicle.

58. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

59. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

60. On each side of crossmember, while holding cam bolt from turning, tighten toe link cam bolt nut (2) to 108 N·m (80 ft. lbs.) torque.

## FUEL DELIVERY

### DESCRIPTION

The front wheel drive car uses a plastic fuel tank located rear center of the vehicle.

The Fuel Delivery System consists of: the following items:

- Electric fuel pump module
- Fuel filter
- Tubes/lines/hoses
- Fuel injectors

The in-tank fuel pump module contains the fuel pump. The pump is serviced as part of the fuel pump module. Refer to Fuel Pump Module.

The fuel filter is replaceable only as part of the fuel pump module.

## OPERATION

The fuel system provides fuel pressure by an in-tank pump module. The Powertrain Control Module (PCM) controls the operation of the fuel system by providing battery voltage to the fuel pump through the fuel pump relay. The PCM requires only three inputs and a good ground to operate the fuel pump relay. The three inputs are:

- Ignition voltage
- Crankshaft Position (CKP) sensor
- Camshaft Position (CMP) sensor

## DIAGNOSIS AND TESTING - FUEL DELIVERY SYSTEM

(Refer to Appropriate Diagnostic Information)

### STANDARD PROCEDURE - FUEL SYSTEM PRESSURE RELEASE PROCEDURE

1. Remove Fuel Pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.
2. Start and run engine until it stalls.
3. Attempt restarting engine until it will no longer run.
4. Turn ignition key to OFF position.
5. Return fuel pump relay to PDC.
6. One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The scan tool must be used to erase a DTC.

## SENSOR-FUEL LEVEL

### REMOVAL

#### LEFT SIDE MODULE

1. Release the fuel pressure, refer to the Fuel Pressure Release Procedure in this section.
2. Disconnect negative battery cable.

**Note:** The fuel level of the vehicle must be below 5/8 of a tank before you remove the module lock-rings. If it is above that you can spill fuel in the vehicle.

3. Drain partial fuel from fuel tank through the filler tube. Use a hard nylon tube, with a 30° cut on the end, to push the check valve open to drain fuel from tank.

4. Remove the rear lower seat cushion.

5. Push seat back and up to remove seat cushion.

6. Fold back the foam pad covering access cover for modules.

7. Disconnect the electrical connector from left side module.

8. Mark the module orientation.

9. Use special tool #9340 to remove left side module lock ring.

10. Drain fuel from left side of fuel tank. Lift module up enough to push hose into tank and drain. Do not spill fuel in interior of vehicle.

11. Disconnect the electrical connector for the left side fuel level card from bottom of the module top.
12. Disconnect the electrical connector for the right side fuel level sending card.
13. Lift module top half off and tip lower half on its side to drain remaining fuel from the reservoir.

14. Remove wire from module.

15. Use a screwdriver to separate the locking tabs on the level sending card.

16. Lift level sending card straight up and out of module.

17. Disconnect the electrical wiring from module.
18. Remove level sending card.

## RIGHT SIDE MODULE

1. Release the fuel pressure, refer to the Fuel Pressure Release Procedure in this section.
2. Disconnect negative battery cable.

**Note:** The fuel level of the vehicle must be below 5/8 of a tank before you remove the module lock-rings. If it is above that you can spill fuel in the vehicle.

3. Drain partial fuel from fuel tank through the filler tube. Use a hard nylon tube, with a 30° cut on the end, to push the check valve open to drain fuel from tank.

4. Remove the rear lower seat cushion.

5. Push seat back and up to remove seat cushion.

6. Fold back the foam pad covering access cover for modules.

7. Disconnect the electrical connector from left side module.  
8. Mark the module orientation.

9. Use special tool #9340 to remove left side module lock ring.

10. Drain fuel from left side of fuel tank. Lift module up enough to push hose into tank and drain. Do not spill fuel in interior of vehicle.

11. Lift module up and out of tank as far as possible.
12. Disconnect the electrical connector from the bottom of the left side module.

13. Pump module left side.
14. Lift module top half off and tip lower half on its side to drain remaining fuel from the reservoir.

15. Push in on the release tab on the fuel line fitting to release the fuel line from the fuel pump fitting.

16. Remove the Fuel supply line from the top of the bottom half of the module.

17. Fuel return line (1) and Saipan return line (2). Just pull tube up to release from module.

18. Remove the fuel return and Siphon return hoses from the bottom module.

19. Remove plastic access covers from floor pan right side.

20. Disconnect the fuel supply line from module.
21. Mark the module orientation.

22. Use special tool #9340 to remove right side module lock ring.

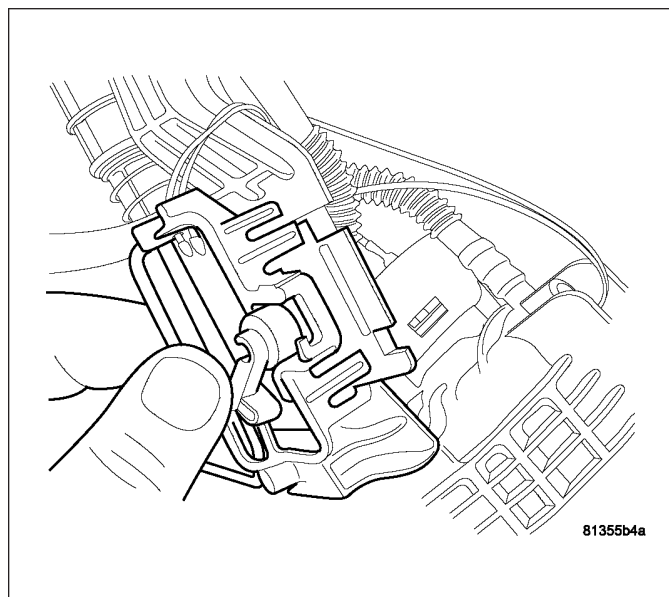

23. Drain fuel from right side of fuel tank. Lift module up enough to push hose into tank and drain. Do not spill fuel in interior of vehicle.

24. Pull module up and out of fuel tank.

25. Unlatch the fuel level sending card from module.

26. Fuel level sending card released.

27. Remove the ground wire from the check valve and fuel pressure regulator.

28. Remove fuel level sending card from module.
29. Cut tie straps from hoses to remove wiring harness for fuel level card.

## INSTALLATION

### LEFT SIDE MODULE

1. Install level sending card, make sure that the locking tabs are locked on the card.

2. Route wires in the proper location.

3. Install module top to module bottom.

4. Connect the electrical connectors for right side fuel level sending card, left side module card and fuel pump.

5. Install module and align marks on the module for proper orientation.

6. Install module lock-ring.
7. Use special tool #9340 to tighten left side module lock ring.
8. Connect the electrical connector to left side module and install plastic access cover.

9. Fold the foam pad covering access cover for modules back into place.

10. Install rear lower seat cushion

11. Rear lower seat cushion installed.

12. Fill fuel tank.

13. Connect negative battery cable.

14. Fill fuel tank. Use the scan tool to pressurize the fuel system. Check for leaks.

**RIGHT SIDE MODULE**

1. Install level sending card, make sure that the locking tabs are locked on the card.

2. Route wires in the proper location.
3. Tie strap the wires harness to the hoses.

4. Feed hoses and wiring harness into fuel tank and over the center hump in tank.

5. Install module and align marks on the module for proper orientation.

6. Install module lock-ring.  
7. Use special tool #9340 to tighten right side module lock ring.  
8. Connect the fuel supply line to module.

9. Install plastic access covers to floor pan right side.

10. Install the fuel return hoses to module.
11. Install fuel supply line to module.

12. Make sure that wires are routed properly.

13. Make sure that the level sending card wire is tie strapped to the fuel supply line at the module.

14. Install left side module top to module bottom.

15. Connect the electrical connectors for right side fuel level sending card, left side module card. Make sure that wires are routed properly.

16. Install module and align marks on the module for proper orientation.

17. Install module lock-ring.
18. Use special tool #9340 to tighten left side module lock ring.
19. Connect the electrical connector to left side module and install plastic access cover.

20. Fold the foam pad covering access cover for modules back into place.

21. Install rear lower seat cushion

22. Rear lower seat cushion installed.

23. Fill fuel tank.

24. Connect negative battery cable.

25. Fill fuel tank. Use the scan tool to pressurize the fuel system. Check for leaks.

## REGULATOR-FUEL PRESSURE

### REMOVAL

1. Release the fuel pressure, refer to the Fuel Pressure Release Procedure in this section.
2. Disconnect negative battery cable.

**Note:** The fuel level of the vehicle must be below 5/8 of a tank before you remove the module lock-rings. If it is above that you can spill fuel in the vehicle.

3. Drain partial fuel from fuel tank through the filler tube. Use a hard nylon tube, with a 30° cut on the end, to push the check valve open to drain fuel from tank.

4. Remove the rear lower seat cushion.

5. Push seat back and up to remove seat cushion.

6. Fold back the foam pad covering access cover for modules.

7. Remove plastic access covers from floor pan right side.

8. Disconnect the fuel supply line from module.
9. Mark the module orientation.

10. Use special tool #9340 to remove right side module lock ring.

11. Drain fuel from right side of fuel tank. Lift module up enough to push hose into tank and drain. Do not spill fuel in interior of vehicle.

12. Pull module up and out of fuel tank.

13. Fuel Pressure regulator location.

14. Note location of ground wire tab location.

15. Remove ground wire.

16. Use a screwdriver and pry up on retaining clip.

17. Clip in the off position.

18. Fuel pressure regulator removed.

19. Remove o-ring from module.

## INSTALLATION

1. Install o-ring.

2. Install ground ring.

3. Install Fuel Regulator and ground ring. Note location of ground ring.

4. Install ground wire.

5. Install Fuel Pressure Regulator retaining clip.

6. Install module into tank.

7. Align marks on the module for proper orientation.

8. Install module lock-ring.

9. Use special tool #9340 to tighten right side module lock ring.

10. Connect the fuel supply line to module.

11. Install plastic access covers to floor pan right side.

12. Fold the foam pad covering access cover for modules back into place.

13. Install rear lower seat cushion

14. Rear lower seat cushion installed.

15. Fill fuel tank.
16. Connect negative battery cable.
17. Fill fuel tank. Use the scan tool to pressurize the fuel system. Check for leaks.

## MODULE-FUEL PUMP

### REMOVAL

1. Release the fuel pressure, refer to the Fuel Pressure Release Procedure in this section.
2. Disconnect negative battery cable.

**Note:** The fuel level of the vehicle must be below 5/8 of a tank before you remove the module lock-rings. If it is above that you can spill fuel in the vehicle.

3. Drain partial fuel from fuel tank through the filler tube. Use a hard nylon tube, with a 30° cut on the end, to push the check valve open to drain fuel from tank.

4. Remove the rear lower seat cushion.

5. Push seat back and up to remove seat cushion.

6. Fold back the foam pad covering access cover for modules.

7. Disconnect the electrical connector from left side module.
8. Mark the module orientation.

9. Use special tool #9340 to remove left side module lock ring.

10. Drain fuel from left side of fuel tank. Lift module up enough to push hose into tank and drain. Do not spill fuel in interior of vehicle.

11. Disconnect the electrical connectors from the module top.
12. Remove the module top half.

13. The module fuel level sending card (1). The fuel return lines (2). The fuel supply line (3).

14. Fuel line release tab, press in the tab and pull up on fuel line.

15. Remove fuel line.

16. Remove fuel return line from lower module. Line unsnap from module.

17. Return line removed.

18. Tip module on its side to drain remaining fuel from reservoir and remove module from vehicle.

## INSTALLATION

1. Install pump module into tank.
2. Connect fuel return lines to module.

3. Lines connected.

4. Connect fuel supply line to module and make sure it is locked in place.

5. Connect electrical connectors to bottom of module top, Install module top to module bottom.

6. Install module and align marks on the module for proper orientation.

7. Install module lock-ring.  
8. Use special tool #9340 to tighten left side module lock ring.  
9. Connect the electrical connector to left side module.

10. Install plastic access cover.

11. Fold the foam pad covering access cover for modules back into place.

12. Install rear lower seat cushion

13. Rear lower seat cushion installed.

14. Fill fuel tank.
15. Connect negative battery cable.
16. Fill fuel tank. Use the scan tool to pressurize the fuel system. Check for leaks.

## RAIL-FUEL

### REMOVAL

#### 2.7L

**WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL RAIL. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.**

1. Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.
2. Disconnect the negative battery cable.
3. Remove intake manifold plenum. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
4. Cover intake manifold to prevent foreign material from entering engine.

5. Disconnect fuel supply tube quick connect fitting at the rear of the fuel rail, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
6. Disconnect electrical connectors at fuel injectors. Refer to graphic. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

7. Remove mounting bolts on both sides of fuel rail.
8. Lift fuel rail straight up off of cylinder head.
9. Remove retaining clips from fuel injectors at fuel rail.
10. Remove fuel injector from fuel rail.

### 3.5L

**WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE SERVICING FUEL RAIL. SERVICE VEHICLES IN WELL VENTILATED AREAS AND AVOID IGNITION SOURCES. NEVER SMOKE WHILE SERVICING THE VEHICLE.**

1. Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.
2. Disconnect the negative battery cable.
3. Remove intake manifold plenum. (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
4. Cover intake manifold to prevent foreign material from entering engine.
5. Disconnect fuel supply tube quick connect fitting at the rear of the fuel rail, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).

6. Disconnect electrical connectors at fuel injectors. Refer to graphic. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

7. Remove mounting bolts on both sides of fuel rail.
8. Lift fuel rail straight up off of cylinder head.
9. Remove retaining clips from fuel injectors at fuel rail.
10. Remove fuel injector from fuel rail.

## 5.7L

**WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.**

**CAUTION:** The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tube. Due to design of tube, it does not use any clamps. Never attempt to install a clamping device of any kind to tube. When removing fuel rail assembly for any reason, be careful not to bend or kink tube.

1. Remove fuel tank filler tube cap.
2. Perform Fuel System Pressure Release Procedure.
3. Remove negative battery cable at battery.
4. Remove flex tube (air cleaner housing to engine).
5. Remove air resonator box at throttle body.
6. Disconnect all spark plug cables from all spark plugs and ignition coils. Do not remove cables from cable routing tray. Note original cable positions while removing.

7. Remove spark plug cable tray from engine by releasing 4 retaining clips (2). Remove tray and cables from engine as an assembly.
8. Disconnect electrical connectors at all 8 ignition coils. Refer to Ignition Coil Removal/Installation.
9. Disconnect fuel line latch clip and fuel line at fuel rail. A special tool will be necessary for fuel line disconnection. Refer to Quick-Connect Fittings.

10. Disconnect electrical connectors at all 8 fuel injectors. Refer to graphic. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.
11. Disconnect electrical connectors at all throttle body sensors.

12. Remove four fuel rail mounting bolts (2) and hold-down clamps.
13. Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in intake manifold. Gently rock and pull **right** side of rail until injectors just start to clear intake manifold head holes. Repeat this procedure (left/right) until all injectors have cleared machined holes.
14. Remove fuel rail (with injectors attached) from engine.

15. If fuel injectors are to be removed, refer to Fuel Injector Removal/Installation.

## INSTALLATION

### 2.7L

1. Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.
2. Install retaining clips on fuel injectors.
3. Push injectors into fuel injector rail until clips are in the correct position.
4. Position fuel rail over cylinder heads, and push rail into place. Tighten fuel rail mounting bolts to 11 N·m (100 in. lbs.) torque.

5. Connect the fuel supply tube quick connect fitting to the fuel rail, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/ QUICK CONNECT FITTING - STANDARD PROCEDURE).
6. Connect the electrical connectors to the fuel injectors.
7. Install intake manifold plenum, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
8. Connect negative cable to battery.
9. Use the scan tool to pressurize the fuel system. Check for leaks.

### 3.5L

1. Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.
2. Install retaining clips on fuel injectors.
3. Push injectors into fuel injector rail until clips are in the correct position.
4. Position fuel rail over cylinder heads, and push rail into place. Tighten fuel rail mounting bolts to 28 N·m (250 in. lbs.) torque.

5. Connect the fuel supply tube quick connect fitting to the fuel rail, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/ QUICK CONNECT FITTING - STANDARD PROCEDURE).
6. Connect the electrical connectors to the fuel injectors.
7. Install intake manifold plenum, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
8. Connect negative cable to battery.
9. Use the scan tool to pressurize the fuel system. Check for leaks.

### 5.7L

1. If fuel injectors are to be installed, refer to Fuel Injector Removal/Installation.
2. Clean out fuel injector machined bores in intake manifold.
3. Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.
4. Position fuel rail/fuel injector assembly to machined injector openings in intake manifold.
5. Guide each injector into intake manifold. Be careful not to tear injector o-rings.
6. Push **right** side of fuel rail down until fuel injectors have bottomed on shoulders. Push **left** fuel rail down until injectors have bottomed on shoulders.

7. Install 4 fuel rail holddown clamps and 4 mounting bolts (2) and (3). Refer to Torque Specifications.

8. Position spark plug cable tray (7) and cable assembly to intake manifold. Snap 4 cable tray retaining clips into intake manifold.

9. Install all cables to spark plugs and ignition coils.
10. Connect electrical connector to throttle body.
11. Install electrical connectors to all 8 ignition coils. Refer to Ignition Coil Removal/Installation.
12. Connect electrical connector to throttle body.

13. Connect electrical connectors at all fuel injectors. Refer to graphic. Push connector onto injector (1) and then push and lock red colored slider (2). Verify connector is locked to injector by lightly tugging on connector.
14. Connect fuel line latch clip and fuel line to fuel rail. Refer to Quick-Connect Fittings.
15. Install air resonator to throttle body (2 bolts).
16. Install flexible air duct to air box.
17. Connect battery cable to battery.
18. Start engine and check for leaks.

## TANK-FUEL

### REMOVAL

1. Release the fuel pressure, refer to the Fuel Pressure Release Procedure in this section.
2. Disconnect negative battery cable.

**Note:** The fuel level of the vehicle must be below 5/8 of a tank before you remove the module lock-rings. If it is above that you can spill fuel in the vehicle.

3. Drain partial fuel from fuel tank through the filler tube. Use a hard nylon tube, with a 30° cut on the end, to push the check valve open to drain fuel from tank.

4. Remove the rear lower seat cushion.

5. Push seat back and up to remove seat cushion.

6. Fold back the foam pad covering access cover for modules.

7. Remove plastic access covers from floor pan right side.

8. Disconnect the fuel supply line from module.  
9. Mark the module orientation.

10. Use special tool #9340 to remove right side module lock ring.

11. Drain fuel from right side of fuel tank. Lift module up enough to push hose into tank and drain. Do not spill fuel in interior of vehicle.

12. Disconnect the electrical connector from left side module.
13. Mark the module orientation.

14. Use special tool #9340 to remove left side module lock ring.

15. Drain fuel from left side of fuel tank. Lift module up enough to push hose into tank and drain. Do not spill fuel in interior of vehicle.
16. Install both module temporarily, hand tighten the lock ring to hold modules in place.
17. Raise vehicle and support.
18. Remove left rear tire.

19. Remove the inner splash shield.

20. Disconnect the filler tube vent line.

21. Remove clamp from filler tube.

22. Remove metal filler tube from rubber tube on fuel tank.

23. Remove the exhaust system, (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - REMOVAL)

24. Remove the drive shaft, (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - REMOVAL)

25. Remove the left underbody splash shield.

26. Remove the right underbody splash shield.

27. Disconnect the EVAP line in the right rear wheel well.

28. Disconnect vapor line.

29. Disconnect the fuel supply line.

30. Support fuel tank with transmission jack.

31. Fuel tank strap bolt locations.

32. Remove bolt for fuel tank strap.

33. Remove bolt for fuel tank strap.

34. Lower tank and pull filler tube vent line through bracket.

35. Lower Fuel tank and remove from vehicle.

36. Left Side Module (Fuel Pump Module).

37. Right Side Module.

38. Control Valve and lines.

## INSTALLATION

1. Support fuel tank with transmission jack.

2. Raise tank and push filler tube vent line through bracket.

3. Fuel tank strap bolt locations.

4. Install bolt for fuel tank strap and tighten.

5. Install bolt for fuel tank strap and tighten.

6. Connect vapor line.

7. Connect the fuel supply line.

8. Connect the EVAP line in the right rear wheel well.

9. Install the drive shaft, (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION)

10. Install the exhaust system, (Refer to 11 - EXHAUST SYSTEM/EXHAUST PIPE - INSTALLATION)

11. Install metal filler tube to rubber tube on fuel tank.

12. Install clamp to filler tube and tighten

13. Connect the filler tube vent line.

14. Install the inner splash shield.

15. Install the left underbody splash shield.

16. Install the right underbody splash shield.

17. Install left rear tire.

18. Lower vehicle.

19. Install module and align marks on the module for proper orientation.

20. Install module lock-ring.  
21. Use special tool #9340 to tighten left side module lock ring.  
22. Connect the electrical connector to left side module and install plastic access cover.

23. Install module and align marks on the module for proper orientation.

24. Install module lock-ring.
25. Use special tool #9340 to tighten right side module lock ring.
26. Connect the fuel supply line to module.

27. Install plastic access covers to floor pan right side.

28. Fold the foam pad covering access cover for modules back into place.

29. Install rear lower seat cushion

30. Rear lower seat cushion installed.

- 31. Fill fuel tank.
- 32. Connect negative battery cable.
- 33. Fill fuel tank. Use the scan tool to pressurize the fuel system. Check for leaks.

## FUEL TANK FILLER TUBE

### REMOVAL

1. Disconnect negative battery cable.
2. Drain fuel from tank.
3. Fuel filler tube assembly.

4. Open filler tube door.

5. Remove retaining wire from inside filler tube rubber.

6. Start removing rubber from body sheet metal.

7. Squeeze rubber and push in.

8. Filler tube and rubber removed from body sheet metal.

9. Raise vehicle and support.  
10. Remove the left rear tire.  
11. Remove the left inner splash shield.

12. Disconnect the filler tube vent line.

13. Remove the filler tube mounting bolt.

14. Remove the under body splash shield.

15. Loosen the filler tube hose clamp. Leave the clamp tight on the hose and fuel tank location.

16. Move clamp toward the fuel tank.

17. Remove the filler tube assembly from the vehicle.

## INSTALLATION

1. Filler tube assembly.

2. Groove in filler tube rubber is for the body sheet metal.

3. Insert filler tube into the fuel tank rubber hose.

4. Slide hose clamp into place and tighten.

5. Hose clamp in place and tighten.

6. Install filler tube mounting bolt.

7. Install Filler tube vent line.

8. Install the underbody splash shield.

9. Install the left inner splash shield.

10. Install the left rear tire.

11. Lower vehicle.

12. Filler tube rubber at body opening.

13. Pull rubber through opening and install to body. Make sure that the sheet metal is in the groove in the rubber.

14. Start the metal wire retaining wire in the groove on the inside of the filler tube rubber.

15. Work wire retaining wire around the rubber.

16. Wire retainer install.  
17. Connect negative battery cable.  
18. Fill fuel tank.

## QUICK CONNECT FITTING

### STANDARD PROCEDURE - QUICK-CONNECT FITTINGS

#### REMOVAL

When disconnecting a quick-connect fitting, the retainer will remain on the fuel tube nipple.

**WARNING: RELEASE FUEL SYSTEM PRESSURE BEFORE DISCONNECTING A QUICK-CONNECT FITTINGS. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.**

1. Perform Fuel Pressure Release Procedure. Refer to the Fuel Pressure Release Procedure in this section.
2. Disconnect negative cable from battery or auxiliary jumper terminal.
3. Squeeze retainer tabs together and pull fuel tube/quick-connect fitting assembly off of fuel tube nipple. The retainer will remain on fuel tube.

#### INSTALLATION

**CAUTION: Make sure that the o-ring is installed in fitting. Never install a quick-connect fitting without the retainer being either on the fuel tube or already in the quick-connect fitting. In either case, ensure the retainer locks securely into the quick-connect fitting by firmly push-pulling-push on fuel tube and fitting to ensure it is secured.**

1. Using a clean lint free cloth, clean the fuel tube nipple and retainer.
2. Prior to connecting the fitting to the fuel tube, coat the fuel tube nipple with clean engine oil.
3. Push the quick-connect fitting over the fuel tube until the **retainer seats and a click is heard**.
4. The plastic quick-connect fitting has windows in the sides of the casing. When the fitting completely attaches to the fuel tube, the retainer locking ears and the fuel tube shoulder are visible in the windows. If they are not visible, the retainer was not properly installed. **Do not rely upon the audible click to confirm a secure connection.**
5. Connect negative cable to battery or auxiliary jumper terminal.

**CAUTION: When using the ASD Fuel System Test, the Auto Shutdown (ASD) Relay remains energized for several minutes, until the test is stopped, or until the ignition switch is turned to the Off position.**

6. Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

#### Single-Button Type Fitting

1. This type of fitting is equipped with a single push-button located on the quick-connect fitting. The push-button is attached to two internal latches. To disconnect, press on button with your thumb and unlatch fitting from fuel line. Special tools are not required for disconnection. **DO NOT ATTEMPT TO PRY OR PULL UP ON PUSH-BUTTON. LATCHES WILL BE BROKEN.**

## TWO-TAB TYPE FITTING

This type of fitting is equipped with tabs located on both sides of the fitting. These tabs are supplied for disconnecting the quick-connect fitting from component being serviced.

**CAUTION:** The interior components (O-rings, spacers) of this type of quick-connect fitting are not serviced separately, but new plastic retainers are available. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

**WARNING:** THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN THIS GROUP. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

### DISCONNECTION/CONNECTION

1. Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.
2. Disconnect negative battery cable from battery or auxiliary jumper terminal.
3. Clean fitting of any foreign material before disassembly.
4. To disconnect quick-connect fitting, squeeze plastic retainer tabs against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer. Pull fitting from fuel system component being serviced. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.
5. Inspect quick-connect fitting body and component for damage. Replace as necessary.

**CAUTION:** When the quick-connect fitting was disconnected, the plastic retainer will remain on the component being serviced. If this retainer must be removed, very carefully release the retainer from the component with two small screwdrivers. After removal, inspect the retainer for cracks or any damage.

6. Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
7. Insert quick-connect fitting to component being serviced and into plastic retainer. When a connection is made, a click will be heard.
8. Verify a locked condition by firmly push-pulling-push on fuel tube and fitting (15-30 lbs.).

9. Connect negative cable to battery or auxiliary jumper terminal.
10. Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

## PLASTIC RETAINER RING TYPE FITTING

This type of fitting can be identified by the use of a full-round plastic retainer ring usually black in color.

**CAUTION:** The interior components (O-rings, spacers, retainers) of this type of quick-connect fitting are not serviced separately. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

**WARNING:** THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

### DISCONNECTION/CONNECTION

1. Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this section.
2. Disconnect negative battery cable from battery or auxiliary jumper terminal.
3. Clean fitting of any foreign material before disassembly.
4. To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting. With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**
5. After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.
6. Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.
7. Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
8. Insert quick-connect fitting into component being serviced until a click is felt.
9. Verify a locked condition by firmly push-pulling-push on fuel tube and fitting (15-30 lbs.).
10. Connect negative battery cable to battery or auxiliary jumper terminal.
11. Use the DRB III® scan tool ASD Fuel System Test to pressurize the fuel system. Check for leaks.

## FUEL LINES

### DESCRIPTION - FUEL LINES/HOSES AND CLAMPS

Also refer to Quick-Connect Fittings.

**WARNING:** THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contaminated fuel in this system. If it is necessary to replace these lines/tubes/hoses, use new original equipment lines/tubes/hoses.

**If equipped:** The hose clamps used to secure rubber hoses on vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause leaks.

Use new original equipment type hose clamps.

## STANDARD PROCEDURE - HOSES AND CLAMP

Inspect all hose connections (clamps and quick connect fittings) for completeness and leaks. Replace cracked, scuffed, or swelled hoses. Replace hoses that rub against other vehicle components or show sign of wear.

Fuel injected vehicles use specially constructed hoses. When replacing hoses, only use hoses marked EFM/EFI.

When installing hoses, ensure that they are routed away from contact with other vehicle components that could rub against them and cause failure. Avoid contact with clamps or other components that cause abrasions or scuffing. Ensure that rubber hoses are properly routed and avoid heat sources.

The hose clamps have rolled edges to prevent the clamp from cutting into the hose. Only use clamps that are original equipment or equivalent. Other types of clamps may cut into the hoses and cause high pressure fuel leaks. Tighten hose clamps to 1 N·m (9 in. lbs.) torque.

Inspect all hose connections such as clamps, couplings and fittings to make sure they are secure and leaks are not present. The component should be replaced immediately if there is any evidence of degradation that could result in failure.

Never attempt to repair a plastic fuel line/tube. Replace as necessary.

Avoid contact of any fuel tubes/hoses with other vehicle components that could cause abrasions or scuffing. Be sure that the plastic fuel lines/tubes are properly routed to prevent pinching and to avoid heat sources.

## FUEL INJECTION

### OPERATION

#### OPERATION - INJECTION SYSTEM

All engines used in this section have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

## OPERATION - MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

There are two different areas of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP modes the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP modes, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP modes the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

1. Engine coolant temperature must be over 35°F.
  - If the coolant is over 35°F the PCM will wait 38 seconds.
  - If the coolant is over 50°F the PCM will wait 15 seconds.
  - If the coolant is over 167°F the PCM will wait 3 seconds.
2. For other temperatures the PCM will interpolate the correct waiting time.
3. O<sub>2</sub> sensor must read either greater than 0.745 volts or less than 0.29 volt.
4. The multi-port fuel injection systems has the following modes of operation:
  - Ignition switch ON (Zero RPM)
  - Engine start-up
  - Engine warm-up
  - Cruise
  - Idle
  - Acceleration
  - Deceleration
  - Wide Open Throttle
  - Ignition switch OFF
5. The engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle modes are OPEN LOOP modes. Under most operating conditions, the acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** are CLOSED LOOP modes.

## IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately 1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

## ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° degree falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within  $\pm 64$  RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

## ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor
- Throttle position
- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

## CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to the Emission section for On-Board Diagnostics).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic converter efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

## ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

## DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)
- Knock sensor
- Manifold absolute pressure
- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

## WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

## IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless O2 Heater Monitor test is being run. Refer to the Emission section for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

## FUEL CORRECTION or ADAPTIVE MEMORIES

### DESCRIPTION

In Open Loop, the PCM changes pulse width without feedback from the O2 Sensors. Once the engine warms up to approximately 30 to 35° F, the PCM goes into closed loop **Short Term Correction** and utilizes feedback from the O2 Sensors. Closed loop **Long Term Adaptive Memory** is maintained above 170° to 190° F unless the PCM senses wide open throttle. At that time the PCM returns to Open Loop operation.

### OPERATION

#### Short Term

The first fuel correction program that begins functioning is the short term fuel correction. This system corrects fuel delivery in direct proportion to the readings from the Upstream O2 Sensor.

The PCM monitors the air/fuel ratio by using the input voltage from the O2 Sensor. When the voltage reaches its preset high or low limit, the PCM begins to add or remove fuel until the sensor reaches its switch point. The short term corrections then begin.

The PCM makes a series of quick changes in the injector pulse-width until the O2 Sensor reaches its opposite preset limit or switch point. The process then repeats itself in the opposite direction.

Short term fuel correction will keep increasing or decreasing injector pulse-width based upon the upstream O2 Sensor input. The maximum range of authority for short term memory is 25% (+/-) of base pulse-width. Short term is violated and is lost when ignition is turned OFF.

### Long Term

The second fuel correction program is the long term adaptive memory. In order to maintain correct emission throughout all operating ranges of the engine, a cell structure based on engine rpm and load (MAP) is used.

The number of cells varies upon the driving conditions. Two cells are used only during idle, based upon TPS and Park/Neutral switch inputs. There may be two other cells used for deceleration, based on TPS, engine rpm, and vehicle speed. The other twelve cells represent a manifold pressure and an rpm range. Six of the cells are high rpm and the other six are low rpm. Each of these cells has a specific MAP voltage range Typical Adaptive Memory Fuel Cells .

As the engine enters one of these cells the PCM looks at the amount of short term correction being used. Because the goal is to keep short term at 0 (O2 Sensor switching at 0.5 volt), long term will update in the same direction as short term correction was moving to bring the short term back to 0. Once short term is back at 0, this long term correction factor is stored in memory.

The values stored in long term adaptive memory are used for all operating conditions, including open loop and cold starting. However, the updating of the long term memory occurs after the engine has exceeded approximately 170°-190° F, with fuel control in closed loop and two minutes of engine run time. This is done to prevent any transitional temperature or start-up compensations from corrupting long term fuel correction.

Long term adaptive memory can change the pulse-width by as much as 25%, which means it can correct for all of short term. It is possible to have a problem that would drive long term to 25% and short term to another 25% for a total change of 50% away from base pulse-width calculation.

### Typical Adaptive Memory Fuel Cells

	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Open Throttle	Idle	Decel
Vacuum	20	17	13	9	5	0		
Above 1,984 rpm	1	3	5	7	9	11	13 Drive	15
Below 1,984 rpm	0	2	4	6	8	10	12 Neutral	14
<b>MAP volt =</b>	0	1.4	2.0	2.6	3.3	3.9		

### Fuel Correction Diagnostics

There are two fuel correction diagnostic routines:

- Fuel System Rich
- Fuel System Lean

A DTC is set and the MIL is illuminated if the PCM detects either of these conditions. This is determined based on total fuel correction, short term times long term.

## SYSTEM DIAGNOSIS

### OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ POWERTRAIN CONTROL MODULE - DESCRIPTION) .

1. Disconnect negative battery cable.
2. Raise vehicle and support.

3. Unlock and disconnect the electrical connector.
4. Remove mounting bolt.
5. Remove sensor.

**3.5L**

1. Disconnect negative battery cable.
2. Raise vehicle and support.

3. Unlock and disconnect the electrical connector.
4. Remove mounting bolt.
5. Remove sensor.

## 5.7L

The Crankshaft Position (CKP) sensor (4) is located at the right-rear side of the engine cylinder block (1). It is positioned and bolted into a machined hole in the engine block.

1. If equipped with AWD (All Wheel Drive) disconnect and isolate negative battery cable.
2. Raise vehicle.
3. If equipped with AWD (All Wheel Drive) remove starter motor.
4. Disconnect CKP electrical connector (2) at sensor.
5. Remove CKP mounting bolt (3).
6. Carefully twist sensor from cylinder block.
7. Remove sensor from vehicle.
8. Check condition of sensor o-ring.

## INSTALLATION

### 2.7L

1. Install sensor.
2. Install mounting bolt and tighten to 12 N·m (105 in. lbs.).
3. Connect the electrical connector and lock.
4. Lower vehicle.
5. Connect negative battery cable.

### 3.5L

1. Install sensor.
2. Install mounting bolt and tighten to 12 N·m (105 in. lbs.).
3. Connect the electrical connector and lock.
4. Lower vehicle.
5. Connect negative battery cable.

### 5.7L

1. Clean out machined hole in engine block.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor (4) into engine block with a slight rocking and twisting action.

**CAUTION:** Before tightening sensor mounting bolt (3), be sure sensor is completely flush to cylinder block. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt (3) and tighten to 12 N·m (106 in. lbs.) torque.
5. Connect electrical connector (2) to sensor.
6. Lower vehicle.

## INJECTOR-FUEL

### REMOVAL

#### 2.7L

**WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL INJECTOR(S), FUEL SYSTEM PRESSURE MUST BE RELEASED.**

To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

1. Release fuel system pressure. Refer to Fuel System Pressure Release Procedure in this section.
2. Disconnect negative cable to battery.
3. Remove intake manifold plenum, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
4. Lift Plenum up off of engine. Cover intake manifold to prevent foreign material from entering engine.
5. Disconnect fuel supply tube quick connect fittings at the rear of intake manifold, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
6. If the injector connectors are not tagged with their cylinder number, tag them to identify the correct cylinder
7. Remove electrical connectors from the fuel injectors.
8. Remove fuel rail (1) mounting bolts.
9. Lift fuel rail straight up off of the cylinder head.

10. Remove retaining clips from fuel injectors (2) at fuel rail.
11. Remove fuel injectors (2).
12. Repeat for remaining injectors.
13. Check injector O-ring for damage. If O-ring is damaged, it must be replaced. Replace the injector clip if it is damaged.

## 5.7L

**WARNING: THE FUEL SYSTEM IS UNDER CONSTANT PRESSURE EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL INJECTOR(S), FUEL SYSTEM PRESSURE MUST BE RELEASED.**

To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

1. Perform Fuel System Pressure Release Procedure.
2. Remove fuel injector rail. Refer to Fuel Injector Rail Removal/Installation.
3. Remove clip(s) (3) retaining injector(s) (4) to fuel rail.
4. Remove injector(s) from fuel rail.

## INSTALLATION

### 2.7L

1. Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.
2. Install retaining clips on fuel injectors.
3. Push injectors into fuel injector rail until clips are in the correct position.
4. Position fuel rail over cylinder head, and push rail into place. Tighten fuel rail mounting bolts to 11 N·m (100 in. lbs.) torque.
5. Connect fuel supply tube quick connect fittings at the rear of intake manifold, (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/QUICK CONNECT FITTING - STANDARD PROCEDURE).
6. Connect electrical connectors to fuel injectors.
7. Install intake manifold plenum, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
8. Connect negative cable to battery.
9. Use the scan tool to pressurize the fuel system. Check for leaks.

## SENSOR-OXYGEN

### REMOVAL

#### 2.7L

The engine uses two heated oxygen sensors, one in each exhaust manifold.

**CAUTION:** Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

**WARNING:** THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

**CAUTION:** When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

1. Remove the negative battery cable.
2. Raise vehicle and support.
3. Disconnect the heated oxygen sensor electrical connector.
4. Use a socket such as Snap-On YA8875 or a crow foot wrench to remove oxygen sensor.

1. Raise and support vehicle.
2. Disconnect wire connector from O2S sensor.

**CAUTION:** When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

3. Remove O2S sensor with an oxygen sensor removal and installation tool.
4. Clean threads in exhaust pipe using appropriate tap.

## INSTALLATION

### 2.7L

**Note:** When replacing an O2 Sensor, the PCM RAM memory must be cleared, either by disconnecting the PCM C-1 connector or momentarily disconnecting the Battery negative terminal. The NGC learns the characteristics of each O2 heater element and these old values should be cleared when installing a new O2 sensor. The customer may experience driveability issues if this is not performed.

**CAUTION:** Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

The engine uses two heated oxygen sensors, one in each exhaust manifold.

1. After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771-64 or equivalent. New sensors have compound on the threads and do not require an additional coating. Tighten the sensor to 28 N·m (20 ft. lbs.) torque.
2. Connect the heated oxygen sensor electrical connector.
3. Lower vehicle.
4. Install the negative battery cable.

1. Install O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.
2. Connect O2S sensor wire connector.
3. Lower vehicle.

## SHORT RUNNER VALVE

### OPERATION

The SRV system operates under WOT conditions above 5000 rpm to maximize engine performance. When actuated by the PCM, the SRV solenoid energizes, allowing mechanical linkage to redirect the intake air flow to six short runners. The PCM looks for a current spike when actuating the solenoid. If the spike is not present, the PCM sets the DTC.

### REMOVAL - 3.5L

1. Disconnect negative battery cable.
2. Remove the electrical connector.

3. Remove the 2 mounting bolts.
4. Remove the Short Runner Valve.

## INSTALLATION - 3.5L

1. Install the Sort Runner Valve. Align the slot in the valve with the tab on the intake manifold shaft.
2. Install the 2 mounting bolts.
3. Tighten bolts to 2.8 N·m (25 in. lbs.).

4. Connect the electrical connector.
5. Connect negative battery cable.

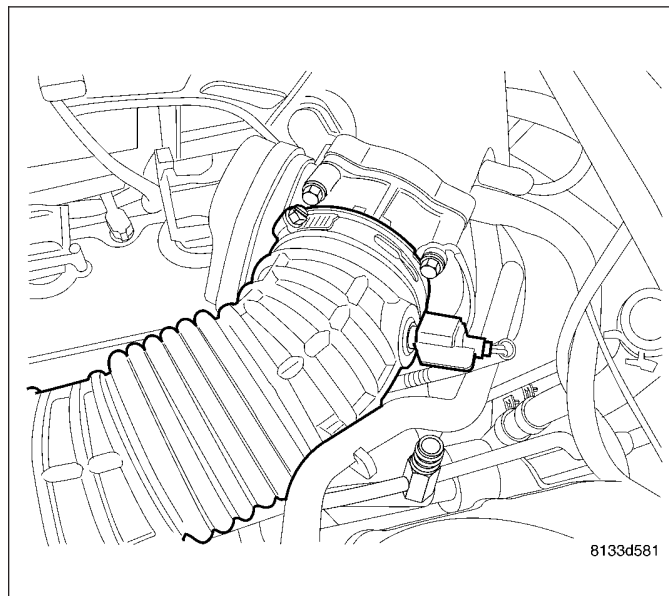

## THROTTLE BODY

### REMOVAL

#### 2.7L

1. Disconnect negative cable from battery
2. Disconnect inlet hose from from throttle body.

3. Disconnect electrical connectors.
4. Disconnect vacuum hose.
5. Remove 3 throttle body bolts.
6. Remove throttle body.

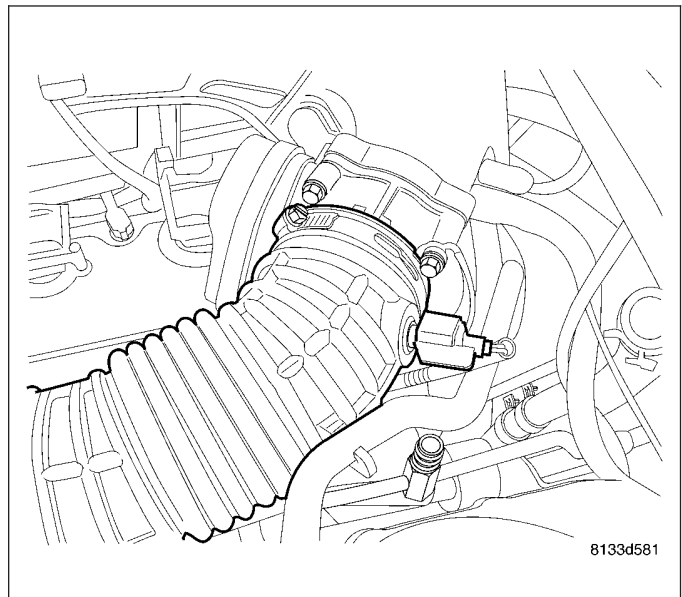

7. Clean mating surfaces.

### 3.5L

1. Disconnect negative cable from battery
2. Remove the inlet hose from throttle body.

3. Disconnect electrical connectors.
4. Disconnect vacuum hose.
5. Remove the throttle body support bracket.
6. Remove throttle body bolts.

7. Clean mating surfaces.

## 5.7L

**CAUTION:** Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

1. Remove rubber air duct at front of throttle body.
2. Disconnect electrical connector (3) at throttle body (1).
3. Remove four throttle body mounting bolts (2).
4. Remove throttle body from intake manifold.

5. Check condition of throttle body o-ring (2) at front of intake manifold (1).

## INSTALLATION

### 2.7L

**CAUTION:** Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

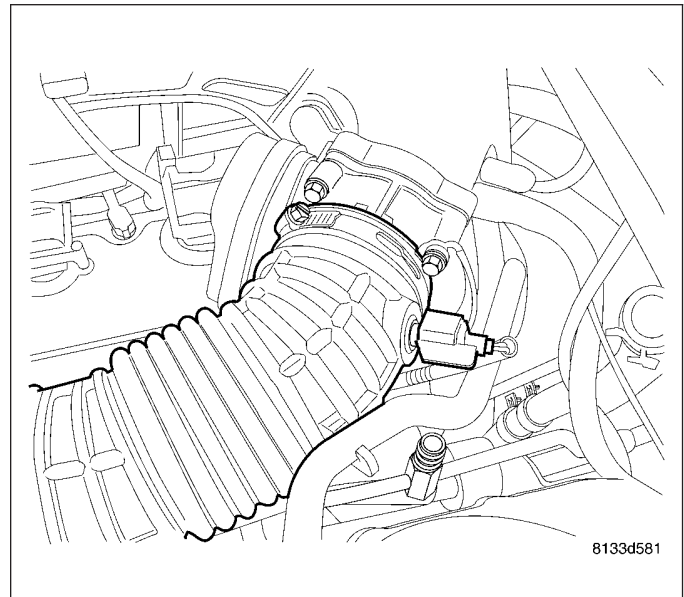

1. Install throttle body gasket.

2. Install throttle body and bolts.
3. Tighten bolts to 11.9 N·m (105 in. lbs.) torque.
4. Connect electrical connectors.
5. Connect vacuum hoses.

6. Install inlet hose and tighten clamp.
7. Connect negative cable to battery.
8. A Scan Tool may be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Relearn. If the relearn is not preformed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

### 3.5L

**CAUTION:** Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

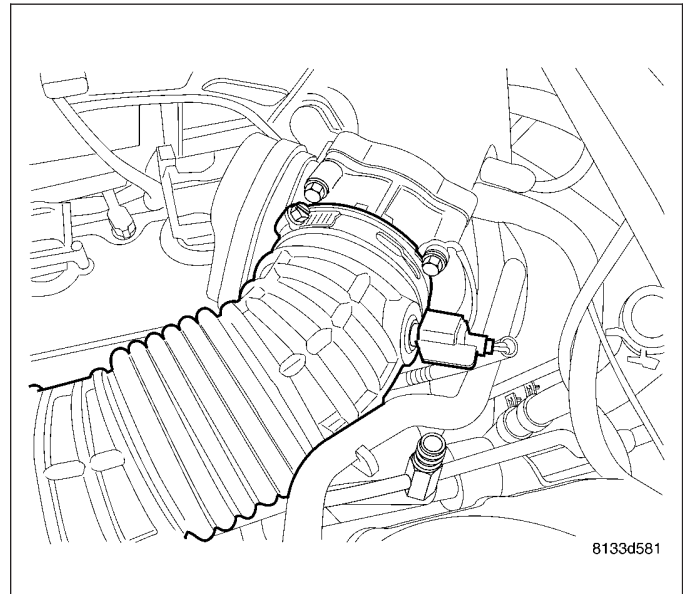

1. Install throttle gasket.

2. Install throttle body and bolts.
3. Tighten bolts to 11.9 N·m (105 in. lbs.) torque.
4. Install the throttle body support bracket to the bottom of the throttle body. Tighten the bolts to 27.1 N·m (20 ft. lbs.) torque.

5. Install inlet hose and tighten clamp.
6. Connect negative cable to battery.
7. A Scan Tool may be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Relearn. If the relearn is not preformed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

## 5.7L

1. Clean and check condition of throttle body-to-intake manifold o-ring (2).
2. Clean mating surfaces of throttle body and intake manifold (1).

**CAUTION:** Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

3. Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.
4. Install and tighten four mounting bolts (2). Refer to Torque Specifications.
5. Install electrical connector (3).
6. Install rubber air hose to throttle body.
7. A Scan Tool may be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Relearn. If the relearn is not performed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

## WARNING

**WARNING:** Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.

**WARNING:** Fluid level should be checked with the engine off to prevent personal injury from moving parts.

## CAUTION

**CAUTION:** Anytime the battery has been disconnected and is reconnected it is important that this be performed properly. The vehicle may be equipped with systems that require special calibration processes. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

**CAUTION:** When the power steering system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

**CAUTION:** When servicing power steering components, do not pinch off power steering hoses in any way to stop fluid flow. Damage to hoses may result.

## DIAGNOSIS AND TESTING

## HYDRAULIC FLOW AND PRESSURE TEST

The following procedure is used to test the operation of the power steering system on this vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform this test anytime a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following test is performed using the Power Steering Analyzer kit 6815 (with appropriate hoses) and Adapters from kit 6893. (Refer to 19 - STEERING - SPECIAL TOOLS)

1. Check power steering belt to ensure it is in good condition and adjusted properly.
2. Assemble Power Steering Analyzer as follows:
  - a. Gauge end (inlet) of Flow Meter And Gauge 6800 (3) – Hose 6905 (6), Hose 6713 (4), Adapter Tube 6844 (5)
  - b. Valve end (outlet) of Flow Meter And Gauge 6800 (3) – Hose 6959 (1), Adapter Fitting 6826 (2)
3. Unthread pressure hose tube nut at power steering pump.
4. Connect Adapter Tube 9091-1 to pressure fitting on power steering pump.
5. Connect power steering pressure hose to Adapter Fitting 9091-3.

2. Assemble Power Steering Analyzer as follows:
  - a. Gauge end (inlet) of Flow Meter And Gauge 6800 (3) – Hose 6905 (6), Hose 6713 (4), Adapter Tube 6844 (5)
  - b. Valve end (outlet) of Flow Meter And Gauge 6800 (3) – Hose 6959 (1), Adapter Fitting 6826 (2)
3. Unthread pressure hose tube nut at power steering pump.
4. Connect Adapter Tube 9091-1 to pressure fitting on power steering pump.
5. Connect power steering pressure hose to Adapter Fitting 9091-3.

- a. Gauge end (inlet) of Flow Meter And Gauge 6800 (3) – Hose 6905 (6), Hose 6713 (4), Adapter Tube 6844 (5)
- b. Valve end (outlet) of Flow Meter And Gauge 6800 (3) – Hose 6959 (1), Adapter Fitting 6826 (2)

- b. Valve end (outlet) of Flow Meter And Gauge  
6800 (3) – Hose 6959 (1), Adapter Fitting 6826  
(2)

3. Unthread pressure hose tube nut at power steering pump.

4. Connect Adapter Tube 9091-1 to pressure fitting on power steering pump.

5. Connect power steering pressure hose to Adapter Fitting 9091-3.

6. Open Analyzer test valve completely.
7. Start engine and allow to idle long enough to circulate power steering fluid through Analyzer flow meter and hoses.
8. Shut off engine and check fluid level; add fluid as necessary. Repeat Step 7 and Step 8 until air is bled from system.
9. Start engine and allow to idle.
10. Check Analyzer gauge (3) pressure. Initial pressure reading should be 50-125 psi (345-862 kPa). If pressure is higher, inspect hoses for restrictions and repair as necessary.
11. Increase engine speed to 1100 rpm and read Analyzer Flow Meter. The reading should be 2.2 GPM (8.2 LPM) minimum. If flow reading is below specification, replace power steering pump.

7. Start engine and allow to idle long enough to circulate power steering fluid through Analyzer flow meter and hoses.

8. Shut off engine and check fluid level; add fluid as necessary. Repeat Step 7 and Step 8 until air is bled from system.

9. Start engine and allow to idle.

10. Check Analyzer gauge (3) pressure. Initial pressure reading should be 50-125 psi (345-862 kPa). If pressure is higher, inspect hoses for restrictions and repair as necessary.

11. Increase engine speed to 1100 rpm and read Analyzer Flow Meter. The reading should be 2.2 GPM (8.2 LPM) minimum. If flow reading is below specification, replace power steering pump.

**CAUTION:** The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

12. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 50 psi (345 kPa) of each other.**

**Note:** Power steering pump maximum relief pressure is 1640-1740 psi (11307 to 11997 kPa).

- Power steering pump pressures above specifications but not within 50 psi (345 kPa) of each other, replace pump.
- Pressures within 50 psi (345 kPa) of each other but below specifications, replace pump.

**CAUTION:** Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

13. Completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest recorded output pressure reading against one stop is not within 50 psi (345 kPa) of the highest recorded reading at the other stop, the steering gear is leaking internally and must be replaced.

\* note: There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.

\*\* note: Power steering pump growl results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.

\* note: Steering shudder can be expected in new vehicles and vehicles with recent steering system repairs. Shudder should dissipate after the vehicle has been driven several weeks.

\*\* note: To evaluate this condition, it may be necessary to disconnect the coupling at the base of the steering column. Turn the steering wheel and feel or listen for internal rubbing in steering column. To avoid damaging the column clockspring, note the following. Before disconnecting coupling, place tires in the straight-ahead position and center steering wheel. Once disconnected, DO NOT rotate steering wheel more than one revolution in either direction and place steering wheel in original location before reconnecting coupling. If this position is lost, the steering column clockspring must be recentered following the procedure found within the procedure for steering column installation in the steering column section.

## COLUMN ELECTRICAL DIAGNOSIS

### DIAGNOSIS AND TESTING

## P0562-BATTERY VOLTAGE LOW

**P0562-BATTERY VOLTAGE LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously.
- **Set Condition:**  
If the voltage to the Steering Column Control Module (SCCM) is below 8.5 volts for more than one minute.

**Possible Causes**

RELATED DTC(S) PRESENT IN PCM  
INTERMITTENT BATTERY VOLTAGE LOW DTC  
(A913) FUSED B(+) CIRCUIT HIGH RESISTANCE  
(Z910) GROUND CIRCUIT HIGH RESISTANCE  
STEERING COLUMN CONTROL MODULE (SCCM)

**Diagnostic Test****1. RELATED DTC(S) PRESENT IN PCM**

Ignition on, engine not running.

With the scan tool, select View DTCs in the Powertrain Control Module.

**Are there any charging system or related battery voltage DTCs present in the PCM?**

**Yes** >> Refer to the appropriate symptom in the Driveability category.

**No** >> Go to 2

**2. DTC STATUS IS ACTIVE**

With the scan tool, select View DTCs in the Steering Column Control Module.

**Is the DTC status Active at this time?**

**Yes** >> Go to 3

**No** >> Go to 5

## P0562-BATTERY VOLTAGE LOW (CONTINUED)

### 3. (A913) FUSED B(+) CIRCUIT HIGH RESISTANCE

Turn the ignition off.

Remove the Steering Column Control Module in accordance with the Service Information.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (A913) Fused B(+) circuit in the Steering Column Control Module harness connector.

**Note: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go to 4

**No** >> Repair the (A913) Fused B(+) circuit.

### 4. (Z910) GROUND CIRCUIT HIGH RESISTANCE

Using a 12-volt test light connected to 12-volts, check the (Z910) Ground circuit in the Steering Column Control Module harness connector.

**Note: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Replace the Steering Column Control Module in accordance with the Service Information.

**No** >> Repair the (Z910) Ground circuit.

### 5. INTERMITTENT BATTERY VOLTAGE LOW DTC

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

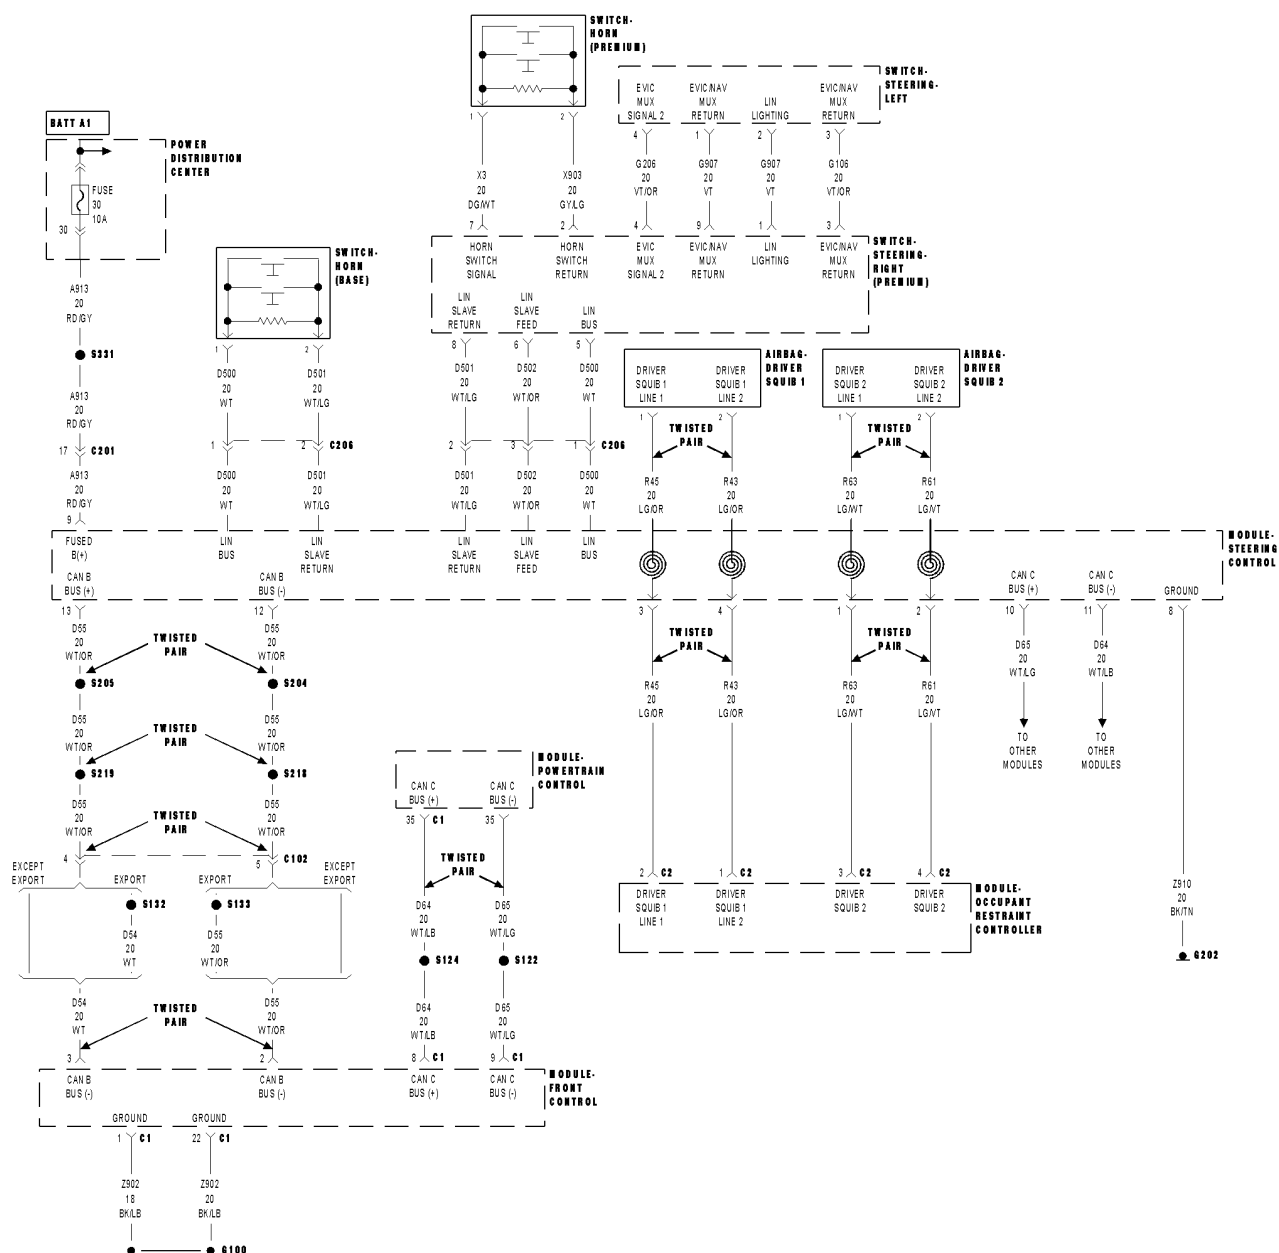

Look for the data to change or for the DTC to reset during the wiggle test.

**Were any problems found?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

## P0563-BATTERY VOLTAGE HIGH

**P0563-BATTERY VOLTAGE HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously.
- **Set Condition:**  
If the voltage to the Steering Column Control Module (SCCM) is above 16 volts for more than one minute.

Possible Causes
RELATED DTC(S) PRESENT IN THE PCM INTERMITTENT BATTERY VOLTAGE HIGH DTC (A913) FUSED B(+) CIRCUIT HIGH RESISTANCE (Z910) GROUND CIRCUIT HIGH RESISTANCE STEERING COLUMN CONTROL MODULE (SCCM)

**Diagnostic Test****1. RELATED DTC(S) PRESENT IN THE PCM**

Ignition on, engine not running.

With the scan tool, select View DTCs in the Powertrain Control Module.

**Are there any charging system or related battery voltage DTCs present in the PCM?**

- Yes** >> Refer to the appropriate symptom in the Driveability category.
- No** >> Go to 2

**2. DTC IS ACTIVE**

Start the engine. Allow the engine to idle for 2 minutes.

With the scan tool, select View DTCs in the Steering Column Control Module.

**Is the DTC status Active at this time?**

- Yes** >> Go to 3
- No** >> Go to 5

**P0563-BATTERY VOLTAGE HIGH (CONTINUED)****3. (A913) FUSED B(+) CIRCUIT HIGH RESISTANCE**

Turn the ignition off.

Remove the Steering Column Control Module in accordance with the Service Information.

Start the engine. Allow the engine to idle.

Using a 12-volt test light connected to ground, check the (A913) Fused B(+) circuit in the Steering Column Control Module harness connector.

**Note: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go to 4

**No** >> Repair the (A913) Fused B(+) circuit.

**4. (Z910) GROUND CIRCUIT HIGH RESISTANCE**

Using a 12-volt test light connected to 12-volts, check the (Z910) Ground circuit in the Steering Column Control Module harness connector.

**Note: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Replace the Steering Column Control Module (SCCM) in accordance with the Service Information.

**No** >> Repair the (Z910) Ground circuit.

**5. INTERMITTENT BATTERY VOLTAGE HIGH DTC**

The conditions necessary to set this DTC are not present at this time.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

While monitoring the scan tool data relative to this circuit, wiggle test the wiring and connectors.

Look for the data to change or for the DTC to reset during the wiggle test.

**Were any problems found?**

**Yes** >> Repair as necessary.

**No** >> Test complete.

**P0585-SPEED CONTROL MULTIPLEXED SWITCH 1/2 CORRELATION**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
The Steering Column Control Module (SCCM) has detected that a non-permissible combination has occurred in the Speed Control Switch.

Possible Causes
INTERMITTENT SPEED CONTROL MULTIPLEXED SWITCH 1/2 CORRELATION DTC
SPEED CONTROL SWITCH
STEERING COLUMN CONTROL MODULE (SCCM)

**Diagnostic Test****1. DTC IS ACTIVE**

**Note:** If **P0562-BATTERY VOLTAGE LOW** or **P0563-BATTERY VOLTAGE HIGH** is set along with this DTC, diagnose the battery voltage DTC first.

Ignition on, engine not running.

With the Scan Tool, select View DTCs in the Steering Column Control Module.

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 4

**2. SPEED CONTROL SWITCH**

Turn the ignition off.

Replace the Speed Control Switch in accordance with the Service Information.

Turn the ignition on.

Move the Speed Control Switch to each position several times.

With the Scan Tool, Clear Stored DTCs in the Steering Column Control Module.

With the Scan Tool, select View DTCs in the Steering Column Control Module.

Move the Speed Control Switch to each position several times while monitoring the Scan Tool.

**Does this DTC reset?**

**Yes** >> Go To 3

**No** >> Test Complete.

## P0585-SPEED CONTROL MULTIPLEXED SWITCH 1/2 CORRELATION (CONTINUED)

### 4. INTERMITTENT SPEED CONTROL MULTIPLEXED SWITCH 1/2 CORRELATION DTC

The conditions necessary to set this DTC are not present at this time.

While monitoring the scan tool data relative to this circuit, move the Speed Control Switch to each position several times.

Look for the DTC to reset while the switch is being moved to each position.

#### Were any problems found?

**Yes** >> Repair as necessary.

**No** >> Test complete.

## P1593—SPEED CONTROL SWITCH 1/2 STUCK

**P1593–SPEED CONTROL SWITCH 1/2 STUCK (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
The Steering Column Control Module (SCCM) has detected that the Speed Control Switches are not operating properly.

Possible Causes
INTERMITTENT SPEED CONTROL SWITCH 1/2 STUCK DTC SPEED CONTROL SWITCH STEERING COLUMN CONTROL MODULE (SCCM)

**Diagnostic Test****1. DTC IS ACTIVE**

**Note:** If **P0562–BATTERY VOLTAGE LOW** or **P0563–BATTERY VOLTAGE HIGH** is set along with this DTC, diagnose the battery voltage DTC first.

Ignition on, engine not running.

With the Scan Tool, select View DTCs in the Steering Column Control Module.

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 4

**2. SPEED CONTROL SWITCH**

Turn the ignition off.

Replace the Speed Control Switch in accordance with the Service Information.

Turn the ignition on.

Move the Speed Control Switch to each position several times.

With the Scan Tool, Clear Stored DTCs in the Steering Column Control Module.

With the Scan Tool, select View DTCs in the Steering Column Control Module.

Move the Speed Control Switch to each position several times while monitoring the Scan Tool.

**Does this DTC reset?**

**Yes** >> Go To 3

## C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously.
- **Set Condition:**  
The Steering Column Control Module (SCCM) has detected a code error from the Steering Angle Sensor.

Possible Causes
INTERMITTENT STEERING ANGLE SENSOR ERRATIC PERFORMANCE DTC
STEERING ANGLE SENSOR TONE WHEEL
STEERING ANGLE SENSOR
STEERING COLUMN CONTROL MODULE (SCCM)

### Diagnostic Test

#### 1. DTC IS ACTIVE

**Note:** If P0562–BATTERY VOLTAGE LOW or P0563–BATTERY VOLTAGE HIGH is set along with this DTC, diagnose the battery voltage DTC first.

Ignition on, engine not running.

Turn the steering wheel from stop to stop at least three times.

With the Scan Tool, select View DTCs in the Steering Column Control Module.

**Is the DTC status Active at this time?**

**Yes** >> Go to 2

**No** >> Go to 5

#### 2. STEERING ANGLE SENSOR TONE WHEEL

Turn the ignition off.

Remove the steering wheel in accordance with the Service Information.

Inspect the clockspring for loose mounting screws or damage.

Remove the clockspring in accordance with the Service Information.

Inspect the Steering Angle Sensor and Tone Wheel for damage, loose or missing mounting screws, etc.

**Were any problems found?**

**Yes** >> Repair or replace Sensor and/or Tone Wheel as necessary.

**No** >> Go To 3

**C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)****3. STEERING ANGLE SENSOR**

Replace the Steering Angle Sensor in accordance with the Service Information.

Ignition on, engine not running.

Turn the steering wheel from stop to stop at least three times.

With the Scan Tool, Clear Stored DTCs in the Steering Column Control Module.

Turn the steering wheel from stop to stop at least three times.

With the Scan Tool, select View DTCs in the Steering Column Control Module.

**B1489-STEERING WHEEL CONTROL AUDIO SWITCH CIRCUIT**

**B1489-STEERING WHEEL CONTROL AUDIO SWITCH CIRCUIT (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The Steering Wheel Control Audio Switch, when pressed, sends a multiplexed signal to the Right Steering Switch. The switching status is transferred to the Steering Column Control Module (SCCM) by way of the LIN bus, a serial sub-bus. The SCCM converts the data to CAN(B) and sends the message to the corresponding module on the bus.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
The Steering Column Control Module senses that the Steering Wheel Control Audio Switch is in the Set position for greater than 50 seconds.

Possible Causes

# B148A-STEERING WHEEL CONTROL MENU SWITCH CIRCUIT

**B148A-STEERING WHEEL CONTROL MENU SWITCH CIRCUIT (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The Steering Wheel Control Menu Switch is part of the Right Steering Switch. The switching status is transferred to the Steering Column Control Module (SCCM) by way of the LIN bus, a serial sub-bus. The SCCM converts the data to CAN(B) and sends the message to the corresponding module on the bus.

- **When Monitored:**

# B2332–HORN SWITCH INPUT CIRCUIT/PERFORMANCE

**B2332–HORN SWITCH INPUT CIRCUIT/PERFORMANCE (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

**Theory of Operation**

The Horn Switch is connected to the Right Steering Switch. The switching status is transferred to the Steering Column Control Module (SCCM) by way of the LIN bus, a serial sub-bus. The SCCM converts the data to CAN(B) and sends the message to the corresponding module on the bus.

- **When Monitored:**  
Continuously with the ignition on.

## COLUMN - SERVICE INFORMATION

### DESCRIPTION

The tilt , telescoping (10) and electronic telescoping (7) column has been designed to be serviced as an assembly; less wiring (5), switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

To service the steering wheel, switches or airbag, refer to Restraints and follow all WARNINGS and CAUTIONS.

**Note:** When servicing the steering wheel after removing the old bolt a new bolt must be used when installing.

**Note:** When servicing the steering coupler a new bolt must be used when installing.

813728e3

**WARNING:** THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

**CAUTION:** Do not hammer on steering column shaft. This may cause damage to the column internally.

**CAUTION:** Do not attempt to remove or modify any part of the column.

## DIAGNOSIS AND TESTING

### STEERING COLUMN

If the vehicle is involved in a front end collision and/or the air bag has deployed, the steering column must be replaced.

### REMOVAL

**WARNING:** Before servicing the steering column the airbag system must be disarmed. Refer to electrical restraint system for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

**CAUTION:** All fasteners must be torqued to specification to ensure proper operation of the steering column.

**Note:** If steering column being removed is an electric telescoping column and it is being reused, place column in mid-tilt position before removal to ease installation.

1. Position the front wheels **straight-ahead**.
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.
4. Remove the airbag (4), (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).

5. Remove the steering wheel retainer bolt (2) then slide the steering wheel (3) off the shaft.

6. Remove the steering column opening cover (1)(Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

7. Remove the steering column opening reinforcement (1).

8. Remove at least one clockspring screw (1), (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

9. Back out the set screw (1) through the access hole (3) in the steering column control module (SCCM) (2) securing the multi function sccm assembly.

10. Pull the sccm assembly (1) off the steering column shaft.

11. Remove the roll top shroud (1).

12. Remove the two retaining nuts (1) at the bulkhead (2) for the steering column.

13. Remove the instrument cluster assembly. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL)

14. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

15. Remove the pinch bolt (4) at the lower coupling shaft (5).
16. Slide the steering shaft (3) out of the lower coupling shaft (5).
17. Lower vehicle.

18. If equipped with electronic telescoping column, remove the screws (3) mounting the brace (1) to the steering column (2) and support beam bracket.

19. Remove the lower steering column mounting pivot bolt and nut (2).

**CAUTION:** When handling the steering column use care to avoid holding the column by any part of the tilt/telescope mechanism or by the shaft boot. The column should be held by its mounting bracket and the shaft by the exposed portions.

20. Remove the two upper mounting bolts (1) from the steering column (3)
21. Remove the steering column assembly from the vehicle.
22. Transfer remaining parts if necessary to the new column.

## INSTALLATION

**WARNING:** Before servicing the steering column the airbag system must be disarmed. Refer to electrical restraint system for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

**CAUTION:** When handling the steering column use care to avoid holding the column by any part of the tilt/telescope mechanism or by the shaft boot. The column should be held by its mounting bracket and the shaft by the exposed portions.

**CAUTION:** All fasteners must be torqued to specification to ensure proper operation of the steering column.

**Note:** New bolts must be used for reinstallation.

1. Position the steering column (2) on the instrument panel and loosely install the upper mounting screws (1).

2. Firmly slide the steering column upward against the instrument panel and hand tighten the pivot bolt and nut (2).

3. Tighten the steering column upper mounting screws (1) to 30 N·m (22 ft. lbs.).

4. If equipped with electronic telescoping column, Install the screws (3) fastening the brace (1) to the steering column (2) and support beam bracket. First, tighten mounting screw at the column to 29 N·m (21 ft. lbs.). Then, tighten mounting screw at the support beam to 12 N·m (106 in. lbs.).

**CAUTION:** When handling the steering column, care must be taken not to squeeze the boot or distort the seal to the body.

5. Center the two retaining nuts (1) at the bulkhead (2) for the steering column and tighten mounting nuts to 7 N·m (62 in. lbs.).
6. Raise and support vehicle.

7. Check and make sure plastic collar (2) on column shaft is engaged in groove within boot (1).

8. Align the pin on the steering shaft with the slot in the lower coupling shaft and slide the steering shaft (3) into the lower coupling (5).
9. Install a **NEW** pinch bolt (4). Tighten pinch bolt to 31 N·m (23 ft. lbs.).
10. Lower the vehicle.
11. Install the instrument cluster. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - INSTALLATION)

12. Install the roll top shroud (1).

13. Install the SCCM assembly (1) onto the steering column.

14. Tighten the set screw (1) securing the SCCM assembly (2).

15. Tighten clockspring screws (1) that were backed out to keep the clockspring from unwinding (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCK-SPRING - REMOVAL).

16. Install the steering column opening reinforcement (1).

17. Install the steering column opening cover (1).

18. Align the spline on the steering wheel hub to shaft.
19. Then install the steering wheel (3) and install a **NEW** retainer bolt (2). Tighten the bolt to 70 N·m (52 ft. lbs.).

20. Install the airbag (4) (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
21. Install the negative battery terminal on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
22. Test the operation of the horn, lights and any other functions that are steering column operated.

## COUPLING - STEERING

### REMOVAL

1. Fully extend or pull out adjustable steering column.
2. Center the steering wheel and lock the steering wheel with a steering wheel holder.
3. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
4. Remove the pinch bolt (4) connecting the steering shaft (3) to the lower steering coupling shaft (5).
5. Separate the lower coupling (5) from the steering shaft (3).

6. Remove the pinch bolt (1) from the steering coupling (2) at the steering gear (3).
7. Carefully slide the coupling (2) from the steering gear (3).
8. Remove the steering coupling (2) from the vehicle.

## INSTALLATION

1. Carefully slide the lower coupling (2) onto the splines of the steering gear (3).
2. Install a **NEW** pinch bolt (1) to the steering coupling (2) at the steering gear (3). Tighten the pinch bolt to 54 N·m (40 ft. lbs).

3. Align the pin on the steering shaft with the slot in the lower coupling shaft and slide the shaft (3) into the lower coupling (5).
4. Install a **NEW** steering coupling pinch bolt (4). Tighten the pinch bolts to 31 N·m (23 ft. lbs).

5. Check and make sure the plastic collar (2) on the column shaft is engaged in the groove within the boot (1).
6. Lower the vehicle.
7. Remove the steering wheel holder.
8. Check the operation of the steering column for binding or noises.

## STEERING COLUMN CONTROL MODULE

### DESCRIPTION

Tilt and telescope steering columns are standard on all models. On 300 Hemi C and international 300C models the tilt and telescope functions are powered and are also included in the standard Memory System settings. Combined with available power seats and optional power adjustable pedals, the tilt and telescope steering column gives the driver every known adjustment to obtain a comfortable driving position. Both columns provide 2.36 inches (60 mm) of telescoping adjustment and 5.2 degrees of tilt. The adjustments are continuously variable for maximum adaptability.

A lever on the left side of the column controls powered adjustment. Fore and aft motion of the lever operates the telescoping mechanism. Up and down motion operates the tilt mechanism. Two electric motors turning threaded actuators move the column. The mechanisms lock in place when movement stops.

The Steering Column Control Module (SCCM) is mounted on the steering column and is removed as a complete unit. The components that are contained within this unit are:

- **Clockspring** - is attached to the top of the SCCM with three screws. The clockspring connector passes through the body of the SCCM and its terminals slide into the male side of the self docking connector within the Steering Column Module (SCM). (Refer to 8 - ELECTRICAL/RESTRAINTS - DESCRIPTION).
- **Multi-Function Switch** - is the middle left lever, and is plugged into, and mounting pins pass through, the SCM secured to the SCCM housing by three screws (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DESCRIPTION).
- **Speed Control Switch** - is the top left lever and is plugged into the SCM and held in place by the three screws of the clockspring (Refer to 8 - ELECTRICAL/SPEED CONTROL - DESCRIPTION).
- **Steering Angle Sensor (if equipped with Electronic Stability Program (ESP))** - is mounted on the right side of the SCCM, below the clockspring and is responsible for informing the ESP of steering angle.
- **Steering Control Module (SCM)** - is the module located in the bottom of the SCCM, retained by three screws, and is the mating point for all the switches and clockspring located in the SCCM.
- **Tilt/Telescopic Lever/Switch (if equipped)** - is the bottom left lever and is used for steering wheel tilt and telescoping. It is plugged into the SCM and if not equipped, will be replaced by a support bar. It is held in place by one of the three clockspring screws and one of its own retaining screws.

The SCCM communicates via the Local Interconnect Network (LIN) serial data bus. This is an ultra-low voltage serial data bus that allows the following components to communicate with the Controller Area Network (CAN) B and C data buses.

- Steering Wheel Switches
- Horn
- Speed Control Switch

- Multi-function Switch
- Tilt/Telescoping Switch (if equipped)
- Steering Angle Sensor (if equipped with Electronic Stability Program (ESP))
- Steering Column Module (SCM)

## REMOVAL

**WARNING:** Before servicing the steering column the airbag system must be disarmed. Refer to electrical restraint system for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury or death.

**CAUTION:** All fasteners must be torqued to specification to ensure proper operation of the steering column.

1. Position the front wheels **straight-ahead**.
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.
4. Remove the driver airbag (4) (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

5. Remove the steering wheel retainer bolt (2) then slide the steering wheel (3) off the shaft.

6. Remove at least one clockspring screw (1), (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL). This will help keep the clockspring from uncentering itself.

7. Back out the set screw (1) through the access hole (3) in the bottom of the Steering Column Control Module (SCCM) (2).

8. Pull the SCCM (1) off the steering column shaft.

## DISASSEMBLY

1. Remove the three clockspring screws (1).

2. Carefully pull straight up on clockspring to remove (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCK-SPRING - REMOVAL).

**Note:** After the clockspring is removed, there is only one more screw on the top side of the SCCM that needs to be removed and is located at approximately the six o'clock position on the SCCM. It holds the lower side of the steering angle sensor, the lower side of the electric tilt lever assembly, or the strengthening strut if not equipped with electric tilt.

3. **If equipped with ESP**, remove the steering angle sensor screw located at the six o'clock position on the SCCM and remove the steering angle sensor (1) from the SCCM (2). **If not equipped with ESP**, there will be a plastic insert there for strengthening of the SCCM that will lift right out.

4. **If equipped with manual telescoping column**, remove the strut screw, located at the six o'clock position, and strut (1).

5. If equipped with electronic telescoping column, remove the one remaining screw (4) to electric tilt located at the six o'clock position, and remove stalk and switch (3).

6. Remove the speed control switch (1).

7. Remove the steering column tilt/telescoping lever (3) screw (4) located at the six o'clock position.

8. Remove the three screws (1) from the bottom of the SCCM for the multi-function switch and SCCM circuit board.

9. Separate the multi-function switch from the SCCM circuit board.

**ASSEMBLY**

1. Position the Steering Column Control Module (SCCM) circuit board onto the multi-function switch.

2. Install the multi-function switch and circuit board and tighten the three screws (1) from the bottom of the SCCM.

3. Install the steering column telescoping lever (3).

4. Install the speed control switch (1).

5. **If equipped with manual telescoping column**  
Install the strut (1).

6. If equipped with electronic telescoping column, install the electric tilt lever and switch (3).

7. If equipped with ESP, install the steering angle sensor and screw (3) located at the six o'clock position.

8. Install the clockspring and screws (1).

9. If equipped with ESP Recalibrate the steering angle sensor using the scan tool.

## INSTALLATION

1. Install the SCCM (1) onto the steering column.

2. Tighten the set screw (1) securing the SCCM (2).

3. Tighten clockspring screws (1) that were backed out to keep the clockspring from unwinding (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

4. Align the spline on the steering wheel hub to shaft and install the steering wheel (3).
5. Install a **NEW** retainer bolt (2). Tighten the bolt to 70 N·m (52 ft. lbs.).

6. Install the driver airbag (4) (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
7. Install the negative battery cable on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
8. Test the operation of the horn, lights and any other functions that are steering column operated.

## SHROUD

### REMOVAL

**WARNING:** Before servicing the steering column the airbag system must be disarmed. Refer to electrical restraint system for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury or death.

**CAUTION:** All fasteners must be torqued to specification to ensure proper operation of the steering column.

1. Position the front wheels **straight-ahead**.
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.
4. Remove the driver airbag (4) (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

5. Remove the steering wheel retainer bolt (2), then slide the steering wheel (3) off the column shaft.

6. Remove at least one clockspring screw (1), (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL). This will help keep the clockspring from uncentering itself.

7. Back out the set screw (1) through the access hole (3) in the bottom of the Steering Column Control Module (SCCM) (2).

8. Pull the SCCM (1) off the steering column shaft.

9. Remove the steering column opening cover (1)(Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).

10. Remove the steering column opening reinforcement (1).

11. Remove the 4 shroud screws (2)
12. **If equipped with manual telescoping steering column** pull the lever (3) downwards.

13. Remove the shroud (1).

## INSTALLATION

1. Install the shroud (1) over the steering column (2).

2. Install the four shroud screws (2).

3. Install the steering column opening reinforcement (1).

4. Install the steering column opening cover (1).
5. Install the SCCM (1) onto the steering column.

6. Tighten the set screw (1) securing the SCCM (2).

7. Tighten clockspring screws (1) that were backed out to keep the clockspring from unwinding (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

8. Align the spline on the steering wheel hub to the column shaft, then install the steering wheel (3).
9. Install a **NEW** retainer bolt (2). Tighten the bolt to 70 N·m (52 ft. lbs.).

10. Install the driver airbag (4) (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
11. Install the negative battery terminal on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
12. Test the operation of the horn, lights and any other functions that are steering column operated.

## WHEEL - STEERING

### REMOVAL

**WARNING:** Before servicing the steering column the airbag system must be disarmed. Refer to electrical restraint system for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

**CAUTION:** All fasteners must be torqued to specification to ensure proper operation of the steering column.

1. Position the front wheels **straight-ahead**.
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.
4. Remove the airbag (4). (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

5. Remove the steering wheel retainer bolt (2), then slide the steering wheel (3) off the shaft.
6. If wheel is being replaced, transfer attached components as necessary.

## INSTALLATION

1. Align the spline on the steering wheel hub to the column shaft, then install the steering wheel (3).
2. Install a **NEW** retainer bolt (2). Tighten the bolt to 70 N·m (52 ft. lbs.).

3. Install the airbag (4) (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - INSTALLATION).
4. Install the negative battery terminal on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). (Refer to 8 - ELECTRICAL/ BATTERY SYSTEM - STANDARD PROCEDURE)
5. Test the operation of the horn, lights and any other functions that are steering column operated.

## LEVER-ELECTRONIC TELESCOPING

### REMOVAL

**WARNING:** Before servicing the steering column the airbag system must be disarmed. Refer to electrical restraint system for service procedures. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

**CAUTION:** All fasteners must be torqued to specification to ensure proper operation of the steering column.

1. Position the front wheels **straight-ahead**.
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.
4. Remove the airbag (4). (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).

5. Remove the steering wheel retainer bolt (2) then slide the steering wheel (3) off the column shaft.

6. Remove the clockspring screws (1), (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

7. **If equipped with ESP**, remove the steering angle sensor (1) from the SCCM (2).

8. Remove the telescoping steering lever screws (4) from the SCCM (5).

9. Remove the telescoping lever from the SCCM.

## INSTALLATION

1. Install the telescoping lever to the SCCM.

2. Install the screws (4) fastening the telescoping steering lever to the SCCM (5).

3. If equipped with ESP, install the steering angle sensor (1) to the SCCM (2).

4. Install the clockspring screws (1). (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

5. Align the spline on the steering wheel hub to shaft.
6. Then install the steering wheel (3) and install a **NEW** retainer bolt (2). Tighten the bolt to 70 N·m (52 ft. lbs.).

7. Install the airbag (4). (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).
8. Install the negative battery terminal on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). (Refer to 8 - ELECTRICAL/ BATTERY SYSTEM - STANDARD PROCEDURE)
9. Test the operation of the horn, lights and any other functions that are steering column operated.

GEAR

DESCRIPTION

The rack and pinion steering gear is made up of two main components, the pinon shaft and the housing (5). Other components are the outer tie rod ends (1), inner tie rod ends (2), boots (3) and mounting bushings (4). The gear cannot be adjusted or internally serviced. If a malfunction or a fluid leak occurs, the gear must be replaced as an assembly. The only serviceable component on the steering gear is the outer tie rod (1).

REMOVAL

1. Drain and siphon the power steering fluid from the reservoir.
2. Raise and support the vehicle.
3. Remove both front tires.

4. Loosen the jam nut (3).
5. Remove the outer tie rod end nut (1) from the knuckle (5).

6. Separate the outer tie rod end (1) from the knuckle with Remover 9630 (2) (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).

7. Remove the steering coupling (2) lower pinch bolt (1) at the gear (3) (Refer to 19 - STEERING/COL-

## UMN/STEERING COUPLING - REMOVAL).

8. Disconnect the pressure line (3) at the gear (2) (Refer to 19 - STEERING/PUMP/HOSES - REMOVAL).
9. Disconnect the return line (1) from the gear (2)(Refer to 19 - STEERING/PUMP/HOSES - REMOVAL).

10. Remove the steering gear mounting bolts (1).
11. Remove the outer tie rods from the old gear if needed on replacement gear. Count the number of turns off for each tie rod for reference upon installation to replacement gear.

## INSTALLATION

1. If necessary, install the outer tie rods from the old gear to the replacement. Install each outer tie rod the same amount of threads as it was installed on old gear. This will get the toe setting close, saving some time when the toe is set later in this procedure.
2. Install the steering gear mounting bolts (1). Tighten to 142 N·m (105 ft.lbs.).

3. Reconnect the return line (1) to the gear (2). Tighten to 47 N·m (35 ft.lbs.). (Refer to 19 - STEERING/PUMP/HOSES - INSTALLATION).
4. Reconnect the pressure line (3) to the gear (2). Tighten to 47 N·m (35 ft.lbs.). (Refer to 19 - STEERING/PUMP/HOSES - INSTALLATION).

5. Install the steering coupling (2) to the gear (3). Install a **NEW** pinch bolt. Tighten bolt to 54 N·m (40 ft. lbs.). (Refer to 19 - STEERING/COLUMN/STEERING COUPLING - INSTALLATION).

6. Install the tie rod end (5) to the knuckle (2), then install the nut (1). Tighten to 85 N·m (63 ft. lbs.)

7. Install both front tires. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
8. Lower the vehicle.
9. Fill the power steering reservoir and perform initial operation procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)
10. Set wheel toe pattern, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

11. Tighten the tie rod jam nuts (3) to 75 N·m (55 ft. lbs.).

## TIE ROD - OUTER

### DIAGNOSIS AND TESTING

#### OUTER TIE ROD END

**Note:** If the outer tie rod end is equipped with a lubrication fitting, grease the joint then road test the vehicle before performing test.

1. Raise the front of the vehicle. Place safety floor stands under both lower control arms as far outboard as possible. Lower the vehicle to allow the stands to support some or all of the vehicle weight.
2. Remove the front tires.
3. Mount a dial indicator solidly to the vehicle steering knuckle and then zero the dial indicator.
4. Position indicator plunger on the topside of the outer tie rod end.

**Note:** The dial indicator plunger must be perpendicular to the machined surface of the outer tie rod end.

5. Position a pry bar in order to pry downwards on the outer tie rod end.
6. If the travel exceeds 0.5 mm (0.020 in.), replace the outer tie rod end (Refer to 19 - STEERING/LINKAGE/TIE ROD END - REMOVAL).
7. If the outer tie rod end is within specs reinstall the front tires (Refer to 22 - TIRES/WHEELS/WHEELS - STANDARD PROCEDURE).

## REMOVAL

**Note:** Do not twist the boot anytime during removal or installation.

1. Loosen the jam nut (3).
2. Remove the outer tie rod end (2) nut (1) from the ball stud.

3. Separate the outer tie rod (1) from the knuckle with Remover 9630 (2).
4. Unthread the outer tie rod from the inner tie rod. **Count the number of turns when removing the tie rod, This will give a good starting point when reassembling and setting toe adjustment.**

## INSTALLATION

**Note:** Do not twist the inner tie rod boot at anytime during removal or installation.

1. Thread the outer tie rod (2) onto the inner tie rod (4), the same number of turns as when removed.

2. Install the outer tie rod end (5) into the steering knuckle (2).
3. Install and tighten the nut (1) on the outer tie rod end ball stud to 85 N·m (63 ft. lbs.).
4. Set wheel toe pattern, (Refer to 2 - SUSPENSION/ WHEEL ALIGNMENT - STANDARD PROCEDURE).
5. Tighten jam nut (3) to 75 N·m (55 ft. lbs.).

## PUMP

### DESCRIPTION

Hydraulic pressure for operation of the power steering gear is provided by a belt-driven all-aluminum power steering pump. It is a droop flow rate and constant displacement type pump. A common power steering pump, mounted in a common location (left front of engine), is standard on all models.

8134e010

### DIAGNOSIS AND TESTING

#### PUMP LEAKAGE

The pump is serviced as an assembly and should not be disassembled.

Check for leaks in the following areas:

- Pump shaft seal behind the pulley
- Pressure and return lines
- Flow control valve fitting

## STANDARD PROCEDURE

### POWER STEERING PUMP INITIAL OPERATION

**WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.**

**CAUTION: MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.**

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal temperature.

1. Turn steering wheel all the way to the left.
2. Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two (2) minutes.
3. Raise the front wheels off the ground.
4. Slowly turn the steering wheel lock-to-lock 20 times with the engine off while checking the fluid level.

**Note: Vehicles with long return lines or oil coolers turn wheel 40 times.**

5. Start the engine. With the engine idling maintain the fluid level.
6. Lower the front wheels and let the engine idle for two minutes.
7. Turn the steering wheel in both direction and verify power assist and quiet operation of the pump.

If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

**CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.**

## REMOVAL

1. Drain and siphon the power steering fluid from the pump.
2. Remove the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Remove the serpentine drive belt,(Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
4. Remove the supply hose at the pump.
5. Remove the pressure hose from the pump.

6. Remove 3 pump mounting bolts (2) through pulley access holes.
7. Remove the pump (1) from the engine.

## INSTALLATION

1. Align the pump with the mounting holes on the engine.
2. Install 3 pump mounting bolts through the pulley access holes. Tighten the bolts to 28 NM (21 ft. lbs.).
3. Install the pressure hose to the pump. Tighten the pressure line to 47 NM (35 ft. lbs.).
4. Install the supply hose to the pump.

5. Install the serpentine drive belt. (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
6. Fill the power steering pump and perform pump initial operation procedure. (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)
7. Install the air cleaner housing and inlet tube. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION)

## FLUID

### DESCRIPTION

The recommended fluid for the power steering system is Mopar® ATF+4 Automatic Transmission Fluid (MS-9602). Mopar® ATF+4, when new, is red in color. ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.**

ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

## STANDARD PROCEDURE

### POWER STEERING FLUID LEVEL CHECKING

**WARNING:** Fluid level should be checked with the engine off to prevent personal injury from moving parts.

**CAUTION:** MOPAR® ATF+4 is to be used in the power steering system. No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if any other fluid is used, and do not overfill.

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two ranges listed on the dipstick, COLD and HOT. Before opening power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick. When the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F), the fluid level should read between the minimum and maximum area of the cold range. When the fluid is hot, fluid level is allowed to read up to the highest end of the HOT range. Only add fluid when the vehicle is cold.

**Use only Mopar® ATF+4 in the power steering system.** Do not overfill the power steering system.

## FLUID COOLER

### REMOVAL

1. Siphon the power steering system.
2. Raise and support the vehicle.
3. Remove the lower splash shield.
4. Disconnect the return hose (1) at the cooler (2) from the gear.
5. Disconnect the return hose (3) at the cooler (2) from the reservoir.

8137b482

6. Push in on the cooler mounting clip tabs.
7. Remove the cooler from the clips.

## INSTALLATION

1. Install the cooler over the mounting clips and past the retaining tabs allowing it to lock into place.

2. Reconnect the return hose (3) at the cooler (2) from the reservoir.
3. Reconnect the return hose (1) at the cooler (2) from the gear.
4. Install the lower splash shield.
5. Lower the vehicle.
6. Fill and bleed the power steering system (Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).

## HOSE - PRESSURE

### REMOVAL

1. Drain and siphon the power steering fluid from the reservoir.
2. Remove the air cleaner housing and inlet tube. (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL)
3. Disconnect the pressure line at the pump.
4. Raise and support the vehicle.
5. Remove the lower splash shield.
6. Disconnect the pressure line retainer at the engine cradle.
7. Remove the pressure and return line mounting bracket bolt (1) from the engine cradle (2).

8. Disconnect the pressure line (3) at the gear (2).
9. Remove the pressure line (3) from the vehicle.

## INSTALLATION

1. Install the pressure line (3) to the vehicle.
2. Reconnect the pressure line (3) to the gear (2). Tighten to 47 N·m (35 ft.lbs.).

3. Install the pressure and return line routing bracket to the engine cradle.
4. Install the pressure line retainer bolt to the engine cradle.
5. Install the lower splash shield.
6. Lower the vehicle.
7. Reconnect the pressure line to the pump. Tighten to 47 N·m (35 ft.lbs.).
8. Fill the power steering reservoir,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
9. Install the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

## HOSE - RETURN

### REMOVAL

#### COOLER TO RESERVOIR

1. Remove the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
2. Drain and siphon the power steering fluid from the reservoir.
3. Disconnect the return hose (1) at the reservoir (2).
4. Remove the upper radiator closer panels.
5. Disconnect the cooler return hose (1) at the cooler (2).
6. Remove the cooler return hose from the vehicle.

#### GEAR TO COOLER

1. Drain and siphon the power steering fluid from the reservoir
2. Raise and support the vehicle.
3. Remove the lower splash shield.
4. Disconnect the return hose (1) from the gear at the cooler (2).

5. Remove the return and pressure routing bracket nut at the engine cradle.
6. Disconnect the return line (1) at the gear (2).
7. Remove the return hose (1) from the vehicle.

## INSTALLATION

### COOLER TO RESERVOIR

1. Install the cooler return hose to the vehicle.
2. Reconnect the cooler return hose at the cooler.
3. Install the upper radiator closeout panels.
4. Reconnect the cooler return hose (1) at the reservoir (2).
5. Fill the power steering reservoir,(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
6. Install the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

## GEAR TO COOLER

1. Install the return line (1) to the vehicle.
2. Reconnect the return line (1) to the gear (2). Tighten to 47 N·m (35 ft. lbs.).
3. Install the pressure and return line routing bracket to the engine cradle.

4. Install the return hose (1) at the cooler (2).
5. Install the lower splash shield.
6. Lower the vehicle.
7. Fill the power steering reservoir.(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)

## HOSE - SUPPLY

### REMOVAL

1. Remove the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
2. Drain and siphon the power steering fluid from the reservoir.

3. Disconnect the pump supply hose (3) at the pump (1).

4. Disconnect the supply hose (3) at the reservoir (2).
5. Remove the supply hose from the vehicle.

## INSTALLATION

1. Install the supply hose (3) to the vehicle.
2. Reconnect the supply hose (3) to the reservoir (2).

3. Reconnect the supply hose (3) at the pump (1).
4. Fill the power steering reservoir.(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE)
5. Install the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

## PULLEY

### REMOVAL

1. Remove power steering pump from engine. (Refer to 19 - STEERING/PUMP - REMOVAL)

**CAUTION:** Do not hammer on power steering pump pulley or shaft to remove power steering pump pulley. This will damage the pulley and the power steering pump.

2. Mount Puller, Special Tool C-4333 (2) , on power steering pump pulley (3). Mount puller (with power steering pump (1) in a vise. This will keep shaft of power steering pump from turning while removing pulley (3).
3. Tighten puller and remove pulley from shaft of power steering pump.

**Note:** Replace power steering pump pulley if bent, cracked, or loose.

4.

### INSTALLATION

**CAUTION:** Do not hammer on power steering pump pulley (2) or shaft to install power steering pump pulley. This will damage the pulley and the power steering pump.

1. Place power steering pump pulley (2) squarely on end of power steering pump shaft.
2. Place Installation Spacer Special Tool 6936 (1), on top of the power steering pump pulley (2).

3. Mount Installer, Special Tool C-4063 (1), in internal threads of the power steering pump shaft and against Special Tool 6936 (2) on power steering pump pulley.
4. Ensuring that special tool and pulley remain aligned with pump shaft, force pulley onto power steering pump shaft until Special Tool 6936 (2) is against the end of the power steering pump shaft.  
**When Special Tool 6936 (2) is against the shaft of the power steering pump, Special Tool C-4063 (1) will no longer be able to be turned.**
5. Remove Installer from power steering pump.
6. Install power steering pump and mounting bracket back on engine.(Refer to 19 - STEERING/PUMP - INSTALLATION).

## RESERVOIR

### REMOVAL

1. Drain and siphon the power steering fluid from the reservoir (2).
2. Remove the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
3. Disconnect the supply hose (3) at the reservoir (2).
4. Disconnect the cooler return hose (1) to the reservoir (2).
5. Remove the reservoir (2) from the coolant bottle (4).

## INSTALLATION

1. Install the reservoir (2) to the coolant bottle (4).
2. Reconnect the cooler return hose (1) to the reservoir (2).
3. Reconnect the supply hose (3) to the reservoir (2).
4. Fill the power steering reservoir (2),(Refer to 19 - STEERING/PUMP - STANDARD PROCEDURE).
5. Install the air cleaner housing and inlet tube (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).

## **AUTOMATIC TRANSMISSION NAG1 - ELECTRICAL DIAGNOSTICS**

### **DIAGNOSIS AND TESTING**

## NAG1 PRE-DIAGNOSTIC CHECK OUT

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

### Diagnostic Test

#### 1. NAG1 PRE-DIAGNOSTIC CHECK OUT

**Note:** Low fluid level can be the cause of many transmission problems. If the fluid level is low, locate and repair the leak then check and adjust the fluid level in accordance with the Service Information.

**Note:** Always perform diagnostics with a fully charged battery to avoid false symptoms.

With the scan tool, read the engine DTCs. Check and repair all engine DTCs prior to performing transmission symptom diagnostic procedures.

With the scan tool, read and record all Transmission DTCs.

**Note:** If the TCM detects and stores a DTC, the TCM also stores the vehicles operating conditions under which the DTC originally set and is located in scan tool under Environmental Data. Before erasing any stored DTCs, record any available data to assist in duplicating the conditions in which the DTC originally set.

**Note:** Check connectors - Clean/repair as necessary.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.

Most DTCs set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.

**Note:** Verify flash level of transmission controller. Some problems are corrected by software upgrades to the transmission controller. Verify no variant DTCs are present. If variant DTCs are present, perform their perspective test first.

**Note:** Check for any Service Information Tune-ups or Technical Service Bulletins that may apply.

**Were there any repairs that fixed the customer's complaint?**

**Yes** >> Testing complete.

**No** >> Refer to 21 - AUTOMATIC TRANSMISSION - AUTOMATIC TRANSMISSION NAG1 - ELECTRICAL DIAGNOSTICS category and perform the appropriate symptom.

P0219–ENGINE OVERSPEED

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Transmission Control Module (TCM) monitors the engine speed over the CAN bus. If the engine speed is greater than 4100+ 800 RPM, the TCM assumes that either the information from the Powertrain Control Module (PCM) is incorrect or that a major mechanical problem exist. Once the DTC is set, the TCM will position the transmission gear into neutral to protect the engine and transmissin from damage. The transmission will remain in neutral and will not be reevaluated by the TCM until the ignition is cycled.

- **When Monitored:**  
Continuously with the ignition on, engine running, with the transmission in gear with a valid Engine RPM message received at least once, and the CAN Bus Circuit and Engine CAN Message Missing are not active.
- **Set Condition:**  
Engine speed is greater than 4100+ 800 RPM.

Possible Causes
MECHANICAL ENGINE PROBLEM MECHANICAL TRANSMISSION PROBLEM POWERTRAIN CONTROL MODULE TRANSMISSION CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMIS- SION/TRANSAXLE/AUTOMATIC - NAG1 - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK FOR OTHER TRANSMISSION DTCS

With the scan tool, check for other transmission DTCS.

Are there any gear ratio and/or speed sensor DTCS present in addition to P0219?

- Yes

>> Refer to the Symptom Category and perform the appropriate symptom. If speed sensor DTCS are present, perform their respective test first.
- No

>> Go To 2

**P0219-ENGINE OVERSPEED (CONTINUED)****2. CHECK IF ENGINE MECHANICAL PROBLEMS ARE PRESENT**

Determine if any Engine mechanical problems are present.

**Are there any Engine mechanical problems present?**

**Yes** >> Repair engine as necessary. Refer to 9 - ENGINE-SERVICE INFORMATION for the appropriate repair procedures.

**No** >> Go To 3

---

**3. CHECK IF TRANSMISSION MECHANICAL PROBLEMS ARE PRESENT**

Determine if any Transmission mechanical problems are present.

Turn the ignition off to the lock position.

Remove the Transmission Oil Pan and inspect for debris or a plugged Transmission Oil Filter. Refer to 21 - AUTOMATIC TRANSMISSION-AUTOMATIC TRANSMISSION NAG1/SERVICE INFORMATION for the appropriate service procedures.

**Is there any debris, plugged Transmission Oil Filter, or signs of an internal transmission problem?**

**Yes** >> Repair Transmission as necessary. Refer to 21 - AUTOMATIC TRANSMISSION-AUTOMATIC TRANSMISSION-NAG1/SERVICE INFORMATION for the appropriate service procedures.

**No** >> Go To 4

---

**4. TEST DRIVE VEHICLE**

**Note:** The Engine and Transmission must not have mechanical problems and be operating normally before proceeding with this test.

Replace and program the Powertrain Control Module (PCM) per the Service Information. Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/POWERTRAIN CONTROL MODULE for the appropriate service procedures.

Reassemble any previously disconnected connectors and/or components.

With the scan tool, erase Transmission DTCs.

Road test the vehicle.

With the scan tool, read Transmission DTCs.

**Did DTC P0219-ENGINE OVERSPEED reset?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE for the appropriate service procedures.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Test Complete  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

## P0562-BATTERY VOLTAGE LOW

**P0562-BATTERY VOLTAGE LOW (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The Transmission Control Module (TCM) monitors ignition voltage. The DTC will set if the monitored battery voltage drops below 8.5 volts and a temporary limp in will be activated. If the voltage rises above 9.0 volts, normal operations is resumed and the TCM will record the DTC as a one trip fault. The DTC will only mature to a full DTC if the voltage is less than 8.5 volts with a engine speed greater than 2000 RPM for a least 60 seconds.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When monitored battery voltage drops below 8.5 volts.

Possible Causes
ENGINE CHARGING SYSTEM DTCS LOW BATTERY VOLTAGE (A1) B(+) CIRCUIT HIGH RESISTANCE (Z912) GROUND CIRCUIT HIGH RESISTANCE (F942) FUSED TRANSMISSION RELAY OUTPUT CIRCUIT HIGH RESISTANCE TRANSMISSION RELAY TRANSMISSION CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - DIAGNOSIS AND TESTING)**

**Diagnostic Test****1. CHECK FOR ENGINE CHARGING SYSTEM DTCS**

With the scan tool, read Engine DTCs.

**Are there any Engine Charging System DTCs present?**

**Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and perform the appropriate symptom.

**No** >> Go To 2

**P0562-BATTERY VOLTAGE LOW (CONTINUED)****2. CHECK SYSTEM VOLTAGE**

Start the engine.

With the scan tool, under transmission, check system voltage.

**Is the transmission system voltage above 9.0 volts?**

**Yes** >> Go To 7

**No** >> Go To 3

**3. CHECK (A1) B(+) CIRCUIT**

Turn the ignition off to the lock position.

Remove the Transmission Control relay.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check the (A1) B(+) circuit in the Transmission Relay connector.

**Note: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (A1) B(+) circuit for high resistance.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**P0562-BATTERY VOLTAGE LOW (CONTINUED)****4. CHECK THE (F942) FUSED TRANSMISSION RELAY OUTPUT CIRCUIT**

Turn the ignition off to the lock position.

Remove the Transmission Relay.

Connect a jumper wire between the (A1) B+ circuit and the (F2) Transmission Relay Output circuit in the Transmission Relay connector.

Start the engine.

With the scan tool, under transmission, check system voltage.

**Is the transmission system voltage above 9.0 volts?**

**Yes** >> Replace the Transmission Relay.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Go To 5

**P0562-BATTERY VOLTAGE LOW (CONTINUED)****5. CHECK THE (F942) FUSED TRANSMISSION RELAY OUTPUT CIRCUIT**

Turn the ignition off to the lock position.

Reinstall the Transmission Relay.

Disconnect the TCM C1 harness connector.

Start the engine.

Using a 12-volt test light connected to ground, check the (F942) Fused Transmission Relay Output circuit in the TCM C1 harness connector.

**Note: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (F942) Fused Transmission Relay Output circuit for high resistance. Pay attention to the Transmission fuse cavity for corrosion, damage, or terminal push out. Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**6. CHECK (Z912) GROUND CIRCUIT**

Turn the ignition off to the lock position.

Using a 12-volt test light connected to 12-volts, check the (Z912) Ground circuit in the TCM C1 harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE for the appropriate service procedures. Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Repair the (Z912) Ground circuit for high resistance.

**P0562-BATTERY VOLTAGE LOW (CONTINUED)****7. INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.

Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.

Wiggle the wires while checking for shorted and open circuits.

**Where there any problems found?**

**Yes** >> Repair as necessary.

Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Test Complete.

---

## P0563-BATTERY VOLTAGE HIGH

**P0563-BATTERY VOLTAGE HIGH (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The Transmission Control Module (TCM) monitors ignition voltage. The DTC will set and temporary limp-in will be activated, if the monitored battery voltage rises above 16.9 volts. If the voltage drops below 16.4 volts, normal operations is resumed and the TCM will record the DTC as a one trip fault. The DTC will only mature to a full DTC if the voltage rises above 16.9 volts with a engine speed greater than 2000 RPM for a least 60 seconds.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When the monitored battery voltage rises above 16.9 volts.

Possible Causes
CHARGING SYSTEM OVERCHARGE CONDITION
JUMP START OFF A 24 VOLT SYSTEM
TRANSMISSION CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - DIAGNOSIS AND TESTING)**

**Diagnostic Test****1. CHECK FOR CHARGING SYSTEM DTCs**

With the scan tool, read Engine DTCs.

**Note:** This includes any one trip faults.

**Are there any Engine Charging System DTCs present?**

**Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and perform the appropriate symptom.

**No** >> Go To 2

**P0563-BATTERY VOLTAGE HIGH (CONTINUED)****2. CHECK IF VOLTAGE IS GREATER THAN 16.9 VOLTS**

Start the engine and raise the engine speed to 2000 RPM.

With the scan tool, monitor the Transmission system voltage for at least 60 seconds.

**Does the Transmission system voltage read above 16.9 volts for any period of time?**

**Yes**    >> Go To 4

**No**    >> Go To 3

---

**3. VERIFY IF VEHICLE WAS JUMP STARTED WITH 24-VOLT SYSTEM**

Verify if the vehicle was jump started by another vehicle using a 24-volt charging system.

**Was the vehicle jump started by another vehicle using a 24-volt charging system?**

**Yes**    >> This is the cause of the DTC. Erase the DTC and return the vehicle to the customer.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**No**    >> Go To 5

---

**P0563-BATTERY VOLTAGE HIGH (CONTINUED)****4. CHECK BATTERY VOLTAGE**

Start the engine and raise the engine speed to 2000 RPM.  
 With the scan tool, read the Transmission system voltage.  
 With a voltmeter, measure the battery voltage at the battery.  
 Compare the readings.

**Does the voltage readings match between the Transmission scan tool reading and the battery voltmeter reading?**

- Yes** >> Repair the charging system for an over charging condition. Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom as if the DTC is current.
- No** >> Using the schematics as a guide, check the Transmission Control Module (TCM) terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE for the appropriate service procedures.  
 Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**5. INTERMITTENT WIRING AND CONNECTORS**

The conditions necessary to set this DTC are not present at this time.  
 Using the schematics as a guide, inspect the wiring and connectors specific to this circuit.  
 Wiggle the wires while checking for shorted and open circuits.

**Were there any problems found?**

- Yes** >> Repair as necessary.  
 Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.
- No** >> Test Complete.

**P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The Transmission Control Module (TCM) performs various internal tests to verify proper controller operation. If the TCM detects that the variables that dictate the vehicle application are not present, the controller will enter Limp-in mode and illuminate the MIL.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
If the TCM detects that the variables that dictate the vehicle application are not present.

Possible Causes
CONTROLLER NOT CODED
TRANSMISSION CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - DIAGNOSIS AND TESTING)**

**Diagnostic Test****1. CHECK IF TCM IS FLASHABLE**

**Note: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.**

With the scan tool, record the vehicles controller part number.

Select Use Controller Part Number under the Flash Tab.

Flash the controller with the correct software.

**Were you able to update (flash) the controller successfully?**

- Yes** >> Test Complete.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.
- No** >> Replace the TCM per the Service Information. Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ TRANSMISSION CONTROL MODULE for the appropriate service procedures.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

P0730-INCORRECT GEAR RATIO

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Transmission Control Module (TCM) constantly calculates the transmission ratio based on the input speed sensor 1 and 2 (N2-N3) signals and the calculated output shaft speed. The intent of this diagnostic is to detect if the transmission is trying to mechanically shift into a lower gear then the TCM intends.

- **When Monitored:**  
Engine RPM greater than 450 RPM, output speed greater than 180 RPM, no N2 - N3 input speed sensor errors present, no gear selector lever errors present, no ABS system errors, and all wheel speeds above 450 RPM.
- **Set Condition:**  
No shifting operation and detected gear is not the actual gear. No shifting operation - detected (calculated) gear is less than actual (expected) gear, no plausible gear is calculated, actual turbine speed - calculated turbine speed is greater than 300 RPM or calculated transmission ratio is above threshold. During an Upshift - detected (calculated) gear is less than actual (expected) gear. During Downshift - detected (calculated) gear is less than actual (expected) gear.

Diagnostic Test

1. CHECK FOR INTERNAL TRANSMISSION PROBLEM

Determine if there are any Transmission mechanical problems present.  
Remove the Transmission Oil Pan and inspect for excessive debris or a plugged Transmission Oil Filter. Refer to 21- AUTOMATIC TRANSMISSION-AUTOMATIC TRANSMISSION NAG1/SERVICE INFORMATION for the appropriate service procedure

- Is there any Transmission mechanical problems present?
- Yes**    >> Repair as necessary. Refer to 21- AUTOMATIC TRANSMISSION-AUTOMATIC TRANSMISSION NAG1/ SERVICE INFORMATION for the appropriate service procedure.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.
- No**    >> Using the schematics as a guide, check the Transmission Control Module (TCM) pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the TCM per the Service Information. Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE for the appropriate service procedure.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The Transmission Control Module (TCM) constantly monitors the amount of torque converter slippage. When the torque converter clutch (TCC) is open the slippage is expected to be above a threshold. If the slippage is less then expected when the TCC is open, the TCM assumes that the TCC is stuck on.

- **When Monitored:**

Ignition on, TCM not in initialization phase, No input speed sensor 1 or 2 (N2–N3) DTCs, No CAN bus or ECM DTCs, No CAN engine speed signal or engine torque signal not implausible DTCs, Engine speed greater than 450 rpm, No shift in progress, Gear 1, 2, 3, 4 or 5 engaged, and the TCM torque converter status is OPEN

# P0743-TCC SOLENOID CIRCUIT

**P0743-TCC SOLENOID CIRCUIT (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The TCC Solenoid is activated when the Transmission Control Module (TCM) determines that the Torque Converter Clutch should be activated. The Torque Converter Clutch is a variable slip torque clutch that allows control of the slip from 5.5% to 95.5% of lock-up. The Clutch is controlled by the TCC Solenoid which is pulse width modulated (PWM) to provide the desired amount of slip. The clutch requires both an electrical PWM of 1000Hz and an hydraulic PWM of 100Hz.

- **When Monitored:**

Continuously with the ignition on, engine running, with the transmission in gear, the TCC Solenoid is inactive, or when the TCC Solenoid is active and controlled above 25% duty cycle, with the Solenoid Supply voltage active.

## P0748-MODULATOR PRESSURE SOLENOID CIRCUIT

**P0748-MODULATOR PRESSURE SOLENOID CIRCUIT (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The Modulating Pressure Control Solenoid Valve's purpose is to control the modulating pressure depending on the continuously changing operating conditions, such as load and gear change.

The Modulating Pressure Control Solenoid Valve is always active. The solenoid uses pulse width modulation (PWM) to control the transmissions hydraulic fluid pressure that is determined by the Transmission Control Module (TCM).

- **When Monitored:**

Continuously with the ignition on, engine running, the Modulating Pressure Control Solenoid Valve is either off, or active with 25-75% duty cycle, with no Solenoid Supply Voltage DTCs present.

- **Set Condition:**

**Theory of Operation**

The 3-4 Solenoid is activated when the Transmission Control Module (TCM) determines that the transmission must shift into or out of 4th gear. The solenoid is only activated during the shifting of the transmission. When the solenoid is activated, hydraulic pressure is applied to the proper shift elements in the transmission to allow the desired shift. Once the shift is completed the solenoid is turned off.

- **When Monitored:**  
When both the 3-4 Solenoid and the Solenoid Supply voltage is active.
- **Set Condition:**  
When 3-4 Solenoid is turned on and the TCM detects any of the following in the 3-4 Solenoid or circuit: open, short to ground, short to voltage, or the solenoid driver in the TCM.

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The Transmission Control Module (TCM) performs various internal tests to verify proper controller operation. During the power up of the controller, the TCM tests the ability of the TCM to shut down the Solenoid Supply Voltage circuit. The controller monitors the A/D feedback on the Solenoid Supply driver output to ensure that battery voltage is no longer present. Note: A short to voltage on the Solenoid Supply Voltage circuit or any one of the solenoids may set this DTC.

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

**Theory of Operation**

The NAG1 transmission has two input speed sensors 1 and 2 (N2 and N3), both speed sensors are located on the valve body. The speed sensors are hall effect speed sensors that are used by the Transmission Control Module (TCM) to calculate the transmissions input speed. Since the input speed could not be measured directly, two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

The input speed sensors 1 and 2 will report the same input speed in gears 2nd, 3rd or 4th. If the 1 and 2 input speed sensor signals are not the same in these gears, the TCM will set the DTC P2784-Input Speed Sensor 1/2 Correlation. The input speed sensor 2 is not reported in 1st and 5th gears. The input speed sensor 1 (N2) is not reported in Reverse. The P01704-Input Speed Sensor 1 Overspeed and P01705-Input Speed Sensor 2 Overspeed DTCs are rationality checks designed to detect a major transmission failure. If either DTC is detected, the TCM will place the transmission in Neutral.

- **When Monitored:**

Continuously with the ignition on, engine running, transmission in gear, and Input Speed Sensor 1 (N2) greater than 0 RPM

P1731-INCORRECT GEAR ENGAGED

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The TCM compares the calculated gear with the gear the transmission has actually engaged. The actual gear is identified by verifying the signals of the two input speed sensors 1 (N2) and 2 (N3) as well as the transmission output speed (from the ABS system). If the actual gear differs from the gear calculated by the TCM, the TCM value is adjusted to the engaged gear and a counter is increased by 2 points. If after a shift the engaged gear and the calculated gear still match, the counter is decreased by 1 point. A DTC is detected as soon as the counter exceeds a threshold.

- **When Monitored:**  
The conditions for gear detection are: engine speed greater than 450 rpm, no input speed sensor failures are active, no selector lever error active, selector lever is not in intermediate position, selector lever position is not showing power-up value, no output speed error is active, no transfer case error is active, output speed (ABS system) greater than 180 rpm, no wheel speed (ABS system) overspeed detected.
- **Set Condition:**  
The detected gear calculated by the TCM is not identical to the actual gear. Exception: detected gear is 1st and actual gear is 2nd. If the problem is present for three consecutive ignition cycles, the TCM places the transmission into Limp-in mode until the DTC is cleared by the scan tool.

Possible Causes

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK IF TRANSMISSION SOLENOID DTCS ARE PRESENT

With the scan tool, check for other transmission DTCS.

- Are there any Transmission Solenoid DTCS present?
- Yes    >> Refer to 21 - AUTOMATIC TRANSMISSION - AUTOMATIC TRANSMISSION NAG1 - ELECTRICAL DIAGNOSTICS category and perform the appropriate symptom.
- No    >> Go To 2

**P1731-INCORRECT GEAR ENGAGED (CONTINUED)****2. CHECK IF ABS DTCS ARE PRESENT**

**Theory of Operation**

The Transmission Control Module (TCM) requests torque reductions over the CAN bus during a transmission shift to improve shift quality. The TCM verifies that the PCM / ECM has performed the requested torque reduction by monitoring the response to the request. If the response is not within a specified tolerance, the TCM increments a counter, and if this counter reaches a threshold, the DTC sets.

- **When Monitored:**  
Engine intervention active for at least 20 ms, no engine torque errors, engine torque demand is greater than 0.

P2783-TORQUE CONVERTER TEMPERATURE TOO HIGH

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

Theory of Operation

The Transmission Control Module (TCM) monitors the friction loss of the torque converter clutch while it is in slipping mode. The TCM calculates friction loss using CAN communication signals such as, engine speed and engine torque, as well as the torque converter turbine speed computed by the TCM. Depending on the friction loss calculated in each program cycle, a corresponding value is added to a factor as long as the torque converter clutch is in slipping mode. The factor is set to 0 when the clutch is opened. If the factor reaches a specified value a DTC is set.

- **When Monitored:**  
When the solenoid supply voltage is active. With no reporting Input Speed Sensor 1 or 2 (N2 - N3), CAN Bus, PCM, CAN Engine, and/or CAN Engine Speed DTCs present. Torque Converter Clutch in slip mode.
- **Set Condition:**  
When the friction loss factor reaches threshold.

# U1118-LOST ENGINE MESSAGE

U1118-LOST ENGINE MESSAGE (CONTINUED)

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W

Theory of Operation

The Transmission Control Module (TCM) receives information from the Engine, Anti-lock Brake System, and the Electronic Gear Shift control modules over the CAN C bus. The CAN C bus is a high speed communication bus that allows real time control capability between various controllers. Most messages are sent every 20 mSec, this means critical information can be shared between multiple controllers almost instantaneously. The CAN C bus is a two wire bus with a CAN (+) and a CAN (-) circuit. To reduce the potential of radio and other electrical noise interference, the CAN Bus circuit wiring is manufactured using a twisted pair configuration within the electrical wiring harness.

- **When Monitored:**  
Continuously with the ignition on.
  - **Set Condition:**  
The DTC will set if a valid CAN ID was not received in the required time from the ECM/PCM.

Possible Causes
TRANSMISSION CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - DIAGNOSIS AND TESTING)

Diagnostic Test

1. CHECK THE FCM FOR CAN C BUS COMMUNICATION DTCS

DIAGNOSIS AND TESTING

P0562–BATTERY VOLTAGE LOW

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagramRefer to Section 8W

Theory of Operation

The Shift Lever Assembly monitors ignition voltage. The DTC will set if the monitored battery voltage drops below 6.0 volts and a temporary limp in will be activated. If the voltage rises above 9.0 volts, normal operations is resumed.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When monitored battery voltage drops below 6.0 volts.

Possible Causes

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagramRefer to Section 8W

Theory of Operation

The Shift Lever Assembly monitors ignition voltage. The DTC will set, if the monitored battery voltage rises above 16.0 volts.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When the monitored battery voltage rises above 16.0 volts.

P0607–ECU INTERNAL PERFORMANCE

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagramRefer to Section 8W

Theory of Operation

The Shifter Lever Assembly performs various internal tests to verify proper controller operation. This DTC indicates that there is an issue with the Shifters internal processor.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
If the Shift Lever Assembly controller detects an error with the optical sensors or internal checksum value is not correct.

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagramRefer to **Section 8W**

**Theory of Operation**

The brake switch signal must be active before the shift lever can be moved out of the park position. The Shifter lever assembly receives two brake switch signals. The first signal is a CAN C Bus message sent to the shift lever assembly. The second signal is a hardwired brake switch signal to the shift lever assembly. The CAN C Bus message is the primary brake switch signal and the hardwired signal serves as the backup brake switch signal.

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
The DTC will set if the high side driver detects a short to ground for 10 seconds.

For a complete wiring diagram Refer to Section 8W

### Theory of Operation

The AutoStick Switch is integrated into the Shift Lever Assembly. The gear requested by the AutoStick selection is then sent over the CAN C bus to the TCM to engage the requested gear.

- **When Monitored:**  
When in AutoStick mode.
- **Set Condition:**  
When the expected switch state is not correctly sensed by the Shift Lever Assembly. If the upshift switch signal is detected as active in gear position other than drive or both upshift and downshift signals are active at the same time.

Possible Causes

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - NAG1 - DIAGNOSIS AND TESTING)

### 1. SHIFTER LEVER ASSEMBLY

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

If there are no possible causes remaining, view repair.

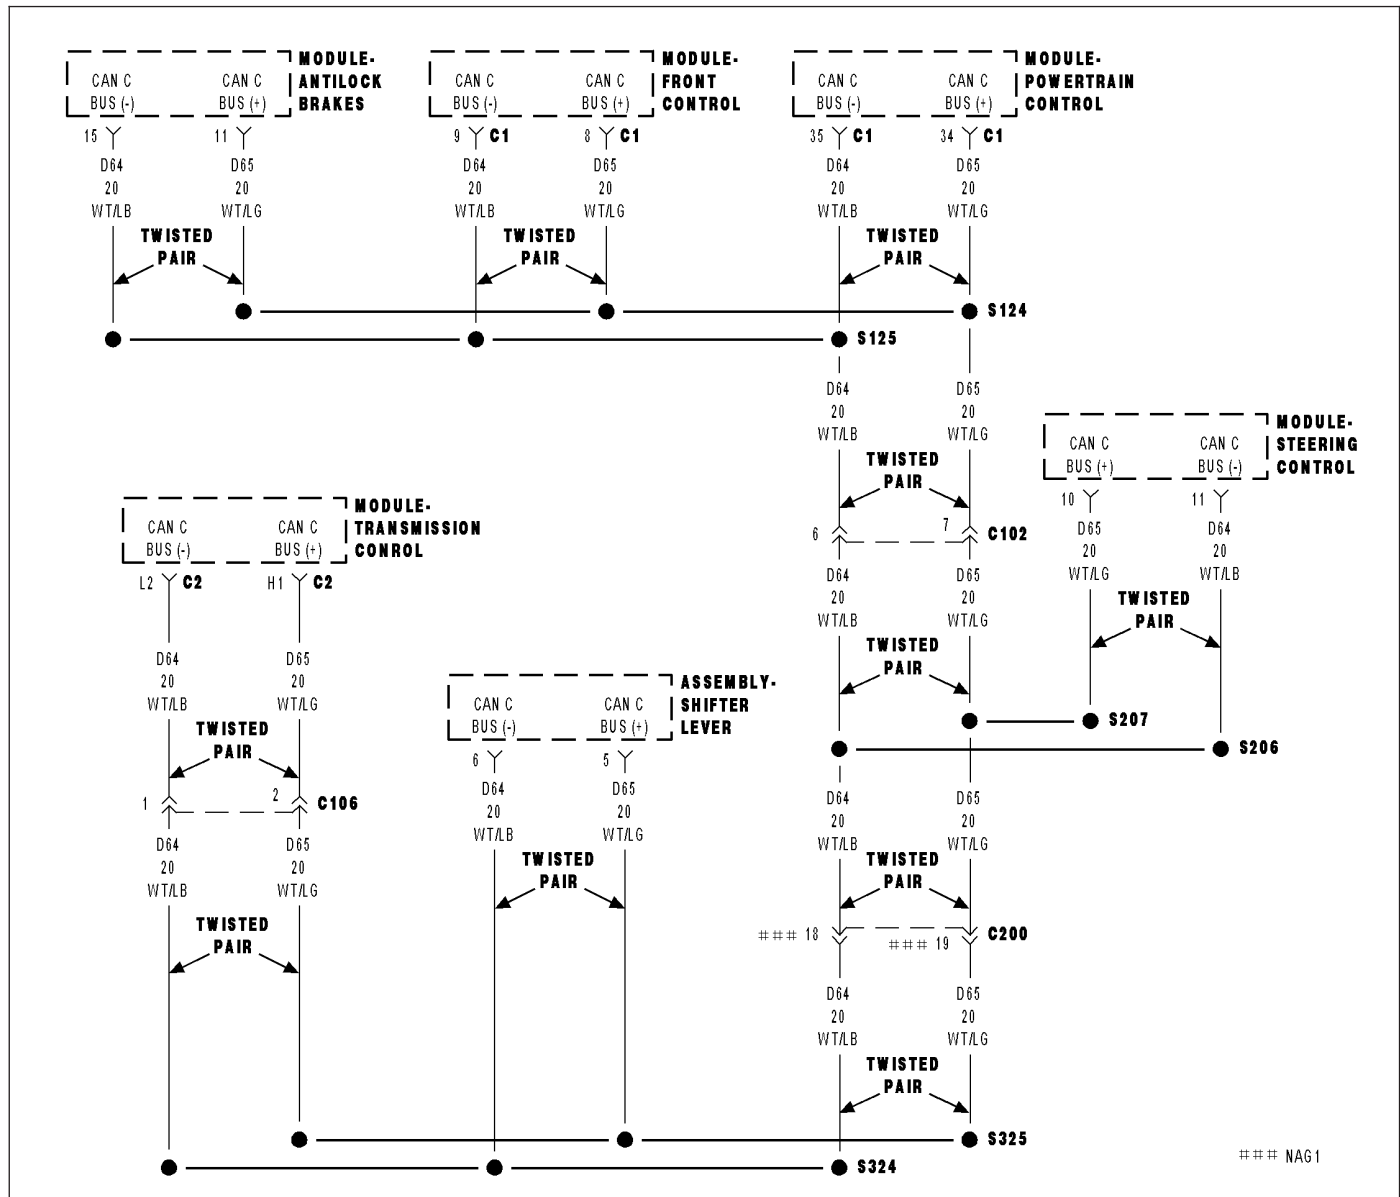

#### Repair

Using the schematics as a guide, check the Shifter Lever Assembly Control Module terminals for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Shift Lever Assembly per the Service Information. Refer to Shift Mechanism for the appropriate service procedures. Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

## **AUTOMATIC TRANSMISSION 42RLE - ELECTRICAL DIAGNOSTICS**

### **DIAGNOSIS AND TESTING**

## PRE-DIAGNOSTIC CHECK OUT

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

#### 1. PRE-DIAGNOSTIC CHECK OUT

**Note:** Low fluid level can be the cause of many transmission problems. If the fluid level is low locate and repair the leak then check and adjust the fluid level per the Service Information.

**Note:** Always perform diagnostics with a fully charged battery to avoid false symptoms.

With the scan tool, read Engine DTC's. Check and repair all Engine DTC's prior to performing any transmission symptom diagnostics.

With the scan tool, read Transmission DTC's. Record all DTC's and 1 Trip Failures.

**Note:** Diagnose 1 Trip Failures as a fully matured DTC.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. Repair as necessary.

Perform the Shift Lever Position Test. If the test does not pass, refer to Symptom test for P0706 Check Shifter Signal.

For Gear Ratio DTC's, check and record all CVI's.

Most DTC's set on start up but some must be set by driving the vehicle such that all diagnostic monitors have run.

**Note:** Verify flash level of Powertrain Control Module. Some problems are corrected by software upgrades to the Transmission and Engine software.

**Note:** Check for applicable TSB's related to the problem.

**Were any repairs made that fixed the customer's complaint?**

**Yes** >> Testing complete.

**No** >> Refer to the diagnostic test procedure related to the DTC.

P0122-TPS/APP CIRCUIT LOW

For the Transmission circuit diagram(Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously with the ignition on and engine running.
- **Set Condition:**  
This DTC will set if the monitored TPS voltage drops below .078 volts for the period of 0.48 seconds.

Possible Causes
RELATED TPS ENGINE DTC'S PRESENT
POWERTRAIN CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

Theory of Operation

The transmission controller receives the throttle position signal and its ground from the Throttle Position Sensor (TPS). The TPS has a 5 volt pull up supplied by the engine controller. The throttle signal is checked for out of range as well as intermittent operation (excessive signal changes). The engine controller transmits the throttle value via the Bus. Most engine controllers can synthesize the throttle value if the throttle position sensor signal is lost. If a throttle error is detected by the transmission controller and the throttle value is available via the Bus, the Bus throttle value will be used and normal operation will continue, however a throttle fault code will be set. If a throttle error is detected and the throttle value is not available via the Bus, normal operation will be discontinued, a throttle fault code will be set, and the MIL will be turned on after 5 min. of substituted operation.

Diagnostic Test

1. DETERMINING IF RELATED ENGINE TPS DTC'S ARE PRESENT

With the scan tool, check Engine DTC's, this includes all one trip failures.

- Are there any Engine TPS DTC's present?
- Yes

>> Refer to the Driveability category and perform the appropriate symptom.  
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.
- No

>> Go To 2

**P0122-TPS/APP CIRCUIT LOW (CONTINUED)****2. CHECK TO SEE IF DTC IS CURRENT**

With the scan tool, record the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

With the scan tool, erase Transmission DTCs.

**Note:** To erase EATX EVENT DATA information, a **BATTERY DISCONNECT** must be performed. Performing a **BATTERY DISCONNECT** will reset all learned Transmission values to controller defaults which may lead to erratic shift schedules.

Drive the vehicle and try to duplicate the conditions in which the DTC was reported by the EATX DTC EVENT DATA.

With the scan tool, read Transmission DTCs.

**3. POWERTRAIN CONTROL MODULE**

**Note:** Due to the integration of the Powertrain and Transmission Control Modules, bus communication between the modules is internal.

Using the schematics as a guide, inspect the wiring and connectors. Repair as necessary. Pay particular attention to all power and ground circuits.

Verify the flash level of the controller and update the controller if available.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

**If there are no possible causes remaining, view repair.**

**Repair**

Replace the Powertrain Control Module per the Service Information. With the scan tool PERFORM QUICK LEARN, then program Pinion Factor in the Front Control Module.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

## P0123-TPS/APP CIRCUIT HIGH

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously with the ignition on and engine running.
- **Set Condition:**  
This DTC will set if the monitored TPS voltage rises above 4.94 volts for the period of 0.48 seconds.

Possible Causes
RELATED TPS ENGINE DTC'S PRESENT

## P0124-TPS/APP INTERMITTENT

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously with the ignition on and engine running.
- **Set Condition:**  
This DTC will set if the monitored TPS throttle angle between the angles of 6° and 120° and the degree change is greater than 5° within a period of less than 7.0 ms.

Possible Causes

## P0218-HIGH TEMPERATURE OPERATION ACTIVATED

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the engine is running.
- **Set Condition:**  
Immediately when a Overheat shift schedule is activated when the Transmission Oil Temperature reaches 155° C or 240° F.

Possible Causes
ENGINE COOLING SYSTEM MALFUNCTION
TRANSMISSION OIL COOLER PLUGGED
HIGH TEMPERATURE OPERATIONS ACTIVATED

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

If the transmission oil temperature rises above 115 C (240 F), the overheat shift schedule is activated refer to Transmission Operation as a function of Transmission Oil Temperature and the code is set. The DTC is an informational code only and is being set to aid the technician in determining root cause of a customer driveability issue. The code is also intended to alert the technician to determine if a cooling system malfunction has occurred or if an additional transmission air to oil cooler should be added to the vehicle if the customer regularly drives in a manner that overheats the transmission. Extended operation above 115 C (240 F) will reduce the durability of the transmission and should be avoided. Correcting the cooling system malfunction or installing an additional transmission oil cooler will improve transmission durability especially for customers who operate in city/construction stop and go traffic, tow trailers regularly, drive aggressively in low gear or drive regularly in mountainous areas.

## Diagnostic Test

### 1. CHECK ENGINE COOLING SYSTEM

Perform Engine Cooling System diagnostics per the Service Information.

**Is the Engine Cooling System functioning properly?**

**Yes** >> Go To 2

**No** >> Repair the cause of the engine overheating. Refer to the Service Information for the related symptoms or repair procedures.  
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

---

### 2. TRANSMISSION OIL COOLER RESTRICTED

Check the Transmission Oil Cooler Flow.

**Is the transmission oil cooler restricted or plugged?**

**Yes** >> Go To 3

**No** >> Repair or replace the plugged Transmission Oil Cooler per the Service Information. Repair the cause of the plugged Transmission Oil Cooler as necessary.  
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

---

**P0218-HIGH TEMPERATURE OPERATION ACTIVATED (CONTINUED)****3. HIGH TEMPERATURE OPERATION**

This DTC is an informational DTC designed to aid the Technician in diagnosing shift quality complaints.

This DTC indicates that the transmission has been operating in the "Overheat" shift schedule which may generate a customer complaint.

The customer driving patterns may indicate the need for an additional transmission oil cooler.

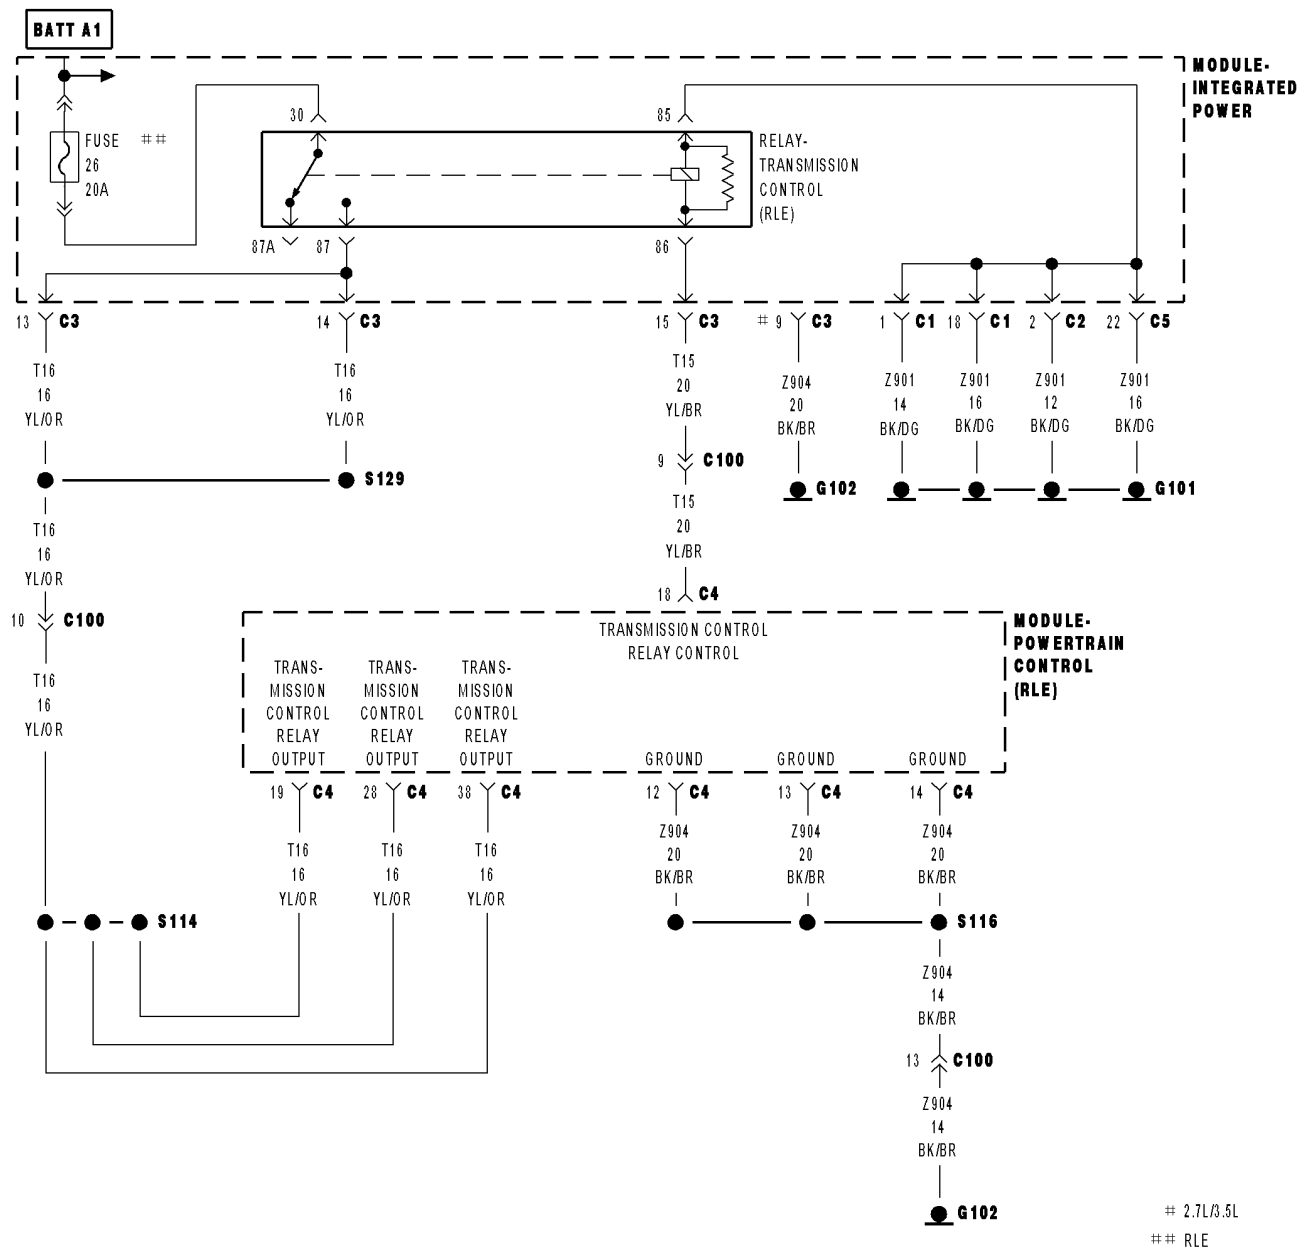

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

**View repair options.****Repair**

Repair the cause of transmission overheating per the Service Information.

**P0562-BATTERY VOLTAGE LOW**

**P0562-BATTERY VOLTAGE LOW (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the engine running and the PCM has closed the Transmission Control Relay.
- **Set Condition:**  
If the battery voltage of the Transmission Control Relay Output Sense circuit(s) to the PCM is less than 10.0 volts for the period of 15 seconds. Note: P0562 generally indicates a gradually falling battery voltage or a resistive connection(s) to the PCM. The DTC will also set if the battery voltage sensed at the PCM is less than 6.5v for 200ms or where Transmission Control Relay Output circuits is less than 7.2v for 200ms.

Possible Causes
RELATED CHARGING SYSTEM DTC'S (Z904) GROUND CIRCUIT OPEN OR HIGH RESISTANCE (INTERNAL) FUSED B+ CIRCUIT TO PCM HIGH RESISTANCE (T16) TRANSMISSION CONTROL RELAY OUTPUT TO TCM OPEN OR HIGH RESISTANCE TRANSMISSION CONTROL RELAY POWERTRAIN CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

**Theory of Operation**

Transmission damage may occur if there is insufficient supply voltage to properly control the solenoids. To prevent this possibility, the battery voltage is monitored and the system is placed in logical limp-in if the battery voltage drops below the limit.

**Diagnostic Test**

**1. RELATED CHARGING SYSTEM DTC'S**

With the scan tool, read the Engine DTC's.

- Are there any Charging System related DTC's present also?**
- Yes**    >> Refer to the Charging System category and repair any PCM Charging System DTC's, before proceeding. NOTE: After repairing the PCM Charging System DTC's, perform the Transmission Verification test to verify the transmission was not damaged.  
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.
- No**    >> Go To 2

**P0562-BATTERY VOLTAGE LOW (CONTINUED)****2. CONDITION P0562 PRESENT**

**Note:** Generator, battery, and charging system must be fully functional before performing this test.

With the scan tool, read Transmission DTC's.

With the scan tool, Check the STARTS SINCE SET counter for P0562.

**Note:** This counter only applies to the last DTC set.

**Is the STARTS SINCE SET counter set at 0?**

**Yes** >> Go To 3

**No** >> Go To 8

**3. CHECKING (Z904) GROUND CIRCUIT**

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

**Note:** Check connectors - Clean/repair as necessary.

**CAUTION:** Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to 12-volts, check the (Z904) Ground circuits in the appropriate terminal of MILLER TOOL #8815.

**Note:** The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.

**Does the test light illuminate brightly for all the Ground circuits?**

**Yes** >> Go To 4

**No** >> Repair the (Z908, Z977) Ground circuit and/or circuits for an open or high resistance.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**P0562-BATTERY VOLTAGE LOW (CONTINUED)****4. CHECKING (INTERNAL) FUSED B+ CIRCUIT**

Turn the ignition off to the lock position.

Remove the Transmission Control Relay.

**Note: Check connectors - Clean/repair as necessary.**

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check the (INTERNAL) Fused B+ circuit in the Transmission Control Relay connector.

**Note: The Test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (INTERNAL) Fused B+ circuit for an open or high resistance.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**5. CHECKING THE (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT**

Turn the ignition off to the lock position.

Disconnect the PCM C4 harness connector.

Remove the Transmission Control Relay.

**Note: Check connectors - Clean/repair as necessary.**

**CAUTION: DO NOT PROBE THE PCM HARNESS CONNECTORS. PROBING THE PCM HARNESS CONNECTORS WILL DAMAGE THE PCM TERMINALS RESULTING IN POOR TERMINAL TO PIN CONNECTION. INSTALL MILLER TOOL #8815 TO PERFORM DIAGNOSIS.**

Connect a jumper wire between (INTERNAL) Fused B+ circuit and the (T16) Transmission Control Relay Output circuit.

Ignition on, engine not running.

Using a 12-volt test light connected to ground, check all (T16) Transmission Control Relay Output circuits in the appropriate terminal of MILLER TOOL #8815.

**Note: The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (T16) Transmission Control Relay Output circuit(s) for an open or high resistance.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**P0562-BATTERY VOLTAGE LOW (CONTINUED)****6. TRANSMISSION CONTROL RELAY**

Turn the ignition off to the lock position.

Install a substitute Relay in place of the Transmission Control Relay.

Start the engine.

Using a voltmeter, measure the battery voltage.

With the scan tool, monitor the Transmission Switched Battery Voltage.

Compare the scan tool Transmission Switched Battery voltage to the actual battery voltage.

**Is the scan tool voltage within 2.0 volts of the battery voltage?**

## P0602-CONTROL MODULE PROGRAMMING ERROR/NOT PROGRAMMED

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Check for generic software is made at power-up.
- **Set Condition:**  
If generic software is found , the MIL will light immediately. This DTC is designed to signal the technician that the controller still has generic software installed.

Possible Causes
PCM - PROGRAMMING ERROR

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

### Theory of Operation

The controller is programmed during manufacturing with generic software to facilitate testing. This software does not have the proper calibrations to control a transmission in a vehicle. The check for generic software is made at power-up. If generic software is found , the MIL will light immediately and the MIL will stay on even if the fault is cleared, until the proper software is installed. Note: Transmission will be placed in limp-in mode.

### Diagnostic Test

#### 1. CONTROL MODULE PROGRAMMING ERROR

**Note: Controller is programmed with generic software and will not allow the correct vehicle Powertrain management.**

With the scan tool.

Record the vehicles controller part number.

Select Use Controller Part Number under the Flash Tab.

Flash the controller with the correct software.

**Verify the controller flashed successfully.**

#### Test Complete

P0604-INTERNAL CONTROL MODULE RAM

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
One time after the ignition key is turned to the run position.
- **Set Condition:**  
The read value does not match the written value in any RAM location.

Possible Causes
PCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING.

Theory of Operation

After the controller is reset, the microprocessor checks the integrity of each RAM location by writing to it and reading back from it. The read value should be the same as the written value. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

Diagnostic Test

1. PCM - INTERNAL ERROR

## P0605-INTERNAL CONTROL MODULE ROM

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
One time after the ignition key is turned to the run position.
- **Set Condition:**  
If the ROM checksum does not match a known constant.

Possible Causes
PCM - INTERNAL ERROR

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

After the controller is reset, the microprocessor checks the integrity of the program memory (ROM). A checksum is calculated by adding all used bytes in the program memory. The sum should be the same as a known constant stored in memory. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

P0613-INTERNAL TRANSMISSION PROCESSOR

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
After the ignition key is turned to the run position and 60 seconds thereafter.
- **Set Condition:**  
Either of the following conditions occur 3 times in less than 590 milliseconds: The watchdog line remains high after the watchdog test or the transmission relay coil is energized and remains on after the watchdog delay expires.

Possible Causes
PCM - INTERNAL ERROR

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).

Theory of Operation

The internal watchdog is a separate hardware circuit which continuously monitors the microprocessor. To make sure the transmission is operating properly, the watchdog must receive a signal from the microprocessor within a specific time window. MIL on after 10 seconds of vehicle operation and transmission will be placed in limp-in.

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

**Theory of Operation**

The C1 through C4 (T1, T3, T41, and T42) sense circuits communicate the shift lever position to the PCM. Each circuit is terminated at the transmission with a switch. Each switch can be either open or closed, depending on the shift lever position. The PCM can decode this information and determine the shift lever position. Each shift lever position has a certain combination of switches, which will be open and closed, this is called a PRNDL code. There are 4 switches, therefore: there are many possible combinations of open and closed switches (codes). However, there are only 9 valid codes (8 for AutoStick), one for each gear position and three recognized between gear codes. The remainder of the codes should never occur, these are called invalid codes. The following chart shows the normal switch states for each shift lever position.

**TRS SWITCH STATES**

P0713-TRANSMISSION TEMPERATURE SENSOR HIGH

**P0713-TRANSMISSION TEMPERATURE SENSOR HIGH (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously with the ignition on and engine running.

- **Set Condition:**

The DTC will set when the monitored Temperature Sensor voltage rises above 4.94 volts for the period of 1.45 seconds. When the fault is set, calculated temperature is substituted for measured temperature, however the fault code is stored only after three consecutive occurrences of the fault.

Possible Causes
(K900) SENSOR GROUND OPEN
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(T54) TRANSMISSION TEMPERATURE SENSOR SIGNAL CIRCUIT SHORT TO VOLTAGE
TRANSMISSION TEMPERATURE SENSOR
POWERTRAIN CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

The temperature sensor is used to sense the temperature of the transmission fluid. Transmission fluid temperature can affect shift quality, torque converter operation and when or if some diagnostics are run. A failed temperature sensor could affect the OBD diagnostics. If a problem occurs in the transmission temperature sensor circuit, transmission temperature will be based on a calculated value.

## 1. CHECK TO SEE IF DTC IS CURRENT

Possible Causes
ENGINE DTCS PRESENT
POWERTRAIN CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

The PCM uses a dual port RAM internal to the controller to send the engine speed signal to the Transmission Control System. The calculated engine RPM is compared to a minimum and maximum value. If the PCM interprets this signal to be out of range when the engine is running the code is set. The MIL illuminates after 10 seconds of vehicle operation and the transmission system defaults to Limp-in mode.

## Diagnostic Test

### 1. CONDITION P0725 PRESENT

## P0731-GEAR RATIO ERROR IN 1ST

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Transmission gear ratio is monitored continuously while the transmission is in gear.

- **Set Condition:**

If the ratio of the Input RPM to the Output RPM does not match the current gear ratio when compared to the known gear ratio.

Possible Causes
RELATED TRANSMISSION DTC'S PRESENT
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into Limp-in mode after four gear ratio error events occur in a given driving cycle.

**P0731-GEAR RATIO ERROR IN 1ST (CONTINUED)****Diagnostic Test****1. DETERMINING IF RELATED TRANSMISSION DTC'S ARE PRESENT**

With the scan tool, read Transmission DTC's.

If any of these DTC's are present, perform their respective tests first.

**Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?**

**Yes**    >> Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTC's are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No**    >> Go To 2

**P0731-GEAR RATIO ERROR IN 1ST (CONTINUED)****2. CHECK TO SEE IF P0731 IS CURRENT**

With the scan tool, perform the 1st gear clutch test. Follow the instructions on the scan tool.

Increase the throttle angle or TPS Degree to 30° for no more than a few seconds.

**CAUTION: Do not overheat the transmission.**

**Did the Clutch Test pass, Input Speed remain at zero?**

**Yes** >> Go To 3

**No** >> Go To 4

**3. CHECK FOR INTERMITTENT OPERATION**

The conditions to set this DTC are not current at this time.

Check the gearshift linkage adjustment.

Gear ratio DTC's can be set by problems in the Input and Output Speed Sensor circuits. If the vehicle passes the Clutch Test and still sets Gear Ratio DTC, check the Speed Sensors for proper operation. Remove the Starter Relay.

**CAUTION: removal of the Starter Relay is to prevent a Transmission, NO RESPONSE, condition and disable the starter.**

Check the wiring and connectors for the Speed Sensors for a good connection, then perform a wiggle test using the Transmission Simulator, Miller tool #8333 and the Electronic Transmission Adapter kit 8333-1A.

This DTC can also be set under extreme temperature conditions, this is usually caused by an internal problem. Verify if the problem is only experienced under extreme hot or cold conditions.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

**Were there any problems found?**

**Yes** >> Repair as necessary.

P0732-GEAR RATIO ERROR IN 2ND

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
The Transmission gear ratio is monitored continuously while the transmission is in gear.
- **Set Condition:**  
If the ratio of the Input RPM to the Output RPM does not match the current gear ratio when compared to the known gear ratio.

Possible Causes
RELATED TRANSMISSION DTC'S PRESENT
TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
INTERMITTENT GEAR RATIO ERRORS
INTERNAL TRANSMISSION

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).

Theory of Operation

The transmission system uses two speed sensors, one to measure input RPM and one to measure output RPM. These inputs are essential for proper transmission operation. Therefore, the integrity of this data is verified through data checks. When in gear, if the gear ratio does not compare to a known gear ratio, the corresponding gear ratio error trouble code is set. The transmission will go into Limp-in mode after four gear ratio error events occur in a given driving cycle.

Diagnostic Test

1. DETERMINING IF RELATED TRANSMISSION DTC'S ARE PRESENT

With the scan tool, read Transmission DTC's.  
If any of these DTC's are present, perform their respective tests first.

Are there any Loss of Prime, Line Pressure Sensor and/or Speed Sensor DTCs present?

- Yes**    >> Refer to appropriate diagnostic procedure in the Transmission category. If any of these DTC's are present, they will cause a gear ratio error. Perform the test for Loss of Prime first if it is present.

## P0740-TCC OUT OF RANGE

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Torque Converter Clutch (TCC) is in FEMCC or PEMCC, Transmission temperature is hot, Engine temperature is greater than 38° C or 100° F, Transmission Input Speed greater than engine speed, Transmission temperature is hot, TPS less than 30°, and brake not applied.

- **Set Condition:**

The TCC is modulated by controlling the duty cycle of the L/R Solenoid until the difference between the Engine and the Transmission Input Speed RPM or duty cycle is within a desired range. The DTC is set after the period of 10 seconds and 3 occurrences of either: FEMCC - with slip greater than 100 RPM or PEMCC - duty cycle greater than 85%.

Possible Causes
RELATED L/R SOLENOID OR PRESSURE SWITCH DTC'S PRESENT
INTERNAL TRANSMISSION

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

When in 2nd, 3rd, or 4th gear, the torque converter clutch (TCC) can be locked or partially locked when certain conditions are met. The TCC piston is electronically modulated by increasing the duty cycle of the LR/TCC solenoid until the torque converter slip difference (difference between engine and turbine speed) is within 60 RPM. Then the LR/TCC solenoid is fully energized (FEMCC / 100% duty cycle). Torque converter slip is monitored in FEMCC to ensure adequate clutch capacity. The transmission will attempt normal EMCC operation (not in Limp-in) even after the MIL is illuminated. MIL will illuminate after 5 minutes of accumulated slip in FEMCC.

**Theory of Operation**

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. **Theory of Operation**

Four solenoids are used to control the friction elements (clutches). The continuity of the solenoids circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the PCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a gear ratio or pressure switch error occurs. In this case, one failure will result in the appropriate DTC being set. The MIL will illuminate and the transmission goes into neutral, if the DTC is set above 35 Km/h (22 MPH), Limp-in mode when vehicle speed is below 35 Km/h (22 MPH).

# P0841-LR PRESSURE SWITCH RATIONALITY

**P0841-LR PRESSURE SWITCH RATIONALITY (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the engine is running.
- **Set Condition:**  
The DTC is set if one of the pressure switches are open or closed at the wrong time in a given gear. If the problem is identified for 3 successive key starts, the transmission will go into Limp-in mode a MIL will turn on after 10 seconds of vehicle operation.

TRANSMISSION SOLENOID/PRESSURE SWITCH ASSEMBLY
POWERTRAIN CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

**Theory of Operation**

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. If a set condition is identified, 1st gear and torque converter lock-up (EMCC) will be inhibited. The vehicle will launch in 2nd gear and shift normally through the gears without allowing EMCC. If during the same key start, the set condition is no longer valid, the transmission will return to normal operation (1st and EMCC available). Limp-in will not occur unless DTC P0841 is accompanied by a code P0706 and the MIL will illuminate after 5 minutes of substituted operation.

## Theory of Operation

Background: Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 24 pressure switches when they are off (ie. when the corresponding friction element is not applied) by briefly applying the OD and 24 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to Limp-in mode.

## Theory of Operation

The Transmission system uses three pressure switches to monitor the fluid pressure in the LR, 2/4, and OD elements. The pressure switches are continuously monitored for the correct states in each gear. The 2/4 pressure switch monitors the fluid pressure to the 2/4 clutch to confirm proper operation of the 2/4 solenoid. If the 2/4 pressure switch is identified as closed in P or N, the code will immediately be set and normal operation will be allowed for that given key start. If the problem is identified for 3 successive ignition cycles, the transmission will go into Limp-in mode.

**Theory of Operation**

Background: Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 24 pressure switches when they are off (ie. when the corresponding friction element is not applied) by briefly applying the OD and 24 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to Limp-in mode.

## P0884-POWER UP AT SPEED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

One time after each controller reset. Note: the Transmission Control Module is integrated with Powertrain Control Module. The Transmission Control Module has separate powers and grounds specifically to its portion of the PCM.

- **Set Condition:**

This DTC will set if the PCM powers up and senses the vehicle in a valid forward gear (no PRNDL DTCs) with a output speed above 800 RPM, approximately 32Km/h or 20 MPH.

Possible Causes
INTERMITTENT POWER AND GROUND CIRCUITS

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

If a vehicle loses power to the PCM, the vehicle will go to the 2nd gear mode since there is no power available to control the transmission solenoids. However if power is restored, the PCM will power-up and normal operation will be restored. This DTC identifies that power to the PCM was restored when the gear selector was in a "Drive" position while the vehicle was moving at speeds above 32 Km/h (20 MPH). If a customer shifts to Neutral and cycles the ignition key and quickly shifts to "Drive" while moving before the PCM comes out of its START ROUTINE, the DTC can be set. Therefore it is critical that this DTC diagnosis repair procedure should only be used if the vehicle is experiencing intermittent 2nd gear operation and subsequently a return to normal operation during normal driving. the transmission will not be placed in Limp-in. This is an informational DTC only, when attempting to diagnosis intermittent 2nd gear operation and subsequently a return to normal transmission operation.

**P0884-POWER UP AT SPEED (CONTINUED)****Diagnostic Test****1. CHECK FOR INTERMITTENT POWER AND GROUND CIRCUITS**

This DTC is set when the PCM is initialized while the vehicle is moving down the road in a valid forward gear. This is usually a momentarily loss of power to the Transmission portion of the PCM.

**CAUTION:** Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

**Note:** Due to the integration of the Powertrain and Transmission Control Modules, the transmission part of the PCM has its own specific power and ground circuits.

Check all of the Fused B+, Fused Ignition Switch Output, and Ground circuits related to the PCM for an intermittent open or short to ground.

Perform a wiggle test on all wiring and connectors pertaining to the PCM while looking for shorts and open circuits.

## Theory of Operation

The transmission control relay is used to supply power to the solenoid pack when the transmission is in normal operating mode. When the relay is off, no power is supplied to the solenoid pack and the transmission is in Limp-in mode. The relay output is fed back to the PCM. It is referred to as the Trans Relay Output circuit or switched battery. After a controller reset (ignition key turned to the run position or after cranking engine), the controller energizes the relay. Prior to this, the PCM verifies that the contacts are open by checking for no voltage at the transmission control relay outputs (switched battery) terminals. After the relay is energized, the PCM monitors the terminals to verify that the voltage is greater than 3 volts. The MIL illuminates and the transmission will be placed in Limp-in.

## Theory of Operation

The transmission relay is used to supply power to the solenoid pack when in normal operating mode, and to turn off power to produce transmission "limp-in" mode. The relay output (which supplies power to the solenoid pack) is fed back to the controller. It is referred to as SWITCHED BATTERY. After a controller reset (ignition key turned to the RUN position or after cranking engine), the controller verifies that the relay contacts are open by checking for no voltage on Switched battery line (ie. transmission control relay output) before the relay is energized. After switched battery is verified for no voltage, the voltage of each of the solenoid pack pressure switches is also checked. Since the solenoid pack is not powered up, there should be no voltage on any of the pressure switches.

## P0897-TRANSMISSION FLUID DETERIORATED

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Each transition from full EMCC to partial EMCC for A/C bump prevention.
- **Set Condition:**  
DTC set if 20 occurrences of a turbine acceleration sum. Fault Set Time: 20 transitions from full EMCC to partial EMCC. transmission will not use partial EMCC established for A/C bump prevention.

Possible Causes
WORN OUT/ BURNT TRANSAXLE FLUID

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

To prevent an objectionable bump due to A/C clutch engagement, a temporary torque converter partial EMCC condition is established prior to A/C clutch engagement. A message is received over the vehicles bus indicating that A/C clutch engagement is imminent. Partial EMCC is then established and a reply message, "ok to engage A/C clutch" is sent via the vehicles bus. Partial EMCC will be held for 450 ms before returning to full EMCC. During the transition from full to partial EMCC a turbine acceleration sum is calculated, if this value exceeds a threshold value for several transitions, degraded transmission fluid is indicated.

## Diagnostic Test

### 1. WORN OUT/ BURNT TRANSMISSION FLUID

Turn the ignition off to the lock position.

Flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

**Note: The Transmission Cooler must be flushed before proceeding.**

Allow the engine to idle for 10 minutes, in Park.

Turn the ignition off to the lock position.

Again, flush the Transmission Oil Cooler and lines, replace the Transmission Oil Filter, refill with new Transmission Fluid, start the engine, and adjust the fluid per the Service Information.

With the scan tool, perform a Battery Disconnect.

**Note: The Battery Disconnect must be done to re-enable EMCC during an A/C Clutch engagement.**

**Note: The vehicle may exhibit intermittent shudder during the first few hundred miles. The new Transmission Fluid will gradually penetrate the Torque Converter Clutch friction material and the shudder should disappear.**

Erase the DTC and return the vehicle to the customer.

**Did the DTC reset and/or does the vehicle still shudder after a few thousand miles?**

**Yes** >> Replace the Torque Converter per the Service Information.  
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.

**No** >> Test Complete.

## P0944-LOSS OF HYDRAULIC PUMP PRIME

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

Every 350 msec

- **Set Condition:**

If the transmission begins to slip in any forward gear, and the pressure switch or switches that should be closed for a given gear are open, a loss of prime test begins. All available elements (in 1st gear LR, 2/4 and OD, in 2nd, 3rd, and 4th gear 2/4 and OD) are turned on by the PCM to see if pump prime exists. The code is set if none of the pressure switches respond. The PCM will continue to run the loss of prime test until pump pressure returns. The vehicle will not move or transmission slips. Normal operation will continue if pump prime returns.

Possible Causes
LOW TRANSMISSION FLUID LEVEL SHIFT LEVER POSITION PLUGGED TRANSMISSION OIL FILTER TRANSMISSION OIL PUMP

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

The Loss of prime test is used to prevent transmission defaults and erroneous fault codes during temporary loss of pump prime that may occur with low transmission fluid under severe braking conditions, start-up, etc. and to point towards more subtle problems such as a plugged or ruptured oil filter. The Loss of Prime fault is set by a loss of hydraulic pressure in the transmission system. This condition, if sustained, will result in the vehicle being unable to move.

## Diagnostic Test

## P0992-2/4/OD HYDRAULIC PRESSURE TEST

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

In any forward gear with engine speed above 1000 RPM, shortly after a shift and every minute thereafter.

- **Set Condition:**

After a shift into a forward gear, with engine speed greater than 1000 RPM, the PCM momentarily turns on element pressure to the clutch circuits that don't have pressure to identify the correct pressure switch closes.

If the pressure switch does not close 2 times the DTC sets.

Possible Causes
CONDITION P0992 PRESENT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

Background: Pressure switches are normally off or open (no pressure applied) and read high (+12 volts). When an element is applied the corresponding pressure switch closes to ground (0 volts) or turns on. The controller tests the OD and 24 pressure switches when they are off (ie. when the corresponding friction element is not applied) by briefly applying the OD and 24 elements which will cause the corresponding pressure switch to close. The test verifies that the switches are operational and that the switch will close when the corresponding element is applied. If a switch fails to respond, it is re-tested. The MIL illuminates and the transmission system defaults to Limp-in mode.

### 1. CHECK TO SEE IF DTC P0992 IS CURRENT

**Note: The vehicle must be driven to set this DTC. The transmission must be warm or hot with the Engine RPM above 1000 RPM.** This DTC is an indication of both the 2/4 and the O/D Hydraulic Pressure Switch DTCs present.

Perform diagnostics for both P0870 and P0845 to determine which switch is failing.

With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.

**If there are no possible causes remaining, view repair.**

- **When Monitored:**  
After a reset (ignition key turned to the RUN position).
- **Set Condition:**  
The checksum of the battery backed RAM does not match the stored checksum. Set Time: Less than 7 msec.

Possible Causes
BATTERY WAS DISCONNECTED PCM WAS REPLACED OR DISCONNECTED QUICK LEARN WAS PERFORMED (A209) FUSED B+ CIRCUIT TO PCM OPEN (Z904) GROUND CIRCUITS OPEN

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

## Theory of Operation

Note: This is not a fault code. It exists to provide reference information only. A battery backed RAM is used to maintain some learned values. When the battery is disconnected, this memory is lost. When the battery is reconnected, the loss of learned values will be detected by the controller. The code will be set and the learned values will be initialized to known constants and the learning process will continue. Setting the code has no effect except for re-initialization of learned values.

# P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION

**P1775-SOLENOID SWITCH VALVE LATCHED IN TCC POSITION (CONTINUED)**

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Prior to a shift into 1st gear.
- **Set Condition:**  
Transmission temperature must be HOT. DTC is set after six unsuccessful attempts to shift into 1st gear.

Possible Causes
RELATED DTC P0841 PRESENT (T16) TRANSMISSION CONTROL RELAY OUTPUT CIRCUIT OPEN (T50) L/R PRESSURE SWITCH SENSE CIRCUIT OPEN (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO GROUND (T50) L/R PRESSURE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE INTERNAL TRANSMISSION POWERTRAIN CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

**Theory of Operation**

The Solenoid Switch Valve, an internal, hydraulically operated valve, controls the direction of the transmission fluid when the LR solenoid is energized. When the solenoid switch valve is in the downshifted position and the LR solenoid is energized, fluid is directed to the LR element for 1st gear. When the solenoid switch valve is in the upshifted position (2nd, 3rd, and 4th gear) and the LR solenoid is energized, fluid is directed into the Lockup Switch Valve which controls the Torque Converter Clutch. When shifting into 1st gear, a special sequence is followed to insure solenoid switch valve movement into the downshifted position. The LR pressure switch is monitored to confirm switch valve movement. If the solenoid switch valve movement is not confirmed (i.e. no LR pressure when the LR solenoid is energized), 2nd gear is substituted for 1st. No 1st gear (2nd gear is substituted). The transmission Torque converter FEMCC operation is inhibited. MIL on after 5 min. of substituted operation.

When doing PEMCC or FEMCC, the LR pressure switch should indicate no pressure if the solenoid switch valve is in the LU position. If the LR pressure switch indicates pressure for some time while in partial or full EMCC, the EMCC operation is aborted and momentarily inhibited to avoid accidental application of the LR clutch. EMCC is attempted again when there is no LR pressure. The fourth detection of LR pressure while in PEMCC or FEMCC will result in setting the DTC. Torque converter EMCC operation inhibited. P1790-FAULT IMMEDIATELY AFTER SHIFT

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
After a Gear Ratio Error code is stored.
- **Set Condition:**  
Gear Ratio Error DTC have already been set. The DTC is set if the fault happened within 1.3 seconds of a shift. The DTC set time will vary from 1.214 seconds to 15 seconds.

Possible Causes
FAULT AFTER SHIFT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

Theory of Operation

This DTC is not stored alone. It is stored if a Gear Ratio DTC is detected immediately after shift. The existence of DTC P1790 indicates a mechanical or hydraulic (non-electrical) related problems. It should be noted, however, that all mechanical problems don't necessarily result in DTC P1790. When this DTC exists, diagnosing the system should be based on the associated DTC and only mechanical causes should be considered.

Diagnostic Test

1. FAULT AFTER SHIFT

This DTC is set along with a Gear Ratio DTC. Perform the appropriate test for the Gear Ratio DTC stored.

**Note: Check 1 trip failures if there are no Gear Ratio DTCs current.**

Possible Causes
SPEED SENSOR GROUND CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).**

**Theory of Operation**

The two speed sensors in the transmission system and use a common ground circuit. The loss of this common ground results in the input signal being sensed by both sensors. After a reset and in neutral, and observing a certain Output/Input ratio will increment the Speed Check Fault Counter. Because the speed sensors and the thermistor share the same ground wire, this DTC may indicate a loss of the common speed sensor ground. In some cases this fault will cause a Gear Ratio Error DTC to be set.

P1797-MANUAL SHIFT OVERHEAT

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously with engine running.
- **Set Condition:**  
If the Engine Temperature exceeds 123° C or 255° F, or the Transmission Temperature exceeds 135° C or 275° F while in AutoStick® mode. Note: Aggressive driving or driving in low for extended periods of time will set this DTC.

Possible Causes
MANUAL SHIFT OVERHEAT

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding. (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING).

Theory of Operation

The major cause of heat build up in the transmission is torque converter slip. With the transmission in the autostick mode, the torque converter can slip during aggressive driving or heavy loading conditions such as trailer tow or steep grades. In the non autostick mode the controller logic prevents the transmission from overheating by managing the shift and EMCC schedule. In the autostick mode when the transmission or engine temperature approaches an overheat condition, the manual shift overheat DTC is set and the autostick mode is temporarily suspended until the temperature returns to a normal condition.

Diagnostic Test

1. MANUAL SHIFT OVERHEAT

- This is an informational DTC only.
- With the scan tool, check the EATX DTC EVENT DATA to help identify the conditions in which the DTC was set.
- Check the engine and transmission cooling system for proper operation.
- Check the Radiator Cooling Fan operation.
- Check the Transmission Cooling operation.
- Check the Transmission Fluid Level per the Service Information. Make sure it is not overfilled.

**Note:** Aggressive driving or driving in low for extended periods of time will set this DTC.

For the Transmission circuit diagram (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

#### 1. 42RLE TRANSMISSION VERIFICATION TEST - VER 1

**Note: 1. After completion of the Transmission Verification Test, the Powertrain Verification Test must be performed. Refer to the Engine Category.**

2. Connect the scan tool to the Data Link Connector (DLC).
3. Reconnect any disconnected components.
4. With the scan tool, erase all Transmission DTC's, also erase the PCM DTC's.
5. Perform \*PRNDL FAULT CLEARING PROCEDURE after completion of repairs for P0706 CHECK SHIFTER SIGNAL.
6. With the scan tool, display Transmission Temperature. Start and run the engine until the Transmission Temperature is HOT, above 43° C or 110° F.
7. Check the transmission fluid and adjust if necessary. Refer to the Service Information for the Fluid Fill procedure.

**Note: 8. If the Powertrain Control Module or Torque Converter has been replaced, or if the Transmission has been repaired or replaced, it is necessary to perform the scan tool Quick Learn Procedure.**

**Note: 9. If the Powertrain Control Module or Front Control Module has been replaced you must reset the Pinion Factor in the Front Control Module.**

10. Road test the vehicle. With the scan tool, monitor the engine RPM. Make 15 to 20 1-2, 2-3, 3-4 upshifts. Perform these shifts from a standing start to 45 MPH with a constant throttle opening of 20 to 25 degrees.
11. Below 25 MPH, make 5 to 8 wide open throttle kickdowns to 1st gear. Allow at least 5 seconds each in 2nd and 3rd gear between each kickdown.
12. For a specific DTC, drive the vehicle to the Symptom's When Monitored/When Set conditions to verify the DTC is repaired.
13. If equipped with AutoStick®, upshift and downshift several times using the AutoStick® feature during the road test.

**Note: 14. Use the EATX OBDII task manager to run Good Trip time in each gear, this will confirm the repair and to ensure that the DTC has not re-matured.**

15. Check for Diagnostic Trouble Codes (DTC's) during the road test. If a DTC sets during the road test, return to the Symptom list and perform the appropriate symptom.

**Note: 16. Erase P0700 DTC in the PCM to turn the MIL light off after making transmission repairs.**

**Were there any Diagnostic Trouble Codes set during the road test?**

- Yes** >> Repair is not complete, refer to the appropriate symptom.  
Perform 42RLE TRANSMISSION VERIFICATION TEST - VER 1.
- No** >> Repair is complete.

The NAG1 automatic transmission is an electronically controlled 5-speed transmission with a lock-up clutch in the torque converter. The ratios for the gear stages are obtained by 3 planetary gear sets. Fifth gear is designed as an overdrive with a high-speed ratio.

NAG1 identifies a family of transmissions and means “N”ew “A”utomatic “G”earbox, generation 1. Various marketing names are associated with the NAG1 family of transmissions, depending on the transmission variation being used in a specific vehicle. Some examples of the marketing names are: W5A300, W5A380, and W5A580. The marketing name can be interpreted as follows:

- W = A transmission using a hydraulic torque converter.
- 5 = 5 forward gears.
- A = Automatic Transmission.
- 580 = Maximum input torque capacity in Newton meters.

The gears are actuated electronically/hydraulically. The gears are shifted by means of an appropriate combination of three multi-disc holding clutches, three multi-disc driving clutches, and two freewheeling clutches.

Electronic transmission control enables precise adaptation of pressures to the respective operating conditions and to the engine output during the shift phase which results in a significant improvement in shift quality.

Furthermore, it offers the advantage of a flexible adaptation to various vehicle and engines.

Basically, the automatic transmission with electronic control offers the following advantages:

- Reduces fuel consumption.
- Improved shift comfort.
- More favourable step-up through the five gears.
- Increased service life and reliability.
- Lower maintenance costs.

## TRANSMISSION IDENTIFICATION

The transmission can be generically identified visually by the presence of a round 13-way connector located near the front corner of the transmission oil pan, on the right side. Specific transmission information can be found stamped into a pad on the left side of the transmission, above the oil pan rail.

## TRANSMISSION GEAR RATIOS

The gear ratios for the NAG1 automatic transmission are as follows:

1st Gear . . . . .	3.59:1
2nd Gear . . . . .	2.19:1
3rd Gear . . . . .	1.41:1
4th Gear . . . . .	1.00:1
5th Gear . . . . .	0.83:1
Reverse . . . . .	3.16:1

## TRANSMISSION HOUSING

The converter housing and transmission are made from a light alloy. These are bolted together and centered via the outer multi-disc carrier of multi-disc holding clutch, B1. A coated intermediate plate provides the sealing. The oil pump and the outer multi-disc carrier of the multi-disc holding clutch, B1, are bolted to the converter housing. The stator shaft is pressed into it and prevented from rotating by splines. The electrohydraulic unit is bolted to the transmission housing from underneath. A sheet metal steel oil pan forms the closure.

## MECHANICAL SECTION

The mechanical section consists of a input shaft, output shaft, a sun gear shaft, and three planetary gear sets which are coupled to each other. The planetary gear sets each have four planetary pinion gears. The oil pressure for the torque converter lock-up clutch and clutch K2 is supplied through bores in the input shaft. The oil pressure to clutch K3 is transmitted through the output shaft. The lubricating oil is distributed through additional bores in both shafts. All the bearing points of the gear sets, as well as the freewheeling clutches and actuators, are supplied with lubricating oil. The parking lock gear is connected to the output shaft via splines.

Freewheeling clutches F1 and F2 are used to optimize the shifts. The front freewheel, F1, is supported on the extension of the stator shaft on the transmission side and, in the locking direction, connects the sun gear of the front planetary gear set to the transmission housing. In the locking direction, the rear freewheeling clutch, F2, connects the sun gear of the center planetary gear set to the sun gear of the rear planetary gear set.

## **ELECTROHYDRAULIC CONTROL UNIT**

The electrohydraulic control unit comprises the shift plate made from light alloy for the hydraulic control and an electrical control unit. The electrical control unit comprises of a supporting body made of plastic, into which the electrical components are assembled. The supporting body is mounted on the shift plate and screwed to it.

Strip conductors inserted into the supporting body make the connection between the electrical components and a plug connector. The connection to the wiring harness on the vehicle and the transmission control module (TCM) is produced via this 13-pin plug connector with a bayonet lock.

## **SHIFT GROUPS**

The hydraulic control components (including actuators) which are responsible for the pressure distribution before, during, and after a gear change are described as a shift group. Each shift group contains a command valve, a holding pressure shift valve, a shift pressure shift valve, overlap regulating valve, and a solenoid.

The hydraulic system contains three shift groups: 1-2/4-5, 2-3, and 3-4. Each shift group can also be described as being in one of two possible states. The active shift group is described as being in the shift phase when it is actively engaging/disengaging a clutch combination. The 1-2/4-5 shift group control the B1 and K1 clutches. The 2-3 shift group controls the K2 and K3 clutches. The 3-4 shift group controls the K3 and B2 clutches.

## **OPERATION**

The transmission control is divided into the electronic and hydraulic transmission control functions. While the electronic transmission control is responsible for gear selection and for matching the pressures to the torque to be transmitted, the transmission's power supply control occurs via hydraulic elements in the electrohydraulic control module. The oil supply to the hydraulic elements, such as the hydrodynamic torque converter, the shift elements and the hydraulic transmission control, is provided by way of an oil pump connected with the torque converter.

The Transmission Control Module (TCM) allows for the precise adaptation of pressures to the corresponding operating conditions and to the engine output during the gearshift phase, resulting in a noticeable improvement in shift quality. The engine speed limit can be reached in the individual gears at full throttle and kickdown. The shift range can be changed in the forward gears while driving, but the TCM employs a downshift safeguard to prevent over-revving the engine. The system offers the additional advantage of flexible adaptation to different vehicle and engine variants.

## **EMERGENCY RUNNING FUNCTION**

In order to ensure a safe driving state and to prevent damage to the automatic transmission, the TCM control module switches to limp-home mode in the event of critical faults. A diagnostic trouble code (DTC) assigned to the fault is stored in memory. All solenoid and regulating valves are thus de-energized.

The net effect is:

- The last engaged gear remains engaged.
- The modulating pressure and shift pressures rise to the maximum levels.
- The torque converter lockup clutch is deactivated.

In order to preserve the operability of the vehicle to some extent, the hydraulic control can be used to engage 2nd gear or reverse using the following procedure:

- Stop the vehicle.
- Switch off engine.
- Move selector lever to "P".
- Wait at least 10 seconds.
- Start engine.
- Move selector lever to D: 2nd gear.
- Move selector lever to R: Reverse gear.

The limp-home function remains active until the DTC is rectified or the stored DTC is erased with the appropriate scan tool. Sporadic faults can be reset via ignition OFF/ON.

## **CLUTCH APPLICATION**

Refer to CLUTCH APPLICATION for which shift elements are applied in each gear position.

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred to the output shaft (26).

### Front Planetary Gear Set

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

### Rear Planetary Gear Set

The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (15). The sun gear (23) is held against the housing by the engaged multiple-disc holding clutch B2 (6), by the locked freewheel F2 (24) during acceleration and by the engaged multiple-disc clutch K3 (12) during deceleration. The planetary gears (19) turn on the fixed sun gear (23) and increase the torque from the annulus gear (11) to the planetary carrier (15). The planetary carrier (15) moves at a reduced speed in the running direction of the engine.

### Center Planetary Gear Set

The annulus gear (10) is driven at the same speed as the rear planetary carrier (15) as a result of a mechanical connection. The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and the center and rear planetary gearset and transferred to the output shaft (26).

### Front Planetary Gear Set

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore blocked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and input shaft.

### Rear Planetary Gear Set

The annulus gear (11) turns at the input speed as a result of the mechanical connection to the front planetary carrier (13). The sun gear (23) is held against the housing by the engaged multiple-disc holding clutch B2 (6), by the locked freewheel F2 (24) during acceleration and by the engaged multiple-disc clutch K3 (12) during deceleration. The planetary pinion gears (19) turn on the fixed sun gear (23) and increase the torque from the annulus gear (11) to the planetary carrier (15). The planetary carrier (15) moves at a reduced speed in the running direction of the engine.

### Center Planetary Gear Set

The annulus gear (10) is driven at the same speed as the rear planetary carrier (15) as a result of a mechanical connection. The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (5) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and the center planetary gearset and transferred to the output shaft (26).

### Front Planetary Gear Set

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore locked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and input shaft (25).

### Rear Planetary Gear Set

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns in the same way as the planetary carrier (15) due to the mechanical connection with the locked front planetary gearset. This planetary gearset is therefore locked and turns as a closed unit.

### Center Planetary Gear Set

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on

the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred to the output shaft (26).

### **Front Planetary Gear Set**

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

### **Rear Planetary Gear Set**

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns at a reduced speed due to the mechanical connection with the front planetary carrier (13). The planetary pinion gears (19) turn between the annulus gear (11) and the sun gear (23). The sun gear (23) moves at an increased speed in the running direction of the engine.

## Center Planetary Gear Set

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The multiple-disc clutch K3 (12) transfers an increased speed to the sun gear (22) due to the connection with the sun gear (23). The planetary pinion gears (18) turn between the annulus gear (10) and the sun gear (22). The speed of the planetary carrier (14) and the output shaft connected to the planetary carrier (5) lies between that of the annulus gear (10) and the sun gear (22). This provides a step-up ratio.

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred with reversed direction of rotation to the output shaft (26).

### Front Planetary Gear Set

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

### Rear Planetary Gear Set

The planetary carrier (15) is held against the housing by the engaged multiple-disc holding clutch B3 (5). The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (13). The planetary gears (19) turn between the annulus gear (11) and the sun gear (23). The direction is reversed by the held planetary carrier (15) so that the sun gear (23) turns in the opposite direction to the running direction of the engine.

## Center Planetary Gear Set

The annulus gear (10) is held against the housing by the multiple-disc holding clutch B3 (5) via the mechanical connection to the planetary carrier (15). The sun gear (22) turns backwards due to the engaged multiple-disc clutch K3 (12). The planetary gears (18) turn on the fixed annulus gear (10) and increase the torque from the sun gear (22) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the opposite direction to the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred with reversed direction of rotation to the output shaft (26) and.

### Front Planetary Gear Set

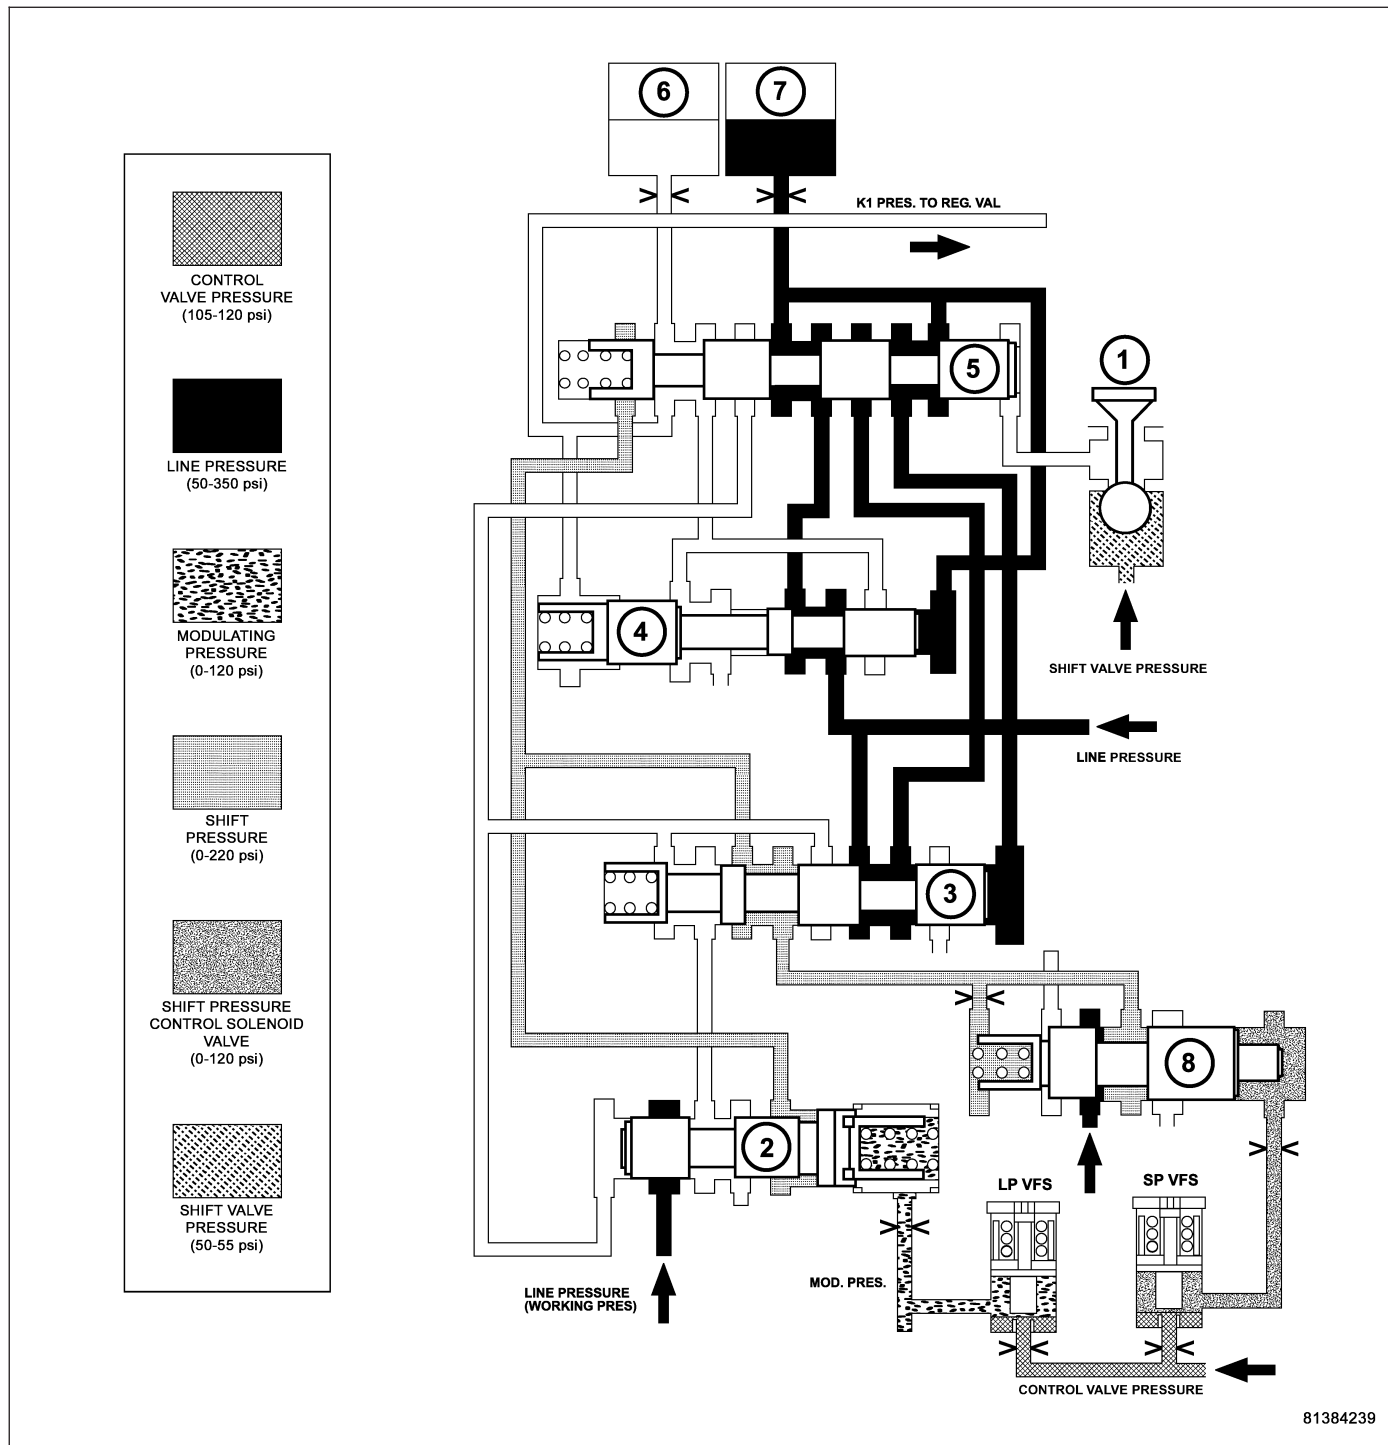

The clutch K1 (7) is shifted. The planetary carrier (13) and sun gear (21) are connected to each other as a result. The annulus gear (8) is driven via the input shaft (25). The planetary gear set is locked and turns as a unit.

### Rear Planetary Gear Set

The planetary carrier (15) is held against the housing by the engaged multiple-disc holding clutch B3 (5). The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (13). The planetary pinion gears (19) turn between the annulus gear (11) and the sun gear (23). - 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE

- 5 - 1-2/4-5 COMMAND VALVE
- 6 - DRIVING CLUTCH K1
- 7 - HOLDING CLUTCH B1

The end face of the command valve (5) is kept unpressurized via the solenoid valve for 1-2 and 4-5 shift (1). Because of the holding pressure shift valve (4), the working pressure (p-A) is present at the multiple-disc holding clutch B1 (7). Clutch K1 (6) is unpressurized.

## Shift Phase - 1-2 Shift Phase 1

**Shift Phase - 1-2 Shift Phase 1**

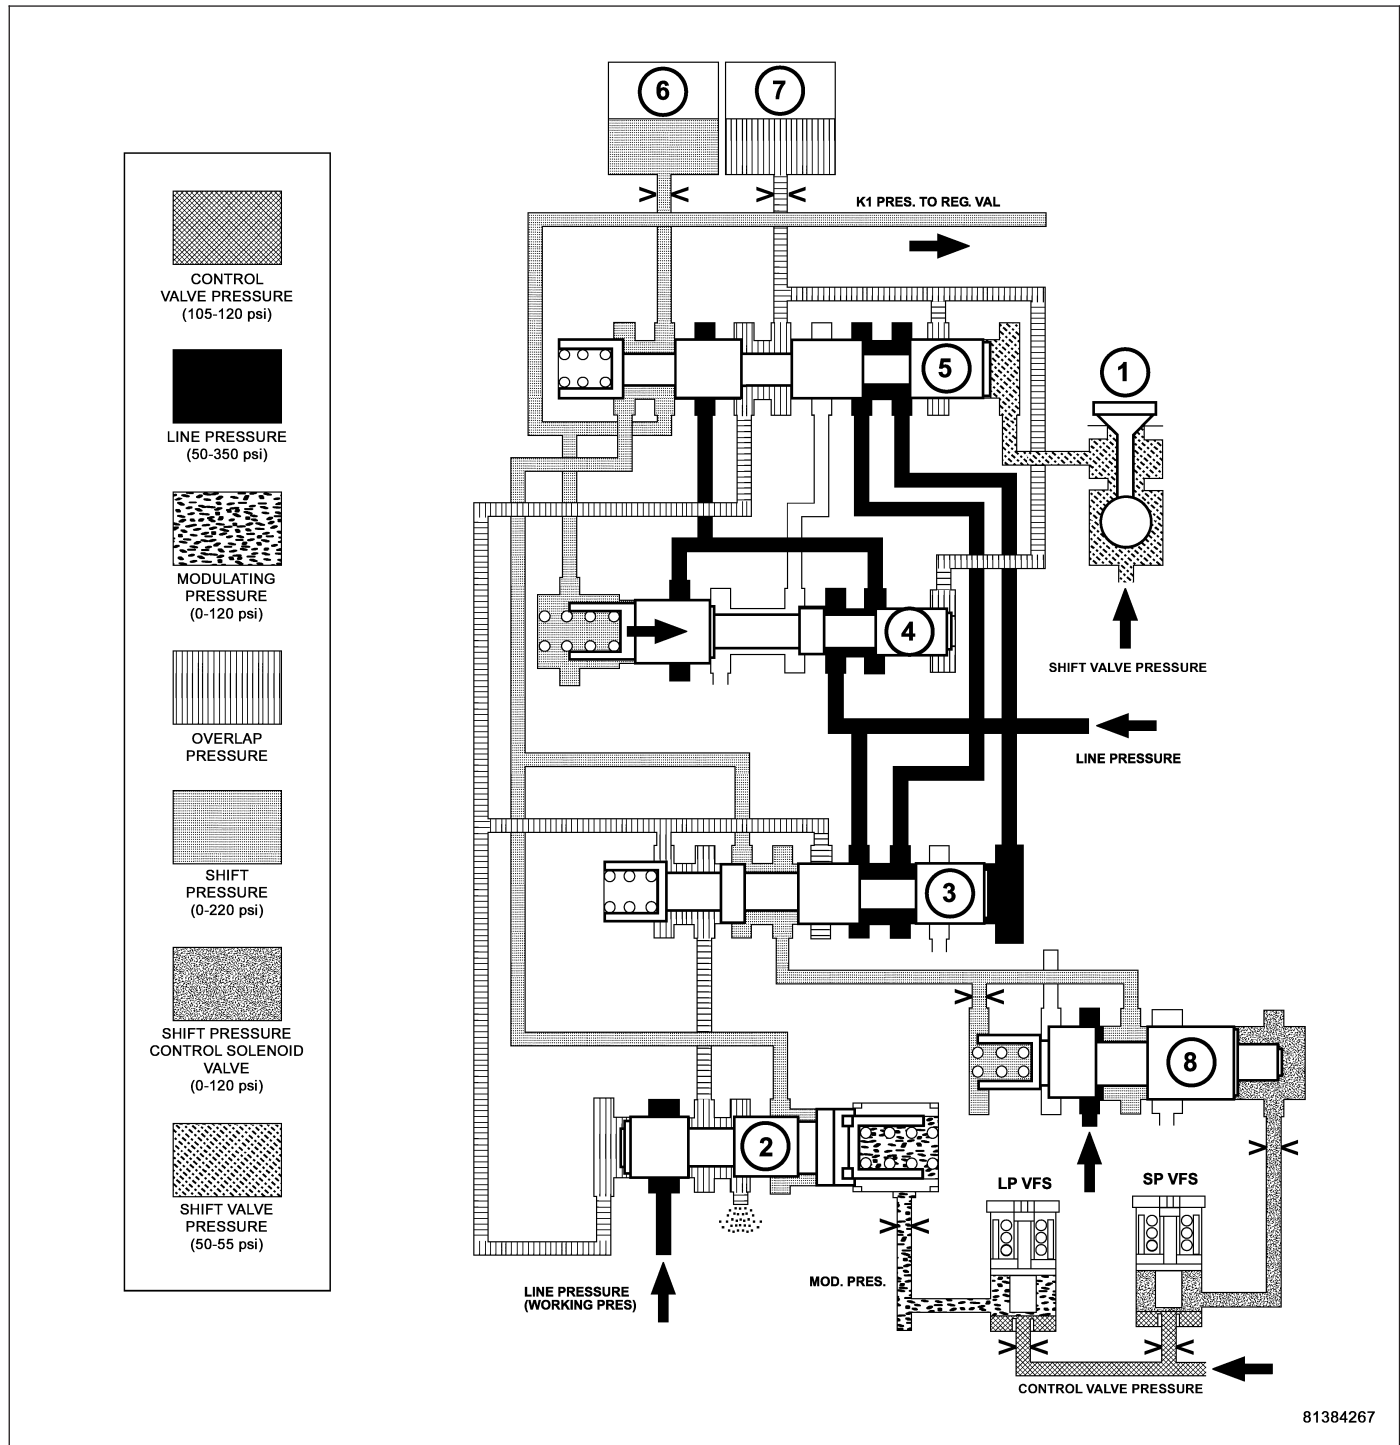

- 1 - 1-2/4-5 SHIFT SOLENOID
- 2 - 1-2/4-5 OVERLAP VALVE
- 3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE
- 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE

- 5 - 1-2/4-5 COMMAND VALVE
- 6 - DRIVING CLUTCH K1
- 7 - HOLDING CLUTCH B1

When the 1-2 and 4-5 shift solenoid valve (1) is turned on, the shift valve pressure (p-SV) is directed onto the end face of the command valve (5). The command valve is moved and the shift pressure (p-S) coming from the shift pressure shift valve (3) is directed via the command valve (5) onto clutch K1 (6).

Simultaneously the clutch B1 (7) is subjected to overlap pressure by the overlap regulating valve (2). The pressure in the clutch B1 (7) as it disengages is controlled during the shift phase depending on engine load by the modulating pressure and the applying clutch pressure (the shift pressure in clutch K1). The controlled pressure in clutch B1 (7) is inversely proportional to the capacity of the clutch being engaged. The rising shift pressure (p-S) at clutch K1 (6) acts on the annular face of the overlap regulating valve (2) and reduces the overlap pressure regulated by the overlap regulating valve (2). When a corresponding pressure level is reached at the holding pressure shift valve (4), this valve switches over.

- 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE

- 5 - 1-2/4-5 COMMAND VALVE
- 6 - DRIVING CLUTCH K1
- 7 - HOLDING CLUTCH B1

The B1 (7) pressure acting on the end face of the shift pressure shift valve (3) is replaced by the working pressure (p-A). The shift pressure is also routed to the spring end of the holding valve (4) and the holding valve downshifts. The line pressure is then routed to the command valve (5).

- 5 - 1-2/4-5 COMMAND VALVE
- 6 - DRIVING CLUTCH K1
- 7 - HOLDING CLUTCH B1

After the gearchange is complete, the pressure on the end face of the command valve (5) is reduced via the 1-2 and 4-5 shift solenoid valve (1), and the command valve (5) is pushed back to its basic position. Via the holding pressure shift valve (4) the working pressure (p-A) now passes via the command valve (5) to clutch K1 (6). The multiple-disc holding clutch B1 (7) is deactivated (unpressurized). The spring of the shift pressure shift valve (3) pushes the valve back to its basic position.

## Shift Phase - 2-1 Shift Phase 1

*Shift Phase - 2-1 Shift Phase 1*

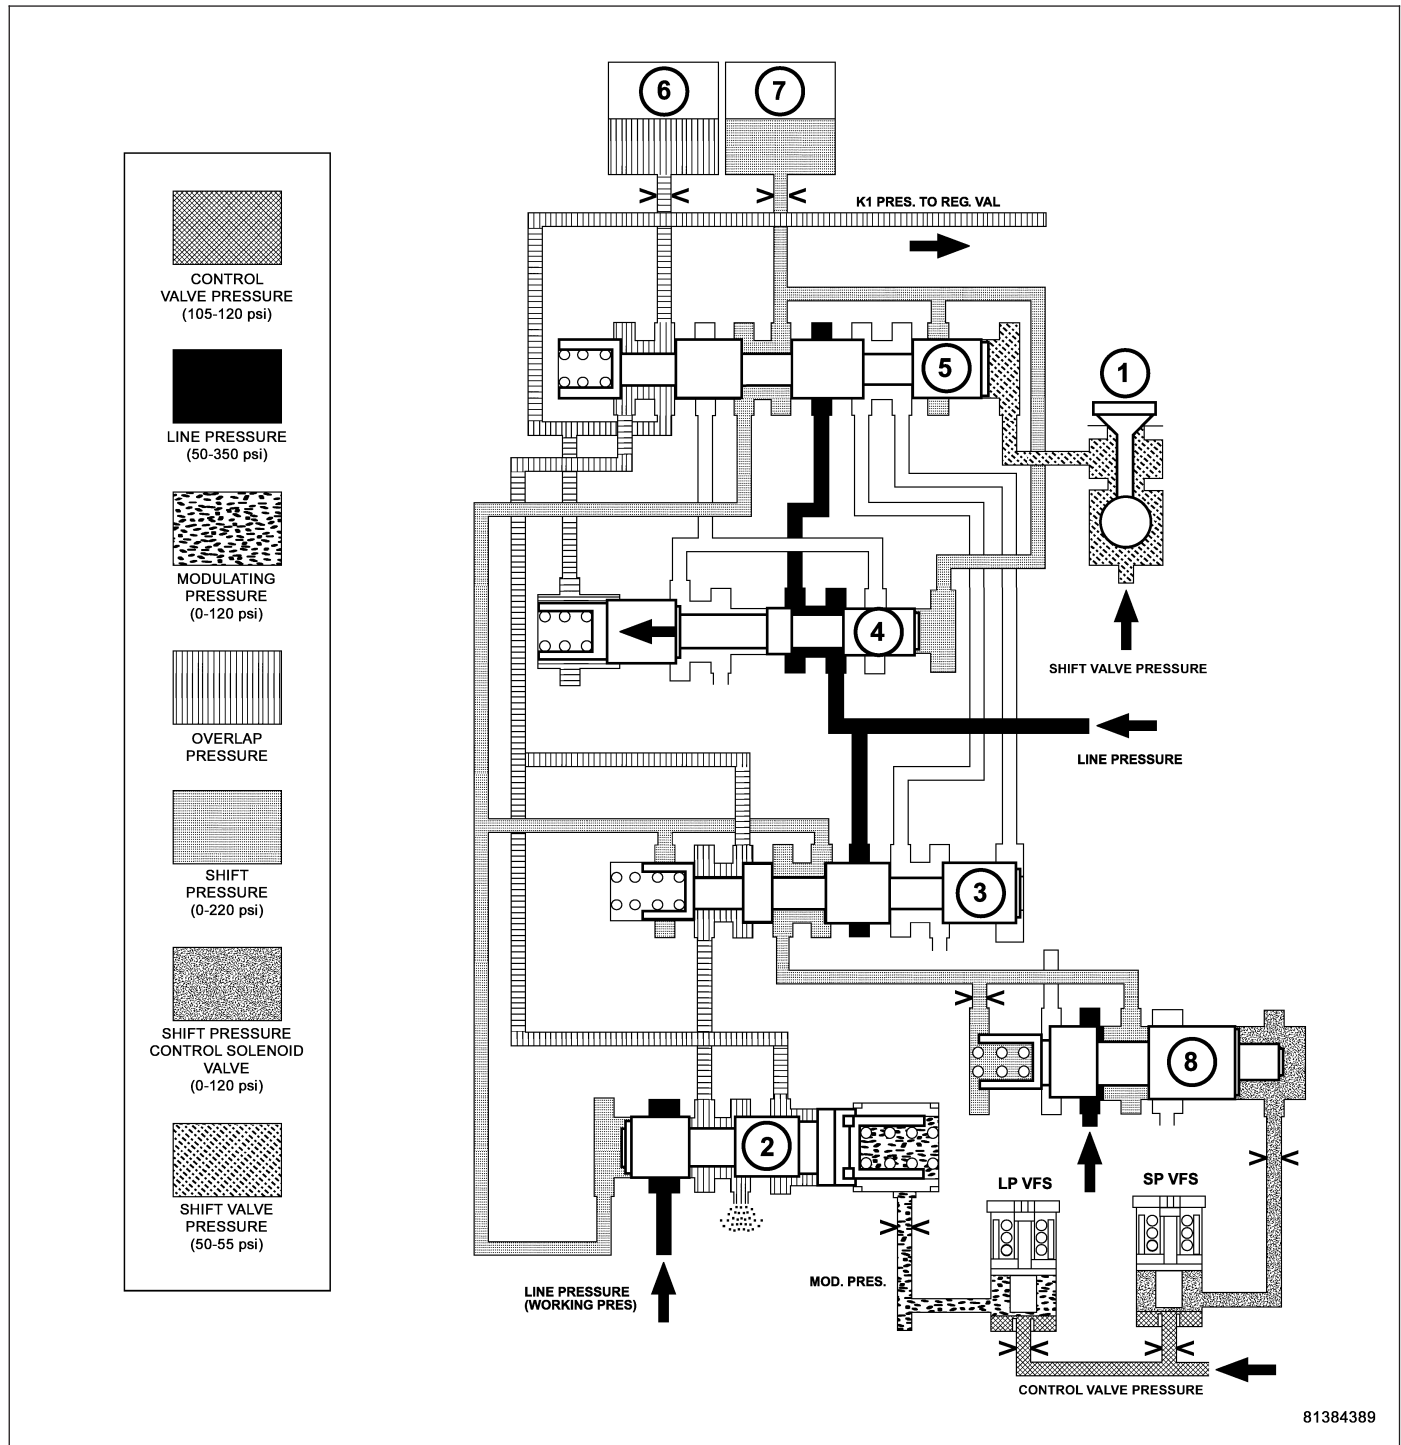

- 1 - 1-2/4-5 SHIFT SOLENOID
- 2 - 1-2/4-5 OVERLAP VALVE
- 3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE
- 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE

- 5 - 1-2/4-5 COMMAND VALVE
- 6 - DRIVING CLUTCH K1
- 7 - HOLDING CLUTCH B1

The 1-2/4-5 shift solenoid (1) is turned ON to apply shift pressure (p-S) to the end face of the 1-2/4-5 command valve (5). This allows the command valve to up-shift and the shift pressure coming from the 1-2/4-5 shift valve (3) is routed to the holding clutch B1 (7) via the command valve.

Simultaneously, the pressure in the releasing clutch, K1 (6), is regulated at the 1-2/4-5 overlap valve (2). The pressure in the K1 clutch as it disengages is controlled during the shift phase depending on engine load, via the modulating pressure (p-MOD), and the shift pressure in clutch B1 (7). The increasing shift pressure in clutch B1, which also acts on the end face of the overlap valve, reduces the overlap pressure.

# Shift Phase - 2-1 Shift Phase 2

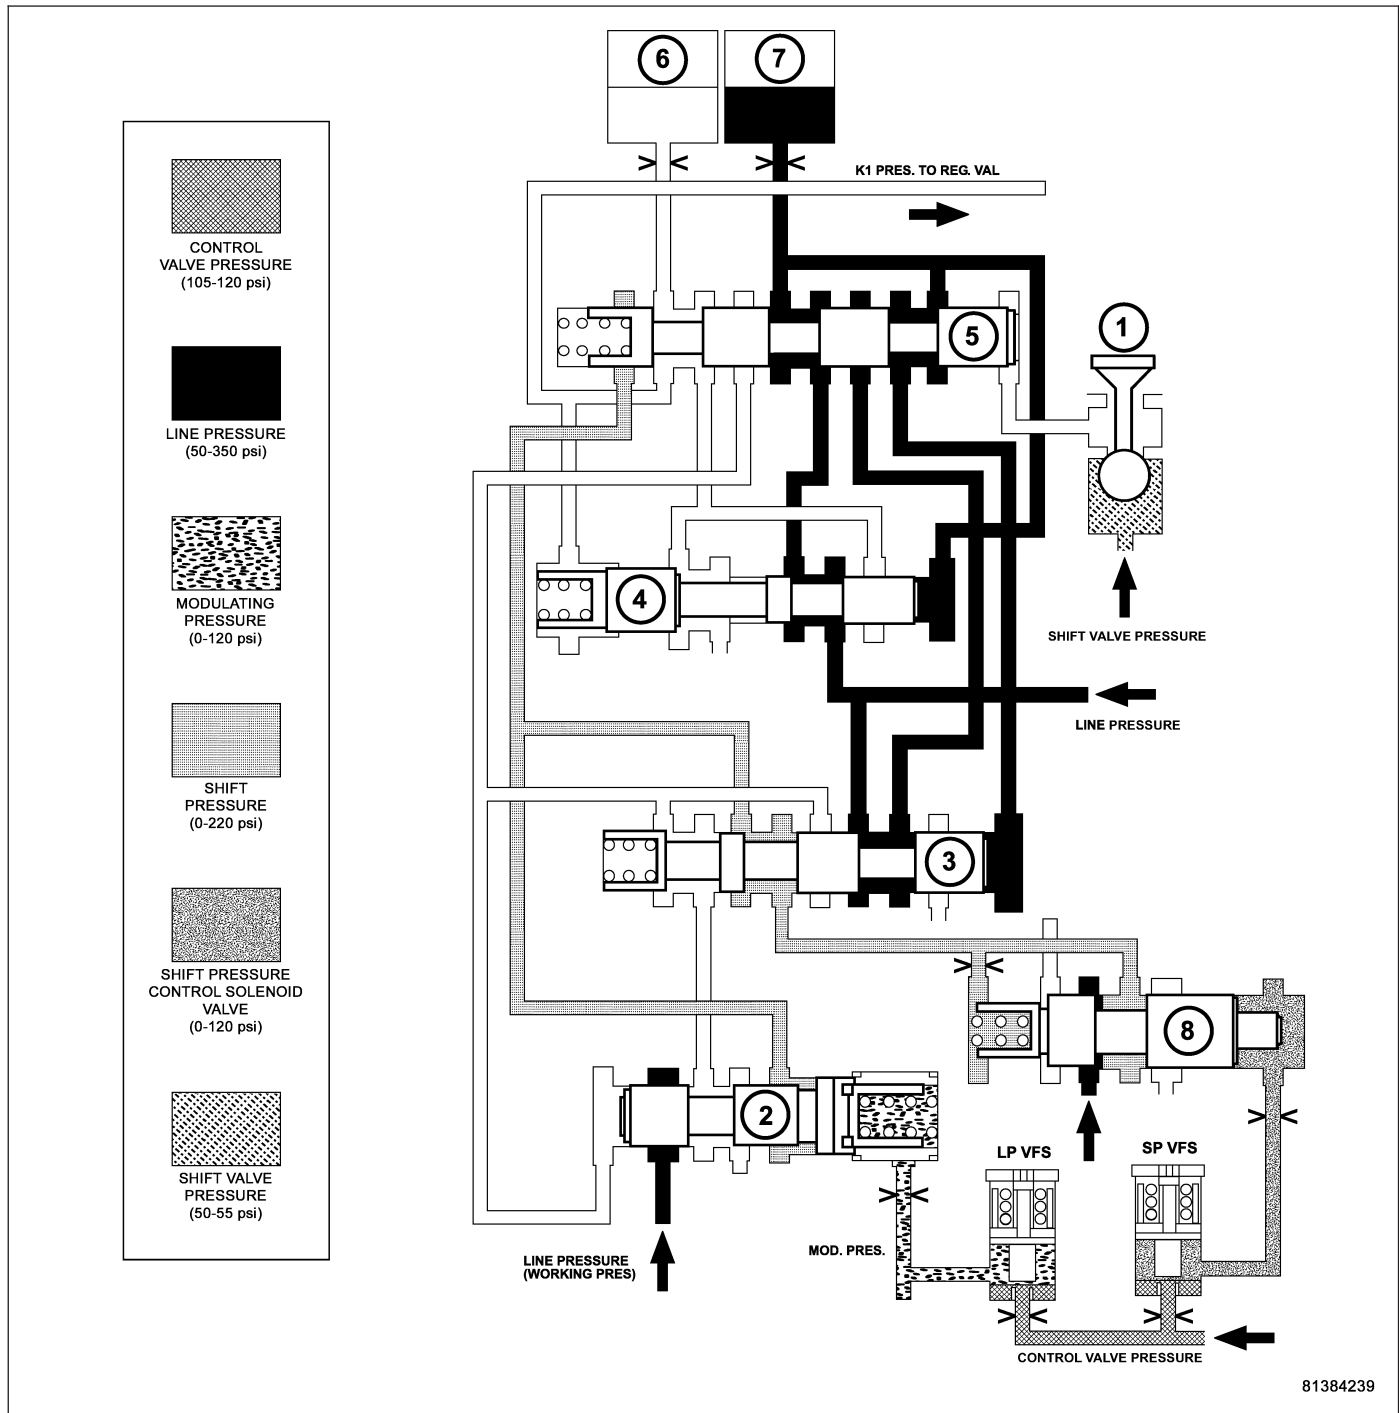

## Shift Phase - 2-1 Shift Phase 2

- 1 - 1-2/4-5 SHIFT SOLENOID
- 2 - 1-2/4-5 OVERLAP VALVE
- 3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE
- 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE

- 5 - 1-2/4-5 COMMAND VALVE
- 6 - DRIVING CLUTCH K1
- 7 - HOLDING CLUTCH B1

The pressure in clutch B1 (7) acting on the end face of the 1-2/4-5 holding valve (4) forces the valve to up-shift against the spring pressure and allows line pressure (p-A) to pass through the command valve (5).

## 2-1 Shift - First Gear Engaged

81384239

### First Gear Engaged

- 1 - 1-2/4-5 SHIFT SOLENOID
- 2 - 1-2/4-5 OVERLAP VALVE
- 3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE
- 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE

- 5 - 1-2/4-5 COMMAND VALVE
- 6 - DRIVING CLUTCH K1
- 7 - HOLDING CLUTCH B1

After the gear change is complete, the 1-2/4-5 shift solenoid (1) is turned off. This reduces the pressure on the end face of the 1-2/4-5 command valve (5) to 0 psi and the spring pressure downshifts the valve to its initial position. The line pressure (p-A) is switched to the holding clutch B1 (7) and the end face of the holding valve by the downshifted command valve. The upshifted holding valve also allows the remaining pressure in clutch K1 (6) to be vented.

With the engine started and the gearshift lever in the NEUTRAL or PARK positions, holding clutch B1 (1) and driving clutch K3 (4) are applied and the various valves in the 1-2/4-5 shift group are positioned to apply pressure to the holding clutch B2.

The selector valve opens the shift pressure (p-S) feed connection from the ball valve (19) with the shift valve B2 (9). With the shift valve B2 (9) in the upper position, shift pressure (p-S) travels behind the piston B2 (5) and simultaneously to the opposing face of the piston B2 (6). The multiple-disc holding clutch B2 begins to close.

The pressure on the opposing face of the piston B2 (6) ensures a soft activation of the multiple-disc holding clutch B2.

The TCM monitors the activation sequence via the speed of the input shaft, which slows down as the frictional connection in the multiple-disc holding clutch increases. When the speed drops to the specified level, the TCM shuts off the power to the 3-4 shift solenoid valve (10). The spring chamber of the shift valve B2 (9) is depressurized and switches downwards. This connects the line to the opposing face of the piston B2 (6) with the pressure holding valve (11). The pressure on the opposing face of the piston B2 (6) drops to a residual pressure.

The working pressure (p-A) is formed and travels via the 2-3 holding pressure shift valve, the 2-3 command valve and the ball valve (16) to multi-plate clutch K3 (4) and via the 3-4 command valve (13) to the end face of the 3-4 shift pressure shift valve (14). The 3-4 shift pressure shift valve (14) is moved against the force of the spring towards the right. At the same time the 3-4 solenoid valve (10) is energized. This allows shift valve pressure (p-SV) to enter the spring chamber of the shift valve B2 (9) and to reach the end face of the 3-4 command valve (13). The shift valve B2 (9) is held in the upper position and the 3-4 command valve (13) switches towards the right. At the end face of the 3-4 shift pressure shift valve (14) the working pressure (p-A) is replaced by shift valve pressure (p-SV).

The 3-4 command valve (13) moves to the left. Working pressure (p-A) travels via the holding pressure shift valve (12) and the 3-4 command valve (13) to the piston of multiple-disc holding clutch B2 (5).

## DIAGNOSIS AND TESTING

### AUTOMATIC TRANSMISSION

**CAUTION:** Before attempting any repair on a NAG1 automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.
- Transfer case performance (if equipped).

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

### PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

#### VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Check fluid level and condition.
3. Adjust gearshift cable if complaint was based on delayed, erratic, or harsh shifts.
4. Road test and note how transmission upshifts, downshifts, and engages.

#### VEHICLE IS DISABLED

1. Check fluid level and condition.
2. Check for broken or disconnected gearshift cable.
3. Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
4. Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:
  - a. If propeller shaft turns but wheels do not, problem is with differential or axle shafts.
  - b. If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and check for debris. If pan is clear, remove transmission and check for damaged driveplate, converter, oil pump, or input shaft.
  - c. If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

### ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart CLUTCH APPLICATION provides a basis for analyzing road test results.

Reverse gear position blocked engagement when moving shift lever from D position	1. Customer shifting into R at vehicle speeds greater than 7mph.	1. Instruct customer that R shifter position is blocked at vehicle speeds greater than 7mph.
	2. Shift system malfunction.	2. Inspect shift system for proper adjustment or damage. Check shifter for DTCs. Repair as needed.
No Engine Cranking in P or N	1. Gearshift cable adjustment.	1. Adjust shift cable and retest.
	2. Shift system malfunction.	2. Check shifter DTCs. Inspect shift cable and lever assembly. Adjust and/or replace worn/damaged parts.
	3. Valve body malfunction.	3. Starter lockout contact malfunction. Remove valve body, replace lead frame assembly.

CONDITION	POSSIBLE CAUSES	CORRECTION
Fluid Leak	1. Leak in area of bell housing.	1. Check bolt torque on internal bell housing bolts. If loose, replace fastener and torque to proper level. If bolts are to proper torque level, check pump outer seal and impeller seal. Replace if needed.
	2. Leak in area of control unit(valve body) electrical connector.	2. Check connector for damaged(cut) or missing o-rings. Replace as needed.
	3. Leak in area of pan gasket.	3. Check for proper torque on oil pan clamps. Check for mis-positioned or rolled gasket. Repair as needed.
	3. Free Wheeling Clutch F2 Defective.	3. Replace Free Wheeling Clutch F2, Hollow Shaft, and Rear Sun Gear/Inner Disc Carrier K3.
	4. Leak in area of park guide plug.	4. Remove park guide plug. Check for damaged(cut) or missing o-ring. If o-ring is in good condition, install new plug.
	5. Leak in area of shift lever.	5. Check for damaged shift lever seal or damaged lever. Repair as needed.
	6. Leak in area of output flange.	6. Check for worn/damaged slinger seal and output seal. Visually inspect output flange seal surface for damage. Repair as needed.
	7. Leak in area of transmission vent.	7. Check fluid level for overfill condition. Adjust as needed. If fluid level is within specification, ride check vehicle. Monitor transmission temperature. If high operating temperatures are observed, fluid may be contaminated or cooling system malfunctioning. Change fluid per service manual procedures. Refer to cooling system diagnostics if needed.
	8. Leak in area of transmission fill tube.	8. Inspect fill tube cap for proper installation. Inspect fill tube grommet between case and fill tube for leakage. Repair as needed.

## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil™ tap, or equivalent, and installing a Heli-Coil™ insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

## REMOVAL

**Note:** If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Mark propeller shaft (1) and the transmission flange (4) for assembly alignment.
4. Remove the bolts (2) holding the rear propeller shaft coupler (3) to the transmission flange (4).
5. Slide the propeller shaft (1) rearward until the coupler clears the propeller shaft pilot (5) on the transmission output shaft.

6. Remove the bolts (2) holding the starter motor (1) to the transmission. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
7. Remove the starter (1) from the transmission starter pocket and safely relocate.

8. Remove the bolt (2) holding the torque converter access cover (1) to the transmission.
9. Remove the torque converter access cover (1) from the transmission.

10. Rotate crankshaft in clockwise direction until converter bolts (1) are accessible. Then remove bolts (1) one at a time. Rotate crankshaft with socket wrench on dampener bolt.

11. Disconnect the gearshift cable (1) from the transmission manual valve lever (3).
12. Loosen the bolts holding the shift cable retaining strap (2) to the transmission.

13. Remove the shift cable (1) from the transmission.
14. Remove bolt (3) and screw (1) holding the heat shield (2) to the transmission.
15. Remove the heat shield (2) from the transmission.

16. Disconnect 13-pin plug connector (1). Turn bayonet lock of guide bushing (2) anti-clockwise.
17. Remove the 13-pin connector (1) from the transmission.

18. Disconnect transmission fluid cooler lines (1) at transmission fittings (2) and clips (3).
19. Disconnect the transmission vent hose from the transmission.

20. Support rear of engine with safety stand or jack.
21. Raise transmission slightly with service jack to relieve load on crossmember and supports.
22. Remove bolts (2) securing rear support and cushion (3) to transmission crossmember (1).
23. Remove bolts attaching crossmember (1) to frame and remove crossmember.

24. Remove the bolts (1) holding the engine oil pan (2) to the transmission (3).

25. Remove all remaining bolts (2) holding the engine (1) to the transmission (3).
26. Carefully work transmission and torque converter assembly rearward off engine block dowels.
27. Hold torque converter in place during transmission removal.
28. Lower transmission and remove assembly from under the vehicle.
29. To remove torque converter, carefully slide torque converter out of the transmission.

## DISASSEMBLY

**Note:** If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

**Note:** Tag all clutch pack assemblies, as they are removed, for reassembly identification.

1. Remove the torque converter (1).

2. Place transmission in a vertical position.
3. Measure input shaft end play as follows:
  - a. Attach Adapter 8266-18 (2) to Handle 8266-8 (1).
  - b. Attach dial indicator C-3339 (3) to Handle 8266-8 (1).
  - c. Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-18 (2) to secure it to the input shaft.
  - d. Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
  - e. Move the input shaft in and out. Record the maximum travel for assembly reference.

4. Loosen guide bushing (12) and remove from transmission housing.
5. Detach oil pan (5).
6. Remove oil filter (4).
7. Unscrew Torx socket bolts (3) and remove electrohydraulic unit (2).

8. Place the transmission in PARK to prepare for the removal of the output shaft nut.
9. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
10. Remove the transmission rear oil seal with a suitable slide hammer and screw.
11. Remove the transmission output shaft washer. Be sure to tag the washer since it is very similar to the geartrain end-play shim and they must not be interchanged.
12. Remove the transmission rear output shaft bearing retaining ring (1).

13. Position Bearing Remover 9082 (1) over the inner race of the output shaft bearing (3).

14. Slide the collar (3) on the Bearing Remover 9082 (1) downward over the fingers (4) of the tool.

15. Remove the output shaft bearing (3).
16. Remove the geartrain end-play shim from the output shaft. Be sure to tag the shim since it is very similar to the output shaft washer and they must not be interchanged.

17. Remove the bolts holding the transmission housing to the converter housing from inside the converter housing.
18. Stand the transmission upright on the converter housing. Be sure to use suitable spacers between the bench surface and the converter housing since the input shaft protrudes past the front surface of the housing.
19. Remove the remaining bolts holding the transmission housing to the converter housing.
20. Remove the transmission housing from the converter housing.
21. Remove output shaft with center and rear gear set and clutch K3 (3).
22. Remove thrust needle bearing (4) and thrust washer (5).
23. Remove input shaft with clutch K2 and front gear set (6).
24. Remove clutch K1 (1).

6 - OIL PUMP

25. Unscrew Torx socket bolts (4) and remove oil pump (6). Screw two opposed bolts into the oil pump housing and press the oil pump out of the converter housing by applying light blows with a plastic hammer.
26. Remove and discard the torque converter hub seal and the oil pump outer o-ring seal from the oil pump.
27. Unscrew Torx socket bolts (1) and remove multiple-disc holding clutch B1 (5) from converter housing. Screw two opposed bolts into the multiple-disc holding clutch B1 (5) and separate from the converter housing by applying light blows with a plastic hammer.
28. Detach intermediate plate (3) from converter housing (2).

### ***Remove B2, B3, and Parking Gear***

29. Remove multiple-disc pack B3 (2) and spring washer (3) by removing snap-ring (1) in transmission housing. To facilitate removal of the snap-ring (1), compress the multiple-disc pack B3 (2). Note which clutch disc is removed just prior to the spring washer (3) for re-assembly. If the clutch discs are re-used, this disc must be returned to its original position on top of the spring washer.
30. Unscrew Torx socket bolts (7).
31. Remove multiple-disc holding clutch B2 (4) from transmission housing. The externally toothed disc carrier for multiple-disc holding clutch B2 is also the piston for multiple-disc holding clutch B3.
32. Remove parking lock gear (5).

## **ASSEMBLY**

**Note:** If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

***Install B2, B3, and Parking Gear***

- |                             |                          |

| 4 - HOLDING CLUTCH B2       |                          |

1. Insert parking lock gear (5).
2. Install multiple-disc holding clutch B2 (4) in transmission housing (6).
3. Screw in both Torx socket bolts (7). Tighten the bolts to 16 N·m (141 in.lbs.).

**Note:** During the measurement the snap ring (7) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (8).

**Note:** Pay attention to sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the spring washer (4) to its original location. Place new friction multiple-discs in ATF fluid for one hour before installing.

4. Insert and measure spring washer (4) and multiple-disc pack B3 (2, 6).

- a. Put multiple-discs for multiple-disc holding clutch B3 together in the sequence shown in the illustration and insert individually.

b.

**CAUTION:** Apply only light pressure (less than 10 N (3 lbs.) of force) to the clutch pack when measuring the clutch clearance with the feeler gauge.

Applying excessive force to the clutch will give an incorrect reading and lead to a transmission failure. Using a feeler gauge, determine the play "L" at three points between the snap ring (7) and outer multiple-disc (1). B3 clutch clearance should be 1.0-1.4 mm (0.039-0.055 in.). Adjust the clearance as necessary.

- c. Adjust with snap-ring (7), if necessary. Snap-rings are available in thicknesses of 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), 4.1 mm (0.162 in.), 4.4 mm (0.173 in.), and 4.7 mm (0.185 in.).

5. Check that the K1 clutch feed hole (1) in the inner hub of clutch B1 is free before installing clutch B1.

6. Place intermediate plate (3) on converter housing (2) and align.

**Note: The intermediate plate can generally be used several times. The plate must not be coated with additional sealant**

7. Install the holding clutch B1 (5) onto the converter housing and intermediate plate. Installed position of clutch B1 in relation to converter housing is specified by a plain dowel pin in clutch B1 (arrow).

8. Install the bolts to hold clutch B1 (5) to the converter housing.

9. Securely tighten multiple-disc holding clutch B1 (5) on converter housing (2) to 10 N·m (88.5 in.lbs.).

10. Install new torque converter hub seal (1) into the oil pump using Seal Installer 8902A.
11. Install new oil pump outer o-ring seal onto oil pump.
12. Install oil pump (6) and securely tighten. Tighten the oil pump bolts to 20 N·m (177 in.lbs.).

### Install K1, K2, and K3 Clutches

- |  |  |
|--|--|
| 1 - DRIVING CLUTCH K1  | 5 - THRUST WASHER  |
| 2 - SUN GEAR OF FRONT PLANETARY GEAR SET                                     | 6 - FRONT PLANETARY GEAR SET, DRIVING CLUTCH K2, AND INPUT SHAFT |
| 3 - DRIVING CLUTCH K3, OUTPUT SHAFT, AND CENTER AND REAR PLANETARY GEAR SETS | 7 - SEALING RINGS  |
| 4 - THRUST NEEDLE BEARING  |  |

13. Using grease, insert sealing rings (7) in the groove so that the joint remains together.
14. Install the K1 (1) clutch onto the B1 clutch.
15. Install input shaft with clutch K2 (6) and front gear set (1).
16. Install front washer (5) and thrust needle bearing (4).

17. Install output shaft with center and rear gear set and clutch K3 (3).

18. Using grease, install both Teflon rings in the groove at the rear of the output shaft so that the joint stays together.

19. Mount transmission housing on converter housing.

20. Screw in Torx socket bolts through the transmission housing into the converter housing. Tighten the bolts to 20 N·m (177 in.lbs.).

**Note: Verify that there are no nicks or other irregularities in the surface of the transmission case that will cause an inaccurate measurement.**

21. Measure end-play between park pawl gear and grooved ball bearing in order to select the proper geartrain end-play shim.

22. Place Gauge Bar 6311 (1) on transmission housing. Using a depth gauge, measure from the gauge bar (1) to the parking lock gear (2).

23. Using a depth gauge, measure from the Gauge Bar 6311 (1) to the contact surface of the output shaft bearing (2) in the transmission housing.

24. Subtract the first figure from the second figure to determine the current end-play of the transmission. Select a shim such that the end-play will be 0.3-0.5 mm (0.012-0.020 in.). Shims are available in thicknesses of 0.2 mm (0.008 in.), 0.3 mm (0.012 in.), 0.4 mm (0.016 in.), and 0.5 mm (0.020 in.).

25. Install the selected end-play shim.

26. Screw in Torx socket bolts through the converter housing into the transmission housing. Tighten the bolts to 20 N·m (177 in.lbs.).

27. Install output shaft bearing (2) in rear transmission housing. Using Bearing Installer 9287 (1), install the output shaft bearing (2) into the transmission housing. **The closed side of the plastic cage**

must point towards the parking lock gear.

28. Install the retaining ring (1). Ensure that the retaining ring is seated correctly in the groove.
29. Check that there is no play between the bearing and the retaining ring using feeler gauge.
30. There must be no play between the retaining ring and the bearing. If the ring cannot be installed, a thinner ring must be used. If there is play between the ring and the bearing, a thicker ring must be installed. Retaining rings are available in thicknesses of 2.0 mm (0.079 in.), 2.1 mm (0.083 in.), and 2.2 mm (0.087 in.).

31. Rotate the transmission so that the bellhousing is pointed upward and ensuring that the output shaft is allowed to move freely.
32. Measure input shaft end-play.

**Note: If end-play is incorrect, transmission is incorrectly assembled, or the geartrain end-play shim is incorrect. The geartrain end-play shim is selective.**

- a. Attach Adapter 8266-18 (2) to Handle 8266-8 (1).
- b. Attach dial indicator C-3339 (3) to Handle 8266-8 (1).
- c. Install the assembled tool onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-18 to secure it to the input shaft.
- d. Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.

- e. Move input shaft in and out and record reading. End play should be 0.3-0.5 mm (0.012-0.020 in.). Adjust as necessary.

33. Install the output shaft washer onto the output shaft.
34. Install a new transmission rear seal into the transmission case with Seal Installer 8902A (1).

35. Place the transmission in PARK to prepare for the installation of the output shaft nut.
36. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut to 120 N·m (88.5 ft.lbs.).
37. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
38. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4).

39. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2).
40. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.

41. Install electrohydraulic unit (2). Tighten the bolts to 8 N·m (71 in.lbs.).
42. Install oil filter (4).
43. Install oil pan (5). Tighten the bolts to 8 N·m (71 in.lbs.).
44. Install guide bushing (12).

## INSTALLATION

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.
4. Place torque converter (1) in position in transmission (2).

**CAUTION:** Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

5. Align torque converter to oil pump seal opening.
6. Insert torque converter hub into oil pump.
7. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
8. Check converter seating with a scale and straight-edge (A). Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.

9. If necessary, temporarily secure converter with C-clamp attached to the converter housing.

10. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
11. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.

12. Raise transmission (3) and align the torque converter with the drive plate and the transmission converter housing with the engine block (1).
13. Move transmission forward. Then raise, lower, or tilt transmission to align the converter housing with the engine block dowels.

14. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
15. Install two bolts (2) to attach the transmission to the engine.

16. Install remaining torque converter housing to engine bolts (2). Tighten to 39 N·m (29 ft.lbs.).
17. Install rear transmission crossmember (1). Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).
18. Install rear support (3) to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).
19. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts(2) to 47 N·m (39 ft.lbs.).
20. Remove engine support fixture.

21. Install the transmission (3) to engine oil pan (2) bolts (1). Tighten to 39 N·m (29 ft.lbs.).

22. Connect the gearshift cable (1) to the transmission manual shift lever (3).

23. Check O-ring on plug connector (1) , and replace if necessary.
24. Install the plug connector (1) into the guide bushing (2). Turn bayonet lock of guide bushing (2) clockwise to connect plug connector (1).

25. Position the heat shield (2) onto the transmission housing and install the screw (1) and bolt (3) to hold the shield in place.

**CAUTION:** It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

26. Install all torque converter-to-driveplate bolts (1) by hand.
27. Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 42 N·m (30.5 ft. lbs.).

28. Install the torque converter bolt access cover (1) onto the transmission. Install the access cover bolt (2) and tighten to 11 N·m (8 ft. lbs.).

29. Install starter motor (1). (Refer to 8 - ELECTRICAL/ STARTING/STARTER MOTOR - INSTALLATION)

30. Connect the cooler line fittings (2) and cooler lines (1) to the transmission.
31. Install transmission fill tube.
32. Install exhaust components.
33. Align and connect the propeller shaft (1). (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION)
34. Adjust gearshift cable if necessary.
35. Lower vehicle.
36. Connect negative battery cable.
37. Fill the transmission with the appropriate transmission fluid (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) according to the standard procedure (Refer to 21 - TRANSMISSION/AUTOMATIC - NAG1/FLUID AND FILTER - STANDARD PROCEDURE).

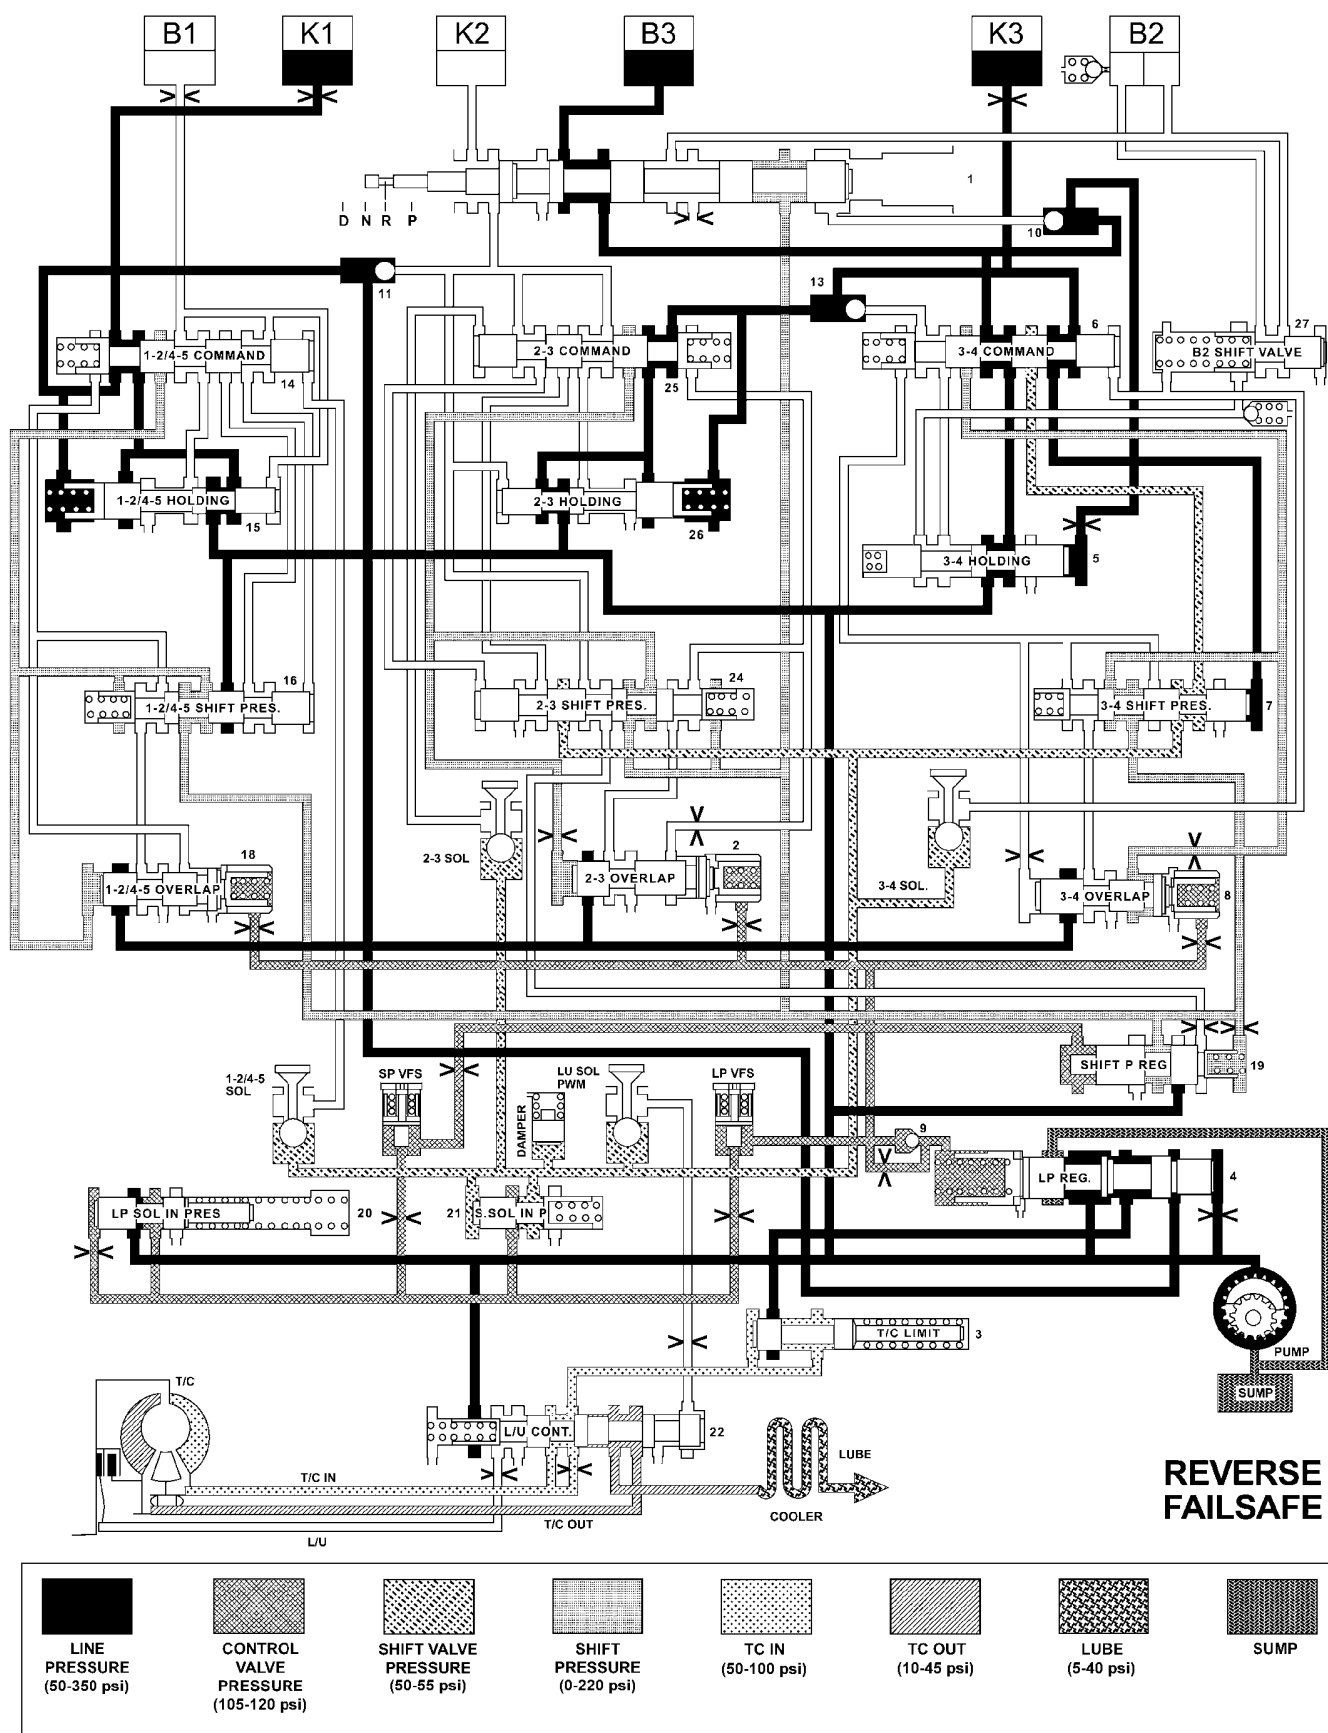

**Note:** If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

38. Verify proper operation.

## MECHANISM-BRAKE TRANSMISSION SHIFT INTERLOCK

### DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a cable operated system that prevents the transmission gear shifter from being moved out of PARK without the proper driver inputs. The system also contains a solenoid that is integral to the shifter assembly. The solenoid works in conjunction with the park lock cable to permit shifter movement out of PARK when the brake is depressed and prevents shifter movement into REVERSE unless a shift into REVERSE is permitted.

A BTSI override (2) is provided on the side of the shifter mechanism (1) to allow the vehicle to be shifted out of PARK in the event of an electrical failure.

### OPERATION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK (1) position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A solenoid in the shifter assembly is energized when the ignition is in the ON position and the brake pedal is depressed. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

<b>ACTION</b>	<b>EXPECTED RESPONSE</b>
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear, except "PARK", and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, and the brake depressed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
<b>NOTE: Any failure to meet these expected responses requires system adjustment or repair.</b>	

### **BTSI Override**

In the event of an electrical failure, the vehicle can be shifted out of PARK by using the following procedure.

1. Turn the key to the ACC or ON position.
2. Remove the liner to the cubby bin to the right side of the shifter.
3. Depress the BTSI override (2) on the side of the shifter assembly (1).
4. While the override is depressed, move the shifter out of the PARK position.
5. Return the cubby bin liner to its original location.

## **DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK**

### **SYSTEM VERIFICATION**

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from ACC to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.

### DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
KEY WILL NOT ROTATE TO THE LOCK POSITION.	1. Misadjusted Park Lock cable.	1. Adjust Park Lock cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - ADJUSTMENTS)
	2. Misadjusted gearshift cable.	2. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)
	3. Burrs on ignition key.	3. Remove burrs and cycle key several times to verify operation.
	4. Binding or broken components.	4. Inspect system components and repair/replace components as necessary.
VEHICLE WILL NOT START UNLESS SHIFTER IS HELD FORWARD, OR REARWARD, OF THE PARK POSITION.	1. Misadjusted gearshift cable.	1. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)

### ADJUSTMENTS - BRAKE TRANSMISSION SHIFT INTERLOCK

The park interlock cable is part of the brake/shift lever interlock system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

#### ADJUSTMENT PROCEDURE

1. Remove floor console as necessary for access to the park lock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
2. Shift the transmission into the PARK position.
3. Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**

**Note: If the key will not turn to the LOCK position, pull up on the cable lock button and manually move the cable in and out until the key can be turned to the LOCK position.**

4. Pull cable lock button up to release cable, if necessary.
5. Remove and discard the cable adjuster lock pin, if a new cable is being installed.
6. Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.
7. Push lock button down until it snaps in place. The lock should be 1-2mm below the surface of the cylindrical portion of the cable adjustment housing.

**BTSI FUNCTION CHECK**

1. Verify removal of ignition key allowed in PARK position only.
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely LOCK position. When the shifter is in any other position, the ignition key should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.
7. The floor shifter lever and gate positions should be in alignment with all transmission detent positions.
8. Engine starts must be possible with shifter lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gate positions other than PARK or NEUTRAL.
9. With the shifter lever handle in the:
  - PARK position- apply forward force on center of handle and remove pressure. Engine start must be possible.
  - PARK position- apply rearward force on center of handle and remove pressure. Engine start must be possible.
  - NEUTRAL position- engine start must be possible.
  - NEUTRAL position, engine running and brakes applied- Apply forward force on center of shift handle. Transmission should not be able to shift into REVERSE detent.

## UNIT-ELECTROHYDRAULIC CONTROL

### DESCRIPTION

The electrohydraulic control unit comprises the shift plate (13) made from light alloy for the hydraulic control and an electrical control unit (12). The electrical control unit (12) comprises of a supporting body made of plastic, into which the electrical components (1 - 11) are assembled. The supporting body is mounted on the shift plate (13) and screwed to it.

Strip conductors inserted into the supporting body make the connection between the electrical components and a plug connector. The connection to the wiring harness on the vehicle and the transmission control module (TCM) is produced via this 13-pin plug connector with a bayonet lock.

## ELECTRICAL CONTROL UNIT

The electric valve control unit (7) consists of a plastic shell which houses the RPM sensors (1,12), regulating solenoid valves (3, 4), solenoid valves (5, 6, 10), the TCC solenoid valve (11), the park/neutral contact (9), and the transmission oil temperature sensor (8). Conductor tracks integrated into the shell connect the electric components to a plug connection (2). This 13-pin plug connection (2) establishes the connection to the vehicle-side cable harness and to the transmission control module (TCM). With the exception of the solenoid valves, all other electric components are fixed to the conductor tracks.

## HYDRAULIC CONTROL UNIT

### Working Pressure (Line Pressure or Operating Pressure) (p-A)

The working pressure provides the pressure supply to the hydraulic control and the transmission shift elements. It is the highest hydraulic pressure in the entire hydraulic system. The working pressure is regulated at the working pressure regulating valve in relation to the load and gear. All other pressures required for the transmission control are derived from the working pressure.

### Lubrication Pressure (p-Sm)

At the working pressure regulating valve surplus oil is diverted to the lubrication pressure regulating valve, from where it is used in regulated amounts to lubricate and cool the mechanical transmission components and the torque converter. Furthermore, the lubrication pressure (p-Sm) is also used to limit the pressure in the torque converter.

### Shift Pressure (p-S)

The shift pressure is determined by the shift pressure regulating solenoid valve and the shift pressure regulating valve. The shift pressure:

- Regulates the pressure in the activating shift element during the shift phase.
- Determines together with the modulating pressure the pressure reduction at the deactivating shift element as regulated by the overlap regulating valve.
- Initializes 2nd gear in limp-home mode.

### Modulating Pressure (p-Mod)

The modulating pressure influences the size of the working pressure and determines together with the shift pressure the pressure regulated at the overlap regulating valve. The modulating pressure is regulated at the modulating pressure regulating solenoid valve, which is under regulating valve pressure. The modulating pressure is variable and relative to the engine load.

### Regulating Valve/Control Valve Pressure (p-RV)

The regulating valve pressure is regulated at the regulating valve pressure regulating valve in relation to the working pressure (p-A) up to a maximum pressure of 8 bar (116 psi). It supplies the modulating pressure regulating solenoid valve, the shift pressure regulating solenoid valve and the shift valve pressure regulating valve.

### Shift Valve Pressure (p-SV)

The shift valve pressure (p-SV) is derived from the regulating valve pressure (p-RV), is regulated at the shift valve pressure regulating valve and is then present at the:

- 1-2 and 4-5 shift solenoid valve.
- 3-4 shift solenoid valve.
- 2-3 shift solenoid valve.
- Torque converter lockup solenoid valve.
- 3-4 and 2-3 shift pressure shift valve.

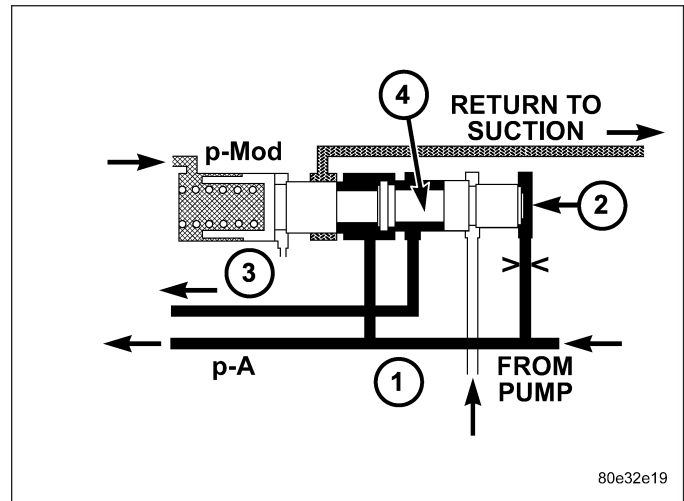

The shift valve pressure (p-SV) controls the command valves via the upshift/downshift solenoid valves.

### Overlap Pressure (p-Ü)

The overlap pressure controls the shift component pressure reduction during a shift phase. The pressure in a shift element as it disengages is controlled during the shift phase depending on engine load (modulating pressure) and the pressure in the shift element as it engages. The adjusted pressure is inversely proportional to the transmission capability of the shift element being engaged (controlled overlap).

### Working Pressure Regulating Valve (Operating Pressure)

The working pressure regulating valve (4) is located in the valve housing of the shift plate. It regulates the primary pressure of the hydraulic system.

| 4 - LUBRICATION                       | 9 - OIL PUMP   |
| 5 - TORQUE CONVERTER LOCK-UP SOLENOID |  |

The torque converter lock-up clutch regulating valve (6) is located in the valve housing of the electrohydraulic control module. The valve is responsible for the hydraulic control of the torque converter lockup clutch and distribution of the lubricating oil.

## Overlap Regulating Valve

Each shift group is assigned one overlap regulating valve (1). The 1-2 / 4-5 overlap regulating valve is installed in the shift valve housing; the 2-3 and 3-4 overlap regulating valves are installed in the valve housing. The overlap regulating valve regulates the pressure reduction during a shift phase.

2 - ANNULAR SURFACE ON OVERLAP REGULATING VALVE

## Command Valve

### Command Valve

1 - HOLDING CLUTCH B1  
2 - DRIVING CLUTCH K1

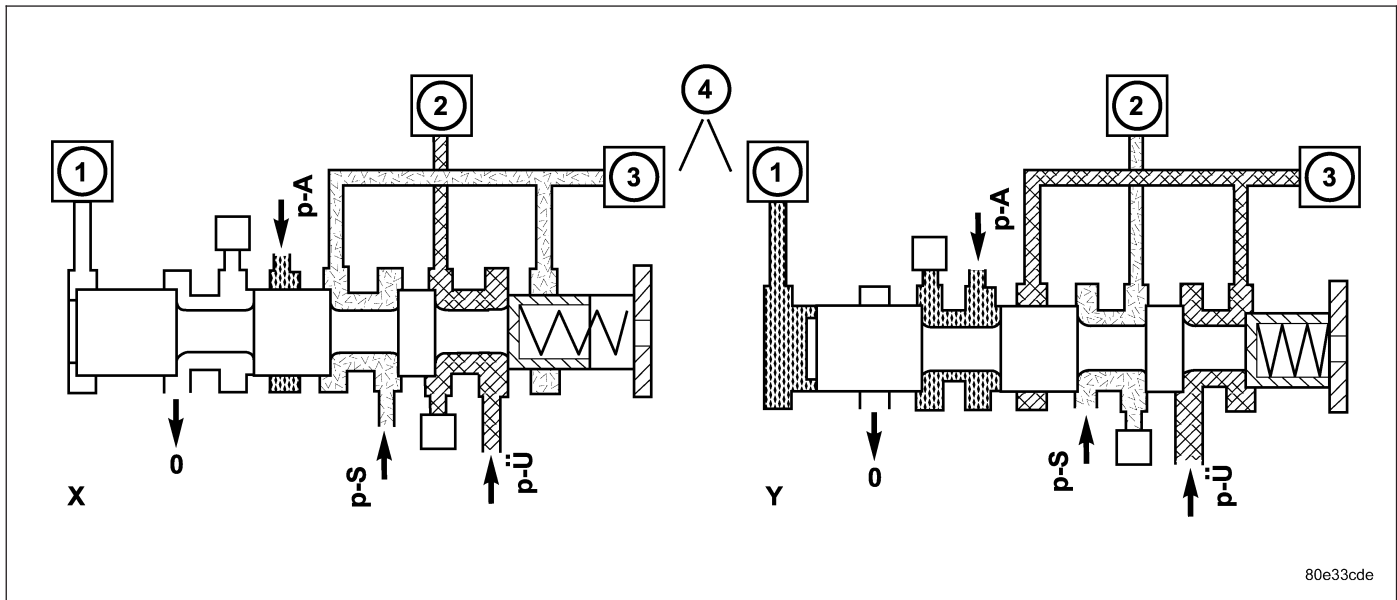

3 - 1-2/4-5 COMMAND VALVE

Each shift group possesses one command valve (3). The 1-2 / 4-5 and 2-3 command valves are installed in the shift valve housing, the 3-4 command valve is installed in the valve housing. The command valve switches the shift group from the stationary phase to the shift phase and back again.

**Holding Pressure Shift Valve*****Holding Pressure Shift Valve***

1 - HOLDING PRESSURE SHIFT VALVE

Each shift group possesses one holding pressure shift valve (1). The 1-2 / 4-5 and 2-3 holding pressure shift valves are installed in the shift valve housing; the 3-4 holding pressure shift valve is installed in the valve housing. The holding pressure shift valve allocates the working pressure to one actuator of a shift group.

**Shift Pressure Shift Valve****Shift Pressure Shift Valve**

1 - 1-2/4-5 COMMAND VALVE  
2 - DRIVING CLUTCH K1

3 - HOLDING CLUTCH B1  
4 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE

Each shift group possesses one shift pressure shift valve (4). The 1-2 / 4-5 and 2-3 shift pressure shift valves are installed in the shift valve housing; the 3-4 shift pressure shift valve is installed in the valve housing. It assigns the shift pressure (p-S) to the activating actuator and the overlap pressure (p-Ü) regulated by the overlap regulating valve to the deactivating actuator.

**Lubrication Pressure Regulating Valve**

The lubrication pressure regulating valve (1) is located in the valve housing of the electrohydraulic control module. The valve controls the fluid to lubricate and cool the mechanical part of the transmission, and limits the pressure in the torque converter.

### Shift Pressure Regulating Valve

The shift pressure regulating valve (1) is located in the valve housing of the shift plate. It regulates the shift pressure ( $p-S$ ).

### Regulating Valve Pressure Regulating Valve

The regulating valve pressure regulating valve (1) is located in the valve housing of the electrohydraulic control module. It regulates the regulating valve/control valve pressure ( $p-RV$ ).

### Shift Valve Pressure Regulating Valve

The shift valve pressure regulating valve (1) is located in the valve housing of the electrohydraulic control module. It regulates the shift valve pressure ( $p-SV$ ).

## OPERATION

### ELECTRICAL CONTROL UNIT

Signals from the transmission control module (TCM) are converted into hydraulic functions in the electric valve control unit (7). The RPM sensors (1, 12), starter interlock contact (9), and transmission oil temperature sensor (8) of the electric valve control unit (7) supply the TCM with input signals. The solenoid valves are controlled by the TCM and trigger the hydraulic functions.

### HYDRAULIC CONTROL UNIT

#### Working Pressure Regulating Valve (Line Pressure or Operating Pressure)

The working pressure ( $p-A$ ) is regulated at the working pressure regulating valve (4) in relation to load (modulating pressure,  $p-Mod$ ) and gear ( $K1$  or  $K2$  pressure) (1). The spring in the working pressure regulating valve sets a minimum pressure level (basic pressure).

- 5 - TORQUE CONVERTER LOCK-UP SOLENOID

- 6 - TORQUE CONVERTER LOCK-UP CLUTCH REGULATING VALVE
- 7 - OIL COOLER
- 8 - LINE PRESSURE REGULATING VALVE
- 9 - OIL PUMP

The torque converter lockup clutch regulating valve (6) regulates the torque converter lockup clutch working pressure (p-TCC) in relation to the torque converter clutch control pressure (p-S/TCC). According to the size of the working pressure (p-A), the torque converter lockup clutch is either Engaged, Disengaged, or Slipping. When the regulating valve (6) is in the lower position, lubricating oil flows through the torque converter and oil cooler (8) into the transmission (torque converter lockup clutch unpressurized). In its regulating position (slipping, torque converter lockup clutch pressurized), a reduced volume of lubricating oil flows through the annular passage (7) bypassing the torque converter and passing direct through the oil cooler into the transmission. The rest of the lubricating oil is directed via the throttle "a" into the torque converter in order to cool the torque converter lockup clutch.

## Overlap Regulating Valve

During the shift phase the pressure in the deactivating shift actuator is regulated in relation to the engine load (modulating pressure, p-Mod) and the pressure in the activating actuator. The regulated pressure is inversely proportional to the transfer capacity of the activating shift actuator (regulated overlap).

## Command Valve

### Command Valve

1 - HOLDING CLUTCH B1  
2 - DRIVING CLUTCH K1

3 - 1-2/4-5 COMMAND VALVE

When the end face is unpressurized (stationary phase), the working pressure (p-A) is directed to the actuated shift element. If the end face of the command valve is subjected to the shift valve pressure (p-SV) (shift phase), then the shift pressure (p-S) is switched to the activating element and the overlap pressure (p-Ü) is switched to the deactivating element.

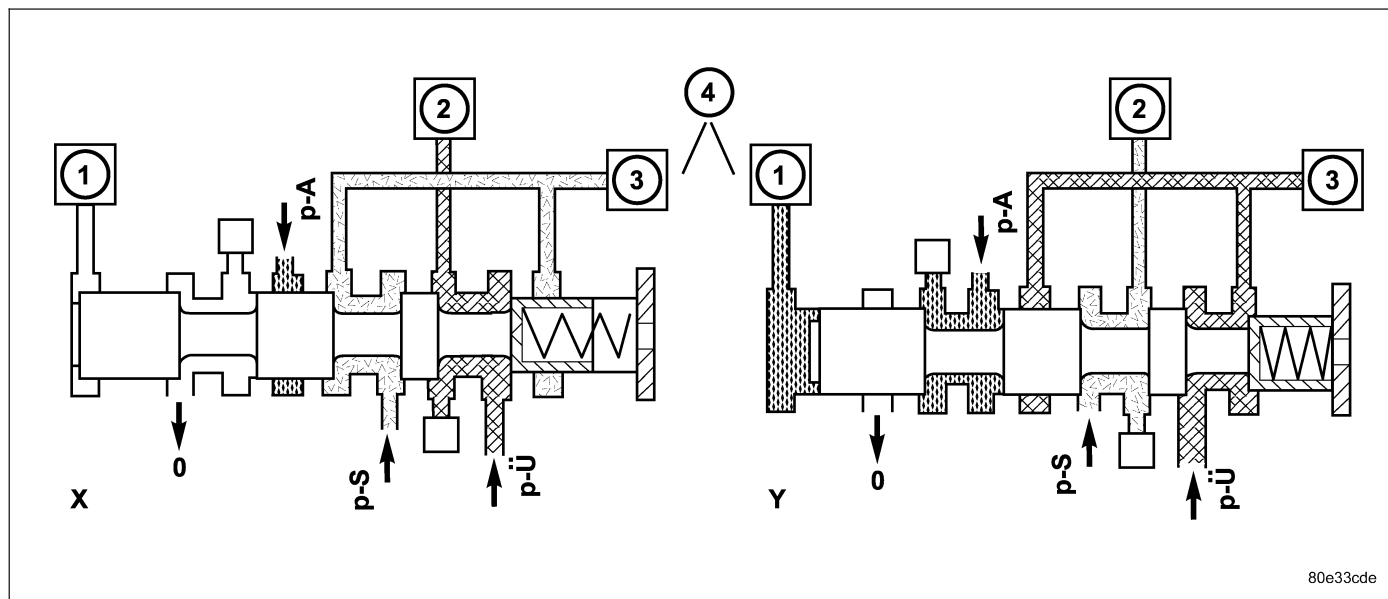

## Shift Valve Holding Pressure

**Shift Valve Holding Pressure**

## 1 - HOLDING PRESSURE SHIFT VALVE

The holding pressure shift valve (1) is actuated by the pressures present at the end face in the actuators and a spring. It assigns the working pressure ( $p-A$ ) to the actuator with the higher pressure (taking into account the spring force and the effective surface area). The other element of the shift group is then unpressurized. The valve switches over only during the shift phase and only at a certain pressure ratio between the overlap pressure ( $p-\ddot{U}$ ) and the shift pressure ( $p-S$ ).

**Shift Pressure Shift Valve**

**Shift Pressure Shift Valve**

1 - 1-2/4-5 COMMAND VALVE  
2 - DRIVING CLUTCH K1

3 - HOLDING CLUTCH B1  
4 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE

When the multiple-disc brake B1 (3) is activated, the working pressure (p-A) is applied to the end face of the 1-2 / 4-5 shift pressure shift valve (4) via the command valve (1). Its shift state is maintained during the shift phase by substituting the shift element pressure acting on its end face (and which is variable during the shift phase) with a corresponding constant pressure. When the multi-plate clutch K1 (2) is activated, the end face of the shift valve is unpressurized during the stationary and shift phases, so the shift state is maintained during the shift phase in this case too.

**Lubrication Pressure Regulating Valve**

At the working pressure regulating valve surplus oil is diverted to the lubrication pressure regulating valve (1), from where the lubrication pressure (p-Sm) is used in regulated amounts to supply the transmission lubrication system including the torque converter.

80e33d95

### Shift Pressure Regulating Valve

The shift pressure is determined by the shift pressure regulating solenoid valve and the shift pressure regulating valve (3). In addition, pressure from the clutch K2 (1) is also present at the annular surface (2) of the shift pressure regulating valve (3). This reduces the shift pressure in 2nd gear.

### Regulating Valve Pressure Regulating Valve

The regulating valve pressure (p-RV) is set at the regulating valve pressure regulating valve (1) in relation to the working pressure (p-A) as far as the maximum pressure.

### Shift Valve Pressure Regulating Valve

The non-constant regulating valve pressure (p-RV) is regulated to a constant shift valve pressure (p-SV) at the shift valve pressure regulating valve (1) and is used to supply the 1-2 and 4-5 / 3-4 / 2-3 solenoid valves and the torque converter lockup clutch PWM solenoid valve.

8. Check O-ring on plug connector (1), and replace if necessary.
9. Install the plug connector (1) into the guide bushing (2). Turn bayonet lock of guide bushing (2) clockwise to connect plug connector (1).

10. Position the heat shield (2) onto the transmission housing and install the screw (1) and bolt (3) to hold the shield in place.
11. Fill the transmission with the correct oil (Refer to LUBRICATION & MAINTENANCE/FLUID TYPES - DESCRIPTION) using the standard procedure (Refer to 21 - TRANSMISSION/AUTOMATIC - NAG1/FLUID AND FILTER - STANDARD PROCEDURE - TRANSMISSION FILL).

## FLUID AND FILTER

### DESCRIPTION

The oil level control is located on the electrohydraulic unit (4) and consists of the float (5) which is integrated into the electrohydraulic unit. The float is positioned to plug the opening (6) between the oil gallery (2) and gearset chamber (1) so that the rotating gearsets do not splash about in oil as the oil level rises. The oil level control reduces power loss and prevents oil from being thrown out of the transmission housing at high oil temperatures.

### OPERATION

With low oil levels, the lubricating oil which flows constantly out of the gearset, flows back to oil gallery (2) through the opening (6). If the oil level rises, the oil presses the float (5) against the housing opening (6). The float (5) therefore separates the oil gallery (2) from the gearset chamber (1). The lubricating oil which continues to flow out of the gearsets is thrown against the housing wall, incorporated by the rotating parts and flows back into the oil gallery (2) through the upper opening (arrow).

## DIAGNOSIS AND TESTING

### EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

### CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

### FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## STANDARD PROCEDURE

### CHECK OIL LEVEL

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

**WARNING: Risk of accident from vehicle starting off by itself when engine running. Risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.**

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position "P".

4. Shift through the transmission modes several times with the vehicle stationary and the engine idling
5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick 9336 into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

**Note:** The dipstick will protrude from the fill tube when installed.

813bffc8

***NAG1 Transmission Fill Graph***

6. Check transmission oil temperature using the appropriate scan tool.

**Note:** The true transmission oil temperature can only be read by a scan tool in REVERSE or any forward gear position. (Refer to 21 - AUTOMATIC TRANSMISSION- NAG1/TRANSMISSION TEMPERATURE SENSOR/ PARK-NEUTRAL SWITCH - OPERATION)

7. The transmission Oil Dipstick 9336 has indicator marks every 10mm. Determine the height of the oil level on the dipstick and using the height, the transmission temperature, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

## TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

3. Add following initial quantity of Mopar® ATF +4, Automatic Transmission Fluid, to the transmission:
  - a. If only fluid and filter were changed, add **7.4 L (14.8 pts.)** of transmission fluid to transmission.
  - b. If the transmission was completely overhauled or the torque converter was replaced or drained, add **8.1 L (17.1 pts.)** of transmission fluid to transmission.
4. Check the transmission fluid (Refer to 21 - TRANSMISSION/AUTOMATIC - NAG1/FLUID AND FLUID - STANDARD PROCEDURE - CHECK OIL LEVEL) and adjust as required.

## FLUID/FILTER SERVICE

1. Run the engine until the transmission oil reaches operating temperature.
2. Raise and support vehicle.
3. Remove the bolts (5) and retainers (4) holding the oil pan to the transmission.
4. Remove the transmission oil pan (3) and gasket (2) from the transmission.
5. Remove the transmission oil filter (1) and o-ring from the electrohydraulic control unit.
6. Clean the inside of the oil pan (3) of any debris. Inspect the oil pan gasket (2) and replace if necessary.
7. Install a new oil filter (1) and o-ring into the electrohydraulic control unit.
8. Install the oil pan (3) and gasket (2) onto the transmission.
9. Install the oil pan bolts (5) and retainers (4). Torque the bolts to 8 N·m (70 in.lbs.).
10. Lower the vehicle and add 7.0 L (7.4 qts.) of transmission fluid to the transmission.
11. Check the oil level (Refer to 21 - TRANSMISSION/AUTOMATIC - NAG1/FLUID AND FILTER - STANDARD PROCEDURE - CHECK OIL LEVEL).

## CLUTCH-FREEWHEELING

### DESCRIPTION

Freewheeling clutches are installed in the front planetary gear set between the sun gear and the stator shaft, and in the rear planetary gear set between the sun gear and the intermediate shaft.

The freewheel consists of an outer race (4), an inner race (7), a number of locking elements (3) and a cage (6) for these locking elements.

### OPERATION

The freewheeling clutch optimizes individual gear-shifts. They lock individual elements of a planetary gear set together or against the transmission housing in one direction of rotation to allow the torque to be transmitted.

If the inner race (7) of the freewheeling clutch is locked and the outer race (4) turns counter-clockwise (1), the locking elements (3) adopt a diagonal position on account of their special contours, allowing the free-wheel function. The inner race (4) slides under the locking elements (3) with minimal friction. If the rotation of the outer race (4) changes to clockwise (2), the locking elements (3) stand up and lock the outer and inner races (4, 7) together.

2. Install snap-ring (2) for freewheeling clutch.
3. Check O-rings (6) on hollow shaft, replace if necessary.
4. Install rear sun gear (4) with K3 internally toothed disc carrier and rear freewheeling clutch (3) onto the hollow shaft.
5. Verify proper operation of the freewheeling clutch F2. When the assembly is held with the F2 clutch snap-ring upward, it should be possible to rotate the hollow shaft counter-clockwise.
6. Install retaining ring (5) onto hollow shaft (1).

## CABLE-GEARSHIFT

### DIAGNOSIS AND TESTING

#### GEARSHIFT CABLE

1. The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
2. Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
3. With floor shift lever handle push-button not depressed and lever in:
  - a. PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.
  - b. PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.
  - c. NEUTRAL position - Normal position. Engine starts must be possible.
  - d. NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

### REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disengage the gearshift cable (1) eyelet at transmission manual shift lever (3) and pull cable out of the mounting bracket (2).

4. Lower the vehicle.
5. Remove the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL) as necessary to access the shift mechanism and cables.
6. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.
7. Remove the gearshift cable (1) from the shift lever pin (3).
8. Remove the gearshift cable retainer (2) from the notch (2) in the shifter assembly.

9. From under the hood, remove the shift cable grommet (2) from the dash panel.
10. Remove gearshift cable (1) from vehicle.

## INSTALLATION

1. From under the hood, route the gearshift cable (1) through the dash panel and toward the shifter assembly.
2. From under the hood, install the grommet (2) to the dash panel.

3. Engage the gearshift cable retainer (2) into the notch (2) in the shifter assembly.
4. Install the gearshift cable (1) onto the shift lever pin (3).
5. Loosen the cable adjustment screw (5), if necessary.

6. From under the hood, route the gearshift cable (1) forward of the air conditioning lines and the heater hoses (2) and toward the transmission (3) manual lever.

7. Raise vehicle.
8. Verify that the transmission is in the PARK position by trying to rotate the propeller shaft. If the propeller shaft rotates, move the transmission manual shift lever to the full rearward position and turn the propeller shaft until the PARK system is engaged.
9. Route the gearshift cable (1) through the mounting bracket (2).
10. Engage the gearshift cable (1) eyelet onto the transmission manual shift lever (3).

11. Lower vehicle.
12. Verify that the shifter is in the PARK position.
13. Tighten the adjustment screw (5) to 7 N-m (65 in.lbs.).
14. Verify correct shifter operation.
15. If necessary, install the shield, covering the gearshift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
16. Install the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION), lower instrument panel components (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION) and dash panel insulation pad as necessary.

## ADJUSTMENTS - GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position contact may be faulty.

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
3. Loosen the shift cable adjustment screw (5).

4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.

9. Lower vehicle
10. Tighten the shift cable adjustment screw (5) to 7 N·m (65 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

Three multiple-disc holding clutches, the front, B1 (1), middle, B3 (4), and rear multiple disc clutches, B2 (5), are located in the planetary gear sets in the transmission housing.

A multiple-disc holding clutch consists of a number of internally toothed discs (10) on an internally toothed disc carrier and externally toothed discs (9) on an externally toothed disc carrier, which is rigidly connected to the transmission housing.

The holding clutches connect the annulus gear, sun gear, or planetary carrier of a planetary gear set against the transmission housing in order to transmit the drive torque.

If the piston (16) on multiple-disc holding clutch B1 (1) is subjected to oil pressure, it presses the internal (3) and external discs (2) of the disc set together. The internally toothed disc carrier (15) locks the sun gear (14) against the housing. The planetary pinion gears (13) turn on the sun gear (14).

If the multiple-disc holding clutch B2 (5) is actuated via the piston (7), the piston compresses the disc set. The internally toothed disc carrier (8) locks the sun gear (12) against the housing. The planetary pinion gears (11) turn on the sun gear (12).

If the multiple-disc holding clutch B3 (4) is actuated via the piston (6), the planetary carrier (9) and the annulus gear (10) are locked. When the multiple-disc brake B3 (4) is actuated, the direction of rotation is reversed.

1. Install piston (2) in outer multiple-disc carrier (1).
2. Place compressor (8) on disc spring (3) and compress until the groove of the snap-ring is exposed.

**Note:** The collar of the snap-ring must point towards the multiple-disc pack. After installing, check snap-ring for correct seat.

3. Insert snap-ring (4).

4. Insert disc spring (2) in the outer multiple-disc carrier. Observe the disc spring (2) installation position. The lugs of the disc spring (2) washer must align with the 3 raised pads (arrow) of the B1 multiple-disc carrier (1). The cone of the spring washer must point downwards.

5. Insert the multiple-disc pack (6) in the outer multiple-disc carrier and measure the clutch clearance.

**Note:** Pay attention to the sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the disc spring (5) to its original location.

**CAUTION:** When working with double sided friction discs, an externally lugged steel plate is installed first, followed by a friction disc, and continuing on until all the required discs are installed. When working with single sided friction discs, an externally lugged disc is installed first, followed by an internally lugged disc, and continuing on until all the required discs are installed. All single sided discs are installed with the friction side up.

**Note:** Place new friction multiple-discs in ATF fluid for one hour before installing.

6. Measure B1 clutch clearance by mounting Pressing Tool 8901 (1) on outer multiple disc.
7. Using a lever press , compress pressing tool as far as the stop (then the marking ring is still visible, see small arrow).

8. For transmissions using double sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (6) and outer multiple-disc (4). During the measurement, the snap-ring (6) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (5). The correct clearance for transmissions using double sided friction discs is 2.3-2.7 mm (0.091-0.106 in.) for two friction disc versions, 2.7-3.1 mm (0.106-0.122 in.) for three disc versions, and 3.0-3.4 mm (0.118-0.134 in.) for four disc versions.
9. Adjust with snap-ring (6), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

The correct clearance is 2.2-2.6 mm (0.087-0.102 in.) for four friction disc versions, 2.4-2.8 mm (0.095-0.110 in.) for six disc versions, and 2.6-3.0 mm (0.102-0.118 in.) for eight disc versions.
11. Adjust with snap-ring (5), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

2. Assemble piston guide (4) and B3 piston (8) in the correct position. Verify that the missing tooth in the B3 piston/B2 outer disc carrier (8) is aligned with the centerline of the two threaded holes in the B2 and B3 piston guide (4).
3. Insert B2 piston (10) in B3 piston (8).

4. Insert piston guide ring (2). The valve (1) in the piston guide ring must be on top.

5. Insert disc spring (14) and spring plate (15). Insert disc spring with the curvature towards the spring plate  
 6. Place Multi-use Spring Compressor 8900 on the disc spring (14) and compress the spring until the groove for the snap-ring is exposed.  
 7. Insert snap-ring (16).

**Note:** Pay attention to sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the disc spring (3) to its original location. Place new friction multiple-discs in ATF fluid for one hour before installing.

8. Insert disc spring (3) and multiple-disc pack (2) in the B2 outer multiple-disc carrier.  
 9. Insert snap-ring (1).

**Note:** During the measurement the snap-ring (8) must contact the upper bearing surface of the groove in the outer multiple-disc carrier.

10. Measure the B2 clutch pack clearance by mounting the Pressing Tool 8901 (1) on outer multiple disc.  
 11. Using a lever press, compress the pressing tool as far as the stop (then the marking ring is still

visible, see small arrow).

12. Using a feeler gauge, determine the play "L" at three points between the snap-ring (8) and outer multiple-disc (7).
13. The correct clutch clearance is 1.9-2.3 mm (0.075-0.091 in.) for the four friction disc versions and 2.0-2.4 mm (0.079-0.095 in.) for the five disc versions.
14. Adjust with snap-ring (8), if necessary. Snap-rings are available in thicknesses of 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

Three multi-plate input clutches (1, 2, 5), the front, middle and rear multi-plate clutches K1 (1), K2 (2), and K3 (5), are located in the planetary gear sets in the transmission housing.

A multi-plate input clutch consists of a number of internally toothed discs (4) on an internally toothed disc carrier and externally toothed discs (3) on an externally toothed disc carrier.

| 11 - CENTER PLANETARY GEARSET ANNULUS GEAR      |  |

The input clutches produce a non-positive locking connection between two elements of a planetary gear set or between one element from each of two planetary gear sets in order to transmit the drive torque.

If the piston (20) on multi-plate clutch K1 (1) is subjected to oil pressure, it presses the internal and external discs of the disc set together. The sun gear (17) is locked with the planetary carrier (15) via the externally toothed disc carrier (19) and the internally toothed disc carrier (18). The front planetary gear set is thus locked and turns as a closed unit.

If the multi-plate clutch K2 (2) is actuated via the piston (14), the piston compresses the disc set. The annulus gear (16) of the front planetary gear set is locked with the annulus gear (11) of the center planetary gear set via the externally toothed disc carrier (13) and the center planetary carrier (10) on which the internally toothed discs are seated. Annulus gear (16) and annulus gear (11) turn at the same speed as the input shaft (21)

If the multi-plate clutch K3 (5) is actuated via the piston (7), the piston compresses the disc set. The sun gear (12) of the center planetary gear set is locked with the sun gear (9) of the rear planetary gear set via the externally toothed disc carrier (6) and the internally toothed disc carrier (8). Sun gear (12) and sun gear (9) turn at the same speed.

1. Remove snap-ring (11) from outer multiple-disc carrier (6).
2. Take multiple-disc pack (12) out of outer multiple-disc carrier (6). Note which clutch disc is removed just prior to the spring plate (8) for re-assembly. If the clutch discs are re-used, this disc must be returned to its original position on top of the spring plate.

3. Place Multi-use Spring Compressor 8900 (2) on the spring plate and compress the spring until the snap-ring (1) is exposed.
4. Remove snap-ring (1).
5. Take out disc spring (7) and remove piston (6) by carefully blowing compressed air into the drilled oil feed passage.
6. Remove snap-ring (3) and take out front freewheeling clutch F1 (2). Take care when removing the F1 clutch to prevent the clutch sprags from falling out. If this occurs, the clutch must be replaced.

1. Install piston (6) in the outer multiple-disc carrier (1). Check sealing rings (4 and 5), replace if necessary. The rounded off edges of the sealing rings must point outwards.
2. Insert disc spring (7). Insert disc spring with the curvature towards the piston.
3. Insert spring plate (8). Insert spring plate with the curvature towards the sun gear. Check sealing ring (9), replace if necessary.

4. Place Multi-use Spring Compressor 8900 (2) on spring plate and compress the spring until the groove of the snap-ring (1) is exposed.
5. Insert snap-ring (1). After installing, check snap-ring for correct seat.

**CAUTION:** When working with double sided friction discs, an externally lugged steel plate is installed first, followed by a friction disc, and continuing on until all the required discs are installed. When working with single sided friction discs, an externally lugged disc is installed first, followed by an internally lugged disc, and continuing on until all the required discs are installed. All single sided discs are installed with the friction side up.

**Note:** Pay attention to the sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the spring plate (8) to its original location.

**Note:** Place new friction multiple-discs in ATF fluid for one hour before installing.

6. Insert multiple-disc pack (12) in the outer multiple-disc carrier.
7. Insert snap-ring (11).
8. Measure the K1 clutch pack clearance by mounting Pressing Tool 8901 (1) on outer multiple disc.
9. Using a lever press, compress pressing tool as far as the stop (then the marking ring is still visible, see small arrow).

10. For transmissions using double sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (5) and outer multiple-disc (3).
11. During the measurement the snap-ring (5) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (4).
12. The correct clutch clearance for transmissions with double sided friction discs is 2.7-3.1 mm (0.106-0.122 in.) for three friction disc versions, 3.0-3.4 mm (0.118-0.134 in.) for four disc versions, 3.3-3.7 mm (0.130-0.146 in.) for five disc versions, and 3.6-4.0 mm (0.142-0.158 in.) for six disc versions.
13. Adjust with snap-ring (5), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).
14. Insert front freewheeling clutch F1 (2) and fit snap-ring (3). The freewheeling clutch F1 (2) must be installed in the direction of the arrow.

16. During the measurement the snap-ring (4) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (3).
17. The correct clutch clearance for transmissions with single sided friction discs is 2.4-2.8 mm (0.095-0.110 in.) for six friction disc versions, 2.6-3.0 mm (0.102-0.118 in.) for eight disc versions, 2.8-3.2 mm (0.110-0.126 in.) for ten disc versions, and 2.9-3.3 mm (0.114-0.130 in.) for twelve disc versions.
18. Adjust with snap-ring (4), if necessary. Snap-rings are available in thicknesses of 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

1. Install piston (6) in the outer multiple-disc carrier (8). Check sealing ring (7), replace if necessary. The rounded off edges of the sealing ring must point outwards.
2. Insert disc spring (5). Insert disc spring with the curvature towards the piston.
3. Mount the Multi-use Spring Compressor 8900 (9) on the spring plate and clamp until the snap-ring groove is exposed.
4. Insert snap-ring (4). The collar of the snap-ring must point towards the multiple-disc pack.

**CAUTION:** When working with double sided friction discs, an externally lugged steel plate is installed first, followed by a friction disc, and continuing on until all the required discs are installed. When working with single sided friction discs, an externally lugged disc is installed first, followed by an internally lugged disc, and continuing on until all the required discs are installed. All single sided discs are installed with the friction side up.

**Note:** Pay attention to the sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the spring plate (3) to its original location.

**Note:** Place new friction multiple-discs in ATF fluid for one hour before installing.

5. Install disk spring (3) and multiple-disc pack (2) in outer multiple-disc carrier (8).
6. Insert snap-ring (1).

7. Measure the K3 clutch clearance by mounting Pressing Tool 8901 (1) on outer multiple disc.
8. Using a lever press, compress pressing tool as far as the stop (then the marking ring is still visible, see small arrow).

9. For transmissions using double sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (8) and outer multiple-disc (2).
10. During the measurement the snap-ring (8) must contact the upper bearing surface of the groove in the outer multiple-disc carrier.
11. The correct clutch clearance for transmissions with double sided friction discs is 2.3-2.7 mm (0.091-0.106 in.) for three friction disc versions, 2.4-2.8 mm (0.095-0.110 in.) for four disc versions, and 2.5-2.9 mm (0.099-0.114 in.) for five disc versions.
12. Adjust with snap-ring (8), if necessary. Snap-rings are available in thicknesses of 2.0 mm (0.079 in.), 2.3 mm (0.091 in.), 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), and 3.5 mm (0.138 in.).

- 1 - OUTER DISC CARRIER
- 2 - OUTER MULTIPLE DISC - 4.0 MM (0.158 IN.)
- 3 - OUTER MULTIPLE DISC - 2.8 MM (0.110 IN.)
- 4 - OUTER MULTIPLE DISC - 1.8 MM (0.079 IN.)
- 5 - DISC SPRING
- 6 - PISTON
- 7 - FRICTION DISCS - 2.1 MM (0.083 IN.)

13. For transmissions using single sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (7) and outer multiple-disc (2).
14. During the measurement the snap-ring (7) must contact the upper bearing surface of the groove in the outer multiple-disc carrier.
15. The correct clutch clearance for transmissions with single sided friction discs is 2.3-2.7 mm (0.091-0.106 in.) for six friction disc versions, 2.4-2.8 mm (0.095-0.110 in.) for eight disc versions, and 2.5-2.9 mm (0.099-0.114 in.) for ten disc versions.
16. Adjust with snap-ring (7), if necessary. Snap-rings are available in thicknesses of 2.0 mm (0.079 in.), 2.3 mm (0.091 in.), 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), and 3.5 mm (0.138 in.).

## SENSORS-INPUT SPEED

### DESCRIPTION

The input speed sensors (6, 8) are fixed to the shell of the control unit via contact blades. The speed sensors are pressed against the transmission housing (2) by a spring (7) which is held against the valve housing of the shift plate (5). This ensures a defined distance between the speed sensors and the exciter ring (4).

## OPERATION

Signals from the input speed sensors (6, 8) are recorded in the transmission control module (TCM) together with the wheel and engine speeds and other information and are processed into an input signal for electronic control.

Input speed sensor N2 (6) records the speed of the front sun gear via the externally toothed disc carrier of the multiple-disc clutch K1 (10) and input speed sensor N3 (8) records the speed of the front planet carrier via the internally toothed disc carrier of multiple-disc clutch K1 (3).

## PUMP-OIL

### DESCRIPTION

The oil pump (2) (crescent-type pump) is installed in the bellhousing behind the torque converter and is driven by the drive flange of the torque converter. The pump creates the oil pressure required for the hydraulic procedures.

## OPERATION

When the engine is running, the oil is pumped through the inlet chamber (5) along the upper and lower side of the crescent (1) to the pressure chamber (6) of the housing. The meshing of the teeth prevents oil flowing from the delivery side to the intake side. An external gear (3) is eccentrically mounted in the pump housing. The external gear is driven by the internal gear (4) which is connected to the torque converter hub.

## DISASSEMBLY

1. Remove pump gears (1 and 2) from pump housing.

2. Remove the inner oil pump seal (1).
3. Replace the outer oil pump O-ring (2).

## INSPECTION

Before measuring any oil pump components, perform a thorough visual inspection of all the components. If any sign of scoring, scratches, or other damage is seen, replace the oil pump as an assembly.

## SIDE CLEARANCE

Side clearance is the difference between the thickness of the pump gears and the depth of the pocket in the pump housing. Side clearance can be measured by laying a flat plate across the mounting face of the pump housing, and measuring the distance between the plate and the gears.

### *Acceptable side clearance:*

- Inner gear: 0.064 mm (0.0025 in) max
- Outer gear: 0.069 mm (0.0027 in) max

## TIP CLEARANCE

Tip clearance is the difference between the tip diameters of the gear teeth and the corresponding diameters of the pocket in the pump housing.

Tip clearance for the inner gear can be checked by moving the inner gear into tight mesh (2) with the outer gear as shown. Clearance between the ID of the crescent feature of the housing and the OD of the teeth of the inner gear (3) should then be measured at a point 37 mm from the corner of the crescent (1) feature, as shown below.

### *Acceptable tip clearance for inner gear:*

- 0.85 mm (0.033 in) max

## ASSEMBLY

1. Install new inner oil pump seal (1) with Seal Installer 8902-A.
2. Replace O-ring (2).

3. Lubricate pump gears and place in the pump housing. Insert pump gear (1) so that the chamfer (arrow) points towards the pump housing.

## BEARING-OUTPUT SHAFT

### REMOVAL

1. Raise and support vehicle.
2. Remove the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL).
3. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
4. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
5. Remove the transmission rear oil seal with a suitable slide hammer and screw.
6. Remove the transmission output shaft washer. Be sure to tag the washer since it is very similar to the geartrain end-play shim and they must not be interchanged.
7. Remove the transmission rear output shaft bearing retaining ring (1).

8. Position Bearing Remover 9082 (1) over the inner race of the output shaft bearing.

9. Slide the collar (3) on the Bearing Remover 9082 (1) downward over the fingers (3) of the tool.

**CAUTION:** Verify that the geartrain end-play shim has remained on the output shaft and against the park gear. The shim may be adhered to the bearing inner race. Retrieve the shim from the bearing and install over the output shaft and against the park gear.

10. Remove the output shaft bearing (3).

## INSTALLATION

**CAUTION:** Verify that the geartrain end-play shim is properly installed over the output shaft and against the park gear.

1. Install output shaft bearing in the rear transmission housing. Using Bearing Installer 9287 (1), install the output shaft bearing (2) into the transmission housing. **The closed side of the plastic cage must point towards the parking lock gear.**

2. Install the retaining ring (1). Ensure that the retaining ring is seated correctly in the groove.
3. Check that there is no play between the bearing and the retaining ring using feeler gauge.
4. There must be no play between the retaining ring and the bearing. If the ring cannot be installed, a thinner ring must be used. If there is play between the ring and the bearing, a thicker ring must be installed. Retaining rings are available in thicknesses of 2.0 mm (0.079 in.), 2.1 mm (0.083 in.), and 2.2 mm (0.087 in.).
5. Install the output shaft washer onto the output shaft.

6. Install a new transmission rear seal into the transmission case with Seal Installer 8902A (1).
7. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
8. Install the propeller shaft flange onto the output shaft and install a new flange nut. Tighten the flange nut to 120 N·m (88.5 ft.lbs.).

9. Stake the output shaft nut to the output shaft as follows. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
10. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4).

11. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2).
12. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.
13. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

## SEAL-OUTPUT SHAFT

### REMOVAL

1. Remove the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL). Move propeller shaft to the right and tie up.
2. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
3. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
4. Remove the output shaft seal with suitable screw and slide hammer.

### INSTALLATION

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Use Seal Installer 8902A (1) to install the seal.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
4. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut to 120 N·m (88.5 ft.lbs.).

5. Stake the output shaft nut to the output shaft as follows. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
6. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4).

7. Press downward on the staking tool until the staking pin (3) contacts the output shaft nut flange (2).
8. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.
9. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

## CABLE-PARK LOCK

### REMOVAL

1. Place ignition key in the ACC (2) position.

2. Remove the lower instrument panel trim as necessary to access the park lock cable.
3. Disconnect park lock cable (4) from ignition cylinder (3).

4. Remove the floor console as necessary for access to the park lock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
5. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.
6. Disconnect the park lock cable from the shift mechanism. Release retention tab using suitable screwdriver.

## INSTALLATION

1. Verify that ignition key is in ACC (2) position.

2. Install the park lock cable (4) to the ignition cylinder (3). Secure the cable to instrument panel at retainer.
3. Install any instrument panel trim that was removed to access the park lock cable.

4. Route park lock cable towards shift mechanism.
5. Connect the park lock cable core to shift mechanism cam (3), and then secure cable housing to shift mechanism.

6. Adjust the park lock cable. (Refer to 21 - TRANSMISSION/AUTOMATIC TRANSMISSION/SHIFT INTERLOCK MECHANISM - ADJUSTMENTS)
7. If necessary, install the shield, covering the gearshift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
8. Install the floor console assembly. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## GEARTRAIN-PLANETARY

### DESCRIPTION

Three planetary gear sets are used to produce the different gear ratios. These are located in the mechanical part of the transmission as the front, middle and rear planetary gear sets.

### OPERATION

The annulus gear (1) and sun gear (3) elements of a planetary gear system are alternately driven and braked by the actuating elements of the multi-plate clutch and multiple-disc brake. The planetary pinion gears (2) can turn on the internal gearing of the annulus gear (1) and on the external gearing of the sun gear (3). This allows for a variety of gear ratios and the reversal of the rotation direction without the need for moving gear wheels or shift collars. When two components of the planetary gear set are locked together, the planetary gear set is locked and turns as a closed unit.

The torque and engine speed are converted according to the lever ratios and the ratio of the number of teeth on the driven gears to that on the drive gears, and is referred to as the gear ratio. The overall ratio of a number of planetary gear sets connected in series is obtained by multiplying the partial ratios.

## MECHANISM-SHIFT

### DESCRIPTION

The automatic transmission is operated with the help of a shift lever assembly (SLA) (1) located in the floor console. There are four positions to which the selection lever can be shifted: P, R, N, D. In addition, the selector lever can be moved sideways (+/-) in position "D" to adjust the shift range.

All selector lever positions, as well as selected shift ranges in position "D", are identified by the SLA. The information is then sent to the transmission control module (TCM) via a hardwire connection. At the same time, the selector lever positions "P", "R", "N" and "D" are transmitted by a shift cable to the selector shaft in the transmission.

813a3972

The SLA is comprised of the following functions:

- **Key lock:** Depending on the selector lever position, the ignition cylinder is locked/unlocked, i.e., the ignition key can be removed only if the selector lever is in position "P". A park lock cable is used to perform this function.
- **Park lock:** The selector lever is not released from position "P" until the brake pedal has been applied and the ignition key is in "ACC" or "ON" positions. Shift lock is controlled by the brake light switch in conjunction with a locking solenoid in the SLA. As soon as the brake pedal is applied firmly, the locking solenoid is energized and retracted to unlock the selector lever. If the selector lever cannot be moved out of position "P" due to a malfunction, the shift lock function can be overridden (2). (Refer to 21 - TRANSMISSION/AUTOMATIC TRANSMISSION - NAG1/SHIFT INTERLOCK MECHANISM - OPERATION)
- **Reverse inhibitor:** As soon as the vehicle speed exceeds approximately 4-7 mph, it is no longer possible to move the selector lever from position "N" to position "R". The reverse inhibit functionality is controlled by the same solenoid as the park lock. As the vehicle accelerates past the calibrated speed threshold, the solenoid is energized to block the sideways motion of the shift lever necessary to move from NEUTRAL to REVERSE. The reverse inhibit is not released until the vehicle speed falls below approximately 4-7 mph and the shifter is moved out of the "D" shifter position.

## OPERATION

With the selector lever in position "D", the transmission control module (TCM) automatically shifts the gears that are best-suited to the current operating situation. This means that shifting of gears is continuously adjusted to current driving and operating conditions in line with the selected shift range and the accelerator pedal position. Starting off is always performed in 1st gear.

The selector lever positions are determined by a sensor assembly internal to the shift lever assembly (SLA). The sensor assembly identifies the various positions of the SLA according to the following table.

Shift Lever Position	Bit 0	Bit 1	Bit 2	Bit 3
Default	0	0	0	0
"D"	1	0	1	0
"N"	0	1	1	0
"R"	1	1	1	0
"P"	0	0	0	1
"+"	1	0	0	1
"_"	0	1	0	1
"ND"	1	1	0	1
"RN"	0	0	1	1
"PR"	1	0	1	1
Implausible	1	1	1	1

The current selector lever position or, if the shift range has been limited, the current shift range is indicated in the instrument cluster display.

The permissible shifter positions and transmission operating ranges are:

- P = Parking lock and engine starting.
- R = Reverse.
- N = Neutral and engine starting (no power is transmitted to the axles).
- D = The shift range includes all forward gears.
- 4= Shift range is limited to gears 1 to 4.
- 3= Shift range is limited to gears 1 to 3.
- 2= Shift range is limited to gears 1 to 2.
- 1= Shift range is limited to the 1st gear.

The shift range can be adjusted to the current operating conditions by tipping the selector lever to the left-hand side ("\_-") or the right-hand side ("+\_") when in position "D". If the shift range is limited, the display in the instrument cluster indicates the selected shift range and not the currently engaged gear.

Tipping the shift lever will have the following results:

- **Tipping the selector lever toward "-" one time after another:** The shift range is reduced in descending sequence by one gear each time, i.e., from D - 4 - 3 - 2 - 1. If the selected limitation of the shift range would result in a downshift causing excessive engine speed, the shifting is not executed and the engaged gear as well as the shift range remain unchanged. This is to prevent the engine from overspeeding. Engine retardation is low with the selector lever in position "D". To make use of the full braking power of the engine, "manual" downshifting by tipping the lever towards the left-hand side is recommended. If this has been done, subsequent upshifting must be carried out manually as well.
- **Tipping the selector lever toward "-" and holding it in this position:** The currently engaged gear in range "D" is indicated in the instrument cluster display and the shift range is limited to this gear.
- **Tipping the selector lever toward "+" one time after another:** The shift range is increased by one gear each time and the increased shift range is displayed in the instrument cluster; possibly, the transmission upshifts to a faster gear.
- **Tipping the selector lever toward "+" several times:** The shift range is increased by one gear each time the lever is tipped until the shift range ends up in "D".
- **Tipping the selector lever toward "+" and holding it in this position:** The shift range is extended immediately to "D", shift ranges are indicated in ascending sequence; possibly, the transmission upshifts to a faster gear due to the extension of the shift range.

## REMOVAL

1. Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
2. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.
3. Shift transmission into PARK.
4. Disconnect the transmission shift cable (1) at shift lever (3) and shifter assembly bracket (2).
5. Remove the shift cable retainer (2) from the notch in the shifter assembly (2).

6. Verify the key is in the LOCK position and disconnect the park lock cable (1) from the shifter mechanism cam (3) and the notch in the shifter assembly (3).

7. Disengage all wiring connectors (2) from the shifter assembly (1).

8. Remove all nuts (2) holding the shifter assembly (1) to the floor pan.
9. Remove the shifter assembly (1) from the vehicle.

## INSTALLATION

1. Install shifter assembly (1) onto the shifter assembly studs on the floor pan.
2. Install the nuts (2) to hold the shifter assembly (1) onto the floor pan. Tighten nuts to 7 N·m (652 in.lbs.).

3. Place the floor shifter lever in PARK position.
4. Loosen the adjustment screw (5) on the gearshift cable (1).
5. Install the gearshift cable (1) to the shift lever pin (3).

6. Install the park lock cable (1) to the shift mechanism cam (3) and the notch in the shifter assembly (2).
7. Verify that the key is in the LOCK position and remains there until the cable is fully adjusted.
8. Verify that the park lock cable adjustment tab is pulled upward to the unlocked position.

9. Install the wiring harness connectors (2) to the shifter assembly.
10. Verify that the shift lever is in the PARK position.
11. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
12. Verify that the key in the LOCK position and the shifter is in PARK.
13. Push downward on the park lock cable adjustment tab to lock the adjustment.
14. Verify correct shifter, park lock, and BTSI operation.
15. If necessary, install the shield, covering the gear-shift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
16. Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## SOLENOID

### DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

1. Increase the amount of current applied to the coil or
2. Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

## UPSHIFT/DOWNSHIFT SOLENOID VALVES

The solenoid valves (1) for upshifts and downshifts are located in the shell of the electric control unit and pressed against the shift plate with a spring.

The solenoid valves (1) initiate the upshift and downshift procedures in the shift plate.

The solenoid valves (1) are sealed off from the valve housing of the shift plate (5) by two O-rings (4, 6). The contact springs (8) at the solenoid valve engage in a slot in the conductor tracks (7). The force of the contact spring (8) ensures safe contacts.

## MODULATING PRESSURE CONTROL SOLENOID VALVE

The modulating pressure control solenoid valve (1) is located in the shell of the electric valve control unit and pressed against the shift plate by a spring.

Its purpose is control the modulating pressure depending on the continuously changing operating conditions, such as load and gear change.

The modulating pressure regulating solenoid valve (1) has an interference fit and is sealed off to the valve body of the shift plate (4) by a seal (arrow). The contact springs (2) at the solenoid valve engage in a slot in the conductor tracks (3). The force of the contact springs (2) ensures secure contacts.

## TORQUE CONVERTER LOCKUP CLUTCH PWM SOLENOID VALVE

The torque converter lockup clutch PWM solenoid valve (1) is located in the shell of the electric valve control unit and pressed against the shift plate by a spring.

The PWM solenoid valve (1) for the torque converter lockup controls the pressure for the torque converter lockup clutch.

The torque converter lockup PWM solenoid valve (1) is sealed off to the valve body of the shift plate (4) by an O-ring (5) and a seal (arrow). The contact springs (2) at the solenoid valve engage in a slot in the conductor tracks (3). The force of the contact springs (2) ensures secure contacts.

## SHIFT PRESSURE CONTROL SOLENOID VALVE

The shift pressure control solenoid valve (1) is located in the shell of the electric valve control unit and pressed against the shift plate by a spring.

Its purpose is to control the shift pressure depending on the continuously changing operating conditions, such as load and gear change.

The shift pressure regulating solenoid valve (1) has an interference fit and is sealed off to the valve body of the shift plate (4) by a seal (arrow). The contact springs (2) at the solenoid valve engage in a slot in the conductor tracks (3). The force of the contact springs (2) ensures secure contacts.

## OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## UPSHIFT/DOWNSHIFT SOLENOID VALVES

If a solenoid valve (1) is actuated by the TCM, it opens and guides the control pressure (p-SV) to the assigned command valve. The solenoid valve remains actuated and therefore open until the shifting process is complete. The shift pressure (p-SV) to the command valve is reduced to zero as soon as the power supply to the solenoid valve is interrupted.

## MODULATING PRESSURE CONTROL SOLENOID VALVE

The modulating pressure regulating solenoid valve (1) assigns a proportional pressure to the current which is controlled by the TCM according to the load.

## TORQUE CONVERTER LOCKUP CLUTCH PWM SOLENOID VALVE

The torque converter lockup PWM solenoid (1) valve converts pulse-wave-modulated current controlled by the TCM into the appropriate hydraulic control pressure (p-S/TCC).

## SHIFT PRESSURE CONTROL SOLENOID VALVE

The shift pressure regulating solenoid valve (1) assigns a proportional pressure to the current which is controlled by the TCM according to the load.

## CONTACT-TEMPERATURE SENSOR/PARK-NEUTRAL

### DESCRIPTION

#### PARK/NEUTRAL CONTACT

The park/neutral contact (4) is located in the shell of the electric control unit and is fixed to the conductor tracks.

Its purpose is to recognize selector valve and selector lever positions "P" and "N". The park/neutral contact consists of:

- the plunger (2).
- the permanent magnet (3).
- the dry-reed contact (4).

#### TRANSMISSION TEMPERATURE SENSOR

The transmission oil temperature sensor (1) is located in the shell of the electric valve control unit and is fixed to the conductor tracks.

Its purpose is to measure the temperature of the transmission oil and pass the temperature to the TCM as an input signal. It is a temperature-dependent resistor (PTC).

## OPERATION

### PARK/NEUTRAL CONTACT

In selector lever positions "P" and "N" the park/neutral contact (4) is actuated by a cam track which is located on the detent plate. The permanent magnet (3) is moved away from the dry-reed contact (4). The dry-reed contact (4) is opened. The TCM receives an electric signal. The circuit to the starter in the selector lever positions "P" and "N" is closed.

### TRANSMISSION TEMPERATURE SENSOR

The temperature of the transmission oil has a considerable effect on the shifting time and therefore the shift quality. By measuring the oil temperature, shift operations can be optimized in all temperature ranges. The transmission oil temperature sensor (1) is switched in series with the park/neutral contact. The temperature signal is transferred to the TCM only when the dry-reed contact of the park/neutral contact is closed in REVERSE or a forward gear position.

Refer to the Transmission Temperature Sensor Specifications table for the relationship between transmission temperature, sensor voltage, and sensor resistance.

## CONVERTER-TORQUE

### DESCRIPTION

**CAUTION:** The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (3), an overrunning clutch, an impeller (2), and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third through fifth gears. The torque converter hub drives the transmission oil (fluid) pump.

A turbine damper (6) has been added for some applications to help improve vehicle noise, vibration, and harshness (NVH) characteristics.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

The impeller (3) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

- 2 - ENGINE ROTATION
- 3 - INPUT SHAFT

- 4 - PORTION OF TORQUE CONVERTER COVER
- 5 - ENGINE ROTATION
- 6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

## STATOR

The stator assembly (1-4) is mounted on a stationary shaft which is an integral part of the oil pump.

The stator (1) is located between the impeller (2) and turbine (4) within the torque converter case. The stator contains a freewheeling clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the freewheeling clutch, the torque multiplication feature of the torque converter is operational.

## TORQUE CONVERTER CLUTCH (TCC)

The TCC (9) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the torque converter lock-up solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

- 9 - CLUTCH PLATE SET
- 10 - EXTERNALLY TOOTHED DISC CARRIER
- 11 - TURBINE DAMPER

## OPERATION

The converter impeller (driving member) (2), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member) (1), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft (4).

- 1 - TURBINE
- 2 - IMPELLER
- 3 - STATOR
- 4 - INPUT SHAFT
- 5 - STATOR SHAFT
- 6 - TURBINE DAMPER

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.0:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

- 1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
- 2 - FRONT OF ENGINE
- 3 - INCREASED ANGLE AS OIL STRIKES VANES
- 4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

## TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller (2) and turbine (1) are rotating at about the same speed and the stator (3) is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material (9), a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth gear ranges.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the torque converter solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

- 1 - TURBINE
- 2 - IMPELLER
- 3 - STATOR
- 4 - INPUT SHAFT
- 5 - STATOR SHAFT
- 6 - PISTON
- 7 - COVER SHELL
- 8 - INTERNALLY TOOTHED DISC CARRIER
- 9 - CLUTCH PLATE SET
- 10 - EXTERNALLY TOOTHED DISC CARRIER
- 11 - TURBINE DAMPER

## NO EMCC

Under No EMCC conditions, the TCC Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

## PARTIAL EMCC

Partial EMCC operation modulates the TCC Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

## FULL EMCC

During Full EMCC operation, the TCM increases the TCC Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

## GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the TCC Solenoid duty cycle.

## REMOVAL

1. Remove transmission and torque converter from vehicle.
2. Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION:** Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

## INSTALLATION

Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

**CAUTION:** Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale and straightedge. Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle.
9. Fill the transmission with the recommended fluid.

## SEAL-TORQUE CONVERTER HUB

### REMOVAL

1. Remove the torque converter (Refer to 21 - TRANSMISSION/AUTOMATIC - NAG1/TORQUE CONVERTER - REMOVAL).
2. Remove the torque converter hub seal with suitable screw and slide hammer.

### INSTALLATION

1. Position the torque converter hub seal (1) over the input shaft and against the transmission oil pump.

2. Using Seal Installer 8902A (2), install a new torque converter hub seal.
3. Install the torque converter (Refer to 21 - TRANSMISSION/AUTOMATIC - NAG1/TORQUE CONVERTER - INSTALLATION).

## AUTOMATIC TRANSMISSION 42RLE - SERVICE INFORMATION

### DESCRIPTION

80180141

42RLE Automatic Transmission

The 42RLE is a four-speed transmission that is a conventional hydraulic/mechanical assembly controlled with adaptive electronic controls and monitors. The hydraulic system of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly

Control of the transmission is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Transmission Control Module (TCM) portion of the Powertrain Control Module (PCM).

The TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

## TRANSMISSION IDENTIFICATION

The 42RLE transmission can be identified by a bar-code label that is affixed to the upper left area of the bellhousing.

The label contains a series of digits that can be translated into useful information such as transmission part number (10), date of manufacture (4, 5), manufacturing origin (2), assembly line identifier (6), build sequence number (7), etc..

If the tag is not legible or is missing, the "PK" number, which is stamped into the left rear flange of the transmission case, can be referred to for identification. The entire part number, build code, and sequence number are stamped into the flange.

OPERATION

The 42RLE transmission ratios are:

Reverse	2.21 : 1

FIRST GEAR POWERFLOW

80f79c31

First Gear Powerflow

- 1 - UNDERDRIVE CLUTCH APPLIED (Turns Rear Sun)
- 2 - LOW-REVERSE CLUTCH APPLIED (Holds Rear Annulus/Front Carrier)

In first gear range, torque input is through the underdrive clutch (1) to the underdrive hub assembly. The underdrive hub is splined to the rear sun gear. When the underdrive clutch is applied, it rotates the underdrive hub and rear sun gear. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly. The rear sun gear drives the rear planetary pinion gears. The rear planetary pinion gears are forced to walk around the inside of the stationary rear annulus gear. The pinions are pinned to the rear carrier and cause the rear carrier assembly to rotate as they walk around the annulus gear. This provides the torque output for first gear. The other planetary gearset components are freewheeling. The first gear ratio is 2.84:1.

**SECOND GEAR POWERFLOW*****Second Gear Powerflow***

- 1 - UNDERDRIVE CLUTCH APPLIED (Turns Rear Sun)  
2 - 2-4 CLUTCH APPLIED (Holds Front Sun)

Second gear is achieved by having both planetary gear sets contribute to torque multiplication. As in first gear, torque input is through the underdrive clutch (1) to the rear sun gear. The 2/4 clutch (2) is applied to hold the front sun gear stationary. The rotating rear sun gear turns the rear planetary pinions. The rear pinions rotate the rear annulus/front carrier assembly. The pinions of the front carrier walk around the stationary front sun gear. This transmits torque to the front annulus/rear carrier assembly, which provides output torque and a gear ratio of 1.57:1.

**THIRD GEAR POWERFLOW*****Third Gear Powerflow***

- 1 - UNDERDRIVE CLUTCH APPLIED (Turns Rear Sun)  
2 - OVERDRIVE CLUTCH APPLIED (Turns Front Carrier/Rear Annulus)

In third gear, two input clutches are applied to provide torque input: the underdrive clutch (1) and overdrive clutch (2). The underdrive clutch rotates the rear sun gear, while the overdrive clutch rotates the front carrier/rear annulus assembly. The result is two components (rear sun gear and rear annulus gear) rotating at the same speed and in the same direction. This effectively locks the entire planetary gearset together and is rotated as one unit. The gear ratio in third is 1:1.

**FOURTH GEAR POWERFLOW*****Fourth Gear Powerflow***

- 1 - OVERDRIVE CLUTCH APPLIED (Turns Rear Sun)  
2 - 2-4 CLUTCH APPLIED (Holds Front Sun)

In fourth gear input torque is through the overdrive clutch (1) which drives the front carrier. The 2/4 clutch (2) is applied to hold the front sun gear. As the overdrive clutch rotates the front carrier, it causes the pinions of the front carrier to walk around the stationary front sun gear. This causes the front carrier pinions to turn the front annulus/rear carrier assembly which provides output torque. In fourth gear, transmission output speed is more than engine input speed. This situation is called overdrive and the gear ratio is 0.69:1.

## REVERSE GEAR POWERFLOW

80f7a053

**Reverse Gear Powerflow**

- 1 - LOW-REVERSE CLUTCH APPLIED (Holds Rear Annulus Front Carrier)  
2 - REVERSE CLUTCH APPLIED (Turns Front Sun)

In reverse, input power is through the reverse clutch (1). When applied, the reverse clutch drives the front sun gear through the overdrive hub and shaft. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly stationary. The front carrier is being held by the L/R clutch so the pinions are forced to rotate the front annulus/rear carrier assembly in the reverse direction. Output torque is provided, in reverse, with a gear ratio of 2.21:1.

## DIAGNOSIS AND TESTING

### AUTOMATIC TRANSMISSION

**CAUTION:** Before attempting any repair on the 42RLE Four Speed Automatic Transmission, always check for proper shift cable adjustment. Also check for diagnostic trouble codes with the scan tool and the 42RLE Transmission Diagnostic information.

42RLE automatic transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions
- Mechanical malfunctions
- Electronic malfunctions

When diagnosing a problem always begin with recording the complaint. The complaint should be defined as specific as possible. Include the following checks:

- Temperature at occurrence (cold, hot, both)
- Dynamic conditions (acceleration, deceleration, upshift, cornering)
- Elements in use when condition occurs (what gear is transmission in during condition)
- Road and weather conditions
- Any other useful diagnostic information.

After noting all conditions, check the easily accessible variables:

- Fluid level and condition
- Shift cable adjustment
- Diagnostic trouble code inspection

Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem exists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

## ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transmission should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transmission cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transmission in all selector positions.

### ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse
P - PARK					X
R - REVERSE			X		X
N - NEUTRAL					X
OD - OVERDRIVE					
First	X				X
Second	X			X	
Direct	X	X			
Overdrive		X		X	
D - DRIVE*					
First	X				X
Second	X			X	
Direct	X	X			
L - LOW*					
First	X				X
Second	X			X	
Direct	X	X			

\* Vehicle upshift and downshift speeds are increased when in these selector positions.

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

## HYDRAULIC PRESSURE TESTS

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most transmission problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows the wheels to turn, and position tachometer so it can be read.

Using special adapters L-4559, attach 300 psi gauge(s) C-3293SP to the port(s) required for test being conducted.

Test port locations are shown in the Pressure Taps graphic.

### TEST ONE - SELECTOR IN MANUAL 1 (1st Gear)

**Note:** This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

1. Attach pressure gauge to the low/reverse clutch tap.
2. Move selector lever to the MANUAL 1 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.
4. Low/reverse clutch pressure should read 115 to 145 psi.

### TEST TWO - SELECTOR IN MANUAL 2 (Second Gear)

**Note:** This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the MANUAL 2 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.
4. In second gear the underdrive clutch pressure should read 110 to 145 psi.

### TEST TWO A - SELECTOR IN DRIVE (OD ON - Fourth Gear)

**Note:** This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the DRIVE position. Verify that the OD switch is ON.

3. Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.
4. Underdrive clutch pressure should read below 5 psi. If not, then either the solenoid assembly or controller is at fault.

### **TEST THREE - SELECTOR IN DRIVE (OD OFF - Third and Second Gear)**

**Note: This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.**

1. Attach gauge to the overdrive clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph.
4. Overdrive clutch pressure should read 74 to 95 psi.
5. Move selector lever to the DRIVE position and increase indicated vehicle speed to 30 mph.
6. The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

### **TEST FOUR - SELECTOR IN DRIVE (OD ON - Fourth Gear)**

**Note: This test checks the 2/4 clutch hydraulic circuit.**

1. Attach gauge to the 2/4 clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in fourth gear.
4. The 2/4 clutch pressure should read 75 to 95 psi.

### **TEST FIVE-SELECTOR IN DRIVE (OD ON - Fourth Gear, CC on)**

**Note: These tests check the torque converter clutch hydraulic circuit.**

1. Attach gauge to the torque converter clutch off pressure tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

**CAUTION: Both wheels must turn at the same speed.**

4. Torque converter clutch off pressure should be less than 5 psi.
5. Now attach the gauge to the torque converter clutch on pressure tap.
6. Move selector to the OD position.
7. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph.
8. Verify the torque converter clutch is applied mode using the RPM display of the scan tool.
9. Torque converter clutch on pressure should be 60-90 psi.

### **TEST SIX-SELECTOR IN REVERSE**

**Note: This test checks the reverse clutch hydraulic circuit.**

1. Attach gauge to the reverse and low/reverse clutch tap.
2. Move selector lever to the REVERSE position.
3. Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 rpm.
4. Reverse and low/reverse clutch pressure should read 165 to 235 psi.

### **TEST RESULT INDICATIONS**

1. If proper line pressure is found in any one test, the pump and pressure regulator are working properly.
2. Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.

3. Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.
4. If the overdrive clutch pressure is greater than 5 psi in Step 6 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.
5. If the underdrive clutch pressure is greater than 5 psi in Step 4 of Test Two-A, a defective solenoid/pressure switch assembly or controller is the cause.

**ALL PRESSURE SPECIFICATIONS ARE PSI (on hoist, with wheels free to turn)**

## CLUTCH AIR PRESSURE TESTS

Inoperative clutches can be located by substituting air pressure for fluid pressure. The clutches may be tested by applying air pressure to their respective passages after the valve body has been removed. Use Special Tool 6599-1 (1) and 6599-2 (1) to perform test.

To make air pressure tests, proceed as follows:

**Note:** The compressed air supply must be free of all dirt and moisture. Use a pressure of 30 psi.

1. Remove oil pan and valve body.(Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
2. Apply air pressure to the holes in the special tool (1), one at a time.
3. Listen for the clutch to apply. It will give a slight thud sound. If a large amount of air is heard escaping, the transmission must be removed from vehicle, disassembled and all seals inspected.

**Air Pressure Test Plate**

- 1 - AIR PRESSURE TEST PLATES  
2 - 2/4 CLUTCH RETAINER HOLE

## 2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer (2). Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

## OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

## REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

## LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole passage. Look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

## UNDERDRIVE CLUTCH

Because this clutch piston cannot be seen, its operation is checked by function. Use an air nozzle (2) to apply air pressure to the low/reverse or the 2/4 clutch opening in Test Plate 6599-1 (2). This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

## FLUID LEAKAGE

### FLUID LEAKAGE - TORQUE CONVERTER HOUSING AREA

When diagnosing converter housing (5) fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal (1) leaks tend to move along the drive hub and onto the rear of the converter. Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt (3) leaks are generally deposited on the inside of the converter housing (5) and not on the converter itself. Pump seal (1) or gasket (4) leaks usually travel down the inside of the converter housing.

### TORQUE CONVERTER LEAKAGE

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1).
- Torque converter hub weld (2).

## STANDARD PROCEDURE - ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils®, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil® tap, or equivalent, and installing a Heli-Coil® insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil®, or equivalent, tools, and inserts are readily available from most automotive parts suppliers.

## REMOVAL

1. Disconnect the negative battery cable.
2. Raise and support the vehicle.
3. Mark propeller shaft (1) and the transmission flange (4) for assembly alignment.
4. Remove the bolts (2) holding the rear propeller shaft coupler (3) to the transmission flange (4).
5. Slide the propeller shaft (1) rearward until the coupler clears the propeller shaft pilot (5) on the transmission output shaft.

6. Remove the bolts (2) holding the starter motor (1) to the transmission. (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - REMOVAL)
7. Remove the starter (1) from the transmission starter pocket and safely relocate.

8. Remove the bolt (2) holding the torque converter access cover (1) to the transmission, 3.5L engines.
9. Remove the torque converter access cover (1) from the transmission.

10. Remove the structural collar bolts (3, 4) and structural collar (2) on vehicles equipped with 2.7L engines. (Refer to 9 - ENGINE - 2.7L/ENGINE BLOCK/STRUCTURAL COVER - REMOVAL)

11. Rotate crankshaft in clockwise direction until converter bolts (1) are accessible. Then remove bolts (1) one at a time. Rotate crankshaft with socket wrench on dampener bolt.

12. Disconnect the gearshift cable (1) from the transmission manual valve lever (3).
13. Loosen the bolts holding the shift cable retaining strap (2) to the transmission.
14. Remove the shift cable (1) from the transmission.

15. Disconnect wires from the input (1) and output (2) speed sensors.

16. Disconnect wires from the transmission range sensor (3).
17. Disconnect wires from the solenoid/pressure switch assembly (1).

18. Remove the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - REMOVAL)

19. Remove the bolt (3) holding the transmission fill tube (2) to the transmission (1).

20. Remove the transmission fill tube (2).
21. Disconnect transmission fluid cooler lines (1) at transmission fittings (2) and clips (3).
22. Disconnect the transmission vent hose from the transmission.

23. Support rear of engine with safety stand or jack.
24. Raise transmission slightly with service jack to relieve load on crossmember and supports.
25. Remove bolts (2) securing rear support and cushion (3) to transmission crossmember (1).

26. Remove bolts attaching crossmember (1) to frame and remove crossmember.
27. Remove the bolts (1) holding the engine oil pan (2) to the transmission (3).

28. Remove all remaining bolts (2) holding the engine (1) to the transmission (3).
29. Carefully work transmission and torque converter assembly rearward off engine block dowels.
30. Hold torque converter in place during transmission removal.
31. Lower transmission and remove assembly from under the vehicle.
32. To remove torque converter, carefully slide torque converter out of the transmission.

## DISASSEMBLY

**Note:** If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

**Note:** Tag all clutch pack assemblies, as they are removed, for reassembly identification.

**CAUTION:** Do not intermix clutch discs or plates as the unit might then fail.

Before disassembling transmission, move the shift lever clockwise as far as it will go and then remove the shift lever.

1. Remove the torque converter (1) from the transmission input shaft (3).

2. Measure input shaft end play using Tool 8266 (1, 2). Set up Tool 8266 and a dial indicator as shown.
3. Move input shaft in and out to obtain end play reading. End play specifications are 0.13 to 0.64 mm (0.005 to 0.025 inch). Record indicator reading for reference when reassembling the transmission. If endplay exceeds the specified range, the #4 thrust plate needs to be inspected and changed if necessary.

**Note:** It is not necessary to remove the output shaft flange to disassemble the transmission. Perform the following steps only if it necessary to replace a component in the extension housing assembly.

4. Place the transmission in PARK to prepare for the removal of the output shaft nut.
5. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
6. Remove the transmission rear oil seal with a suitable slide hammer and screw.
7. Remove the transmission output shaft washer.

8. Remove the transmission rear output shaft bearing retaining ring (1).
9. Position Bearing Remover 9082 (1) over the inner race of the output shaft bearing (3).

10. Slide the collar (3) on the Bearing Remover 9082 (1) downward over the fingers (4) of the tool.

11. Remove the output shaft bearing (3).
12. Remove the geartrain end-play shim from the output shaft. Be sure to tag the shim since it is very similar to the output shaft washer and they must not be interchanged.

**Note:** The four bolts (3) along the bottom of the extension housing (2) have a sealing patch applied from the factory. Note the locations of these bolts and separate these bolts for reuse.

13. Remove the bolts that hold the extension housing (2) onto the transmission case.

14. Remove the extension (2) housing from the transmission case. There are two pry slots located near the bottom corners of the housing for separation.

rating the housing from the transmission case.

15. Inspect the lube tube grommet (3) for damage. If the grommet lip is damaged, it will need to be replaced.

**Note:** The speed sensor bolts have a sealing patch applied from the factory. Separate these bolts for reuse.

16. Remove the input speed sensor bolt.

**Note:** The speed sensor bolts have a sealing patch applied from the factory. Separate these bolts for reuse.

17. Remove the output speed sensor bolt.

18. Remove the input and output (2) speed sensors. Identify the speed sensors for re-installation since they are not interchangeable.

**Note:** One of the oil pan bolts has a sealing patch applied from the factory. Separate this bolt for reuse.

19. Remove the transmission oil pan bolts (2).

20. Remove the transmission oil pan (1).

21. Remove the transmission oil filter screws (2).

22. Remove transmission oil filter (1).

23. Remove the oil filter o-ring (2) from the valve body.
24. If necessary, use a suitable tool to push the transmission fill tube grommet and extension from the transmission case from the bottom.

25. Remove valve body-to-case bolts (1).

**CAUTION:** Do not handle the valve body by the manual shaft. Damage could result.

26. Remove valve body (1) from transmission.

27. Remove underdrive and overdrive accumulators (1, 2).

28. Remove the low/reverse accumulator snap ring (1).

29. Remove the low/reverse accumulator plug (2).

30. Remove low/reverse accumulator piston (1) using suitable pliers.

31. Remove piston (1) and springs (2).

32. Remove and discard the oil pump-to-case bolts (1). The oil pump bolts are not to be reused.

33. Remove oil pump using C-3752 Pullers (2).

34. Remove oil pump while pushing in on input shaft (1).

35. Remove oil pump gasket (2).

**CAUTION:** By-pass valve must be replaced if transmission failure occurs.

36. Remove the cooler by-pass valve (1).

37. Remove the #1 caged needle bearing (1).

38. Remove the input clutch assembly (1).

39. Remove the #4 thrust plate (2).

40. Remove the front sun gear assembly (1) and #4 thrust washer (if still in place).

41. Remove the front carrier/rear annulus (2) and #6 needle bearing (1).

42. Remove the rear sun gear (2) and #7 needle bearing (1).

**Note:** The number seven needle bearing (1) has three antireversal tabs and is common with the number five and number two position. The orientation should allow the bearing to seat flat against the rear sun gear. A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

**Note:** Verify that Tool 5058A (1) is centered properly over the 2/4 clutch retainer (4) before compressing. If necessary, fasten the 5058A bar to the bellhousing flange with any combination of locking pliers and bolts to center the tool properly.

43. Install and load Tool 5058A to remove the 2/4 clutch retainer snap ring (3).

**Note:** The 2/4 Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

44. Remove the 2/4 clutch retainer (1).

45. Remove the 2/4 clutch return spring (1).

46. Remove the 2/4 clutch pack (1, 2).

47. Remove the tapered snap ring (4).

48. Remove the low/reverse reaction plate (1).

49. Remove one (1) low/reverse clutch disc to facilitate snap ring removal.

50. Remove the low/reverse reaction plate snap ring (2).

51. Remove the low/reverse clutch pack (1, 2).

**CAUTION:** Failure to grind and open stakes (4) of the output shaft nut will result in thread damage to the shaft during nut removal.

**WARNING:** WEAR SAFETY GOGGLES WHILE GRINDING STAKE NUTS.

52. Using a die grinder or equivalent, grind the stakes in the shoulder of the shaft nut (2) as shown. Do not grind all the way through the nut and into the shaft. There are two stakes on each nut.

53. Using a small chisel (1), carefully open the stakes on nut (2).

54. Use special tool 6497 (1) and 6498A (2) to remove the output shaft nut.

55. Remove the output shaft (1) from case (3) using a shop press (2).

56. Use special tool 6596 (2) with a shop press (1) to remove the front output shaft bearing cup.

57. Use special tool 6597 (2) and handle C-4171 (1) and C-4171-2 to press the rear output shaft bearing cup rearward.

58. Remove the rear carrier front bearing cone (3).

59. Install and load compressor 5059A (4) as shown.

60. Remove the low/reverse belleville spring snap ring (1).

61. Remove the low/reverse piston belleville spring (1).

62. Remove the park sprag pivot retaining screw.
63. Drive out the anchor shaft using suitable punch (1).

64. Remove the guide bracket pivot pin (1). Inspect all components for wear and replace if necessary.

**Note: The Low/Reverse Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.**

65. Remove the low/reverse clutch piston (1).
66. Remove the low/reverse piston retainer screws.

67. Remove low/reverse piston retainer (1).

68. Remove the low/reverse piston retainer gasket (2).

## ASSEMBLY

**Note:** If the transmission assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE).

1. Install the output bearing cups using Special Tool - 5050A.

2. Install low/reverse piston retainer gasket (2).

3. Install low/reverse piston retainer (1).

4. Install low/reverse piston retainer-to-case screws (3) and torque to 5 N·m (45 in. lbs.).

**Note:** The Low/Reverse Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

5. Install low/reverse clutch piston (1).

6. Assemble guide bracket (1) assembly as shown, if necessary.

**CAUTION:** When installing, be sure guide bracket and split sleeve touch the rear of the transmission case.

7. Install guide bracket pivot pin (1).
8. Install park sprag pivot retaining screw and torque to 4.5 N·m (40 in. lbs.).

9. Install low/reverse piston belleville spring (1) into position.

10. Install and load low/reverse spring compressor tool (3, 4, 5) as shown to facilitate snap ring (2) installation.

11. Install snap ring (1) and remove compressor tool.

12. Install rear carrier (4) front bearing cone.

Check output bearing preload. **Output bearing preload must be checked and/or adjusted if any of the following items have been replaced:**

- Output shaft (rear carrier assembly)
- Output shaft bearings
- Transmission case

13. **PRELOAD CHECK/SHIM SELECTION:** Install rear output shaft bearing cone and special tool 6618A (1).

14. Install special tool 6618A (1). Lightly tighten retaining screws. Screws should be below the plate surface, but do not snug screws.
15. Turn case over on arbor press so that the plate is resting on the press base. **CAUTION: The output shaft will extend through the hole of tool 6618A. Ensure your press table has clearance for the output shaft.**

16. Install shim (1) on output shaft (2). Apply small amount of petrolatum onto the shim to hold it in place. Use the original shim as a starting point. If original shim is not available, use the thickest shim available.

17. Install output shaft/rear carrier into rear bearing. The shaft must be pressed into position. Use special tool MD-998911 (Disc) (2) and C- 4171 and C4171-2 (Handle) (1) to press shaft into rear bearing.

**CAUTION:** Do not re-use old output shaft nut because the removed stake weakens the nut flange. Using special tools 6497 and 6498-A, install new output shaft nut. Tighten new output shaft nut to 271 N·m (200 ft. lbs.).

18. Check the turning torque (1) of the output shaft. The shaft should have 1 to 8 in. lbs. of turning torque. If the turning torque is **higher than** 8 in. lbs., install a thicker shim. If turning torque is **less than** 1 in. lb., install a thinner shim. Make sure there is no end play.

**CAUTION:** Failure to stake nut could allow the nut to back-off during use.

19. The new nut (3) must be staked after the correct turning torque is obtained. Use special tool 6639 (2) to stake output shaft nut.

20. Verify that the nut has been properly staked to the output shaft.

21. Install low/reverse clutch pack (1, 2). Leave uppermost disc out to facilitate snap ring installation.

22. Install low/reverse reaction plate snap ring (2).

23. Install one low/reverse clutch disc (1).

24. Install low/reverse reaction plate (1) with flat side up.

25. Install a new tapered snap ring (2) (tapered side out).

26. Make sure that the snap ring ends are oriented as shown.

27. Measure low/reverse clutch pack. Set up dial indicator (1) as shown. Press down clutch pack with finger and zero dial indicator. Record measurement in four (4) places and take average reading. **Low/Reverse clutch pack clearance is 0.84 to 1.60 mm (0.033 to 0.063 inch).**
28. Select the proper low/reverse reaction plate to achieve specifications.

29. Install 2/4 clutch pack (1, 2).

**Note:** The 2/4 Clutch Piston has bonded seals which are not individually serviceable. Seal replacement requires replacement of the piston assembly.

30. Install 2/4 clutch belleville spring (1).

31. Verify the proper orientation of the return spring (2) to the 2/4 retainer (3).

32. Install 2/4 clutch retainer (1).

**Note:** Verify that Tool 5058A (1) is centered properly over the 2/4 clutch retainer (4) before compressing. If necessary, fasten the 5058A bar to the bellhousing flange with any combination of locking pliers and bolts to center the tool properly.

33. Set up Tool 5058 (1) as shown. Compress 2/4 clutch just enough to facilitate snap ring installation.

34. **Measure 2/4 clutch clearance:** Set up dial indicator (1) as shown. Press down clutch pack with finger and zero dial indicator. Record measurement in four (4) places and take average reading. **The 2/4 clutch pack clearance is 0.76 to 2.64 mm (0.030 to 0.104 inch).** If not within specifications, the clutch is not assembled properly or is excessively worn. **There is no adjustment for the 2/4 clutch clearance.**

35. Install the #7 needle bearing (1) to the rear sun gear (2). The number 7 needle bearing has three antireversal tabs and is common with the number 5 and number 2 position. The orientation should allow the bearing to seat flat against the rear sun gear. A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

36. Install rear sun gear (2) and #7 needle bearing (1).

37. Install front carrier/rear annulus assembly (2) and #6 needle bearing (1).

38. Install front sun gear assembly (1) and #4 thrust washer (2).

39. Determine proper #4 thrust plate thickness. Select the thinnest available #4 thrust plate.
40. Install #4 thrust plate (2) using petrolatum to hold into position.
41. Install input clutch assembly. Ensure the input clutch assembly is completely seated by viewing position through input speed sensor hole. **If the speed sensor tone wheel is not centered in the opening, the input clutches assembly is not seated properly.**

42. Remove the oil pump o-ring (2) and install oil pump and gasket to transmission. **Use screw-in dowels or phillips-head screwdrivers to align pump to case. Be sure to reinstall O-ring on oil pump after selecting the proper No. 4 thrust plate.**

43. Measure the input shaft end play with the transmission in the vertical position. This will ensure that the measurement will be accurate.
44. Set up and measure endplay using End Play Set 8266 (1, 2) and Dial Indicator Set C3339 (3) as shown.
45. Measure input shaft end play. **Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch).** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch, which is within specifications.

46. Remove oil pump, gasket, and input clutch assembly to gain access to and install proper #4 thrust plate.
47. Install input clutch assembly (1) with proper thrust plate.

48. Install #1 caged needle bearing (1).

**CAUTION: By-pass valve MUST be replaced if transmission failure occurs.**

49. Replace cooler by-pass valve (1) if transmission failure has occurred.

**Note: To align oil pump, gasket, and case during installation, use threaded dowels or phillips screwdrivers.**

50. Install oil pump gasket (2).

51. Install oil pump (2) and torque oil pump-to-case bolts (1) to 30 N·m (265 in. lbs.). Do not reuse original oil pump bolts.

52. Install low/reverse accumulator (1) as shown.

53. Install low/reverse accumulator plug (2).

54. Install low/reverse accumulator snap ring (1).

55. Install underdrive (2) and overdrive (1) accumulators and springs.

**CAUTION:** Do not handle the valve body by the manual shaft. Damage could result.

56. Install valve body (1) into place as shown.

57. Install seven (7) valve body-to-case bolts (1) and torque to 12 N·m (105 in. lbs.).

58. Install transmission oil filter (1) and o-ring. Tighten the bolts to 5 N·m (45 in. lbs.).
59. If necessary, install a new transmission fill tube grommet and extension into the transmission case with Installer 8254.

60. Install transmission oil pan (1) with a bead of Mopar® ATF RTV.

**Note:** Before installing the oil pan bolt in the bolt hole located between the torque converter clutch on and U/D clutch pressure tap circuits , it will be necessary to replentish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

61. Install and torque the oil pan-to-case bolts to 20 N·m (14.5 ft. lbs.).

**Note:** Before installing either speed sensor bolt, it will be necessary to replentish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

62. Install both speed sensors (1, 2) into the transmission case. Torque the speed sensor bolts to 9 N·m (80 in. lbs.).

63. As a final check of the transmission, measure the input shaft end play. This will indicate when a #4 thrust plate change is required. The #4 thrust plate is located behind the overdrive clutch hub. Attach a dial indicator to transmission bell housing with its plunger seated against end of input shaft. Move input shaft in and out to obtain end play reading. **Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch).** If not within specifications, make the necessary thrust plate adjustment.

64. Inspect the lube tube grommet (2) for damage. If the grommet lip is damaged, it will need to be replaced.

65. Install output shaft bearing in the rear transmission housing. Using Bearing Installer 9287 (1), install the output shaft bearing (2) into the transmission housing. **The closed side of the plastic cage must point towards the transmission.**

66. Install the snap-ring into the groove in the output shaft.
67. Install the output shaft into the output shaft bearing.
68. Install the retaining ring (1). Ensure that the retaining ring is seated correctly in the groove.
69. Install the output shaft washer onto the output shaft.

70. Install a new transmission rear seal into the transmission case with Seal Installer 8902A (1).
71. Install the propeller shaft flange onto the output shaft and install an new flange nut finger tight.

72. Install the extension housing (2) onto the transmission case.

**Note:** Before installing the lowermost four extension housing bolts, it will be necessary to replenish the sealing patch on the bolts using Mopar® Lock & Seal Adhesive.

73. Install the bolts that hold the extension housing onto the transmission case. Be sure to install any stud bolts to their original locations. Tighten the bolts to 54 N·m (40 ft.lbs.).
74. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut. Tighten the flange nut to 120 N·m (88.5 ft.lbs.).
75. Stake the output shaft nut to the output shaft as follows. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
76. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4).

77. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2).
78. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.

## INSTALLATION

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.
2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.

4. Place torque converter (1) in position in transmission (2).

**CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.**

5. Align torque converter to oil pump seal opening.
6. Insert torque converter hub into oil pump.
7. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
8. Check converter seating with a scale and straight-edge (A). Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.

9. If necessary, temporarily secure converter with C-clamp attached to the converter housing.

10. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
11. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
12. Raise transmission (3) and align the torque converter with the drive plate and the transmission converter housing with the engine block (1).
13. Move transmission forward. Then raise, lower, or tilt transmission to align the converter housing with the engine block dowels.
14. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
15. Install two bolts (2) to attach the transmission to the engine.
16. Install remaining torque converter housing to engine bolts (2). Tighten to 39 N·m (29 ft.lbs.).
17. Install rear transmission crossmember (1). Tighten crossmember to frame bolts to 68 N·m (50 ft.lbs.).
18. Install rear support (3) to transmission. Tighten bolts to 47 N·m (35 ft.lbs.).
19. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts(2) to 47 N·m (39 ft.lbs.).
20. Remove engine support fixture.

21. Install the transmission (3) to engine oil pan (2) bolts (1). Tighten to 39 N·m (29 ft.lbs.).

22. Connect input (1) and output (2) speed sensor wires and the transmission range sensor (3).

23. Connect wires to the solenoid/pressure switch assembly (1).

24. Install the crankshaft position sensor. (Refer to 14 - FUEL SYSTEM/FUEL INJECTION/CRANKSHAFT POSITION SENSOR - INSTALLATION)

25. Connect the gearshift cable (1) to the transmission manual shift lever (3).

**CAUTION:** It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

26. Install all torque converter-to-driveplate bolts (1) by hand.
27. Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 42 N·m (30.5 ft. lbs.).

28. Install the torque converter bolt access cover (1) onto the transmission, for vehicles equipped with 3.5L engines. Install the access cover bolt (2) and tighten to 11 N·m (8 ft.lbs.).

29. Install the structural collar (2) and bolts (3, 4) for vehicles equipped with a 2.7L engine. (Refer to 9 - ENGINE - 2.7L/ENGINE BLOCK/STRUCTURAL

# COVER - INSTALLATION)

30. Install starter motor (1). (Refer to 8 - ELECTRICAL/STARTING/STARTER MOTOR - INSTALLATION)

31. Connect the cooler line fittings (2) and cooler lines (1) to the transmission.

32. Install the transmission fill tube (2).
33. Install exhaust components.

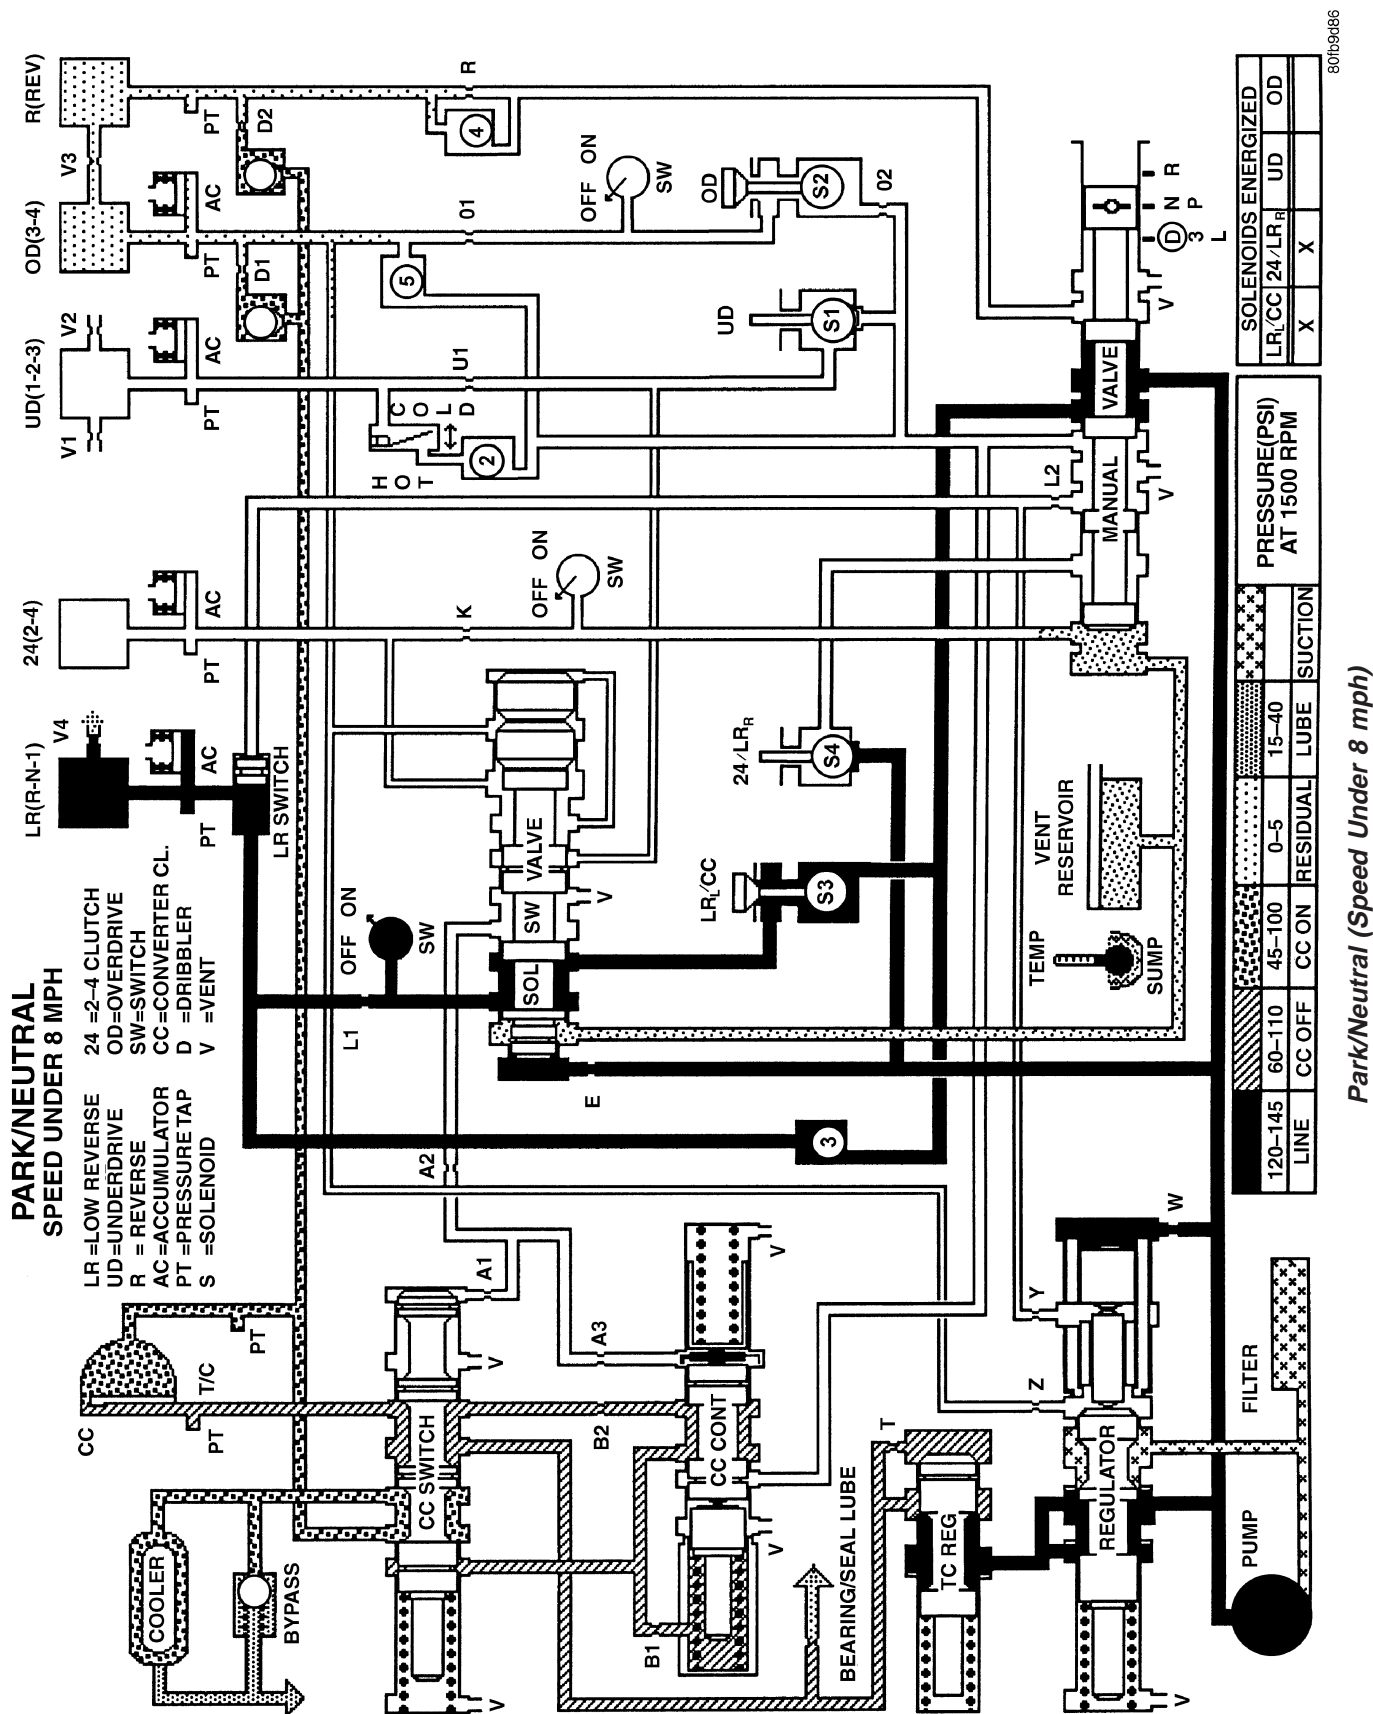

34. Align and connect the propeller shaft (1). (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT - INSTALLATION)
35. Adjust gearshift cable if necessary.
36. Lower vehicle.
37. Connect negative battery cable.
38. Fill transmission with appropriate transmission fluid (Refer to LUBRICATION & MAINTENANCE/ FLUID TYPES - DESCRIPTION) according to the standard procedure (Refer to 21 - TRANSMISSION/AUTOMATIC - NAG1/FILTER - STANDARD PROCEDURE).
39. Verify proper operation.

## ACCUMULATOR

### DESCRIPTION

The 42RLE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, return spring(s), and a cover or plug. The overdrive (1) and underdrive (2) accumulators are located within the transmission case, and are retained by the valve body.

The low reverse (1) accumulator is also located within the transmission case, but the assembly is retained by a cover and a snap-ring.

The 2/4 accumulator (5) is located in the valve body. It is retained by a cover and retaining screws.

## OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and springs. The intended result is a smooth, firm clutch application.

## BEARINGS

### ADJUSTMENTS

#### BEARING ADJUSTMENT PROCEDURES

Take extreme care when removing and installing bearing cups and cones. **Use only an arbor press for installation**, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat will give a false end play reading, while gauging for proper shims. Improperly seated bearing cup and cones are subject to low-mileage failure.

Bearing cups and cones should be replaced if they show signs of pitting or heat distress.

If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.

**Note: Bearing drag torque specifications must be maintained to avoid premature bearing failures.**

Used (original) bearing may lose up to 50 percent of the original drag torque after break-in.

**Note: All bearing adjustments must be made with no other component interference or gear inter-mesh.**

Oil all bearings before checking turning torque.

## MECHANISM-BRAKE TRANSMISSION SHIFT INTERLOCK

### DESCRIPTION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a cable operated system that prevents the transmission gear shifter from being moved out of PARK without the proper driver inputs. The system also contains a solenoid that is integral to the shifter assembly. The solenoid works in conjunction with the park lock cable to permit shifter movement out of PARK when the brake is depressed.

A BTSI override (2) is provided on the side of the shifter mechanism (1) to allow the vehicle to be shifted out of PARK in the event of an electrical failure.

### OPERATION

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK (1) position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A solenoid in the shifter assembly is energized when the brake pedal is depressed. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

<b>ACTION</b>	<b>EXPECTED RESPONSE</b>
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear position, except PARK, and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, and the brake depressed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
<b>NOTE: Any failure to meet these expected responses requires system adjustment or repair.</b>	

### **BTSI Override**

In the event of an electrical failure, the vehicle can be shifted out of PARK by using the following procedure.

1. Turn the key to the ACC or ON position.
2. Remove the liner to the cubby bin to the right side of the shifter.
3. Depress the BTSI override (2) on the side of the shifter assembly (1).
4. While the override is depressed, move the shifter out of the PARK position.
5. Return the cubby bin liner to its original location.

## **DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK**

### **SYSTEM VERIFICATION**

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from ACC to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).

5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.

### DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
KEY WILL NOT ROTATE TO THE LOCK POSITION.	1. Misadjusted Park Lock cable.	1. Adjust Park Lock cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/BRAKE TRANSMISSION SHIFT INTERLOCK SYSTEM - ADJUSTMENTS)
	2. Misadjusted gearshift cable.	2. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)
	3. Burrs on ignition key.	3. Remove burrs and cycle key several times to verify operation.
	4. Binding or broken components.	4. Inspect system components and repair/replace components as necessary.
VEHICLE WILL NOT START UNLESS SHIFTER IS HELD FORWARD, OR REARWARD, OF THE PARK POSITION.	1. Misadjusted gearshift cable.	1. Adjust gearshift cable. (Refer to 21 - TRANSMISSION AND TRANSFER CASE/AUTOMATIC TRANSMISSION/GEAR SHIFT CABLE - ADJUSTMENTS)

### ADJUSTMENTS - BRAKE TRANSMISSION SHIFT INTERLOCK

The park interlock cable is part of the brake/shift lever interlock system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

#### ADJUSTMENT PROCEDURE

1. Remove floor console as necessary for access to the park lock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
2. Shift the transmission into the PARK position.
3. Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**

**Note: If the key will not turn to the LOCK position, pull up on the cable lock button and manually move the cable in and out until the key can be turned to the LOCK position.**

4. Pull cable lock button up to release cable, if necessary.
5. Remove and discard the cable adjuster lock pin, if a new cable is being installed.
6. Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.
7. Push lock button down until it snaps in place. The lock should be 1-2mm below the surface of the cylindrical portion of the cable adjustment housing.

## BTSI FUNCTION CHECK

1. Verify removal of ignition key allowed in PARK position only.
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely LOCK position. When the shifter is in any other position, the ignition key should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.
7. The floor shifter lever and gate positions should be in alignment with all transmission detent positions.
8. Engine starts must be possible with shifter lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gate positions other than PARK or NEUTRAL.
9. With the shifter lever handle in the:
  - PARK position- apply forward force on center of handle and remove pressure. Engine start must be possible.
  - PARK position- apply rearward force on center of handle and remove pressure. Engine start must be possible.
  - NEUTRAL position- engine start must be possible.
  - NEUTRAL position, engine running and brakes applied- Apply forward force on center of shift handle. Transmission should not be able to shift into REVERSE detent.

## CLUTCHES-DRIVING

### DESCRIPTION

Three hydraulically applied input clutches are used to drive planetary components. The underdrive (2), overdrive (3), and reverse (4) clutches are considered input/driving clutches and are contained within the input clutch assembly. The input clutch assembly also contains:

- Input shaft
- Input hub
- Clutch retainer
- Underdrive piston
- Overdrive/reverse piston
- Overdrive hub
- Underdrive hub

## OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

**Note: (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.**

## UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

## OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

## REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

## FLUID AND FILTER

## DIAGNOSIS AND TESTING

### CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

1. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
2. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

### EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

### FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

## **STANDARD PROCEDURE**

### **CHECK OIL LEVEL**

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

**WARNING: Risk of accident from vehicle starting off by itself when engine running. Risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.**

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position "P".
4. Shift through the transmission modes several times with the vehicle stationary and the engine idling
5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick 9336 into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

**Note: The dipstick will protrude from the fill tube when installed.**

813c6002

**42RLE Fluid Temperature Chart**

6. Check transmission oil temperature using the appropriate scan tool.
7. The transmission Oil Dipstick 9336 has indicator marks every 10mm. Determine the height of the oil level on the dipstick and using the height, the transmission temperature, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

## FLUID/FILTER SERVICE

**Note:** Only fluids of the type labeled Mopar® ATF+4, Automatic Transmission Fluid, should be used in the transmission sump. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

**Note:** If the transmission is disassembled for any reason, the fluid and filter should be changed.

1. Raise vehicle on a hoist. Place a drain container with a large opening, under transmission oil pan.

**Note:** One of the oil pan bolts (5) has a sealing patch applied from the factory. Separate this bolt for reuse.

2. Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.
3. Install a new filter and o-ring on bottom of the valve body and tighten retaining screws to 5 N·m (40 in. lbs.).

**Note:** Before installing the oil pan bolt (5) in the bolt hole located between the torque converter clutch on and U/D clutch pressure tap circuits, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

4. Clean the oil pan and magnet. Reinstall pan using new Mopar® Silicone Adhesive sealant. Tighten oil pan bolts to 19 N·m (165 in. lbs.).
5. Pour four quarts of Mopar® ATF+4, Automatic Transmission Fluid, through the dipstick opening.
6. Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.
7. Check the transmission fluid level and add an appropriate amount to bring the transmission fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick.
8. Recheck the fluid level after the transmission has reached normal operating temperature (180°F.).
9. To prevent dirt from entering transmission, make certain that dipstick is fully seated into the dipstick opening.

## TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4, Automatic Transmission Fluid, to transmission:
  - a. If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.
  - b. If transmission was completely overhauled, or torque converter was replaced or drained, add **12 pints (6 quarts)** of ATF +4 to transmission.
3. Apply parking brakes.
4. Start and run engine at normal curb idle speed.
5. Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.
6. Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick**. Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.
7. Drive vehicle until transmission fluid is at normal operating temperature.
8. With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

**CAUTION:** Do not overfill transmission, fluid foaming and shifting problems can result.

9. Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

## CABLE-GEARSHIFT

### DIAGNOSIS AND TESTING - GEARSHIFT CABLE

1. Engine starts must be possible with shift lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any other gear position.
2. With the shift lever in the:
  - a. PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
  - b. PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.
  - c. NEUTRAL position - Normal position. Engine starts must be possible.
  - d. NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

### REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.
3. Disengage the gearshift cable (1) eyelet at transmission manual shift lever (3) and pull cable out of mounting bracket (2).

4. Lower the vehicle.
5. Remove the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL) as necessary to access the shift mechanism and cables.
6. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.
7. Remove the gearshift cable (1) from the shift lever pin (3).

8. Remove the gearshift cable retainer (2) from the notch (2) in the shifter assembly.
9. From under the hood, remove the shift cable grommet (2) from the dash panel.
10. Remove gearshift cable (1) from vehicle.

## INSTALLATION

1. From under the hood, route the gearshift cable (1) through the dash panel and toward the shifter assembly.
2. Install the grommet (2) to the dash panel.

3. Engage the gearshift cable retainer (2) into the notch (2) in the shifter assembly.
4. Install the gearshift cable (1) onto the shift lever pin (3).
5. Loosen the cable adjustment screw (5), if necessary.

6. From under the hood, route the gearshift cable (1) forward of the air conditioning lines and the heater hoses (2) and toward the transmission (3) manual lever.

7. Raise vehicle.
8. Verify that the transmission is in the PARK position by trying to rotate the propeller shaft. If the propeller shaft rotates, move the transmission manual shift lever until the PARK system is engaged.
9. Route the gearshift cable (1) through the mounting bracket (2).
10. Engage the gearshift cable (1) eyelet onto the transmission manual shift lever (3).

11. Lower vehicle.
12. Verify that the shifter is in the PARK position and tighten the adjustment screw (5) to 7 N·m (65 in.lbs.).
13. Verify correct shifter operation.
14. If necessary, install the shield, covering the gearshift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
15. Install the floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION) as necessary.

## ADJUSTMENTS - GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position contact may be faulty.

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
3. Loosen the shift cable adjustment screw (5).

4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.

9. Lower vehicle
10. Tighten the shift cable adjustment screw (5) to 7 N·m (65 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## CLUTCHES-HOLDING

### DESCRIPTION

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 (2) and Low/Reverse (3) clutches are considered holding clutches and are contained at the rear of the transmission case.

### OPERATION

**Note:** (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - DIAGNOSIS AND TESTING) for a collective view of which clutch elements are applied at each position of the selector lever.

#### 2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transmission case.

#### LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transmission case.

## ASSEMBLY-INPUT CLUTCH

### DISASSEMBLY

1. Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).
2. Tap down (2) reverse clutch reaction plate (4) to release pressure from snap ring.
3. Remove reverse clutch snap ring (3).

4. Pry up reverse clutch reaction plate (1).

5. Remove reverse clutch reaction plate (1).

**Note:** Tag reverse clutch pack for reassembly identification.

6. Remove the reverse clutch pack (two fibers/one steel) (1, 2).

7. Remove the OD/Reverse reaction plate (1) snap ring (3).

8. Remove OD/Reverse pressure plate (1).

9. Remove OD/Reverse reaction plate wave snap ring (2).

10. Remove OD shaft/hub and OD clutch pack (1).

**Note:** Tag overdrive clutch pack for reassembly identification.

11. Remove the overdrive clutch (1, 3) from the overdrive hub/shaft (2).

12. Remove and inspect number 3 and 4 thrust plates (1, 3).

13. Remove the underdrive shaft assembly (2).

14. Remove the number 2 needle bearing (1).

15. Remove the OD/UD reaction plate tapered snap ring (1).

**Note:** The OD/UD clutch reaction plate has a step on both sides. The OD/UD clutches reaction plate goes tapered step side up.

16. Remove the OD/UD reaction plate (1).

17. Remove the first UD clutch disc (1).

18. Remove the UD clutch flat snap ring (1).

**Note: Tag underdrive clutch pack for reassembly identification.**

19. Remove the UD clutch pack (1, 3).

**CAUTION:** Compress return spring just enough to remove or install snap ring.

20. Using Tool 5059A (4) and an arbor press (2), compress UD clutch piston enough to remove snap ring (3).

21. Remove the underdrive spring retainer snap ring (2), spring retainer (1), and spring (4).

22. Remove the UD clutch piston (1).

23. Remove the input hub tapered snap ring (2).

24. Tap on input hub (1) with soft faced hammer (2) and separate input hub from OD/Reverse piston and clutch retainer.

25. Separate the input hub from OD/Reverse piston (5) and clutch retainer (2).

26. Separate clutch retainer (2) from OD/Reverse piston (1).

27. Using Tool 6057 (4) and an arbor press (1), compress OD/Reverse piston (5) return spring just enough to remove snap ring (3).

28. Remove the OD/Reverse piston (5) return spring and snap ring (3).

29. Remove input shaft (1) to input clutch hub snap ring (3).

30. Using a suitably sized socket (2) and an arbor press (1), remove input shaft (5) from input shaft hub.

## ASSEMBLY

Use petrolatum on all seals to ease assembly of components.

1. Using an arbor press(2), install input shaft (1) to input shaft hub (2).

2. Install input shaft snap ring (3).

3. Position the OD/Reverse piston return spring (2) and snap ring (3) onto the OD/Reverse piston (1).

4. Using an arbor press (1) and Tool 6057 (4), install the OD/Reverse piston return spring (6) and snap ring (3).

5. Install the OD/Reverse piston (1) assembly to the input clutch retainer (2).

6. Install the input hub/shaft assembly (1) to the OD/Reverse piston/clutch retainer assembly (2).

7. Install input hub tapered snap ring (2). **Make sure snap ring is fully seated.**

8. Install the UD clutch piston (1).

9. Install UD piston return spring (1) and Tool 5067 (2).

10. Position the UD spring retainer (1) and snap ring (2) on the piston return spring (4).

**CAUTION:** Compress return spring just enough to install snap ring.

11. Using Tool 5059A (6) and an arbor press (1), install the UD spring retainer and snap ring (3).

12. Install the UD clutch pack (four fibers/four steels) (1, 3). Leave the top disc (2) out until after the snap ring is installed.

13. Install the UD clutch flat snap ring (1).

14. Install the last UD clutch disc (1).

15. Install the OD/UD clutch reaction plate (1). The OD/UD clutches reaction plate has a step on both sides. Install the OD/UD clutches reaction plate tapered step side up.

**Note:** Snap ring ends must be located within one finger of the input clutch hub. Be sure that snap ring is fully seated, by pushing with screwdriver, into snap ring groove all the way around.

16. Install the UD/OD tapered snap ring (1).

17. Seat tapered snap ring (1) to ensure proper installation.

18. Install input clutch assembly (1) to the Input Clutch Pressure Fixture 8391 (2).

19. Set up dial indicator (1) on the UD clutch pack (2).

20. Using moderate pressure, press down and hold (near indicator) the UD clutch pack (2) with screwdriver or suitable tool and zero dial indicator (1). When releasing pressure on clutch pack, indicator reading should advance 0.005-0.010 inches.

**CAUTION: Do not apply more than 30 psi (206 kPa) to the underdrive clutch pack.**

21. Apply 30 psi (206 kPa) to the underdrive hose on Tool 8391 and measure UD clutch clearance. Measure and record UD clutch pack measurement in four (4) places, 90° apart.
22. Take average of four measurements and compare with UD clutch pack clearance specification. **Underdrive clutch pack clearance must be 0.94-1.50 mm (0.037-0.059 in.).**
23. If necessary, select the proper reaction plate to achieve specifications.

24. Install the OD clutch pack (four fibers/three steels) (1).

25. Install OD reaction plate waved snap ring (1).

26. Install the OD/Reverse reaction plate (1) with large step down (towards OD clutch pack).

27. Install OD reaction plate flat snap ring (3).

28. Measure OD clutch pack clearance. Set up dial indicator (1) on top of the OD/Reverse reaction plate (2).

29. Zero dial indicator and apply 30 psi (206 kPa) air pressure to the overdrive clutch hose on Tool 8391. Measure and record OD clutch pack measurement in four (4) places, 90° apart.

30. Take average of four measurements and compare with OD clutch pack clearance specification. **The overdrive (OD) clutch pack clearance is 1.07-3.25 mm (0.042-0.128 in.).**

If not within specifications, the clutch is not assembled properly. There is no adjustment for the OD clutch clearance.

31. Install reverse clutch pack (two fibers/one steel) (1, 2).

32. Install reverse clutch reaction plate (1) with the flat side down towards reverse clutch.

33. Tap reaction plate (3) down to allow installation of the reverse clutch snap ring (1). Install reverse clutch snap ring (1).

34. Pry up reverse reaction plate (4) to seat against snap ring (2).

35. Set up a dial indicator (1) on the reverse clutch pack (2).

36. Using moderate pressure, press down and hold (near indicator) reverse clutch disc (2) with screwdriver or suitable tool and zero dial indicator (1). When releasing pressure, indicator should advance 0.005-0.010 inches as clutch pack relaxes.
37. Apply 30 psi (206 kPa) air pressure to the reverse clutch hose on Tool 8391. Measure and record reverse clutch pack measurement in four (4) places, 90° apart.
38. Take average of four measurements and compare with reverse clutch pack clearance specification. **The reverse clutch pack clearance is 0.89-1.37 mm (0.035-0.054 in.).** Select the proper reverse clutch snap ring to achieve specifications.
39. To complete the assembly, reverse clutch and overdrive clutch must be removed.

40. Install the number 2 needle bearing (1).

41. Install the underdrive shaft assembly (1).

42. Install the number 3 thrust washer (1) to the underdrive shaft assembly (2). Be sure five tabs are seated properly.

43. Install the number 3 thrust plate (3) to the bottom of the overdrive shaft assembly (1). Retain with petrolatum or transmission assembly gel (2).

44. Install the overdrive shaft assembly (1).

45. Reinstall overdrive and reverse clutch. **Rechecking these clutch clearances is not necessary.**

## SENSOR-INPUT SPEED

### DESCRIPTION

The Input (1) and Output (2) Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

### OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

### REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the input speed sensor 91).

**Note:** The speed sensor bolt has a sealing patch applied from the factory. Be sure to reuse the same bolt.

4. Remove the bolt holding the input speed sensor (1) to the transmission case.
5. Remove the input speed sensor (1) from the transmission case.

## INSTALLATION

1. Install the input speed sensor (1) into the transmission case.

**Note:** Before installing the speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

2. Install the bolt to hold the input speed sensor (1) into the transmission case. Tighten the bolt to 9 N·m (80 in.lbs.).
3. Install the wiring connector onto the input speed sensor
4. Verify the transmission fluid level. Add fluid as necessary. (Refer to 21 - TRANSMISSION/AUTOMATIC TRANSMISSION - 42RLE/FLUID - STANDARD PROCEDURE)
5. Lower vehicle.

## PUMP-OIL

### DESCRIPTION

The oil pump is located in the pump housing inside the bell housing of the transmission case. The oil pump assembly consists of an inner (3) and outer (2) gear, a housing (1), and a cover that also serves as the reaction shaft support (6).

### OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

## DISASSEMBLY

1. Remove the reaction shaft support bolts.
2. Remove the reaction shaft support(2) from the pump housing (1).

3. Remove the pump gears (2, 3) and check for wear and damage on pump housing (1) and gears (2, 3).

4. Re-install the gears and check clearances.
5. Measure the clearance between the outer gear (1) and the pump pocket (2). Clearance should be 0.089-0.202 mm (0.0035-0.0079 in.).
6. Measure clearance between outer gear and crescent. Clearance should be 0.060-0.298 mm (0.0023-0.0117 in.).
7. Measure clearance between inner gear and crescent. Clearance should be 0.093-0.385 mm (0.0036-0.0151 in.).
8. Position an appropriate piece of Plastigage across both pump gears.
9. Align the Plastigage to a flat area on the reaction shaft support housing.

10. Install the reaction shaft to the pump housing. Tighten the bolts to 27 N·m (20 ft. lbs.).
11. Remove bolts and carefully separate the housings. Measure the Plastigage following the instructions supplied.
12. Clearance between outer gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.). Clearance between inner gear side and the reaction shaft support should be 0.020-0.046 mm (0.0008-0.0018 in.).

## ASSEMBLY

1. Assemble oil pump as shown
2. Install and torque reaction shaft support-to-oil pump housing bolts to 28 N·m (20 ft. lbs.) torque.

## BEARING-OUTPUT SHAFT

### REMOVAL

1. Raise and support vehicle.
2. Remove the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL).
3. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
4. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
5. Remove the transmission rear oil seal with a suitable slide hammer and screw.
6. Remove the transmission rear output shaft bearing retaining ring (1).

7. Position Bearing Remover 9082 (1) over the inner race of the output shaft bearing.

8. Slide the collar (3) on the Bearing Remover 9082 (1) downward over the fingers (3) of the tool.

9. Remove the output shaft bearing (3).

## INSTALLATION

1. Install output shaft bearing in the rear transmission housing. Using Bearing Installer 9287 (1), install the output shaft bearing (2) into the transmission housing. **The closed side of the plastic cage must point towards the transmission.**

2. Install the retaining ring (1). Ensure that the retaining ring is seated correctly in the groove.
3. Install the output shaft washer onto the output shaft.

4. Install a new transmission rear seal into the transmission case with Seal Installer 8902A (1).
5. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
6. Install the propeller shaft flange onto the output shaft and install a new flange nut. Tighten the flange nut to 120 N·m (88.5 ft.lbs.).

7. Stake the output shaft nut to the output shaft as follows. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
8. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4).

9. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2).
10. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.
11. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

## SEAL-OUTPUT SHAFT

### REMOVAL

1. Remove the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - REMOVAL). Move propeller shaft to the right and tie up.
2. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
3. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
4. Remove the output shaft seal with suitable screw and slide hammer.

### INSTALLATION

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Use Seal Installer 8902A (1) to install the seal.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
4. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut to 120 N·m (88.5 ft.lbs.).

5. Stake the output shaft nut to the output shaft as follows. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
6. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4).

7. Press downward on the staking tool until the staking pin (3) contacts the output shaft nut flange (2).
8. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.
9. Install the propeller shaft (Refer to 3 - DIFFERENTIAL & DRIVELINE/PROPELLER SHAFT/PROPELLER SHAFT - INSTALLATION).

## SENSOR-OUTPUT SPEED

### DESCRIPTION

The Input (1) and Output (2) Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

## OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft rpm.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft rpm.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage
- Torque converter element speed ratio

## REMOVAL

1. Raise vehicle.
2. Place a suitable fluid catch pan under the transmission.
3. Remove the wiring connector from the output speed sensor (2).

**Note:** The speed sensor bolt has a sealing patch applied from the factory. Be sure to reuse the same bolt.

4. Remove the bolt holding the output speed sensor (2) to the transmission case.
5. Remove the output speed sensor (2) from the transmission case.

## INSTALLATION

1. Install the output speed sensor (2) into the transmission case.

**Note:** Before installing the speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

2. Install the bolt to hold the output speed sensor (2) into the transmission case. Tighten the bolt to 9 N·m (80 in.lbs.).
3. Install the wiring connector onto the output speed sensor (2).
4. Verify the transmission fluid level. Add fluid as necessary. (Refer to 21 - TRANSMISSION/AUTOMATIC TRANSMISSION - 42RLE/FLUID - STANDARD PROCEDURE)
5. Lower vehicle.

## CABLE-PARK LOCK

### REMOVAL

1. Place ignition key in the ACC (2) position.

2. Remove the lower instrument panel trim as necessary to access the park lock cable.
3. Disconnect park lock cable (4) from ignition cylinder (3).

4. Remove the floor console as necessary for access to the park lock cable. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
5. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.
6. Disconnect the park lock cable from the shift mechanism. Release retention tab using suitable screwdriver.

## INSTALLATION

1. Verify that ignition key is in ACC (2) position.

2. Install the park lock cable (4) to the ignition cylinder (3). Secure the cable to instrument panel at retainer.
3. Install any instrument panel trim that was removed to access the park lock cable.

4. Route park lock cable towards shift mechanism.
5. Connect the park lock cable core to shift mechanism cam (3), and then secure cable housing to shift mechanism.

6. Adjust the park lock cable. (Refer to 21 - TRANSMISSION/AUTOMATIC TRANSMISSION/SHIFT INTERLOCK MECHANISM - ADJUSTMENTS)
7. If necessary, install the shield, covering the gearshift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
8. Install the floor console assembly. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## GEARTRAIN-PLANETARY

### DESCRIPTION

The planetary geartrain is located between the input clutch assembly and the rear of the transmission case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft.

### OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

## SEAL-OIL PUMP

### REMOVAL

1. Remove the transmission from the vehicle (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - REMOVAL).
2. Remove the torque converter from the transmission bellhousing.
3. Use special tool C-3981B to remove oil pump seal.

### INSTALLATION

1. Clean and inspect oil pump seal seat. Then install seal using special tool C-4193-A.
2. Clean and inspect torque converter hub. If nicks, scratches or hub wear are found, torque converter replacement will be required.

**CAUTION:** If the torque converter is being replaced, apply a light coating of grease to the crankshaft pilot hole. Also inspect the engine drive plate for cracks. If any cracks are found replace the drive plate. Do not attempt to repair a cracked drive plate. Always use new torque converter to drive plate bolts.

3. Apply a light film of transmission oil to the torque converter hub and oil seal lips. Then install torque converter into transmission. Be sure that the hub lugs mesh with the front pump lugs when installing.
4. Reinstall the transmission into the vehicle.(Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE - INSTALLATION)

## MECHANISM-SHIFT

### DESCRIPTION

The automatic transmission is operated with the help of a shift lever assembly (SLA) (1) located in the floor console. There are six positions to which the selection lever can be shifted: P, R, N, D, 3, L.

All selector lever positions are identified by the SLA and transmitted by a shift cable to the selector shaft in the transmission.

The SLA is comprised of the following functions:

- **Key lock:** Depending on the selector lever position, the ignition cylinder is locked/unlocked, i.e., the ignition key can be removed only if the selector lever is in position "P". A park lock cable is used to perform this function.
- **Park lock:** The selector lever is not released from position "P" until the brake pedal has been applied and the ignition key is in "ACC" or "ON" positions. Shift lock is controlled by the brake light switch in conjunction with a locking solenoid in the SLA. As soon as the brake pedal is applied firmly, the locking solenoid is energized and retracted to unlock the selector lever. If the selector lever cannot be moved out of position "P" due to a malfunction, the shift lock function can be overridden (2). (Refer to 21 - TRANSMISSION/AUTOMATIC TRANSMISSION - NAG1/SHIFT INTERLOCK MECHANISM - OPERATION)

### OPERATION

With the selector lever in position "D", the transmission control module (TCM) automatically shifts the gears that are best-suited to the current operating situation. This means that shifting of gears is continuously adjusted to current driving and operating conditions in line with the selected shift range and the accelerator pedal position. Starting off is always performed in 1st gear.

The current selector lever position or, if the shift range has been limited, the current shift range is indicated in the instrument cluster display.

The permissible shifter positions and transmission operating ranges are:

- P = Parking lock and engine starting.
- R = Reverse.
- N = Neutral and engine starting (no power is transmitted to the axles).
- D = The shift range includes all forward gears.
- 3= Shift range is limited to gears 1 to 3.
- 1= Shift range is limited to the 1st gear.

## REMOVAL

1. Remove any necessary console parts for access to shift lever assembly and shifter cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)
2. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.
3. Shift transmission into PARK.
4. Disconnect the transmission shift cable (1) at shift lever (3) and shifter assembly bracket (2).
5. Remove the shift cable retainer (2) from the notch in the shifter assembly (2).

6. Verify the key is in the LOCK position and disconnect the park lock cable (1) from the shifter mechanism cam (3) and the notch in the shifter assembly (3).

7. Disengage all wiring connectors (2) from the shifter assembly (1).

8. Remove all nuts (2) holding the shifter assembly (1) to the floor pan.
9. Remove the shifter assembly (1) from the vehicle.

## INSTALLATION

1. Install shifter assembly (1) onto the shifter assembly studs on the floor pan.
