4. Install and tighten both mounting bolts (2). Refer to Torque Specifications.
5. Install steering gear assembly and mounting bolts. Install steering column coupling bolt (pinch bolt). Refer to Steering section for torque specifications.
6. Install steering gear heat-shield.
7. Lower vehicle.
8. Connect negative battery cable.

## HEATED GLASS - SERVICE INFORMATION

### DESCRIPTION

#### CHRYSLER

**CAUTION:** Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned ON or OFF by a control switch located on the A/C-heater control at the center of the instrument panel and by a rear window defogger relay timing circuit integral to the front control module (FCM) (Refer to 8 - ELECTRICAL/HEATED GLASS/SWITCH-REAR WINDOW DEFOGGER - DESCRIPTION).

Circuit protection is provided by a fuse located in the junction block (JB).

## DODGE

**CAUTION:** Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned ON or OFF by a control switch located on the A/C-heater control at the center of the instrument panel and by a rear window defogger relay timing circuit integral to the front control module (FCM) (Refer to 8 - ELECTRICAL/HEATED GLASS/SWITCH-REAR WINDOW DEFOGGER - DESCRIPTION).

Circuit protection is provided by a fuse located in the junction block (JB).

## OPERATION

The electric backlight (EBL) system is controlled by a momentary switch (1) located in the A/C-heater control (2) on the instrument panel. When the defogger switch for the EBL system is pressed to the On position, current is directed to the rear defogger grid lines and the heated power mirrors (when equipped). The heated grid lines heat the glass to help clear the rear window and side mirror surfaces of fog or frost.

A yellow indicator (3) in the defogger switch will illuminate to indicate when the EBL system is turned on. The front control module (FCM) contains the EBL system control circuitry.

**Note: The EBL system turns off automatically after approximately ten minutes of initial operation. Each following activation cycle of the EBL system will last approximately five minutes.**

The EBL system will be automatically turned off after a programmed time interval of about ten minutes. After the initial time interval has expired, if the defogger switch is turned on again during the same ignition cycle, the EBL system will automatically turn off after about five minutes.

The EBL system will automatically shut off if the ignition switch is turned to the Off position, or it can be turned off manually by depressing the defogger switch a second time.

Repair of the rear defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent (Refer to 8 - ELECTRICAL/HEATED GLASS/REAR WINDOW DEFOGGER GRID - STANDARD PROCEDURE - GRID LINE REPAIR).

## DIAGNOSIS AND TESTING

### ELECTRIC BACKLIGHT (EBL) SYSTEM

**Note: Illumination of the defogger switch indicator lamp means that there is electrical current available at the output of the rear window defogger logic circuitry, but does not confirm that the electrical current is reaching the rear glass heating grid lines.**

**Note: For circuit descriptions and diagrams of the rear window defogger system, refer to 8W - WIRING DIAGRAM INFORMATION.**

Operation of the electrical backlight (EBL) system can be confirmed by the following:

1. If equipped with the automatic temperature control (ATC) heating-A/C system, use a scan tool and check for diagnostic trouble codes (DTCs) related to the A/C-heater control and the front control module (FCM). If equipped with the manual temperature control (MTC) heating-A/C system, use the A/C-heater control to check for diagnostic trouble codes (DTCs) related to the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - HVAC SELF DIAGNOSTICS). If no DTCs are found, go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2.
2. Turn the ignition switch to the On position. Set the defogger switch in the On position. The rear win-

81319945

J918N-2

dow defogger operation can be checked by feeling the rear window or outside rear view mirror glass. A distinct difference in temperature between the grid lines (4 and 5) and the adjacent clear glass or the mirror glass can be detected within three to four minutes of operation.

3. If a temperature difference is not detected, use a 12-volt DC voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
  - Confirm that the ignition switch is in the On position.
  - Make sure that the rear glass heating grid feed wire (3) and ground wire (6) are connected to the terminals. Confirm that the ground wire has continuity to ground.
  - Check the EBL relay and fuse located in the junction block at the rear of the vehicle. The relay and fuse must be tight in their receptacles and all electrical connections must be secure (Refer to 8 - ELECTRICAL/HEATED GLASS/RELAY-REAR WINDOW DEFOGGER - REMOVAL).

When the above steps have been completed and the rear glass heating grid is still inoperative, one or more of the following is faulty:

- Rear window defogger control switch in the A/C-heater control.
- Rear window defogger grid lines (all grid lines would have to be broken, or the power feed or the ground wire disconnected, for the entire heating grid to be inoperative).

## GRID-REAR WINDOW DEFOGGER

### STANDARD PROCEDURE

### GRID LINE AND TERMINAL REPAIR PROCEDURE

**WARNING:** Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow the warnings could result in possible personal injury or death.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.
3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. For grid line repairs, mask the area to be repaired with masking tape or use a template.
5. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).

6. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
7. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.

8. Carefully remove the masking tape or template.

**CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.**

9. Allow the epoxy to cure 24 hours at room temperature, or carefully use a heat gun for fifteen minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).

10. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire. Do not attach the wire harness connectors until the curing process is complete.

11. Check the operation of the rear window defogger glass heating grid.

## RELAY-REAR WINDOW DEFOGGER

### DESCRIPTION

The rear window defogger (EBL) relay (1) is a International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The EBL relay is an electromechanical device that switches battery current through a fuse in the rear junction block to the rear window defogger grid and when equipped, switches battery current to the outside mirror heating grids. The EBL relay is energized when the relay coil is provided a ground path by the control circuitry within the front control module (FCM).

The EBL relay is located in the junction block (JB) at the rear of the vehicle, near the battery.

### OPERATION

The ISO-standard rear window defogger (EBL) relay consists of an electromagnetic coil, a resistor or diode, and three (two fixed and one movable) electrical contacts. The movable (common feed) relay contact is held against one of the fixed contacts (normally closed) by spring pressure. When the electromagnetic coil is energized, it draws the movable contact away from the normally closed fixed contact, and holds it against the other (normally open) fixed contact.

When the electromagnetic coil is de-energized, spring pressure returns the movable contact to the normally closed position. The resistor is connected in parallel with the electromagnetic coil in the relay, and helps to dissipate voltage spikes that are produced when the coil is de-energized.

Refer to the appropriate wiring information for diagnosis and testing of the EBL relay and for complete EBL system wiring diagrams.

## REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Open the cover of the junction block (1) located at the rear of the vehicle near the battery (2).
3. Remove the EBL relay (3) from the junction block.

## INSTALLATION

1. Position the EBL relay (3) into the proper receptacle of the junction block (1) located at the rear of the vehicle near the battery (2).
2. Align the EBL relay terminals with the terminal cavities in the junction block receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the junction block.
4. Reconnect the negative battery cable.

## SWITCH-REAR WINDOW DEFOGGER

### DESCRIPTION

The rear window defogger switch (1) is integrated into the A/C-heater control (2) which is mounted to the center of the instrument panel. The rear window defogger switch and the rear window defogger LED indicator (3) cannot be repaired and, if faulty or damaged, the A/C-heater control must be replaced (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CONTROL-A/C HEATER - REMOVAL).

### OPERATION

An LED indicator will illuminate when the rear window defogger control switch is activated. When the control switch is activated, the A/C-heater control requests the front control module (FCM) to operate the rear window defogger (EBL) relay via the controller area network (CAN) B bus. The EBL relay controls the current to flow to the grids of the rear window defogger and to the heated power side view mirrors, when equipped. The EBL relay will be on for approximately ten minutes or until the control switch or the ignition switch is turned off.

HEATED MIRRORS - SERVICE INFORMATION

TABLE OF CONTENTS	
	page
	page
HEATED MIRRORS - SERVICE INFORMATION	OPERATION . . . . . 8
DESCRIPTION . . . . . 8	

HEATED MIRRORS - SERVICE INFORMATION

DESCRIPTION

The heated mirror system only operates in concert with the EBL system. For more information, refer to 8 - ELECTRICAL/HEATED GLASS - DESCRIPTION.

OPERATION

When the rear window defogger switch (1) located on the A/C-heater control (2) is pressed, the rear window defogger (EBL) system becomes activated and an electric heater grid located behind the glass of each of the outside rear view mirrors is energized. When energized, each of these heater grids produce heat to help clear the outside rear view mirrors of ice, snow, or fog. A yellow indicator (3) in the defogger switch will illuminate to indicate when the EBL system is turned on. The A/C-heater control contains the EBL system control circuitry.

**Note:** The EBL system turns off automatically after approximately ten minutes of initial operation. Each following activation cycle of the EBL system will last approximately five minutes.

The EBL system will be automatically turned off after a programmed time interval of about ten minutes. After the initial time interval has expired, if the defogger switch is turned on again during the same ignition cycle, the EBL system will automatically turn off after about five minutes.

The EBL system will automatically shut off if the ignition switch is turned to the Off position, or it can be turned off manually by depressing the defogger switch a second time.

If the outside mirror heating grids are both inoperative, refer to 8 - ELECTRICAL/HEATED GLASS - DIAGNOSIS AND TESTING in this group. If only one of the outside mirror heating grids is inoperative, refer to 8 - ELECTRICAL/POWER MIRRORS - DIAGNOSIS AND TESTING.

The heating grid behind each outside mirror glass cannot be repaired and, if faulty or damaged, the mirror glass must be replaced (Refer to 23 - BODY/EXTERIOR/MIRROR-SIDE VIEW - GLASS - REMOVAL) and (Refer to 23 - BODY/EXTERIOR/MIRROR-SIDE VIEW - GLASS - INSTALLATION).

## HEATED SEATS - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

B1084-LEFT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE

**B1084-LEFT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set after the Cluster detects the heated seat switch sense circuit low for a predetermined amount of time.

Possible Causes
(P365) LEFT HEATED SEAT SWITCH SENSE SHORTED TO GROUND
LEFT HEATED SEAT SWITCH
CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B1084-LEFT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Is the DTC B1084 LEFT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**2. DISCONNECT THE LEFT HEATED SEAT SWITCH CONNECTOR AND CHECK SWITCH STATUS**

Turn the ignition switch off.

Disconnect the Left Heated Seat Switch connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

With the scan tool in CCN Inputs/Outputs, read the Left Heated Seat state.

**Does the switch state display Not Set?**

**Yes** >> Replace the Left Heated Seat Switch.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**B1084-LEFT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE (CONTINUED)****3. CHECK THE (P365) LEFT HEATED SEAT SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition switch off.

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (P365) Left Heated Seat Switch sense circuit.

**Was the resistance below 5.0 ohms?**

**Yes** >> Repair the (P365) Left Heated Seat Switch sense circuit for a short to ground

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

## B1087-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE

**B1087-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set after the Cluster detects the heated seat switch sense circuit low for a predetermined amount of time.

Possible Causes
(P366) RIGHT HEATED SEAT SWITCH SENSE SHORTED TO GROUND RIGHT HEATED SEAT SWITCH CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B1087-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Is the DTC B1087 RIGHT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**2. DISCONNECT THE RIGHT HEATED SEAT SWITCH CONNECTOR AND CHECK SWITCH STATUS**

Turn the ignition switch off.

Disconnect the Right Heated Seat Switch connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

With the scan tool in CCN Inputs/Outputs, read the Right Heated Seat state.

**Does the switch state display Not Set?**

**Yes** >> Replace the Right Heated Seat Switch.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**B1087-RIGHT HEATED SEAT SWITCH INPUT CIRCUIT/PERFORMANCE (CONTINUED)****3. CHECK THE (P366) RIGHT HEATED SEAT SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition switch off.

Disconnect the Cluster C3 connector.

Measure the resistance between ground and the (P366) Right Heated Seat Switch sense circuit.

**Was the resistance below 5.0 ohms?**

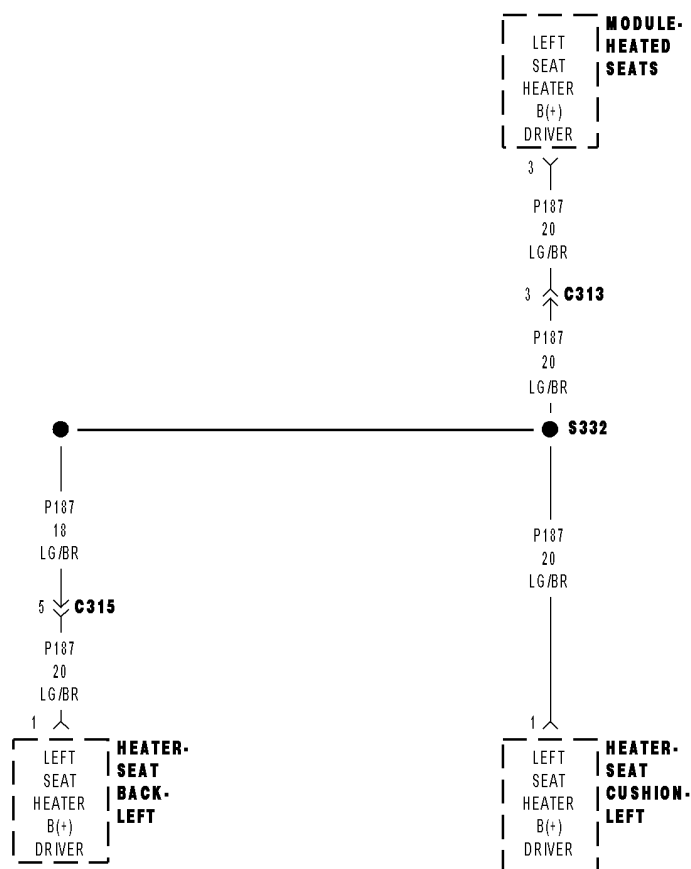

**Yes** >> Repair the (P366) Right Heated Seat Switch sense circuit for a short to ground

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW**

**MODULE-HEATED SEATS**

**HEATER-SEAT CUSHION-LEFT**

**HEATER-SEAT BACK-LEFT**

**B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module detects the control circuit shorted to ground.

Possible Causes
(P187) DRIVER SEAT HEATER B(+) DRIVER SHORTED TO GROUND SEAT HEATER ELEMENT PIGTAIL HARNESS SHORTED SEAT CUSHION HEATER ELEMENT SHORTED SEAT BACK HEATER ELEMENT SHORTED HEATED SEAT MODULE

**Diagnostic Test****1. VERIFY THAT DTC B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B1092 FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)****2. DISCONNECT LEFT CUSHION HEATER 2-WAY CONNECTOR AND READ DTC'S**

Disconnect the Left Seat Cushion Heater connector.

**Note: Check connectors - Clean and repair as necessary.**

With the scan tool, erase HSM DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the scan tool display the same DTC?**

**Yes** >> Go To 7

**No** >> Go To 3

**3. CHECK THE LEFT SEAT BACK HEATER RESISTANCE**

Disconnect the Left Seat Back Heater connector.

**Note: Check connectors - Clean and repair as necessary.**

Check the resistance of the seat back heater element by measuring between the (P187) Left Seat Heater B(+) Driver and the Ground circuit at the Left seat back heater connector.

**Is the resistance below 4.0 ohms?**

**No** >> Go To 4

**Yes** >> Replace the seat back heater element as necessary.  
Perform BODY VERIFICATION TEST – VER 1(Refer to BODY VERIFICATION TEST – VER 1).

**B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)****4. CHECK THE LEFT SEAT BACK HEATER FOR A SHORT TO GROUND**

Measure between the (P187) Left Seat Heater B(+) Driver circuit at the Left seat back heater connector and the seat frame for a short to ground.

**Is the resistance below 1000 ohms?**

**Yes** >> Repair the pigtail harness for a short to ground condition or replace the seat back heater element as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**5. CHECK THE LEFT CUSHION HEATER RESISTANCE**

Check the resistance of the cushion heater element by measuring between the (P187) Left Seat Heater B(+) Driver and the Ground circuit at the Left seat cushion heater connector.

**Was the resistance below 3.5 ohms?**

**No** >> Go To 6

**Yes** >> Replace the heater element as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1092-FRONT LEFT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)****6. CHECK THE LEFT CUSHION HEATER FOR A SHORT TO GROUND**

Measure between the (P187) Left Seat Heater B(+) Driver circuit at the Left seat cushion heater connector and the seat frame for a short to ground.

**Is the resistance below 1000 ohms?**

**Yes** >> Repair the pigtail harness or replace the heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**7. Check the (P187) Left Seat Heater B(+) Driver circuit for a short to ground**

Disconnect the Heat Seat Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Measure the (P187) Left Seat Heater B(+) Driver circuit to ground at the HSM connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (P187) Left Seat Heater B(+) Driver circuit for a short to ground.

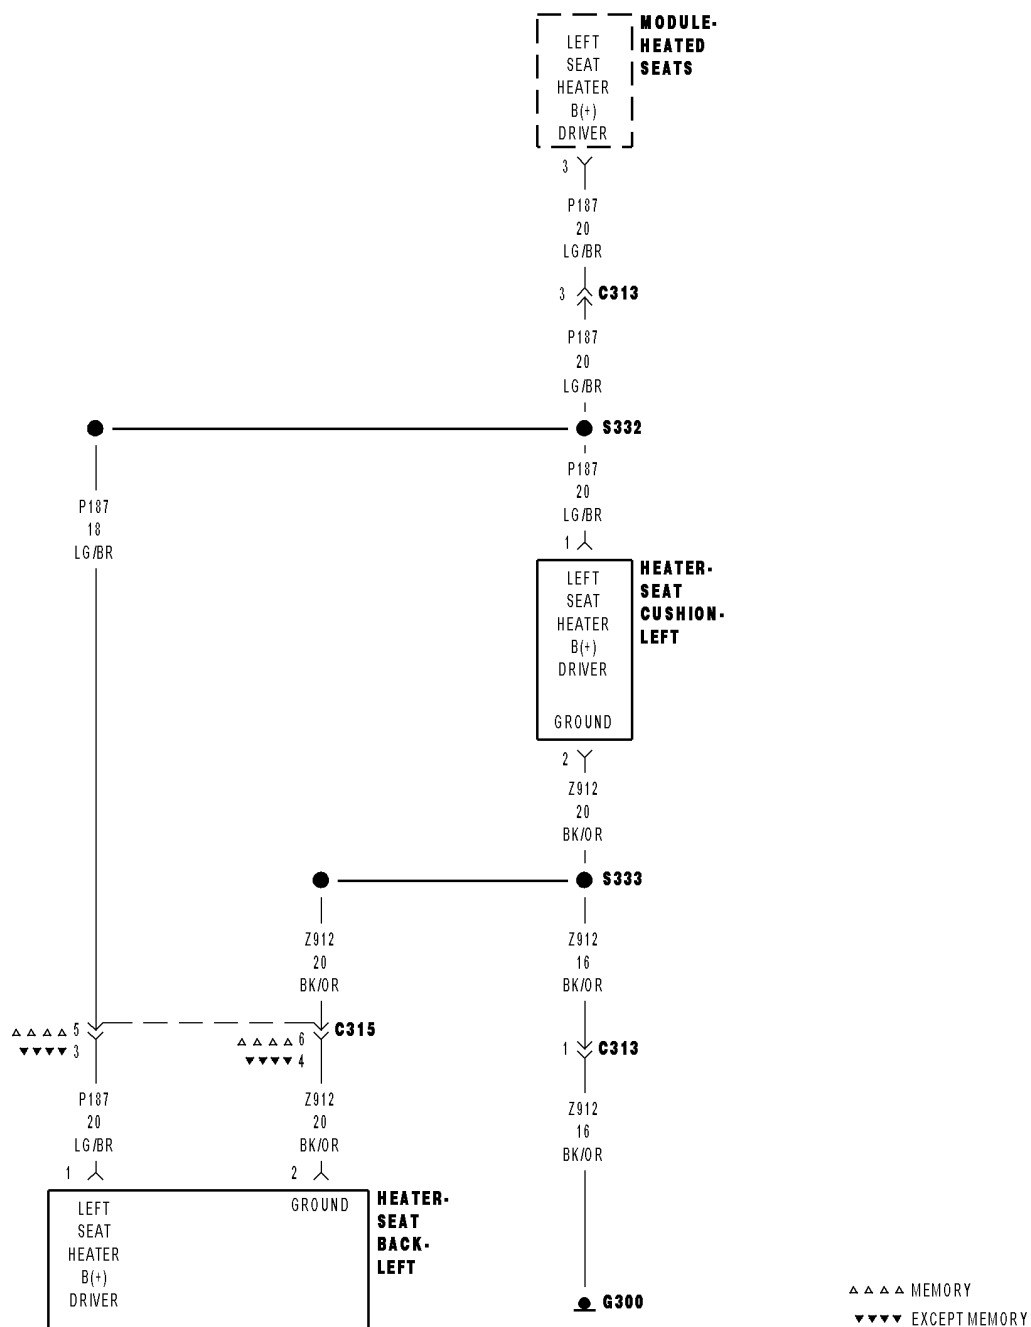

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

# B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN

**B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module detects an open in the seat heater B(+) driver circuit.

Possible Causes
(P187) LEFT SEAT HEATER B(+) DRIVER WIRE OPEN
(Z912) GROUND WIRE OPEN
SEAT CUSHION HEATER ELEMENT OPEN
SEAT BACK HEATER ELEMENT OPEN
HEATED SEAT MODULE

**Diagnostic Test****1. VERIFY THAT DTC B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B1094 FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**2. CHECK FOR AN OPEN SEAT HEATER ELEMENT**

Disconnect the Left Seat Cushion Heater 2 – way connector.

**Note: Check connectors - Clean and repair as necessary.**

Measure the total resistance of the cushion and seat back heater elements at the Left Seat Cushion 2 – way connector (seat side).

**Is the total resistance 2.5 ohms + or – .5 ohms?**

**Yes** >> Go To 4

**No** >> Go To 3

**B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)****3. CHECK THE LEFT SEAT BACK HEATER RESISTANCE**

Disconnect the Left Seat Back Heater 2 – way connector.

**Note: Check connectors - Clean and repair as necessary.**

Check the resistance of the seat back heater element by measuring between the (P187) Left Seat Heater B(+) Driver and the Ground circuit at the connector.

**Is the resistance above 5.8 ohms?**

**Yes** >> Repair the open pigtail harness or replace the seat back heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the open pigtail harness or replace the seat cushion heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**4. CHECK THE LEFT SEAT HEATER GROUND CIRCUIT RESISTANCE**

Measure the resistance of the Ground circuit at the Left Seat Heater Cushion 2 – way connector.

**Was the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the open ground circuit.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1094-FRONT LEFT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)****5. Check the (P187) Left Seat Heater B(+) Driver circuit for an open.**

Disconnect the Heated Seat Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Measure the (P187) Left Seat Heater B(+) Driver circuit from the Left Seat Cushion Heater 2-way connector (harness side) to the HSM connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Heated Seat Module.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Repair the (P187) Left Seat Heater B(+) Driver circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

## B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW

**MODULE-  
HEATED SEATS**

**HEATER-  
SEAT CUSHION-  
RIGHT**

**HEATER-  
SEAT BACK-  
RIGHT**

**B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Ignition on, during the heated seat operation.
- **Set Condition:**This code is set immediately after the Heated Seat Module detects the seat heater B(+) driver circuit shorted to ground.

Possible Causes
(P188) RIGHT SEAT HEATER B(+) DRIVER SHORTED TO GROUND SEAT HEATER ELEMENT PIGTAIL HARNESS SHORTED SEAT CUSHION HEATER ELEMENT SHORTED SEAT BACK HEATER ELEMENT SHORTED HEATED SEAT MODULE

**Diagnostic Test**

**1. VERIFY THAT DTC B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW IS ACTIVE**

With the scan tool, record and erase DTC's  
Operate the Heated Seat Switch in both positions several times.  
With the scan tool, read DTC's.

**Does the DTC B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW reset?**

- Yes**
- >> Go To 2
- No**
- >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)****2. DISCONNECT RIGHT SEAT CUSHION HEATER 2-WAY CONNECTOR AND READ DTC'S**

Disconnect the Right Seat Cushion Heater connector.

**Note: Check connectors - Clean and repair as necessary.**

With the scan tool, erase HSM DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the scan tool display the same DTC?**

**Yes** >> Go To 7

**No** >> Go To 3

**3. CHECK THE RIGHT SEAT BACK HEATER RESISTANCE**

Disconnect the Right Seat Back Heater connector.

**Note: Check connectors - Clean and repair as necessary.**

Check the resistance of the seat back heater element by measuring between the (P188) Right Seat Heater B(+) Driver and the Ground circuit at the Right seat back heater connector.

**Is the resistance below 4.0 ohms?**

**No** >> Go To 4

**Yes** >> Replace the seat back heater element as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**4. CHECK THE RIGHT SEAT BACK HEATER FOR A SHORT TO GROUND**

Measure between the (P188) Right Seat Heater B(+) Driver circuit at the Right Seat Back Heater connector and the seat frame for a short to ground.

**Is the resistance below 1000 ohms?**

**Yes** >> Repair the pigtail harness for a short to ground condition or replace the seat back heater element as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)****5. CHECK THE RIGHT SEAT CUSHION HEATER RESISTANCE**

Check the resistance of the cushion heater element by measuring between the (P188) Right Seat Heater B(+) Driver and the Ground circuit at the Right seat cushion heater connector.

**Was the resistance below 3.5 ohms?**

**No** >> Go To 6

**Yes** >> Replace the heater element as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**6. CHECK THE RIGHT SEAT CUSHION HEATER FOR A SHORT TO GROUND**

Measure between the (P188) Right Seat Heater B(+) Driver circuit at the Right Seat Cushion Heater connector and the seat frame for a short to ground.

**Is the resistance below 1000 ohms?**

**Yes** >> Repair the pigtail harness or replace the heater element as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for an intermittent short to ground.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1096-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT LOW (CONTINUED)****7. Check the (P188) Right Seat Heater B(+) Driver circuit for a short to ground**

Disconnect the Heated Seat Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Measure the (P188) Right Seat Heater B(+) Driver circuit to ground at the HSM connector.

**Is the resistance below 5.0 ohms?**

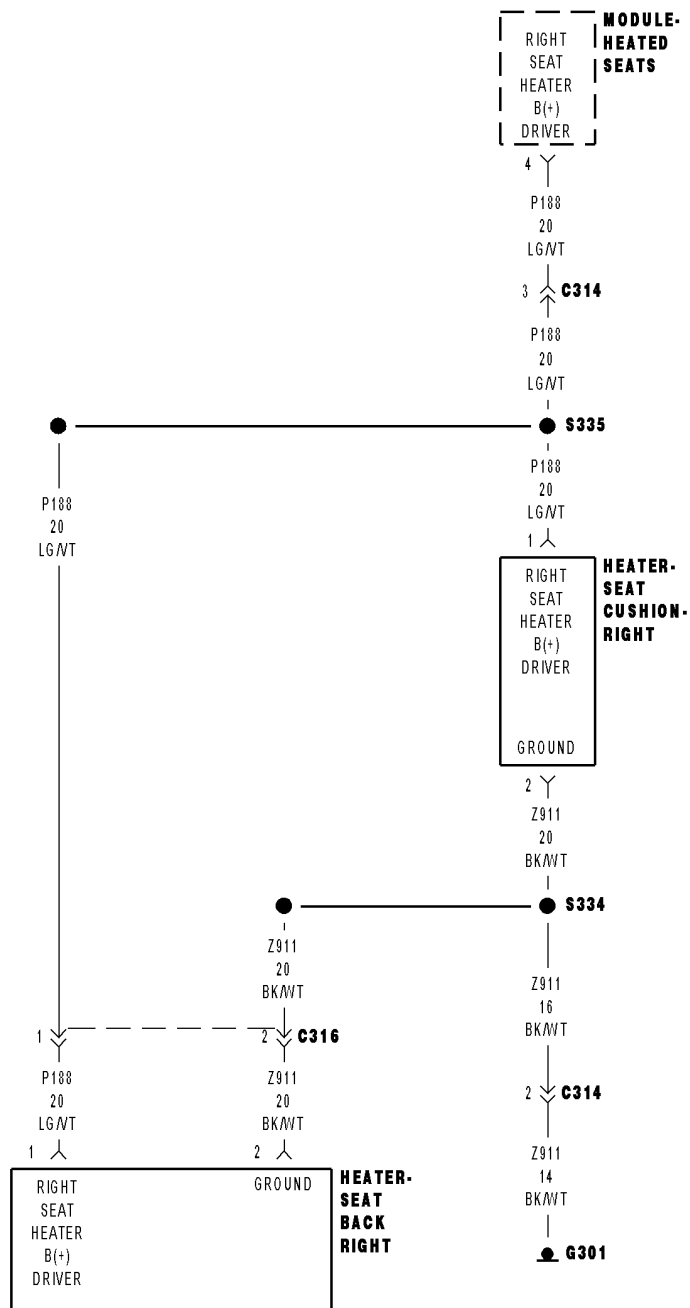

**Yes** >> Repair the (P188) Right Seat Heater B(+) Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Heated Seat Module.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN**

**B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on, during the heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module detects an open in the seat heat B(+) driver circuit.

Possible Causes
(P188) PASSENGER SEAT HEATER B(+) DRIVER WIRE OPEN
(Z911) GROUND WIRE OPEN
SEAT CUSHION HEATER ELEMENT OPEN
SEAT BACK HEATER ELEMENT OPEN
HEATED SEAT MODULE

**Diagnostic Test****1. VERIFY THAT DTC B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B1098 FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**2. CHECK FOR AN OPEN SEAT HEATER ELEMENT**

Disconnect the Right Seat Cushion Heater 2 – way connector.

**Note: Check connectors - Clean and repair as necessary.**

Measure the total resistance of the cushion and seat back heater elements at the Right Seat Cushion Heater 2 – way connector (seat side).

**Is the total resistance 2.5 ohms + or – .5 ohms?**

**Yes** >> Go To 4

**No** >> Go To 3

**B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)****3. CHECK THE RIGHT SEAT BACK PAD HEATER RESISTANCE**

Disconnect the Right Seat Back Heater 2 – way connector.

**Note: Check connectors - Clean and repair as necessary.**

Check the resistance of the seat back heater element by measuring between the (P188) Right Seat Heater B(+) Driver and the Ground circuit at the Right seat back heater connector.

**Is the resistance above 5.8 ohms?**

**Yes** >> Repair the open pigtail harness or replace the seat back heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the open pigtail harness or replace the seat cushion heater element as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**4. CHECK THE RIGHT SEAT HEATER GROUND CIRCUIT RESISTANCE**

Measure the resistance of the Ground circuit at the Right Seat Cushion Heater 2 – way connector (harness side).

**Was the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the open ground circuit.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1098-FRONT RIGHT SEAT HEATER CONTROL CIRCUIT OPEN (CONTINUED)****5. Check the (P188) Right Seat Heater B(+) Driver circuit for an open.**

Disconnect the Heated Seat Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Measure the (P188) Right Seat Heater B(+) Driver circuit from the Right Seat Cushion Heater connector to the HSM connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Heated Seat Module.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Repair the (P188) Right Seat Heater B(+) Driver circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH

**B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Continuously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects excessive voltage on the heated seat indicator control circuit.

Possible Causes
(P83) LEFT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT SHORTED TO BATTERY
LEFT HEATED SEAT SWITCH
CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B120E-LEFT HEATED SEAT SWITCH HI INDICATOR CONTROL CIRCUIT HIGH IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**2. DISCONNECT THE LEFT HEATED SEAT SWITCH AND RE-READ DTC**

Disconnect the Left Heated Seat Switch connector.

With the scan tool erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

**Does the DTC B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 3

**No** >> Replace the Left Heated Seat switch.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B120E-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)****3. DISCONNECT THE CLUSTER C3 CONNECTOR AND CHECK FOR VOLTAGE**

Disconnect the Cluster C3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

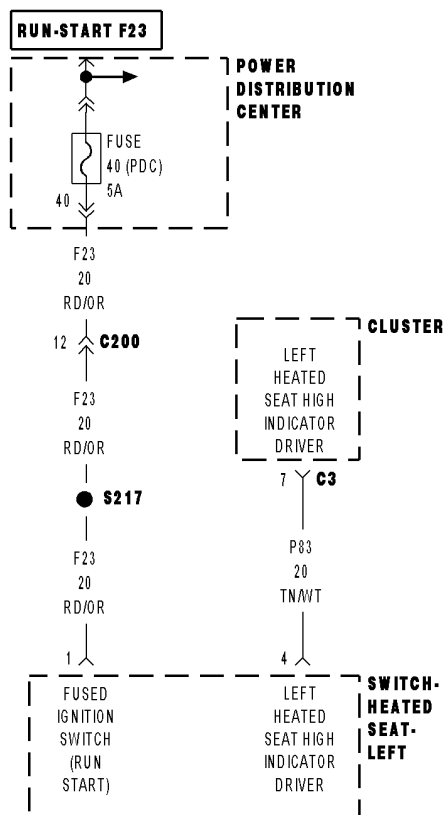

Measure the voltage at the (P83) Left Heated Seat High Indicator Driver circuit at the Cluster C3 connector.

**Is there any voltage present?**

- Yes** >> Repair the (P83) Left Heated Seat High Indicator Driver circuit for a short to battery.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Cluster in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

# B120F-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN

**B120F-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Continuously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects low voltage on the heated seat indicator control circuit.

Possible Causes
PDC FUSE #40 (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN (P83) LEFT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT OPEN/SHORTED TO GROUND LEFT HEATED SEAT SWITCH CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B120F-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B120F-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**2. INSPECT PDC FUSE #40**

Check PDC fuse #40.

**Is the fuse open?**

**Yes** >> Check for a possible short to ground on the (F23) Fused Ignition Switch Output (Run-Start) Circuit and replace the fuse as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**B120F-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****3. DISCONNECT THE CLUSTER C3 CONNECTOR AND CHECK FOR VOLTAGE**

Reinstall fuse if removed in previous test.

Disconnect the Cluster C3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage at the (P83) Left Heated Seat High Indicator Driver circuit at the Cluster C3 connector.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**4. CHECK THE (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START)**

Disconnect the Left Heated Seat switch connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage of the (F23) Fused Ignition Switch Output (Run-Start) circuit at the Left Heated Seat Switch connector.

**Is the voltage above 10.0 volts ?**

**Yes** >> Go To 5

**No** >> Repair the (F23) Fused Ignition Switch Output (Run-Start) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B120F-LEFT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****5. CHECK THE (P83) LEFT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (P83) Left Heated Seat High Indicator Driver circuit.

**Was the resistance below 5.0 ohms?**

- Yes** >> Repair the (P83) Left Heated Seat High Indicator Driver circuit for a short to ground  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 6

**6. CHECK THE (P83) LEFT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT FOR AN OPEN**

Measure the resistance of the (P83) Left Heated Seat High Indicator Driver circuit between the Cluster C3 connector and the Left Heated Seat Switch connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Left Heated Seat Switch.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Repair the (P83) Left Heated Seat High Indicator Driver circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

## B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH

**B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Continuously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects excessive voltage on the heated seat indicator control circuit.

Possible Causes
(P81) LEFT HEATED SEAT LO INDICATOR DRIVER CIRCUIT SHORTED TO BATTERY
LEFT HEATED SEAT SWITCH
CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B1216-LEFT HEATED SEAT SWITCH LO INDICATOR CONTROL CIRCUIT HIGH IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**2. DISCONNECT THE DRIVER HEATED SEAT SWITCH AND RE-READ DTC**

Disconnect the Left Heated Seat Switch connector.

With the scan tool erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

**Does the DTC B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 3

**No** >> Replace the Left Heated Seat switch.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**B1216-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)****3. DISCONNECT THE CLUSTER C3 CONNECTOR AND CHECK FOR VOLTAGE**

Disconnect the Cluster C3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

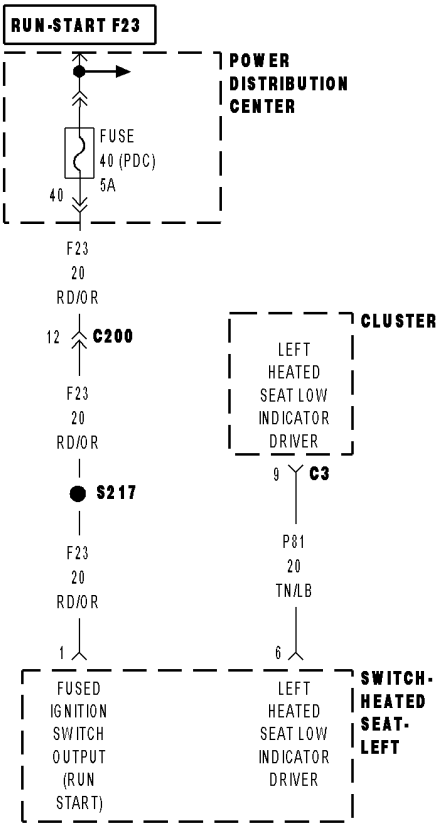

Measure the voltage at the (P81) Left Heated Seat Low Indicator Driver circuit at the Cluster C3 connector.

**Is there any voltage present?**

- Yes** >> Repair the (P81) Left Heated Seat Low Indicator Driver circuit for a short to battery.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Cluster in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

B1217-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN

**B1217-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**Continuously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects low voltage on the heated seat indicator control circuit.

Possible Causes
PDC FUSE #40 (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN (P81) LEFT HEATED SEAT LOW INDICATOR DRIVER CIRCUIT OPEN/SHORTED TO GROUND LEFT HEATED SEAT SWITCH CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B1217-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B1217-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
 Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. INSPECT PDC FUSE #40**

Check Junction Block fuse #2.

**Is the fuse open?**

**Yes** >> Check for a possible short to ground on the (F23) Fused Ignition Switch Output (Run-Start) Circuit and replace the fuse as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**B1217-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****3. DISCONNECT THE CLUSTER C3 CONNECTOR AND CHECK FOR VOLTAGE**

Reinstall fuse if removed in previous test.

Disconnect the Cluster C3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage at the (P81) Left Heated Seat Low Indicator Driver circuit at the Cluster C3 connector.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**4. CHECK THE (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START)**

Disconnect the Left Heated Seat switch connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage of the (F23) Fused Ignition Switch Output (Run-Start) circuit at the Left Heated Seat Switch connector.

**Is the voltage above 10.0 volts ?**

**Yes** >> Go To 5

**No** >> Repair the (F23) Fused Ignition Switch Output (Run-Start) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B1217-LEFT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****5. CHECK THE (P81) LEFT HEATED SEAT LO INDICATOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (P81) Left Heated Seat Lo Indicator Driver circuit.

**Was the resistance below 5.0 ohms?**

- Yes** >> Repair the (P81) Left Heated Seat Lo Indicator Driver circuit for a short to ground  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Go To 6

**6. CHECK THE (P81) LEFT HEATED SEAT LO INDICATOR DRIVER CIRCUIT FOR AN OPEN**

Measure the resistance of the (P81) Left Heated Seat Lo Indicator Driver circuit between the Cluster C3 connector and the Driver Heated Seat Switch connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Left Heated Seat Switch.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (P81) Left Heated Seat Lo Indicator Driver circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

B121A-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH

**B121A-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Continuously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects excessive voltage on the heated seat indicator control circuit.

Possible Causes
(P84) RIGHT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT SHORTED TO BATTERY
RIGHT HEATED SEAT SWITCH
CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B121A-RIGHT HEATED SEAT SWITCH HI INDICATOR CONTROL CIRCUIT HIGH IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B121A-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. DISCONNECT THE RIGHT HEATED SEAT SWITCH AND RE-READ DTC**

Disconnect the Right Heated Seat Switch connector.

With the scan tool erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

**Does the DTC B121A-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 3

**No** >> Replace the Right Heated Seat switch.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B121A-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)****3. DISCONNECT THE CLUSTER C-3 CONNECTOR AND CHECK FOR VOLTAGE**

Disconnect the Cluster C-3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

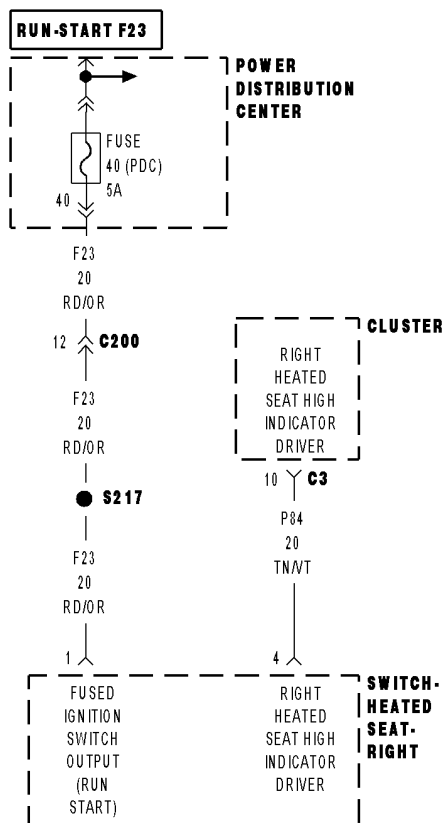

Measure the voltage at the (P84) Right Heated Seat High Indicator Driver circuit at the Cluster C-3 connector.

**Is there any voltage present?**

- Yes** >> Repair the (P84) Right Heated Seat High Indicator Driver circuit for a short to battery.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Cluster in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

# B121B-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN

**B121B-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Continuously with the ignition on.
- **Set Condition:** This code is set immediately when the Cluster detects low voltage on the heated seat indicator control circuit.

Possible Causes
PDC FUSE #40 (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN (P84) RIGHT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT OPEN/SHORTED TO GROUND RIGHT HEATED SEAT SWITCH CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B121B-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B121B-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. INSPECT PDC FUSE #40**

Check PDC fuse #40.

**Is the fuse open?**

**Yes** >> Check for a possible short to ground on the (F23) Fused Ignition Switch Output (Run-Start) Circuit and replace the fuse as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**B121B-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****3. DISCONNECT THE CLUSTER C3 CONNECTOR AND CHECK FOR VOLTAGE**

Reinstall fuse if removed in previous test.

Disconnect the Cluster C3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage at the (P84) Right Heated Seat High Indicator Driver circuit at the Cluster C3 connector.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**4. CHECK THE (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START)**

Disconnect the Right Heated Seat switch connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage of the (F23) Fused Ignition Switch Output (Run-Start ) circuit at the Right Heated Seat Switch connector.

**Is the voltage above 10.0 volts ?**

**Yes** >> Go To 5

**No** >> Repair the (F23) Fused Ignition Switch Output (Run-Start ) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B121B-RIGHT HEATED SEAT HI INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****5. CHECK THE (P84) RIGHT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (P84) Right Heated Seat High Indicator Driver circuit.

**Was the resistance below 5.0 ohms?**

- Yes** >> Repair the (P84) Right Heated Seat High Indicator Driver circuit for a short to ground  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Go To 6

**6. CHECK THE (P84) RIGHT HEATED SEAT HIGH INDICATOR DRIVER CIRCUIT FOR AN OPEN**

Measure the resistance of the (P84) Right Heated Seat High Indicator Driver circuit between the Cluster C3 connector and the Right Heated Seat Switch connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Right Heated Seat Switch.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (P84) Right Heated Seat High Indicator Driver circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

## B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH

**B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Continuously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects excessive voltage on the heated seat indicator control circuit.

Possible Causes
(P82) RIGHT HEATED SEAT LOW INDICATOR DRIVER CIRCUIT SHORTED TO BATTERY
RIGHT HEATED SEAT SWITCH
CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B1222-RIGHT HEATED SEAT SWITCH LO INDICATOR CONTROL CIRCUIT HIGH IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. DISCONNECT THE PASSENGER HEATED SEAT SWITCH AND RE-READ DTC**

Disconnect the Right Heated Seat Switch connector.

With the scan tool erase DTC's

Cycle the ignition switch off then back on.

With the scan tool, read DTC's.

**Does the DTC B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH reset?**

**Yes** >> Go To 3

**No** >> Replace the Right Heated Seat switch.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B1222-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)****3. DISCONNECT THE CLUSTER C-3 CONNECTOR AND CHECK FOR VOLTAGE**

Disconnect the Cluster C-3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

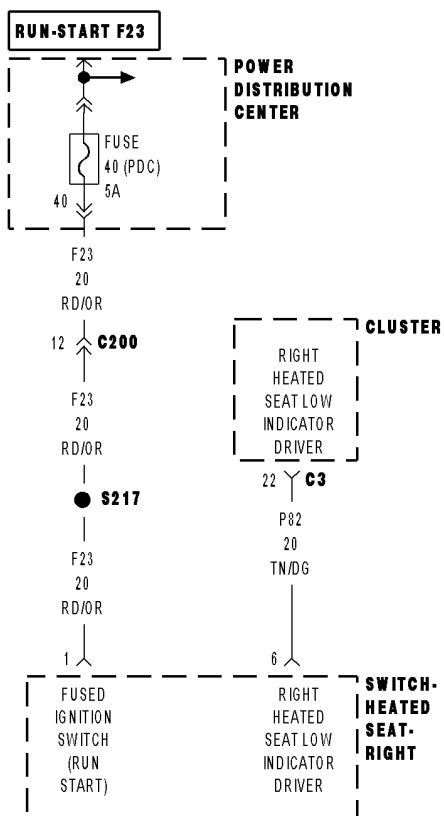

Measure the voltage at the (P82) Right Heated Seat Low Indicator Driver circuit at the Cluster C-3 connector.

**Is there any voltage present?**

- Yes** >> Repair the (P82) Right Heated Seat Low Indicator Driver circuit for a short to battery.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/FRONT CONTROL MODULE - DIAGNOSIS AND TESTING)
- No** >> Replace the Cluster in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B1223-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN**

**B1223-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**Continuously with the ignition on.
- **Set Condition:**This code is set immediately when the Cluster detects low voltage on the heated seat indicator control circuit.

Possible Causes
PDC FUSE #40 (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN (P82) RIGHT HEATED SEAT LOW INDICATOR DRIVER CIRCUIT OPEN/SHORTED TO GROUND RIGHT HEATED SEAT SWITCH CLUSTER

**Diagnostic Test****1. VERIFY THAT DTC B1223-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN IS ACTIVE**

With the scan tool, record and erase DTC's

Operate the Heated Seat Switch in both positions several times.

With the scan tool, read DTC's.

**Does the DTC B1223-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN reset?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
 Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. INSPECT PDC FUSE #40**

Check Junction Block fuse #2.

**Is the fuse open?**

**Yes** >> Check for a possible short to ground on the (F23) Fused Ignition Switch Output (Run-Start) Circuit and replace the fuse as necessary.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**B1223-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****3. DISCONNECT THE CLUSTER C-3 CONNECTOR AND CHECK FOR VOLTAGE**

Reinstall fuse if removed in previous test.

Disconnect the Cluster C-3 connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage at the (P82) Right Heated Seat Low Indicator Driver circuit at the Cluster C-3 connector.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Cluster in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**4. CHECK THE (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START)**

Disconnect the Right Heated Seat switch connector.

**Note: Check connectors - Clean and repair as necessary.**

Turn the ignition on.

Measure the voltage of the (F23) Fused Ignition Switch Output circuit at the Right Heated Seat Switch connector.

**Is the voltage above 10.0 volts ?**

**Yes** >> Go To 5

**No** >> Repair the (F23) Fused Ignition Switch Output circuit for an open.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B1223-RIGHT HEATED SEAT LO INDICATOR CONTROL CIRCUIT OPEN (CONTINUED)****5. CHECK THE (P82) RIGHT HEATED SEAT LO INDICATOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (P82) Right Heated Seat Lo Indicator Driver circuit.

**Was the resistance below 5.0 ohms?**

- Yes** >> Repair the (P82) Right Heated Seat Lo Indicator Driver circuit for a short to ground  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Go To 6

**6. CHECK THE (P82) RIGHT HEATED SEAT LO INDICATOR DRIVER CIRCUIT FOR AN OPEN**

Measure the resistance of the (P82) Right Heated Seat Lo Indicator Driver circuit between the Cluster C-3 connector and the Right Heated Seat Switch connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Right Heated Seat Switch.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (P82) Right Heated Seat Lo Indicator Driver circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

## B210D-BATTERY VOLTAGE LOW

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Engine running, during heated seat operation.
- **Set Condition:**This code is set immediately after the Heated Seat Module receives a low charging system voltage message over the CAN B Bus or detects voltage under 11.3 volts on the (A33) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLTAGE LOW (A33) FUSED B(+) CIRCUIT HEATED SEAT MODULE

## Diagnostic Test

### 1. CHECK PCM FOR CHARGING SYSTEM DTC

With the scan tool, read Powertrain Control Module DTC's.

**Are there any Charging System DTC's set in the Powertrain Control Module?**

- Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.
- No** >> Go To 2  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

### 2. VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

With the scan tool, read DTC's.

**Does the DTC B210D-BATTERY VOLTAGE LOW reset?**

- Yes** >> Go To 3
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B210D-BATTERY VOLTAGE LOW (CONTINUED)****3. CHECK THE VOLTAGE ON THE (A940) FUSED B(+) CIRCUIT**

Disconnect the Heated Seat Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Start the engine and let idle.

Measure the voltage on the (A33) Fused B(+) circuit at the HSM connector and compare to voltage at the vehicle battery.

**Is the voltage at the HSM connector the same as measured at the battery?**

- Yes** >> Replace the Heated Seat Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (A33) Fused B(+) circuit as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

## B210E-BATTERY VOLTAGE HIGH

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Engine running, during heated seat operation.
- **Set Condition:** This code is set immediately after the Heated Seat Module receives a high charging system voltage message over the CAN B Bus or detects voltage over 15 volts on the (A33) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH (A33) FUSED B(+) CIRCUIT HEATED SEAT MODULE

## Diagnostic Test

### 1. CHECK PCM FOR CHARGING SYSTEM DTC

With the scan tool, read Powertrain Control Module DTC's.

**Are there any Charging System DTC's set in the Powertrain Control Module?**

**Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.

**No** >> Go To 2

### 2. VERIFY THAT DTC B210E-BATTERY VOLTAGE HIGH IS ACTIVE

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

Attempt to operate the heated seats.

With the scan tool, read DTC's.

**Does the DTC B210E-BATTERY VOLTAGE HIGH reset?**

**Yes** >> Go To 3

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)****3. CHECK THE VOLTAGE ON THE (A940) FUSED B(+) CIRCUIT**

Disconnect the Heated Seat Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Start the engine and let idle.

Measure the voltage on the (A33) Fused B(+) circuit at the HSM connector and compare to voltage at the vehicles battery.

**Is the voltage at the HSM connector the same as measured at the battery?**

- Yes** >> Replace the Heated Seat Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (A33) Fused B(+) circuit as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

B221A-HEATED SEAT MODULE INTERNAL

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**Ignition on.
- **Set Condition:**This code is set immediately if the Heated Seat Module internal self test fails.

Possible Causes
HEATED SEAT MODULE

Diagnostic Test

1. VERIFY THAT DTC B221A-HEATED SEAT MODULE INTERNAL IS ACTIVE

With the scan tool, record and erase DTC's  
Cycle the ignition switch off then back on.  
With the scan tool, read DTC's.

- Does the DTC B221A-HEATED SEAT MODULE INTERNAL reset?**
- Yes** >> Replace the Heated Seat Module.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**U0019–CAN B BUS – HSM (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D54) CAN B BUS (–) CIRCUIT OPEN (D55) CAN B BUS (+) CIRCUIT OPEN HEATED SEAT MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display U0019 CAN B BUS CIRCUIT?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. CHECK FRONT CONTROL MODULE DTC's**

With the scan tool, read Front Control Module DTC's

**Does the scan tool display any CAN B BUS DTC's – ACTIVE?**

**Yes** >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

**No** >> Go to 3

**U0019-CAN B BUS – HSM (CONTINUED)****3. CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Heated Seat Module connector.

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the Can B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**4. CAN B BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 connector and the Heated Seat Module connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the Heated Seat Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the Can B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

### **U0019-CAN B BUS – HSM (CONTINUED)**

### **U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

## HEATED SEATS - SERVICE INFORMATION

### DESCRIPTION

**WARNING:** The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the front seat passenger if the vehicle is involved in an accident. The following requirements must be strictly adhered to:

- Do not modify the front passenger seat assembly or components in any way.
- Do not modify the front seat center console or center position seat in any way.
- Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.
- Do not replace the seat trim cover with an aftermarket trim cover.
- Do not add a secondary trim cover other than those approved by DaimlerChrysler/Mopar.
- At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by DaimlerChrysler/Mopar.

Vehicles with the heated seat option can be visually identified by the two heated seat switches (1) located in the center stack of the instrument panel. The heated seat system allows the driver and front seat passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system for this vehicle includes the following major components, which are described in further detail later in this section:

- **Heated Seat Elements** - Four heated seat elements are used per vehicle. Two heated seat elements are integral to each seat, one in the seat back and the other in the seat cushion.
- **Heated Seat Module** - One heated seat module is used per vehicle. The Heated Seat Module is mounted under the right front seat. This module contains the control logic and software for the front heated seat system. The module communicates on the Controller Area Network (CAN) data bus.
- **Heated Seat Switches** - Two heated seat switches are used per vehicle, one for each heated seat. Both switches are mounted in the instrument panel center stack.
- **Instrument Cluster (CCN)** - A Cab Compartment Node (CCN) is part of the instrument cluster on this vehicle. The CCN utilizes integrated software and information carried on the CAN data bus. The CCN serves as the link between the heated seat switches and the heated seat module.

## OPERATION

The heated seat system operates on battery current received through a fuse in the Integrated Power Module (IPM). Fused ignition switch output (run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On position. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except On.

A Heated Seat Module is used to control the heated seat system. The module responds to heated seat switch messages and ignition switch status inputs by controlling the 12v output to the front seat heating elements through integral solid-state relays.

When either of the heated seat switches are depressed a resistance signal is sent to the Cab Compartment Node (CCN) or instrument cluster. The CCN then sends a message via the Controller Area Network (CAN) data bus to the heated seat module, signaling the module to energize the heating element for the selected seat. Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The heated seat module energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after two hours of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting also turns off automatically after two hours.

The module will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

## DIAGNOSIS AND TESTING

### HEATED SEAT SYSTEM

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

**Note:** Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.1v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

## HEATER-CUSHION PAD

### DESCRIPTION

Vehicles equipped with the optional heated seat system have two, carbon fiber heated seat elements, located in each front seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat element consists of multiple heating circuits operating in parallel throughout the carbon fiber element. The heated seat elements are captured between the leather trim cover and the seat cushion assembly. If a malfunction occurs in one or more of the individual carbon fiber circuits, the others will continue to provide heat.

The heated seat elements cannot be repaired. If found to be damaged or inoperative, a new heating element assembly must be installed.

### OPERATION

One end of the heated seat element is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element by the heated seat module. The heated seat module will energize the heated seat element when the heated seat switch is depressed in the Low or High position.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperses some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

## DIAGNOSIS AND TESTING

### HEATED SEAT ELEMENT

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

The wire harness connectors (2&3) for the heating elements are located under the seat (1).

**Note:** When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.

1. Locate and disconnect the seat electrical connector.
2. Check the resistance between the circuit leading in and out of the suspect heated seat element. The resistance should be between 3.8 - 4.8 ohms for a seat cushion element and 4.3 - 5.4 ohms for a seat back element. If OK, (Refer to 8 - ELECTRICAL/ HEATED SEATS - DIAGNOSIS AND TESTING). If not OK, replace the inoperative heated seat element.

## REMOVAL

**Note:** Do not remove the factory installed heating elements (3) from the seat or seat back cushions. The original element is permanently attached and cannot be removed without permanent damage. The replacement heating element is designed to be applied directly on top of the inoperative factory installed heating element.

1. Disconnect and isolate the battery negative cable.
2. Remove the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - REMOVAL).
3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Locate the wires leading from the inoperative heating element and cut them off flush with the edge of the original heating element.

## INSTALLATION

1. Peel off the adhesive backing on the back of the replacement heating element (2) and stick directly on top of the factory installed heating element (1).

**CAUTION:** During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

2. Connect the new heating element electrical connectors (3&4).
3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion, (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION) or seat back trim cover, (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - INSTALLATION).

**Note:** Make certain the seat wire harness is correctly routed through the seat and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover.

## MODULE-HEATED SEATS

### DESCRIPTION

The heated seat module (1) is located under the right front seat. It has a single electrical connector (3) and four locking tabs (2) that secure it to the floor cross member. The module can be accessed through the separation between the front and rear carpet assemblies.

The heated seat module is a microprocessor designed to use Controller Area Network (CAN) data bus messages from the instrument cluster also known as the Cabin Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

### OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Controller Area Network (CAN) data bus messages and standard hardwired 12volt power and ground. In response to the CAN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch CAN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38C (100.4°F), and the High heat set point is about 42C (107.6°F).

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate diagnostic trouble code (DTC).

## DIAGNOSIS AND TESTING

### HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

**Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.**

**Note:** Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.0v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the right front seat from the vehicle, (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
3. Reposition the front carpet assembly aside to gain access to the heated seat module (1).
4. Disconnect the wire harness connector (3) from the heated seat module (1).
5. Unsnap the heated seat module retaining clips (2) from the floor crossmember.
6. Remove the heated seat module (1) from the vehicle.

## INSTALLATION

1. Install the heated seat module (3) in the vehicle.
2. Position the retaining clips (2) with the retaining holes (1) in the floor cross member. Firmly apply even pressure to the module (3) until all four retaining clips (2) snap into place.

3. Connect the wire harness connector (3) to the heated seat module (1).
4. Reposition the front carpet assembly to the original position.
5. Install the right, front seat, (Refer to 23 - BODY/ SEATS/SEAT - INSTALLATION).
6. Connect the battery negative cable.
7. Check for proper heated seat system operation.

## SWITCH-HEATED SEAT

### DESCRIPTION

The heated seat switches (1) are both mounted in the instrument panel. The two switches are snapped into mounting holes in the instrument panel center bezel. The two heated seat switches are identical in appearance and construction.

Each heated seat switch provides a resistor-multiplexed signal to the Cab Compartment Node (CCN). Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The LED indicator lamps in each heated seat switch cannot be repaired. If the LED lamps are inoperative or damaged, or the switch is inoperative or damaged the individual heated seat switch assembly must be replaced.

### OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch provides a hard-wired resistor multiplexed signal to the Cabin Compartment Node (CCN). The CCN is responsible for supplying the Controller Area Network (CAN) data bus message to the heated seat module, signaling the module to power the heated seat element of the selected seat and maintain the temperature setting.

If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the CCN will go through the process again to change the temperature setting. If a heated seat switch is depressed a second time to the same position as the currently selected state, the CCN and heated seat module interpret the second input as a request to turn the seat heater OFF. The CCN will then signal the heated seat module to turn the heated seat elements for that seat off.

## DIAGNOSIS AND TESTING

### HEATED SEAT SWITCH

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

**Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.**

**Note: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.0v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.**

Before any testing of the power seat system is attempted, the battery should be fully-charged.

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the ash receiver (1) from the instrument panel, (Refer to 23 - BODY/INSTRUMENT PANEL/ASH RECEIVER - REMOVAL).
3. Disconnect the heated seat switch connector (2) from the heated seat switch (3).
4. From the back of the ash receiver (1), gently pry the switch (3) free and push the heated seat switch out through the front of the bezel.

### INSTALLATION

1. From the front of the ash receiver (1), gently push the heated seat switch (3) in through the front of the bezel.
2. Connect the heated seat switch connector (2) onto the heated seat switch (3).
3. Install the ash receiver (1) into the instrument panel, (Refer to 23 - BODY/INSTRUMENT PANEL/ASH RECEIVER - INSTALLATION).
4. Connect the battery negative cable.
5. Verify heated seat system operation.

HORN - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

# B2336-HORN CONTROL CIRCUIT LOW – FCM

**B2336–HORN CONTROL CIRCUIT LOW – FCM (CONTINUED)**

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Front Control Module detects a shorted low condition on the Horn Relay Control circuit this DTC will set.

Possible Causes
HORN FUSE (A905) FUSED B(+) OPEN RELAY POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTC's.

**Does the scan tool display B2336 – HORN CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. HORN FUSE**

Using a 12-volt test light connected to ground, check the Horn fuse.

**Does the test light illuminate and was the fuse OK?**

**No** >> Replace the horn fuse if open and check for a short to ground on the Horn Relay Output circuit or correct the open B(+) circuit to the fuse.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go To 3

**B2336-HORN CONTROL CIRCUIT LOW – FCM (CONTINUED)****3. OPEN (A905) FUSED B(+) TO RELAY**

Remove the Horn Relay from the PDC.

Using a 12-volt test light connected to ground, check the Fused B(+) circuit at the relay connector.

**Does the test light illuminate?**

- No** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- Yes** >> Go To 4

**4. HORN RELAY**

Install a known good relay in place of the Horn Relay.

With the scan tool erase DTC's

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTC's.

**Does the scan tool display B2336 – HORN CONTROL CIRCUIT LOW?**

- No** >> Replace the original Horn Relay.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- Yes** >> Go To 5

**5. (X4) HORN RELAY CONTROL SHORTED**

Remove the Horn Relay.

Disconnect the Front Control Module from the PDC 49 – way connector.

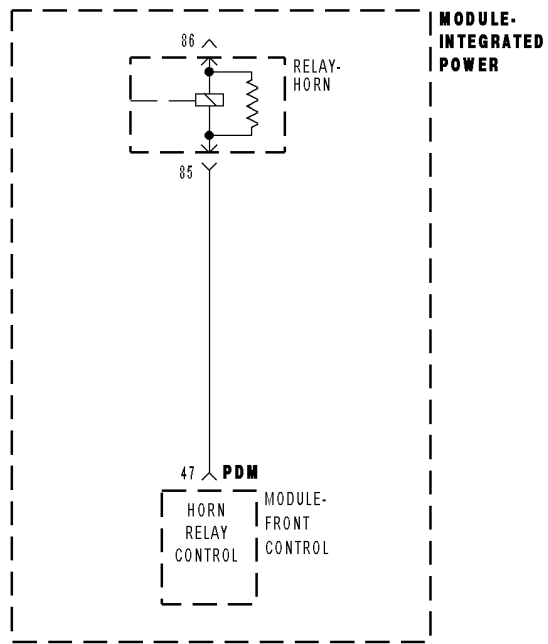

Measure the resistance between ground and the (X4) Horn Relay Control circuit at the relay.

**Is the resistance below 1000.0 ohms?**

- Yes** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Replace the Front Control Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

# **B2337-HORN CONTROL CIRCUIT HIGH – FCM**

**B2337-HORN CONTROL CIRCUIT HIGH – FCM (CONTINUED)**

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN SYSTEM - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Front Control Module detects excessive current on the Horn Relay Control circuit.

Possible Causes
HORN RELAY POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTC's.

**Does the scan tool display B2337 – HORN CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**2. HORN RELAY**

Turn the ignition off.

Install a known good relay in place of the Horn Relay.

With the scan tool erase DTC's

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTC's.

**Does the scan tool display B2337 – HORN CONTROL CIRCUIT HIGH?**

**No** >> Replace the original Horn Relay.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go To 3

**B2337-HORN CONTROL CIRCUIT HIGH – FCM (CONTINUED)****3. SHORTED POWER DISTRIBUTION CENTER**

Remove the Horn Relay.

Disconnect the Front Control Module from the PDC 49 – way connector.

Turn the ignition on.

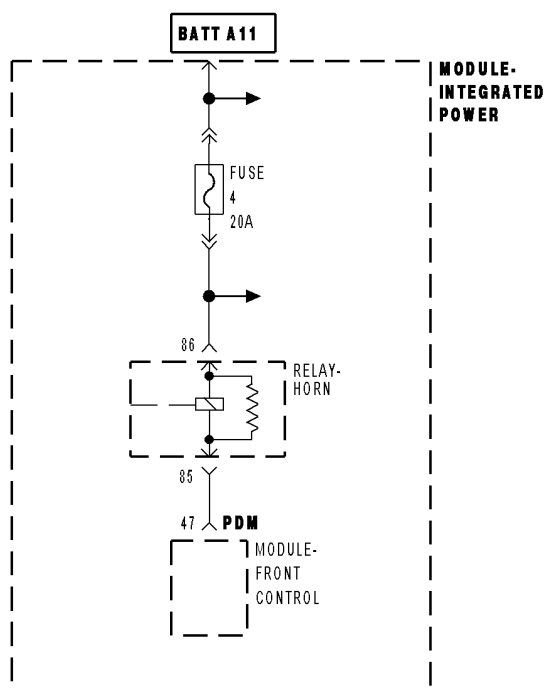

Measure the voltage between (X4) Horn Relay Control circuit and ground.

**Is there any voltage present?**

- Yes** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Front Control Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B2338—HORN CONTROL CIRCUIT OPEN – FCM**

**B2338–HORN CONTROL CIRCUIT OPEN – FCM (CONTINUED)**

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN SYSTEM - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Front Control Module does not detect voltage on the Horn Relay Control circuit.

Possible Causes
HORN FUSE B(+) OPEN RELAY POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTC's.

**Does the scan tool display B2338 – HORN CONTROL CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. HORN FUSE**

Using a 12-volt test light connected to ground, check the Horn fuse.

**Does the test light illuminate and was the fuse OK?**

**No** >> Replace the horn fuse if open and check for a short to ground on the Horn Relay Output circuit or correct the open B(+) circuit to the fuse.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go To 3

**B2338-HORN CONTROL CIRCUIT OPEN – FCM (CONTINUED)****3. OPEN FUSED B(+) TO RELAY**

Remove the Horn Relay from the PDC.

Using a 12-volt test light connected to ground, check the Fused B(+) circuit at the relay connector.

**Does the test light illuminate?**

**No** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go To 4

**4. HORN RELAY**

Install a known good relay in place of the Horn Relay.

With the scan tool erase DTC's

Operate the Horn Switch several times.

Cycle the ignition from on to off 3 times and leave on.

With the scan tool, read DTC's.

**Does the scan tool display B2338 – HORN CONTROL CIRCUIT OPEN?**

**No** >> Replace the original Horn Relay.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go To 5

**B2338-HORN CONTROL CIRCUIT OPEN – FCM (CONTINUED)****5. (X4)HORN RELAY CONTROL OPEN**

Measure the resistance of the (X4)Horn Relay Control circuit from the relay connector to FCM connector.

**Is the resistance below 3.0 ohms?**

- Yes** >> Replace the Front Control Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

REMOVAL	14		

HORN SYSTEM- SERVICE INFORMATION

DESCRIPTION

The dual-note horn system features two electromagnetic horn units. The horn system includes the following major components:

- **Horn** - The two horns are located behind the grille below a trim cover.
- **Horn Switch** - The horn switch is molded into the driver airbag trim cover.

OPERATION

The horn system operates on battery current received through a fuse in the Integrated Power Module (IPM). The horn system circuit is designed so that the system will remain operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING - HORN SYSTEM

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn fuse from the Integrated Power Module (IPM).

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## HORN

### REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove cover above horn.
3. Disconnect electrical harness connector.
4. Remove mounting fastener and remove horn.

### INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Position horn. Install and tighten mounting fasteners.
2. Connect electrical harness connector.
3. Install cover above horn.
4. Connect battery negative cable.

## SWITCH-HORN

### DESCRIPTION

The horn switch is molded into the driver airbag cover. The horn switch can not be serviced separately. (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).

### DIAGNOSIS AND TESTING

#### HORN SWITCH

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

For complete circuit diagrams, refer to the appropriate wiring information.

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## IGNITION SYSTEMS - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

## B2100-IGNITION RUN/START INPUT CIRCUIT PERFORMANCE

**B2100-IGNITION RUN/START INPUT CIRCUIT PERFORMANCE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Anytime the ignition input is compared against the CAN B Bus ignition status message.
- **Set Condition:**  
The Front Control Module will set this DTC if the CAN bus message and the hardwired ignition circuit do not match.

Possible Causes
ACTIVE IGNITION RELATED FCM DTCS (A106) FUSED B+ CIRCUIT OPEN (F20) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN REAR PDC FUSE IGNITION SWITCH FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

**Note:** If B2104 or B2105 are active, perform those tests first before proceeding.

**Note:** Check the rear PDC fuses. An open fuse can cause this DTC to set. If open refer to the wiring diagrams to help isolate a possible shorted circuit.

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**2. CHECK THE (F20) FUSED IGNITION SWITCH OUTPUT CIRCUIT FOR AN OPEN**

Turn the ignition off.

Remove the fused ignition switch output fuse from the rear PDC.

Turn the ignition on.

Measure the voltage of the (F20) Fused Ignition Switch Output circuit (input side of fuse).

**Is the voltage above 10.0 volts?**

**Yes** >> Go To 3

**No** >> Go To 4

**B2100-IGNITION RUN/START INPUT CIRCUIT PERFORMANCE (CONTINUED)****3. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN**

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

**Note: Install the fuse in the rear PDC.**

Turn the ignition on.

Measure the voltage of the (F202) Fused Ignition Switch Output circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (F202) Ignition Switch Output circuit for an open between the rear PDC and the front PDM.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (A106) FUSED B+ CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Ignition Switch harness connector.

Measure the voltage of the (A106) Fused B+ circuit.

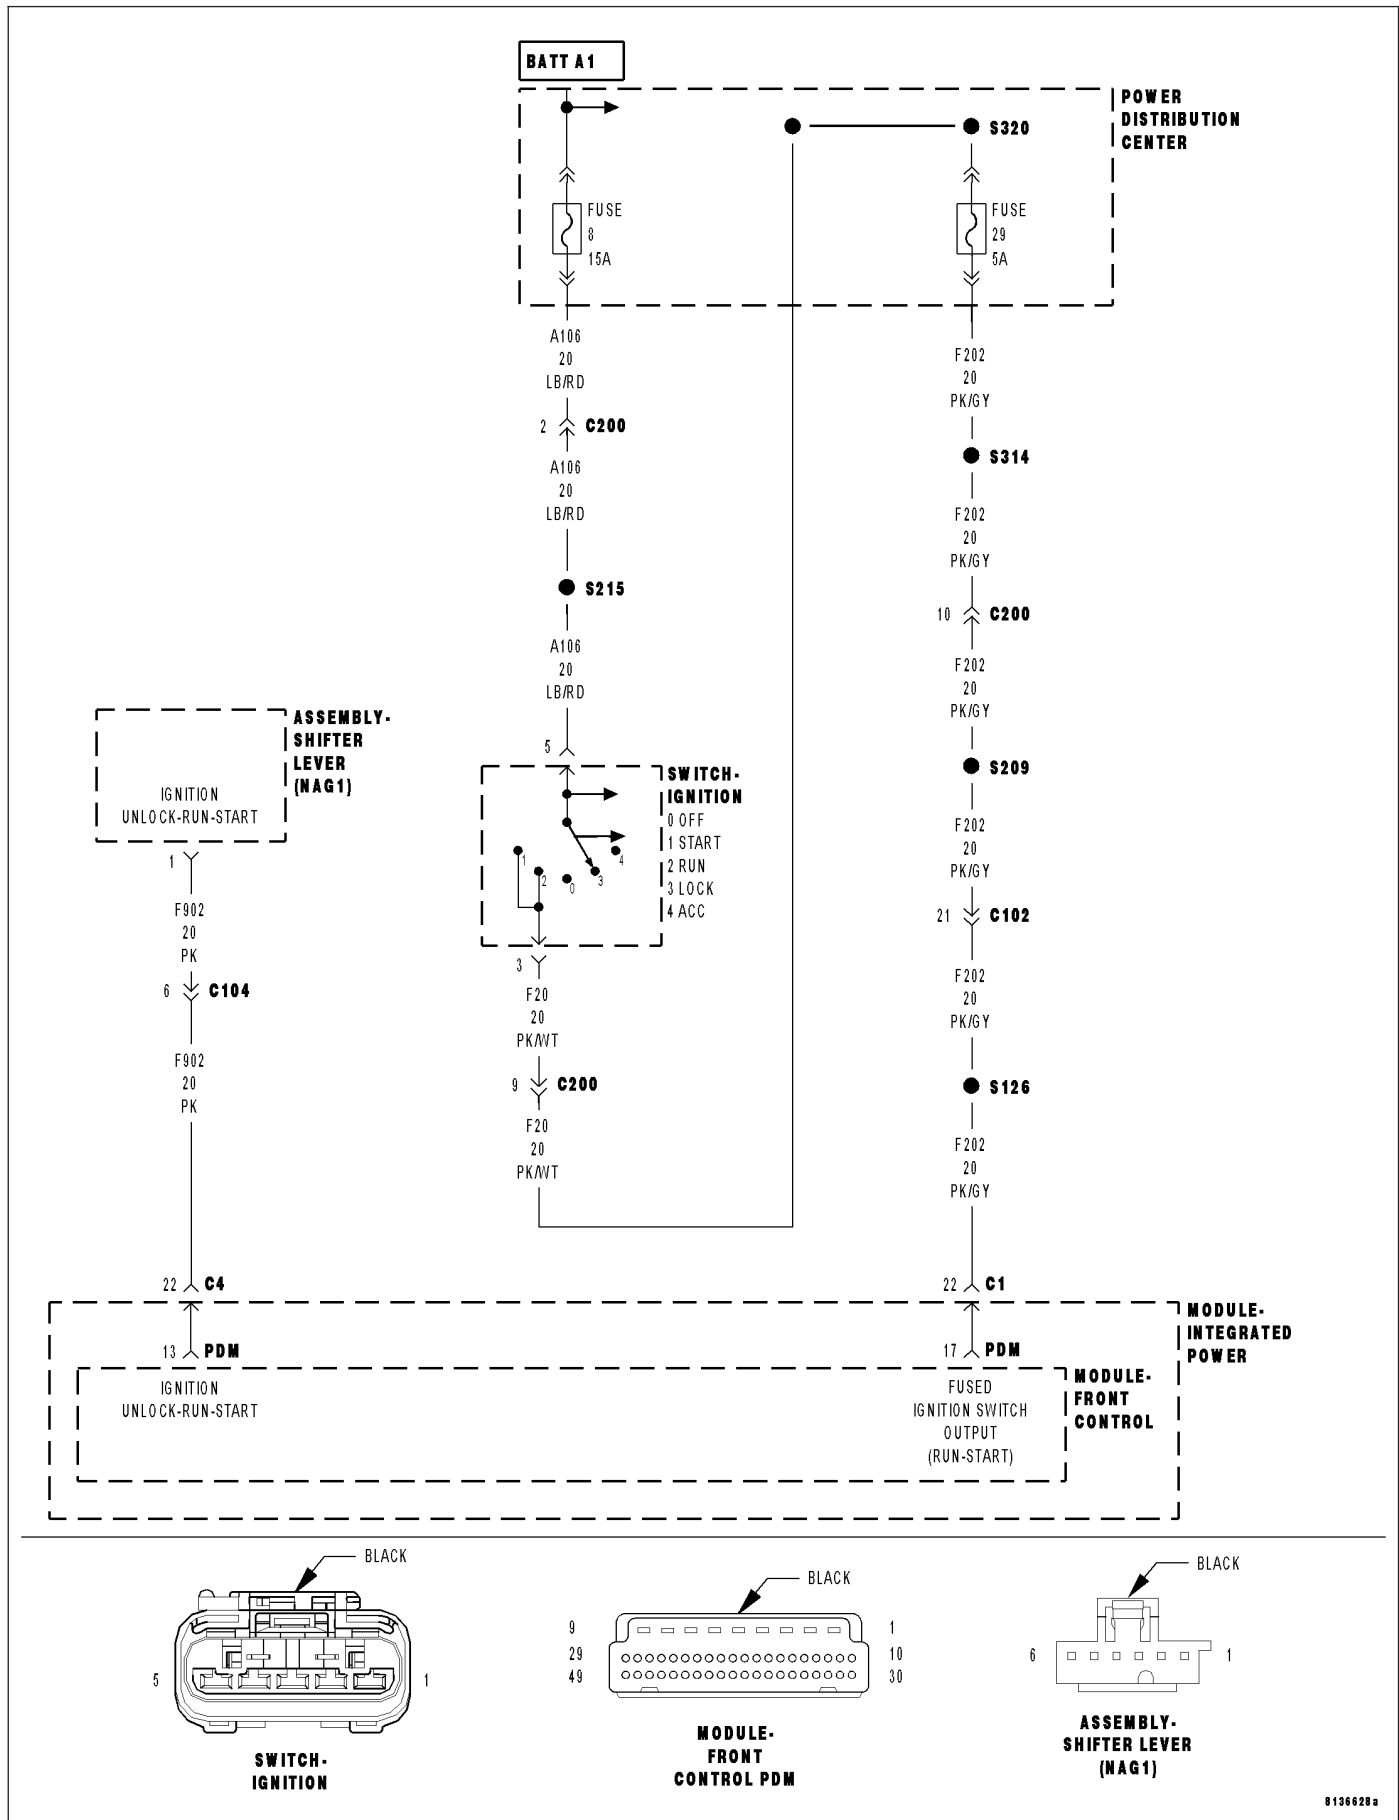

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (F20) Fused Ignition Switch Output circuit for an open between the Ignition Switch and the rear PDC. If ok, replace the Ignition Switch in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (A106) Fused B+ circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

# B2104-IGNITION UNLOCK RUN/START CONTROL CIRCUIT LOW

**B2104-IGNITION UNLOCK RUN/START CONTROL CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will set this DTC within 500ms if the ignition unlock run/start circuit voltage is less than the expected value.

Possible Causes
(F902) IGNITION UNLOCK RUN START CIRCUIT SHORTED TO GROUND SHIFTER LEVER ASSEMBLY FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**2. SHIFTER LEVER ASSEMBLY**

With the scan tool, erase the FCM DTC's.

Turn the ignition off.

Disconnect the Shifter Lever Assembly harness connector.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the Shifter Lever Assembly in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B2104-IGNITION UNLOCK RUN/START CONTROL CIRCUIT LOW (CONTINUED)****3. (F902) IGNITION UNLOCK RUN START CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

Measure the resistance between ground and the (F902) Ignition Unlock Run Start circuit.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (F902) Ignition Unlock Run Start circuit for a short to ground.

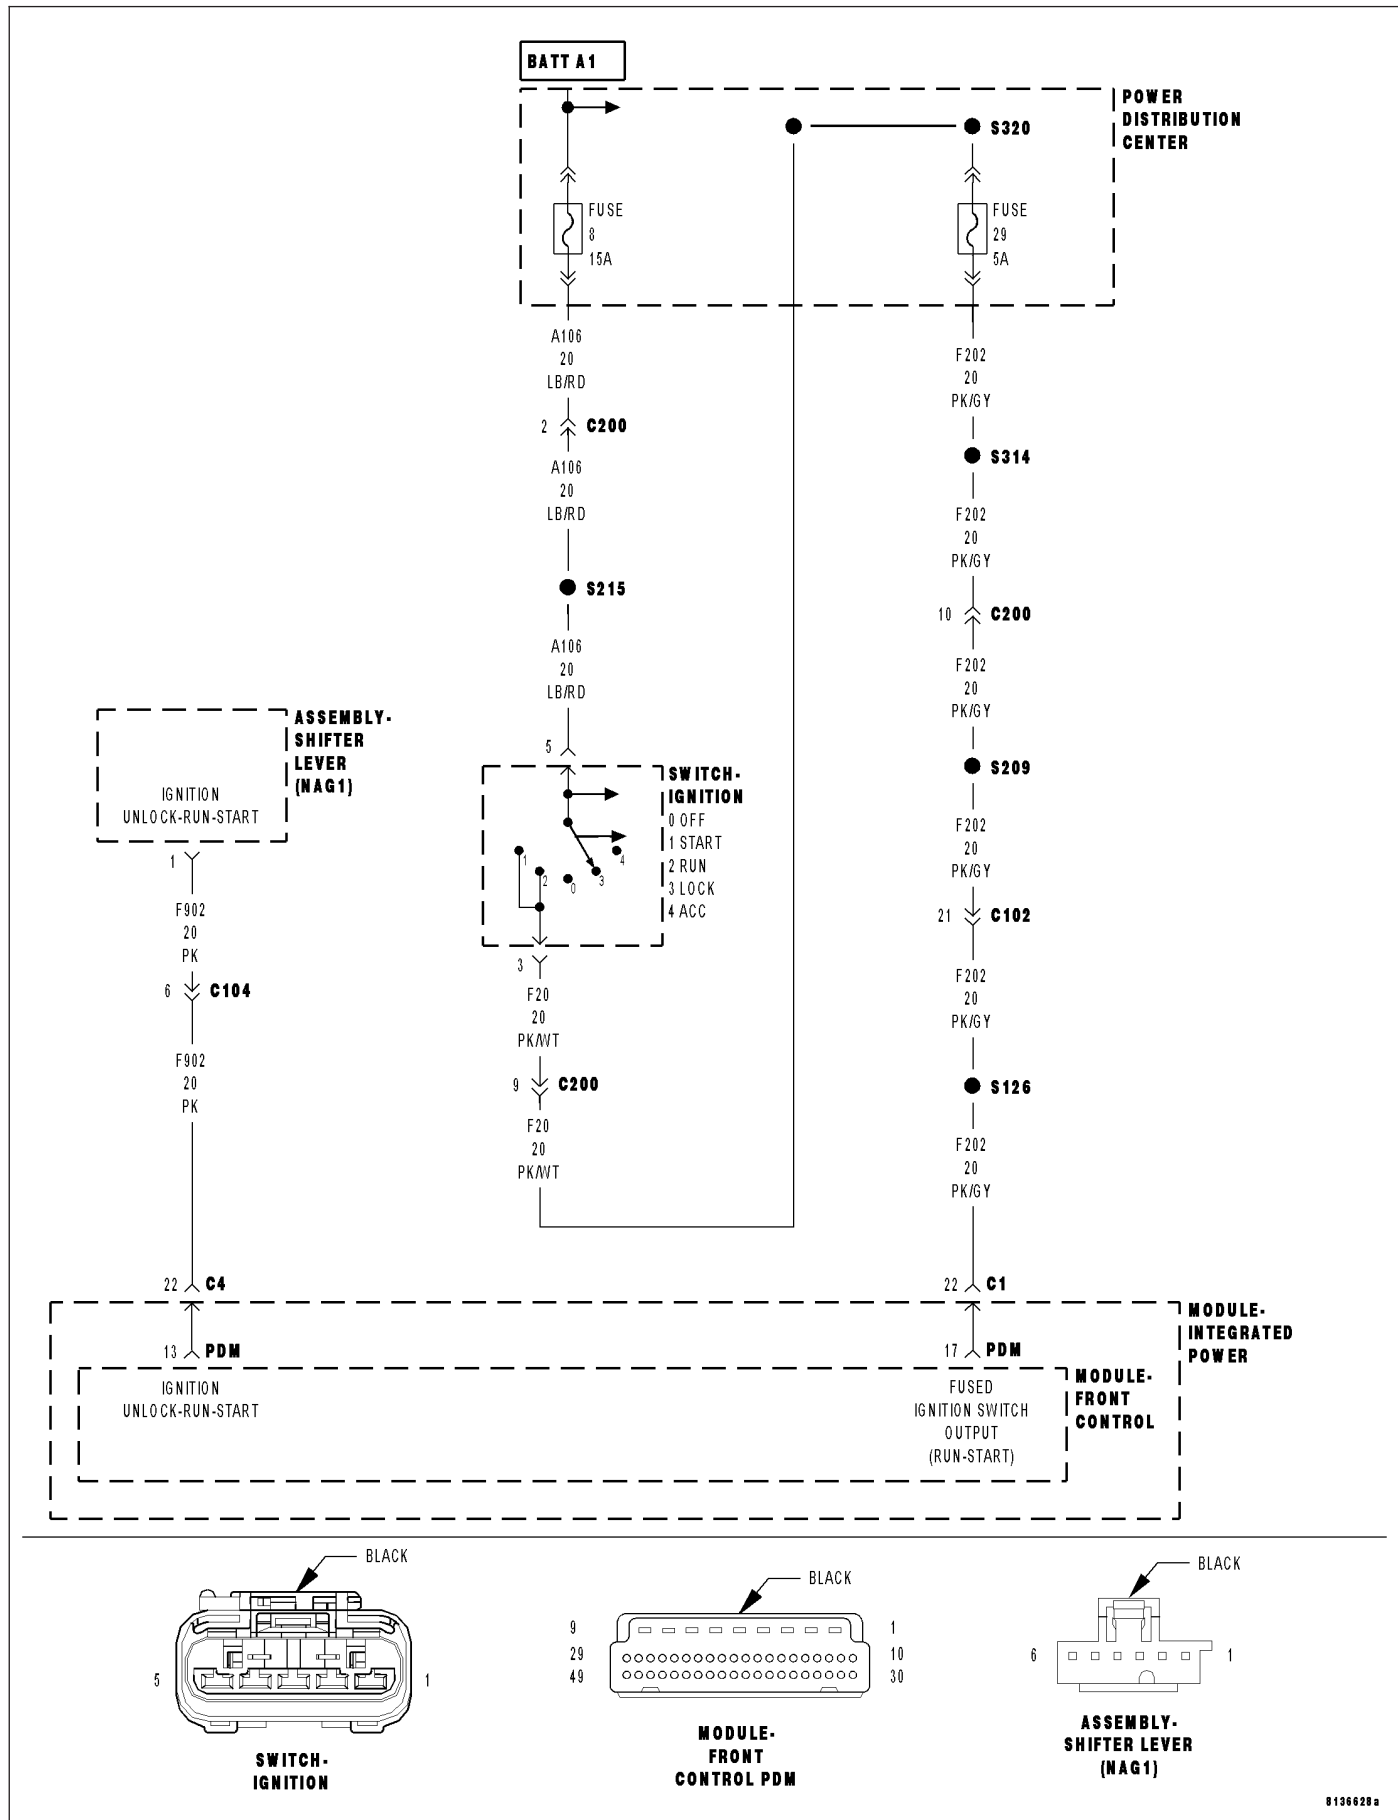

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B2105-IGNITION UNLOCK RUN/START CONTROL CIRCUIT HIGH**

**B2105-IGNITION UNLOCK RUN/START CONTROL CIRCUIT HIGH (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on or off and with the FCM awake.
- **Set Condition:**  
The Front Control Module will set this DTC within 2 seconds if the ignition unlock run/start circuit voltage is not what the expected value should be.

Possible Causes
(F902) IGNITION UNLOCK RUN START CIRCUIT OPEN
(F902) IGNITION UNLOCK RUN START CIRCUIT SHORTED TO VOLTAGE
SHIFTER LEVER ASSEMBLY
FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds then turn the ignition off.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**2. (F902) IGNITION UNLOCK RUN START CIRCUIT SHORTED TO VOLTAGE**

Disconnect the Shifter Lever Assembly harness connector.

Cycle the ignition switch from off to on then back to off.

**Note: The ignition switch must be in the off position when performing the following step.**

Using a 12-volt test light connected to ground, check the (F902) Ignition Unlock Run Start circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (F902) Ignition Unlock Run Start circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**B2105-IGNITION UNLOCK RUN/START CONTROL CIRCUIT HIGH (CONTINUED)****3. SHIFTER LEVER ASSEMBLY**

Turn the ignition on.

With the test light still connected from the previous step, check the (F902) Ignition Unlock Run Start circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Shifter Lever Assembly in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 4

**4. (F902) IGNITION UNLOCK RUN START CIRCUIT OPEN**

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

Measure the resistance of the (F902) Ignition Unlock Run Start circuit between the Shifter Lever Assembly and the FCM-PDM connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Repair the (F902) Ignition Unlock Run Start circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

# B211E-IGNITION RUN/ACC/PAD CONTROL CIRCUIT LOW

**B211E-IGNITION RUN/ACC/PAD CONTROL CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will set this DTC within 500ms if the (P307) Accessory Delay Relay Control circuit is open or shorted to ground.

Possible Causes
(P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN (P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO GROUND ACCESSORY DELAY RELAY FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. ACCESSORY DELAY RELAY**

Turn the ignition off.

Install a substitute relay in place of the original Accessory Delay Relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the original Accessory Delay Relay.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B211E-IGNITION RUN/ACC/PAD CONTROL CIRCUIT LOW (CONTINUED)****3. (P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN**

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

Remove the Accessory Delay Relay from the Rear Power Distribution Module.

Measure the resistance of the Accessory Delay Relay Control circuit from the Front Control Module PDM connector to the Relay connector.

**Is the resistance below 10.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the Accessory Delay Relay Control circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO GROUND**

Measure the resistance between ground and the (P307) Accessory Delay Relay Control circuit at the relay cavity (85).

**Is the resistance below 100.0 ohms?**

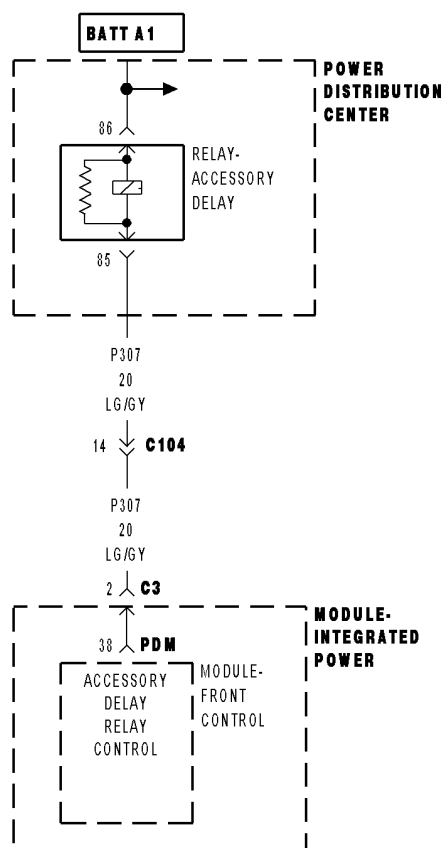

**Yes** >> Repair the (P307) Accessory Delay Relay Control circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B211F-IGNITION RUN/ACC/PAD CONTROL CIRCUIT HIGH**

**B211F-IGNITION RUN/ACC/PAD CONTROL CIRCUIT HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will set this DTC within 500ms if the (P307) Ignition Run/Acc/Pad Relay Control circuit is shorted to voltage.

Possible Causes
(P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE ACCESSORY DELAY RELAY FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. ACCESSORY DELAY RELAY**

Turn the ignition off.

Install a substitute relay in place of the original Accessory Delay Relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the original relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B211F-IGNITION RUN/ACC/PAD CONTROL CIRCUIT HIGH (CONTINUED)****3. (P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

Remove the Accessory Delay Relay from the Rear Power Distribution Module.

Turn the ignition on.

Measure the voltage of the (P307) Accessory Delay Relay Control circuit at the relay connector (cavity 85).

**Is there any voltage present?**

**Yes** >> Repair the (P307) Accessory Delay Relay Control circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

# B2120-IGNITION RUN/ACC/PAD CONTROL CIRCUIT OPEN

**B2120-IGNITION RUN/ACC/PAD CONTROL CIRCUIT OPEN (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will set this DTC within 500ms if the (P307) Ignition Accessory Delay Relay Control circuit is open.

Possible Causes
(P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN ACCESSORY DELAY RELAY FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. ACCESSORY DELAY RELAY**

Turn the ignition off.

Install a substitute relay in place of the original Accessory Delay Relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the original Accessory Delay Relay.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B2120-IGNITION RUN/ACC/PAD CONTROL CIRCUIT OPEN (CONTINUED)****3. (P307) ACCESSORY DELAY RELAY CONTROL CIRCUIT OPEN**

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

Remove the Accessory delay Relay from the Rear Power Distribution Module.

Measure the resistance of the Accessory Delay Relay Control circuit from the FCM-PDM connector to the relay connector.

**Is the resistance below 10.0 ohms?**

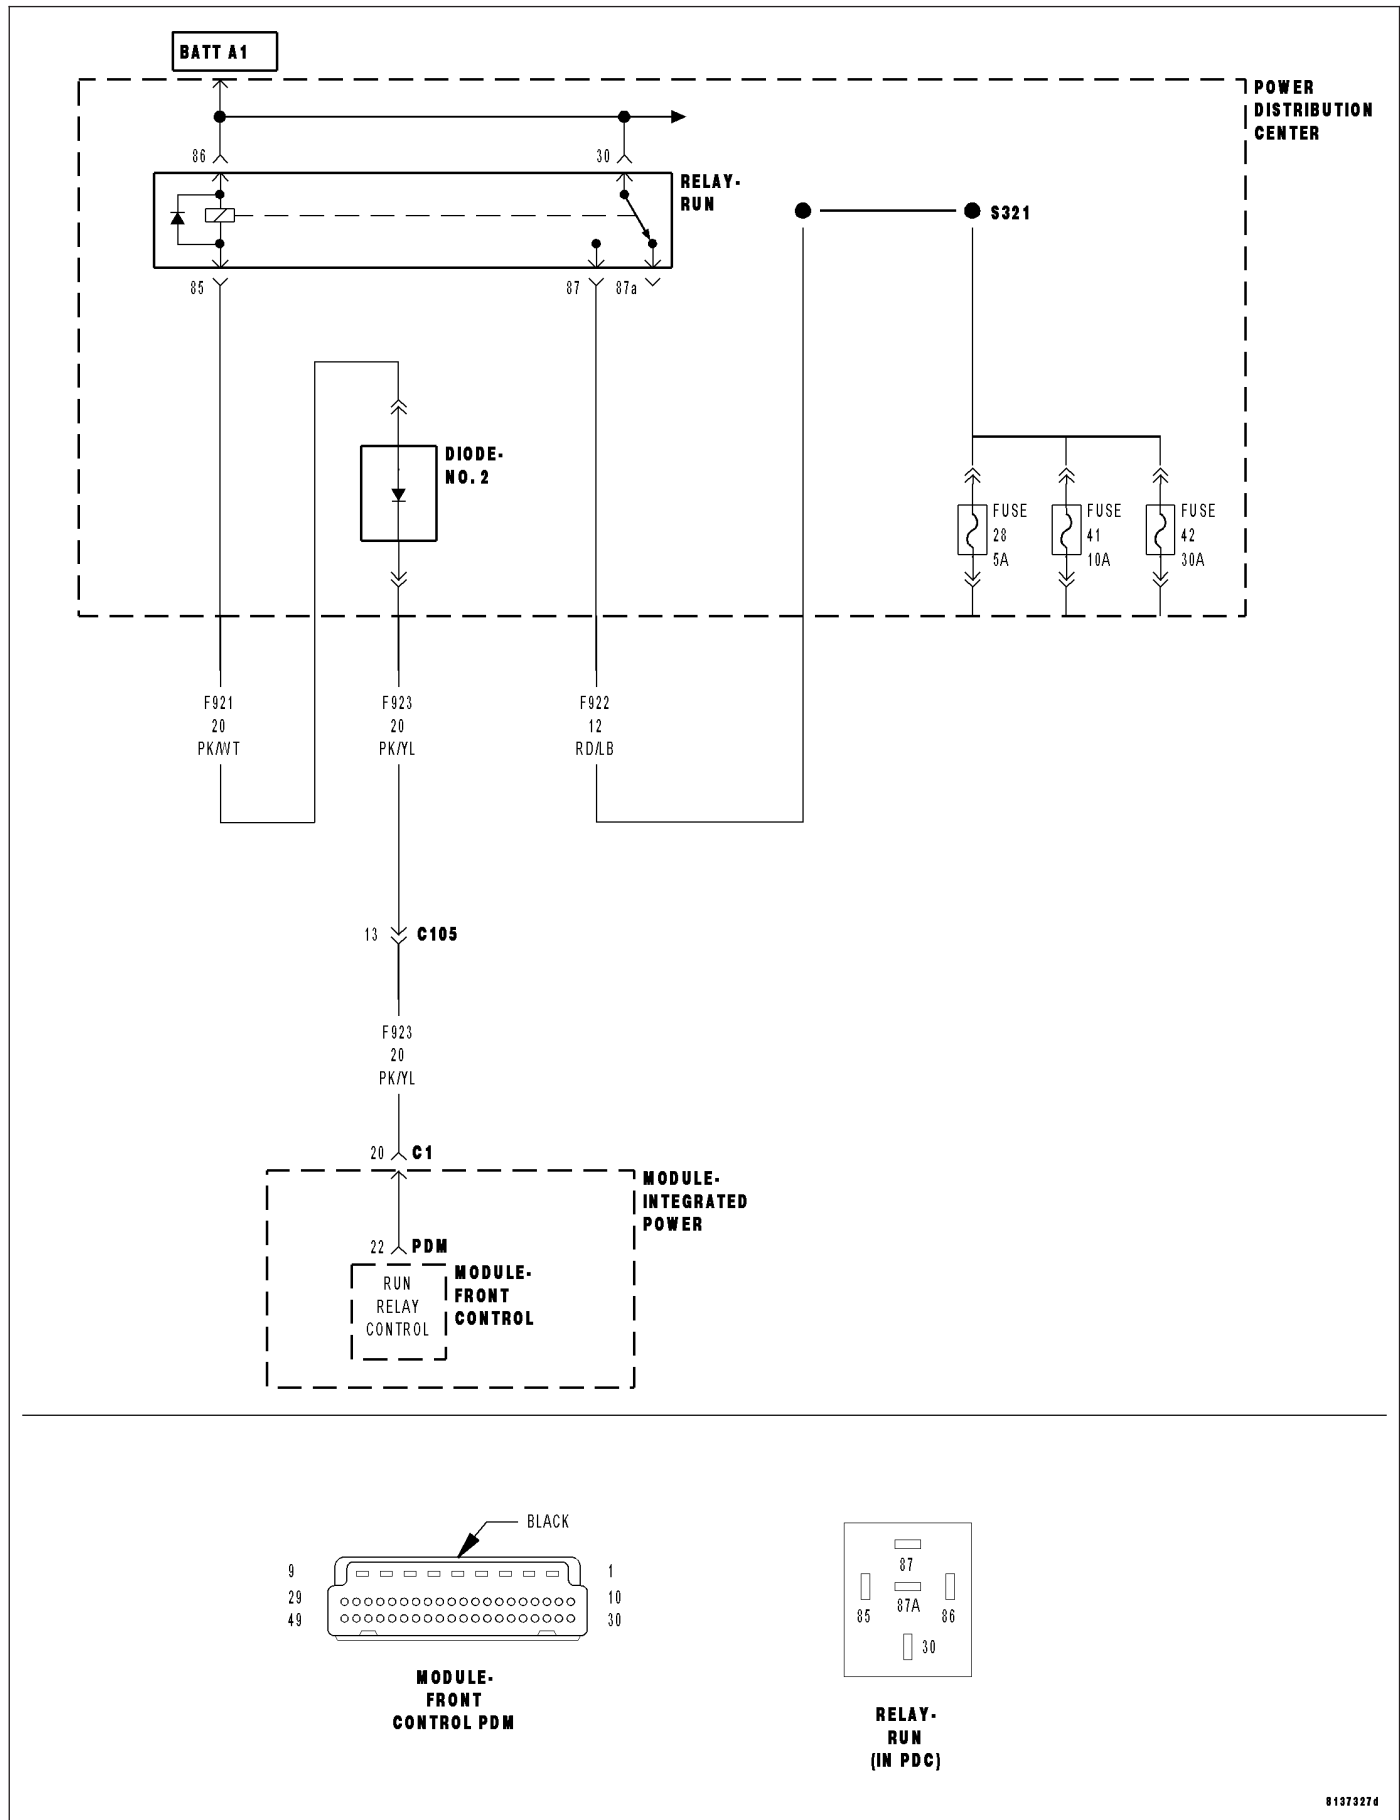

**No** >> Repair the Accessory Delay Relay Control circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If OK, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B2122-IGNITION RUN CONTROL CIRCUIT LOW**

**B2122-IGNITION RUN CONTROL CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will set this DTC within 500ms if the (F921) or (F923) run relay control circuit voltage is open or shorted to ground.

Possible Causes
(F921) or (F923) RUN RELAY CONTROL CIRCUIT OPEN OR SHORTED TO GROUND RUN RELAY FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. RUN RELAY**

Turn the ignition off.

Install a substitute run relay in place of the original run relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the original run relay.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B2122-IGNITION RUN CONTROL CIRCUIT LOW (CONTINUED)****3. (F921) or (F923) RUN RELAY CONTROL CIRCUIT OPEN**

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

Remove the run relay from the Rear Power Distribution Module.

**Note: This circuit contains a diode. When checking resistance of this circuit the red ohmmeter lead must be connected to the run relay cavity (85) and the black ohmmeter lead must be connected to the FCM-PDM connector.**

Measure the resistance of the Run Relay Control circuit.

**Is the resistance below 10.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the Run Relay Control circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (F921) RUN RELAY CONTROL CIRCUIT SHORTED TO GROUND**

**Note: This circuit contains a diode. When checking for a short to ground you must check both sides of the diode.**

Measure the resistance between ground and the (F921) Run Relay Control circuit at the run relay cavity (85).

**Is the resistance below 10.0 ohms?**

**Yes** >> Repair the (F921) Run Relay Control circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**B2122-IGNITION RUN CONTROL CIRCUIT LOW (CONTINUED)****5. (F923) RUN RELAY CONTROL CIRCUIT SHORTED TO GROUND**

**Note:** This circuit contains a diode. When checking for a short to ground you must check both sides of the diode.

Measure the resistance between ground and the (F923) Run Relay Control circuit at the FCM-PDM connector.

**Is the resistance below 10.0 ohms?**

**Yes** >> Repair the (F923) Run Relay Control circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B2123-IGNITION RUN CONTROL CIRCUIT HIGH**

**B2123-IGNITION RUN CONTROL CIRCUIT HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will set this DTC within 500ms if the (F921) or (F923) run relay control circuit voltage is shorted to voltage.

Possible Causes
(F921) or (F923) RUN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE RUN RELAY FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. RUN RELAY**

Turn the ignition off.

Install a substitute run relay in place of the original run relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the original run relay.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B2123-IGNITION RUN CONTROL CIRCUIT HIGH (CONTINUED)****3. (F921) RUN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE**

**Note:** This circuit contains a diode. When checking for a short to voltage you must check both sides of the diode.

Turn the ignition off.

Remove the FCM from the Power Distribution Module.

Remove the run relay from the Rear Power Distribution Module.

Turn the ignition on.

Measure the voltage of the (F921) Run Relay Control circuit at the run relay cavity (85).

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (F921) Run Relay Control circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**4. (F923) RUN RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE**

**Note:** This circuit contains a diode. When checking for a short to voltage you must check both sides of the diode.

Measure the voltage of the (F923) Run Relay Control circuit at the FCM–PDM connector.

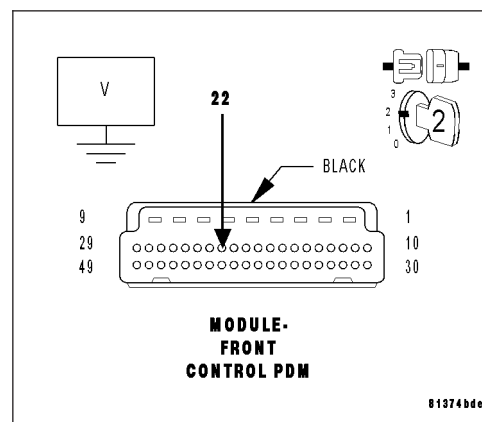

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (F923) Run Relay Control circuit for a short to voltage.

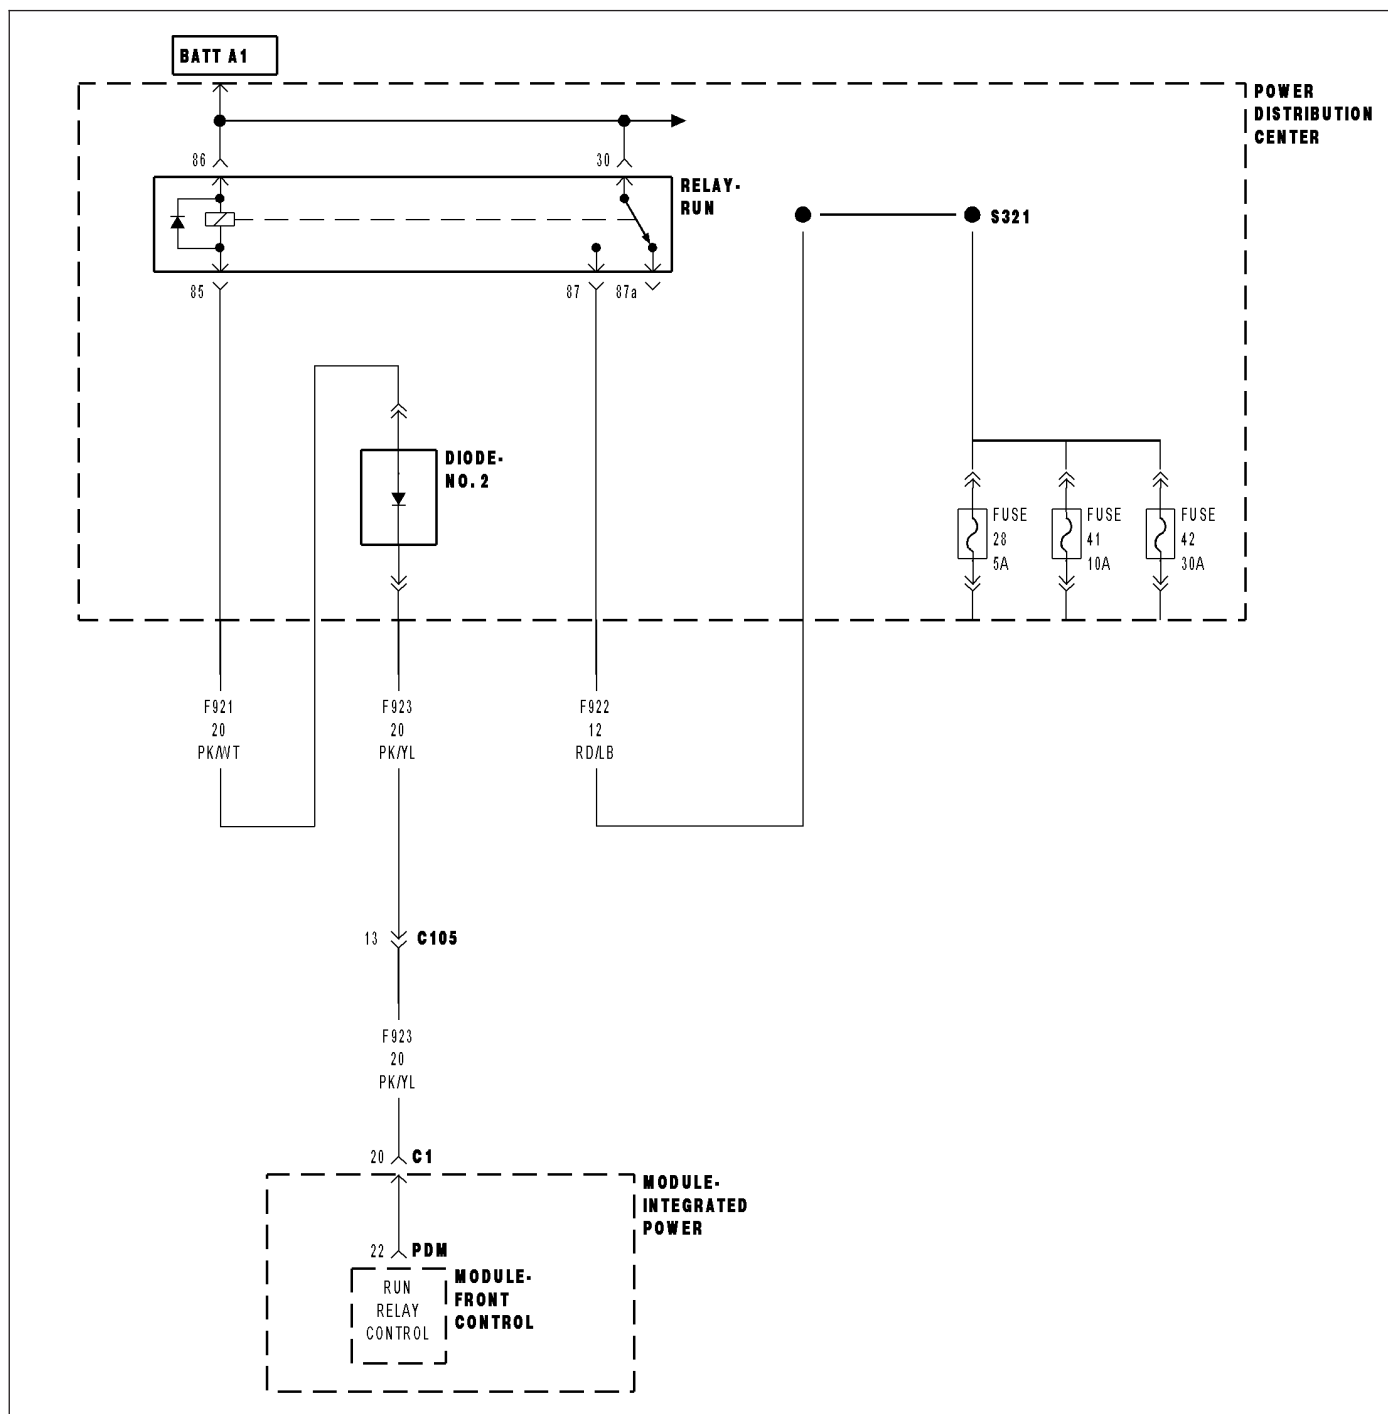

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

# B2124-IGNITION RUN CONTROL CIRCUIT OPEN

**B2124-IGNITION RUN CONTROL CIRCUIT OPEN (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will set this DTC within 500ms if the (F921) or (F923) run relay control circuit voltage is open or shorted to ground.

Possible Causes
(F921) or (F923) RUN RELAY CONTROL CIRCUIT OPEN OR SHORTED TO GROUND RUN RELAY FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. RUN RELAY**

Turn the ignition off.

Install a substitute run relay in place of the original run relay.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

## IGNITION SYSTEM - SERVICE INFORMATION

### DESCRIPTION

### IGNITION SYSTEM

**Note:** All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on these engines is referred to as the Direct Ignition System (DIS). The system's three main components are the coils, crankshaft position sensor, and camshaft position sensor. If equipped with the coil on plug ignition system it utilizes an ignition coil for every cylinder, it is mounted directly over the each spark plug.

### DESCRIPTION - 5.7L V-8 ENGINE

The ignition system is controlled by the Powertrain Control Module (PCM) on all engines.

**For additional information, also refer to Ignition Coil Description and Operation.**

The 5.7L V-8 engine is equipped with 16 spark plugs. Two plugs are used for each cylinder. The 5.7L is also equipped with 8 separate and independent ignition coils. The one-piece coil bolts directly to the cylinder head cover and attaches the coils secondary output terminal directly to a spark plug using a rubber boot seal. Each coil is also equipped with a second output terminal. This second terminal connects a conventional spark plug cable directly to a spark plug on the opposite cylinder bank. A separate primary electrical connector is used for each coil.

Eight conventional spark plug cables are used with the 5.7L. These cables connect a coil on one cylinder bank, directly to a spark plug on the opposite cylinder bank. The cables are placed and routed in a special plastic loom to keep them separated. This loom is clipped to the intake manifold. To prevent a mismatch of cables, a corresponding spark plug / coil number is displayed on each plug cable: 1/6, 2/3, 4/7 and 5/8. These numbers (2) and (3) can also be found on the top of the intake manifold.

Two knock sensors (one for each cylinder bank) are used to help control spark knock.

The 5.7L engine will not use a conventional distributor.

The ignition system consists of:

- 16 Spark Plugs (2 per cylinder)
- 8 Separate, Dual-Secondary Output, Ignition Coils
- 2 Knock Sensors
- 8 Secondary Ignition Cables
- Powertrain Control Module (PCM)
- Also to be considered part of the ignition system are certain inputs from the Crankshaft Position, Camshaft Position, Throttle Position, MAP and two knock sensors

**OPERATION - IGNITION SYSTEM**

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate pulses that are inputs to the PCM. The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft & camshaft position. For a description of both sensors, refer to Camshaft Position Sensor and Crankshaft Position Sensor.

**SPECIFICATIONS****TORQUE**

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Camshaft Position Sensor - 2.7L	12	-	105
Camshaft Position Sensor - 3.5L	12	-	105

* Knock Sensor - 5.7L V-8 Engine	20	15	176
** Spark Plugs - 5.7L V-8 Engine	18 (± 3)	13 (± 2)	-
* Do not apply any sealant, thread-locker or adhesive to bolts. Poor sensor performance may result.			
** Torque critical tapered design. Do not exceed 15 ft. lbs.			

FIRING ORDER / CABLE ROUTING – 5.7L V-8 ENGINE

Eight conventional spark plug cables are used with the 5.7L. These cables connect a coil on one cylinder bank, directly to a spark plug on the opposite cylinder bank. The cables are placed and routed in special plastic looms to keep them separated. These plastic looms are clipped to the intake manifold. To prevent a miss-match of cables, a corresponding spark plug / coil number is displayed on each plug cable: 1/6, 2/3, 4/7 and 5/8. These numbers (2) and (3) can also be found on the top of the intake manifold.

SPARK PLUG CABLE RESISTANCE

MINIMUM	MAXIMUM
250 Ohms Per Inch	1000 Ohms Per Inch
3000 Ohms Per Foot	12,000 Ohms Per Foot

## SPARK PLUGS

ENGINE	PLUG TYPE	ELECTRODE GAP
2.7L	RE10PMC5	0.048 TO 0.058 in.
3.5L	ZFR5LP-13G	0.048 TO 0.058 in.
5.7L V-8	Champion - RE14MCC4	1.14 mm (.045 in.)

## IGNITION COIL RESISTANCE - 5.7L V-8

PRIMARY RESISTANCE @ 21-27°C (70-80°F)
0.558 - 0.682 Ohms (Plus or Minus 10% @ 70-80° F)

## IGNITION TIMING-5.7L

Ignition timing is not adjustable on the 5.7L engine.

## SENSOR-CAMSHAFT POSITION

### REMOVAL

#### 2.7L

1. Disconnect negative battery cable.
2. Unlock and disconnect electrical connector.

3. Remove mounting bolt.
4. Remove sensor.

### 3.5L

1. Camshaft Position Sensor location.
2. Disconnect negative battery cable.

3. Unlock electrical connector.
4. Remove electrical connector.

5. Remove mounting bolt.
6. Remove sensor.

## 5.7L

The Camshaft Position Sensor (CMP) on the 5.7L V-8 engine (1) is bolted to the front/top of the timing chain cover (2).

1. Disconnect electrical connector (4) at CMP sensor.
2. Remove sensor mounting bolt (3).
3. Carefully twist sensor from timing chain cover.
4. Check condition of sensor o-ring.

## INSTALLATION

### 2.7L

1. Install sensor.
2. Install mounting bolt.
3. Tighten bolt to 12 N·m (105 in. lbs.).

4. Connect electrical connector and lock.
5. Connect negative battery cable.

### 3.5L

1. Install new spacer to sensor if installing the old sensor or new sensor will have the spacer installed.

2. Install sensor and insert until sensor makes contact with tone wheel.
3. Install mounting bolt.
4. Tighten mounting bolt to 12 N·m (105 in. lbs.).

5. Install electrical connector.
6. Lock connector.
7. Connect negative battery cable.

**5.7L**

1. Clean out machined hole in timing chain cover.
2. Apply a small amount of engine oil to sensor o-ring.
3. Install sensor (1) into timing chain cover (2) with a slight rocking action. Do not twist sensor into position as damage to o-ring may result.

**CAUTION:** Before tightening sensor mounting bolt, be sure sensor is completely flush to timing chain cover. If sensor is not flush, damage to sensor mounting tang may result.

4. Install mounting bolt (3) and tighten. Refer to Torque Specifications.
5. Connect electrical connector (4) to sensor

**COIL-IGNITION****REMOVAL****2.7L**

1. Disconnect negative battery cable.
2. Remove the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
3. Prior to removing the ignition coils, spray compressed air around the coil area and spark plug.

4. Remove electrical connector from ignition coil.
5. Remove 2 fasteners from ignition coil assembly.
6. Remove ignition coil assembly.

### 3.5L

1. Disconnect negative battery cable.
2. Remove the intake manifold, (Refer to 9 - ENGINE/ MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
3. Prior to removing the ignition coils, spray compressed air around the coil area and spark plug.
4. Unlock and remove electrical connector from ignition coil.

On 3.5L engines, it is necessary to loosen the screws by alternating back and forth. Do not lose the spacers under the coil when loosening the screws.

5. Remove 2 fasteners from ignition coil assembly.
6. Remove ignition coil assembly.

## 5.7L

Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position.

An individual ignition coil (1) is used at each cylinder. The coil mounts to the top of the valve cover with two bolts (2). The bottom of the coil is equipped with a rubber boot (3) to seal the spark plug to the coil. Inside each rubber boot is a spring. The spring is used for a mechanical contact between the coil and the top of the spark plug.

1. Depending on which coil is being removed, the throttle body air intake tube or intake box may need to be removed to gain access to coil.

2. Unlock electrical connector (4) by moving slide lock (1) first. Press on release lock (3) while pulling electrical connector from coil.
3. Disconnect secondary high-voltage cable (2) from coil with a twisting action.
4. Clean area at base of coil with compressed air before removal.
5. Remove two mounting bolts (6) (note that mounting bolts are retained to coil).
6. Carefully pull up coil from cylinder head opening with a slight twisting action.
7. Remove coil from vehicle.
8. Before installing spark plug cables to either the spark plugs or coils, or before installing a coil to a spark plug, apply dielectric grease to inside of boots.

## INSTALLATION

### 2.7L

1. Install ignition coil assembly to spark plug.
2. Install coil screws and tighten: 2.7L engine to 6.2 N·m (55 in. lbs.).
3. Connect the electrical connector and lock.

4. Install the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
5. Connect negative battery cable.

### 3.5L

On 3.5L engines, it is necessary to tighten the screws by alternating back and forth. Do not lose the spacers under the coil when installing ignition coils.

1. Install ignition coil assembly to spark plug.
2. Install coil screws and tighten 3.5L engines to 6.7 N·m (60 in. lbs.).
3. Connect the electrical connector and lock.

4. Install the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
5. Connect negative battery cable.

## 5.7L

1. Using compressed air, blow out any dirt or contaminants from around top of spark plug.
2. Before installing spark plug cables to either the spark plugs or coils, or before installing a coil to a spark plug, apply dielectric grease to inside of boots.
3. Position ignition coil into cylinder head opening and push boot (3) onto spark plug. Twist coil into position.
4. Install two coil mounting bolts (2). Refer to torque specifications.

5. Connect electrical connector (1) to coil by snapping into position.
6. Install cable to coil. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.
7. If necessary, install throttle body air tube.

## CAPACITOR-IGNITION COIL REMOVAL

1. Remove the negative battery cable.
2. Disconnect the electrical connector.
3. Remove nut and capacitor.

## INSTALLATION

1. Install capacitor and tighten nut.
2. Attach electrical connector to capacitor.
3. Install the negative battery cable

## SENSOR-KNOCK

### REMOVAL

#### 2.7L

1. Disconnect negative battery cable.  
The sensors screws into the cylinder block, directly below the intake manifold.
2. Remove intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
3. Remove the passenger side cylinder head, refer to the Engine section (Refer to 9 - ENGINE/CYLINDER HEAD - REMOVAL).
4. Disconnect electrical connector from knock sensor.
5. Use a crows foot socket to remove the knock sensors.

### 3.5L

1. Disconnect the negative battery cable.
2. Remove the upper intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL)
3. Disconnect the electrical connector.

4. Remove the knock sensor.

## 5.7L

Two sensors (1) are used. Each sensor is bolted to the outside of cylinder block below the exhaust manifold (3).

1. Raise vehicle.
2. Disconnect knock sensor electrical connector (5).
3. Remove sensor mounting bolt (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
4. Remove sensor from engine.

## INSTALLATION

### 2.7L

The sensors screws into the cylinder block, directly below the intake manifold.

1. Install knock sensor. Tighten knock sensor to 10 N·m (7 ft. lbs.) torque. **Over or under tightening effects knock sensor performance resulting in possible improper spark control.**
2. Attach electrical connector to knock sensor.
3. Install the passenger side cylinder head, (Refer to 9 - ENGINE/CYLINDER HEAD - INSTALLATION)
4. Install intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
5. connect negative battery cable.

### 3.5L

1. Install knock sensor. Tighten knock sensor to 20 N·m (15.2 in. lbs.) torque. **Over or under tightening effects knock sensor performance, possibly causing improper spark control.**

2. Route the knock sensor wire in the proper location.
3. Install the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)

4. Connect electrical connector.
5. Connect negative battery cable.

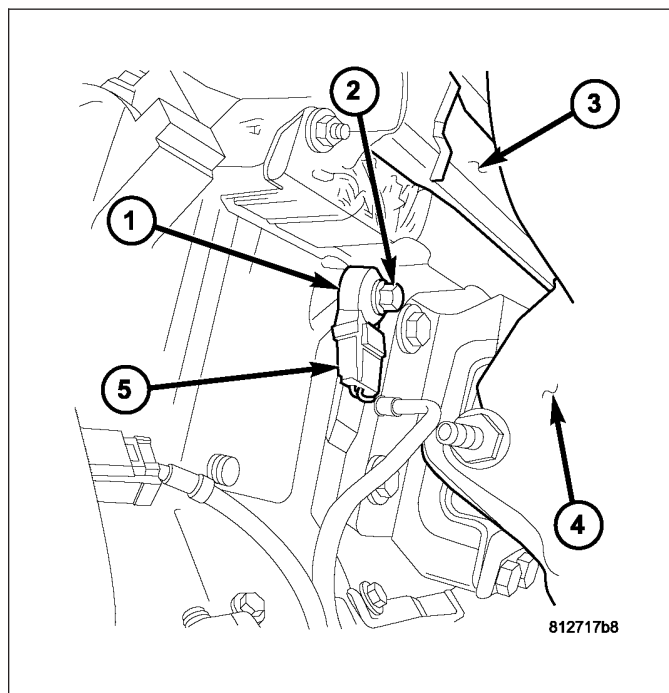

## 5.7L

1. Thoroughly clean knock sensor mounting hole.
2. Install sensor (1) into cylinder block.

**Note:** Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control. Always use the specified torque when installing the knock sensors. The torque for the knock sensor bolt is relatively light for an 8mm bolt.

**Note:** Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

3. Install and tighten mounting bolt (2). Refer to torque specification.
4. Install electrical connector to sensor.

## SPARK PLUG

### DESCRIPTION - PLATINUM PLUGS

The V6 engines use platinum resistor spark plugs. They have resistance values of 6,000 to 20,000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications, Refer to the Specifications section.

**Do not use an ohm meter to check the resistance of the spark plugs. This will give an inaccurate reading.**

When the spark plugs use a single or double platinum tips and they have a recommended service life of 100,000 miles for normal driving conditions per schedule A in this manual. The spark plugs have a recommended service life of 75,000 miles for severe driving conditions per schedule B in this manual. A thin platinum pad is welded to both

or just the center electrode end(s) as shown in. Extreme care must be used to prevent spark plug cross threading, mis-gapping and ceramic insulator damage during plug removal and installation.

**CAUTION:** Cleaning of the platinum plug may damage the platinum tip.

## REMOVAL

### 2.7L

Always remove the ignition coil assembly by grasping at the spark plug boot, turning the assembly 1/2 turn and pulling straight back in a steady motion.

1. Disconnect the negative battery cable.
2. Remove the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Prior to removing the ignition coils, spray compressed air around the coil area and spark plug.

On 3.5L engines, it is necessary to loosen the screws by alternating back and forth. Do not lose the spacers under the coil when loosening the screws.

4. Remove the ignitions coil.
5. Remove the spark plug using a quality socket with a rubber or foam insert.
6. Inspect the spark plug condition.

### 3.5L

Always remove the ignition coil assembly by grasping at the spark plug boot, turning the assembly 1/2 turn and pulling straight back in a steady motion.

1. Disconnect the negative battery cable.
2. Remove the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
3. Prior to removing the ignition coils, spray compressed air around the coil area and spark plug.

On 3.5L engines, it is necessary to loosen the screws by alternating back and forth. Do not lose the spacers under the coil when loosening the screws.

4. Remove the ignitions coil.
5. Remove the spark plug using a quality socket with a rubber or foam insert.
6. Inspect the spark plug condition.

### 5.7L

Eight of the 16 spark plugs are located under an ignition coil; the other 8 are not. If spark plug being removed is under coil, coil must be removed to gain access to spark plug. Refer to Ignition Coil Removal/Installation and observe all CAUTIONS and WARNINGS.

Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.

Before installing spark plug cables to either the spark plugs or coils, apply dielectric grease to inside of boots.

1. Remove necessary air filter tubing at throttle body.
2. Prior to removing ignition coil (if coil removal is necessary), spray compressed air around coil base at cylinder head cover.
3. Prior to removing spark plug, spray compressed air into cylinder head opening. This will help prevent foreign material from entering combustion chamber.
4. Remove spark plug from cylinder head using a quality socket with a rubber or foam insert.
5. Inspect spark plug condition.

## INSTALLATION

### 2.7L

1. To avoid cross threading, start the spark plug into the cylinder head by hand.
2. Tighten spark plugs. Tighten to 28 N·m (20 ft. lbs.).
3. Install ignition coil assembly onto spark plug.
4. Hand tighten coil screws.
5. Tighten ignition coil screws to 6.7 N·m (60 in. lbs.).
6. Connect and lock the electrical connector.
7. Install the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
8. Connect the negative battery cable.

### 3.5L

1. To avoid cross threading, start the spark plug into the cylinder head by hand.
2. Tighten spark plugs. Tighten to 28 N·m (20 ft. lbs.).
3. Install ignition coil assembly onto spark plug.
4. Hand tighten coil screws.
5. Tighten ignition coil screws to 6.7 N·m (60 in. lbs.).
6. Connect and lock the electrical connector.
7. Install the intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION)
8. Connect the negative battery cable.

### 5.7L

1. Special care should be taken when installing spark plugs into the cylinder head spark plug wells. Be sure the plugs do not drop into the plug wells as electrodes can be damaged.
2. Start the spark plug into cylinder head by hand to avoid cross threading aluminum threads. To aid in installation, attach a piece of rubber hose, or an old spark plug boot to spark plug.
3. The 5.7L V-8 is equipped with torque critical design spark plugs. Do not exceed 15 ft. lbs. torque. Tighten spark plugs. Refer to torque specifications.

4. Before installing spark plug cables to either the spark plugs or coils, apply dielectric grease to inside of boots.
5. To prevent ignition crossfire, spark plug cables **MUST** be placed in cable tray (routing loom) into their original position. Refer to Spark Plug Cable Removal for a graphic.
6. Install ignition coil(s) to necessary spark plugs. Refer to Ignition Coil Installation.
7. Install spark plug cables to remaining spark plugs. Remember to apply dielectric grease to inside of boots.

## SPARK PLUG CABLES

### REMOVAL

#### 5.7L

Spark plug cables on the 5.7L engine are paired on cylinders 1/6, 2/3, 4/7 and 5/8. Before removing or disconnecting any spark plug cables, note their original position. Remove cables one-at-a-time. To prevent ignition crossfire, spark plug cables **MUST** be placed in the routing looms into their original position. The cable retention clips must also be securely locked.

Before installing spark plug cables to either the spark plugs or coils, apply dielectric grease to inside of boots.

## INSTALLATION

### 5.7L

1. Install cables into the proper engine cylinder firing order sequence.
2. When replacing the spark plug and coil cables, route the cables correctly and secure them in the proper retainers. Failure to route the cables properly may cause the radio to reproduce ignition noise. It could also cause cross-ignition of the plugs, or, may short-circuit the cables to ground.
3. When installing new cables, make sure a positive connection is made. A snap should be felt when a good connection is made.
4. Refer to Spark Plug Cable Removal for additional information.

INSTRUMENT CLUSTER - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

**B1200-AIRBAG WARNING INDICATOR CIRCUIT LOW**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on and when requested to turn on by the Occupant Restraint Controller (ORC).
- **Set Condition:**  
The Instrument Cluster software detects the voltage across the Airbag Lamp is below 0.5 volts when ON.

Possible Causes
INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

**Note:** The Instrument Cluster performs internal tests on the Airbag Lamp during each ignition cycle.

With the scan tool, erase DTCs.

Turn the ignition off, wait 10 seconds, then turn the ignition on.

Wait for the Instrument Cluster to perform the bulb check.

With the scan tool, read DTCs.

**Is the DTC active?**

- Yes** >> Replace and program the Instrument Cluster in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Test complete.

B1201-AIRBAG WARNING INDICATOR CIRCUIT OPEN

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on and when requested to turn on by the Occupant Restraint Controller (ORC).
- **Set Condition:**  
The Instrument Cluster software detects the voltage across the Airbag Lamp is above 4.0 volts when ON.

Possible Causes
INSTRUMENT CLUSTER

Diagnostic Test

1. CHECK FOR AN ACTIVE DTC

**Note:** The Instrument Cluster performs internal tests on the Airbag Lamp during each ignition cycle.

With the scan tool, erase DTCs.  
Turn the ignition off, wait 10 seconds, then turn the ignition on.  
Wait for the Instrument Cluster to perform the bulb check.  
With the scan tool, read DTCs.

- Is the DTC active?**
- Yes**    >> Replace and program the Instrument Cluster in accordance with the Service Information.  
            Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No**      >> Test complete.

## B1225-REAR WIPER INDICATOR CONTROL CIRCUIT LOW

**B1225-REAR WIPER INDICATOR CONTROL CIRCUIT LOW (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Ignition Run-Start transition to on.
- **Set Condition:**  
Rear Wiper Output status HIGH.

Possible Causes
(W213) REAR WIPER INDICATOR DRIVER CIRCUIT OPEN (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN SWITCH BANK INSTRUMENT CLUSTER

**Diagnostic Test**

**1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.  
With the scan tool, record and erase DTCs.  
Activate the rear wiper switch.  
Wait 30 seconds.  
With the scan tool, read DTCs.

- Is the DTC active?**
- Yes**    >> Go To 2
- No**    >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1225-REAR WIPER INDICATOR CONTROL CIRCUIT LOW (CONTINUED)****2. CHECK FOR VOLTAGE AT THE SWITCH BANK HARNESS CONNECTOR**

Disconnect the Switch Bank harness connector.

Check the voltage on the (F23) Fused Ignition Switch Output (Run-Start) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Go To 3

**No** >> Repair the (F23) Fused Ignition Switch Output (Run-Start) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (W213) REAR WIPER INDICATOR DRIVER CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Measure the resistance of the (W213) Rear Wiper Indicator Driver Circuit between the Instrument Cluster Harness connector and the Switch Bank harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (W213) Rear Wiper Indicator Driver Circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B1225-REAR WIPER INDICATOR CONTROL CIRCUIT LOW (CONTINUED)****4. CHECK THE OPERATION OF THE REAR WIPER SWITCH**

Turn the ignition on.

Reconnect the Switch Bank harness connector.

Measure the voltage on the (W213) Rear Wiper Indicator Driver Circuit at the Instrument Cluster C3 harness connector.

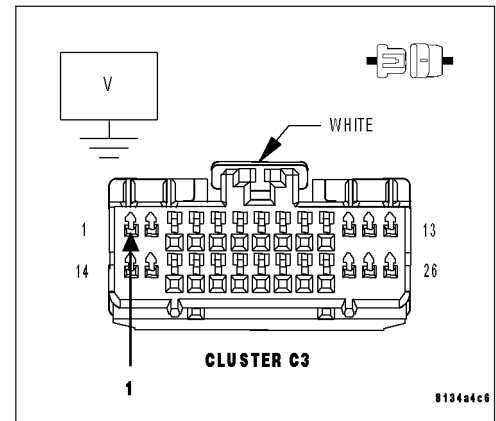

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Switch Bank in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## B1226-REAR WIPER INDICATOR CONTROL CIRCUIT HIGH

**B1226-REAR WIPER INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Ignition Run-Start transition to on.
- **Set Condition:**  
Rear Wiper Output status LOW.

Possible Causes
(W213) REAR WIPER INDICATOR DRIVER CIRCUIT SHORT TO VOLTAGE SWITCH BANK INSTRUMENT CLUSTER

**Diagnostic Test**

**1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.  
With the scan tool, record and erase DTCs.  
Activate the rear wiper switch.  
Wait 30 seconds.  
With the scan tool, read DTCs.

- Is the DTC active?**
- Yes**    >> Go To 2
- No**    >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1226-REAR WIPER INDICATOR CONTROL CIRCUIT HIGH (CONTINUED)****2. CHECK THE (W213) REAR WIPER INDICATOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect Switch Bank harness connector.

Disconnect the Instrument Cluster C3 harness connector.

Turn the ignition on.

Measure the voltage on the (W213) Rear Wiper Indicator Driver circuit.

**Is the voltage above 5 volts?**

**Yes** >> Repair the (W213) Rear Wiper Indicator Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B160A-PANEL DIMMER INPUT CIRCUIT LOW

**B160A-PANEL DIMMER INPUT CIRCUIT LOW (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Instrument Cluster awake.
- **Set Condition:**  
Panel Dimmer Input less than 0.5 volts.

Possible Causes
(E2) PANEL LAMPS DIMMER SIGNAL CIRCUIT SHORTED TO GROUND HEADLAMP SWITCH INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Panel Dimmer Switch.

Wait 30 seconds.

With the scan tool, read DTCs.

**Is the DTC active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK OPERATION OF HEADLAMP SWITCH**

Disconnect the Headlamp Switch harness connector.

With the scan tool, read Instrument Cluster DTCs.

**Does the scan tool display-B160B-PANEL DIMMER INPUT CIRCUIT HIGH?**

**Yes** >> Replace the Headlamp Switch in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**B160A-PANEL DIMMER INPUT CIRCUIT LOW (CONTINUED)****3. CHECK THE (E2) PANEL LAMPS DIMMER SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance between ground and the (E2) Panel Lamps Dimmer Signal Circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (E2) Panel Lamps Dimmer Signal Circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## B160B-PANEL DIMMER INPUT CIRCUIT HIGH

**B160B-PANEL DIMMER INPUT CIRCUIT HIGH (CONTINUED)**

For the Instrument Cluster circuit diagram.

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Instrument Cluster awake.
- **Set Condition:**  
Panel Dimmer Input greater than 4.8 volts.

**Possible Causes**

(E2) PANEL LAMPS DIMMER SIGNAL CIRCUIT SHORTED TO VOLTAGE  
(L900) HEADLAMP SWITCH MUX RETURN CIRCUIT SHORTED TO VOLTAGE  
(L900) HEADLAMP SWITCH MUX RETURN CIRCUIT OPEN  
(E2) PANEL LAMPS DIMMER SIGNAL CIRCUIT OPEN  
HEADLAMP SWITCH

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Panel Dimmer Switch.

Wait 30 seconds.

With the scan tool, read DTCs.

**Is the DTC active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B160B-PANEL DIMMER INPUT CIRCUIT HIGH (CONTINUED)****2. CHECK THE (E2) PANEL LAMPS DIMMER SIGNAL CIRCUIT, AND THE (L900) HEADLAMP SWITCH MUX RETURN CIRCUIT FOR A SHORT TO VOLTAGE**

Disconnect the Headlamp Switch harness connector.

Turn the ignition on.

Using a test light, measure for voltage on the (E2) Panel Lamps Dimmer Signal circuit.

Using a test light, measure for voltage on the (L900) Headlamp Switch MUX Return circuit.

**Is voltage present on the E2 or L900 circuit?**

**Yes** >> Repair the E2 or the L900 for a short to voltage.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK THE OPERATION OF THE PANEL LAMPS DIMMER SWITCH**

Connect a jumper wire at the Headlamp Switch harness connector between the (E2) Panel Lamps Dimmer Signal circuit and the (L900) Headlamp Switch MUX Return circuit.

With the scan tool, read DTCs.

**Does the Scan tool display-B160A-PANEL DIMMER INPUT CIRCUIT LOW?**

**Yes** >> Replace the Headlamp Switch in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B160B-PANEL DIMMER INPUT CIRCUIT HIGH (CONTINUED)****4. CHECK THE (L900) HEADLAMP SWITCH MUX RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance of the (L900) Headlamp Switch MUX Return circuit between the Instrument Cluster C2 harness connector and the Headlamp Switch harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (L900) Headlamp Switch MUX Return circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE (E2) PANEL LAMPS DIMMER SIGNAL CIRCUIT FOR AN OPEN**

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance of the (E2) Panel Lamps Dimmer Signal circuit between the Instrument Cluster C1 harness connector and the Headlamp Switch harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (E2) Panel Lamps Dimmer Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Ignition on, and the Panel Illumination active.
- **Set Condition:**  
Panel Illumination Status HIGH.

Possible Causes
(E12) PANEL LAMPS DRIVER CIRCUIT SHORTED TO GROUND HEADLAMP SWITCH SHORTED TO GROUND DRIVER HEATED SEAT SWITCH SHORTED TO GROUND PASSENGER HEATED SEAT SWITCH SHORTED TO GROUND CLOCK MODULE SHORTED TO GROUND PRNDL LAMP SHORTED TO GROUND SWITCH BANK SHORTED TO GROUND INSTRUMENT CLUSTER

**Diagnostic Test**

**1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.  
With the scan tool, record and erase DTCs.  
Activate the Panel Illumination.  
Wait 30 seconds.  
With the scan tool, read DTCs.

- Is the DTC active?**
- Yes**    >> Go To 2
- No**    >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW (CONTINUED)****2. CHECK THE SWITCH BANK FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Switch Bank harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

**Does the scan tool display-B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the Switch Bank in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK THE HEADLAMP SWITCH FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Headlamp Switch harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

**Does the scan tool display-B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the Headlamp Switch in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW (CONTINUED)****4. CHECK THE DRIVER HEATED SEAT SWITCH FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Driver Heated Seat Switch harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

**Does the scan tool display-B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the Driver Heated Seat Switch in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE PASSENGER HEATED SEAT SWITCH FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Passenger Heated Seat Switch harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

**Does the scan tool display-B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the Passenger Heated Seat Switch in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW (CONTINUED)****6. CHECK THE CLOCK MODULE FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Clock Module harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

**Does the scan tool display-B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the Clock Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 7

**7. CHECK THE PRNDL LAMP FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the PRNDL Lamp harness connector.

Turn the ignition on.

Activate the Panel Illumination.

With the scan tool, read DTCs.

**Does the scan tool display-B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the PRNDL Lamp in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 8

**B1613-PANEL ILLUMINATION CONTROL CIRCUIT LOW (CONTINUED)****8. CHECK THE (E12) PANEL LAMPS DRIVER CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

With all the above components disconnected, measure the resistance to ground of the (E12) Panel Lamps Driver Circuit from the Instrument Cluster C3 harness connector.

**Is the resistance less than 10K ohms?**

**Yes** >> Repair the (E12) Panel Lamps Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Ignition on, and the Panel Illumination not active.
- **Set Condition:**  
Panel Illumination status HIGH.

Possible Causes
(E12) PANEL LAMPS DRIVER CIRCUIT FOR AN OPEN INSTRUMENT CLUSTER

**Diagnostic Test**

**1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.  
With the scan tool, record and erase DTCs.  
Activate the Panel Illumination.  
Wait 30 seconds.  
With the scan tool, read DTCs.

- Is the DTC active?**
- Yes**    >> Go To 2
- No**    >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1614-PANEL ILLUMINATION CONTROL CIRCUIT HIGH (CONTINUED)****2. CHECK (E12) PANEL LAMPS DRIVER CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Disconnect the Headlamp Switch harness connector.

Measure the resistance of the (E12) Panel Lamps Driver Circuit between the Instrument Cluster C3 harness connector and the Headlamp Switch harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (E12) Panel Lamps Driver Circuit for an open. Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information. Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

The diagram illustrates the electrical connections for the 8130A5000. It features a central power distribution center (PDC) with a 40 5A fuse. The connections are as follows:

- Cluster C3:** Connected to the PDC via a 2-wire line (C3). It includes an indicator dimmer signal and a control-A/C-heater (MTC) signal.
- Control-A/C-Heater C1 (MTC):** Connected to the PDC via a 9-wire line (C1). It includes an indicator dimmer signal and a control-A/C-heater (MTC) signal.
- Run-Start F20:** Connected to the PDC via a 40 5A fuse. It includes a 20-wire line (F23) and a 20-wire line (RD/OR).
- Switch-Bank:** Connected to the PDC via a 5-wire line (F23) and a 5-wire line (RD/OR). It includes a 20-wire line (F23) and a 20-wire line (RD/OR).

Below the diagram are three component views:

- Cluster C3:** A 14-pin connector with a white wire.
- Control-A/C-Heater C1 (MTC):** A 9-pin connector with a black wire.
- Switch-Bank:** A 12-pin connector with a black wire.

**B1694-ACCESSORY DIMMING CONTROL CIRCUIT HIGH (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Indicator Dimming Signal active. ATC not present.
- **Set Condition:**  
Indicator Dimmer Signal Output status LOW.

Possible Causes
(E22) INDICATOR DIMMER SIGNAL CIRCUIT SHORTED TO VOLTAGE INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Activate the Accessory Dimming.

With the scan tool, read DTCs.

**Is the DTC active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1694-ACCESSORY DIMMING CONTROL CIRCUIT HIGH (CONTINUED)****2. CHECK (E22) INDICATOR DIMMER SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Disconnect the Switch Bank harness connector.

Disconnect the A/C Heater Control C1 (MTC) harness connector.

Turn the ignition on.

Check the voltage on the (E22) Indicator Dimmer Signal circuit.

**Is the voltage above 0.5 volts?**

**Yes** >> Repair the (E22) Indicator Dimmer Signal circuit for a short to voltage.

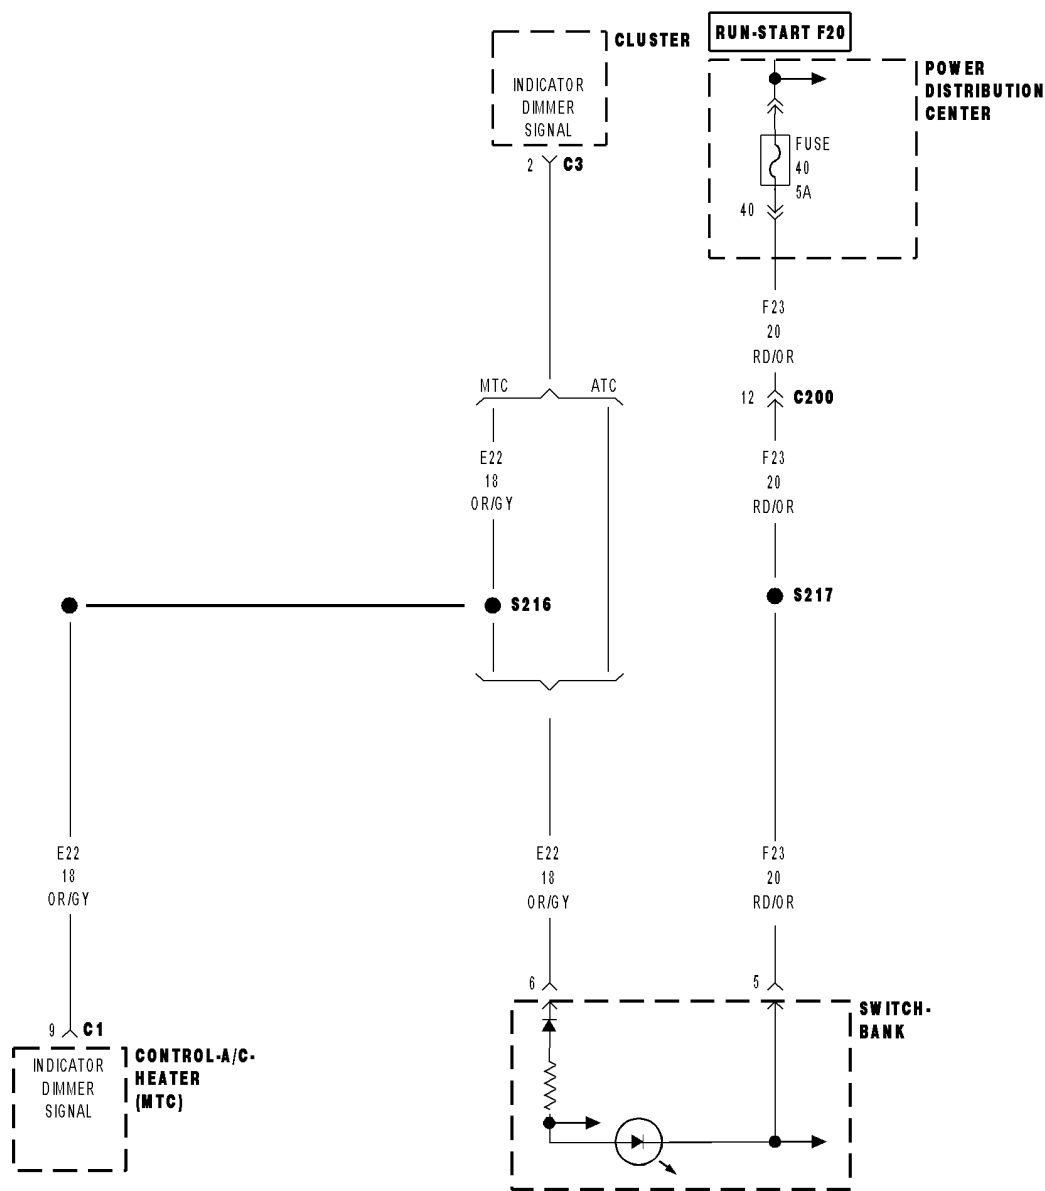

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

# B1695-ACCESSORY DIMMING CONTROL CIRCUIT OPEN

**CLUSTER C3**

**CONTROL-A/C-HEATER C1 (MTC)**

**SWITCH-BANK**

**B1695-ACCESSORY DIMMING CONTROL CIRCUIT OPEN (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Ignition Run/Start transition to on, and ATC not present.
- **Set Condition:**  
Input Dimmer Signal Output status HIGH.

Possible Causes
(E22) INDICATOR DIMMER SIGNAL CIRCUIT OPEN INSTRUMENT CLUSTER

**Diagnostic Test**

**1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.  
With the scan tool, record and erase DTCs.  
Activate the rear wiper switch.  
With the scan tool, read DTCs.

- Is the DTC active?**
- Yes**    >> Go To 2
- No**    >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1695-ACCESSORY DIMMING CONTROL CIRCUIT OPEN (CONTINUED)****2. CHECK THE (E22) INDICATOR DIMMER SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Disconnect the Switch Bank harness connector.

Measure the resistance of the (E22) Indicator Dimmer Signal Circuit between the Instrument Cluster C3 Harness connector and the Switch Bank harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (E22) Indicator Dimmer Signal Circuit for an open.

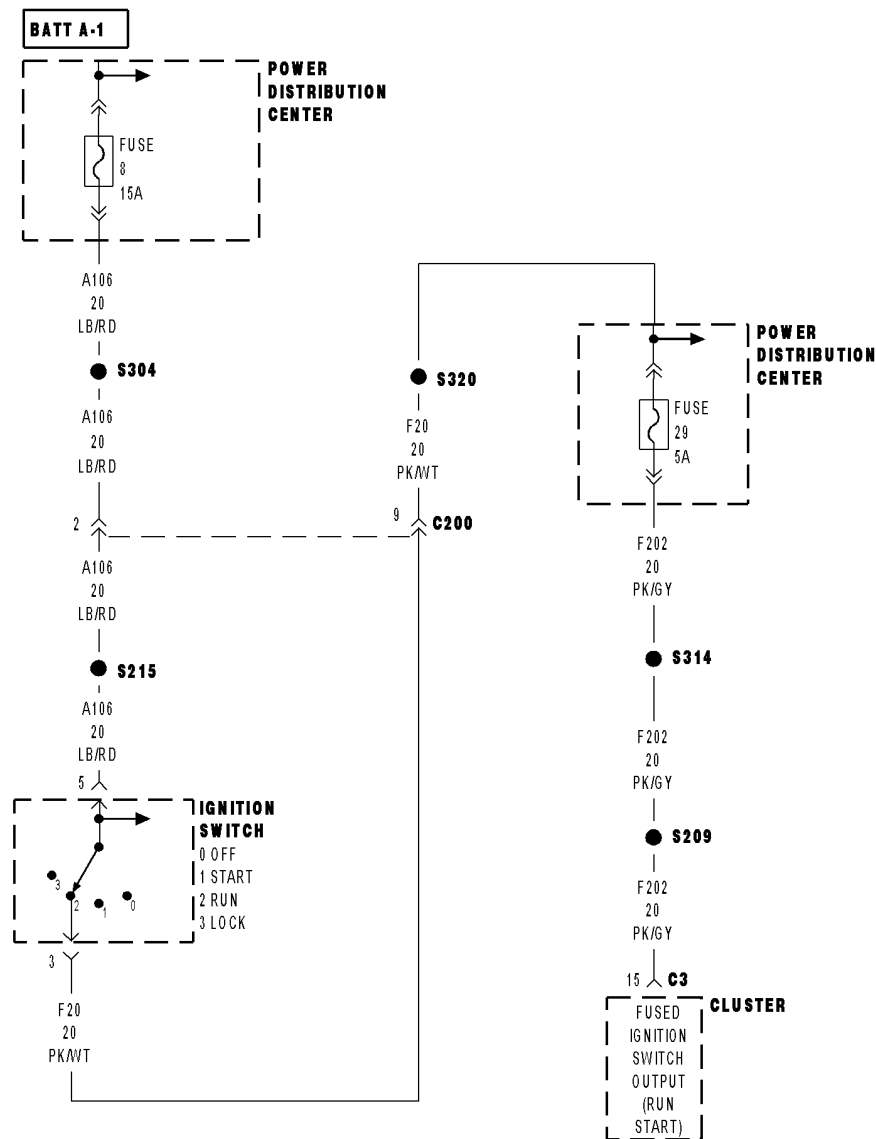

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## B2107-IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE

**B2107-IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Instrument Cluster awake.
- **Set Condition:**  
Ignition switch in RUN or START, and Ignition RUN/START LOW. Ignition Switch in LOCK or UNLOCK, and Ignition RUN/START HIGH.

Possible Causes
FUSED IGNITION SWITCH FUSES (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) OPEN (A106) FUSED B+ CIRCUIT OPEN IGNITION SWITCH INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

**Is the DTC active?**

- Yes** >> Go To 2
- No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK PDC FUSES**

Inspect PDC fuses #8, and #29 in the PDC.

**Is either fuse open?**

- Yes** >> Using the wiring diagram/schematic as a guide, inspect the wiring and connectors for a short to ground condition.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Go To 3

**B2107-IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)****3. CHECK FOR VOLTAGE ON THE (F202) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Turn the ignition on.

Measure the voltage of the (F202) Fused Ignition Switch Output (Run-Start) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**4. CHECK THE (F202, F20) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN**

Disconnect the Ignition Switch harness connector.

Measure the resistance of the (F202, F20) Fused Ignition Switch Output (Run-Start) circuit between the Instrument Cluster C3 harness connector and the Ignition Switch harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (F202, F20) Fused Ignition Switch Output (Run-Start) circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**B2107-IGNITION SWITCH SENSE INPUT CIRCUIT/PERFORMANCE (CONTINUED)****5. CHECK THE (A106) FUSED B+ CIRCUIT FOR AN OPEN**

Measure the voltage on the (A106) Fused B+ circuit at the Ignition Switch harness connector.

**Is the voltage above 10.0 volts?**

- Yes** >> Replace the Ignition Switch in accordance with the service information.
- No** >> Repair the (A106) Fused B+ circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B2108-IGNITION SWITCH SENSE INPUT CIRCUIT LOW

**B2108-IGNITION SWITCH SENSE INPUT CIRCUIT LOW (CONTINUED)**

For the Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Instrument Cluster awake.
- **Set Condition:**  
Ignition Switch Sense circuit voltage less than .3 volts.

Possible Causes
(G20) IGNITION SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND (G20) IGNITION SWITCH SENSE CIRCUIT SHORT TO (G900) IGNITION SWITCH SENSE RETURN CIRCUIT IGNITION SWITCH INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Wait 30 seconds.

With the scan tool, read DTCs.

**Is the DTC active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B2108-IGNITION SWITCH SENSE INPUT CIRCUIT LOW (CONTINUED)****2. CHECK OPERATION OF IGNITION SWITCH**

Turn the ignition off.

Disconnect the Ignition Switch harness connector.

Connect a jumper wire between Ignition Switch harness connector cavities 3 and 5.

**Note: This will provide power to the vehicle systems with the ignition switch disconnected.**

With the scan tool, erase Instrument Cluster DTCs.

Wait 30 seconds.

With the scan tool, read Instrument Cluster DTCs.

**Does the scan tool display-B2109-IGNITION SWITCH SENSE INPUT CIRCUIT HIGH?**

**Yes** >> Replace the Ignition Switch in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK THE (G20) IGNITION SWITCH SENSE CIRCUIT FOR A SHORT TO THE (G900) IGNITION SWITCH SENSE RETURN CIRCUIT**

Remove the jumper wire between Ignition Switch harness connector cavities 3 and 5.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance between the (G20) Ignition Switch Sense Circuit and the (G900) Ignition Switch Sense Return circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (G20) Ignition Switch Sense Circuit for a short to the (G900) Ignition Switch Sense Return circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B2108-IGNITION SWITCH SENSE INPUT CIRCUIT LOW (CONTINUED)****4. CHECK THE (G20) IGNITION SWITCH SENSE CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (G20) Ignition Switch Sense Circuit.

**Is the resistance below 10K ohms?**

- Yes** >> Repair the (G20) Ignition Switch Sense Circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Instrument Cluster in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## B2109-IGNITION SWITCH SENSE INPUT CIRCUIT HIGH

**B2109-IGNITION SWITCH SENSE INPUT CIRCUIT HIGH (CONTINUED)**

For the Instrument Cluster circuit diagram (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Instrument Cluster awake.
- **Set Condition:**  
Ignition Switch Sense circuit voltage greater than 4.7 volts.

Possible Causes
(G20) IGNITION SWITCH SENSE CIRCUIT OPEN (G900) IGNITION SWITCH SENSE RETURN CIRCUIT OPEN IGNITION SWITCH INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs

Wait 30 seconds.

With the scan tool, read DTCs.

**Is the DTC active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B2109-IGNITION SWITCH SENSE INPUT CIRCUIT HIGH (CONTINUED)****2. CHECK THE (G20) IGNITION SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Ignition Switch harness connector.

Connect a jumper wire between Ignition Switch harness connector cavities 3 and 5.

**Note: This will provide power to the vehicle systems with the ignition switch disconnected.**

Measure the voltage on the (G20) Ignition Switch Sense circuit.

**Is the voltage above 5.4 volts?**

**Yes** >> Go To 3

**No** >> Go To 4

**3. CHECK THE (G20) IGNITION SWITCH SENSE CIRCUIT FOR A SHORT TO VOLTAGE**

Remove the jumper wire between Ignition Switch harness connector cavities 3 and 5.

Disconnect the Instrument Cluster C2 harness connector.

Measure the voltage of the (G20) Ignition Switch Sense Circuit.

**Is the voltage above 5.4 volts?**

**Yes** >> Repair the (G20) Ignition Switch Sense circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B2109-IGNITION SWITCH SENSE INPUT CIRCUIT HIGH (CONTINUED)****4. CHECK OPERATION OF IGNITION SWITCH**

Turn the ignition off.

Disconnect the Ignition Switch harness connector.

Connect a jumper wire between Ignition Switch harness connector cavities 3 and 5.

**Note: This will provide power to the vehicle systems with the ignition switch disconnected.**

Connect a jumper wire between Ignition Switch harness connector cavities 1 and 2.

With the scan tool, erase Instrument Cluster DTCs.

Wait 30 seconds.

With the scan tool, read Instrument Cluster DTCs.

**Does the scan tool display-B2108-IGNITION SWITCH SENSE INPUT CIRCUIT LOW?**

**Yes** >> Replace the Ignition Switch in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE (G900) IGNITION SWITCH SENSE RETURN CIRCUIT FOR AN OPEN.**

Remove the jumper wire between Ignition Switch harness connector cavities 3 and 5.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance of the (G900) Ignition Switch Sense Return circuit between the Instrument Cluster C2 harness connector and the Ignition Switch Harness connector.

**Is the resistance greater than 5 ohms?**

**Yes** >> Repair the (G900) Ignition Switch Sense Return circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B2213–CCN INTERNAL**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the Instrument Cluster awake.
- **Set Condition:**  
The Instrument Cluster detects an internal failure.

Possible Causes
INSTRUMENT CLUSTER

**Diagnostic Test**

**1. REPLACE THE INSTRUMENT CLUSTER**

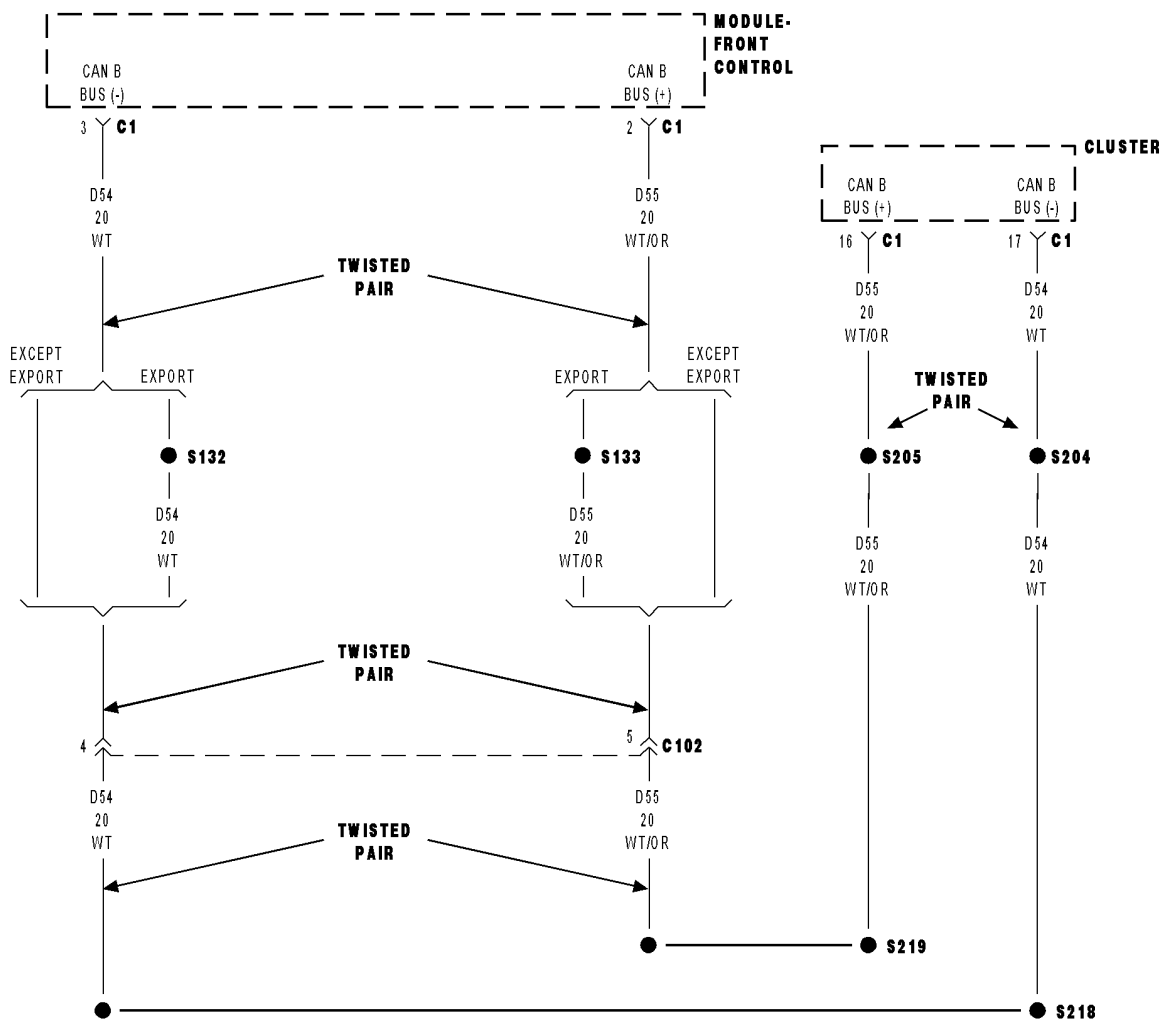

When this code is set, the Instrument Cluster must be replaced.

**View Repair**

**Repair**

Replace the Instrument Cluster in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

# U0019-CAN B BUS

**U0019–CAN B BUS (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the Instrument Cluster awake.
- **Set Condition:**  
Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN FRONT CONTROL MODULE (D54) CAN B BUS (–) CIRCUIT OPEN (D55) CAN B BUS (+) CIRCUIT OPEN INSTRUMENT CLUSTER

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase DTCs.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

**Is the DTC active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK FRONT CONTROL MODULE DTCs**

With the scan tool, read Front Control Module DTCs.

**Does the scan tool display the U0019–CAN B BUS DTC?**

**Yes** >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

**No** >> Go to 3

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## U0019-CAN B BUS (CONTINUED)

### 3. CAN B BUS (+) CIRCUIT OPEN

Turn the ignition off.

Disconnect the Instrument Cluster C1 harness connector.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Instrument Cluster C1 harness connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the Can B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

### 4. CAN B BUS (-) CIRCUIT OPEN

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 harness connector and the Instrument Cluster C1 harness connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the Instrument Cluster in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the Can B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## **U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER**

For a complete wiring diagram Refer to Section 8W.

INSTRUMENT CLUSTER - SERVICE INFORMATION

DESCRIPTION

The instrument cluster is an ElectroMechanical Instrument Cluster (EMIC) that is located in the instrument panel above the steering column opening, directly in front of the driver. The remainder of the EMIC, including the mounts and the electrical connections, are concealed within the instrument panel behind the cluster bezel. Besides analog gauges and indicators, the EMIC module incorporates two blue-green digital Vacuum Fluorescent Display (VFD) units for displaying odometer/trip odometer information, engine hours, automatic transmission gear selector position (PRNDL), several warning or reminder indications and certain diagnostic information. The instrument cluster also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

Besides typical instrument cluster gauge and indicator support, the electronic functions and features that the EMIC supports or controls include the following:

- **Accessory Power Delay Relay Control** - The EMIC provides timing and control for the accessory power delay relay based upon inputs from both the ignition switch and the door ajar switches.
- **Audible Warnings** - The EMIC electronic circuit board is equipped with an audible tone transducer and programming that allows it to provide various audible alerts to the vehicle operator, including chime tones and beep tones. An electromechanical relay is also soldered onto the circuit board to produce audible clicks that emulate the sound of a conventional turn signal or hazard warning flasher. (Refer to 8 - ELECTRICAL/CHIME/BUZZER - DESCRIPTION).
- **Automatic Headlamps Control** - On models equipped with optional automatic headlamps, the EMIC monitors inputs from both the headlamp switch and a sun load sensor located on the top of the instrument panel to provide automatic headlamps.
- **Brake Lamp Control** - The EMIC provides electronic brake lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for brake lamp control, excluding control of the Center High Mounted Stop Lamp (CHMSL), which remains controlled by a direct hard wired output of the brake lamp switch.

- **Brake Transmission Shift Interlock Control** - The EMIC monitors inputs from the brake lamp switch, ignition switch, and the Transmission Range Sensor (TRS), then controls a high-side driver output to operate the Brake Transmission Shift Interlock (BTSI) solenoid that locks and unlocks the automatic transmission gearshift selector lever on the steering column.
- **Compass Mini Trip Computer Support** - The EMIC provides support for the optional Compass Mini Trip Computer (CMTC) by calculating average fuel economy, distance to empty and outside temperature values and storing trip odometer and elapsed ignition on time data. The EMIC receives data and reset requests from the CMTC and transmits the appropriate information for the CMTC to display using electronic messaging.
- **Enhanced Accident Response Support** - The EMIC monitors an input from the Occupant Restraint Controller (ORC) and, following an airbag deployment, will immediately disable the power lock output, unlock all doors by activating the power unlock output, then enables the power lock output if the power lock switch input remains inactive for two seconds. The EMIC also monitors an input from the Powertrain Control Module (PCM) to automatically turn on the interior lighting after an airbag deployment event, ten seconds after the vehicle speed is zero. The interior lighting remains illuminated until the ignition switch is turned to the Off position, at which time the interior lighting returns to normal operation and control. These Enhanced Accident Response System (EARS) features are each dependent upon a functional vehicle electrical system following the vehicle impact event.
- **Exterior Lamp Load Shedding** - The EMIC provides a battery saver feature which will automatically turn off all exterior lamps that remain on with the ignition switch in the Off position after a timed interval of about five minutes.
- **Exterior Lighting Control** - The EMIC provides electronic head lamp and/or park lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for the appropriate exterior lamp control of standard head and park lamps, as well as optional front fog lamps. This includes support for headlamp beam selection and the optical horn feature, also known as flash-to-pass.
- **Exterior Lighting Fail-safe** - In the absence of a headlamp switch input, the EMIC will turn on the cluster illumination lamps and provide electronic headlamp low beam and park lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for default exterior lamp operation. The FCM will also provide default park lamp and headlamp low beam operation and the EMIC will turn on the cluster general illumination lighting if there is a failure of the electronic data bus communication between the EMIC and the FCM.
- **Fuel Level Data Support** - The EMIC provides a current source for and receives a hard wired analog input from the fuel level sending unit located on the fuel pump module in the fuel tank. The EMIC uses this input to calculate the proper fuel gauge needle position and low fuel indicator operation. Based upon this input, the EMIC also calculates fuel level, average fuel economy and distance to empty data, then uses electronic messaging to transmit this data over the CAN data bus for use by other electronic modules in the vehicle.
- **Heated Seat Control** - The EMIC monitors inputs from the ignition switch and electronic engine speed messages from the Powertrain Control Module (PCM) to control a high side driver output to the heated seat switch Light Emitting Diode (LED) indicators. This input allows the heated seat switches to wake up the heated seat module if the switch is actuated. The EMIC will de-energize the heated seat switch LED indicators, which deactivates the heated seat system, if the ignition switch is turned to any position except On or Start, or if the engine speed message indicates zero. (Refer to 8 - ELECTRICAL/HEATED SEATS - DESCRIPTION).
- **Horn Control** - The EMIC monitors an input from the horn switch and provides electronic horn request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for horn relay control. The EMIC also controls horn relay operation in this manner to provide the horn features of the optional Remote Keyless Entry (RKE) or Vehicle Theft Security System (VTSS).
- **Interior Lamp Load Shedding** - The EMIC provides a battery saver feature which will automatically turn off all interior lamps that remain on after a timed interval of about fifteen minutes.
- **Interior Lighting Control** - The EMIC monitors inputs from the interior lighting switch, the door ajar switches, the reading lamp switches, and the Sentry Key Remote Entry Module (SKREEM) to provide courtesy lamp control. This includes support for timed illuminated entry with theater-style fade-to-off and courtesy illumination defeat features.
- **Panel Lamps Dimming Control** - The EMIC monitors hard wired multiplexed inputs from the headlamp switch on the instrument panel, then provides a hard wired 12-volt Pulse-Width Modulated (PWM) output that synchronizes the dimming level of all panel lamps dimmer controlled lamps with that of the cluster illumination lighting.
- **Power Locks** - The EMIC monitors inputs from the power lock switches and the Sentry Key Remote Entry Module (SKREEM) to provide control of the power lock motors through high side driver outputs to the motors.

This includes support for rolling door locks (also known as automatic door locks), automatic door unlock, brief-case lock mode, door lock inhibit mode, and central locking (with the optional Vehicle Theft Security System only). (Refer to 8 - ELECTRICAL/POWER LOCKS - DESCRIPTION).

- **Remote Keyless Entry** - The EMIC supports the standard Remote Keyless Entry (RKE) system features, including support for the RKE Lock, Unlock (with optional driver-door-only unlock, and unlock-all-doors), Panic, audible chirp, optical chirp, illuminated entry modes, an RKE programming mode, as well as optional Vehicle Theft Security System (VTSS) arming (when the proper VTSS arming conditions are met) and disarming.
- **Remote Radio Switch Interface** - The EMIC monitors inputs from the optional remote radio switches and then provides the appropriate electronic data bus messages to the radio to select the radio operating mode, volume control, preset station scan and station seek features.
- **Turn Signal & Hazard Warning Lamp Control** - The EMIC monitors hard wired multiplexed inputs from the multi-function switch on the steering column, then provides electronic turn and hazard lamp request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for turn and hazard lamp control. The EMIC also provides an audible click at one of two rates to emulate normal and bulb out turn or hazard flasher operation based upon electronic lamp outage messages from the FCM, and provides an audible turn signal on chime warning if a turn is signalled continuously for more than about 1.6 kilometers (one mile) and the vehicle speed remains greater than about twenty-four kilometers-per-hour (fifteen miles-per-hour).
- **Vacuum Fluorescent Display Synchronization** - The EMIC monitors hard wired multiplexed inputs from the headlamp switch on the instrument panel, then transmits electronic panel lamp dimming level messages which allows all other electronic modules on the CAN data bus with Vacuum Fluorescent Display (VFD) units to coordinate their illumination intensity with that of the EMIC VFD units. This includes a parade mode (also known as funeral mode) that allows all VFD units in the vehicle to be illuminated at full (daytime) intensity while driving during daylight hours with the exterior lamps turned On.
- **Vehicle Theft Security System Control** - The EMIC monitors inputs from the door ajar switches, the liftgate ajar switch, the ignition switch, and the Sentry Key REmote Entry Module (SKREEM), then provides electronic horn and lighting request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for the appropriate VTSS alarm output features.
- **Wiper/Washer System Control** - The EMIC monitors both hard wired multiplexed inputs from the front wiper and washer switches in the multi-function switch on the steering column and electronic messages from the rear wiper and washer switches in the heater and air conditioner control on the instrument panel. The EMIC then provides electronic wiper and/or washer request messages to the Front Control Module (FCM) located on the Integrated Power Module (IPM) for the appropriate front or rear wiper and washer system features. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - DESCRIPTION).

## ELECTRONIC VEHICLE INFORMATION CENTER

Eight switches mounted on the steering wheel control the Electronic Vehicle Information Center (EVIC). Pressing the switches, conveniently selects from a variety of useful information. Personal settings, hands-free system communication system screens, Navigation system screens, trip computer functions, outside temperature, compass headings, audio modes and System Status messages including Tire Pressure Monitor System warnings can be displayed in the EVIC. For more detailed information (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFORMATION CENTER - DESCRIPTION).

## CHRYSLER INSTRUMENT CLUSTERS

Three clusters are offered on Chrysler 300 sedans.

### 300 AND 300 TOURING EDITION

The Chrysler 300 and base 300 Touring Edition model instrument clusters include the following features:

- Four large easy to read gauges: Fuel, speedometer, tachometer and engine temperature.
- Electroluminescent silhouette-lit alabaster gauges (gauge faces glow blue-green when headlamps are on). Electroluminescent lighting is totally uniform and glare free for optimum driver visibility.
- Black gauge pointers.
- Vertical vacuum-fluorescent transmission shift-range indicator.

- Up to 19 warning indicators depending on equipment level.
- Chrome gauge rings.
- 140-mph speedometer.
- Vacuum-fluorescent odometer with outside temperature indicator and three warning indicators: Trunk Ajar, Low Washer Fluid, and Door Ajar.

### 300 TOURING LUXURY AND LUXURY SPORT

Instrument clusters on Chrysler 300 Touring Edition with Luxury or Luxury Sport packages include the following features:

- Four large easy to read gauges: Fuel, speedometer, tachometer and engine temperature.
- Electroluminescent silhouette-lit alabaster gauges (gauge faces glow blue-green when headlamps are on). Electroluminescent lighting is totally uniform and glare free for optimum driver visibility.
- Black gauge pointers.
- Vertical vacuum-fluorescent transmission shift-range indicator.
- Up to 19 warning indicators depending on equipment level.
- Chrome gauge rings.
- Electronic Vehicle Information Center with driver-interactive three-line dot-matrix display controlled by steering wheel switches.

### HEMI C AND EXPORT 300C

The Chrysler 300Hemi C and Export 300C instrument cluster include the following features:

- Four large easy to read gauges: Fuel, speedometer, tachometer and engine temperature.
- Electroluminescent silhouette-lit alabaster gauges (gauge faces glow blue-green when headlamps are on). Electroluminescent lighting is totally uniform and glare free for optimum driver visibility.
- Black gauge pointers.
- Vertical vacuum-fluorescent transmission shift-range indicator.
- Up to 19 warning indicators depending on equipment level.
- Chrome gauge rings.
- Electronic Vehicle Information Center with driver-interactive three-line dot-matrix display controlled by steering wheel switches.
- 160-mph speedometer.

### APPEARANCE AND LIGHTING

Alabaster gauge faces with black nomenclature and black pointers provide excellent visibility in daylight. With the headlamps on, the electroluminescent gauges glow blue-green. The lighting intensity of the gauges can be adjusted to suit the driver's preference, using the thumbwheel dimmer control that is part of the headlamp switch. Electroluminescent lighting is totally uniform and glare free for optimum driver visibility.

### FIXED SEGMENT DISPLAYS

The standard cluster features two fixed—segment vacuum fluorescent digital displays to show transmission range and odometer reading. The fixed-segment odometer display also includes the following indicators:

**ODOMETER DISPLAY INDICATORS**

INDICATOR	DISPLAY	COLOR
Trunk Ajar	ISO	Blue/Green
Low Wash	ISO	Blue/Green
Door Ajar	ISO	Blue/Green
Outside Temperature	Numeric	Blue/Green

**INDICATOR LAMPS**

The following indicator lamps are included in all instrument clusters. Actual usage depends on how the vehicle is equipped.

**INDICATOR LAMPS**

INDICATOR	DISPLAY	COLOR
Right Turn	ISO	Green
Left Turn	ISO	Green
Front Fog Lamps	ISO	Green
Rear Fog (Export Only)	ISO	Amber
High Beam	ISO	Blue
Brake	Word U.S. only/ISO Export	Red
Seat Belt	ISO	Red
Airbag	ISO	Red
Electronic Throttle Control	ISO	Red
Low Oil Pressure	ISO	Red
Engine Temperature	ISO	Red
Charge	ISO	Red
VTA (Vehicle Theft Alarm)	Dot	Red
ABS	ISO	Amber
Check Engine	ISO	Amber
BAS (Brake Assist)	ISO	Amber
ASR/ESP (Anti-Slip Regulation/Electronic Stability Program)	ISO	Amber
Low Fuel	ISO	Amber
TPM (Tire Pressure Monitor)	ISO	Amber

**DODGE INSTRUMENT CLUSTERS**

Two clusters are offered on the Dodge Magnum Sports Tourer.

**DODGE MAGNUM SE AND SXT**

The Magnum SE and SXT instrument clusters include the following features:

- Horizontal odometer with outside temperature indicator and four blue-green ISO messages (fixed segment display).
- Vertical transmission shift-range indicator.
- White mask and lens assembly for individual gauges.
- Electroluminescent silhouette-lit white gauges (gauges glow white when headlights are on).
- Four large easy to read gauges: Fuel, 140-mph speedometer, tachometer and engine temperature.
- Non-lit orange pointers.

**DODGE MAGNUM RT**

The Magnum RT instrument cluster includes the following features:

- Vertical transmission shift-range indicator.
- White mask and lens assembly for individual gauges.
- Electroluminescent silhouette-lit white gauges (gauges glow white when headlamps are on).
- Four large easy to read gauges: Fuel, 140-mph speedometer, tachometer and engine temperature.
- Non-lit orange pointers.
- Dot-matrix Electronic Vehicle Information Center with Driver-Interactive Display.
- 160-mph speedometer.

**APPEARANCE AND LIGHTING**

White gauge faces with black nomenclature provide excellent visibility in daylight. Pointers are non-lit orange. With the headlamps on, the electroluminescent gauges glow white. The lighting intensity of the gauges can be adjusted to suit the driver's preference, using the thumbwheel dimmer control that is part of the headlamp switch. Electroluminescent lighting is uniform and glare free for optimum driver visibility.

**FIXED SEGMENT DISPLAYS**

The standard cluster features two fixed—segment vacuum fluorescent digital displays to show transmission range and odometer reading. The fixed-segment odometer display also includes the following indicators:

**ODOMETER DISPLAY INDICATORS**

INDICATOR	DISPLAY	COLOR
Hatch Ajar	ISO	Blue/Green
Low Wash	ISO	Blue/Green
Door Ajar	ISO	Blue/Green
Outside Temperature	Numeric	Blue/Green

**INDICATOR LAMPS**

The following indicator lamps are included in all instrument clusters. Actual usage depends on how the vehicle is equipped.

**INDICATOR LAMPS**

INDICATOR	DISPLAY	COLOR
Right Turn	ISO	Green
Left Turn	ISO	Green
Front Fog Lamps	ISO	Green
High Beam	ISO	Blue
Brake	Word U.S. only/ISO Export	Red
Seat Belt	ISO	Red
Airbag	ISO	Red
Electronic Throttle Control	ISO	Red
Low Oil Pressure	ISO	Red

INDICATOR	DISPLAY	COLOR
Engine Temperature	ISO	Red
Charge	ISO	Red
VTA (Vehicle Theft Alarm)	Dot	Red
ABS	ISO	Amber
Check Engine	ISO	Amber
BAS (Brake Assist)	ISO	Amber
ASR/ESP (Anti-Slip Regulation/Electronic Stability Program)	ISO	Amber
Low Fuel	ISO	Amber
TPM (Tire Pressure Monitor)	ISO	Amber

## OPERATION

The microprocessor-based EMIC hardware and software uses various inputs to control the gauges and indicators visible on the face of the cluster. Some of these inputs are hard wired, but most are in the form of electronic messages that are transmitted by other electronic modules over the Controller Area Network (CAN) data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

The EMIC microprocessor smooths the input data using algorithms to provide gauge readings that are accurate, stable and responsive to operating conditions. These algorithms are designed to provide gauge readings during normal operation that are consistent with customer expectations. However, when abnormal conditions exist such as high coolant temperature, the algorithm can drive the gauge pointer to an extreme position and the microprocessor can sound a chime through the on-board audible tone transducer to provide distinct visual and audible indications of a problem to the vehicle operator. The EMIC may also produce audible warnings for other electronic modules in the vehicle based upon electronic tone request messages received over the CAN data bus. Each audible warning is intended to provide the vehicle operator with an audible alert to supplement a visual indication.

The EMIC circuitry operates on battery current received through a fused B(+) fuse on a non-switched fused B(+) circuit, and on battery current received through a fused ignition switch output (run-start) fuse on a fused ignition switch output (run-start) circuit. This arrangement allows the EMIC to provide some features regardless of the ignition switch position, while other features will operate only with the ignition switch in the On or Start positions. The EMIC circuitry is grounded through a ground circuit of the instrument panel wire harness.

The EMIC also has a self-diagnostic actuator test capability (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING), which will test each of the CAN bus message-controlled functions of the cluster by lighting the appropriate indicators, positioning the gauge needles at several predetermined calibration points across the gauge faces, and illuminating all segments of the odometer/trip odometer and gear selector indicator Vacuum-Fluorescent Display (VFD) units.

## GAUGES

All gauges receive battery current through the EMIC circuitry only when the ignition switch is in the On or Start positions. With the ignition switch in the Off position battery current is not supplied to any gauges, and the EMIC circuitry is programmed to move all of the gauge needles back to the low end of their respective scales. Therefore, the gauges do not accurately indicate any vehicle condition unless the ignition switch is in the On or Start positions.

All of the EMIC gauges are air core magnetic units. Two fixed electromagnetic coils are located within each gauge. These coils are wrapped at right angles to each other around a movable permanent magnet. The movable magnet is suspended within the coils on one end of a pivot shaft, while the gauge needle is attached to the other end of the shaft. One of the coils has a fixed current flowing through it to maintain a constant magnetic field strength. Current flow through the second coil changes, which causes changes in its magnetic field strength. The current flowing through the second coil is changed by the EMIC circuitry in response to messages received over the CAN data bus. The gauge needle moves as the movable permanent magnet aligns itself to the changing magnetic fields created around it by the electromagnets.

## ENGINE COOLANT TEMPERATURE GAUGE

This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine coolant temperature gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Temperature Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is between the low end of normal [about 54° C (130° F)] and the high end of normal [about 122° C (252° F)], the gauge needle is moved to the actual relative temperature position on the gauge scale.
- **Engine Temperature Low Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is below the low end of normal [about 54° C (130° F)], the gauge needle is held at the "C" increment at low end of the gauge scale. The gauge needle remains at the low end of the gauge scale until the cluster receives a message from the PCM indicating that the engine temperature is above about 54° C (130° F), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is above about 122° C (252° F), the gauge needle is moved into the red zone on the gauge scale, the engine temperature indicator is illuminated, and a single chime tone is sounded. The gauge needle remains in the red zone and the engine temperature indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine temperature is below about 122° C (252° F), or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.
- **Communication Error** - If the cluster fails to receive an engine temperature message, it will hold the gauge needle at the last indication for about five seconds or until the ignition switch is turned to the Off position, whichever occurs first. After five seconds, the cluster will move the gauge needle to the low end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine coolant temperature gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the instrument cluster. For further diagnosis of the engine coolant temperature gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service. The engine coolant temperature gauge is serviced as a unit with the instrument cluster.

## FUEL GAUGE

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and a hard wired input received by the cluster from the fuel level sending unit on the fuel pump module in the fuel tank.

The fuel gauge is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Fuel Level Sending Unit Input** - The cluster provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls and decreases as the fuel level rises causing changes in the sense input voltage. The cluster programming applies an algorithm to calculate the proper fuel gauge needle position based upon the fuel level sense input, then moves the gauge needle to the proper relative position on the gauge

scale. This algorithm is used to dampen gauge needle movement against the negative effect that fuel sloshing within the fuel tank can have on accurate inputs from the fuel tank sending unit to the cluster.

- **Less Than Ten Percent Tank Full Input** - Each time the fuel level sense input to the cluster indicates the fuel tank is about ten percent full or less for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, the gauge needle is moved to about the one-eighth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about thirteen percent full for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled off and then on again by the appropriate inputs from the fuel level sending unit.
- **Less Than Empty Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is less than the Empty gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is a short circuit.
- **More Than Full Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is more than the Full gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is an open circuit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the fuel gauge needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The instrument cluster continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The fuel gauge is serviced as a unit with the instrument cluster.

## SPEEDOMETER

The speedometer gives an indication to the vehicle operator of the vehicle road speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The speedometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Vehicle Speed Message** - Each time the cluster receives a vehicle speed message from the PCM it will calculate the correct vehicle speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new vehicle speed message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be positioned at the relative vehicle speed position on the gauge scale until the vehicle stops moving, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a speedometer message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the speedometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the vehicle speed sensor to determine the vehicle road speed. The PCM then sends the proper vehicle speed messages to the instrument cluster. For further diagnosis of the speedometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The speedometer is serviced as a unit with the instrument cluster.

## TACHOMETER

The tachometer gives an indication to the vehicle operator of the engine speed. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The tachometer is an air core magnetic unit that receives battery current on the instrument cluster electronic circuit board through the fused ignition switch output (run-start) circuit whenever the ignition switch is in the On or Start positions. The cluster is programmed to move the gauge needle back to the low end of the scale after the ignition switch is turned to the Off position. The instrument cluster circuitry controls the gauge needle position and provides the following features:

- **Engine Speed Message** - Each time the cluster receives an engine speed message from the PCM it will calculate the correct engine speed reading and position the gauge needle at that relative speed position on the gauge scale. The cluster will receive a new engine speed message and reposition the gauge pointer accordingly about every 88 milliseconds. The gauge needle will continually be repositioned at the relative engine speed position on the gauge scale until the engine stops running, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive an engine speed message, it will hold the gauge needle at the last indication for about three seconds, or until the ignition switch is turned to the Off position, whichever occurs first. After three seconds, the gauge needle will return to the left end of the gauge scale.
- **Actuator Test** - Each time the cluster is put through the actuator test, the tachometer needle will be swept to several calibration points on the gauge scale in a prescribed sequence in order to confirm the functionality of the gauge and the cluster control circuitry.

The PCM continually monitors the crankshaft position sensor to determine the engine speed. The PCM then sends the proper engine speed messages to the instrument cluster. For further diagnosis of the tachometer or the instrument cluster circuitry that controls the gauge, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The tachometer is serviced as a unit with the instrument cluster.

The gauges are diagnosed using the EMIC self-diagnostic actuator test (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN data bus and the electronic data bus message inputs to the EMIC that control each gauge require the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## VACUUM-FLUORESCENT DISPLAYS

The Vacuum-Fluorescent Display (VFD) units are soldered to the EMIC electronic circuit board. With the ignition switch in the Off or Accessory positions, the odometer display is activated when the driver door is opened (Rental Car mode) and is deactivated when the driver door is closed. Otherwise, both display units are active when the ignition switch is in the On or Start positions, and inactive when the ignition switch is in the Off or Accessory positions.

The illumination intensity of the VFD units is controlled by the EMIC circuitry based upon an input from the headlamp switch and a dimming level input received from the panel dimmer switch. The EMIC synchronizes the illumination intensity of other VFD units with that of the units in the EMIC by sending electronic dimming level messages to other electronic modules in the vehicle over the CAN data bus.

While in the odometer mode with the ignition switch in the On position and the engine not running, depressing the odometer/trip odometer switch for about six seconds will display the engine hours information. Holding this switch depressed while turning the ignition switch from the Off position to the On position will initiate the EMIC self-diagnostic actuator test. Refer to the instrument cluster diagnosis and testing service information for additional details on this cluster function. The EMIC microprocessor remembers which display mode is active when the ignition switch is turned to the Off position, and returns the VFD display to that mode when the ignition switch is turned On again.

The VFD units are diagnosed using the EMIC self-diagnostic actuator test (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Proper testing of the CAN data bus and the electronic data bus message inputs to the EMIC that control some of the VFD functions requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## TRANSMISSION RANGE INDICATOR

The electronic transmission range indicator gives an indication to the vehicle operator of the transmission gear that has been selected with the automatic transmission gear selector lever. This indicator is controlled by the instrument

cluster circuit board based upon cluster programming and electronic messages received from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The transmission range indicator information is displayed by a dedicated Vacuum Fluorescent Display (VFD) unit soldered onto the instrument cluster electronic circuit board, and the VFD will not display the transmission range indicator information after the ignition switch is turned to the Off position. Each time the cluster is disconnected from battery current for more than about five minutes, it must configure itself for the automatic transmission model that is in the vehicle once it is reconnected to battery current. The instrument cluster circuitry operates the transmission range indicator VFD to provide the following features:

- **Selected Gear Message** - Each time the cluster receives a selected gear message from the PCM, a box will be illuminated around the appropriate character in the gear selector indicator VFD. The box will remain illuminated until the cluster receives a different selected gear message, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Communication Error** - If the cluster fails to receive a selected gear message from the PCM within three seconds, the instrument cluster circuitry will display all gear selector positions boxed (selected) until a valid selected gear message is received or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the gear selector indicator VFD will display all of its characters at once, then step through each character segment individually during the VFD portion of the test to confirm the functionality of the VFD and the cluster control circuitry.

The PCM continually monitors a hard wired multiplex input from the Transmission Range Sensor (TRS), then sends the proper selected gear messages to the instrument cluster. For further diagnosis of the transmission range indicator or the instrument cluster circuitry that controls this function, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The Transmission Range indicator is serviced with the instrument cluster.

## INDICATORS

Indicators are located in various positions within the EMIC and are all connected to the EMIC electronic circuit board. The various EMIC indicators are controlled by different strategies; some receive fused ignition switch output from the EMIC circuitry and have a switched ground, while others are grounded through the EMIC circuitry and have a switched battery feed. However, all indicators are completely controlled by the EMIC microprocessor based upon various hard wired and electronic message inputs. All indicators except those located within the VFD units are illuminated at a fixed intensity, which is not affected by the selected illumination intensity of the electro-luminescent EMIC general illumination lamp. The illumination intensity of those within the VFD units is synchronized with that of the EMIC general illumination lamp.

In addition, certain indicators in this instrument cluster are automatically configured or self-configured. This feature allows the configurable indicators to be enabled by the EMIC circuitry for compatibility with certain optional equipment. The EMIC defaults for the ABS indicator and airbag indicator are enabled, and these configuration settings must be programmatically disabled in the EMIC using a diagnostic scan tool for vehicles that do not have this equipment. The automatically configured or self-configured indicators remain latent in each EMIC at all times and will be active only when the EMIC receives the appropriate CAN message inputs for that optional system or equipment.

## ABS INDICATOR

The ABS indicator gives an indication to the vehicle operator when the ABS system is faulty or inoperative. This indicator is controlled by a transistor on the

instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The ABS indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the ABS indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the ABS indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **ABS Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the ABS indicator will be illuminated. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Communication Error** - If the cluster receives no lamp-on or lamp-off messages from the CAB for five consecutive message cycles, the ABS indicator is illuminated. The indicator remains illuminated until the cluster receives a valid message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the ABS indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.
- **ABS Diagnostic Test** - The ABS indicator is blinked on and off by lamp-on and lamp-off messages from the CAB during the performance of the ABS diagnostic tests.

The CAB continually monitors the ABS circuits and sensors to decide whether the system is in good operating condition. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ABS indicator fails to light due to an open or short in the cluster ABS indicator circuit, the cluster sends a message notifying the CAB of the condition, then the instrument cluster and the CAB will each store a DTC. The ABS indicator is serviced with the instrument cluster.

## AIRBAG INDICATOR

The airbag indicator gives an indication to the vehicle operator when the airbag system is faulty or inoperative. The airbag indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Occupant Restraint Controller (ORC) over the Controller Area Network (CAN) data bus.

The airbag indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the airbag indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the airbag indicator is illuminated for about six to eight seconds. The entire bulb test is a function of the ORC.
- **ORC Lamp-On Message** - Each time the cluster receives a lamp-on message from the ORC, the airbag indicator will be illuminated. The indicator remains illuminated for about twelve seconds or until the cluster receives a lamp-off message from the ORC, whichever is longer.
- **Communication Error** - If the cluster receives no airbag messages for ten consecutive message cycles, the airbag indicator is illuminated. The indicator remains illuminated until the cluster receives a single lamp-off message from the ORC.
- **Actuator Test** - Each time the cluster is put through the actuator test, the airbag indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the airbag indicator is a function of the instrument cluster.

The ORC continually monitors the airbag system circuits and sensors to decide whether the system is in good operating condition. The ORC then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the ORC sends a lamp-on message after the bulb test, it indicates that the ORC has detected a system malfunction and/or that the airbags and seat belt tensioners may not deploy when required, or may deploy when not required. The ORC will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the airbag indicator fails to illuminate due to an open or short in the cluster airbag indicator circuit, the cluster sends a message notifying the ORC of the condition, the instrument cluster and the ORC will each store a DTC, and the cluster will flash the seat belt indicator on and off as a backup to notify the vehicle operator. The Airbag indicator is serviced with the instrument cluster.

## BRAKE/PARK BRAKE INDICATOR

The brake indicator gives an indication to the vehicle operator when the parking brake is applied, when there are certain brake hydraulic system malfunctions as indicated by a low brake hydraulic fluid level condition, or when the brake fluid level switch is disconnected.

The brake indicator can also give an indication when certain faults are detected in the Antilock Brake System (ABS). This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus, and a hard wired input from the park brake switch.

The brake indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the brake indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the brake indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **Brake Lamp-On Message** - Each time the cluster receives a lamp-on message from the CAB, the brake indicator will be illuminated. The CAB can also send brake lamp-on messages as feedback during ABS diagnostic procedures. The indicator remains illuminated until the cluster receives a lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Park Brake Switch Input** - Each time the cluster detects ground on the park brake switch sense circuit (park brake switch closed = park brake applied or not fully released) while the ignition switch is in the On position, the brake indicator flashes on and off. The indicator continues to flash until the park brake switch sense input to the cluster is an open circuit (park brake switch open = park brake fully released), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the brake indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The park brake switch on the park brake pedal mechanism provides a hard wired ground input to the instrument cluster circuitry through the park brake switch sense circuit whenever the park brake is applied or not fully released. The CAB continually monitors the ABS system circuits and sensors, including the brake fluid level switch on the brake master cylinder reservoir, to decide whether the system is in good operating condition. The CAB then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the CAB sends a lamp-on message after the bulb test, it indicates that the CAB has detected a brake hydraulic system malfunction and/or that the ABS system has become inoperative. The CAB will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. The Brake/Park Brake indicator is serviced with the instrument cluster.

## CHARGING INDICATOR

The charging indicator gives an indication to the vehicle operator when the electrical system voltage is too low or too high. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The charging indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the charging indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the charging indicator is illuminated by the instrument cluster for about two seconds as a bulb test.
- **Voltage Low Message** - Each time the cluster receives a message from the PCM indicating the electrical system voltage is low (less than about 11.5 volts is a charge fail condition), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the

electrical system voltage is normal (greater than about 12.0 volts, but less than 16.0 volts), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Voltage High Message** - Each time the cluster receives a message from the PCM indicating the electrical system voltage is high (greater than about 16.0 volts), the charging indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating the electrical system voltage is normal (less than about 15.5 volts, but greater than 11.5 volts), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the charging indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the electrical system voltage to control the generator output. The PCM then sends the proper system voltage messages to the instrument cluster. If the instrument cluster turns on the charging indicator due to a charge fail or voltage high condition, it may indicate that the charging system requires service. For further diagnosis of the charging indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The Charging indicator is serviced with the instrument cluster.

## ENGINE TEMPERATURE INDICATOR

The engine temperature indicator gives an indication to the vehicle operator when the engine temperature gauge reading reflects a condition requiring immediate attention.

This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The engine temperature indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the engine temperature indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the engine temperature indicator is illuminated for about two seconds as a bulb test. The entire bulb test is a function of the PCM.
- **Engine Temperature High Message** - Each time the cluster receives a message from the PCM indicating the engine coolant temperature is above about 122° C (252° F), the engine temperature indicator will be illuminated and a single chime tone is sounded. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine coolant temperature is below about 119° C (246° F), or until the ignition switch is turned to the Off position, whichever occurs first. The chime tone feature will only repeat during the same ignition cycle if the engine temperature indicator is cycled off and then on again by the appropriate engine temperature messages from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the engine temperature indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine coolant temperature sensor to determine the engine operating temperature. The PCM then sends the proper engine coolant temperature messages to the instrument cluster. For further diagnosis of the engine temperature indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the engine temperature indicator due to a high engine temperature gauge reading, it may indicate that the engine or the engine cooling system requires service. The Engine Temperature indicator is serviced with the instrument cluster.

## ELECTRONIC THROTTLE CONTROL INDICATOR

The Electronic Throttle Control (ETC) indicator gives an indication to the vehicle operator when the ETC system is faulty or inoperative. The ETC indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The ETC indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the ETC indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the ETC indicator is illuminated for about fifteen seconds. The entire bulb test is a function of the PCM.
- **ETC Lamp-On Message** - Each time the cluster receives a lamp-on message from the PCM, the ETC indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM message. The indicator remains illuminated solid or continues to flash for about twelve seconds or until the cluster receives a lamp-off message from the PCM, whichever is longer. If the indicator is illuminated solid with the engine running the vehicle will usually remain drivable. If the indicator is flashing with the engine running the vehicle may require towing. A flashing indicator means the ETC system requires immediate service.
- **Actuator Test** - Each time the cluster is put through the actuator test, the ETC indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry. The actuator test illumination of the ETC indicator is a function of the PCM.

The PCM continually monitors the ETC system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. If the PCM sends a lamp-on message after the bulb test, it indicates that the PCM has detected an ETC system malfunction and/or that the ETC system is inoperative. The PCM will store a Diagnostic Trouble Code (DTC) for any malfunction it detects. Each time the ETC indicator fails to illuminate due to an open or short in the cluster ETC indicator circuit, the cluster sends a message notifying the PCM of the condition, the instrument cluster and the PCM will each store a DTC. The Electronic Throttle Control indicator is serviced with the instrument cluster.

## FOG LAMP INDICATOR

The fog lamp indicator gives an indication to the vehicle operator whenever the optional fog lamps are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Front Control Module (FCM) (also known as the Integrated Power Module/IPM) over the Controller Area Network (CAN) data bus.

The fog lamp indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the fog lamp indicator for the following reasons:

- **Fog Lamp-On Message** - Each time the cluster receives a fog lamp-on message from the FCM indicating the fog lamp relay is energized, the fog lamp indicator will be illuminated. The indicator remains illuminated until the cluster receives a fog lamp-off message from the FCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the fog lamp indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors a hard wired input from the headlamp switch to determine the selected fog lamp switch status. The instrument cluster then sends the proper fog lamp-on and lamp-off messages to the FCM over the CAN data bus. The FCM activates the fog lamp relay then sends the proper fog lamp indicator lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the fog lamp indicator or the

instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The Fog Lamp indicator is serviced with the instrument cluster.

## HIGH BEAM INDICATOR

The high beam indicator gives an indication to the vehicle operator whenever the headlamp high beams are illuminated. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired multiplex input received by the cluster from the headlamp beam select switch circuitry of the multi-function switch on the washer/beam select switch mux circuit.

The high beam indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the high beam indicator for the following reasons:

- **High Beam Headlamps-On Input** - Each time the cluster detects a high beam headlamps-on input from the headlamp beam select switch circuitry of the multi-function switch on the washer/beam select switch mux circuit, the headlamp high beams and the high beam indicator will be illuminated. The headlamp high beams and the high beam indicator remain illuminated until the cluster receives a high beam headlamps-off input from the multi-function switch, or until the exterior lamp load shedding (battery saver) timed interval expires, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the high beam indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors the headlamp switch and the multi-function switch to determine the proper headlamp low beam and high beam control. The instrument cluster then sends the proper low beam and high beam lamp-on and lamp-off messages to the Front Control Module (FCM) over the Controller Area Network (CAN) data bus and turns the high beam indicator on or off accordingly. For further diagnosis of the high beam indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The High Beam indicator is serviced with the instrument cluster.

## LOW FUEL INDICATOR

The low fuel indicator gives an indication to the vehicle operator when the level of fuel in the fuel tank becomes low. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired input received by the cluster from the fuel level sending unit on the fuel pump module in the fuel tank.

The low fuel indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low fuel indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the low fuel indicator is illuminated for about two seconds as a bulb test.
- **Less Than Ten Percent Tank Full Input** - The cluster provides a constant current source to the fuel level sending unit and monitors a return input on a fuel level sense circuit. The resistance through the fuel level sending unit increases as the fuel level falls and decreases as the fuel level rises causing changes in the sense input voltage. Each time the fuel level sense input to the cluster indicates the fuel tank is about ten percent full or less for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, the fuel gauge needle is moved to about the one-eighth graduation on the gauge scale, the low fuel indicator is illuminated, and a single chime tone is sounded. The low fuel indicator remains illuminated until the fuel level sense input indicates that the fuel tank is greater than about thirteen percent full for ten consecutive seconds and the vehicle speed is zero, or for sixty consecutive seconds and the vehicle speed is greater than zero, or until the ignition switch is turned to the Off position, which-

ever occurs first. The chime tone feature will only repeat during the same ignition cycle if the low fuel indicator is cycled off and then on again by the appropriate inputs from the fuel level sending unit.

- **Less Than Empty Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is less than the Empty gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is a short circuit.
- **More Than Full Stop Input** - Each time the cluster receives a fuel level sense input that indicates the fuel level in the fuel tank is more than the Full gauge needle stop position, the gauge needle is moved to the low end of the gauge scale and the low fuel indicator is illuminated immediately. This input would indicate that the fuel level sense input to the cluster is an open circuit.
- **Actuator Test** - Each time the cluster is put through the actuator test, the low fuel indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster continually monitors the fuel tank sending unit to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the low fuel indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The Low Fuel indicator is serviced with the instrument cluster.

## LOW OIL PRESSURE INDICATOR

The low oil pressure indicator gives an indication to the vehicle operator when the engine oil pressure reading reflects a condition requiring immediate attention. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus.

The low oil pressure indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the low oil pressure indicator for the following reasons:

- **Engine Oil Pressure Low Message** - Each time the cluster receives a message from the PCM indicating the engine oil pressure is about 6.9 kPa (1 psi) or lower, the low oil pressure indicator will be illuminated. The indicator remains illuminated until the cluster receives a message from the PCM indicating that the engine oil pressure is above about 6.9 kPa (1 psi), or until the ignition switch is turned to the Off position, whichever occurs first. The cluster will only turn the indicator on in response to an engine oil pressure low message if the engine speed is greater than zero.
- **Actuator Test** - Each time the cluster is put through the actuator test, the low oil pressure indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the engine oil pressure sensor to determine the engine oil pressure. The PCM then sends the proper engine oil pressure messages to the instrument cluster. For further diagnosis of the low oil pressure indicator or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The Low Oil Pressure indicator is serviced with the instrument cluster.

## MALFUNCTION INDICATOR LAMP

The Malfunction Indicator Lamp (MIL) gives an indication to the vehicle operator when the Powertrain Control Module (PCM) has recorded a Diagnostic Trouble Code (DTC) for an On-Board Diagnostics II (OBDII) emissions-related circuit or component malfunction. The MIL is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the PCM over the Controller Area Network (CAN) data bus.

The MIL Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the MIL for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the indicator is illuminated for about fifteen seconds as a bulb test. The entire bulb test is a function of the PCM.
- **MIL Lamp-On Message** - Each time the cluster receives a MIL lamp-on message from the PCM, the indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the PCM message. For some DTC's, if a problem does not recur, the PCM will send a lamp-off message automatically. Other DTC's may require that a fault be repaired and the PCM be reset before a lamp-off message will be sent. For more information on the PCM, and the DTC set and reset parameters, (Refer to 25 - EMISSIONS CONTROL - OPERATION).
- **Communication Error** - If the cluster receives no messages from the PCM for ten consecutive message cycles, the MIL is illuminated by the instrument cluster to indicate a loss of bus communication. The indicator remains controlled and illuminated by the cluster until a valid message is received from the PCM.
- **Actuator Test** - Each time the cluster is put through the actuator test, the MIL indicator will be turned on during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The PCM continually monitors the fuel and emissions system circuits and sensors to decide whether the system is in good operating condition. The PCM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the MIL or the instrument cluster circuitry that controls the LED, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster turns on the MIL after the bulb test, it may indicate that a malfunction has occurred and that the fuel and emissions systems may require service. The Malfunction Indicator Lamp is serviced with the instrument cluster.

## SEAT BELT INDICATOR

The seat belt indicator gives an indication to the vehicle operator of the status of the driver side front seat belt. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming and a hard wired input from the seat belt switch in the driver side front seat belt retractor through the seat belt indicator driver circuit.

The seat belt indicator also includes a programmable enhanced seat belt reminder or "beltminder" feature that is enabled when the vehicle is shipped from the factory. This beltreminder feature can be disabled and enabled by the customer using a specific programming event sequence, or by the dealer using a diagnostic scan tool.

The seat belt indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the LED will always be off when the ignition switch is in any position except On or Start. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the seat belt indicator for the following reasons:

- **Seat Belt Reminder Function** - Each time the cluster receives a battery current input on the fused ignition switch output (run-start) circuit, the indicator will be illuminated as a seat belt reminder for about six seconds, or until the ignition switch is turned to the Off position, whichever occurs first. This reminder function will occur regardless of the status of the seat belt switch input to the cluster.
- **Driver Side Front Seat Belt Not Buckled - Beltminder Active** - Following the seat belt reminder function, each time the cluster detects an open circuit on the seat belt indicator driver circuit (seat belt switch open = seat belt unbuckled) with the ignition switch in the Start or On positions, the indicator will be illuminated. In addition, if the driver side front seat belt remains unbuckled about sixty seconds after the conclusion of the seat belt reminder function with the vehicle speed greater than about 8 kilometers-per-hour (5 miles-per-hour), the seat belt indicator will begin to cycle between flashing on and off for three seconds, then lighting solid for two seconds. The seat belt indicator will continue to cycle between flashing and solid illumination for thirteen complete cycles, until the seat belt indicator driver input to the cluster is closed to ground (seat belt switch closed = seat belt buckled), or until the ignition switch is turned to the Off position, whichever occurs first.
- **Driver Side Front Seat Belt Not Buckled - Beltminder Inactive** - Following the seat belt reminder function, each time the cluster detects an open circuit on the seat belt indicator driver circuit (seat belt switch open = seat belt unbuckled) with the ignition switch in the Start or On positions, the indicator will be illuminated. The

seat belt indicator remains illuminated until the seat belt indicator driver input to the cluster is closed to ground (seat belt switch closed = seat belt buckled), or until the ignition switch is turned to the Off position, whichever occurs first.

- **Airbag Indicator Backup** - If the instrument cluster detects a fault in the airbag indicator circuit it will send a message indicating the fault to the Occupant Restraint Controller (ORC), then flash the seat belt indicator on and off. The cluster will continue to flash the seat belt indicator until the airbag indicator circuit fault is resolved, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the seat belt indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The seat belt switch is connected in series between ground and the seat belt indicator driver input to the instrument cluster. The seat belt switch input to the instrument cluster circuitry may be diagnosed using conventional diagnostic tools and methods. Refer to the appropriate wiring information. The Seat Belt indicator is serviced with the instrument cluster.

## SECURITY INDICATOR

The security indicator gives an indication to the vehicle operator when the Vehicle Theft Security System (VTSS) is arming or is armed. On models equipped with the Sentry Key Immobilizer System (SKIS), the security indicator also gives an indication to the vehicle operator of the status of the SKIS. This indicator is controlled by a transistor on the instrument cluster circuit board based upon cluster programming, hard wired inputs to the cluster from the various security system components, electronic messages received by the cluster from the Sentry Key REMote Entry Module (SKREEM) over the Controller Area Network (CAN) data bus.

The security indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, the LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the security indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the security indicator illuminates for about two seconds as a bulb test. The entire bulb test is a function of the SKREEM.
- **VTSS Indication** - During the sixteen second VTSS arming function, the cluster will flash the security indicator on and off repeatedly at a steady, fast rate to indicate that the VTSS is in the process of arming. Following successful VTSS arming, the cluster flashes the security indicator on and off continuously at a slower rate to indicate that the VTSS is armed. The security indicator continues flashing at the slower rate until the VTSS is disarmed or triggered. If the VTSS has alarmed and rearmed, the cluster will flash the security indicator at a steady, slow rate for about thirty seconds after the VTSS is disarmed.
- **SKIS Lamp-On Message** - Each time the cluster receives a SKIS lamp-on message from the SKREEM, the security indicator will be illuminated. The indicator can be flashed on and off, or illuminated solid, as dictated by the SKREEM message. The indicator remains illuminated solid or continues to flash until the cluster receives a SKIS lamp-off message from the SKREEM, or until the ignition switch is turned to the Off position, whichever occurs first. For more information on the SKIS and the security indicator control parameters, (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/SENTRY KEY IMMOBILIZER SYSTEM - OPERATION).
- **Communication Error** - If the cluster receives no SKIS lamp-on or lamp-off messages from the SKREEM for ten consecutive message cycles, the security indicator is illuminated by the instrument cluster. The indicator remains controlled and illuminated by the cluster until a valid SKIS lamp-on or lamp-off message is received from the SKREEM.
- **Actuator Test** - Each time the instrument cluster is put through the actuator test, the security indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The instrument cluster circuitry controls the security indicator whenever the ignition switch is in the Off position and the VTSS is arming, armed, or alarming. Whenever the ignition switch is in the On or Start positions, the SKREEM performs a self-test to decide whether the SKIS is in good operating condition and whether a valid key is present in the ignition lock cylinder. The SKREEM then sends the proper lamp-on or lamp-off messages to the instrument cluster. For further diagnosis of the security indicator or the instrument cluster circuitry that controls the indicator,

(Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). If the instrument cluster flashes the security indicator upon ignition On, or turns on the security indicator solid after the bulb test, it indicates that a SKIS malfunction has occurred or that the SKIS is inoperative. The Security indicator is serviced with the instrument cluster.

### TRACTION CONTROL INDICATOR

The traction control indicator gives an indication to the vehicle operator when the electronic Traction Control System (TCS) has been activated. This indicator is controlled by the instrument cluster circuit board based upon cluster programming and electronic messages received by the cluster from the Controller Antilock Brake (CAB) over the Controller Area Network (CAN) data bus.

The traction control indicator is completely controlled by the instrument cluster logic circuit, and that logic will only allow this indicator to operate when the instrument cluster receives a battery current input on the fused ignition switch output (run-start) circuit. Therefore, the indicator will always be off when the ignition switch is in any position except On or Start. The indicator only illuminates when it is switched to ground by the instrument cluster circuitry. The instrument cluster will turn on the traction control indicator for the following reasons:

- **Bulb Test** - Each time the ignition switch is turned to the On position the traction control indicator is illuminated for about four seconds as a bulb test. The entire bulb test is a function of the CAB.
- **Traction Control Lamp-On Message** - Each time the cluster receives a traction control lamp-on message from the CAB indicating that the TCS has been activated, the traction control indicator will be illuminated. The indicator remains illuminated until the cluster receives a traction control lamp-off message from the CAB, or until the ignition switch is turned to the Off position, whichever occurs first.
- **Actuator Test** - Each time the cluster is put through the actuator test, the traction control indicator will be turned on, then off again during the bulb check portion of the test to confirm the functionality of the LED and the cluster control circuitry.

The CAB continually monitors the traction control switch to determine the proper outputs to the components of the Antilock Brake System (ABS). The CAB then sends the proper traction control lamp-on and lamp-off messages to the instrument cluster. For further diagnosis of the traction control indicator or the instrument cluster circuitry that controls the indicator, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The Traction Control indicator is serviced with the instrument cluster.

### TURN SIGNAL INDICATORS

The turn signal indicators give an indication to the vehicle operator that the turn signal (left or right indicator flashing) or hazard warning (both left and right indicators flashing) have been selected and are operating. These indicators are controlled by transistors on

the instrument cluster electronic circuit board based upon the cluster programming, a hard wired multiplex input received by the cluster from the turn signal and hazard warning switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, and electronic messages received from the Front Control Module (FCM) (also known as the Integrated Power Module/IPM) over the Controller Area Network (CAN) data bus.

Each turn signal indicator Light Emitting Diode (LED) is completely controlled by the instrument cluster logic circuit, and that logic will allow this indicator to operate whenever the instrument cluster receives a battery current input on the fused B(+) circuit. Therefore, each LED can be illuminated regardless of the ignition switch position. The LED only illuminates when it is provided a path to ground by the instrument cluster transistor. The instrument cluster will turn on the turn signal indicators for the following reasons:

- **Turn Signal-On Input** - Each time the cluster detects a turn signal-on input from the turn signal switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, it sends the appropriate electronic turn signal switch status messages to the FCM over the CAN data bus. The FCM responds to these messages by controlling a battery voltage output and the flash rate for either the right or left turn signal lamps. The FCM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right or left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional turn signal flasher.

The turn signals and the turn signal indicators continue to flash on and off until the cluster receives a turn signal-off input from the multi-function switch, or until the ignition switch is turned to the Off position, whichever occurs first.

- **Hazard Warning-On Input** - Each time the cluster detects a hazard warning-on input from the hazard warning switch circuitry of the multi-function switch on the turn/hazard switch mux circuit, it sends the appropriate electronic hazard switch status messages to the FCM over the CAN data bus. The FCM responds to these messages by controlling a battery voltage output and the flash rate for each of the right and left turn signal lamps. The FCM also sends the appropriate electronic messages back to the EMIC to control the illumination and flash rate of the right and left turn signal indicators, as well as to control the click rate of an electromechanical relay soldered onto the EMIC electronic circuit board that emulates the sound emitted by a conventional hazard warning flasher. The turn signals and the turn signal indicators continue to flash on and off until the cluster receives a hazard warning-off input from the multi-function switch.
- **Lamp Out Mode** - The instrument cluster also sends electronic turn signal on and off messages to the FCM over the CAN data bus, and the FCM flashes the appropriate exterior turn signal lamps. If the FCM detects an inoperative turn signal lamp or circuit, it increases the flash rate for the remaining operative turn signals and sends an electronic message back to the instrument cluster. The instrument cluster then increases the flash rate of the turn signal indicator(s) and the clicking rate of the electromechanical relay to provide an indication of the problem to the vehicle operator.
- **Actuator Test** - Each time the cluster is put through the actuator test, the turn signal indicators will be turned on, then off again during the bulb check portion of the test to confirm the functionality of each LED and the cluster control circuitry.

The instrument cluster continually monitors the multi-function switch and electronic messages from the FCM to determine the proper turn signal and hazard warning system control. For further diagnosis of the turn signal indicators or the instrument cluster circuitry that controls the indicators, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). The Turn Signal indicators are serviced with the instrument cluster.

## CLUSTER ILLUMINATION

The EMIC has a single electro-luminescent lamp that provides cluster back lighting whenever the exterior lighting is turned On. The illumination intensity of this lamp is adjusted when the interior lighting thumbwheel on the headlamp switch is rotated (down to dim, up to brighten) to one of six available minor detent positions. The EMIC monitors a resistor multiplexed input from the headlamp switch on a dimmer input circuit. In response to that input, the EMIC electronic circuitry converts a fused 12-volt input it receives on a hard wired panel lamps dimmer switch signal circuit into a 12-volt Pulse Width Modulated (PWM) output.

The EMIC uses this PWM output to control the illumination intensity of the electro-luminescent cluster illumination lamp and the VFD units on the EMIC circuit board, then provides a synchronized PWM output on various hard wired fused panel lamps dimmer switch signal circuits to control and synchronize the illumination intensity of other incandescent illumination lamps in the vehicle. The EMIC also transmits electronic dimming level messages over the CAN data bus to other electronic modules in the vehicle to control and synchronize the illumination intensity of their VFD units to that of the EMIC VFD units.

In addition, the thumbwheel on the headlamp switch has a Parade Mode position to provide a parade or funeral mode. The EMIC monitors the request for this mode from the headlamp switch, then transmits an electronic dimming level message to illuminate all VFD units in the vehicle at full (daytime) intensity for easier visibility when driving in daylight with the exterior lighting turned On.

The electro-luminescent lamp unit consists of layers of phosphor, carbon, indium tin oxide, and dielectric applied by a silk-screen process between two polyester membranes and includes a short pigtail wire and connector. The lamp pigtail wire is connected to a connector receptacle on the EMIC circuit board. The EMIC powers this lamp with an Alternating Current (AC) rated at 80 volts rms (root mean squared) and 415 Hertz produced by a transformer on the circuit board, which excites the phosphor particles causing them to luminesce.

## ELECTRONIC VEHICLE INFORMATION CENTER

The following Modes allow the driver to access and display the driver- interactive features:

### TRIP MODE

Provides a choice of units displayed in English or metric. The following information can be displayed at the top of the screen: Average MPG, distance to empty (DTE), Trip A and Trip B odometers, and elapsed time. The odometer

is displayed at the bottom of the screen. If warnings exist, they will replace the odometer in the display. The driver can scroll to view multiple warnings.

### COMPASS, TEMPERATURE AND AUDIO MODE

Compass heading and outside temperature are displayed at the top of the screen. On the lower half of the screen the audio mode is displayed along with the odometer.

### TELEPHONE MODE

Provides the following information and features for the optional hands-free communications system:

- Phone status: idle, voice mail, roaming, battery strength and signal strength in increments of 20 percent.
- Call status: Incoming call, connecting, connected, air time in minutes and seconds, call ended, busy, call failed, roaming and no phone connection.
- Caller ID phone number display.

### NAVIGATION MODE

Displays Turn-by-Turn directions that appear in the display as the vehicle approaches a designated turn within a programmed route.

### PERSONAL SETTINGS MODE

Allows the driver to set and recall features when the transmission is in Park.

### SYSTEM STATUS MODE

Displays warnings and user interaction messages. Initial warnings will be displayed full-screen for three seconds, then override the odometer and show text warnings on the bottom line of the display. Critical text warnings will be displayed until the failure is corrected. Non-critical text warnings will be displayed for 60 seconds. The driver can scroll to view multiple messages. A single chime sounds for all warnings.

For a more detailed operation of the EVIC (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - OPERATION).

## DIAGNOSIS AND TESTING

### INSTRUMENT CLUSTER

**WARNING:** To avoid personal injury or death, on vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment, personal injury or death.

If all of the instrument cluster gauges and indicators are inoperative, be certain to check the instrument cluster fused B(+) fuse and the instrument cluster fused B(+) and ground circuits for shorts or opens. Refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

If an individual hard wired gauge or indicator is inoperative, refer to the diagnosis and testing service information for that specific gauge or indicator. If an individual Controller Area Network (CAN) data bus message-controlled gauge or indicator is inoperative, perform the Actuator Test as follows:

**CAUTION:** Instrument clusters used in this model automatically configure themselves for compatibility with the features and optional equipment in the vehicle in which they are initially installed. The instrument cluster is programmed to do this by embedding the Vehicle Identification Number (VIN) and other information critical to proper cluster operation into electronic memory. This embedded information is learned through electronic messages received from other electronic modules in the vehicle over the Controller Area Network (CAN) data bus, and through certain hard wired inputs received when the cluster is connected to the vehicle electrically. Once configured, the instrument cluster memory may be irreparably damaged and certain irreversible configuration errors may occur if the cluster is connected electrically to another vehicle; or, if an electronic module from another vehicle is connected that provides data to the instrument cluster (including odometer values) that conflicts with that which was previously learned and stored. Therefore, the practice of exchanging (swapping) instrument clusters and other electronic modules in this vehicle with those removed from another vehicle must always be avoided. Failure to observe this caution may result in instrument cluster damage, which is not reimbursable under the terms of the product warranty. Service replacement instrument clusters are provided with the correct VIN, and the certified odometer and engine hours values embedded into cluster memory, but will otherwise be automatically configured for compatibility with the features and optional equipment in the vehicle in which they are initially installed.

**Note:** Certain indicators in this instrument cluster are automatically configured. This feature allows those indicators to be activated or deactivated for compatibility with certain optional equipment. If the problem being diagnosed involves improper illumination of the cruise indicator, the electronic throttle control indicator, the tow/haul indicator, the service four-wheel drive indicator, the four-wheel drive low indicator, the four-wheel drive lock indicator, the transmission overtemp indicator, the security indicator or the gear selector indicator, disconnect and isolate the battery negative cable. After about five minutes, reconnect the battery negative cable and turn the ignition switch to the On position. The instrument cluster should automatically relearn the equipment in the vehicle and properly configure the configurable indicators accordingly.

## ACTUATOR TEST

The instrument cluster actuator test will put the instrument cluster into its self-diagnostic mode. In this mode the instrument cluster can perform a self-diagnostic test that will confirm that the instrument cluster circuitry, the gauges, and the indicators are capable of operating as designed. During the actuator test the instrument cluster circuitry will position each of the gauge needles at various calibration points and illuminate all of the segments in the Vacuum Fluorescent Display (VFD) units.

Successful completion of the actuator test will confirm that the instrument cluster is operational. However, there may still be a problem with the CAN data bus, the Powertrain Control Module (PCM), the Front Control Module (FCM), the Transmission Control Module (TCM), the Occupant Restraint Controller (ORC), the Controller Anti-lock Brake (CAB), or the hard wired inputs to one of these electronic control modules. Use a diagnostic scan tool to diagnose these components. Refer to the appropriate diagnostic information.

1. Begin the test with the ignition switch in the Off position.
2. Depress the odometer/trip odometer switch button.
3. While still holding the odometer/trip odometer switch button depressed, turn the ignition switch to the On position, but do not start the engine.
4. Release the odometer/trip odometer switch button.
5. The instrument cluster will simultaneously begin to illuminate all of the operational segments in both VFD units, and perform a bulb check of each operational LED indicator. The VFD segments and LED indicators remain illuminated as each gauge needle is swept to several calibration points and back. If a VFD segment or an LED indicator fails to illuminate, or if a gauge needle fails to sweep through the calibration points and back during this test, the instrument cluster must be replaced.
6. The actuator test is now completed. The instrument cluster will automatically exit the self-diagnostic mode and return to normal operation at the completion of the test. The actuator test will be aborted if the ignition switch is turned to the Off position, or if a vehicle speed message indicating that the vehicle is moving is received from the PCM over the CAN data bus during the test.
7. Go back to Step 1 to repeat the test, if necessary.

## STANDARD PROCEDURE

### ENHANCED SEATBELT REMINDER PROGRAMMING

The seatbelt indicator also includes a programmable enhanced seatbelt reminder or "beltminder" feature that is enabled when the vehicle is shipped from the factory. This beltreminder feature provides extended and modified visual seatbelt indicator and audible chime warning responses to an unbuckled driver side front seat belt. The beltreminder feature may be disabled or enabled by the customer using the programming sequence that follows, or by the dealer using a diagnostic scan tool. The following sequence of events must occur within sixty (60) seconds of the ignition switch being placed in the On position in order for the programming to be completed successfully.

1. With the ignition switch in any position except On or Start, buckle the driver side front seat belt.
2. Turn the ignition switch to the On position and wait for the seatbelt indicator reminder function to conclude (about six seconds).
3. Unbuckle and buckle the driver side front seat belt three or more times, ending with the belt buckled.
4. Turn the ignition switch to any position except On or Start to toggle the beltreminder feature from its current setting (from active to inactive, or from inactive to active). A single chime tone will provide an audible confirmation that the programming sequence has been successfully completed.

### REMOVAL

1. Disconnect and isolate the battery negative cable.
- 2.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

3. Remove the instrument cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
4. Remove the four cluster retaining screws.
5. Disconnect the cluster electrical connectors.
6. Remove cluster from instrument panel.

## INSTALLATION

1. Position cluster into instrument panel opening.
2. Connect the cluster electrical connectors.
3. Install the four cluster retaining screws.
4. Install the cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
5. Connect the battery negative cable.

## CLUSTER LENS

### REMOVAL

1. Disconnect and isolate the battery negative cable.
- 2.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

3. Remove the instrument cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
4. Remove the cluster lens retaining screws.
5. Separate the cluster lens from the cluster and remove from Instrument panel.

## INSTALLATION

1. Place cluster lens into position on cluster.
2. Install the cluster lens screws.
3. Install the cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - INSTALLATION).
4. Connect the battery negative cable.

## INSTRUMENT PANEL SWITCH POD

### DESCRIPTION

The Instrument Panel Switch Pod is located in the instrument panel center bezel just above the radio, and between the A/C outlet ducts. The switch pod includes push button controls for the Hazard Flashers, Electronic Stability Program (ESP) or Anti-Slip Regulation (ASR) Off switch, and on Dodge models Rear Wiper/Washer. Also the Passenger Airbag Disabled (PAD) Indicator is located within the switch pod. The switch pod is a single unit with one wire connector and two mounting tabs and cannot be taken apart or serviced. If one or more of the switches, or illumination is inoperative, the entire pod must be replaced.

There are different configurations depending on the model and country.

## DOMESTIC SEDAN

The sedan for sale in North America will have a Hazard Switch, Passenger Airbag Disabled (PAD) Indicator, and Electronic Stability Program (ESP) Off Switch.

8135f679

## DOMESTIC WAGON

The wagon for sale in North America will have Rear Wipe/Wash Switch, Hazard Switch, Passenger Airbag Disabled (PAD) Indicator, and Electronic Stability Program (ESP) Off Switch.

81352c18

## EXPORT WAGON

The wagon for sale outside North America will have Rear Wipe/Wash Switch, Hazard Switch, Passenger Airbag Disabled (PAD) Indicator, and Electronic Stability Program (ESP) Off Switch.

8134f367

Export wagons may also have Rear Wipe/Wash Switch, Hazard Switch, Passenger Airbag Disabled (PAD) Indicator, and Anti-Slip Regulation (ASR) Off Switch.

8134f382

## OPERATION

### LIFTGATE WIPER AND WASHER SWITCH

A liftgate wiper and washer rocker switch provides intermittent wiper operation as well as rear washer operation. Pressing one side of the rocker switch knob actuates the washer system, while pressing the other side of the rocker switch knob turns the intermittent rear wiper ON and OFF. When the rear intermittent wiper is ON, an indicator in the switch knob is illuminated. Refer to Wipers/Washers for description and operation of the Rear Wiper/Washer Switch.

## HAZARD WARNING SWITCH

A latching push-button hazard-warning switch is placed in the instrument panel switch pod. This is an ergonomic place for the switch where it can be conveniently reached. Refer to Lamps/Lighting - Exterior for description and operation of the hazard warning switch.

## PASSENGER AIRBAG DISABLED (PAD) INDICATOR

The indicator is placed in the instrument panel switch pod. This is an ergonomic place for the indicator where it can be conveniently seen by all interior occupants. Refer to Restraints for description and operation of the Passenger Airbag Disabled (PAD) Indicator.

## ELECTRONIC STABILITY PROGRAM (ESP) OFF SWITCH

A momentary contact, push-button ESP switch is placed in the instrument panel switch pod. This is an ergonomic place for the switch where it can be conveniently reached. Refer to Brakes for description and operation of the ESP system and ESP off switch.

## ANTI-SLIP REGULATION (ASR) OFF SWITCH

A momentary contact, push-button ASR switch is placed in the instrument panel switch pod. This is an ergonomic place for the switch where it can be conveniently reached. Refer to Brakes for description and operation of the ASR system and ASR off switch.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
- 2.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

3. Remove the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
4. Remove the two screws (1) from the rear of the switch pod.
5. Separate switch from center bezel.

## INSTALLATION

1. Place the switch pod in the bezel opening and install the two screws (1).
2. Install the instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
3. Connect the battery negative cable.

## **LAMPS/LIGHTING - EXTERIOR - ELECTRICAL DIAGNOSTICS**

### **DIAGNOSIS AND TESTING**

## B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW

**B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a LOW condition.

Possible Causes
(L43) LEFT LOW BEAM CONTROL CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

- Turn the ignition on.
- With the Scan Tool, clear all FCM DTC's.
- Turn the Headlamps on.
- With the Scan Tool read the DTC information.

**Does the Scan Tool read: B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW?**

- Yes**    >> Go To 2
- No**    >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST - VER 1.

**B162B-LEFT LOW BEAM CONTROL CIRCUIT LOW (CONTINUED)****2. (L43) LEFT LOW BEAM CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance between ground and the (L43) Left Low Beam Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Front Control Module (FCM) in accordance with the service information.

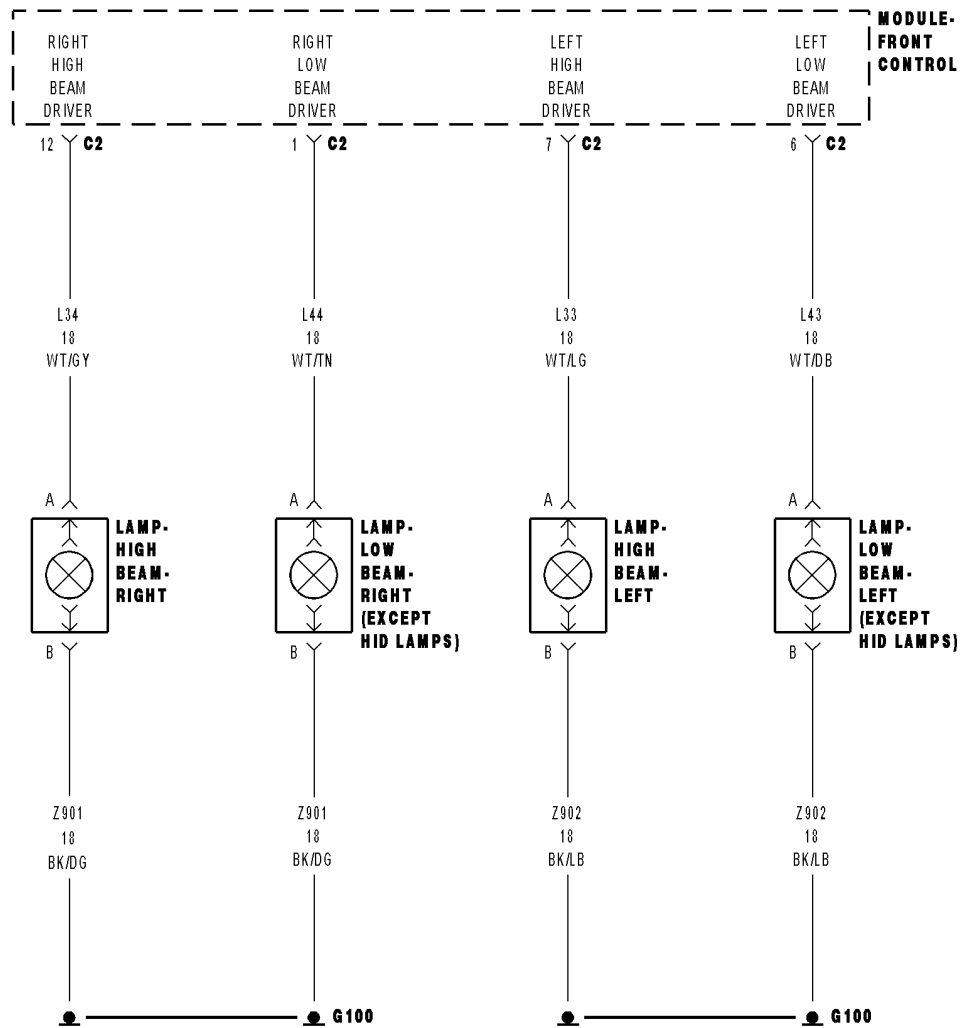

Perform the BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (L43) Left Low Beam Control circuit for a short to ground condition.

Perform the BODY VERIFICATION TEST - VER 1.

## B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW

**B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a LOW condition.

Possible Causes
(L44) RIGHT LOW BEAM CONTROL CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Headlamps on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1.

**B162F-RIGHT LOW BEAM CONTROL CIRCUIT LOW (CONTINUED)****2. (L44) RIGHT LOW BEAM CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance between ground and the (L44) Right Low Beam Control circuit.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Front Control Module (FCM) in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.
- No** >> Repair the (L44) Right Low Beam Control circuit for a short to ground condition.  
Perform the BODY VERIFICATION TEST - VER 1.

# B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH

**B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a LOW condition.

Possible Causes
(L44) RIGHT LOW BEAM CONTROL CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

- Turn the ignition on.
- With the Scan Tool, clear all FCM DTC's.
- Turn the Headlamps on.
- With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST - VER 1.

**B1630-RIGHT LOW BEAM CONTROL CIRCUIT HIGH (CONTINUED)****2. (L44) RIGHT LOW BEAM CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance of the (L44) Right Low Beam Control circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (L44) Right Low Beam Control circuit for a short to battery condition.

Perform the BODY VERIFICATION TEST - VER 1.

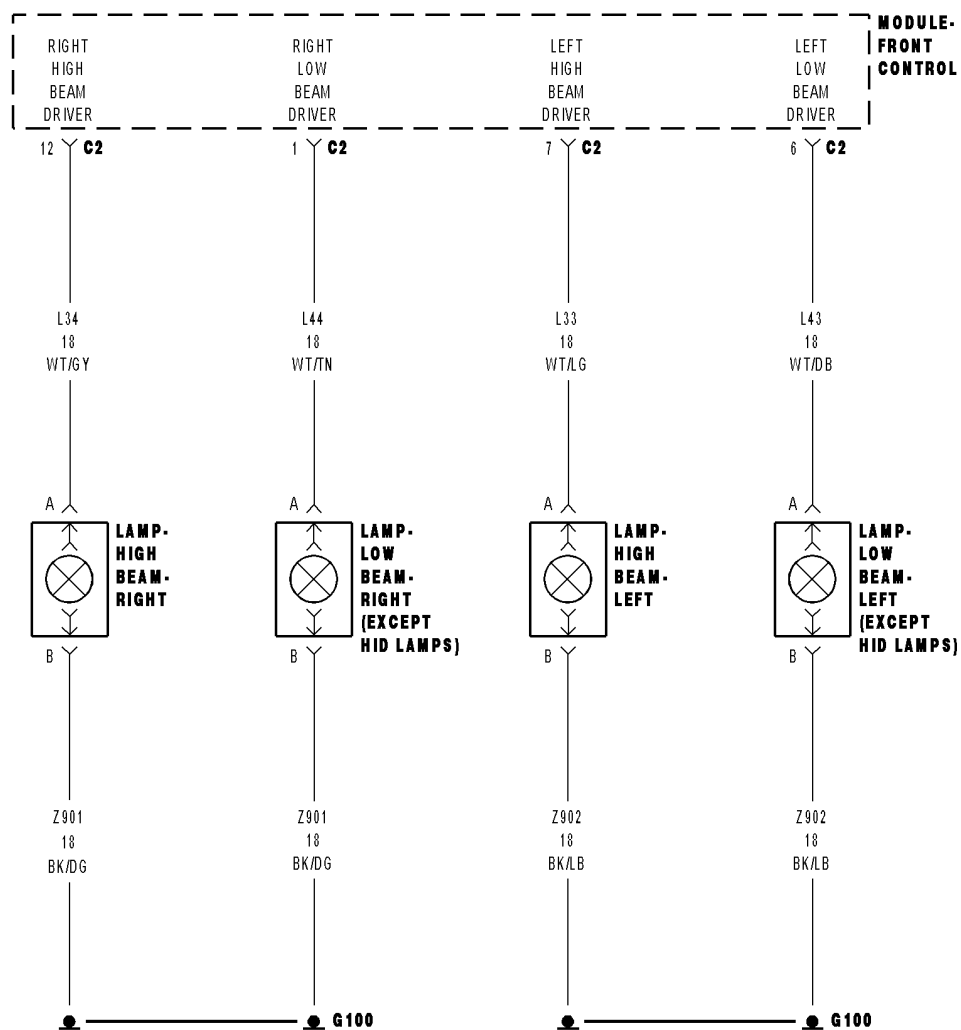

**No** >> Replace the Front Control Module (FCM) in accordance with the service information.

Perform the BODY VERIFICATION TEST - VER 1.

## B1633-LEFT HI BEAM CONTROL CIRCUIT LOW

**B1633-LEFT HI BEAM CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a LOW condition.

Possible Causes
(L33) LEFT HIGHBEAM OUTPUT CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Highbeam Headlamps on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1633-LEFT HI BEAM CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1.

**B1633-LEFT HI BEAM CONTROL CIRCUIT LOW (CONTINUED)****2. (L33) LEFT HIGHBEAM OUTPUT CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance between ground and the Left Highbeam Output circuit.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Front Control Module (FCM) in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.
- No** >> Repair the (L33) Left Highbeam Output circuit for a short to ground condition.  
Perform the BODY VERIFICATION TEST - VER 1.

## B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH

**B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a HIGH condition.

Possible Causes
(L33) HIGH BEAM CONTROL CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

- Turn the ignition on.
- With the Scan Tool, clear all FCM DTC's.
- Turn the Headlamps on.
- With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH?**

- Yes**
- >> Go To 2
- No**
- >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST - VER 1.

**B1634-LEFT HI BEAM CONTROL CIRCUIT HIGH (CONTINUED)****2. (L33) HIGH BEAM CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance of the (L33) High Beam Control circuit.

**Is the resistance above 5.0 ohms?**

- Yes** >> Repair the (L33) High Beam Control circuit for a short to battery condition.  
Perform the BODY VERIFICATION TEST - VER 1.
- No** >> Replace the Front Control Module (FCM) in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.

## B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW

**B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Highbeam Headlamps activated.
- **Set Condition:**
- When the FCM detects a High condition.

Possible Causes
(L34) RIGHT HIGHBEAM OUTPUT CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Highbeam Headlamps on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1.

**B1637-RIGHT HI BEAM CONTROL CIRCUIT LOW (CONTINUED)****2. (L34) RIGHT HIGHBEAM OUTPUT CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance between ground and the Right Highbeam Output circuit.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Front Control Module (FCM) in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.
- No** >> Repair the (L34) Right Highbeam Output circuit for a short to ground condition.  
Perform the BODY VERIFICATION TEST - VER 1.

## B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH

**B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Headlamps activated.
- **Set Condition:**
- When the FCM detects a HIGH condition.

Possible Causes
(L34) HIGH BEAM CONTROL CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

- Turn the ignition on.
- With the Scan Tool, clear all FCM DTC's.
- Turn the Headlamps on.
- With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST - VER 1.

**B1638-RIGHT HI BEAM CONTROL CIRCUIT HIGH (CONTINUED)****2. (L34) HIGH BEAM CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

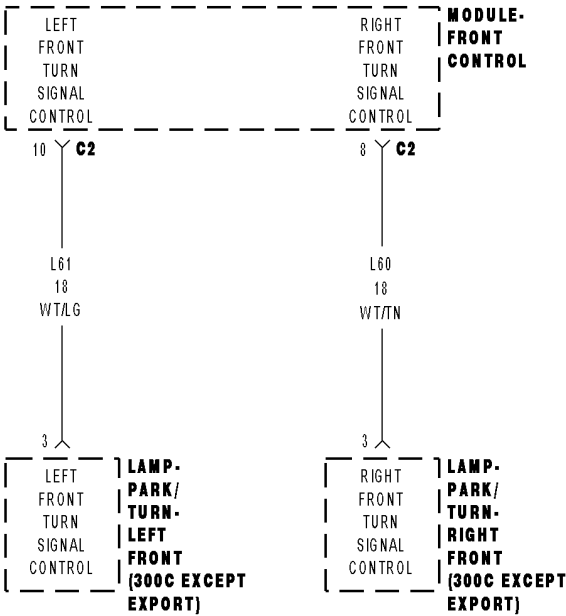

Measure the resistance of the (L34) High Beam Control circuit.

**Is the resistance above 5.0 ohms?**

- Yes** >> Repair the (L34) High Beam Control circuit for a short to battery condition.  
Perform the BODY VERIFICATION TEST - VER 1.
- No** >> Replace the Front Control Module (FCM) in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.

B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW

**B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
(L61) FRONT LEFT TURN SIGNAL CONTROL CIRCUIT POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Left Turn Signals on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST - VER 1.

**B163B-FRONT LEFT TURN CONTROL CIRCUIT LOW (CONTINUED)****2. L61 FRONT LEFT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 connector.

Measure the resistance between ground and the (L61) Front Left Turn Signal Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (L61) Front Left Turn Signal Control circuit for a short to ground.  
Perform the BODY VERIFICATION TEST - VER 1.

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the FCM C2 connector.

Measure the resistance between ground and the (L61) Front Left Turn Signal Control circuit in the FCM.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Power Distribution Center in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.

## B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH

**B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Front Control Module detects a short to battery on the Control circuit.

Possible Causes
(L61) TURN SIGNAL CONTROL CIRCUIT POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

Clear all FCM DTC's

Turn the Left Turn Signal on.

With the scan tool, read DTC's.

**Does the scan tool read: B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**B163C-FRONT LEFT TURN CONTROL CIRCUIT HIGH (CONTINUED)****2. L61 LEFT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 connector.

Measure the resistance of the (L61) Front Left Turn Signal Control circuit.

**Is the resistance above 5.0 ohms?**

**No** >> Repair the (L61) Turn Signal Control circuit.  
Perform BODY VERIFICATION TEST - VER 1.

**Yes** >> Go To 3

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Front Control Module from the PDC 49-way connector.

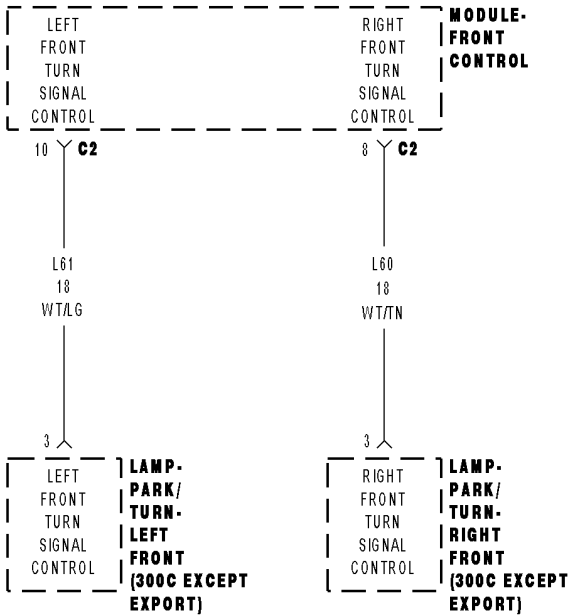

Measure the voltage between (L61) Front Left Turn Signal Control circuit and ground.

**Is there any voltage present?**

**Yes** >> Replace the Power Distribution Center in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW

**B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
(L60) FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Right Turn Signals on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST - VER 1.

**B163F-FRONT RIGHT TURN CONTROL CIRCUIT LOW (CONTINUED)****2. L60 FRONT RIGHT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM C2 harness connector.

Measure the resistance between ground and the (L60) Front Turn Signal Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (L60) Front Right Turn Signal Control circuit for a short to ground.  
Perform the BODY VERIFICATION TEST - VER 1.

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the FCM connector.

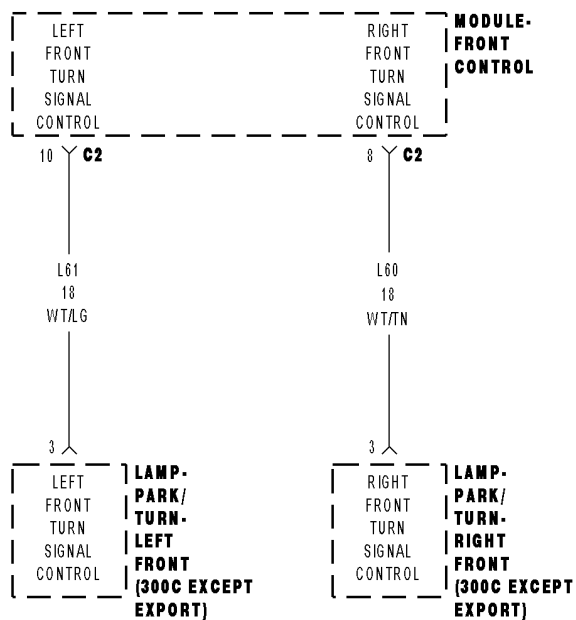

Measure the resistance between ground and the (L60) Front Right Turn Signal Control circuit in the FCM.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Power Distribution Center in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST - VER 1.

## B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH

**B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Front Control Module detects a short to battery on the Control circuit.

Possible Causes
(L60) TURN SIGNAL CONTROL CIRCUIT POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

Clear all FCM DTC's

Turn the Right Turn Signal on.

With the scan tool, read DTC's.

**Does the scan tool read: B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**B1640-FRONT RIGHT TURN CONTROL CIRCUIT HIGH (CONTINUED)****2. L60 RIGHT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the PDC connector from the FCM.

Measure the resistance of the (L60) Front Right Turn Signal Control circuit.

**Is the resistance above 5.0 ohms?**

**No** >> Repair the (L60) Turn Signal Control circuit.  
Perform BODY VERIFICATION TEST - VER 1.

**Yes** >> Go To 3

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Front Control Module from the PDC 49 way connector.

Measure the voltage between (L60) Front Right Turn Signal Control circuit and ground.

**Is there any voltage present?**

**Yes** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Front Control Module.  
Perform BODY VERIFICATION TEST - VER 1.

# B1643-REAR LEFT TURN CONTROL CIRCUIT LOW

**B1643-REAR LEFT TURN CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
(L63) REAR LEFT TURN SIGNAL CONTROL CIRCUIT MODULE POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Left Turn Signals on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1643-REAR LEFT TURN CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST-VER1.

**B1643-REAR LEFT TURN CONTROL CIRCUIT LOW (CONTINUED)****2. L63 LEFT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM PDM connector.

Measure the resistance between ground and the (L63) Rear Left Turn Signal Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (L63) Rear Left Turn Signal Control circuit for a short to ground.  
Perform the BODY VERIFICATION TEST-VER1.

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the FCM connector.

Disconnect the PDM connector.

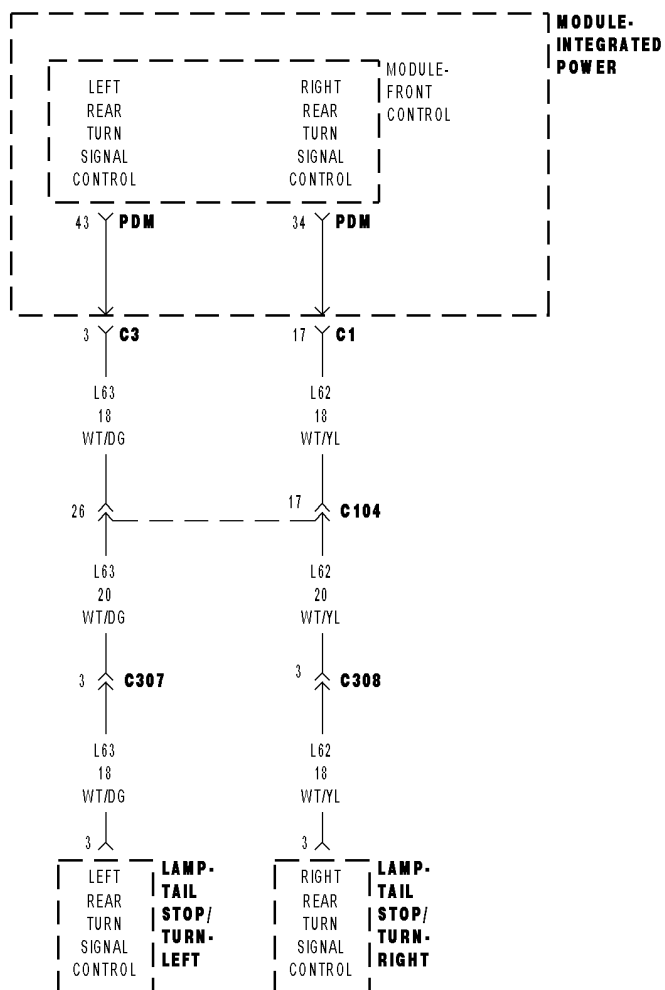

Measure the resistance between ground and the (L63) Left Turn Signal Control circuit in the PDM.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Module Power Distribution Center in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

**No** >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

## B1644-REAR LEFT TURN CONTROL CIRCUIT HIGH

**B1644-REAR LEFT TURN CONTROL CIRCUIT HIGH (CONTINUED)**

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN SYSTEM - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Front Control Module detects a short to battery on the Control circuit.

Possible Causes
(L63) TURN SIGNAL CONTROL CIRCUIT POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Diagnostic Test**

**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.  
Clear all FCM DTC's  
Turn the Left Turn Signal on.  
With the scan tool, read DTC's.

**Does the scan tool read: B1644-REAR LEFT TURN CONTROL CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**B1644-REAR LEFT TURN CONTROL CIRCUIT HIGH (CONTINUED)****2. L63 LEFT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the PDM connector from the FCM.

Measure the resistance of the (L63) Left Rear Turn Signal Control circuit.

**Is the resistance above 5.0 ohms?**

**No** >> Repair the (L63) Turn Signal Control circuit.  
Perform BODY VERIFICATION TEST - VER 1.

**Yes** >> Go To 3

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Front Control Module from the PDM 49 way connector.

Measure the voltage between (L63) Left Rear Turn Signal Control circuit and ground.

**Is there any voltage present?**

**Yes** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Front Control Module.  
Perform BODY VERIFICATION TEST - VER 1.

## B1647-REAR RIGHT TURN CONTROL CIRCUIT LOW

**B1647-REAR RIGHT TURN CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
(L62) REAR RIGHT TURN SIGNAL CONTROL CIRCUIT MODULE POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Right Turn Signals on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1647-REAR RIGHT TURN CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST-VER1.

**B1647-REAR RIGHT TURN CONTROL CIRCUIT LOW (CONTINUED)****2. L62 RIGHT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM PDM connector.

Measure the resistance between ground and the (L62) Rear Turn Signal Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (L62) Rear Right Turn Signal Control circuit for a short to ground.  
Perform the BODY VERIFICATION TEST-VER1.

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the FCM connector.

Disconnect the PDM connector.

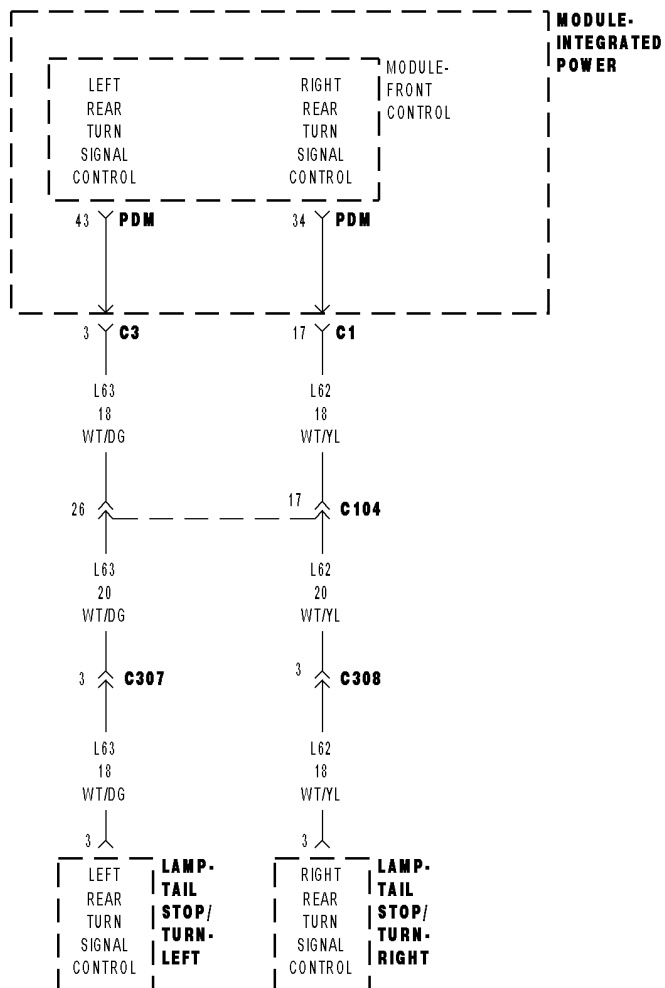

Measure the resistance between ground and the (L62) Right Turn Signal Control circuit in the PDM.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Module Power Distribution Center in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

**No** >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

## B1648-REAR RIGHT TURN CONTROL CIRCUIT HIGH

**B1648-REAR RIGHT TURN CONTROL CIRCUIT HIGH (CONTINUED)**

For the Horn System circuit diagram (Refer to 8 - ELECTRICAL/HORN SYSTEM - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Front Control Module detects a short to battery on the Control circuit.

Possible Causes
(L62) TURN SIGNAL CONTROL CIRCUIT POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.  
Clear all FCM DTC's  
Turn the Right Turn Signal on.  
With the scan tool, read DTC's.

**Does the scan tool read: B1648-REAR RIGHT TURN CONTROL CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**B1648-REAR RIGHT TURN CONTROL CIRCUIT HIGH (CONTINUED)****2. L62 RIGHT TURN SIGNAL CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the PDM connector from the FCM.

Measure the resistance of the (L62) Right Rear Turn Signal Control circuit.

**Is the resistance above 5.0 ohms?**

**No** >> Repair the (L62) Turn Signal Control circuit.  
Perform BODY VERIFICATION TEST - VER 1.

**Yes** >> Go To 3

**3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Front Control Module from the PDM 49 way connector.

Measure the voltage between (L62) Right Rear Turn Signal Control circuit and ground.

**Is there any voltage present?**

**Yes** >> Replace the Power Distribution Center.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Replace the Front Control Module.  
Perform BODY VERIFICATION TEST - VER 1.

## B1659-FRONT FOG LAMP CONTROL CIRCUIT LOW

**B1659-FRONT FOG LAMP CONTROL CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Fog Lamps activated.
- **Set Condition:**
- When the FCM detects a LOW condition.

Possible Causes
(L139) FOG LAMP CONTROL CIRCUIT FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Fog Lamps on.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1659-FRONT FOG LAMP CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST-VER1.

**2. (L139) FOG LAMP CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the FCM PDM harness connector.

Measure the resistance between ground and the (L139) Fog Lamp Control circuit.

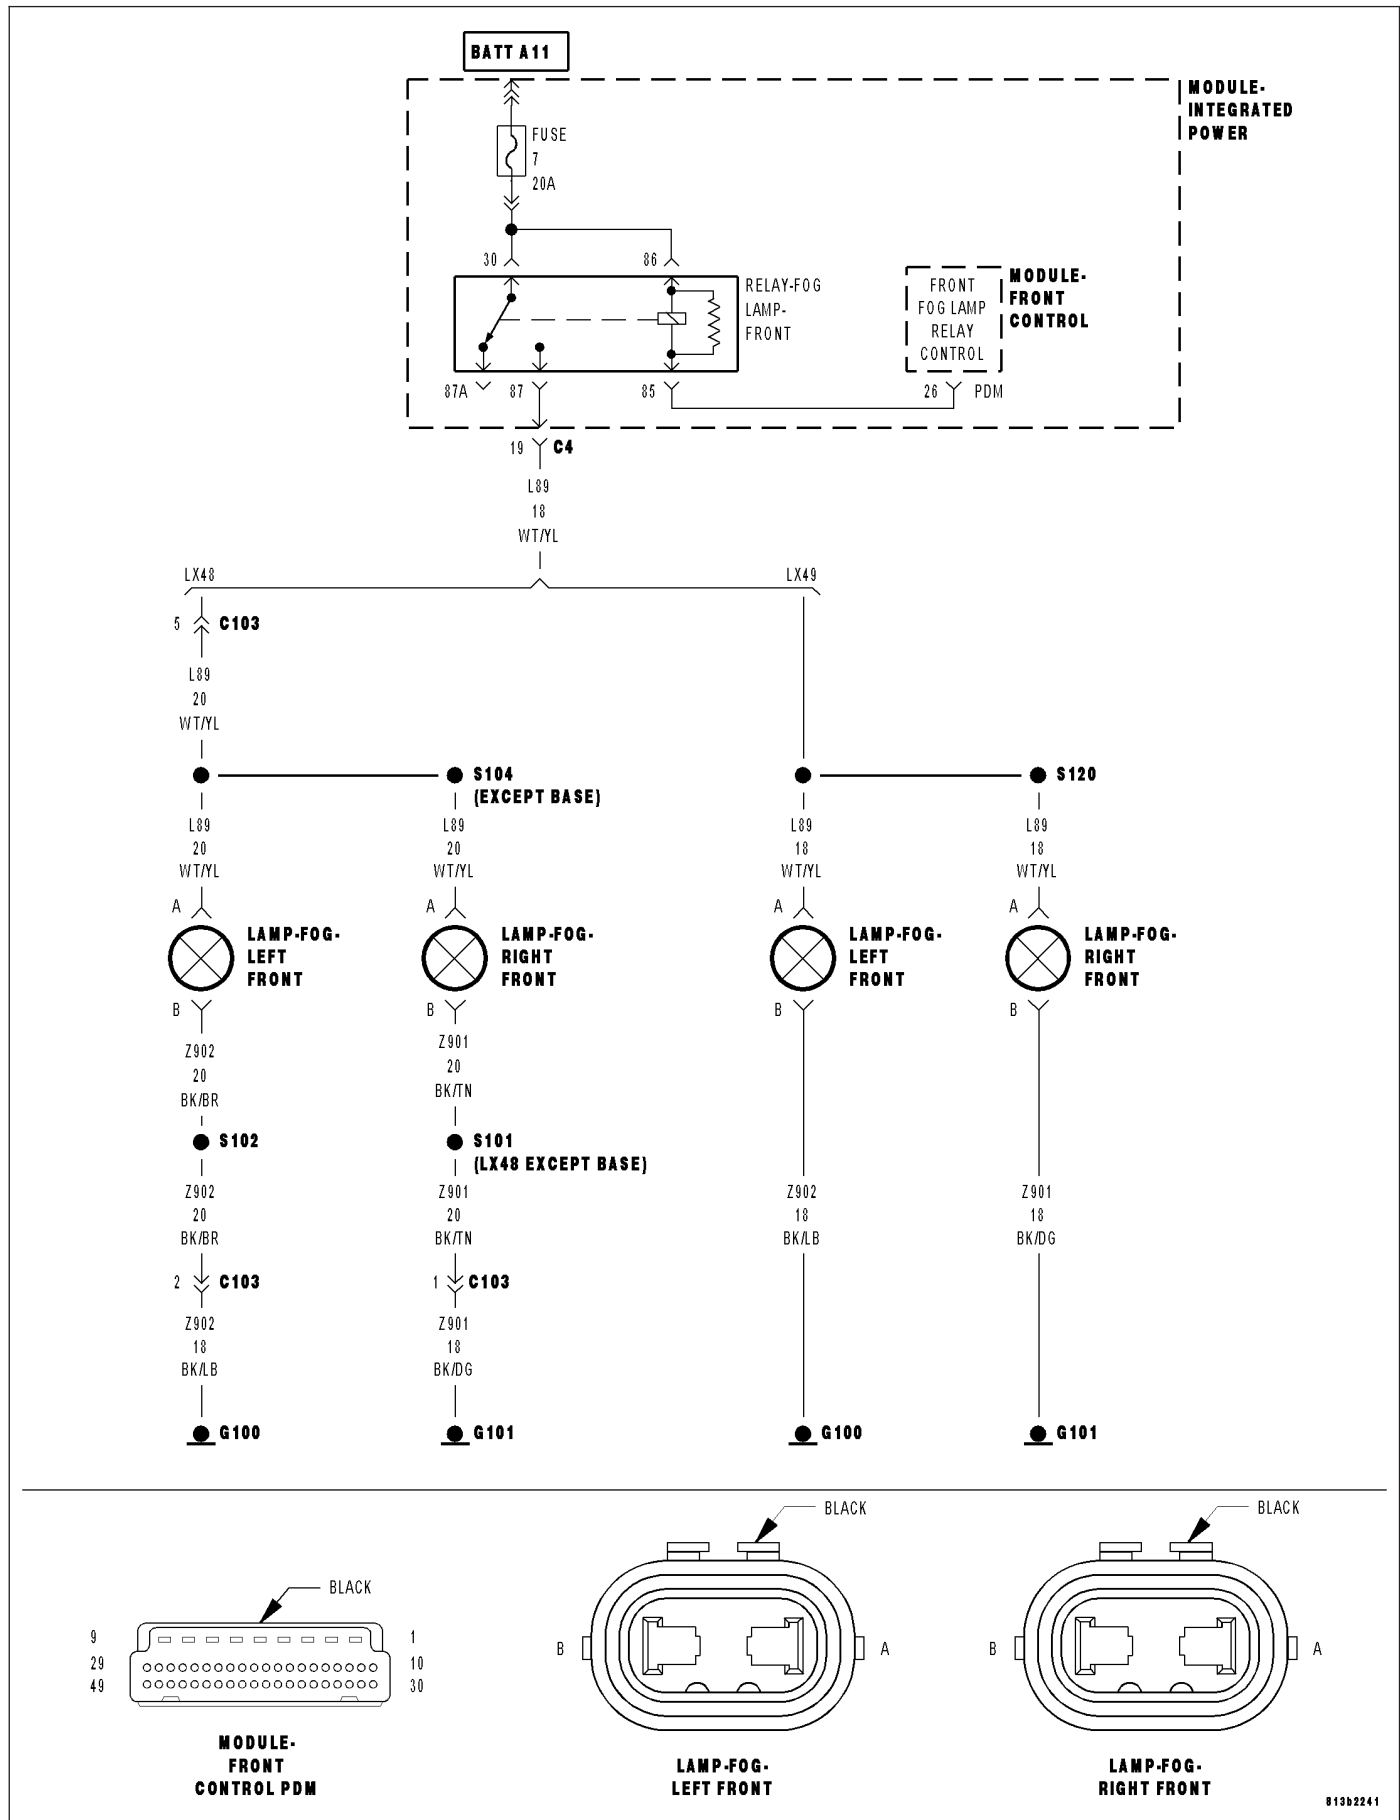

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Front Control Module (FCM) in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER1.

**No** >> Repair the (L139) Fog Lamp Control circuit for a short to ground condition.  
Perform the BODY VERIFICATION TEST VER1.

# B1660-FRONT FOG LAMP CONTROL CIRCUIT HIGH

**B1660-FRONT FOG LAMP CONTROL CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Front Fog Lamps activated.
- **Set Condition:**
- When the FCM detects a HIGH condition.

Possible Causes
FRONT FOG LAMP RELAY
MODULE-POWER DISTRIBUTION
FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Actuate the Front Fog Lamps.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B1660-FRONT FOG LAMP CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST-VER1.

**2. FRONT FOG LAMP RELAY**

Turn the ignition off.

Remove and install a known good relay in place of the Front Fog Lamp Relay.

**Do the Front Fog Lamps operate normally?**

**Yes** >> Replace the Front Fog Lamp Relay in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER1.

**No** >> Go To 3

**B1660-FRONT FOG LAMP CONTROL CIRCUIT HIGH (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

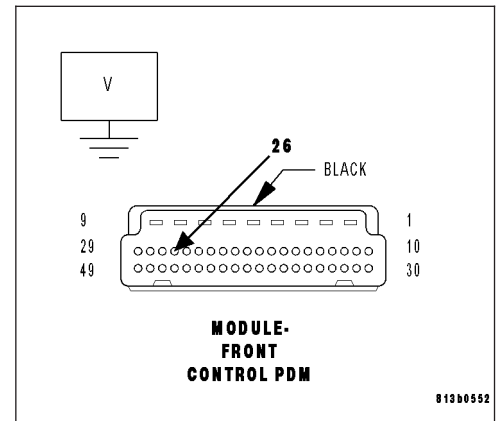

Remove the Front Fog Lamp Relay from the MPD.

Remove the FCM from the Module Power Distribution.

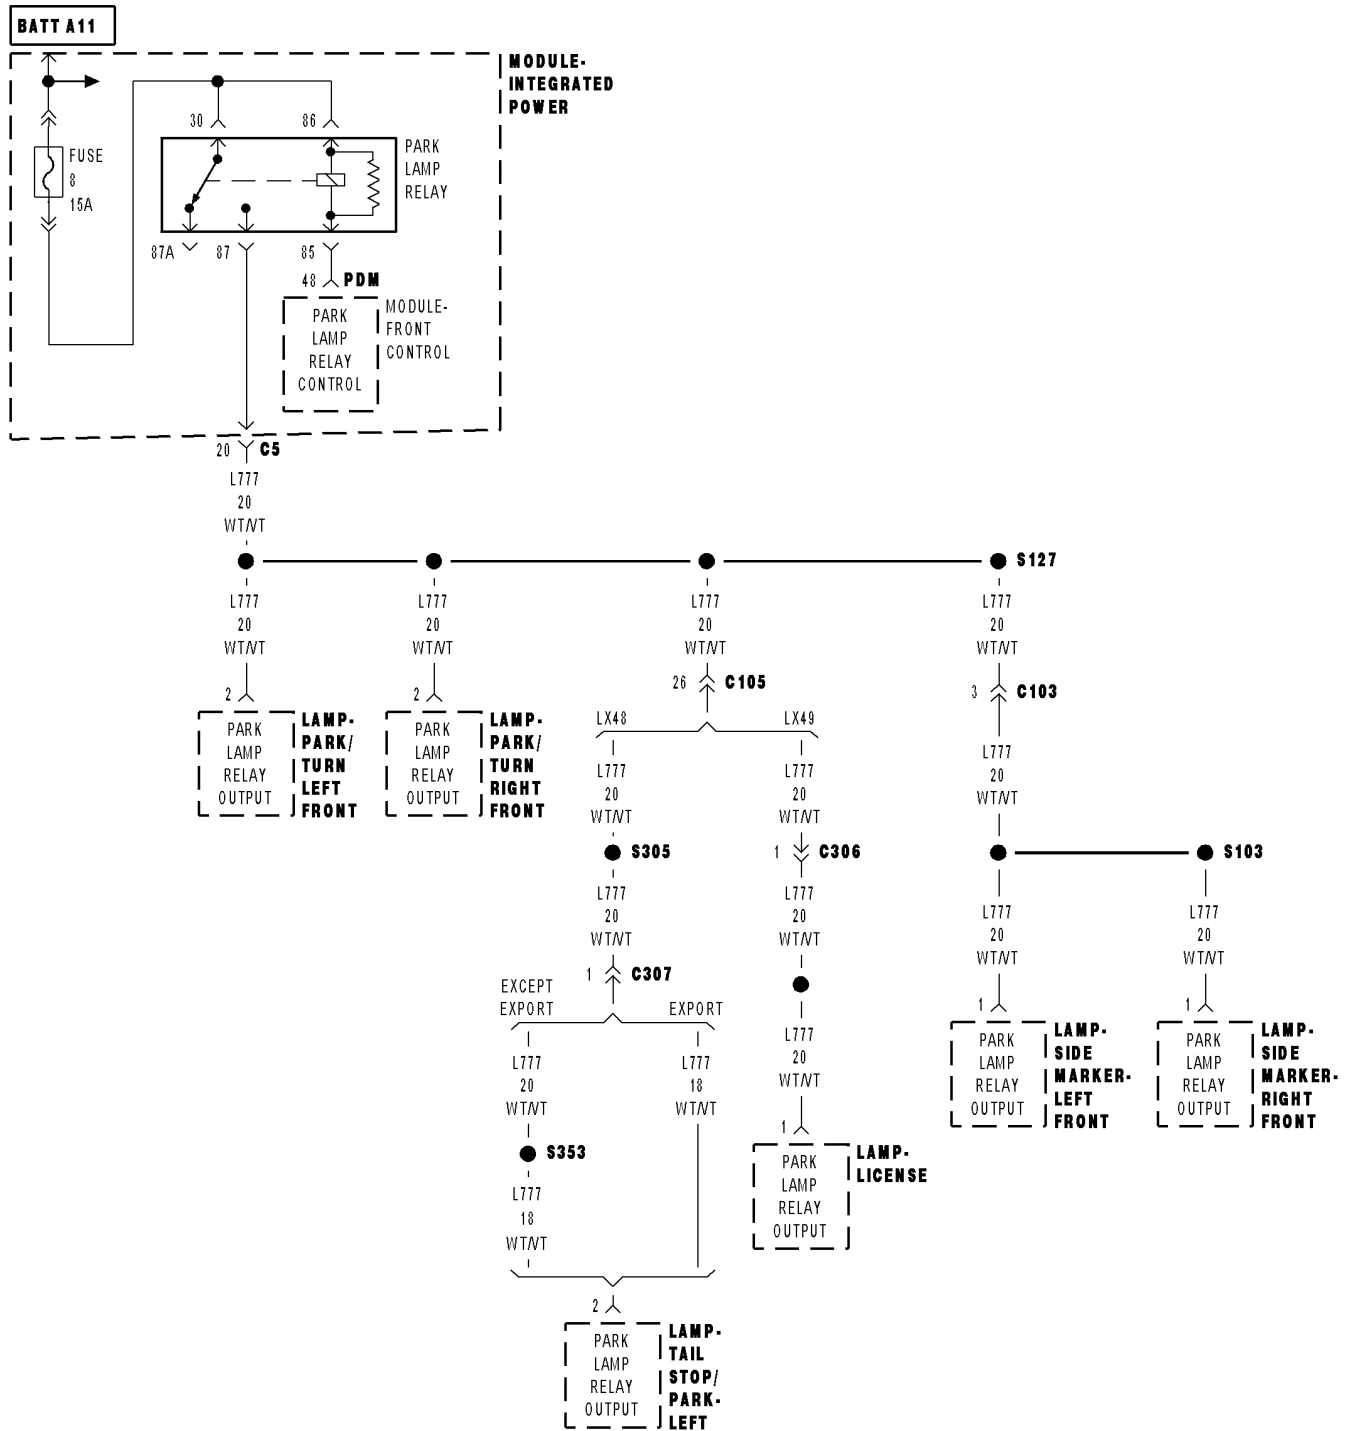

Measure the voltage of the (L139) Front Fog Lamp Relay Output circuit and ground.

**Is the voltage above 1.0 volts?**

- Yes** >> Replace the Module Power Distribution center in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.
- No** >> Replace the Module Front Control in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

## B165C-PARK LAMP CONTROL CIRCUIT LOW

B165C-PARK LAMP CONTROL CIRCUIT LOW (CONTINUED)

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**
- With the Park Lamps activated.
- **Set Condition:**
- When the FCM detects a LOW condition.

Possible Causes
(L177) PARK LAMP CONTROL CIRCUIT FRONT CONTROL MODULE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. INTERMITTENT CONDITION

Turn the ignition on.  
With the Scan Tool, clear all FCM DTC's.  
Turn the Park Lamps on.  
With the Scan Tool read the DTC information.

Does the Scan Tool read: B165C-PARK LAMP CONTROL CIRCUIT LOW?

- Yes >> Go To 2
- No >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST-VER1.

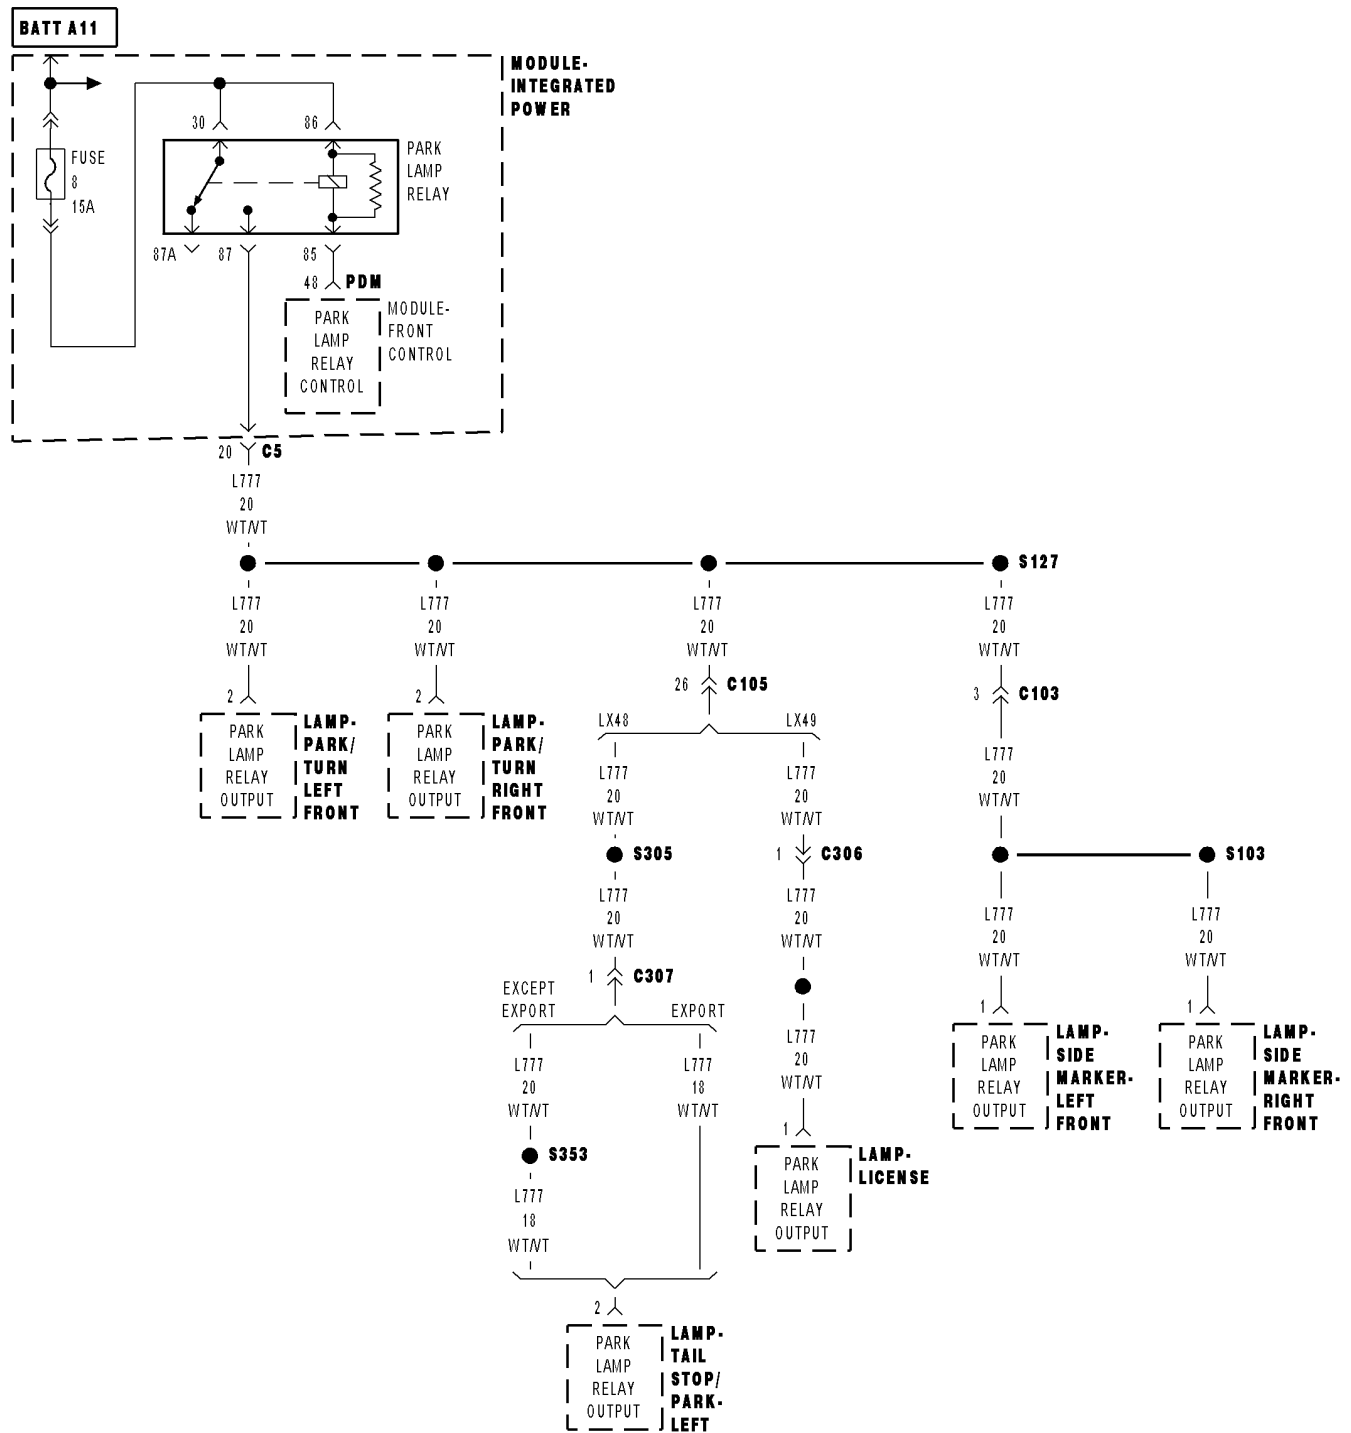

2. (L177) PARK LAMP CONTROL CIRCUIT

Turn the ignition off.  
Disconnect the FCM PDM harness connector.  
Measure the resistance between ground and the (L177) Park Lamp Control circuit.

- Is the resistance below 5.0 ohms?
- Yes >> Replace the Front Control Module (FCM) in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER1.
- No >> Repair the (L177) Park Lamp Control circuit for a short to ground condition.  
Perform the BODY VERIFICATION TEST VER1.

## B165D-PARK LAMP CONTROL CIRCUIT HIGH

**B165D-PARK LAMP CONTROL CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Front Fog Lamps activated.
- **Set Condition:**
- When the FCM detects a HIGH condition.

Possible Causes
PARK LAMP RELAY
MODULE-POWER DISTRIBUTION
FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Actuate the Park Lamps.

With the Scan Tool read the DTC information.

**Does the Scan Tool read: B165D-PARK LAMP CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST-VER1.

**2. PARK LAMP RELAY**

Turn the ignition off.

Remove and install a known good relay in place of the Park Lamp Relay.

**Do the Front Fog Lamps operate normally?**

**Yes** >> Replace the Park Lamp Relay in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER1.

**No** >> Go To 3

**B165D-PARK LAMP CONTROL CIRCUIT HIGH (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Remove the Park Lamp Relay from the MPD.

Remove the FCM from the Module Power Distribution.

Measure the voltage of the (L177) Park Lamp Relay Output circuit and ground.

**Is the voltage above 1.0 volts?**

- Yes** >> Replace the Module Power Distribution center in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.
- No** >> Replace the Module Front Control in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

B1607-HEADLAMP SWITCH INPUT CIRCUIT LOW

**B1607-HEADLAMP SWITCH INPUT CIRCUIT LOW (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
HEADLAMP SWITCH (L900) MUX RETURN CIRCUIT INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all CCN DTC's.

Turn the Headlamps on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1607-HEADLAMP SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST — VER 1.

**2. HEADLAMP SWITCH**

Disconnect the Headlamp Switch connector.

Turn the ignition on.

Measure the voltage of the (L900) MUX Return circuit.

**Does the voltage read 5.0 volts?**

**Yes** >> Go To 3

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Headlamp Switch in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**B1607-HEADLAMP SWITCH INPUT CIRCUIT LOW (CONTINUED)****3. (L900) MUX RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Headlamp Switch connector.

Disconnect the Instrument Cluster C2 connector.

Measure the resistance of the (L900) MUX Return circuit to ground.

**Is the resistance below 5.0 ohms?**

- Yes** >> Repair the (L900) Headlamp MUX return circuit.  
Perform the BODY VERIFICATION TEST — VER 1.
- No** >> Replace the Instrument Cluster in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

## B1608-HEADLAMP SWITCH INPUT CIRCUIT HIGH

**B1608-HEADLAMP SWITCH INPUT CIRCUIT HIGH (CONTINUED)**

For the Exterior Lighting system circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
HEADLAMP SWITCH (L900) HEADLAMP MUX RETURN CIRCUIT (L307) HEADLAMP MUX INPUT CIRCUIT INSTRUMENT CLUSTER

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all CCN DTC's.

Turn the Headlamps on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1608-HEADLAMP SWITCH INPUT CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**     >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.
- Perform the BODY VERIFICATION TEST — VER 1.

**2. HEADLAMP SWITCH**

Disconnect the Headlamp Switch connector.

Turn the ignition on.

Measure the voltage between the (L900) Headlamp MUX Return circuit and (L307) Headlamp Input MUX circuit.

**Does the voltage read 0.0 volts?**

- Yes**    >> Replace the Headlamp Switch in accordance with the service information.
- Perform the BODY VERIFICATION TEST — VER 1.
- No**     >> Go To 3

**B1608-HEADLAMP SWITCH INPUT CIRCUIT HIGH (CONTINUED)****3. (L900) MUX RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Headlamp Switch connector.

Disconnect the Instrument Cluster C2 connector.

Measure the resistance of the (L900) Headlamp MUX Return circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (L900) Headlamp MUX Return circuit.  
Perform the BODY VERIFICATION TEST — VER 1.

**4. INSTRUMENT CLUSTER**

Turn the ignition off.

Disconnect the Headlamp Switch connector.

Disconnect the Instrument Cluster C2 connector.

Measure the resistance of the (L307) Headlamp MUX circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the instrument Cluster in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Repair the (L307) Headlamp MUX circuit.  
Perform the BODY VERIFICATION TEST — VER 1.

**B167A-LEFT FRONT HEADLAMP LIGHT SOURCE CIRCUIT (CONTINUED)**

For the Exterior Lighting System circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition on.
- Set Condition:
- The code will set when the HID Module detects an INOP Headlamp Source.

Possible Causes
HEADLAMP SOURCE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. Verify DTC B167A-LEFT FRONT HEADLAMP LIGHT SOURCE CIRCUIT IS ACTIVE**

**Note:** If a DTC is set, erase the DTC and attempt to reset the DTC.  
**If the DTC resets, follow test.**

This is a Headlamp Source failure

[View repair](#)

**Does the DTC reset and read B167A-LEFT FRONT HEADLAMP LIGHT SOURCE CIRCUIT?**

**Repair**

- Replace the appropriate Headlamp Source in accordance with the service information.
- Perform the BODY VERIFICATION TEST — VER 1.

**B167B-RIGHT FRONT HEADLAMP LIGHT SOURCE CIRCUIT (CONTINUED)**

For the Exterior Lighting System circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition on.
- Set Condition:
- The code will set when the HID Module detects an INOP Headlamp Source.

Possible Causes
HEADLAMP SOURCE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. Verify DTC B167B-RIGHT FRONT HEADLAMP LIGHT SOURCE CIRCUIT IS ACTIVE**

**Note: If a DTC is set, erase the DTC and attempt to reset the DTC.  
If the DTC resets, follow test.**

This is a Headlamp Source failure

[View repair](#)

**Does the DTC reset and read B167B-RIGHT FRONT HEADLAMP  
LIGHT SOURCE CIRCUIT?**

**Repair**

Replace the appropriate Headlamp Source in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

B2235-LEFT FRONT HEADLAMP BALLAST ECU INTERNAL

For the Exterior Lighting System circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the Headlamps on.
- Set Condition:
- The code will set when a Check Sum error is detected.

Possible Causes
LEFT HEADLAMP BALLAST ECU FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Verify DTC B2235-LEFT FRONT HEADLAMP BALLAST ECU INTERNAL IS ACTIVE

**Note:** If a DTC is set, erase the DTC and attempt to reset the DTC.  
**If the DTC resets, follow test.**

This is an internal Ballast ECU failure  
[View repair](#)

**Does the DTC reset and read B2235-LEFT FRONT HEADLAMP BALLAST ECU INTERNAL?**

Repair

Replace the Left Side Headlamp Ballast ECU in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**B2236-RIGHT FRONT HEADLAMP BALLAST ECU INTERNAL**

For the Exterior Lighting System circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the Headlamps on.
- Set Condition:
- The code will set when a Check Sum error is detected.

Possible Causes
RIGHT HEADLAMP BALLAST ECU FAILURE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. Verify DTC B2236-RIGHT FRONT HEADLAMP BALLAST ECU INTERNAL IS ACTIVE**

**Note: If a DTC is set, erase the DTC and attempt to reset the DTC.**

**If the DTC resets, follow test.**

This is an internal Headlamp Ballast ECU failure

View repair

**Does the DTC reset and read B2236-RIGHT FRONT HEADLAMP BALLAST ECU INTERNAL?**

**Repair**

Replace the Right Side Headlamp Ballast ECU in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

B2239-HID LEVELING TRANSLATOR ECU INTERNAL

For the Exterior Lighting System circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition on.
- Set Condition:
- The code will set when the HID Module detects an internal failure.

Possible Causes
MODULE INTERNAL FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Verify DTC B2239-HID LEVELING TRANSLATOR ECU INTERNAL IS ACTIVE

**Note:** If a DTC is set, erase the DTC and attempt to reset the DTC.  
**If the DTC resets, follow test.**

This is an internal module failure

View repair

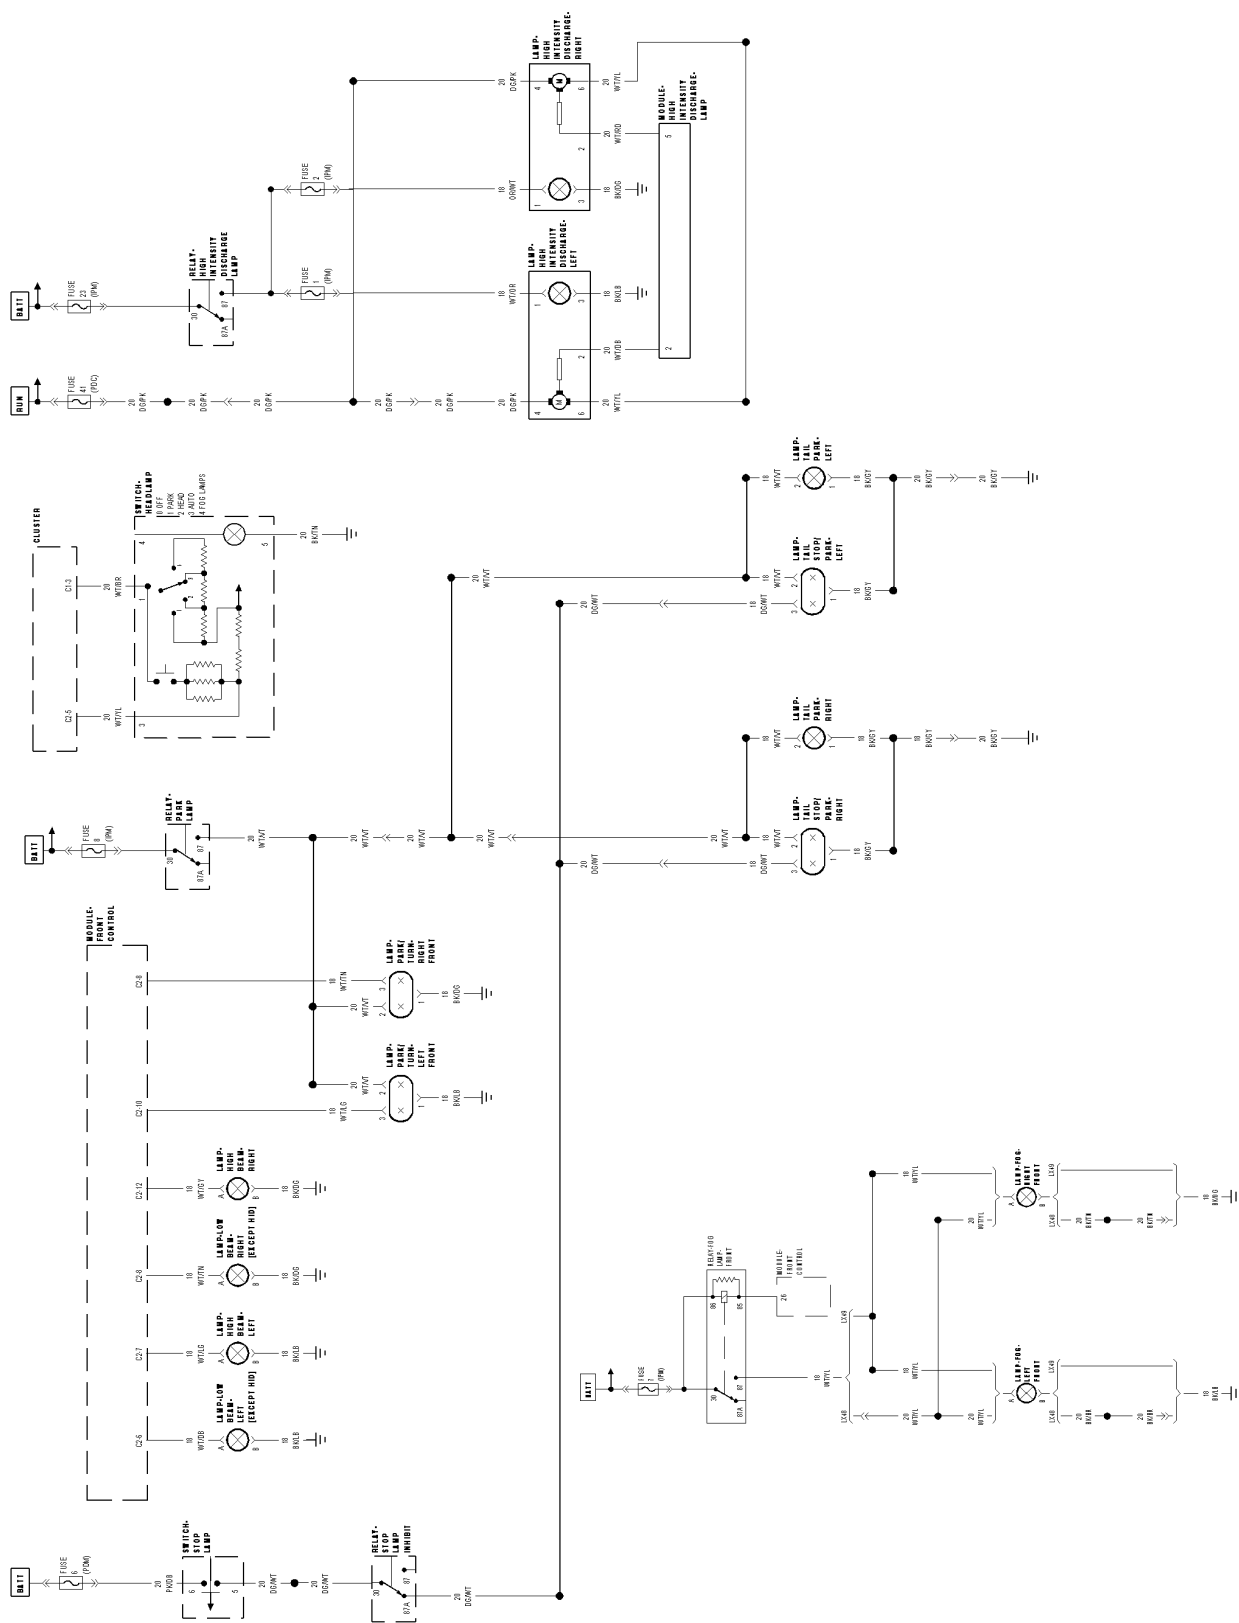

**Does the DTC reset and read B2239-HID LEVELING TRANSLATOR ECU INTERNAL?**

Repair

- Replace the HID Translator Module in accordance with the service information.
- Perform the BODY VERIFICATION TEST — VER 1.

## LAMPS/LIGHTING - EXTERIOR - SERVICE INFORMATION

### DESCRIPTION

The exterior lighting system for this model includes the following exterior lamp units:

- **Center High Mounted Stop Lamp** - A Center High Mounted Stop Lamp (CHMSL) is centered on the rear shelf trim panel at the base of the backlite on sedans, and on the liftgate spoiler just above the liftgate glass opening at the rear of the vehicle on the wagon.
- **Front Fog Lamps** - Vehicles equipped with this option have a fog lamp unit mounted near each outboard end of the front bumper support, behind the lower portion of the front fascia.
- **Front Headlamp Units** - A front headlamp unit is mounted to the front of each front fender panel on either side of the grille opening.
- **License Plate Lamp** - A rear license plate lamp unit is mounted to the rear fascia, just above the license plate tub.

- **Tail Lamp Units** - A tail lamp unit is mounted to the rear of each quarter panel on either side of the liftgate opening.

These exterior lighting lamps and their controls are combined to provide the following exterior lighting features:

- **Automatic Headlamps** - Vehicles with the automatic headlamps option are equipped with a unique headlamp switch that includes an automatic position and a sun load sensor located on the top of the instrument panel to sense ambient light levels. When the Auto position of the headlamp switch is selected, the headlamps are turned On automatically when ambient light levels are low.
- **Daytime Running Lamps** - Vehicles manufactured for sale in Canada illuminate the low beam filament of the headlamp bulb in each front lamp unit to serve as the Daytime Running Lamps (DRL). Fleet vehicles manufactured for sale in the United States illuminate the high beam filament of the headlamp bulb in each front lamp unit to serve as the DRL.

Other components of the exterior lighting system for this model include:

- **Backup Lamp Switch** - A Transmission Range Sensor (TRS) integral to the solenoid pack on the valve body of the electronic automatic transmission performs the backup lamp switch function for this model.
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the steering column support bracket under the instrument panel and is actuated by the brake pedal arm.
- **Front Control Module** - The Front Control Module (FCM) is integral to the Integrated Power Module (IPM). The FCM/IPM is located in the engine compartment, near the battery and the Power Distribution Center (PDC). (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION - DESCRIPTION).
- **Headlamp Switch** - A headlamp switch is located on the left side of the instrument panel, below and outboard of the steering column. The headlamp switch includes a rotary knob for the park lamps and headlamps On or Off, and a push button switch for selecting the front fog lamps on vehicles so equipped. The headlamp switch also features a vertical thumbwheel for selecting the panel lamps dimming level, a Parade mode to illuminate all Vacuum Fluorescent Display (VFD) units at full brightness for visibility when driving in daylight with the exterior lighting turned On, and for interior lighting control.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Control Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DESCRIPTION).
- **Multi-Function Switch** - The multi-function switch is located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the switch is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn).

## OPERATION

### DAYTIME RUNNING LAMPS

Power is reduced using pulse-width modulation (PWM) to the high beams, where by the power is switched on and off rapidly instead of remaining on continuously. The duration and interval of the power pulses is programmed into the IPM.

### AUTOMATIC HEADLAMP SYSTEM

Automatic headlamps are controlled by the Cab Compartment Node (CCN). With the headlamp switch in the AUTO position, the CCN will control the headlamp, parking, side marker, tail and instrumentation lamps based on ambient light levels. Ambient light levels are monitored by the CCN using the ambient light signal present. Ambient light readings are averaged to limit cycling the lamps ON and OFF when passing through areas with varying light levels. The automatic headlamps will only function when the engine is running with RPM > 300. When the headlamp switch is in the AUTO position (Automatic mode), the Headlamp Time Delay system will function when the ignition switch is placed in any position other than run/start.

### HEADLAMP TIME DELAY SYSTEM

The headlamp time delay system is activated by turning the headlamps ON (high or low beam) while the engine is running, turning the ignition switch OFF, and then turning the headlamp switch OFF. The Cab Compartment Node (CCN) will allow the headlamps to remain ON for 90 seconds (configurable) before they automatically turn off (If the key is in the ignition during the headlamp time delay mode, then both the headlamps and park lamps (including panel dimming) will be ON). Refer to the Owner's Manual for more information.

If the headlamp switch is in the Auto Headlamp Position, the headlamps are ON due to the night signal from the ambient light sensor and the ignition switch is in any position other than run/start, the CCN shall enter a 90 second (configurable) Auto Headlamps time delay mode. If the key is in the ignition during the headlamp time delay mode, then both the headlamps and park lamps (including panel dimming) will be ON. If the key is not in the ignition, then only the headlamps will be ON. The CCN will allow the headlamps to remain ON for 90 seconds before they automatically turn OFF. Refer to the Owner's Manual for more information.

## **WARNING**

**Eye protection should be used when servicing glass components. Personal injury or death could result.**

**This vehicle contains mercury added devices added by the manufacturer: High Intensity Discharge (HID) headlamps. Remove devices before vehicle disposal. Upon removal of devices, please reuse, recycle, or dispose of as hazardous waste.**

**Do not back probe any connectors or pierce any wiring to the HID headlamp system. High voltage (a/c voltage) is used in this system and component and personal injury or death could result (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP - DIAGNOSIS AND TESTING - HID HEADLAMPS).**

**Do not power up the headlamp assembly with the headlamp access cover off. A high voltage a/c (alternating current) shock may occur causing personal injury or death.**

**On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.**

**Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result. Do not use bulbs other than those indicated in the bulb application table. Damage to lamp and/or daytime running lamp module can result. Do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the owners manual.**

**Do not use bulbs other than those listed in the bulb application table. Damage to lamp can result. Do not touch bulbs with fingers or other oily surfaces. Bulb life will be reduced.**

## **STANDARD PROCEDURE**

### **FRONT LAMP AIMING**

#### **VEHICLE PREPARATION FOR LAMP ALIGNMENT**

1. Check for and correct any burnt out bulbs.
2. Repair or replace any faulty, worn or damaged body or suspension components that could hinder proper lamp alignment.
3. Verify proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
5. Verify that there is no load in the vehicle (cargo or passengers), except for the driver.
6. The fuel tank should be Full. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
7. Verify correct vehicle suspension height.

**LAMP ALIGNMENT SCREEN PREPARATION**

The procedure that follows will prepare a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.
2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so that the side of the vehicle is parallel to the vertical zero reference, and so that the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.

8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

## HEADLAMP ALIGNMENT

There are two different kinds of headlamp aiming procedures, depending on which type of headlamp the vehicle is equipped with:

- **Visual Aim Optical Left (VOL)** - 300C with halogen, 300C w/HID, and 300C w/HID - Export.
- **Visual Aim Optical Right (VOR)** - 300/300 Touring and Dodge Magnum.

The VOL or VOR is embossed on the lower front of each headlamp unit.

**VOL Headlamp Aiming** - With the horizontal centerline of the headlamp (2) transferred on the wall, measure down 53 mm (2.1 in). This line (1) will be the vertical aiming mark. Using the left side of the headlamp vertical centerline (3), adjust the headlamp unit so the residual light from the headlamp, not the hot spot (6), is below the line (1) that was marked previously 53 mm (2.1 in) below the horizontal centerline (2). The ideal alignment should be (7). The right headlamp aiming will be the same, but using the area left of right headlamp vertical centerline.

**VOR Headlamp Aiming** - With the horizontal centerline of the headlamp (1) transferred on the wall, this line (1) will be the vertical aiming mark. Using the right side of the headlamp vertical centerline (2 or 6). Adjust the headlamp unit so the residual light from the headlamp (4), is below the horizontal centerline (1). The ideal alignment should be (4).

**VOL Export Headlamp Aiming** - With the horizontal centerline of the headlamp (1) transferred on the wall, measure down 76 mm (3 in). This line (8) will be the vertical aiming mark. Using the intersecting point (7) of the horizontal centerline (8) and the vertical centerline (2) for the left headlamp, adjust the headlamp unit horizontally and vertically so (7) is the intersecting point at lines (8 and 2). For the right headlamp unit, cover up the left headlamp and follow the same procedure but intersecting at (8 and 4).

1. Turn the headlamps On and select the Low beams.
2. Rotate the headlamp vertical adjustment screw (and horizontal on export) on each lamp to adjust the beam height as required.

## FOG LAMP ALIGNMENT

A properly aimed front fog lamp will project a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp.

1. Turn the fog lamps On.
2. Rotate the fog lamp vertical adjustment screw (2) on each lamp to adjust the beam height as required.

## AUTO HEADLAMP SENSOR

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the defroster grille (Refer to 23 - BODY/ INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).

3. Using a trim stick (special tool #C-4755) or equivalent, gently pry up on the auto headlamp sensor (1).
4. Pull the sensor from the top of the instrument panel.
5. Disconnect the one electrical connector.

## INSTALLATION

1. Connect the one electrical connector.
2. Position the auto headlamp sensor (1) in instrument panel and press firmly down to snap into place.

3. Install the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - INSTALLATION).
4. Connect the battery negative cable.

## CENTER HIGH MOUNTED STOP LAMP

### REMOVAL

#### SEDAN

1. Disconnect and isolate the battery negative cable.
2. Remove the rear shelf trim panel (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - REMOVAL).

3. Disconnect the CHMSL electrical connector (1).

4. Remove the two mounting fasteners (3) to the CHMSL (2).

## WAGON

1. Remove the rear spoiler (Refer to 23 - BODY/EXTERIOR/SPOILER - REMOVAL).
2. With the rear spoiler on bench, remove the fasteners and electrical connector from the CHMSL.

## INSTALLATION

### SEDAN

1. Place the center high mounted stop lamp (2) into position at the bottom of the backlite.
2. Install and tighten the mounting fasteners (3).

3. Connect the electrical connector (1).

4. Install the rear shelf trim (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - INSTALLATION).
5. Connect the battery negative cable.

## WAGON

1. Place the CHMSL on the spoiler (1) and install and tighten the mounting fasteners.
2. Install the spoiler (Refer to 23 - BODY/EXTERIOR/SPOILER - INSTALLATION).

## FOG LAMP UNIT

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Open hood and remove the upper radiator closeout panel (2 and 4).
3. Remove the six upper fascia retaining fasteners (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).

4. Remove the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

5. From behind the bumper fascia, disconnect the harness connector.
6. Remove two fog lamp unit mounting fasteners.
7. Remove fog lamp unit (1).

## INSTALLATION

1. Position the fog lamp unit (1) in fascia opening.
2. Install the two fog lamp unit mounting fasteners.
3. Connect the harness connector.

4. Install the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

5. Install the six upper fascia retaining fasteners (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
6. Install the upper radiator closeout panel (2 and 4).
7. Connect the battery negative cable.

## FRONT SIDE MARKER LAMP

### REMOVAL

#### CHRYSLER

1. Disconnect and isolate the battery negative cable.
2. Remove the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

3. It may be necessary to loosen the fascia (1) to gain access to the side marker lamp (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
4. Remove side marker lamp from side marker lamp unit by twisting lamp socket.

#### DODGE

1. Disconnect and isolate the battery negative cable.
2. Remove the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP

UNIT - REMOVAL).

3. Remove the front side marker lamp from the head-lamp unit.

## INSTALLATION

### CHRYSLER

1. Install the side marker lamp into side marker lamp unit by twisting lamp socket.
2. If the fascia (1) was loosened to gain access to the side marker lamp, install the fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/Front FASCIA - INSTALLATION).

3. Install the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).
4. Connect the battery negative cable.

## DODGE

1. Install the front side marker lamp into the headlamp unit.

2. Install the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).
3. Connect the battery negative cable.

## FRONT PARK/TURN SIGNAL LAMP

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. From atop the headlamp unit, reach behind and just below the upper radiator crossmember and twist the park/turn signal lamp socket out.
3. Remove the lamp from the socket.

### INSTALLATION

1. Install lamp into socket.
2. Install lamp socket (1) into the headlamp unit. Twist socket clockwise.
3. Connect the battery negative cable.

## HEADLAMP

### DESCRIPTION

Quad headlamps are standard equipment on this model. They are halogen headlamps, both low and high beams.

This vehicle may be equipped with optional **High Intensity Discharge (HID)** low beams. The HID type lamp is used in place of the conventional halogen low beam lamp. High beam lamps remain the same halogen type.

HID lamps get their name from the intense white light produced by the electrical discharge. The light produced by the HID lamps appears as a white color as opposed to the yellow color of the standard halogen lamps.

HID lighting provides about three times the light output of standard halogen lamps while using less energy. The lamps are also designed to last 10 times longer than standard halogen lamps.

## OPERATION

To turn on the headlamps, turn the left knob of the headlamp switch clockwise to the first detent for parking lamp and instrument panel lamp operation. Turn to the second detent for headlamp, park lamp and instrument panel lamp operation.

High Intensity Discharge Headlamps (HID) rely on an AC (alternating current) electrical charge to ignite xenon gas contained in a sealed beam lamp. The HID lamps are similar in operation to common vapor filled street headlamps. Instead of using a filament to produce light, the gas inside the lamp is ignited by creating an arc between two electrodes.

The color of the light source is classified as its color temperature. As the color temperature increases, the color of the light moves from yellow to blue-white to white. The light produced by the HID lamps appears as a white color as opposed to the yellow color of the standard (halogen) lamps. HID lamps provide light as a higher color temperature than standard halogen lamps.

For the color temperature of different lamp types, refer to the COLOR TEMPERATURE table. As a point of reference, typical sunlight at noon has a color temperature of 4977° C (8990° F).

## COLOR TEMPERATURE

LAMP	TEMPERATURE
INCANDESCENT LAMPS	2527° C (4580° F)
HALOGEN LAMPS	2927° C (5300° F)
HID LAMPS	3827° C (6920° F)

There are three components to each of the HID headlamps:

1. **Ballast Module** - The 12 volt Direct Current (DC) power supplied by the low beam relay is converted to Alternating Current (AC) power by the ballast module. Each lamp requires its own ballast module. The ballast converts and steps up the low beam relay output to 800 volts AC, and supplies the lamp assembly via a cable connected to the igniter.

2. **Lamp/Igniter** - The lamp contains electrodes and xenon gas. The lamp takes about 10-15 seconds of warm-up time to reach full operation. The light appears blue during warm-up and then turns to white. The igniter controls the voltage applied to the lamp electrodes. The igniter uses the voltage supplied by the ballast module and momentarily steps up the voltage to 25,000 volts to start the lamp. Once ignited, it will reduce the voltage to 85 volts.

3. **Cable** - The cable is used to transfer the high voltage produced by the ballast module to the lamp/igniter.

## DIAGNOSIS AND TESTING

### HIGH INTENSITY DISCHARGE HEADLAMPS

The High Intensity Discharge (HID) headlamps are supplied B+ voltage and ground, the same as normal halogen low beam lamps. The low beam system is different from there forward. The ballast module is mounted to the bottom of the headlamp unit. The ballast module has internal circuit protection to prevent module damage in case of an open or shorted circuit. The module has overcharge and undercharge circuit protection. If either is sensed, the module will not illuminate the headlamps for that key cycle or until the fault is corrected. Recycle the ignition and headlamp switch if both headlamps do not illuminate. Before determining the headlamp assembly is faulty, check the connector at the headlamp and check if there is voltage coming from the IPM pin providing the power to the respective headlamp. If the module senses a short or open circuit condition, it will not operate the lamp/igniter.

**WARNING:** The headlamp unit must be removed to perform these tests (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL). Failure to do so could result in personal injury or death.

1. Inspect lamp for a burned out lamp. If lamp is burned out it will appear black or smoky, similar to a normal halogen bulb. If lamp looks OK, go to Step 2.
2. Check for B+ battery voltage at the connector going into the ballast module. Refer to Wiring Diagrams for connector location. If battery voltage and a good ground are present, go to Step 3. If B+ voltage and a good ground are not present, refer to Wiring Diagrams for circuit and connector locations to find short or open circuit.
3. Plug in a known good ballast module and check for lamp operation. If lamp lights, replace ballast module. If lamp still fails to light, replace igniter assembly.

## REMOVAL

### HALOGEN HEADLAMP

**Note:** If replacing the left low or high beam headlamp, the air box has to be removed first (Refer to 9 - ENGINE/AIR INTAKE SYSTEM - REMOVAL).

1. Disconnect and isolate the battery negative cable.
2. Disconnect the lamp electrical connector.
3. Twist lamp (1 and 2) out of headlamp housing.

### HIGH INTENSITY DISCHARGE (HID) HEADLAMPS (IF EQUIPPED) - LOW BEAM

#### HEADLAMP

**Note:** If replacing the left front low beam HID headlamp, the air box has to be removed first (Refer to 9 - ENGINE/AIR INTAKE SYSTEM - REMOVAL).

1. Disconnect and isolate the battery negative cable.
2. Remove the rubber boot (1) protecting the lamp/igniter from the elements.

3. Disconnect the electrical cable connector to the lamp/igniter by pulling straight down.

4. Release the retaining wire clip on the back of the lamp/igniter.
5. Grab the igniter by pulling rearward and rocking it slightly as you pull.
6. Pull the igniter straight out of the headlamp unit. The lamp is integral to the igniter and cannot be separated.

## BALLAST MODULE

1. Remove the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP

UNIT - REMOVAL).

2. From the underside of the headlamp unit, remove the six retaining screws (1).

3. Pull the ballast module out of headlamp unit.
4. Disconnect the two electrical connectors (1 and 2).
  - One of the connectors (1) will be a standard push tab to release connector.
  - The second connector (2) has a lever that must be rotated away or down from the wire of the cable and connector.
5. Separate ballast module from headlamp unit.

**CABLE**

1. Remove the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

2. From the underside of the headlamp unit, remove the six retaining screws (1).

3. Pull the ballast module out of headlamp unit.
4. Disconnect the cable connector (2) Move the lever away or down from the wire of the cable and

connector.

5. Remove the rubber boot (1) protecting the lamp/igniter from the elements.

6. Disconnect the electrical cable connector to the lamp/igniter by pulling straight down.

7. Maneuver cable through headlamp unit to separate.

## INSTALLATION

### HALOGEN HEADLAMP

1. Twist lamp (1 or 2) into headlamp housing clockwise.
2. Connect the lamp electrical connector.
3. Connect the battery negative cable.

**Note:** If replacing the left low or high beam headlamp, the air box has to be reinstalled (Refer to 9 - ENGINE/AIR INTAKE SYSTEM - INSTALLATION).

**HIGH INTENSITY DISCHARGE (HID) HEADLAMPS (IF EQUIPPED) - LOW BEAM****HEADLAMP**

1. Push the igniter straight into the headlamp unit with the connector pointing straight down. The lamp is integral to the igniter.
2. Put the retaining wire clip on the back of the lamp/igniter.

3. Connect the electrical cable connector to the lamp/igniter.

4. Install the rubber boot (1) protecting the lamp/igniter from the elements.
5. Connect the battery negative cable.

**Note:** If replacing the left low beam headlamp, the air box has to be reinstalled (Refer to 9 - ENGINE/AIR INTAKE SYSTEM - INSTALLATION).

## BALLAST MODULE

1. Connect the two electrical connectors (1 and 2).
  - One of the connectors (1) will be a standard push tab to release connector.
  - The second connector (2) has a lever that must be locked when connected.
2. Position the ballast module in of headlamp unit.

3. From the underside of the headlamp unit, install the six retaining screws (1).

4. Install the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

**CABLE**

1. Maneuver cable through headlamp unit.

2. Connect the cable electrical connectors (2). The connector (2) has a lever that must be locked when connected.

3. From the underside of the headlamp unit, install the six retaining screws (1).

4. Connect the electrical cable connector to the lamp/igniter.

5. Install the rubber boot (1) protecting the lamp/igniter from the elements.

6. Install the headlamp unit (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).

## HEADLAMP LEVELING MODULE - EXPORT

### DESCRIPTION

The Headlamp Leveling Module or HID Translator Module is the remote electronic sub-component of the headlamp leveling system. The HID translator module is used to translate communication of the headlamps leveling system. The sensors communicate over a K-Line to the headlamp stepper motors, then to the translator module. To enable the scan tool to read system inputs and outputs, and to retrieve Diagnostic Trouble Codes (DTC's), the translator module must convert this K-Line data into Controller Area Network (CAN) data.

The HID translator module is located inside the right front engine compartment, just behind the headlamp unit. It is mounted to a stamped steel bracket by one fastener and has one electrical connector that connects it to the wiring harness.

### OPERATION

The system is designed to automatically level the vehicle, regardless of cargo or passenger loads. When the vehicle is loaded with passengers and/or cargo, as the ignition is turned to RUN, the system will look at the front and rear sensors and make an adjustment based upon feedback from the sensor to see if it has approximately 27.5 degrees from its zero or neutral position. The headlamp stepper motor then adjusts the headlamp up or down for proper headlamp aiming.

**Note: If the headlamp leveling module (HID translator module) is replaced, the system needs to be calibrated using a Scan Tool.**

When in calibration mode, the vehicle doors, trunk/liftgate, and hood must be closed. In addition, the vehicle may not be touched (bounced or bumped) until the calibration is complete. The headlamps must be ON to power the stepper motors. The approximate calibration time is 12 - 15 seconds. The scan tool will display a "status of calibration" message. These being either "still in progress", "passed", or "failed."

If a system fault occurs, the translator module will store the Diagnostic Trouble Code (DTC) and enable it to be read using the scan tool and assist in diagnosing the headlamp leveling system.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. disconnect the one electrical connector to the HID translator module.
3. Remove the one bolt holding the module to the bracket.

## INSTALLATION

**WARNING:** When replacing the headlamp leveling module/HID translator module, the system must be calibrated using a Scan Tool.

1. Install the one bolt holding the module to the bracket.
2. Connect the one electrical connector to the HID translator module.
3. Connect the battery negative cable.
4. Using a Scan Tool, calibrate the headlamp leveling system.

## HEADLAMP LEVEL SENSOR - EXPORT

### DESCRIPTION

The headlamp leveling system uses two headlamp level sensors to determine when the vehicle has had its ride height or angle changes, due to passenger or cargo additions. There is one sensor (1) mounted on the spring link (3) on the right side of the rear suspension.

There is a second sensor (2) mounted on the upper control arm (1) on the right side, in the front of the vehicle.

Each sensor has a link that is connected to the suspension and to the sensor, one electrical connector that connects the sensor to the vehicle's electrical system wiring harness, and one bracket that mounts with one nut to the vehicle.

### OPERATION

The system is designed to automatically level the vehicle, regardless of cargo or passenger loads. When the vehicle is loaded with passengers and/or cargo, as the ignition is turned to RUN, the system will look at the front and rear sensors and make an adjustment to the headlamp stepper motors based upon feedback from the sensor to see if it has moved approximately 27.5 degrees from its zero or neutral position. The headlamp stepper motor then adjusts the headlamp up or down for proper headlamp aiming.

The headlamp level sensors act like a potentiometer to relay information via the data bus to the HID translator module when the vehicle has changed its angle or ride height in either the front or rear of the vehicle.

**Note:** If the headlamp leveling module (HID translator module) is replaced, the system needs to be calibrated using a Scan Tool.

When in calibration mode, the vehicle doors, trunk/liftgate, and hood must be closed. In addition, the vehicle may not be touched (bounced or bumped) until the calibration is complete. The headlamps must be ON to power the stepper motors. The approximate calibration time is 12 - 15 seconds. The scan tool will display a "status of calibration" message. These being either "still in progress", "passed", or "failed."

If a system fault occurs, the translator module will store the Diagnostic Trouble Code (DTC) and enable it to be read using the scan tool and assist in diagnosing the headlamp leveling system.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Hoist vehicle.
3. Unsnap the sensor link from the upper control arm (front) (1).

4. Unsnap the sensor link from the spring link (rear) (3).
5. Disconnect the electrical connector (2).
6. Remove the one retaining nut to the sensor and bracket (1).

## INSTALLATION

1. Install the one retaining nut to the sensor and bracket (1).
2. Connect the electrical connector (2).
3. Snap the sensor link onto the spring link (rear) (3).

4. Snap the sensor link onto the upper control arm (front) (1).
5. Remove the vehicle from the hoist.
6. Connect the battery negative cable.

## SWITCH-HEADLAMP

### REMOVAL

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
3. From underneath and behind the instrument panel, push up on the lower clip on headlamp switch then wiggle it down and out of instrument panel.
4. Disconnect the headlamp switch electrical connector.

## INSTALLATION

1. Connect the headlamp switch electrical connector.
2. Position headlamp switch in instrument panel and firmly snap into place.
3. Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).

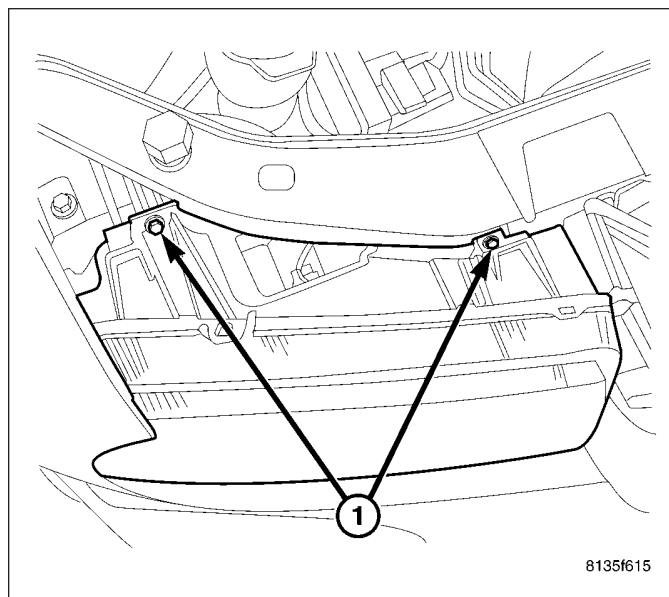

## HEADLAMP UNIT

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Open hood and remove the two upper headlamp unit mounting screws.

3. The two upper retaining screws (1) are located just in front of the upper radiator crossmember.

**Note:** It may be necessary to loosen the side of the fascia to access the lower headlamp unit retaining screw (Refer to 13 - FRAME & BUMPERS/ BUMPERS/FRONT FASCIA - REMOVAL).

4. Remove the one lower headlamp unit retaining screw.

5. Disconnect the electrical connectors.  
6. Separate headlamp unit from vehicle.

## INSTALLATION

1. Position the headlamp unit in the opening in the headlamp mounting crossmember.
2. Connect the electrical connector.

3. Install the one lower headlamp unit retaining screw.

**Note:** If the fascia was loosened, reattach it (Refer to 13 - FRAME & BUMPERS/BUMPERS/Front FASCIA - INSTALLATION).

4. Install the two upper retaining screws (1).
5. Connect the battery negative cable.

## LICENSE PLATE LAMP UNIT

### REMOVAL

1. Remove the two mounting screws (1) to the license lamp unit.

2. Remove the lamp socket from the lamp unit by twisting socket counterclockwise.

3. Separate socket from lamp.

## INSTALLATION

1. Position lamp socket into lamp unit.

2. Twist the socket clockwise until stops.

3. Maneuver the lamp unit up into rear fascia and install the two retaining screws (1).

## MULTI-FUNCTION SWITCH

### DESCRIPTION

The multi-function switch (2) is located on the steering column, just below the steering wheel, within the Steering Column Control Module (SCCM).

The only visible components of the multi-function switch are the control stalk and control knob that extend through the SCCM on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connection, and the turn signal cancel actuator are concealed within the SCCM.

Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. Three integral locating posts on the switch housing, slide into channels in a receptacle in the circuit board within the SCCM. A single integral connector receptacle in the circuit board connects the switch to the vehicle electrical system through the instrument panel wire harness.

The multi-function switch provides the vehicle operator with a control interface for the following functions:

- **Front Washer Control** - The multi-function switch control knob provides a momentary position for front washer system operation.
- **Front Wiper Control** - The multi-function switch control knob provides two continuous front wipe switch positions, low speed or high speed; and, an intermittent front wipe mode with six delay interval positions.
- **Headlamp Beam Selection** - The multi-function switch control stalk provides detent switching for selection of the headlamp high or low beams. There is also an intermediate momentary position that allows the headlamp high beam circuits to be momentarily flashed to provide an optical horn feature (sometimes referred to as flash-to-pass) as an optical signalling device.
- **Turn Signal Control** - The multi-function switch control stalk provides momentary non-detent (lane change) switching and detent switching with automatic cancellation for both the left and right turn signal lamps.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is faulty, or if the switch is damaged, the entire switch must be replaced as a unit (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - DISASSEMBLY).

## OPERATION

The multi-function switch operates as follows:

- **Front Washer Control** - The control knob on the end of the multi-function switch control stalk is depressed towards the steering column to momentarily activate the washer pump in the front washer mode. The washer pump will continue to operate in the front washer mode until the control knob is released. The multi-function switch provides an output by sending electronic front washer switch status messages to the Front Control Module (FCM) over the Controller Area Network (CAN) data bus. The FCM responds by energizing or de-energizing the washer pump in the front washer mode.
- **Front Wiper Control** - The control knob on the end of the multi-function switch control stalk is rotated to one of the continuous front wiper detents, to one of six intermittent ( or auto wipe sensitivity positions if so equipped) wiper detents, or to the Off position to select the front wiper mode. The multi-function switch provides an output by sending electronic front wiper switch status messages to the FCM over the CAN data bus. The FCM responds by energizing or de-energizing the wiper on/off and high/low relays in the Power Distribution Center (PDC) for front wiper system control.
- **Headlamp Beam Selection** - The control stalk of the multi-function switch is pushed toward the instrument panel for a latching high beam selection. Pulling the stalk rearward toward the steering wheel for a latching low beam selection. Each time the control stalk is actuated to the momentary position with the headlamps turned off, the headlamp high beams will be illuminated for as long as the control stalk is held in this position. The multi-function switch provides an output to the FCM over the CAN data bus. The FCM energizes or de-energizes the selected low or high beam circuits.
- **Turn Signal Control** - The control stalk of the multi-function switch is moved upward to activate the right turn signal circuitry, and, downward to activate the left turn signal circuitry. The turn signal switch has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that provides turn signals only until the control stalk is released. When the control stalk is moved to a turn signal switch detent position, the cancel actuator extends toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the two turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral Off position. When a turn signal is activated, the multi-function switch provides an output to the FCM over the CAN data bus. In addition, the message is sent to the CCN via the CAN bus to activate the proper signal within the EMIC. The FCM energizes and flashes or de-energizes the selected left or right turn signal circuits.

The multi-function switch can be diagnosed using a diagnostic scan tool and the appropriate diagnostic information.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is faulty, or if the switch is damaged, the entire switch must be replaced as a unit (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - DISASSEMBLY).

## REPEATER LAMP - EXPORT

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick (C-4755) or equivalent, Gently pry the lamp from the fender.
3. Disconnect the wire harness connector (1) and remove lamp (3).

### INSTALLATION

1. Connect the harness connector (2) to the repeater lamp (3).
2. Install the lamp (3) into the fender (2), firmly snapping into place with hand.
3. Connect the battery negative cable.

## SWITCH - STOP LAMP

### DESCRIPTION

The stop lamp switch (2) is located under the instrument panel at the brake pedal arm. This switch contains three internal switches controlling various functions of the vehicle, one of them controls operation of the vehicle's brake lamps. Other functions of the internal switches include speed control deactivation and brake sense for the ABS and the brake transmission shift interlock.

### OPERATION

The stop lamp switch has three internal switches used for various functions. Among these are:

- Brake lamp actuation
- Speed control deactivation, and
- Brake sense for ABS and brake transmission shift interlock

When the brake pedal is in the released position, the plunger on the outside of the stop lamp switch is pushed inward by the brake pedal. In this position, the electrical contacts for one internal switch are open while the electrical contacts for other two internal switches are closed.

When the brake pedal is pressed, the plunger on the outside of the stop lamp switch extends outward. This action closes the electrical contacts for the one internal switch and opens the contacts for the remaining two switches within the stop lamp switch. The internal switch which closes when the brake pedal is pressed completes the circuit to the brake lamps at the rear of the vehicle, thus allowing illumination of the brake lamps and the center-high-mounted stop lamp (CHMSL).

### DIAGNOSIS AND TESTING

#### STOP LAMP SWITCH

**Note:** Before proceeding with this diagnostic test, verify the adjustment of the stop lamp switch to rule out misadjustment. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - ADJUSTMENTS)

If the electrical circuit has been tested and the stop lamp switch is suspected of being faulty, it can be tested using the following method.

1. Remove the switch from the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - REMOVAL)

2. With the switch in the released position (plunger extended), use an ohmmeter to test each of the three internal switches as shown. You should achieve the results as indicated in the figure.

3. Gently push the plunger on the stop lamp switch in until it stops.
4. With the switch in the depressed position (plunger pushed in), use an ohmmeter to test each of the three internal switches as shown. You should achieve the results as indicated in the figure.

If you do not achieve the results as indicated in both figures, the switch is faulty and must be replaced.

5. Install the switch in the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/STOP LAMP SWITCH - INSTALLATION)

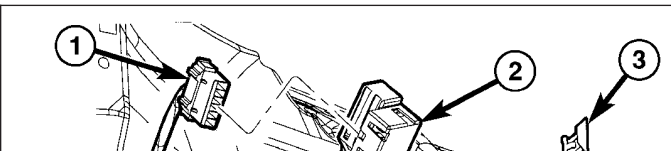

## REMOVAL

1. Depress and hold the brake pedal.
2. Remove the stop lamp switch (2) from it's bracket on the brake pedal assembly (6). To do so, rotate the stop lamp switch in a counterclockwise direction approximately 30 degrees from its proper mounting position. Pull the switch rearward and remove it from it's mounting bracket.
3. Disconnect the wiring harness connector (1) from the switch.

## INSTALLATION

**Note:** Prior to installing the stop lamp switch into it's bracket, the plunger must be moved to its fully extended position using the procedure described in Step 1.

1. Hold the stop lamp switch firmly in one hand. Using your other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.
  2. Connect the wiring harness connector (1) to the stop lamp switch (2).
  3. Mount the stop lamp switch into the bracket on the brake pedal assembly (6) as follows: Depress the brake pedal as far down as possible. Install the switch in it's bracket by aligning the index key on switch with the notch in the square mounting hole of the mounting bracket. Once the switch is fully seated, rotate the switch clockwise approximately 30° to lock the switch into the bracket.
- 
- The diagram shows a line drawing of the brake pedal assembly. Three numbered callouts are present: (1) points to a wiring harness connector, (2) points to the stop lamp switch, and (3) points to a small component, likely a pin or clip, used for mounting the switch to the bracket. The switch is shown being inserted into a bracket on the pedal assembly.

**CAUTION:** Do not use excessive force when pulling back on the brake pedal to adjust the stop lamp switch. If too much force is used, damage to the stop lamp switch or striker can result.

4. Gently pull back on brake pedal until the pedal stops moving. This will cause the switch plunger to ratchet backward to the correct position.
5. Check for proper operation of the brake lamps and speed control.

## ADJUSTMENTS

### STOP LAMP SWITCH ADJUSTMENT

1. Depress and hold the brake pedal.
2. Remove the stop switch from it's bracket. To do so, rotate the stop lamp switch in a counterclockwise direction approximately 30 degrees from its proper mounting position. Pull the switch rearward and remove it from it's mounting bracket.
3. Hold the stop lamp switch firmly in one hand. Using your other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.
4. Mount the stop lamp switch into the bracket as follows: Depress the brake pedal as far down as possible. Install the switch in it's bracket by aligning the index key on switch with the notch in the square mounting hole of the mounting bracket. Once the switch is fully seated, rotate the switch clockwise approximately 30° to lock the switch into the bracket.

**CAUTION:** Do not use excessive force when pulling back on the brake pedal to adjust the stop lamp switch. If to much force is used, damage to the stop lamp switch or striker can result.

5. Gently pull back on brake pedal until the pedal stops moving. This will cause the switch plunger to ratchet backward to the correct position.
6. Check for proper operation of the brake lamps and speed control.

## TAIL LAMP UNIT

### REMOVAL

#### SEDAN

1. Disconnect and isolate the battery negative cable.
2. From inside the trunk, peel back the trunk trim and disconnect the electrical connector.

3. Remove the three plastic wing nuts (3).
4. Pull the tail lamp unit (1) straight out of the rear of the quarter trim panel.

## WAGON

1. Disconnect and isolate the battery negative cable.
2. Remove the two push fasteners (1) in the liftgate opening.

3. From inside the cargo area, using a trim stick (special tool #C-4755) or equivalent, gently pry the access panel off the rear of the quarter trim panel.
4. Remove the one plastic wing nut.

5. Pulling rearward, release the mounting tabs of the tail lamp unit (1).

6. Disconnect the electrical connector (3) from tail lamp unit (1).

1. Twist counterclockwise to remove the Stop (1), Turn Signal (2), or Back-Up lamps.

## INSTALLATION

### SEDAN

1. Position the tail lamp unit (1) in the rear quarter panel of vehicle.
2. Install and tighten the three plastic wing nuts (3).

3. From within the trunk, connect the electrical connector (1) to tail lamp unit (2).
4. Replace trunk carpeting.
5. Connect the battery negative cable.

## WAGON

1. Connect the electrical connector (3) to the tail lamp unit (2).

2. Position the tail lamp unit (2) in quarter panel opening.
3. Give a firm push forward to seat the indexing pins.

4. Install and tighten the one plastic wing nut.
5. Install the two push pin fasteners (1) in the liftgate opening.
6. Connect the battery negative cable.

LAMPS/LIGHTING - INTERIOR - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

# B161B-COURTESY/DOME LAMP OUTPUT CIRCUIT SHORT TO GROUND

**B161B-COURTESY/DOME LAMP OUTPUT CIRCUIT SHORT TO GROUND (CONTINUED)**

For the Interior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
(M24) COURTESY LAMP DRIVER CIRCUIT SHORT TO GROUND INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all CCN DTC's.

Turn the Dome Lamps on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B161B-COURTESY/DOME LAMP OUTPUT CIRCUIT SHORT TO GROUND?**

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present.  
Inspect the related wiring for a possible intermittent condition.  
Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. HEADLAMP SWITCH**

Disconnect the Headlamp Switch connector.

Turn the Ignition on.

Using the Scan Tool.

**Does the Scan Tool display Headlamp Switch 5.0 volts?**

- Yes** >> Go To 3
- No** >> Replace the Headlamp Switch in accordance with the service information.

**B161B-COURTESY/DOME LAMP OUTPUT CIRCUIT SHORT TO GROUND (CONTINUED)****3. INSTRUMENT CLUSTER/DRIVER CIRCUIT SHORT**

Turn the ignition on.

Disconnect the Instrument Cluster C3 connector.

Measure the resistance of the (M24) Courtesy Lamp Driver circuit to ground.

**Is the resistance below 5.0 ohms?**

- Yes**    >> Repair the (M24) Courtesy lamp Driver circuit.  
             Perform the BODY VERIFICATION TEST — VER 1.
- No**      >> Replace the Instrument Cluster in accordance with the service information.  
             Perform the BODY VERIFICATION TEST — VER 1.

## B1623-GLOVEBOX/MAP LAMP OUTPUT CIRCUIT SHORT TO GROUND

**B1623-GLOVEBOX/MAP LAMP OUTPUT CIRCUIT SHORT TO GROUND (CONTINUED)**

For the Interior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
(M27) GLOVE BOX/MAP LAMP OUTPUT CIRCUIT SHORT TO GROUND INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

Turn the ignition on.  
With the Scan Tool, clear all CCN DTC's.  
Turn the Glove Box lamps on.  
With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1623-GLOVEBOX/MAP LAMP OUTPUT CIRCUIT SHORT TO GROUND?**

- Yes**    >> Go To 2
- No**    >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**B1623-GLOVEBOX/MAP LAMP OUTPUT CIRCUIT SHORT TO GROUND (CONTINUED)****2. INSTRUMENT CLUSTER**

Turn the ignition off.

Disconnect the Glovebox Lamp Switch harness connector.

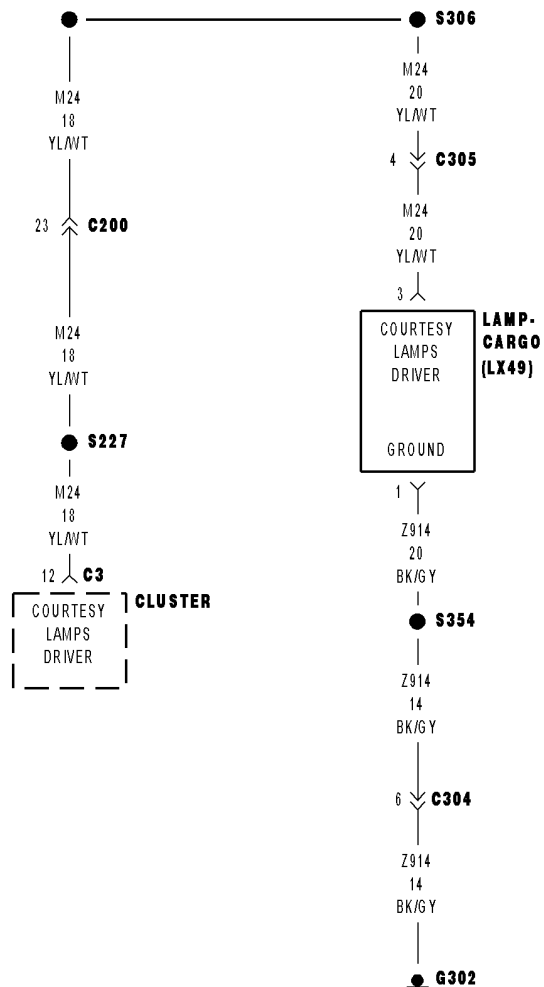

Disconnect the Instrument Cluster C3 connector.

Measure the resistance of the (M27) Glovebox Lamp Output circuit to ground.

**Is the resistance below 5.0 ohms?**

- Yes** >> Repair the (M27) Glovebox-Map Lamp Output circuit.  
Perform the BODY VERIFICATION TEST — VER 1.
- No** >> Replace the Instrument Cluster in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**B1627-CARGO LAMP OUTPUT CIRCUIT SHORT TO GROUND**

**B1627-CARGO LAMP OUTPUT CIRCUIT SHORT TO GROUND (CONTINUED)**

For the Interior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
Headlamp Switch (M22) Cargo Lamp Output Circuit Short to Ground Instrument Cluster

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. Intermittent Condition**

turn the ignition on.

With the Scan Tool, clear all CCN DTC's.

Turn the Cargo Lamps on.

With the Scan Tool, read the DTC information.

**Does the SCan Tool read: B1627-CARGO LAMP OUTPUT CIRCUIT SHORT TO GROUND?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. Headlamp Switch**

Disconnect the Headlamp Switch connector.

Turn the ignition on.

Using the Scan Tool, read DTC's.

**Does the Scan Tool display Headlamp Switch 5.0 volts?**

**Yes** >> Go To 3

**No** >> Replace the Headlamp Switch.  
Perform the BODY VERIFICATION TEST VER — 1.

**B1627-CARGO LAMP OUTPUT CIRCUIT SHORT TO GROUND (CONTINUED)****3. Instrument Cluster**

Turn the ignition off.

Disconnect the Headlamp Switch connector.

Disconnect the Instrument Cluster C3 connector.

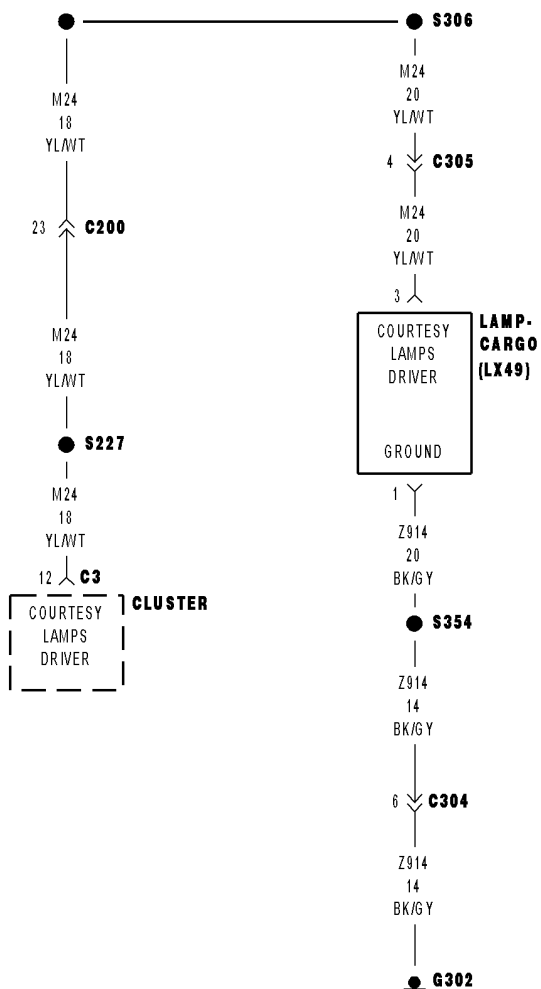

Measure the resistance of the of the (M22) Cargo Lamp Output circuit to ground.

**Is the resistance below 5.0 ohms?**

- Yes** >> Repair the Cargo Lamp Output circuit.  
Perform the BODY VERIFICATION TEST VER — 1.
- No** >> Replace the Instrument Cluster in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER — 1.

## B1629-CARGO LAMP OUTPUT CIRCUIT OPEN

**B1629-CARGO LAMP OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Interior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
HEADLAMP SWITCH (M24) CARGO LAMP OUTPUT CIRCUIT OPEN INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

turn the ignition on.

With the Scan Tool, clear all CCN DTC's.

Turn the Cargo Lamps on.

With the Scan Tool, read the DTC information.

**Does the SCan Tool read: B1629-CARGO LAMP OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. HEADLAMP SWITCH**

Disconnect the Headlamp Switch connector.

Turn the ignition on.

Using the Scan Tool, read DTC's.

**Does the Scan Tool display Headlamp Switch 5.0 volts?**

**Yes** >> Go To 3

**No** >> Replace the Headlamp Switch.  
Perform the BODY VERIFICATION TEST VER — 1.

**B1629-CARGO LAMP OUTPUT CIRCUIT OPEN (CONTINUED)****3. INSTRUMENT CLUSTER**

Turn the ignition off.

Disconnect the Headlamp Switch connector.

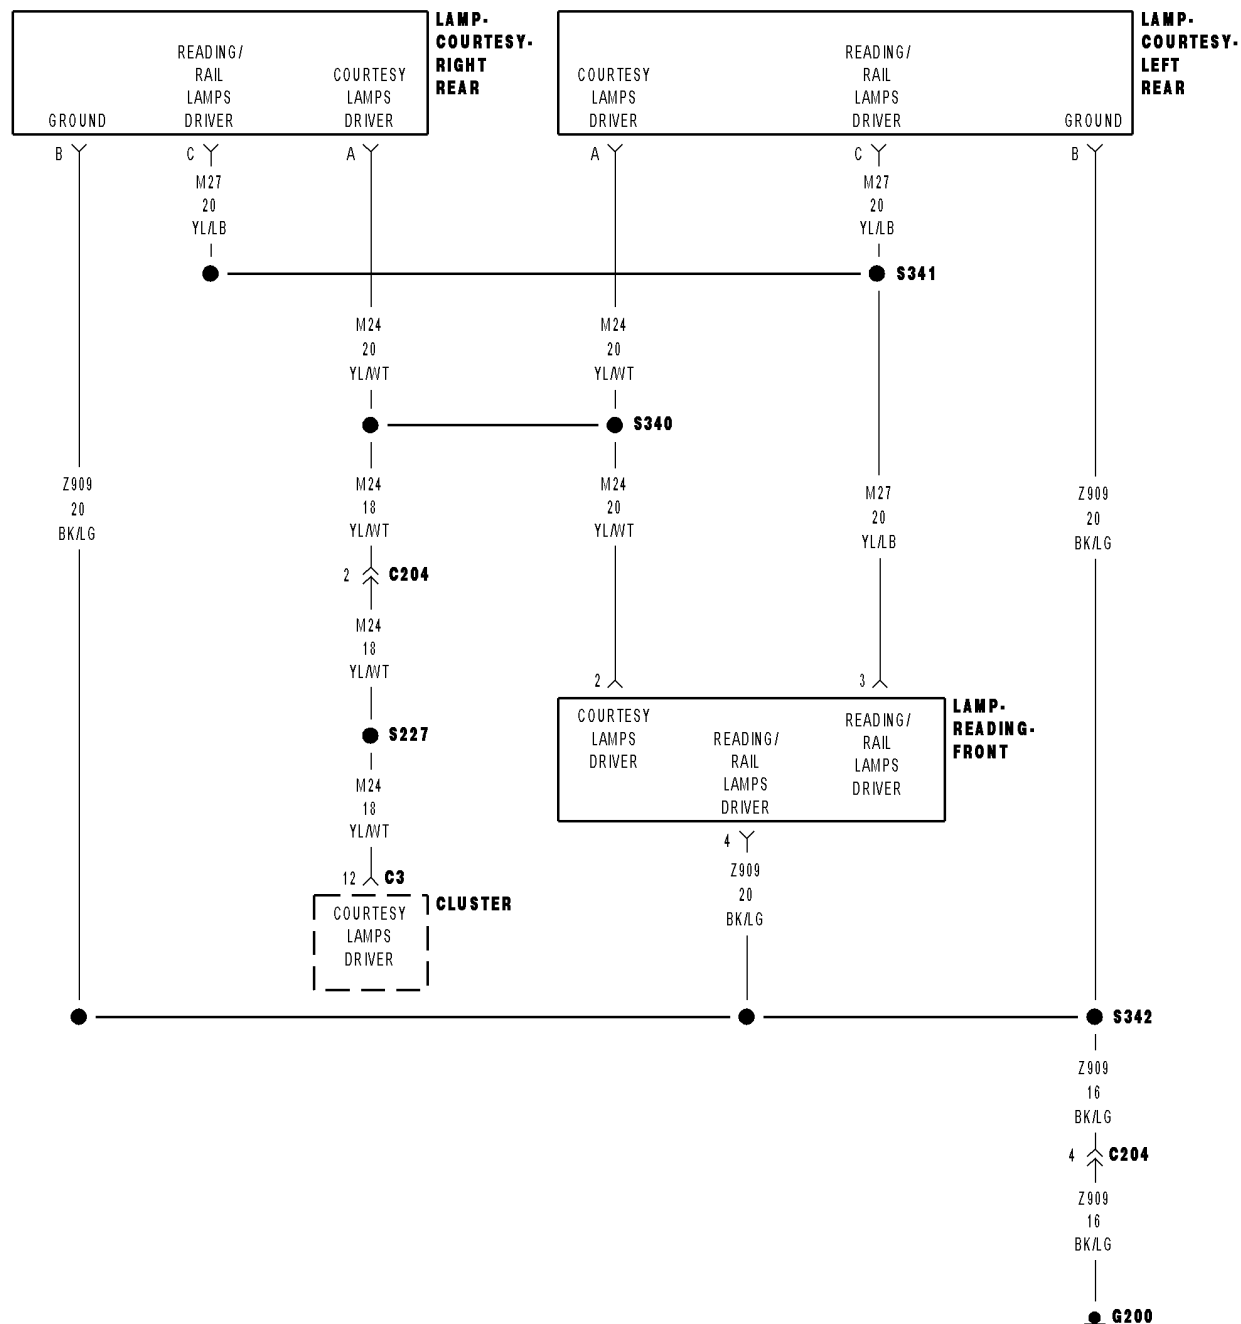

Disconnect the Instrument Cluster C3 connector.

Measure the resistance of the of the (M24) Cargo Lamp Output circuit.

**Is the resistance above 5.0 ohms?**

- Yes** >> Repair the (M24) Cargo Lamp Output circuit.  
Perform the BODY VERIFICATION TEST VER — 1.
- No** >> Replace the Instrument Cluster in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER — 1.

**B161C-COURTESY/DOME LAMP CONTROL CIRCUIT HIGH****CLUSTER C3****LAMP-READING-FRONT****LAMP-COURTESY-LEFT REAR****LAMP-COURTESY-RIGHT REAR**

**B161C-COURTESY/DOME LAMP CONTROL CIRCUIT HIGH (CONTINUED)**

For the Interior Lighting System circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Instrument Cluster detects a short to battery on the Control circuit.

Possible Causes
(M27) CONTROL CIRCUIT INSTRUMENT CLUSTER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

Clear all CCN DTC's

Turn the Courtesy Lamps on.

With the scan tool, read DTC's.

**Does the scan tool read: B161C-COURTESY/DOME LAMP CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**B161C-COURTESY/DOME LAMP CONTROL CIRCUIT HIGH (CONTINUED)****2. M27 COURTESY LAMP CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the Instrument Cluster C3 harness connector.

Measure the resistance of the (M27) Courtesy Lamp Control circuit.

**Is the resistance above 5.0 ohms?**

- No**     >> Repair the (M27) Courtesy Lamp Control circuit.  
             Perform BODY VERIFICATION TEST - VER 1.
- Yes**     >> Replace the Instrument Cluster in accordance with the service information.  
             Perform BODY VERIFICATION TEST - VER 1.

## B161F-READING LAMP CONTROL CIRCUIT LOW

**B161F-READING LAMP CONTROL CIRCUIT LOW (CONTINUED)**

For the Interior Lighting circuit diagram (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - INTERIOR - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
M27 READING/RAIL LAMP DRIVER READING/MAP LAMP ASSEMBLY INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

- Turn the ignition on.
- With the Scan Tool, clear all CCN DTC's.
- Turn the Reading Lamps on.
- With the Scan Tool read the DTC information.

**Does the Scan Tool read: B161F-READING LAMP CONTROL CIRCUIT LOW?**

- Yes**

>> Go To 2
- No**

>> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST-VER1.

**B161F-READING LAMP CONTROL CIRCUIT LOW (CONTINUED)****2. M27 READING/RAIL LAMPS DRIVER**

Turn the ignition off.

Disconnect the CCN C3 harness connector.

Measure the resistance between ground and the (M27) Reading/Rail Lamps Driver circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (M27) Reading/Rail Lamps Driver circuit for a short to ground.  
Perform the BODY VERIFICATION TEST-VER1.

**3. INSTRUMENT CLUSTER**

Turn the ignition off.

Disconnect the CCN C3 harness connector.

Disconnect the Reading/Map Lamp connector.

Measure the resistance between ground and the (M27) Reading/Rail Lamps Driver circuit.

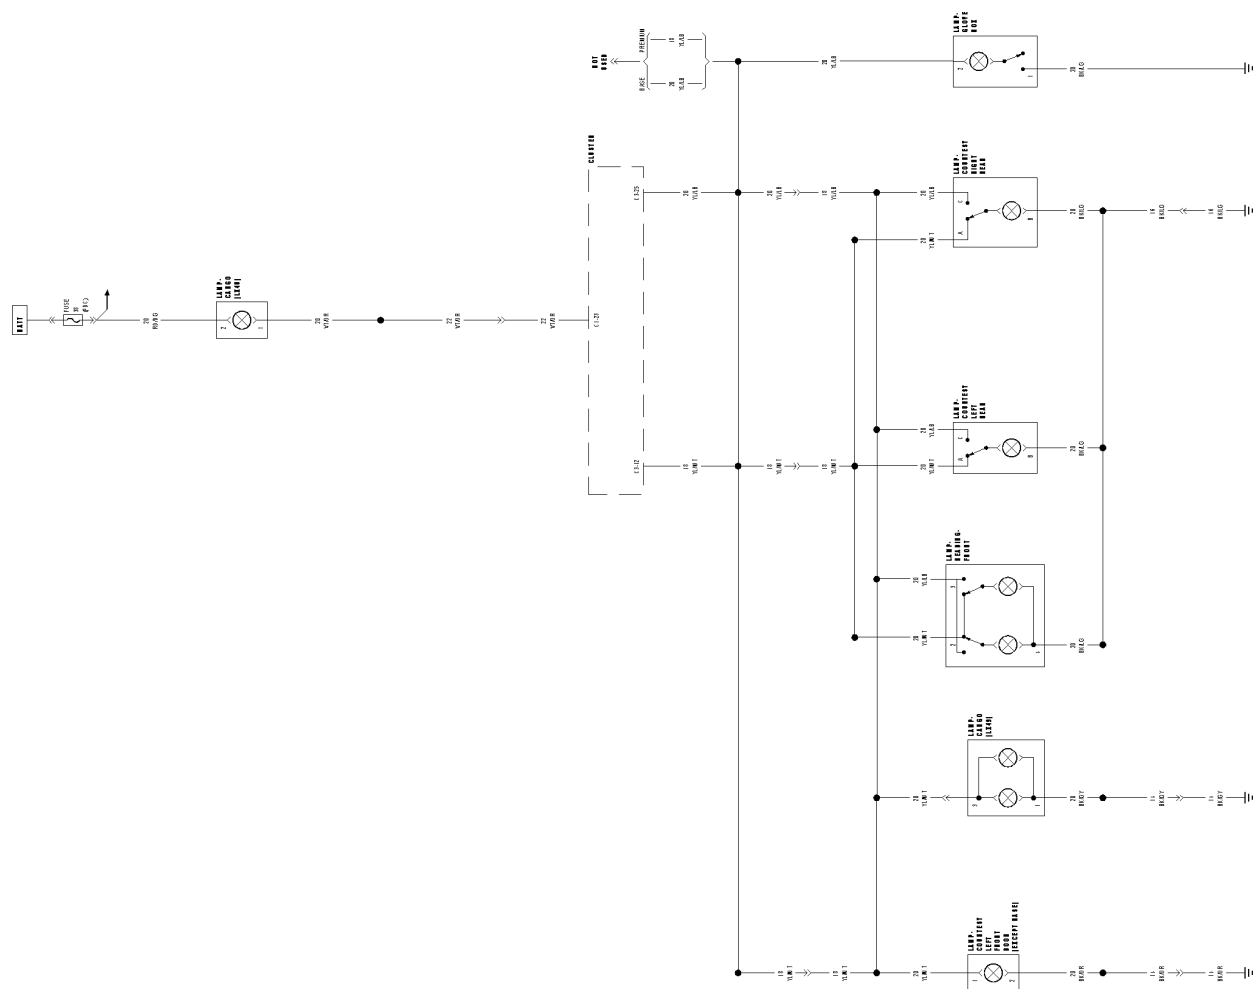

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Instrument Cluster in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

**No** >> Replace the Reading/Map Lamp Assembly in accordance with the service information.  
Perform the BODY VERIFICATION TEST-VER1.

## DOOR COURTESY LAMP

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).

3. With the trim panel on bench, gently pull the door courtesy lamp (1) out of courtesy lamp unit.

## INSTALLATION

1. Place the door courtesy lamp (1) into the courtesy lamp unit.

2. Install the front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
3. Connect the battery negative cable.

## LIFTGATE LAMP

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Open liftgate.
3. Using a trim stick (3) (special tool #C-4755) or equivalent, gently pry out on liftgate lamp lens (2) and remove from trim panel (1).

4. Gently pry up on the edge of the affected lamp and pull out of the liftgate lamp unit to remove.

### INSTALLATION

1. Place new lamp over retaining clips in liftgate lamp unit retaining clips and firmly snap into place.

2. Place the liftgate lamp lens (2) over the retaining pins making sure that they are lined up and then firmly snap into place.
3. Connect the battery negative cable.

## READING LAMP

### REMOVAL

#### OVERHEAD CONSOLE

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick (special tool #C-4755) or equivalent, gently pry out the top (toward windshield) side of the reading lamp lens.

3. Lift the top of the lens up and slide forward (toward windshield) until the tab is released from the overhead console.
4. Gently pull the lamp out of the overhead console.

## REAR

1. Disconnect and isolate the battery negative cable.
2. Using a trim stick (special tool #C-4755) or equivalent, gently pry out the edge of the reading lamp lens. There will be a small slot on the side of the lens that should be used. Looking at the unit it will be on the left side of the lens.

3. Lift out on the lens and slide the lens to the left so that the retaining tabs are exposed and the lens can be then removed.

4. Grasp lamp with fingers and firmly pull lamp (1) from unit.

## INSTALLATION

### OVERHEAD CONSOLE

1. Firmly push the lamp into the overhead console.
2. Place the tab inside the rear edge of the overhead console. Carefully push down on the front of the lens making sure to snap in both sides of the lens.
3. Connect the battery negative cable.

### REAR

1. Firmly push the lamp (1) into the reading lamp unit.

2. Looking at the lamp unit place the right side in first and make sure the tabs are under the lip of the unit. Slide right and then firmly snap lens (1) into place.
3. Connect the battery negative cable.

## **OVERHEAD CONSOLE - ELECTRICAL DIAGNOSTICS**

### **DIAGNOSIS AND TESTING**

**B1A32-UNIVERSAL GARAGE DOOR SWITCH 1 STUCK**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Electronic Overhead Module detects the UGDO switch in the closed position for more than 2 minutes.

Possible Causes
ELECTRONIC OVERHEAD MODULE

**Diagnostic Test****1. REPLACE THE ELECTRONIC OVERHEAD MODULE**

When this code is set, the Electronic Overhead Module must be replaced.

**Repair**

Replace the Electronic Overhead Module in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

---

**B1A33-UNIVERSAL GARAGE DOOR SWITCH 2 STUCK**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Electronic Overhead Module detects the UGDO switch in the closed position for more than 2 minutes.

Possible Causes
ELECTRONIC OVERHEAD MODULE

**Diagnostic Test**

**1. REPLACE THE ELECTRONIC OVERHEAD MODULE**

When this code is set, the Electronic Overhead Module must be replaced.

**Repair**

Replace the Electronic Overhead Module in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1A34-UNIVERSAL GARAGE DOOR SWITCH 3 STUCK**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Electronic Overhead Module detects the UGDO switch in the closed position for more than 2 minutes.

Possible Causes
ELECTRONIC OVERHEAD MODULE

**Diagnostic Test****1. REPLACE THE ELECTRONIC OVERHEAD MODULE**

When this code is set, the Electronic Overhead Module must be replaced.

**Repair**

Replace the Electronic Overhead Module in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

---

B2217 - EVIC/EOM/CMTC INTERNAL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, internal self test routine running.
- **Set Condition:**  
The Electronic Overhead Module fails one of seven internal tests.

Possible Causes
ELECTRONIC OVERHEAD MODULE

Diagnostic Test

1. VERIFY OPERATION OF THE ELECTRONIC OVERHEAD MODULE

Turn the ignition on.  
With the scan tool, erase Electronic Overhead Module DTCs.  
With the scan tool, activate the Electronic Overhead Module self test.  
Wait for self test to complete.  
With the scan tool, read Electronic Overhead Module DTCs.

- Does the scan tool display: B2217–EVIC/EOM/CMTC INTERNAL?**
- YES**    >> Replace the Electronic Overhead Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- NO**      >> Test complete.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B222D - ECU UNABLE TO CONFIGURE / CONFIGURATION NOT LEARNED**

For the Electronic Overhead Module circuit diagram (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Electronic Overhead Module does not receive the configuration information from the Front Control Module.

POSSIBLE CAUSES
NO COMMUNICATION WITH FRONT CONTROL MODULE
ACTIVE FCM DTCs

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on.

With the scan tool, record and erase any Electronic Overhead Module DTCs.

Turn the ignition off, wait 30 seconds then turn the ignition on.

With the scan tool, read DTCs.

**Is the DTC active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Using the wiring diagram as a guide, inspect the wiring and connectors for an intermittent condition. Operate the system several times and recheck for active DTCs. Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK COMMUNICATION TO THE FRONT CONTROL MODULE**

With the scan tool, check to see if the Front Control Module is active on the bus.

**Is the scan tool able to communicate with the Front Control Module?**

**Yes** >> Replace the Electronic Overhead Module in accordance with the Service Information. Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Refer to the symptom list for problems related to Communication. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B2331–VEHICLE NEEDS DEGAUSSED**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Vehicle speed greater than 10 mph.
- **Set Condition:**  
The magnetic field around the vehicle is greater than 2.4 gauss.

**Diagnostic Test****1. PERFORM THE VEHICLE DEMAGNETIZING PROCEDURE**

**Note:** A blank compass display indicates that vehicle degaussing is required.

**Note:** After demagnetizing, the vehicle will enter Auto Fast-Cal when the ignition is turned on.

**Note:** Ensure that the correct compass variance is stored in the compass memory. See “Setting Compass Variance” in the Service Information.

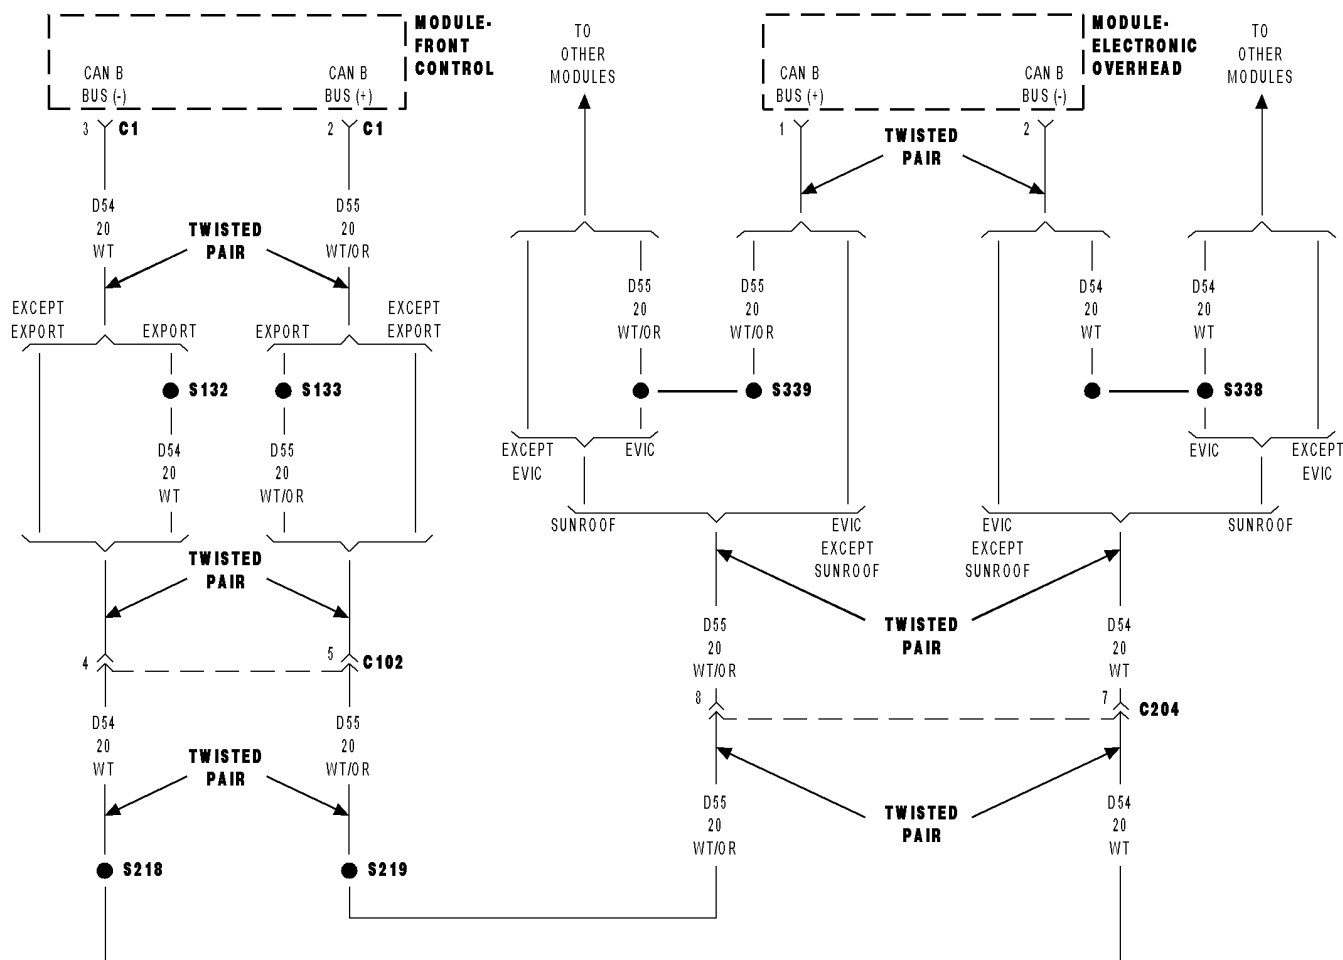

**View repair.**

**Repair**

Refer to the Service Information and perform the Compass Demagnetizing Standard Procedure.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

---

# U0019-CAN B BUS

**U0019–CAN B BUS (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously.
- **Set Condition:**  
If the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage, or shorted to ground.

**Possible Causes**

CAN B BUS DTCs IN FRONT CONTROL MODULE  
(D55) CAN B BUS (+) CIRCUIT OPEN  
(D54) CAN B BUS (–) CIRCUIT OPEN  
ELECTRONIC OVERHEAD MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC U0019–CAN B BUS**

Turn the ignition on.

With the scan tool, record and erase any Electronic Overhead Module DTCs.

Turn the ignition off, wait 30 seconds then turn the ignition on.

With the scan tool, read DTCs.

**Is DTC U0019–CAN B BUS active?**

- Yes** >> Go To 2
- No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK FOR ACTIVE CAN B BUS RELATED DTCs IN THE FRONT CONTROL MODULE**

With the scan tool, read Front Control Module DTCs

**Does the scan tool display any active CAN B BUS related DTCs?**

- Yes** >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)
- No** >> Go to 3

**U0019-CAN B BUS (CONTINUED)****3. CHECK (D55) CAN B BUS (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the Electronic Overhead Module harness connector.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Electronic Overhead Module harness connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the Can B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**4. CHECK THE (D54) CAN B BUS (-) CIRCUIT FOR AN OPEN**

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 harness connector and the Electronic Overhead Module harness connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the Electronic Overhead Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the Can B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## **U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0155-LOST COMMUNICATION WITH CLUSTER/CCN**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0159-LOST COMMUNICATION WITH PARKING ASSIST CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0167-LOST COMMUNICATION WITH INTRUSION TRANSCEIVER CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0184-LOST COMMUNICATION WITH RADIO**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0195-LOST COMMUNICATION WITH SDARS**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0196-LOST COMMUNICATION WITH VEHICLE ENTERTAINMENT CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0212-LOST COMMUNICATION WITH SCCM-CAN-B**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE**

For a complete wiring diagram **Refer to Section 8W.**

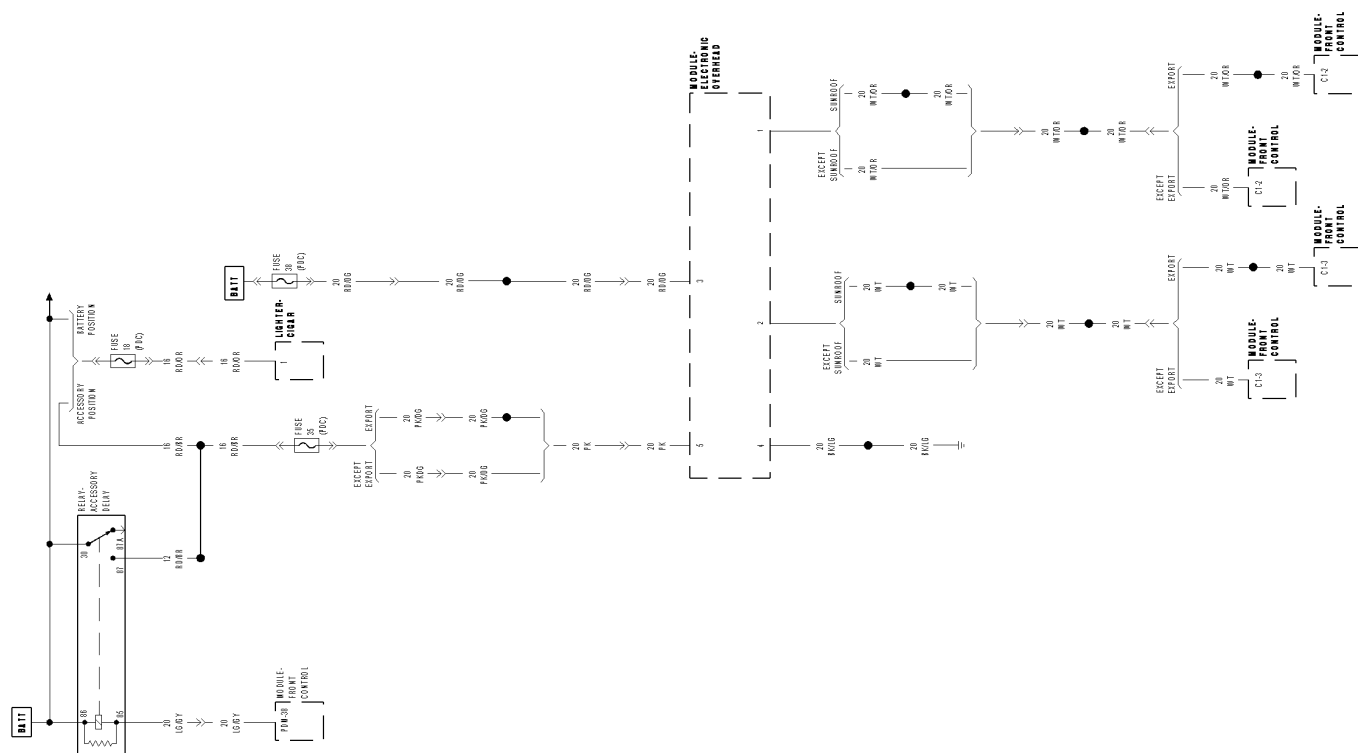

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0241-LOST COMMUNICATION WITH AUTO HIGHBEAM HEADLAMP CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## OVERHEAD CONSOLE - SERVICE INFORMATION

## DESCRIPTION

An overhead console is standard on this vehicle and includes the following components:

- Overhead storage compartment (1)
- Front map/reading lamps (2)
- Power sunroof switch (3) - if equipped
- Universal transmitter (4)
- Electronic Overhead Module

The overhead console assembly is mounted by three snap clips (1) securing it to a molded plastic retainer bracket located above the headliner. The Electronic Overhead Module is secured to the overhead console with screws (2).

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Pull downward on the sides of the overhead console housing firmly and evenly to disengage the snap clips from the overhead console bracket.

3. Lower the overhead console from the headliner far enough to access the wire harness connectors (2).
4. Disconnect the roof wire harness connectors (2) from the overhead console wire harness connector.
5. Remove the overhead console from the headliner.

## INSTALLATION

1. Position the overhead console near the mounting location on the headliner.
2. Reconnect the roof wire harness connectors (2) to the overhead console.
3. Align the snap clips on the overhead console housing with their receptacles (1) in the overhead console bracket.
4. Push upward firmly and evenly on the sides of the overhead console housing over the snap clip locations until the snap clip is fully engaged with its receptacle in the overhead console bracket.
5. Reconnect the battery negative cable.

## ELECTRONIC VEHICLE INFORMATION CENTER

### DESCRIPTION

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. The display is located in the upper part of the instrument cluster between the speedometer and tachometer. This system conveniently allows the driver to select a variety of useful information by pressing the switches mounted on the steering wheel. The EVIC displays information related to the following:

- System Status
- Vehicle information warning message displays
- Tire Pressure Monitor System — If Equipped
- Personal Settings (customer programmable features)
- Compass display
- Outside temperature display
- Trip computer functions
- UConnect™ hands-free communication system displays — If Equipped
- Navigation system screens — If Equipped
- Audio mode display

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster
- Steering Wheel Switches
- Ambient Temperature Sensor
- Electronic Overhead Module
- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display is part of the Instrument Cluster assembly and is not serviced as a separate component. If the display is inoperative the complete Instrument Cluster assembly must be replaced, (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - REMOVAL). If the steering wheel switches are inoperative and require replacement, (Refer to 8 - ELECTRICAL/AUDIO/REMOTE SWITCHES - REMOVAL) for the appropriate procedure. If the compass position sensor (Electronic Overhead Module) is inoperative and requires replacement, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/UNIVERSAL TRANSMITTER - REMOVAL) for the appropriate procedure.

## OPERATION

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the On position. When the ignition switch is turned to the On position, the EVIC display will return to the last function being displayed before the ignition was turned to the Off position.

The EVIC system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Buses. If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system.

The steering wheel switches are used to operate the different functions of the EVIC system. Pressing and releasing the MENU button (1) will change the mode displayed between Trip Functions, Navigation (If Equipped), System Status, Personal Settings, and Telephone (If Equipped). Pressing and releasing the C/T (compass/thermometer) button (3) will cause the EVIC to return to the compass/thermometer/trip computer display mode from any other mode.

The SCROLL buttons (3) are used to scroll through Trip Functions, Navigation (If Equipped), System Status Messages, and Personal Settings (Customer Programmable Features). Pressing and releasing the FUNCTION SELECT button (1) accepts a selected choice. The AUDIO MODE SELECT button (2) changes the mode of the radio from AM to FM to Tape to CD, or to Satellite (SAT) depending on which radio is in the vehicle. This button can also be used to return to a previous navigation menu selection.

## EVIC DISPLAY MODES

### SYSTEM STATUS MODE

Displays warnings and user interaction messages. Initial warnings will be displayed full-screen for three seconds, then override the odometer and show text warnings on the bottom line of the display. Critical text warnings will be displayed until the failure is corrected. Non-critical text warnings will be displayed for 60 seconds. The driver can scroll to view multiple messages by using the SCROLL buttons.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn Signal On (with a continuous warning chime)
- Left Front Turn Signal Lamp Out
- Left Rear Turn Signal Lamp Out
- Right Front Turn Signal Lamp Out
- Right Rear Turn Signal Lamp Out
- RKE Battery Low (with a single chime)
- Memory #1/#2 Profile Set
- Memory #1/#2 Profile Recall
- Memory System Disabled – Vehicle Not In Park (with a single chime)
- Memory System Disabled – Seat Belt Buckled (with a single chime)
- Personal Settings Not Available – Vehicle Not in Park
- Left/Right Front Door Ajar (one or more, with a single chime if speed is above 1 mph)
- Left/Right Rear Door Ajar (one or more, with a single chime if speed is above 1 mph)
- Door (S) Ajar (with a single chime if vehicle is in motion)
- Trunk Ajar (with a single chime)
- Low Washer Fluid (with a single chime)
- Adjustable Pedals Disabled – Cruise Engaged
- Adjustable Pedals Disabled – Vehicle In Reverse
- Channel 1, 2, OR 3 Transmit
- Channel 1, 2, OR 3 Training
- Channel 1, 2, OR 3 Trained
- Clearing Channels
- Channels Cleared
- Channels Defaulted
- Did Not Train
- Left Front Tire Low Pressure
- Left Rear Tire Low Pressure
- Right Front Tire Low Pressure
- Right Rear Tire Low Pressure
- Check Tire Pressure Monitoring (TPM) System
- Service Park Assist System

### TRIP MODE

Provides a choice of units displayed in English or metric. The following information can be displayed at the top of the screen:

- Average Miles Per Gallon (MPG)
- Distance to empty (DTE)
- Trip A odometer
- Trip B odometer
- Elapsed time

The EVIC trip computer features several functions that can be reset. Pressing and releasing the FUNCTION SELECT button once will clear the resettable function currently being displayed. Reset will only occur if a resettable function is currently being displayed. To reset all resettable functions, press and release the FUNCTION SELECT

button a second time within 3 seconds of resetting the currently displayed function (>Reset ALL will be displayed during this 3 second window).

The odometer is displayed at the bottom of the screen. If warnings exist, they will replace the odometer in the display. The driver can scroll to view information in the EVIC by using the SCROLL buttons.

### **COMPASS, TEMPERATURE AND AUDIO MODE**

Compass heading and outside temperature are displayed at the top of the screen. On the lower half of the screen the audio mode is displayed along with the odometer. Eight-point compass headings are displayed (N, S, E, W, NE, NW, SE, SW) and up to 15 compass variance settings can be set and recalled. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit). Audio mode can display any one of 12 radio station preset frequencies, CD disc number, CD track number, tape, and one of 200 Satellite Radio Channels - if equipped.

### **TELEPHONE MODE - IF EQUIPPED**

Provides the following information and features for the optional hands-free communications system:

- Phone status: idle, voice mail, roaming, battery strength and signal strength in increments of 20 percent
- Call status: Incoming call, connecting, connected, air time in minutes and seconds, call ended, busy, call failed, roaming and no phone connection
- Caller ID phone number display

### **NAVIGATION MODE - IF EQUIPPED**

When the Navigation System is On, the steering wheel buttons can be used to select the Map or Menu display on the Navigation Unit. When the Menu display is active, the SCROLL buttons can be used to scroll through the list, the FUNCTION SELECT button can be used to select an item, and the AUDIO MODE SELECT button can be used to return to the previous menu. When the Map display is active, pressing the FUNCTION SELECT button will change the Navigation Unit Display to the Menu.

If Turn by Turn Navigation is enabled through Personal Settings, the Navigation System will provide turn by turn directions to the programmed destination in the EVIC display. The name of the approaching road is displayed at the top of the screen, followed by an arrow to show the direction of the turn and the remaining distance to the turn counted down.

### **PERSONAL SETTINGS MODE (CUSTOMER PROGRAMMABLE FEATURES)**

Allows the driver to set and recall features when the transmission is in Park by pressing and releasing the MENU button until Personal Settings is displayed in the EVIC. The following personal settings can be set and recalled:

- Language: English, Spanish, German, Italian or French
- Display units in English or Metric
- Lock doors automatically at 15 mph (24 Kph), On or Off
- Unlock door automatically on exit, On or Off
- Remote Keyless Entry unlock driver door on first press or unlock all doors on first press
- Recall Memory with Remote Keyless Entry Unlock, On or Off
- Sound horn with Remote Keyless Entry Lock, On or Off
- Delay turning headlamps off for 0, 30, 60 or 90 seconds
- Headlamps on with wipers, On or Off
- Rain Sensing Intermittent Wipers, On or Off
- Automatically move seat back on exit, On or Off
- Tilt mirrors down and in when transmission is shifted to Reverse, On or Off
- Delay Power off to accessories until exit off, 45-seconds maximum, 5-minute maximum, 10-minute maximum or 60-minute maximum
- Turn headlamps on with Remote Keyless Entry Lock, On or Off
- Turn headlamps on with Remote Keyless Entry Unlock, Off or 30 seconds
- Park Assist System, On or Off
- Confirmation of Voice Commands, On or Off
- Turn-by-Turn Navigation, On or Off

## DIAGNOSIS AND TESTING

### ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) Data Bus circuit. The EVIC will not function properly if the bus messages from any of these components is not receive. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the Instrument Cluster functions and the Front Control Module (FCM).

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the EVIC and the CAN Data Bus circuit. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

## STANDARD PROCEDURE

### COMPASS CALIBRATION

**CAUTION:** Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not use magnetic tools when servicing the overhead console.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that the vehicle may acquire during normal use. If the compass readings appear to be erratic or the Electronic Vehicle Information Center (EVIC) displays "CAL", perform the following calibration procedure. Also, any time EVIC service replacement components are installed, they must be calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

Calibrate the compass manually as follows:

1. Turn the ignition switch to the On position.
2. Depress and hold the C/T push button (3) for approximately two seconds.

3. Use the SCROLL buttons (3) until MANUAL COMPASS CALIBRATION is highlighted.
4. Press and release the FUNCTION SELECT button (1) to start the calibration. The message "CAL" will appear in the EVIC display.
5. Drive the vehicle on a level surface, away from large metal objects and power lines, through one or two **complete** circles in not less than 16 seconds. The "CAL" message will disappear from the display to indicate that the compass is now calibrated.

**Note:** A blank compass display indicates that vehicle degaussing (demagnetizing) is necessary.

**Note:** If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the unit is inoperative. Repeat the calibration procedure at least one more time.

**Note:** If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.

## COMPASS DEMAGNETIZING

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

To demagnetize the roof panel proceed as follows:

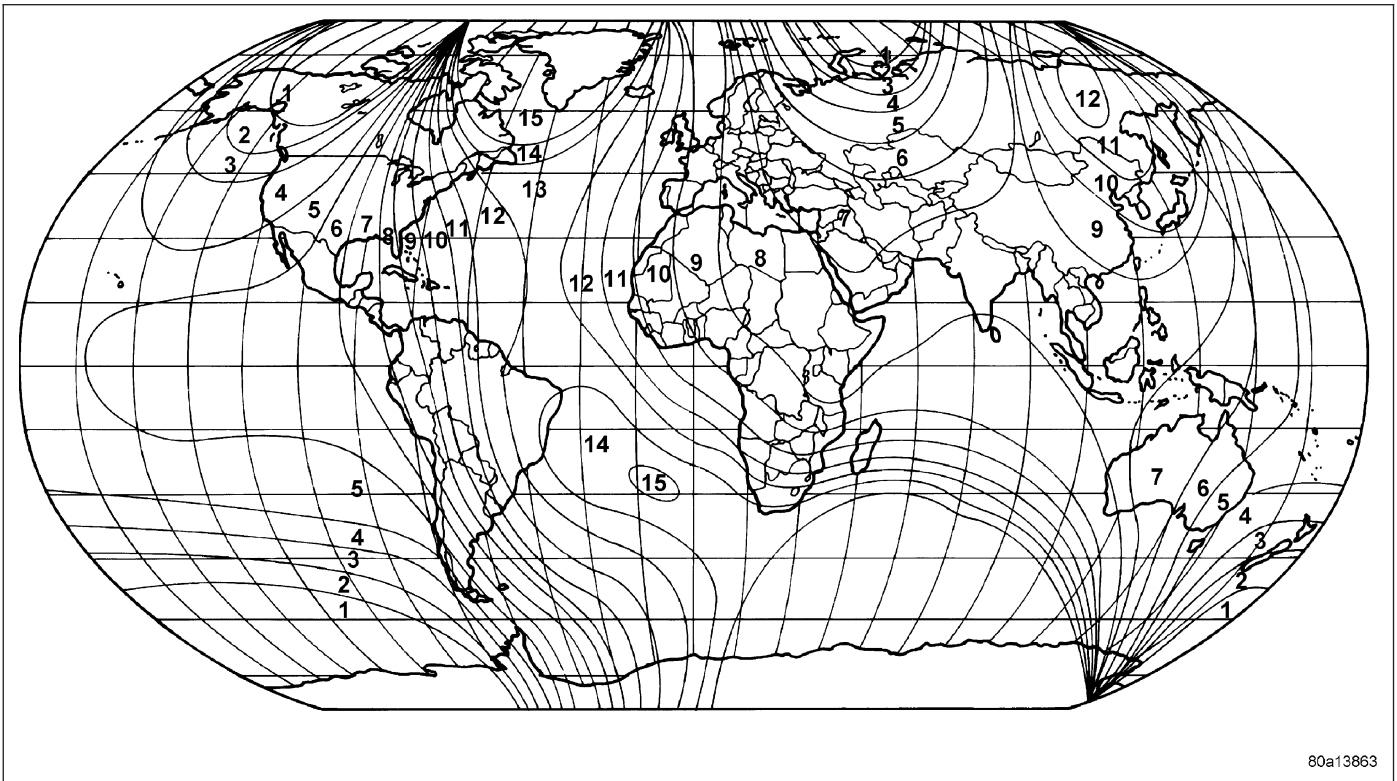

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.
2. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
3. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.
4. Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.
5. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.
6. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
7. Calibrate the compass, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - STANDARD PROCEDURE - COMPASS CALIBRATION) and adjust the compass variance, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT).

## COMPASS VARIATION ADJUSTMENT

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance setting may need to be changed.

To set the compass variance:

80a13863

1. Using the Variance Settings map, find your geographic location and note the zone number.
2. Turn the ignition switch to the On position.
3. Depress and hold the C/T push button (3) for approximately two seconds.

8135c523

4. Use the SCROLL buttons (3) until COMPASS VARIANCE is highlighted. The "COMPASS VARIANCE" message and the last variance zone number will be displayed.
5. Press and release the FUNCTION SELECT button (1) until the zone number for your geographic location appears in the display.

6. Depress and release the C/T push button (3) to exit.
7. Confirm that the correct directions are now indicated by the compass.

## UNIVERSAL TRANSMITTER

### DESCRIPTION

The universal transmitter transceiver is integral to the overhead console. The only visible component of the universal transmitter are the three transmitter push buttons (4) at the front of the overhead console. The buttons are marked with one, two or three illuminated dots, respectively, for identification of each channel.

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 286 to 399 MegaHertz (MHz) frequency range for remote operation. The universal transmitter is capable of operating systems using either rolling code or non-rolling code technology. The system will not transmit operating signals if the Vehicle Theft Security System is armed.

The universal transmitter cannot be repaired, and is available for service only as a unit. This unit includes the push button switches and the plastic module.

### DIAGNOSIS AND TESTING

#### UNIVERSAL TRANSMITTER

If the Universal Transmitter is inoperative, but the Electronic Vehicle Information Center (EVIC) is operating normally, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/UNIVERSAL TRANSMITTER - STANDARD PROCEDURE) for instructions on training the Transmitter. Retrain the Transmitter with a known good transmitter as instructed and test the Transmitter operation again.

If the unit is still inoperative, test the universal transmitter with Radio Frequency Detector special tool. as described below:

1. Turn the Radio Frequency (RF) Detector ON. A "chirp" will sound and the green power LED will light. If the green LED does not light, replace the battery.
2. Hold the RF detector within one inch of the TRAINED universal transmitter and press any of the transmitters buttons.
3. The red signal detection LEDs will light and the tool will beep if a radio signal is detected. Repeat this test for each button. If any button is inoperative, replace the universal transmitter assembly, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/UNIVERSAL TRANSMITTER - REMOVAL).

If both the Transmitter and the EVIC module are inoperative, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - DIAGNOSIS AND TESTING) for further diagnosis. Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

## STANDARD PROCEDURE

### PROGRAMMING TRANSMITTER CODES

**CAUTION:** Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the transceiver. Exhaust gas can cause serious injury or death.

**CAUTION:** Your motorized door or gate will open and close while you are training the Universal Transceiver. Do not train the transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display which includes HomeLink system messages. The EVIC is located in the upper part of the cluster between the speedometer and tachometer.

1. Press and hold the two outer HomeLink buttons (4), and release only when the EVIC display shows "Channels Cleared" (after 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat step one to program a second and/or third hand-held transmitter to the remaining two HomeLink buttons.
2. Position the end of your hand-held transmitter 1-3 inches (3-8 cm) away from the HomeLink buttons.
3. Simultaneously press and hold both the HomeLink button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**
4. The EVIC display will show "Channel X Training" (where X is Channel 1, 2, or 3). Release both buttons after the EVIC display shows "Channel X Trained".

**Note:** If the EVIC display shows "Did Not Train" repeat steps 2–4.

5. Press and hold the just trained HomeLink button and observe the EVIC display. If the EVIC display shows "Channel X Transmit" (where X is Channel 1, 2, or 3), programming is complete and your device should activate when the HomeLink button is pressed and released.

**Note:** To program the remaining two HomeLink buttons, begin with "Programming" step two. Do not repeat step one.

**Note:** If your hand-held transmitter appears to program the universal transceiver, but your garage door does not operate using the transmitter and your garage door opener was manufactured after 1995, your garage door opener may have a multiple security code system (rolling code system). Please proceed to steps 6–8 to complete the programming of a rolling code equipped device (most common garage door openers require this step).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

**Note:** There are 30 seconds in which to initiate step eight.

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink button. Repeat the "**press/hold/release**" sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.
9. HomeLink should now activate your rolling code equipped device.

10. To program the remaining two HomeLink buttons, begin with "Programming" step two. Do not repeat step one.

## ERASING TRANSMITTER CODES

**Note:** Individual channels cannot be erased. Erasing the transmitter codes will erase ALL programmed codes.

To erase programming from the three buttons (individual buttons cannot be erased but can be "reprogrammed" - note below), follow the step noted:

- Press and hold the two outer HomeLink buttons and release only when the Electronic Vehicle Information Center (EVIC) display shows "Channels Cleared" (after 20 seconds). Release both buttons. Do not hold for longer than 30 seconds. HomeLink is now in the train (or learning) mode and can be programmed at any time, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/UNIVERSAL TRANSMITTER - STANDARD PROCEDURE).

## REPROGRAMMING TRANSMITTER CODES

**CAUTION:** Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the transceiver. Exhaust gas can cause serious injury or death.

**CAUTION:** Your motorized door or gate will open and close while you are training the Universal Transceiver. Do not train the transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious injury or death to people and pets or damage to objects.

To program a device to HomeLink using a HomeLink button previously trained, follow these steps:

1. Press and hold the desired HomeLink button (4).  
**Do NOT** release the button.

2. The EVIC display will show "Channel X Transmit" (where X is Channel 1, 2, or 3) for 20 seconds and then change to "Channel X Training". Without releasing the HomeLink button, proceed to step 3.

3. Position the end of your hand-held transmitter 1-3 inches (3-8 cm) away from the HomeLink buttons.

4. Simultaneously press and hold both the HomeLink button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**

5. Press and hold the just trained HomeLink button and observe the EVIC display. If the EVIC display shows "Channel X Transmit" (where X is Channel 1, 2, or 3), programming is complete and your device should activate when the HomeLink button is pressed and released.

**Note:** To program the remaining two HomeLink buttons, begin with "Programming" step two. Do not repeat step one.

**Note:** If your hand-held transmitter appears to program the universal transceiver, but your garage door does not operate using the transmitter and your garage door opener was manufactured after 1995, your garage door opener may have a multiple security code system (rolling code system). Please proceed to steps 6-8 to complete the programming of a rolling code equipped device (most common garage door openers require this step).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

**Note:** There are 30 seconds in which to initiate step eight.

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink button. Repeat the "**press/hold/release**" sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.
9. HomeLink should now activate your rolling code equipped device.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console assembly, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Remove the universal transmitter retaining screws (2) and separate the transmitter from the overhead console.

## INSTALLATION

**Note:** In addition to the Universal Transmitter operation the Electronic Overhead Module is responsible for some of the compass functions. Anytime the Electronic Overhead Module is replaced the compass variance value must be set, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - STANDARD PROCEDURE - COMPASS VARIATION ADJUSTMENT).

1. Position the universal transmitter onto the overhead console assembly and install the retaining screws (2).
2. Install the overhead console assembly, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
3. Connect the battery negative cable.
4. Program the universal transmitter codes, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/UNIVERSAL TRANSMITTER - STANDARD PROCEDURE).

## SENSOR-AMBIENT AIR TEMPERATURE

### DESCRIPTION

The ambient temperature sensor is a variable resistor type sensor. It is mounted to the lower front fascia behind the radiator grille and in front of the engine compartment.

The ambient temperature sensor cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

### OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal sent by the Front Control Module (FCM). The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the FCM. Based upon the resistance in the sensor, the FCM senses a specific voltage on the temperature sensor signal circuit. The FCM then translates the voltage into a temperature reading that it sent over the Controller Area Network (CAN) data bus to other modules utilizing temperature information.

### DIAGNOSIS AND TESTING

#### AMBIENT TEMPERATURE SENSOR

The temperature function is supported by the ambient temperature sensor, a wiring circuit, and the Front Control Module (FCM). If any portion of the ambient temperature sensor circuit fails or if the Controller Area Network (CAN) data bus information is missing, a (— —) will appear in the Electronic Vehicle Information Center (EVIC) display in place of the temperature. When the sensor is exposed to temperatures above 55° C (130° F), or if the sensor circuit is shorted, 55° C (130° F) will appear in the EVIC display in place of the temperature. When the sensor is exposed to temperatures below - 40° C (- 40° F) or if the sensor circuit is open, - 40° C (- 40° F) will appear in the EVIC display.

The ambient temperature sensor circuit can also be diagnosed using the following Sensor Test, and Sensor Circuit Test. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect, test the EVIC operation, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - DIAGNOSIS AND TESTING).

#### SENSOR TEST

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor harness connector.
2. Measure the resistance of the ambient temperature sensor. At - 40° C (- 40° F), the sensor resistance is 336 kilohms. At 55° C (130° F), the sensor resistance is 2.488 kilohms. The sensor resistance should read between these two values. If OK, refer to Sensor Circuit Test in this group. If not OK, replace the inoperative ambient temperature sensor.

#### SENSOR CIRCUIT TEST

Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the wire harness connectors from the ambient temperature sensor and the FCM.
2. Connect a jumper wire between the two terminals in the body half of the ambient temperature sensor harness connector.

3. Check for continuity between the sensor return circuit and the ambient temperature sensor signal circuit cavities of the FCM harness connector. There should be continuity. If OK, go to Step 4. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.
4. Check for continuity between the ambient temperature sensor signal circuit cavity of the FCM harness connector and a good ground. There should be no continuity. If OK, test the EVIC operation, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - DIAGNOSIS AND TESTING). If not OK, repair the shorted ambient temperature sensor signal circuit as required.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the belly pan, (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL).
3. Disconnect the wire harness connector (1) from the ambient temperature sensor (2).
4. Remove the fastener that secures the ambient temperature sensor bracket to the front fascia.
5. Remove the ambient temperature sensor from the vehicle.

## INSTALLATION

1. Position the ambient temperature sensor in the vehicle.
2. Install the fastener that secures the ambient temperature sensor to the front fascia.

3. Connect the wire harness connector (1) to the ambient temperature sensor (2).
4. Install the belly pan, (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION).
5. Connect the battery negative cable.

**CLUSTER C1**

**SWITCH-WINDOW/DOOR LOCK-DRIVER EXPRESS C2 (EXCEPT BASE)**

**CLUSTER C2**

**B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW — CLUSTER (CONTINUED)**

For the Power Door Lock circuit diagram (Refer to 8 - ELECTRICAL/POWER LOCKS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Driver Door Lock Switch Mux circuit is below 0.15 volts for over 10 seconds.

Possible Causes
(G161) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND
(G161) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO THE (G167) DRIVER DOOR LOCK SWITCH RETURN CIRCUIT
DOOR LOCK SWITCH SHORT TO GROUND
INSTRUMENT CLUSTER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Operate the Driver Door Lock Switch in all positions several times.

Turn the ignition on and wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW — CLUSTER (CONTINUED)****2. DOOR LOCK SWITCH SHORTED**

With the scan tool, erase DTC's.

Disconnect the Driver Window/Door Lock Switch C1 and C2 connectors.

With the scan tool, read DTC's.

**Does the scan tool display B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW?**

**No** >> Replace the Driver Express Window/Door Lock Switch.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (G161) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Cluster C1 connector.

Measure the resistance between ground and the (G161) Driver Door Lock Switch Mux circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (G161) Driver Door Lock Switch Mux circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1801-DRIVER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW — CLUSTER (CONTINUED)****4. (G161) DRIVER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO (G167) DRIVER DOOR LOCK SWITCH RETURN CIRCUIT**

Disconnect the Cluster C2 connector.

Measure the resistance between the (G161) Driver Door Lock Switch Mux circuit (in the C1 connector) and the (G167) Driver Door Lock Switch Return circuit (in the C2 connector).

**Is the resistance below 10000.0 ohms?**

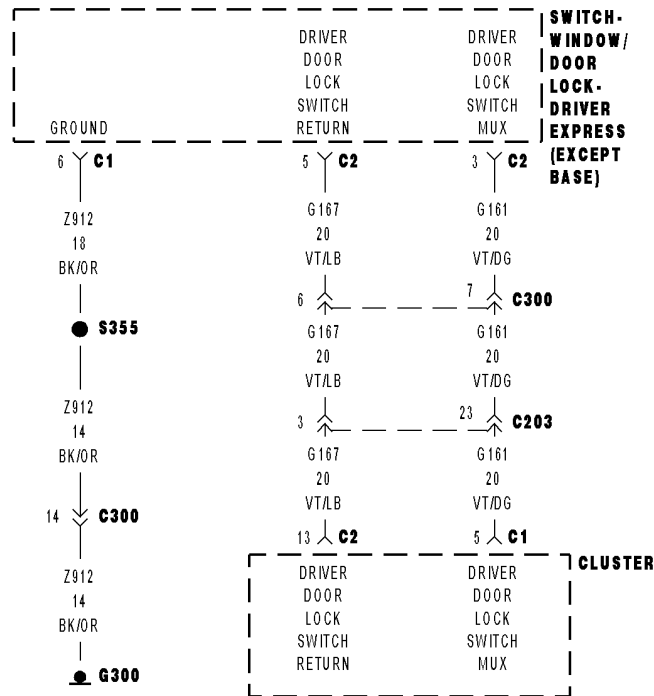

**Yes** >> Repair the (G161) Driver Door Lock Switch Mux circuit for a short to the (G167) Driver Door Lock Switch Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Instrument Cluster.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Passenger Express Window/Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Cluster C1 connector.

Measure the resistance between ground and the (G160) Passenger Door Lock Switch Mux circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (G160) Passenger Door Lock Switch Mux circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1806-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT LOW — CLUSTER (CONTINUED)****4. (G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO (P37) PASSENGER DOOR LOCK SWITCH RETURN CIRCUIT**

Disconnect the Cluster C2 connector.

Measure the resistance between the (G160) Passenger Door Lock Switch Mux circuit and the (P37) Passenger Door Lock Switch Return circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (G160) Passenger Door Lock Switch Mux circuit for a short to the (P37) Passenger Door Lock Switch Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Instrument Cluster.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1808-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK LOCK — CLUSTER

CLUSTER C1

CLUSTER C2

SWITCH-  
WINDOW/  
DOOR LOCK-  
PASSENGER  
EXPRESS  
(EXCEPT BASE)

**B1808-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK LOCK — CLUSTER (CONTINUED)**

For the Power Door Lock circuit diagram (Refer to 8 - ELECTRICAL/POWER LOCKS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Passenger Door Lock Switch Mux circuit is between 0.8 and 1.5 volts for over 30 seconds.

Possible Causes
(G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND
(G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO THE (P37) PASSENGER DOOR LOCK SWITCH RETURN CIRCUIT
DOOR LOCK SWITCH SHORT TO GROUND
INSTRUMENT CLUSTER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Operate the Passenger Door Lock Switch in all positions several times.

Turn the ignition on and wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1808-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK LOCK?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST – VER 1.

**B1808-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK LOCK — CLUSTER (CONTINUED)****2. DOOR LOCK SWITCH SHORTED**

With the scan tool, erase DTC's.

Disconnect the Passenger Express Window/Door Lock Switch connector.

With the scan tool, read DTC's.

**Does the scan tool display B1808-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK LOCK?**

**No** >> Replace the Passenger Express Window/Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Cluster C1 connector.

Measure the resistance between ground and the (G160) Passenger Door Lock Switch Mux circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (G160) Passenger Door Lock Switch Mux circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1808-PASSENGER DOOR LOCK/UNLOCK SWITCH CIRCUIT STUCK LOCK — CLUSTER (CONTINUED)****4. (G160) PASSENGER DOOR LOCK SWITCH MUX CIRCUIT SHORT TO (P37) PASSENGER DOOR LOCK SWITCH RETURN CIRCUIT**

Disconnect the Cluster C2 connector.

Measure the resistance between the (G160) Passenger Door Lock Switch Mux circuit and the (P37) Passenger Door Lock Switch Return circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (G160) Passenger Door Lock Switch Mux circuit for a short to the (P37) Passenger Door Lock Switch Return circuit.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST – VER 1.

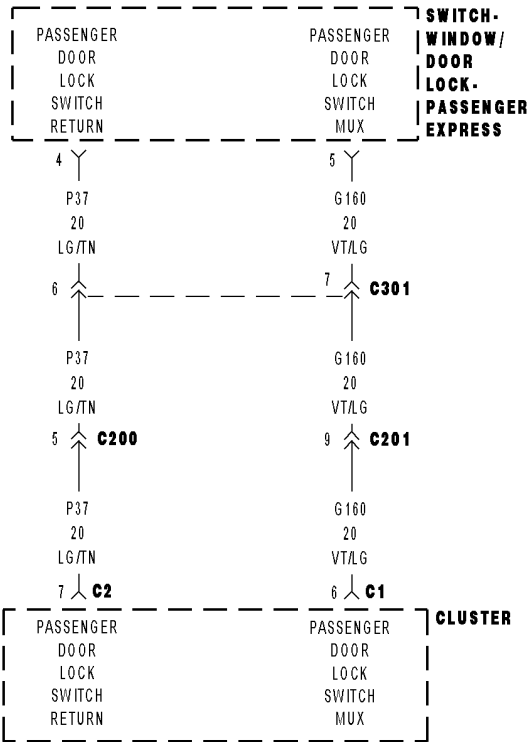

**No** >> Replace the Instrument Cluster.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST – VER 1.

**Diagnostic Test****1. DECKLID/LIFTGATE OPERATIONAL FROM RKE ONLY**

**Is the Decklid Or Liftgate operational from the RKE only?**

**No** >> Go To 2

**Yes** >> Go To 7

---

**\*DECKLID/LIFTGATE RELEASE INOPERATIVE (CONTINUED)****2. DECKLID OR LIFTGATE LATCH INOPERATIVE**

**Note: Ensure all fuses are good before proceeding.**

Disconnect the liftgate or decklid latch connector.

Connect a test light between the (P31) Decklid/Liftgate Release Driver circuit and the Ground circuit.

Turn the ignition on.

Operate the decklid or liftgate and observe the test light.

**Does the testlight illuminate brightly for approximately 300 ms. when the decklid or liftgate is operated?**

**Yes** >> Replace the Decklid or Liftgate Latch.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. OPEN GROUND CIRCUIT.**

Using a 12-volt test light connected to 12-volts, check the Ground circuit in the latch connector.

**Does the test light illuminate brightly?**

**No** >> Repair the Ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

**\*DECKLID/LIFTGATE RELEASE INOPERATIVE (CONTINUED)****4. (P31) DECKLID/LIFTGATE RELEASE DRIVER CIRCUIT SHORT TO GROUND.**

Turn the ignition off.

Disconnect the Cluster C3 connector.

Measure the resistance between Ground and the (P31) Decklid/Liftgate Release Driver circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (P31) Decklid/Liftgate Release Driver circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. (P31) DECKLID/LIFTGATE RELEASE DRIVER CIRCUIT SHORT TO VOLTAGE.**

Turn the ignition on.

Measure the voltage between Ground and the (P31) Decklid/Liftgate Release Driver circuit.

**Is there any voltage present?**

**Yes** >> Repair the (P31) Decklid/Liftgate Release Driver circuit for a short to voltage.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**No** >> Go To 6

**\*DECKLID/LIFTGATE RELEASE INOPERATIVE (CONTINUED)****6. (P31) DECKLID/LIFTGATE RELEASE DRIVER CIRCUIT OPEN.**

Turn the ignition off.

Measure the resistance of the (P31) Decklid/Liftgate Release Driver circuit between the Latch connector and the Cluster C3 connector.

**Is the resistance below 5.0 ohms?**

**No** >> Repair the (P31) Decklid/Liftgate Release Driver circuit for an open.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**Yes** >> Replace the Instrument Cluster.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**7. IS THIS VEHICLE A 4 DOOR SEDAN?**

**Is this vehicle a 4 door sedan?**

**Yes** >> Go To 8

**No** >> Go To 12

**8. DECKLID SWITCH INOPERATIVE.**

**Note: Ensure the Decklid Latch is connected before proceeding.**

Disconnect the Decklid Release Switch connector.

Turn the Ignition On.

Momentarily connect a jumper wire between the (G25) Decklid/Liftgate Release Switch Sense circuit and the Ground circuit.

**Did the decklid open?**

**Yes** >> Replace the decklid switch.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

**\*DECKLID/LIFTGATE RELEASE INOPERATIVE (CONTINUED)****9. SWITCH GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the Ground circuit.

**Does the test light illuminate brightly?**

**No** >> Repair the Ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**Yes** >> Go To 10

**10. (P25) DECKLID/LIFTGATE RELEASE SWITCH SENSE CIRCUIT SHORT TO GROUND.**

Turn the ignition off.

Disconnect the Cluster C1 connector.

Measure the resistance between Ground and the (G25) Decklid/Liftgate Release Switch sense circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (G25) Decklid/Liftgate Release Switch Sense circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**No** >> Go To 11

**\*DECKLID/LIFTGATE RELEASE INOPERATIVE (CONTINUED)****11. (P25) DECKLID/LIFTGATE RELEASE SWITCH SENSE CIRCUIT OPEN.**

Measure the resistance of the (G25) Decklid/Liftgate Release Switch sense circuit between the Switch connector and the Cluster C1 connector.

**Is the resistance below 5.0 ohms?**

**No** >> Repair the (G25) Decklid/Liftgate Release Switch Sense circuit for an open.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

## B1826-TRUNK RELEASE SWITCH INPUT CIRCUIT LOW

**B1826-TRUNK RELEASE SWITCH INPUT CIRCUIT LOW (CONTINUED)**

For the Power Door Lock circuit diagram(Refer to 8 - ELECTRICAL/POWER LOCKS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake
- **Set Condition:**  
When the (G25) Decklid/Liftgate Release Switch Sense circuit is shorted low for over 30 seconds.

Possible Causes
(G25) DECKLID/LIFTGATE RELEASE SWITCH SENSE CIRCUIT SHORT TO GROUND DECKLID OR LIFTGATE SWITCH SHORTED TO GROUND INSTRUMENT CLUSTER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's  
Operate the Decklid or Liftgate Switch several times.  
Turn the ignition on and wait 30 seconds.  
With the scan tool, read DTC's.

**Does the scan tool display B1826-TRUNK RELEASE SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST – VER 1).

**B1826-TRUNK RELEASE SWITCH INPUT CIRCUIT LOW (CONTINUED)****2. TRUNK SWITCH SHORTED**

Disconnect the Decklid or Liftgate Release Switch connector.

With the scan tool, record and erase DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display B1826-TRUNK RELEASE SWITCH INPUT CIRCUIT LOW?**

**No** >> Replace the decklid or liftgate switch.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go To 3

**3. (P25) DECKLID/LIFTGATE RELEASE SWITCH SENSE CIRCUIT SHORT TO GROUND.**

Turn the ignition off.

Disconnect the Cluster C1 connector.

Measure the resistance between Ground and the (G25) Decklid/Liftgate Release Switch sense circuit.

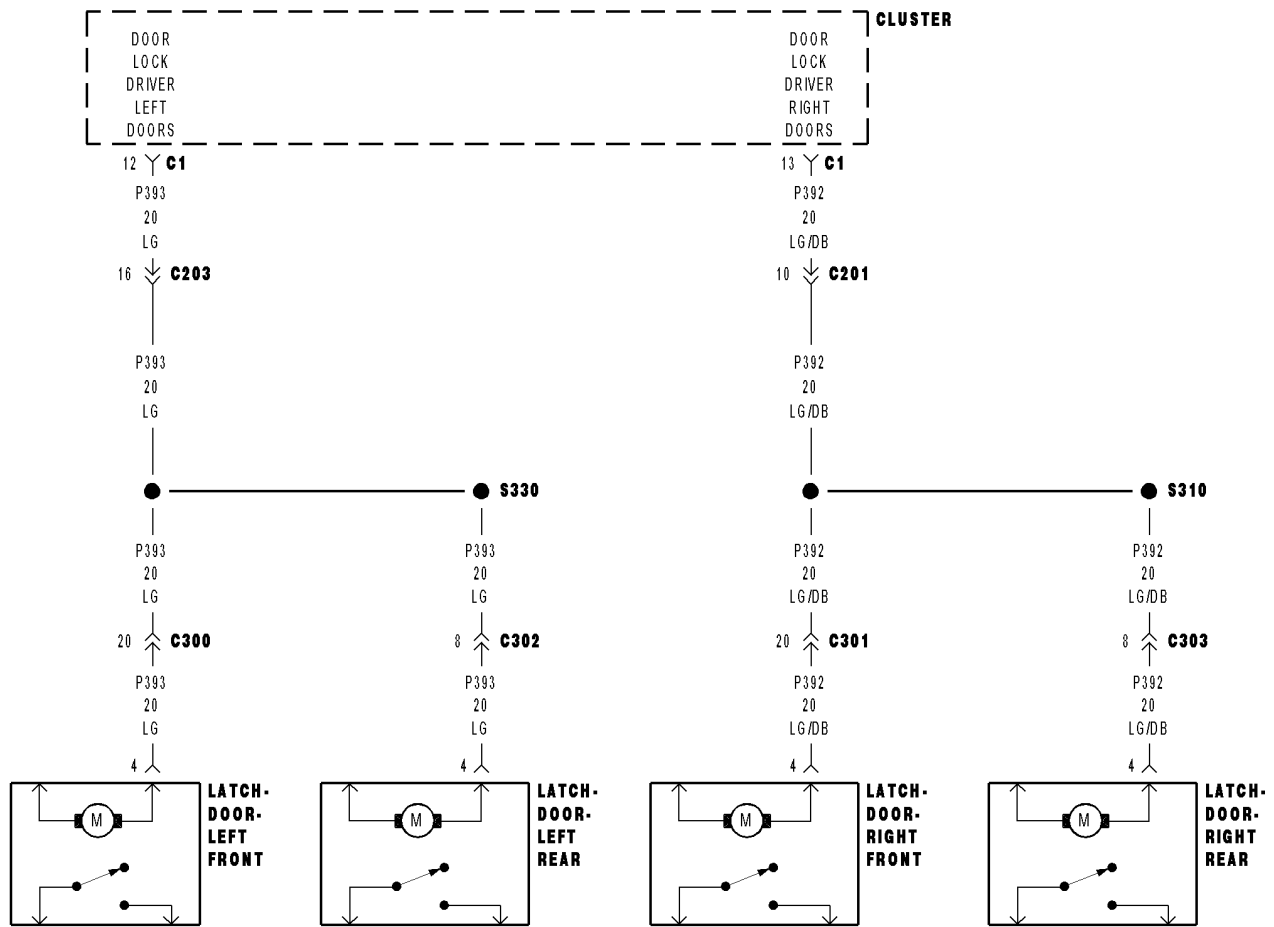

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (G25) Decklid/Liftgate Release Switch Sense circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster  
Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1).

**\*ALL DOORS FAIL TO LOCK**

**\*ALL DOORS FAIL TO LOCK (CONTINUED)**

For the Power Door Lock circuit diagram (Refer to 8 - ELECTRICAL/POWER LOCKS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The Door Lock Driver Right Doors circuit and the Door Lock Driver Left Doors circuits are connected together inside the Cluster. Therefore either circuit shorted will affect all door locks. Depending on where the short is, some doors may lock.

Possible Causes
(P392) DOOR LOCK DRIVER RIGHT DOORS CIRCUIT SHORT TO GROUND
(P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT SHORT TO GROUND
CLUSTER

**Diagnostic Test****1. CHECK FOR DOOR LOCK DTC'S**

Turn the ignition on.

With the scan tool, record and erase DTC's.

Turn the ignition off, wait 10 seconds then turn the ignition on.

Try to operate the door locks several times.

With the scan tool, read active DTC's.

**Does the scan tool display any Door Lock System DTC's?**

**No** >> Go To 2

**Yes** >> Refer to symptom list for problems related to POWER DOOR LOCKS.

**\*ALL DOORS FAIL TO LOCK (CONTINUED)****2. CHECK (P392) DOOR LOCK DRIVER RIGHT DOORS CIRCUIT FOR A SHORT TO GROUND**

**Note:** If only one motor is inoperative when the door locks are actuated, disconnect that motor and retest to see if the other doors lock properly. If they do, replace the defective motor.

**Note:** Ensure the door lock inhibit (key in ignition) and the door ajar systems are operating properly before proceeding. These systems affect the door lock locking functions if they are not working as they should.

Turn the ignition off.

Disconnect the Cluster C1 connector.

Measure the resistance between ground and the (P392) Door Lock Driver Right Doors circuit.

**Is the resistance below 1000.0 ohms?**

**No** >> Go To 3

**Yes** >> Repair the (P392) Door Lock Driver Right Doors circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**3. CHECK (P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (P393) Door Lock Driver Left Doors circuit.

**Is the resistance below 1000.0 ohms?**

**No** >> Replace the Cluster in accordance with service information.

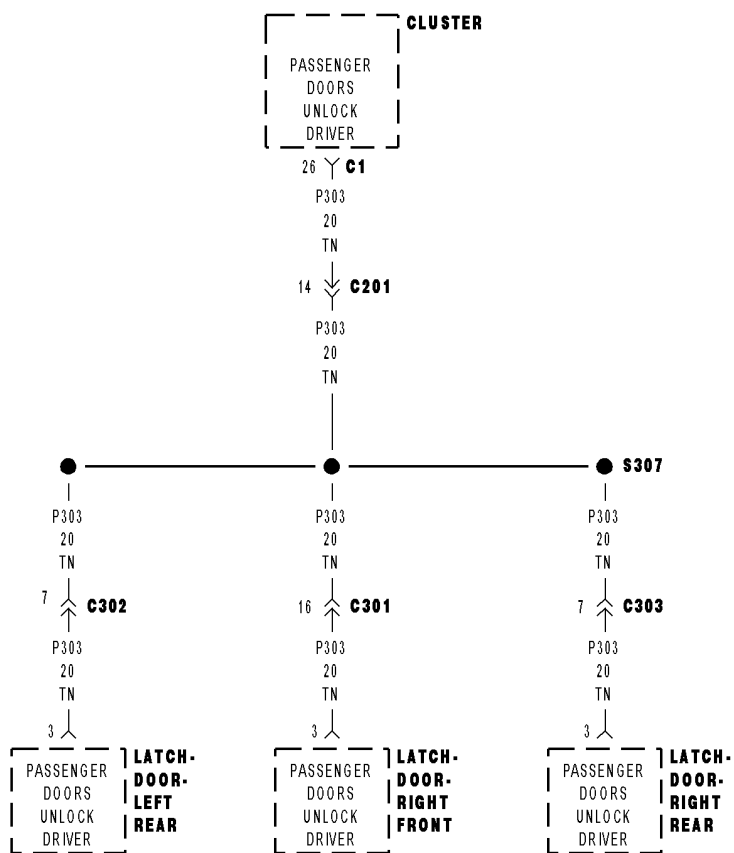

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Repair the (P393) Door Lock Driver Left Doors circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT OPEN (P303) PASSENGER DOOR UNLOCK DRIVER CIRCUIT OPEN CLUSTER

**Diagnostic Test****1. CHECK (P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT FOR AN OPEN**

Turn the ignition off.

Remove the left door door inner trim panel to gain access to the door latch connector.

Disconnect the Left Rear Door Latch connector.

Disconnect the Instrument Cluster C1 connector.

Measure the resistance of the (P393) Door Lock Driver Left Doors circuit between the Cluster C1 connector and the Left Rear Door Latch connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 2

**No** >> Repair the (P393) Door Lock Driver Left Doors circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**\*LEFT DOOR LOCKS INOPERATIVE (CONTINUED)****2. CHECK (P303) PASSENGER DOORS UNLOCK DRIVER CIRCUIT FOR AN OPEN**

Measure the resistance of the (P303) Passenger Doors Unlock Driver circuit between the Cluster C1 connector and the Left Rear Door Latch connector.

**Is the resistance below 2.0 ohms?**

- Yes** >> Replace the Cluster in accordance with service information.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- No** >> Repair the (P303) Passenger Doors Unlock Driver circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**\*DRIVER DOOR LOCK INOPERATIVE**

**\*DRIVER DOOR LOCK INOPERATIVE (CONTINUED)**

For the Power Door Lock circuit diagram (Refer to 8 - ELECTRICAL/POWER LOCKS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT OPEN (P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT SHORT TO GROUND (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT OPEN (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT SHORT TO GROUND DRIVER DOOR LATCH CLUSTER

**Diagnostic Test**

**1. DRIVER DOOR LATCH INOPERATIVE**

Disconnect the Driver Door Latch connector.  
Connect a test light between the (P393) Door Lock Driver Left Doors circuit and the (P1) Driver Door Unlock Driver circuit.  
Close the front doors or trip the door latches to the closed position.  
Operate the door locks in both positions and observe the test light.

**Does the test light illuminate brightly for approximately 300 ms. when the door locks are actuated?**

- Yes**    >> Replace the Driver Door Latch.  
          Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.
- No**      >> Go To 2

**\*DRIVER DOOR LOCK INOPERATIVE (CONTINUED)****2. CHECK (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT FOR AN OPEN**

Disconnect the Cluster C1 connector.

Measure the resistance of the (P1) Driver Door Unlock Driver circuit between the Latch connector and the Cluster C1 connector.

**Is the resistance below 2.0 ohms?**

**No** >> Repair the (P1) Driver Door Unlock Driver circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. CHECK (P1) DRIVER DOOR UNLOCK DRIVER CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between Ground and the (P1) Driver Door Unlock Driver circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (P1) Driver Door Unlock Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**\*DRIVER DOOR LOCK INOPERATIVE (CONTINUED)****4. CHECK (P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT FOR AN OPEN**

Measure the resistance of the (P393) Door Lock Driver Left Doors circuit between the Cluster C1 connector and the Driver Door Latch connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (P393) Door Lock Driver Left Doors circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**5. CHECK (P393) DOOR LOCK DRIVER LEFT DOORS CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between Ground and the (P393) Door Lock Driver Left Doors circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (P393) Door Lock Driver Left Doors circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Instrument Cluster in accordance with service information.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**\*ONE PASSENGER DOOR LOCK INOPERATIVE**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(P392) OR (P393) DOOR LOCK DRIVER CIRCUIT OPEN
(P392) OR (P393) DOOR LOCK DRIVER CIRCUIT SHORT TO GROUND
(P303) PASSENGER DOOR UNLOCK DRIVER CIRCUIT OPEN
(P303) PASSENGER DOOR UNLOCK DRIVER CIRCUIT SHORT TO GROUND
DOOR LATCH

**Diagnostic Test**

**1. PASSENGER DOOR LATCH INOPERATIVE**

**Note:** Graphics show Right Front Latch but the other 2 passenger latches are similar.

Turn the ignition off.

Disconnect the inoperative Passenger Door latch connector.

Connect a test light between the (P392/3) Door Lock Driver circuit and the (P303) Passenger Door Unlock Driver circuit.

Close the front doors or trip the door latches to the closed position.

Operate the door locks in both positions and observe the test light.

**Does the test light illuminate brightly for approximately 300 ms. when the door locks are actuated?**

**Yes**    >> Replace the Passenger Door Latch.  
          Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1.

**No**    >> Go To 2

**\*ONE PASSENGER DOOR LOCK INOPERATIVE (CONTINUED)****2. CHECK (P303) PASSENGER DOOR UNLOCK DRIVER CIRCUIT FOR AN OPEN**

Disconnect the Cluster C1 connector.

Measure the resistance of the (P303) Passenger Door Unlock Driver circuit between the Latch connector and the Cluster C1 connector.

**Is the resistance below 2.0 ohms?**

**No** >> Repair the (P303) Passenger Door Unlock Driver circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. CHECK (P303) PASSENGER DOOR UNLOCK DRIVER CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between Ground and the (P303) Passenger Door Unlock Driver circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (P303) Passenger Door Unlock Driver circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**\*ONE PASSENGER DOOR LOCK INOPERATIVE (CONTINUED)****4. CHECK (P392/3) DOOR LOCK DRIVER CIRCUIT FOR AN OPEN**

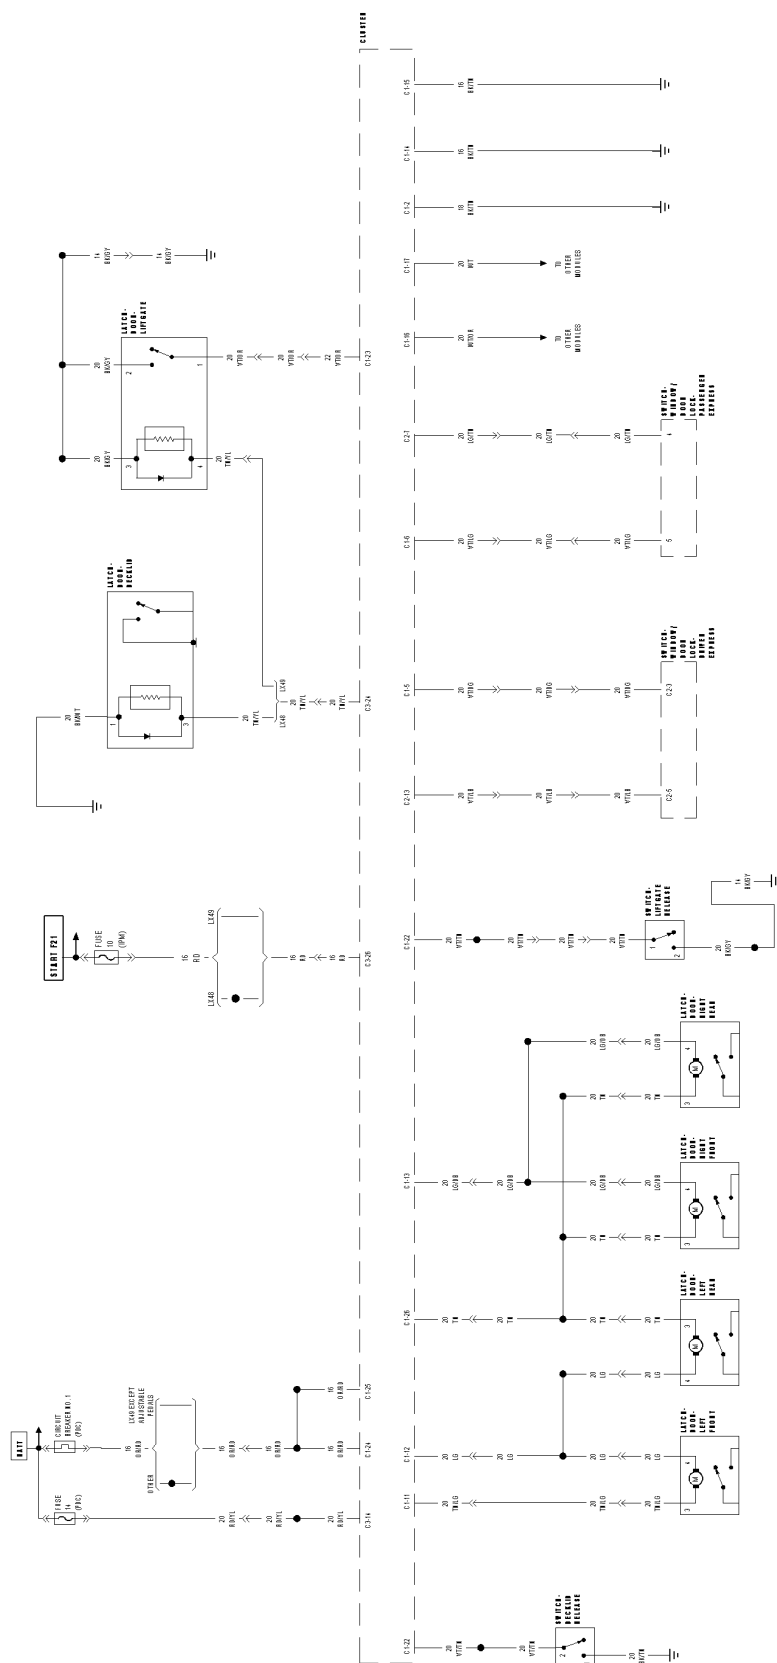

Measure the resistance of the (P392/3) Door Lock Driver circuit between the Cluster C1 connector and the Passenger Door Latch connector.

**Is the resistance below 2.0 ohms?**

- Yes** >> Repair the (P392/3) Door Lock Driver circuit for a short to ground.
- No** >> Repair the (P392/3) Door Lock Driver circuit for an open. Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

POWER LOCKS - SERVICE INFORMATION

DESCRIPTION

POWER LOCKS

The power lock system allows all of the doors and liftgate to be locked or unlocked electrically by operating a switch on either front door trim panel. The power lock system receives non-switched battery current through a fuse in the Junction Block (JB), so that the power locks remain operational, regardless of the ignition switch position.

The instrument cluster locks the doors automatically when the vehicle is driven beyond the speed of 25.7 Km/h (15 mph), all doors are closed, and the accelerator pedal is depressed. The rolling door lock feature can be disabled through the EVIC.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences.

The power lock system for this vehicle can also be operated remotely using the Remote Keyless Entry (RKE) transmitters.

CENTRAL LOCKING/UNLOCKING

- The central locking system controls powered operation of the door and liftgate locks and the illuminated entry system. Central locking included the following features:
- Automatic locking of the doors and liftgate when the vehicle speed exceeds approximately 25 km/h (15 mph).
  - Locking prevention with a door lock switch or the RKE transmitter if the key is in the ignition switch and the driver's door is open.
  - Driver selectable unlocking mode: Unlock only the driver's door or all doors and the liftgate with one press of the RKE transmitter unlock button. The driver's door cylinder can also be used to unlock the door. One turn of the cylinder will unlock the driver's door, two turns within 5 seconds will unlock all doors.
  - Automatic illumination of interior courtesy lamps when the vehicle is unlocked.
  - Locking all doors and the liftgate by pressing the lock button on the RKE transmitter, or by pressing a lock switch on one of the front doors.

## DOOR LOCK MOTORS

The lock mechanisms are actuated by a reversible electric motor mounted within each door. The power lock motors are integral to the door latch units.

The power lock motors cannot be adjusted or repaired. If inoperative or damaged, the door latch unit must be replaced.

## REMOTE KEYLESS ENTRY

The Remote Keyless Entry (RKE) system locks and unlocks the doors and liftgate, turns on interior lamps, and arms and disarms the Vehicle Theft Security System (if equipped). The RKE system operates on non-switched battery current through a fuse in the Integrated Power Module (IPM), so that the system remains operational, regardless of the ignition switch position.

The RKE transmitters are also equipped with a Panic button. If the Panic button on the RKE transmitter is depressed, the horn will sound and the exterior lights will flash on the vehicle for about three minutes, or until the Panic button is depressed a second time. A vehicle speed of about 25.7 kilometers-per-hour (15 miles-per-hour) will also cancel the panic event.

The RKE system can also perform other functions on this vehicle. If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), the RKE transmitter will arm the VTSS when the Lock button is depressed, and disarm the VTSS when the Unlock button is depressed.

The RKE system includes two transmitters when the vehicle is shipped from the factory, but the system can retain the vehicle access codes of up to a total of eight transmitters. The transmitter codes are retained in the RKE module memory, even if the battery is disconnected. If an RKE transmitter is faulty or lost, new transmitter vehicle access codes can be programmed into the system using a scan tool.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences. Customer programmable feature options affecting the RKE system include:

- **Remote Unlock Sequence** - Allows the option of having only the driver side front door unlock when the RKE transmitter Unlock button is depressed the first time. The remaining doors unlock when the button is depressed a second time within 5 seconds of the first unlock press. Another option is having all doors and liftgate unlock upon the first depression of the RKE transmitter Unlock button.
- **Sound Horn on Lock** - Allows the option of having the horn sound a short chirp as an audible verification that the RKE system received a valid Lock request from the RKE transmitter, or having no audible verification.
- **Flash Lights with Lock and Unlock** - Allows the option of having the park lamps flash as an optical verification that the RKE system received a valid Lock request or Unlock request from the RKE transmitter, or having no optical verification.
- **Programming Additional Transmitters** - Allows up to a total of eight transmitter vehicle access codes to be stored in the receiver memory.

Certain functions and features of the RKE system rely upon resources shared with other electronic modules in the vehicle over the CAN data bus network. For diagnosis of these electronic modules or of the data bus network, the use of a scan tool and the appropriate diagnostic information are required.

## OPERATION

### POWER LOCKS

The instrument cluster locks or unlocks the doors when an actuation input signal from a door lock switch or Remote Keyless Entry (RKE) transmitter is received. The instrument cluster turns on the output drivers and provides a voltage level to the door lock motor for a specified time. All passenger doors can be locked or unlocked using a mechanical button mounted on the door trim panel. The drivers door can be locked or unlocked by using the key cylinder.

## DOOR LOCK MOTORS

The door lock motors are controlled by the instrument cluster. A positive and negative battery connection to the two motor terminals will cause the motor to move in one direction. Reversing the current will cause the motor to move in the opposite direction.

## REMOTE KEYLESS ENTRY

- **LOCK:** Pressing the LOCK button locks all doors, sounds horn (chirp) once if enabled, flashes the park lamps once if enabled, and arms the Vehicle Theft Security System (VTSS), if enabled. The chirp verifies that the instrument cluster has sent a message for door lock operation. If a door has not been closed before pressing the LOCK button, the vehicle may not be secured and the VTSS (if equipped) will not arm until the door is closed.
- **UNLOCK:** Pressing the UNLOCK button once will unlock the driver's door first if enabled, flashes the park lamps twice if enabled, activates the illuminated entry system, and disarms the Vehicle Theft Security System (VTSS), if equipped. Pressing the UNLOCK button twice within five seconds will unlock all doors, if driver's door first is enabled.
- **PANIC:** Pressing the PANIC button sounds the horns at half second intervals, flashes the exterior lamps, and turns ON the interior lamps. The panic alarm will remain on for three minutes, or until the PANIC button is actuated again or the vehicle speed exceeds 25.7 Km/h (15 mph) will cancel the panic event.

## DIAGNOSIS AND TESTING

### POWER LOCKS

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to the appropriate wiring information.

Following are tests that will help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the CAN data bus network must be checked.

### PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter. Then, proceed as follows:

- If the entire power lock system fails to function with either the power lock switches or the RKE transmitter, check the fuse in the Junction Block (JB).
- If the power lock system functions with both power lock switches, but not with the RKE transmitter, proceed to diagnosis of the Remote Keyless Entry (RKE) system.
- If the power lock system functions with the RKE transmitter, but not with one or both power lock switches, proceed to diagnosis of the door lock switches.
- If the driver side power lock switch operates only the driver side front door power lock motor, but all other power lock motors operate with the passenger side power lock switch or the RKE transmitter, use a scan tool and the appropriate diagnostic information to diagnose the CAN data bus.
- If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, use a scan tool and the appropriate diagnostic information to diagnose the CAN data bus.

## SWITCH-WINDOW/DOOR LOCK

### DESCRIPTION

A window/lock switch located in each front door trim panel. The driver's side window/lock switch includes the following:

- **Power Lock Switch** - A two-way, momentary, resistor multiplexed switch to control the power lock system.
- **Power Window Lockout Switch** - A two-way, latching, push-button switch allows the vehicle operator to lock out the power window switches on each passenger door so that the passenger door power windows may be operated only from the master switches.
- **Power Window Switches** - A two-way, momentary power window switch for the driver side front door also has a second detent in the Down direction and internal circuitry to provide an Auto-Down feature for the driver side front door power window. In addition to the power window switch for its own door, the window/lock switch houses individual master switches for each passenger door power window.

The passenger side window/lock switch includes the following:

- **Power Lock Switch** - A two-way, momentary, resistor multiplexed switch to control the power lock system.
- **Power Window Switch** - A two-way, momentary power window switch for the passenger side front door.

## OPERATION

The driver side window/lock switch combines a power lock switch, a driver power window switch with an Auto-down feature, master switches for each passenger door power window, a power window lockout switch, a power mirror selector switch, and four power mirror adjustment switches in a single assembly. The switches in the window/lock switch can be diagnosed using conventional diagnostic tools and methods.

### Power Lock Switch

The power lock switch circuitry is connected in series between ground and the driver door switch mux input of the instrument cluster (without memory). If equipped with the memory system, the circuitry is connected to the memory mirror module. Each power lock switch position (Lock, Unlock, and Neutral) provides a different resistance value to the instrument cluster or memory mirror input, which allows the instrument cluster or memory module to sense the switch position. Based upon the power lock switch input, the instrument cluster or memory module controls the battery and ground feed outputs to the individual power lock motors to lock or unlock the door latches. The Light-Emitting Diode (LED) in the power lock switch is connected to battery current through the power window circuit breaker in the Integrated Power Module (IPM) on a fused ignition switch output (run-acc) circuit so that the switch will be illuminated whenever the ignition switch is in the On or Accessory positions.

### Power Window Switches

The power window switch circuitry is connected to battery current through a circuit breaker in the Integrated Power Module (IPM) on a fused ignition switch output (run-acc) circuit so that the power windows will operate whenever the ignition switch is in the On or Accessory positions. Each two-way, momentary master passenger power window switch in the window/lock switch provides battery current and ground to the individual power window switches on each passenger door so that the power window switch controls the battery current and ground feeds to its respective power window motor. The switch for the driver side front door power window includes an auto-down feature. When this switch is depressed to a second momentary detent position and released, the driver door power window is automatically operated through an internal circuit and relay to its fully lowered position. The Auto-down event is cancelled if the switch paddle is depressed a second time in either the Up or Down direction. When the two position window lockout switch in the window/lock switch is depressed and latched in the lockout position, the battery current feed to each of the individual passenger power window switches is interrupted so that the passenger door power windows can only be operated from the switches in the window/lock switch. The window lockout switch also controls the battery current feed for the LED in each passenger power window switch so that the switch will not be illuminated when it is locked out.

## REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove the door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Using a flat bladed tool, remove the window/lock switch (2) from the door trim panel.

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Install window/lock switch (2) to door trim panel and snap into place.
2. Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
3. Connect battery negative cable.

## REMOTE KEYLESS ENTRY TRANSMITTER

### DIAGNOSIS AND TESTING

#### REMOTE KEYLESS ENTRY TRANSMITTER

Using special tool 9001, first test to ensure that the transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for Asian transmitters and 30.5 centimeters (12 inches) for all others. To test, position the transmitter as shown. Press any transmitter button, then test each button individually. The tool will beep if a radio signal strength that lights five or more LED's is detected. Repeat this test three times. If transmitter fails any of the test refer to the proper Diagnostic Procedures information.

### STANDARD PROCEDURE

#### REMOTE KEYLESS ENTRY CUSTOMER PREFERENCES

##### HORN CHIRP DISABLING/ENABLING

The horn chirp can be toggled using a scan tool or by using the Remote Keyless Entry (RKE) transmitter.

To DISABLE (cancel) the horn chirp feature: With the ignition in the ON position, press and hold the transmitter LOCK button for four seconds. While pressing the LOCK button in, press the PANIC button within 6 seconds. Release both buttons when a single chime is heard.

To ENABLE the horn chirp feature, repeat the above procedure.

## UNLOCK SEQUENCE

The unlock sequence can be toggled using a scan tool or by using the following procedure.

1. Place the key in the ignition.
2. Within 10 seconds, cycle the key from the OFF position to the ON position four times, ending in the ON position (Do not start the engine).
3. Within 30 seconds, press the driver's door lock switch in the UNLOCK direction. A single chime will be heard to indicate the feature has been disabled.

This will toggle between Driver door first and Unlock all doors function.

To ENABLE this feature, repeat the above procedure.

## REMOTE KEYLESS ENTRY TRANSMITTER BATTERIES

The Remote Keyless Entry (RKE) transmitter case snaps open and shut for battery access. To replace the RKE transmitter batteries:

1. Using a trim stick or a thin coin, gently pry at the notch in the center seam of the RKE transmitter case halves located near the key ring until the two halves unsnap.
2. Lift the back half of the transmitter case off of the RKE transmitter.
3. Remove the two batteries from the RKE transmitter.
4. Replace the battery with a new CR2032. Be certain that the battery is installed with the polarity correctly oriented.
5. Align the two RKE transmitter case halves with each other, and squeeze them firmly and evenly together using hand pressure until they snap back into place.

## REMOTE KEYLESS ENTRY TRANSMITTER PROGRAMMING

If vehicle is not equipped with Sentry Key Theft Deterrent, new Remote Keyless Entry (RKE) transmitters can be programmed using a scan tool and the proper Diagnostic Procedures manual. If vehicle is equipped with Sentry Key Theft Deterrent, (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE).

## SPECIFICATIONS

### REMOTE KEYLESS ENTRY TRANSMITTER

Normal operation range is up to 20 meters (60 feet) of the vehicle. Range may be better or worse depending on the environment around the vehicle.

## POWER MIRRORS - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

# B1D04-MIRROR ADJUST SWITCH INPUT CIRCUIT/PERFORMANCE – DRIVER DOOR MODULE

**MODULE-  
DOOR-  
DRIVER C3  
(MEMORY)**

**SWITCH-  
MIRROR**

**B1D04-MIRROR ADJUST SWITCH INPUT CIRCUIT/PERFORMANCE – DRIVER DOOR MODULE (CONTINUED)**

For the Power Memory Mirror System circuit diagram(Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously

- **Set Condition:**

When the Driver Door Module receives a mirror movement comand from the switch but then senses an open or shorted circuit on one of the switch sense circuits for over 100 ms., this code will set.

Possible Causes
(P703) MIRROR HORIZONTAL LEFT SWITCH SENSE OPEN
(P703) MIRROR HORIZONTAL LEFT SWITCH SENSE SHORT TO GROUND
(P703) MIRROR HORIZONTAL LEFT SWITCH SENSE CIRCUIT SHORTED TO ANOTHER SWITCH SENSE CIRCUIT
(P704) MIRROR HORIZONTAL RIGHT SWITCH SENSE OPEN
(P704) MIRROR HORIZONTAL RIGHT SWITCH SENSE SHORT TO GROUND
(P704) MIRROR HORIZONTAL RIGHT SWITCH SENSE CIRCUIT SHORTED TO ANOTHER SWITCH SENSE CIRCUIT
(P705) MIRROR VERTICAL DOWN SWITCH SENSE OPEN
(P705) MIRROR VERTICAL DOWN SWITCH SENSE SHORT TO GROUND
(P705) MIRROR VERTICAL DOWN SWITCH SENSE CIRCUIT SHORTED TO ANOTHER SWITCH SENSE CIRCUIT
(P706) MIRROR VERTICAL UP SWITCH SENSE OPEN
(P706) MIRROR VERTICAL UP SWITCH SENSE SHORT TO GROUND
(P706) MIRROR VERTICAL UP SWITCH SENSE CIRCUIT SHORTED TO ANOTHER SWITCH SENSE CIRCUIT
(P710) MIRROR COMMON SWITCH SENSE OPEN
(P710) MIRROR COMMON SWITCH SENSE SHORT TO GROUND
(P710) MIRROR COMMON SWITCH SENSE CIRCUIT SHORTED TO ANOTHER SWITCH SENSE CIRCUIT
MIRROR SWITCH
DRIVER DOOR MODULE

## Theory of Operation

This code will only set in vehicles that have the Memory System. The supply circuit for the Memory Mirrors are supplied by the Driver Door Module.

**B1D04-MIRROR ADJUST SWITCH INPUT CIRCUIT/PERFORMANCE – DRIVER DOOR MODULE (CONTINUED)****Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Press the Mirror Switch in all directions several times.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display B1D04-MIRROR ADJUST SWITCH INPUT CIRCUIT/PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. If the conditions returns, replace the switch.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. TEST THE SWITCH**

Turn the ignition off.

Remove the Driver Window/Door Lock Switch assembly.

Test the Mirror Switch in all positions by using the procedure in SERVICE INFORMATION / POWER LOCKS / WINDOW/LOCK SWITCH / DIAGNOSING & TESTING / WINDOW/LOCK SWITCH.

**Does the switch pass the test in all positions**

**No** >> Replace the Mirror Switch..

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go to 3

**B1D04-MIRROR ADJUST SWITCH INPUT CIRCUIT/PERFORMANCE – DRIVER DOOR MODULE (CONTINUED)****3. TEST FOR SWITCH SENSE WIRE SHORT TO GROUND**

Disconnect the Driver Door Module C3 connector.

Measure the resistance between Ground and the (P703) Mirror Horizontal Left Switch Sense circuit in the Driver Door Module connector.

Measure the resistance between Ground and the (P704) Mirror Horizontal Right Switch Sense circuit in the Driver Door Module connector.

Measure the resistance between Ground and the (P705) Mirror Vertical Down Switch Sense circuit in the Driver Door Module connector.

Measure the resistance between Ground and the (P706) Mirror Vertical Up Switch Sense circuit in the Driver Door Module connector.

Measure the resistance between Ground and the (P710) Mirror Common Switch Sense circuit in the Driver Door Mirror Module connector.

**Is the resistance below 5000.0 ohms in any of the circuits?**

**Yes** >> Repair the Appropriate Switch Sense circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go to 4

**4. TEST FOR SWITCH SENSE CIRCUIT OPEN**

Disconnect the Mirror Switch connector.

Measure the resistance of the (P703) Mirror Horizontal Left Switch Sense circuit between the Driver Door Module connector and the Mirror Switch connector.

Measure the resistance of the (P704) Mirror Horizontal Right Switch Sense circuit between the Driver Door Module connector and the Mirror Switch connector.

Measure the resistance of the (P705) Mirror Vertical Down Switch Sense circuit between the Driver Door Module connector and the Mirror Switch connector.

Measure the resistance of the (P706) Mirror Vertical Up Switch Sense circuit between the Driver Door Module connector and the Mirror Switch connector.

Measure the resistance of the (P710) Mirror Common Switch Sense circuit between the Driver Door Module connector and the Mirror Switch connector.

**Is the resistance below 2.0 ohms in all of the Switch Sense circuits?**

**No** >> Repair the Appropriate Switch Sense circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go to 5

**B1D04-MIRROR ADJUST SWITCH INPUT CIRCUIT/PERFORMANCE – DRIVER DOOR MODULE (CONTINUED)****5. TEST FOR A SWITCH SENSE CIRCUIT SHORTED TO ANOTHER SWITCH SENSE CIRCUIT**

Measure the resistance between each of the switch sense circuits to each of the other switch sense circuits.

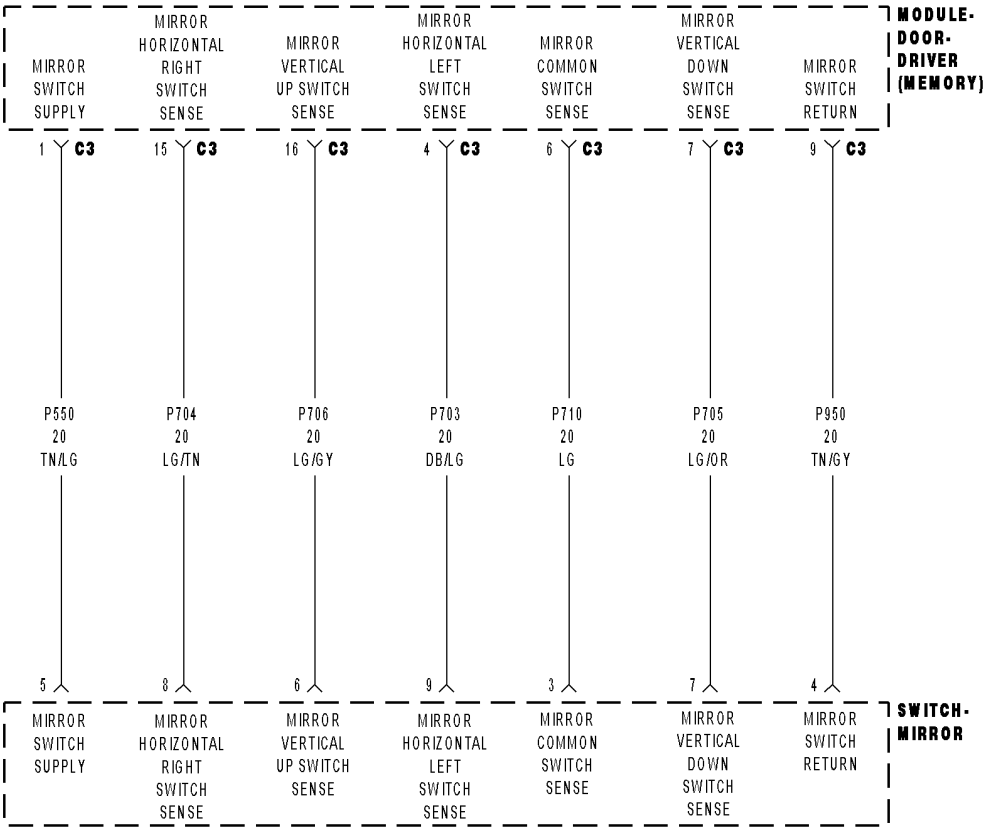

**Is the resistance below 10000.0 ohms between any of the switch sense circuits?**

- Yes** >> Repair the appropriate switch sense circuit for a short to the other switch sense circuits.  
Perform the BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Driver Door Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

B1D07-MIRROR ADJUST SWITCH INPUT CIRCUIT STUCK- DRIVER DOOR  
MODULE

**B1D07-MIRROR ADJUST SWITCH INPUT CIRCUIT STUCK- DRIVER DOOR MODULE (CONTINUED)**

For the Power Memory Mirror System circuit diagram(Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously

- **Set Condition:**

When the Driver Door Module receives a mirror movement comand from the switch for over 30 seconds., this code will set.

Possible Causes
MIRROR SWITCH
DRIVER DOOR MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Press the Mirror Switch in all directions several times.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display B1D07-MIRROR ADJUST SWITCH INPUT CIRCUIT STUCK?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors. If the conditions returns, replace the switch.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

### 2. TEST THE SWITCH

Turn the ignition off.

Remove the Driver Window/Door Lock Switch assembly.

Remove the Mirror Switch.

Test the Mirror Switch in all positions by using the procedure in SERVICE INFORMATION / POWER LOCKS / WINDOW/LOCK SWITCH / DIAGNOSING & TESTING / WINDOW/LOCK SWITCH.

**Does the switch pass the test in all positions**

**No** >> Replace the Mirror Switch..

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Replace the Driver Door Module.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1).

## B1D09,B1D12-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT LOW – MEMORY MIRROR MODULE

**B1D09,B1D12-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT LOW – MEMORY MIRROR MODULE (CONTINUED)**

For the Power Memory Mirror System circuit diagram(Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously

- **Set Condition:**

When the Driver Door Module senses voltage below 4.3 volts on the Mirror Position Sensor Supply circuit for over 30ms., this code will set.**Note: This test covers both the Driver and Passenger code depending on the side the code appeared in.**

Possible Causes
(P145) OR (P146) MIRROR POSISTION SENSOR SUPPLY CIRCUIT SHORT TO GROUND
(P145) OR (P146) MIRROR POSISTION SENSOR SUPPLY CIRCUIT SHORTED TO (P69) OR (P66) MIRROR SENSOR GROUND CIRCUIT.
MIRROR SHORTED
DRIVER OR PASSENGER DOOR MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Mirror Switch in all directions several times.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display B1D09 or B1D12-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

## B1D09,B1D12-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT LOW – MEMORY MIRROR MODULE (CONTINUED)

**2. TEST FOR A SHORTED MIRROR**

Turn the ignition off.

Disconnect the appropriate mirror connector.

Turn the ignition on.

Measure the voltage between the (P145) or (P146) Mirror Position Sensor Supply circuit and the ((P69) or (P66) Mirror Sensor Ground circuit.

**Is the voltage above 4.6 volts?**

**Yes** >> Replace the Mirror.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go to 3

**3. TEST THE (P145) OR (P146) MIRROR POSITION SENSOR SUPPLY WIRE**

Turn the ignition off.

Disconnect the appropriate Driver Door Module connector.

Measure the resistance between ground and the (P145) or (P146) Mirror Position Sensor Supply circuit.

**Is the resistance below 5000.0 ohms?**

**Yes** >> Repair the (P145) or (P146) Mirror Position Sensor Supply circuit for a short to ground..

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go to 4

**B1D09,B1D12-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT LOW – MEMORY MIRROR MODULE (CONTINUED)****4. TEST THE (P145) OR (P146) MIRROR POSITION SENSOR SUPPLY WIRE SHORTED TO THE (P69) OR (P66) MIRROR SENSOR GROUND CIRCUIT.**

Measure the resistance between the (P145) or (P146) Mirror Position Sensor Supply circuit and the (P69) or (P66) Mirror Sensor Ground circuit.

**Is the resistance below 5000.0 ohms?**

**Yes** >> Repair the (P145) or (P146) Mirror Position Sensor Supply circuit for a short to the (P69) or (P66) Sensor Ground Circuit..

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the appropriate Driver Door Module.

Perform BODY VERIFICATION TEST - VER 1(Refer to BODY VERIFICATION TEST - VER 1)..

# B1D0A,B1D13-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT HIGH – DOOR MODULE

**B1D0A,B1D13-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT HIGH – DOOR MODULE (CONTINUED)**

For the Power Memory Mirror System circuit diagram(Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Continuously

- **Set Condition:**

When the Driver/Passenger Door Module senses voltage above 5.5 volts on the Mirror Position Sensor Supply circuit for over 30ms., this code will set.**Note: This test covers both the Driver and Passenger code depending on the side the code appeared in.**

Possible Causes
(P145) OR (P146) MIRROR POSITION SENSOR SUPPLY CIRCUIT OPEN
(P145) OR (P146) MIRROR POSITION SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE
(P69) R (P66) MIRROR SENSOR GROUND CIRCUIT OPEN
MIRROR OPEN
DRIVER/PASSENGER DOOR MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Mirror Switch in all directions several times.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display B1D0A or B1d13-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B1D0A,B1D13-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT HIGH - DOOR MODULE (CONTINUED)****2. TEST FOR AN OPEN MIRROR**

Turn the ignition off.

Disconnect the appropriate mirror connector.

Turn the ignition on.

Measure the voltage between the (P145) or (P146) Mirror Position Sensor Supply circuit and the ((P69) or (P66) Mirror Sensor Ground circuit.

**Is the voltage between 4.8 and 5.2 volts?**

**Yes** >> Replace the Mirror.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go to 3

**3. TEST THE (P145) OR (P146) MIRROR POSITION SENSOR SUPPLY WIRE FOR AN OPEN**

Turn the ignition off.

Disconnect the appropriate Door Module C4 connector.

Measure the resistance between of the (P145) or (P146) Mirror Position Sensor Supply circuit between the Module connector and the Mirror connector..

**Is the resistance below 2.0 ohms?**

**No** >> Repair the (P145) or (P146) Mirror Position Sensor Supply circuit for an open..

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go to 4

**B1D0A,B1D13-MIRROR POSITION SENSOR POWER SUPPLY CIRCUIT HIGH – DOOR MODULE (CONTINUED)****4. TEST THE (P69) OR (P66) MIRROR SENSOR GROUND WIRE FOR AN OPEN**

Measure the resistance of the ((P69) or (P66) Mirror Sensor Ground circuit between the Module connector and the Mirror connector.

**Is the resistance below 2.0 ohms?**

**No** >> Repair the (P69) or (P66) Mirror Sensor Ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**Yes** >> Go to 5  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**5. TEST THE (P145) OR (P146) MIRROR POSITION SENSOR SUPPLY WIRE SHORTED TO VOLTAGE**

Turn the ignition on.

Measure the voltage between ground and the (P145) or (P146) Mirror Position Sensor Supply circuit.

**Is there any voltage present?**

**Yes** >> Repair the (P145) or (P146) Mirror Position Sensor Supply circuit for a short to voltage.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the appropriate Door Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Mirror Switch in all directions several times.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display B1D0C or B1D15-MIRROR VERTICAL POSITION SENSOR INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B1D0C,B1D15-MIRROR VERTICAL POSITION SENSOR INPUT CIRCUIT LOW – DOOR MODULE (CONTINUED)****2. TEST FOR A SHORTED MIRROR**

Disconnect the appropriate mirror connector.

With the scan tool, erase DTC's.

Operate the Mirror Switch in all directions several times.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display B1D0C or B1D15-MIRROR VERTICAL POSITION SENSOR INPUT CIRCUIT LOW?**

- No** >> Replace the Mirror.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- Yes** >> Go to 3

**3. TEST THE (P67) OR (P64) MIRROR VERTICAL POSITION SIGNAL WIRE FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the appropriate Door Module C4 connector.

Measure the resistance between ground and the (P67) or (P64) Mirror Vertical Position Signal circuit.

**Is the resistance below 5000.0 ohms?**

- Yes** >> Repair the (P67) or (P64) Mirror Vertical Position Signal circuit for a short to ground.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Go to 4

**No** >> Go to 4

**B1D22,B1D2E-MIRROR HORIZONTAL MOTOR CONTROL CIRCUIT/PERFORMANCE – DOOR MODULE (CONTINUED)****4. TEST THE (P75) OR (P74) MIRROR HORIZONTAL MOTOR DRIVER CIRCUIT SHORTED TO THE (Z912) OR (Z911) GROUND CIRCUIT.**

Measure the resistance between the (P75) or (P74) Mirror Horizontal Driver circuit and the (Z912) or (Z911) Ground circuit.

**Is the resistance below 5000.0 ohms?**

**Yes** >> Repair the (P75) or (P74) Mirror Horizontal Motor Driver circuit for a short to the (Z912) or (Z911) Mirror Heater Ground Circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

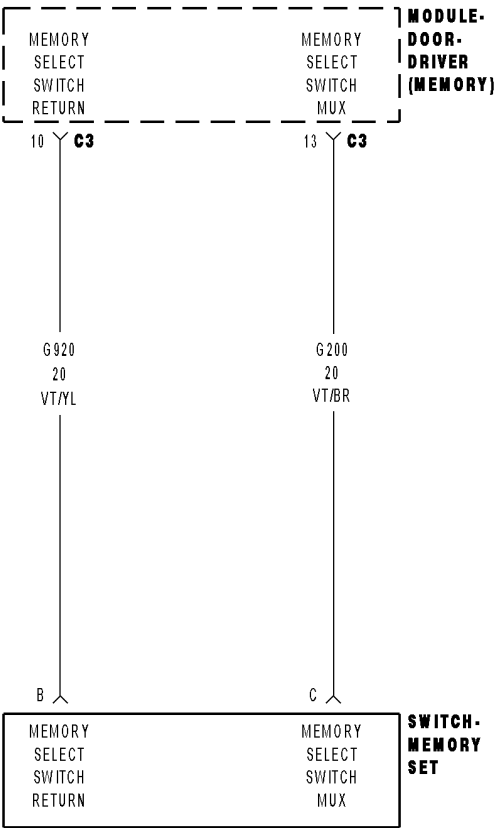

**No** >> Replace the appropriate Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

813ac86e

B1D4D–MEMORY SWITCH INPUT CIRCUIT STUCK – DOOR MODULE

**B1D4D-MEMORY SWITCH INPUT CIRCUIT STUCK – DOOR MODULE (CONTINUED)**

For the Power Memory Mirror System circuit diagram (Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Memory Select Switch Mux is under 2.6 volts for over 30 seconds.

Possible Causes
(P200) MEMORY SELECT SWITCH MUX WIRE PARTIAL SHORT TO GROUND
(P200) MEMORY SELECT SWITCH MUX CIRCUIT SHORTED TO THE (G920) MEMORY SELECT SWITCH RETURN CIRCUIT
MEMORY SET SWITCH
DRIVER DOOR MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's  
Press the Memory Set Switch several times in all positions.  
Cycle the ignition from on to off 3 times.  
Turn the ignition on.  
With the scan tool, read DTC's.

**Does the scan tool display MEMORY SWITCH INPUT CIRCUIT STUCK?**

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. MEMORY SELECTOR SWITCH SHORTED TO GROUND**

With the scan tool, erase DTC's.  
Disconnect the Memory Set Switch connector.  
Turn the ignition on.  
With the scan tool, read DTC's.

**Does the scan tool display MEMORY SWITCH INPUT CIRCUIT STUCK?**

- No** >> Replace the Memory Set Switch.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- Yes** >> Go to 3

**B1D4D-MEMORY SWITCH INPUT CIRCUIT STUCK – DOOR MODULE (CONTINUED)****3. (P200) MEMORY SELECT SWITCH MUX CIRCUIT SHORT TO THE GROUND**

Disconnect the Driver Door Module C3 connector.

Measure the resistance between ground and the (P200) Memory Select Switch Mux circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the Memory Select Switch Mux wire for a short to ground.

Perform the BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go to 4

**4. (P200) MEMORY SELECT SWITCH MUX CIRCUIT SHORT TO THE (G920) MEMORY SELECT SWITCH RETURN CIRCUIT**

Measure the resistance between the (P200) Memory Select Switch Mux circuit and the (G920) Memory Select Switch Return circuit in the Driver Door Module C3 connector.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (P200) Memory Select Switch Mux circuit for a short to the (G920) Memory Select Switch return circuit. Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Driver Door Module. Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B210D-BATTERY VOLTAGE LOW**

For the Power Mirror System circuit diagram.(Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Engine running.
- **Set Condition:**This code is set immediately after the Door Module detects voltage under 11.3 volts on the (A913) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLTAGE LOW (A913) FUSED B(+) CIRCUIT DRIVER/PASSENGER DOOR MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

**Are there any Charging System DTC's set in the Powertrain Control Module?**

- Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.
- No** >> Go To 2  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE**

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

With the scan tool, read DTC's.

**Does the DTC B210D-BATTERY VOLTAGE LOW reset?**

- Yes** >> Go To 3
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B210D-BATTERY VOLTAGE LOW (CONTINUED)****3. CHECK THE VOLTAGE ON THE (A913) FUSED B(+) CIRCUIT**

Disconnect the appropriate Door Module C4 connector.

**Note: Check connectors - Clean and repair as necessary.**

Start the engine and let idle.

Measure the voltage on the (A913) Fused B(+) circuit at the Door Module C4 connector and compare to voltage at the vehicle battery.

**Is the voltage at the Door Module C4 connector the same as measured at the battery?**

- Yes** >> Replace the Driver/Passenger Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (A913) Fused B(+) circuit as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B210E-BATTERY VOLTAGE HIGH**

For the Power Mirror System circuit diagram.(Refer to 8 - ELECTRICAL/POWER MIRRORS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Engine running.
- **Set Condition:**This code is set immediately after the Door Module detects voltage over 15 volts on the (A913) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLAGE HIGH (A913) FUSED B(+) CIRCUIT DRIVER/PASSENGER DOOR MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

**Are there any Charging System DTC's set in the Powertrain Control Module?**

- Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.
- No** >> Go To 2  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**2. VERIFY THAT DTC B210E-BATTERY VOLTAGE HIGH IS ACTIVE**

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

With the scan tool, read DTC's.

**Does the DTC B210E-BATTERY VOLTAGE HIGH reset?**

- Yes** >> Go To 3
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)****3. CHECK THE VOLTAGE ON THE (A913) FUSED B(+) CIRCUIT**

Disconnect the appropriate Door Module C4 connector.

**Note: Check connectors - Clean and repair as necessary.**

Start the engine and let idle.

Measure the voltage on the (A913) Fused B(+) circuit at the Door Module C4 connector and compare to voltage at the vehicle battery.

**Is the voltage at the Door Module C4 connector the same as measured at the battery?**

- Yes** >> Replace the Driver/Passenger Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (A913) Fused B(+) circuit as necessary.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

**B2218,B2219-DOOR MODULE INTERNAL**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on.
- **Set Condition:** This code is set immediately if the Driver/Passenger Door Module internal self test fails.

Possible Causes
DRIVER/PASSENGER DOOR MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. VERIFY THAT DTC B2218, B2219-DOOR MODULE INTERNAL IS ACTIVE**

With the scan tool, record and erase DTC's

Cycle the ignition switch off then back on.

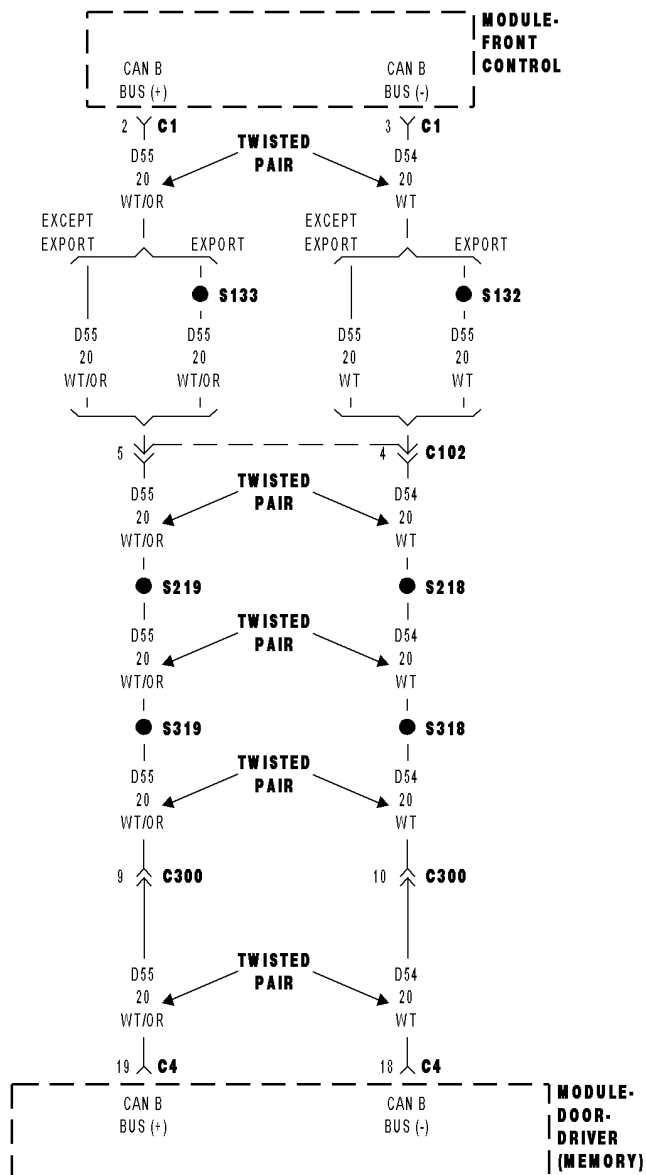

With the scan tool, read DTC's.

**Does the DTC B2218 or B2219 - DOOR MODULE INTERNAL reset?**

- Yes** >> Replace the appropriate Door Module.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST – VER 1.(Refer to BODY VERIFICATION TEST - VER 1).

## U0019-CAN B BUS – DRIVER DOOR MODULE

**MODULE-FRONT  
CONTROL C1**

**MODULE-DOOR-  
DRIVER C4  
(MEMORY)**

**U0019-CAN B BUS – DRIVER DOOR MODULE (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the CAN B Bus (+) or CAN B (-) circuit is open.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN DRIVER DOOR MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTCs**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. CHECK FRONT CONTROL MODULE DTC's**

With the scan tool, read Front Control Module active DTC's

**Does the scan tool display any CAN B BUS DTC's – ACTIVE?**

**Yes** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

**No** >> Go To 3

---

**U0019-CAN B BUS – DRIVER DOOR MODULE (CONTINUED)****3. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the Driver Door Module C4 connector.

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 connector and the Driver Door Module C4 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (D54) CAN B BUS (–) CIRCUIT OPEN**

Measure the resistance of the (D54) CAN B Bus (–) circuit between the Front Control Module C1 connector and the Driver Door Module C4 connector.

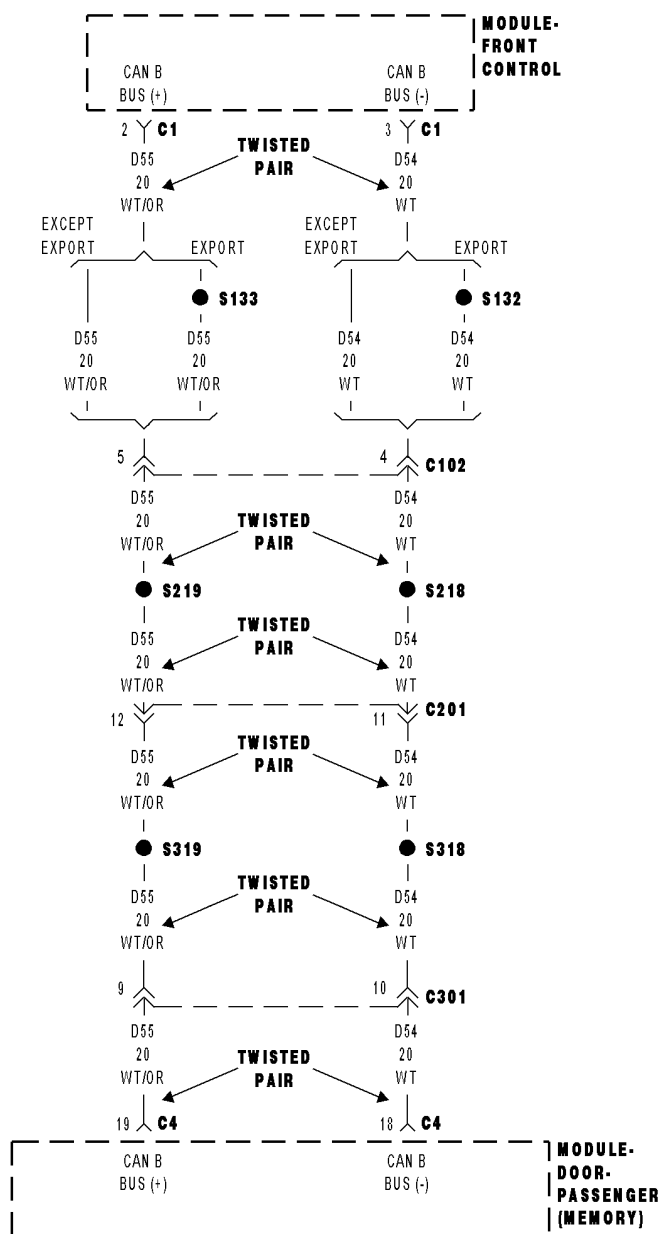

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the Driver Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (D54) CAN B Bus (–) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

# U0019-CAN B BUS – PASSENGER DOOR MODULE

**MODULE-DOOR-PASSENGER C4 (MEMORY)**

**MODULE-FRONT CONTROL C1**

**U0019–CAN B BUS – PASSENGER DOOR MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the CAN B Bus (+) or CAN B (-) circuit is open.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN PASSENGER DOOR MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTCs**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. CHECK FRONT CONTROL MODULE DTC's**

With the scan tool, read Front Control Module active DTC's

**Does the scan tool display any CAN B BUS DTC's – ACTIVE?**

**Yes** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

**No** >> Go To 3

---

**U0019-CAN B BUS – PASSENGER DOOR MODULE (CONTINUED)****3. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the Passenger Door Module C4 connector.

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 connector and the Passenger Door Module C4 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (D54) CAN B BUS (–) CIRCUIT OPEN**

Measure the resistance of the (D54) CAN B Bus (–) circuit between the Front Control Module C1 connector and the Passenger Door Module C4 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the Passenger Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (D54) CAN B Bus (–) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

POWER MIRRORS - SERVICE INFORMATION

DESCRIPTION

AUTOMATIC DAY/NIGHT MIRROR

The automatic day/night mirror system is able to automatically change the reflectance of the inside rear view and outside left mirror in order to reduce the glare of headlamps approaching the vehicle from the rear. The automatic day/night rear view mirror receives battery current through a fuse in the junction block only when the ignition switch is in the On position.

OUTSIDE REAR VIEW MIRROR

The power operated rear view mirrors allow the driver to adjust both outside mirrors electrically from the driver side front seat position by operating a switch on the driver side front door trim panel. The power mirrors receive a non-switched battery feed through a fuse in the junction block so that the system will remain operational, regardless of the ignition switch position.

OPERATION

AUTOMATIC DAY/NIGHT MIRROR

A switch located on the bottom of the automatic day/night mirror housing allows the vehicle operator to select whether the automatic dimming feature is operational. When the automatic day/night mirror is turned on, the mirror switch is lighted by an integral Light-Emitting Diode (LED). The mirror will automatically disable its self-dimming feature whenever the vehicle is being driven in reverse. The day/night mirror is automatically turned ON each time the ignition is turned to the ON position, regardless if it was previously turned OFF.

DIAGNOSIS AND TESTING

POWER MIRRORS

Any diagnosis of the Power Mirror system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

1. Check the fuses in the Power Distribution Center (PDC) and the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).
2. Check for battery voltage at the fuse in the junction block. If OK, go to Step 3. If not OK, repair the open circuit to the PDC as required.

3. Disconnect and isolate the battery negative cable. Remove the driver side power window switch and bezel assembly and unplug the wire harness connector from the power mirror switch. Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity in the door wire harness half of the power mirror switch wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the junction block as required.
4. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity in the door wire harness half of the power mirror switch wire harness connector and a good ground. There should be continuity. If not OK, repair open in the ground circuit.

## MIRROR-INSIDE REARVIEW

### DESCRIPTION

The automatic day/night mirror uses a thin layer of electrochromic material between two pieces of conductive glass to form the face of the mirror. When the mirror switch is in the On position, two photocell sensors are used by the mirror circuitry to monitor external light levels and adjust the reflectance of the mirror.

### OPERATION

The ambient photocell sensor is located on the forward-facing (windshield side) of the rear view mirror housing, and detects the ambient light levels outside of the vehicle. The headlamp photocell sensor is located inside the rear view mirror housing behind the mirror glass and faces rearward, to detect the level of the light being received at the rear window side of the mirror. When the circuitry of the automatic day/night mirror detects that the difference between the two light levels is too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), it begins to darken the mirror.

The automatic day/night mirror circuitry also monitors the transmission using an input from the backup lamp circuit. The mirror circuitry is programmed to automatically disable its self-dimming feature whenever it senses that the transmission backup lamp circuit is energized.

The automatic day/night mirror is a completely self-contained unit and cannot be repaired. If faulty or damaged, the entire mirror assembly must be replaced.

## DIAGNOSIS AND TESTING

### AUTOMATIC DAY/NIGHT MIRROR

**For complete circuit diagrams, refer to the appropriate wiring information.**

1. Check the fuse in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the On position. Check for battery voltage at the fuse in the junction block. If OK, go to Step 3. If not OK, repair the open circuit to the ignition switch as required.
3. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the automatic day/night mirror. Connect the battery negative cable. Turn the ignition switch to the On position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the junction block as required.
4. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the circuit to ground as required.
5. Connect the battery negative cable. Turn the ignition switch to the On position. Apply the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to Step 6. If not OK, repair the open circuit as required.
6. Turn the ignition switch to the Off position. Disconnect the battery negative cable. Plug in the automatic day/night mirror wire harness connector. Connect the battery negative cable. Cover the forward facing ambient photocell sensor to keep out any ambient light. Turn the ignition switch to the On position. Place the transmission gear selector lever in the Neutral position. Place the mirror switch in the On (the LED in the mirror switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

**Note:** The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.

7. Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. If OK, go to Step 8. If not OK, replace the faulty automatic day/night mirror unit.
8. With the mirror glass darkened, place the transmission gear selector lever in the Reverse position. The mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror.

## SWITCH-MIRROR

### DESCRIPTION

A power mirror switch is located on the driver's door trim panel, attached to the window/lock switch. The power mirror switch includes the following:

- **Power Mirror Selector Switch** - A three-position rotary joystick switch selects the right or left power mirror for adjustment, or turns the power mirror system Off in the center position.
- **Power Mirror Adjustment Switch** - A momentary joystick directional switch allows the driver to adjust the selected power mirror in the Up, Down, Right or Left directions.

### OPERATION

The power mirror switch circuitry is connected to battery current through a fuse in the IPM on a fused B(+) circuit so that the power mirrors remain operational regardless of the ignition switch position. A rotary joystick selector switch has three positions, one to select the right mirror, one to select the left mirror, and a center Off position. After the right or left mirror is selected, the joystick is moved to move the selected mirror Up, Down, Right or Left.

In vehicles without Memory Mirrors the power mirror switch circuitry controls the battery current and ground feeds to each of the four (two in each mirror head) power mirror motors. In vehicles with Memory Mirrors the mirror switch connects to the driver power mirror module. The driver memory mirror module uses the mirror switch inputs to control the battery current and ground feeds to driver mirror motor and sends a CAN Bus message to the passenger mirror module. The passenger mirror module controls the battery current and ground feeds to passenger mirror motors based on the CAN bus message from the driver memory module.

In vehicles equipped with the exterior day/night mirror, the operation of the dimming feature is controlled by the interior day/night mirror. The exterior mirror is hard wired to the interior mirror.

## DIAGNOSIS AND TESTING

### POWER MIRROR SWITCH

1. Disconnect and isolate the battery negative cable.
2. Remove the power mirror switch (Refer to 8 - ELECTRICAL/POWER MIRRORS/POWER MIRROR SWITCH - REMOVAL).
3. Disconnect the wire harness connector from the switch.
4. Test the switch continuity. refer to the Power Mirror Switch Tests chart to determine if the continuity is correct for the switch in each switch position. If not OK, replace the inoperative switch as required.

### POWER MIRROR SWITCH TEST

SWITCH POSITION	CONTINUITY BETWEEN PINS OF MIRROR SWITCH
LEFT MIRROR SELECTED	
UP	PINS 5 & 7, PINS 4 & 3
DOWN	PINS 4 & 7, PINS 5 & 3
RIGHT	PINS 4 & 9, PINS 5 & 3
LEFT	PINS 4 & 3, PINS 5 & 9

SWITCH POSITION	CONTINUITY BETWEEN PINS OF MIRROR SWITCH
RIGHT MIRROR SELECTED	
UP	PINS 4 & 3, PINS 5 & 6
DOWN	PINS 4 & 6, PINS 5 & 3
RIGHT	PINS 4 & 8, PINS 5 & 3
LEFT	PINS 4 & 3, PINS 5 & 8

## REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove the window/lock switch (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK SWITCH - REMOVAL).
3. Remove the power mirror switch from the window/lock switch by twisting the switch counter-clockwise.

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Install power mirror switch to window/lock switch assembly.
2. Connect wire harness connectors to switches.
3. Install window/lock switch assembly (Refer to 8 - ELECTRICAL/POWER LOCKS/POWER LOCK SWITCH - INSTALLATION).
4. Connect battery negative cable.

## POWER SEATS - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

## B1D62-POWER SEAT SWITCH STUCK

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Memory Seat Module detects the switch engaged in an active position for over 50 seconds, this code will set.

Possible Causes
DRIVER SEAT SWITCH

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Press the Seat Switch in all directions several times.

Wait one minute.

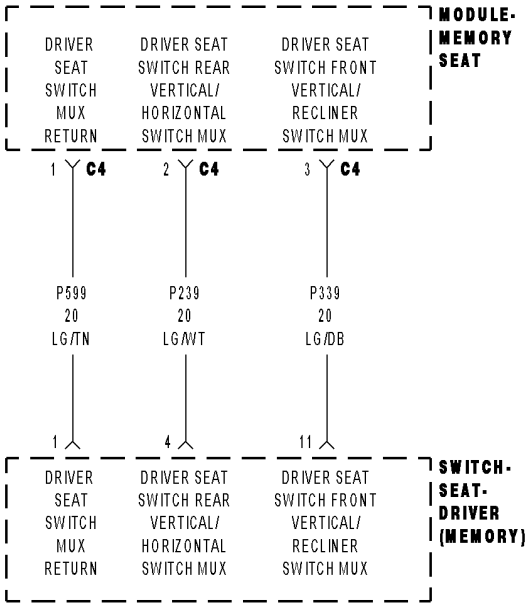

With the scan tool, read DTC's.

#### Does the scan tool display B1D62-POWER SEAT SWITCH STUCK?

- Yes** >> Replace the Driver Seat Switch as necessary.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

B1D63-POWER SEAT SWITCH OPEN

**B1D63-POWER SEAT SWITCH OPEN (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the Memory Seat Module detects an open driver seat switch MUX circuit this code will set.

Possible Causes
(P239) DRIVER SEAT REAR VERTICAL/HORIZONTAL SWITCH MUX OPEN
(P339) DRIVER SEAT FRONT VERTICAL/RECLINER SWITCH MUX OPEN
(P599) DRIVER SEAT SWITCH MUX RETURN OPEN
DRIVER SEAT SWITCH
MEMORY SEAT MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Press the Seat Switch in all directions several times.

Wait one minute.

With the scan tool, read DTC's.

**Does the scan tool display B1D63-POWER SEAT SWITCH OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D63-POWER SEAT SWITCH OPEN (CONTINUED)****2. CHECK THE (P239) DRIVER SEAT REAR VERTICAL/HORIZONTAL SWITCH MUX CIRCUIT RESISTANCE**

Disconnect the Memory Seat Module C4 connector.

**Note: Check connectors - Clean and repair as necessary.**

Measure the resistance between the (P239) Driver Seat Rear Vertical/Horizontal Switch MUX circuit and the (P599) Driver Seat Switch MUX Return circuit in the C4 connector.

**Is the resistance 47.0 ohms + or – 1.0?**

**Yes** >> Go To 3

**No** >> Go To 5

**3. CHECK THE (P339) DRIVER SEAT FRONT VERTICAL/RECLINER SWITCH MUX CIRCUIT RESISTANCE**

Measure the resistance between the (P339) Driver Seat Front Vertical/Recliner Switch MUX circuit and the (P599) Driver Seat Switch MUX Return circuit in the C4 connector.

**Is the resistance 47.0 ohms + or – 1.0?**

**Yes** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Go To 4

**B1D63-POWER SEAT SWITCH OPEN (CONTINUED)****4. CHECK THE (P339) DRIVER SEAT FRONT VERTICAL/RECLINER SWITCH MUX WIRE RESISTANCE**

Disconnect the Driver Seat Switch.

**Note:** Check connectors - Clean and repair as necessary.

Measure the resistance of the (P339) Driver Seat Front Vertical/Recliner Switch MUX circuit between the C4 connector and the Driver Seat Switch connector.

**Is the resistance below 1.0 ohm?**

- Yes** >> Replace the Driver Seat Switch.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
- No** >> Repair the (P339) Driver Seat Front Vertical/Recliner Switch MUX circuit for an open.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**5. CHECK THE (P239) DRIVER SEAT REAR VERTICAL/HORIZONTAL SWITCH MUX WIRE RESISTANCE**

Measure the resistance of the (P239) Driver Seat Rear Vertical/Horizontal Switch MUX circuit between the C4 connector and the Driver Seat Switch connector.

**Is the resistance below 1.0 ohm?**

- Yes** >> Go To 6
- No** >> Repair the (P239) Driver Seat Rear Vertical/Horizontal Switch MUX circuit for an open.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D63-POWER SEAT SWITCH OPEN (CONTINUED)****6. CHECK THE (P599) DRIVER SEAT SWITCH MUX RETURN WIRE RESISTANCE**

Measure the resistance of the (P599) Driver Seat Switch MUX Return circuit between the C4 connector and the Driver Seat Switch connector.

**Is the resistance below 1.0 ohm?**

- Yes** >> Replace the Driver Seat Switch.  
Perform BODY VERIFICATION TEST – VER 1(Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (P599) Driver Seat Switch MUX Return circuit for an open.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

## B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW

**B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If sensor voltage is not within a specified range this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO GROUND
DRIVER HORIZONTAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch in the Horizontal position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D6D-SEAT HORIZONTAL POSITION SENSOR CIRCUIT LOW (CONTINUED)****2. CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE VOLTAGE**

Disconnect the Driver Horizontal Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the Seat Switch in the Horizontal position during the next step. Using a 12-volt test light connect one lead to the (G401) Driver Seat Horizontal Position Sense circuit and the other lead to Driver Seat Horizontal Sensor Ground at the Driver Horizontal Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

- Yes** >> Replace the seat track horizontal motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
- No** >> Go To 3

**3. CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE WIRE FOR A SHORT TO GROUND**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G401) Driver Seat Horizontal Position Sense wire at the Driver Horizontal Seat Adjuster Motor connector to ground.

**Is the resistance below 1000.0 ohm?**

- Yes** >> Repair the (G401) Driver Seat Horizontal Position Sense circuit for a short to ground.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
- No** >> Replace the Memory Seat Module.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH

**B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If during motor operation the sensor voltage is not within a specified range this code will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
DRIVER RECLINER SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the seat switch in the horizontal position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D6E-SEAT HORIZONTAL POSITION SENSOR CIRCUIT HIGH (CONTINUED)****2. CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE VOLTAGE**

Disconnect the Driver Horizontal Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

With the scan tool erase DTC's

Move the seat switch in the horizontal positions 3 times.

With the scan tool, read DTC's.

**Does the same DTC reset?**

- No** >> Inspect the position sense wire for a possible intermittent short to voltage from another circuit, if OK replace the Driver Horizontal Seat Adjuster Motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
- Yes** >> Inspect the position sense wire for a possible short to voltage from another circuit, if OK replace the Memory Seat Module.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
-

## B1D71-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW

**B1D71-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If sensor voltage is not within a specified range this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND
FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch in the Front Vertical position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D71-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D71-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT LOW (CONTINUED)****2. CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE VOLTAGE**

Disconnect the Front Driver Vertical Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the seat switch in the front vertical position during the next step. Using a 12-volt test light connect one lead to the (G404) Driver Seat Front Vertical Position Sense circuit and the other lead to the Driver Seat Front Vertical Sensor Ground at the Front Driver Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

**Yes** >> Replace the Front Driver Seat Adjuster Motor assembly. Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Go To 3

**3. CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE WIRE FOR A SHORT TO GROUND**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense wire at the Front Driver Vertical Seat Adjuster Motor connector to ground.

**Is the resistance below 1000.0 ohm?**

**Yes** >> Repair the (G404) Driver Seat Front Vertical Position Sense circuit for a short to ground. Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Replace the Memory Seat Module. Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

B1D72-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT HIGH

**B1D72-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT HIGH (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If during motor operation the sensor voltage is not within a specified range this code will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the seat switch front vertical position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D72-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D72-SEAT FRONT VERTICAL POSITION SENSOR CIRCUIT HIGH (CONTINUED)****2. CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE VOLTAGE**

Disconnect the Front Driver Vertical Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

With the scan tool erase DTC's

Move the seat switch in the both front vertical positions 3 times.

With the scan tool, read DTC's.

**Does the same DTC reset?**

- No** >> Inspect the position sense wire for a possible intermittent short to another circuit, if OK replace the Front Driver Vertical Seat Adjuster Motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
- Yes** >> Inspect the position sense wire for a possible short to another circuit, if OK replace the Memory Seat Module.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
-

## B1D75-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW

**B1D75-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If sensor voltage is not within a specified range this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO GROUND REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch in the Rear Vertical position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D75-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D75-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT LOW (CONTINUED)****2. CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE VOLTAGE**

Disconnect the Rear Driver Vertical Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the seat switch in the rear vertical position during the next step. Using a 12-volt test light connect one lead to the (G402) Driver Seat Rear Vertical Position Sense circuit and the other lead to Driver Seat Rear Vertical Sensor Ground at the Rear Driver Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

**Yes** >> Replace the Rear Driver Vertical Seat Adjuster Motor assembly.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Go To 3

**3. CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE WIRE FOR A SHORT TO GROUND**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense wire at the Rear Driver Vertical Seat Adjuster Motor connector to ground.

**Is the resistance below 1000.0 ohm?**

**Yes** >> Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for a short to ground.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

B1D76-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT HIGH

**B1D76–SEAT REAR VERTICAL POSITION SENSOR CIRCUIT HIGH (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If during motor operation the sensor voltage is not within a specified range this code will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT SHORTED TO VOLTAGE REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the seat switch rear vertical position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D76–SEAT REAR VERTICAL POSITION SENSOR CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D76-SEAT REAR VERTICAL POSITION SENSOR CIRCUIT HIGH (CONTINUED)****2. CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE VOLTAGE**

Disconnect the Rear Driver Vertical Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

With the scan tool erase DTC's

Move the seat switch in the both rear vertical positions 3 times.

With the scan tool, read DTC's.

**Does the same DTC reset?**

- No** >> Inspect the position sense wire for a possible intermittent short to voltage from another circuit, if OK replace the Rear Driver Vertical Seat Adjuster Motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
- Yes** >> Inspect the position sense wire for a possible short to voltage from another circuit, if OK replace the Memory Seat Module.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)
-

## B1D79-SEAT RECLINER POSITION SENSOR CIRCUIT LOW

**B1D79–SEAT RECLINER POSITION SENSOR CIRCUIT LOW (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If sensor voltage is not within a specified range this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT SHORTED TO GROUND
DRIVER RECLINER SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch recliner position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D79–SEAT RECLINER POSITION SENSOR CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D79-SEAT RECLINER POSITION SENSOR CIRCUIT LOW (CONTINUED)****2. CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE VOLTAGE**

Disconnect the Driver Recliner Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the seat switch in the recliner position during the next step.

Using a 12-volt test light connect one lead to the (G403) Driver Seat Recliner Position Sense circuit and the other lead to Driver Seat Recliner Position Sensor Ground at the Driver Recliner Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

**Yes** >> Replace the Driver Recliner Seat Adjuster Motor assembly. Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Go To 3

**3. CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE WIRE FOR A SHORT TO GROUND**

Disconnect the Memory Seat Module C2 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G403) Driver Seat Recliner Position Sense wire at the Driver Recliner Seat Adjuster Motor connector to ground.

**Is the resistance below 1000.0 ohm?**

**Yes** >> Repair the (G403) Driver Seat Recliner Position Sense circuit for a short to ground. Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Replace the Memory Seat Module. Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

B1D7A–SEAT RECLINER POSITION SENSOR CIRCUIT HIGH

**B1D7A-SEAT RECLINER POSITION SENSOR CIRCUIT HIGH (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When the seat motor is activated (sensor supply voltage is switched on whenever motor is activated).

- **Set Condition:**

If during motor operation the sensor voltage is not within a specified range this code will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
(G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT SHORTED TO VOLTAGE
DRIVER RECLINER SEAT ADJUSTER MOTOR
MEMORY SEAT MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the seat switch recliner position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D7A-SEAT BACKREST POSITION SENSOR CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**B1D7A-SEAT RECLINER POSITION SENSOR CIRCUIT HIGH (CONTINUED)****2. CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE VOLTAGE**

Disconnect the Driver Recliner Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

With the scan tool erase DTC's

Move the seat switch in the both recliner positions 3 times.

With the scan tool, read DTC's.

**Does the same DTC reset?**

**No** >> Inspect the position sense wire for a possible intermittent short to voltage from another circuit, if OK replace the Driver Recliner Seat Adjuster Motor assembly.

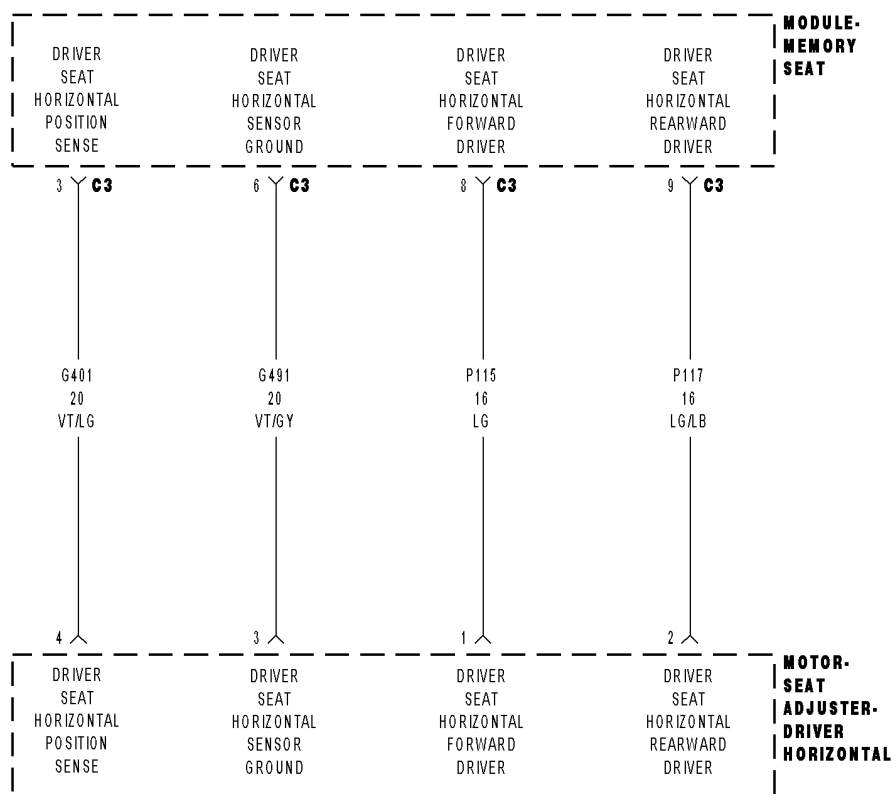

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**Yes** >> Inspect the position sense wire for a possible short to voltage from another circuit, if OK replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

---

## B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE

**B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the seat motor is activated.
- **Set Condition:**  
If the Memory Seat Module does not detect the rotation of the seat motor this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G401) DRIVER SEAT HORIZONTAL POSITION SENSE CIRCUIT OPEN (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND CIRCUIT OPEN (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER DRIVER HORIZONTAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

**Diagnostic Test**

**1. CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES**

Turn the ignition on.  
With the scan tool, read DTC's.

- Does the scan tool display any seat position sensor DTC's?**
- Yes**    >> Diagnose and repair the other DTC(s) first. Refer to the Table of Contents in this Section for a complete list of symptoms.
- No**    >> Go To 2

**B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****2. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch in the Horizontal position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE?**

**Yes** >> Go To 3

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**3. CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE VOLTAGE**

Disconnect the Driver Horizontal Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the Seat Switch in the Horizontal position during the next step. Using a 12-volt test light connect one lead to the (G401) Driver Seat Horizontal Position Sense circuit and the other lead to Driver Seat Horizontal Sensor Ground at the Driver Horizontal Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

**Yes** >> Go To 4

**No** >> Go To 5

**B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****4. CHECK THE DRIVER SEAT HORIZONTAL FORWARD/REARWARD DRIVER VOLTAGE**

Move the Seat Switch in the Horizontal position during the next step.  
Using a 12-volt test light connect one lead to the (P115) Driver Seat Horizontal Forward Driver circuit and the other lead to (P117) Driver Seat Horizontal Rearward Driver circuit at the Driver Horizontal Seat Adjuster Motor connector.

**Does the test light illuminate with the seat switch engaged?**

**Yes** >> Replace the track/horizontal motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Go To 7

**5. CHECK THE (G401) DRIVER SEAT HORIZONTAL POSITION SENSE WIRE FOR AN OPEN**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G401) Driver Seat Horizontal Position Sense circuit at the Driver Horizontal Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G401) Driver Seat Horizontal Position Sense circuit for an open.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Go To 6

### B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)

## 6. CHECK THE (G491) DRIVER SEAT HORIZONTAL SENSOR GROUND FOR AN OPEN

Measure the resistance of the (G491) Driver Seat Horizontal Sensor Ground circuit at the Driver Horizontal Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G491) Driver Seat Horizontal Sensor Ground circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

## 7. CHECK THE (P115) DRIVER SEAT HORIZONTAL FORWARD DRIVER WIRE FOR AN OPEN

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (P115) Driver Seat Horizontal Forward Driver circuit at the Driver Horizontal Seat Adjuster Motor connector to the C3 connector.

Is the resistance above 1.0 ohm?

**Yes** >> Repair the (P115) Driver Seat Horizontal Forward Driver circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Go To 8

**B1D7B-SEAT HORIZONTAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****8. CHECK THE (P117) DRIVER SEAT HORIZONTAL REARWARD DRIVER AN OPEN**

Measure the resistance of the (P117) Driver Seat Horizontal Rearward Driver circuit at the Driver Horizontal Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (P117) Driver Seat Horizontal Rearward Driver circuit for an open.

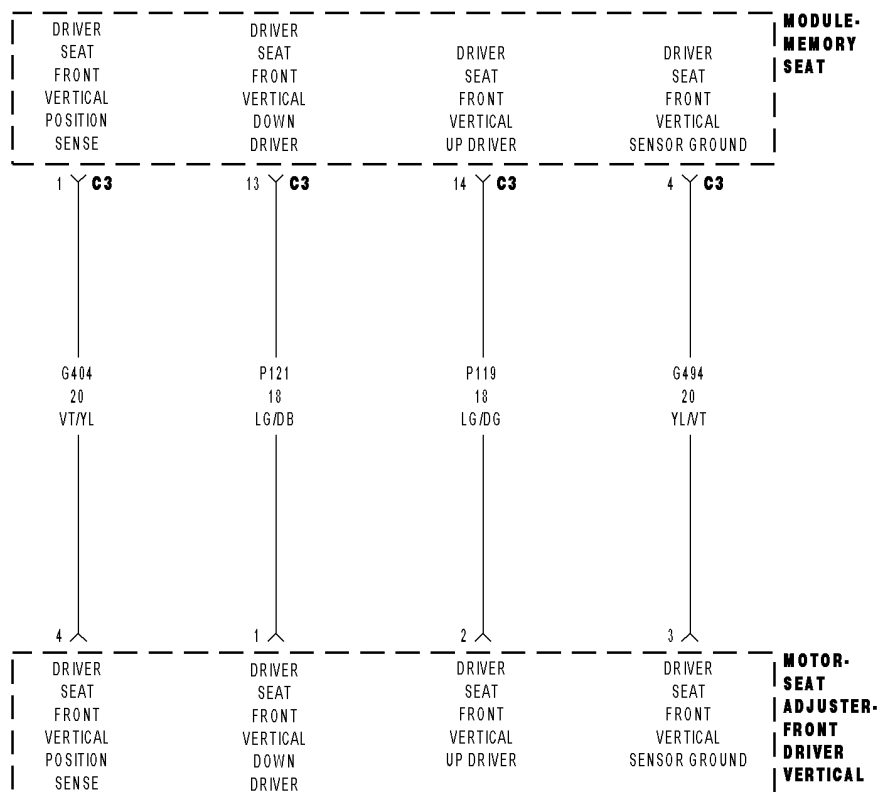

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1(Refer to 8 - ELECTRICAL/POWER SEATS - DIAGNOSIS AND TESTING)

## B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

**B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the seat motor is activated.

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the seat motor this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE CIRCUIT OPEN (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND CIRCUIT OPEN (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER FRONT DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

## Diagnostic Test

### 1. CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display any seat position sensor DTC's?**

**Yes** >> Diagnose and repair other DTC(s) first. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

### 2. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch in the Front Vertical position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE?**

**Yes** >> Go To 3

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****3. CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE VOLTAGE**

Disconnect the Front Driver Vertical Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the Seat Switch in the front vertical position during the next step. Using a 12-volt test light connect one lead to the (G404) Driver Seat Front Vertical Position Sense circuit and the other lead to Driver Seat Front Vertical Sensor Ground at the Driver Front Vertical Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

**Yes** >> Go To 4

**No** >> Go To 5

**4. CHECK THE DRIVER SEAT FRONT VERTICAL UP/DOWN DRIVER VOLTAGE**

Move the Seat Switch in the front vertical position during the next step. Using a 12-volt test light connect one lead to the (G119) Driver Seat Front Vertical Up Driver circuit and the other lead to (P121) Driver Seat Front Vertical Down Driver circuit at the Front Driver Vertical Seat Adjuster Motor connector.

**Does the test light illuminate with the seat switch engaged?**

**Yes** >> Replace the Front Driver Vertical Seat Adjuster motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 7

**B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****5. CHECK THE (G404) DRIVER SEAT FRONT VERTICAL POSITION SENSE WIRE FOR AN OPEN**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G404) Driver Seat Front Vertical Position Sense circuit at the Front Driver Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G404) Driver Seat Front Vertical Position Sense circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 6

**6. CHECK THE (G494) DRIVER SEAT FRONT VERTICAL SENSOR GROUND FOR AN OPEN**

Measure the resistance of the (G494) Driver Seat Front Vertical Sensor Ground circuit at the Driver Front Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G494) Driver Seat Front Vertical Sensor Ground circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**B1D7F-SEAT FRONT VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****7. CHECK THE (P119) DRIVER SEAT FRONT VERTICAL UP DRIVER WIRE FOR AN OPEN**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (P119) Driver Seat Front Vertical Up Driver circuit at the Driver Front Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (P119) Driver Seat Front Vertical Up Driver circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 8

**8. CHECK THE (P121) DRIVER SEAT FRONT VERTICAL DOWN DRIVER AN OPEN**

Measure the resistance of the (P121) Driver Seat Front Vertical Down Driver circuit at the Driver Front Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (P121) Driver Seat Front Vertical Down Driver circuit for an open.

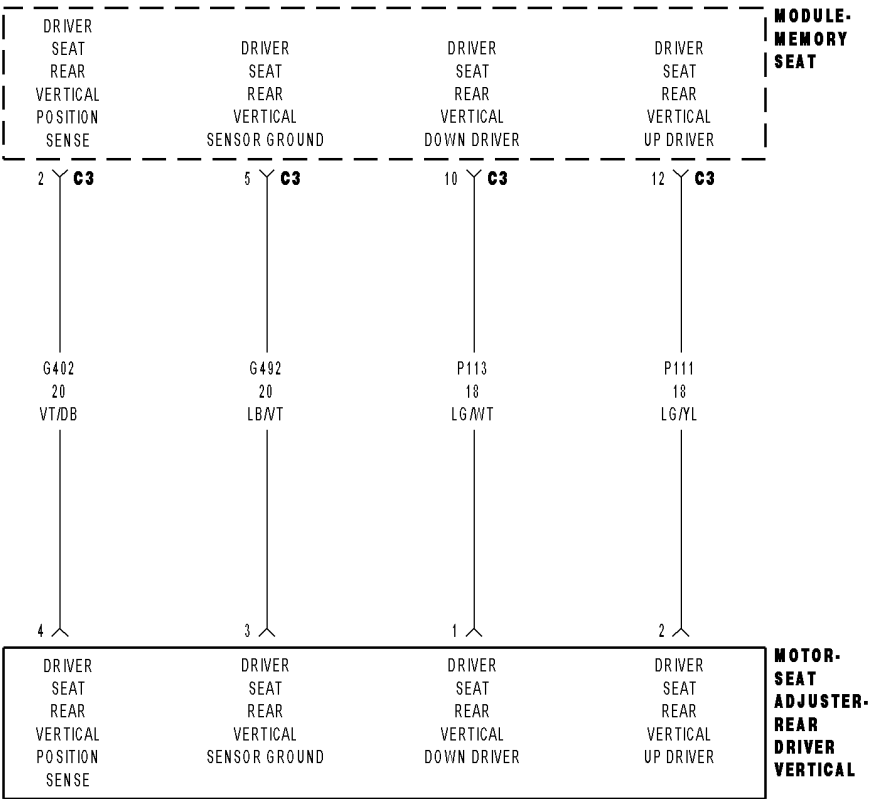

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

B1D83–SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE

**B1D83–SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the seat motor is activated.

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the seat motor this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE CIRCUIT OPEN (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND CIRCUIT OPEN (P111) DRIVER SEAT REAR VERTICAL UP DRIVER (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER REAR DRIVER VERTICAL SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

## Diagnostic Test

### 1. CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display any seat position sensor DTC's?**

**Yes** >> Diagnose and repair other DTC(s) first. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

### 2. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch in the Rear Vertical position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D83–SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE?**

**Yes** >> Go To 3

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**B1D83-SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****3. CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE VOLTAGE**

Disconnect the Rear Driver Vertical Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the Seat Switch in the rear vertical position during the next step. Using a 12-volt test light connect one lead to the (G402) Driver Seat Rear Vertical Position Sense circuit and the other lead to Driver Seat Rear Vertical Sensor Ground at the Driver Rear Vertical Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

**Yes** >> Go To 4

**No** >> Go To 5

**4. CHECK THE DRIVER SEAT REAR VERTICAL UP/DOWN DRIVER VOLTAGE**

Move the Seat Switch in the rear vertical position during the next step. Using a 12-volt test light connect one lead to the (P111) Driver Seat Rear Vertical Up Driver circuit and the other lead to (P113) Driver Seat Rear Vertical Down Driver circuit at the Rear Driver Vertical Seat Adjuster Motor connector.

**Does the test light illuminate with the seat switch engaged?**

**Yes** >> Replace the Rear Driver Vertical Seat Adjuster motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 7

**B1D83-SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****5. CHECK THE (G402) DRIVER SEAT REAR VERTICAL POSITION SENSE WIRE FOR AN OPEN**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G402) Driver Seat Rear Vertical Position Sense circuit at the Rear Driver Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G402) Driver Seat Rear Vertical Position Sense circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 6

**6. CHECK THE (G492) DRIVER SEAT REAR VERTICAL SENSOR GROUND FOR AN OPEN**

Measure the resistance of the (G492) Driver Seat Rear Vertical Sensor Ground circuit at the Driver Rear Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G492) Driver Seat Rear Vertical Sensor Ground circuit for an open.

Perform MEMORY SYSTEM VERIFICATION TEST – VER 1

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**B1D83-SEAT REAR VERTICAL MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****7. CHECK THE (P111) DRIVER SEAT REAR VERTICAL UP DRIVER WIRE FOR AN OPEN**

Disconnect the Memory Seat Module C3 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (P111) Driver Seat Rear Vertical Up Driver circuit at the Driver Rear Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (P111) Driver Seat Rear Vertical Up Driver circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 8

**8. CHECK THE (P113) DRIVER SEAT REAR VERTICAL DOWN DRIVER AN OPEN**

Measure the resistance of the (P113) Driver Seat Rear Vertical Down Driver circuit at the Driver Rear Vertical Seat Adjuster Motor connector to the C3 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (P113) Driver Seat Rear Vertical Down Driver circuit for an open.

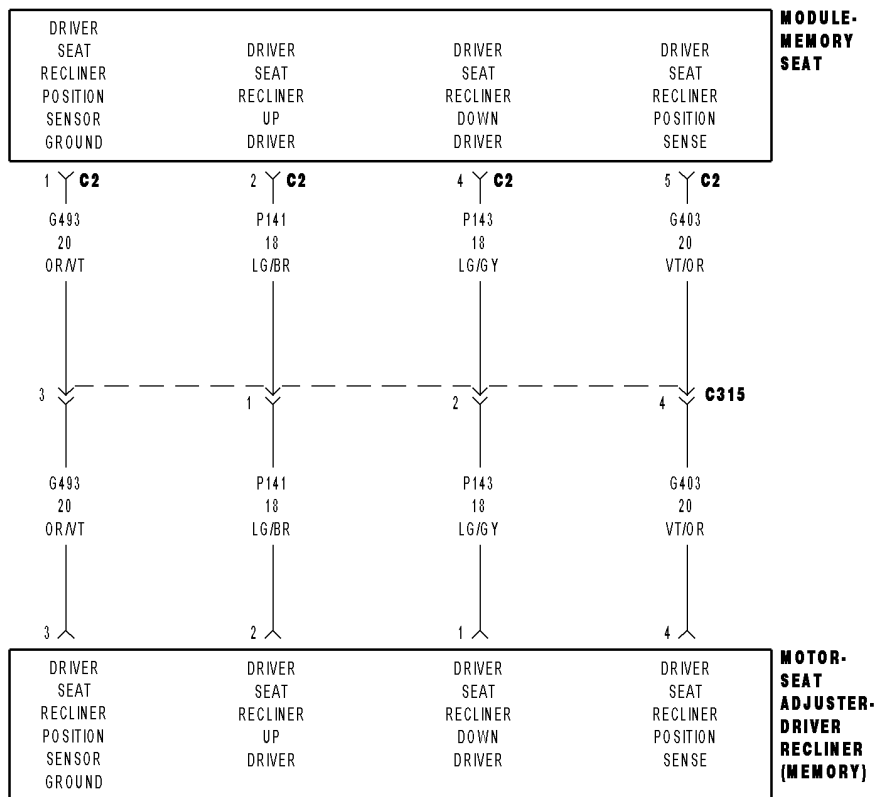

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

## B1D87-SEAT RECLINER MOTOR CONTROL CIRCUIT PERFORMANCE

**B1D87-SEAT RECLINER MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the seat motor is activated.

- **Set Condition:**

If the Memory Seat Module does not detect the rotation of the seat motor this DTC will set. This DTC will only set when the seat switch is moved in the same direction three consecutive times.

Possible Causes
SEAT POSITION SENSOR CIRCUIT DIAGNOSTIC TROUBLE CODES (G403) DRIVER SEAT RECLINER POSITION SENSE CIRCUIT OPEN (G493) DRIVER SEAT RECLINER POSITION SENSOR GROUND CIRCUIT OPEN (P141) DRIVER SEAT RECLINER UP DRIVER (P143) DRIVER SEAT RECLINER DOWN DRIVER DRIVER RECLINER SEAT ADJUSTER MOTOR MEMORY SEAT MODULE

## Diagnostic Test

### 1. CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display any seat position sensor DTC's?**

**Yes** >> Diagnose and repair the other DTC(s) first. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

### 2. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the Seat Switch in the Recliner position 3 times.

With the scan tool, read DTC's.

**Does the scan tool display B1D7B-SEAT BACKREST MOTOR CONTROL CIRCUIT PERFORMANCE?**

**Yes** >> Go To 3

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**B1D87-SEAT RECLINER MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****3. CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE VOLTAGE**

Disconnect the Driver Recliner Seat Adjuster Motor.

**Note: Check connectors – Clean and repair as necessary.**

Move the Seat Switch in the Recliner position during the next step.

Using a 12-volt test light connect one lead to the (G403) Driver Seat Recliner Position Sense circuit and the other lead to Driver Seat Recliner Position Sensor Ground at the Driver Recliner Seat Adjuster Motor connector.

**Does the test light illuminate for approximately 2 seconds then turn off with the seat switch engaged?**

**Yes** >> Go To 4

**No** >> Go To 5

**4. CHECK THE DRIVER SEAT RECLINER FORWARD/REARWARD DRIVER VOLTAGE**

Move the Seat Switch in the Recliner position during the next step.

Using a 12-volt test light connect one lead to the (P141) Driver Seat Recliner Up Driver circuit and the other lead to (P143) Driver Seat Recliner Down Driver circuit at the Driver Recliner Seat Adjuster Motor connector.

**Does the test light illuminate with the seat switch engaged?**

**Yes** >> Replace the Recliner motor assembly.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 7

**B1D87-SEAT RECLINER MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****5. CHECK THE (G403) DRIVER SEAT RECLINER POSITION SENSE WIRE FOR AN OPEN**

Disconnect the Memory Seat Module C2 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (G403) Driver Seat Recliner Position Sense circuit at the Driver Recliner Seat Adjuster Motor connector to the C2 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G403) Driver Seat Recliner Position Sense circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 6

**6. CHECK THE (G493) DRIVER SEAT RECLINER POSTION SENSOR GROUND FOR AN OPEN**

Measure the resistance of the (G493) Driver Seat Recliner Position Sensor Ground circuit at the Driver Recliner Seat Adjuster Motor connector to the C2 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (G493) Driver Seat Recliner Position Senor Ground circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**B1D87-SEAT RECLINER MOTOR CONTROL CIRCUIT PERFORMANCE (CONTINUED)****7. CHECK THE (P141) DRIVER SEAT RECLINER UP DRIVER WIRE FOR AN OPEN**

Disconnect the Memory Seat Module C2 connector.

**Note: Check connectors – Clean and repair as necessary.**

Measure the resistance of the (P141) Driver Seat Recliner Up Driver circuit at the Driver Recliner Seat Adjuster Motor connector to the C2 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (P141) Driver Seat Recliner Up Driver circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Go To 8

**8. CHECK THE (P143) DRIVER SEAT RECLINER DOWN DRIVER AN OPEN**

Measure the resistance of the (P143) Driver Seat Recliner Down Driver circuit at the Driver Recliner Seat Adjuster Motor connector to the C2 connector.

**Is the resistance above 1.0 ohm?**

**Yes** >> Repair the (P143) Driver Seat Recliner Down Driver circuit for an open.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

**No** >> Replace the Memory Seat Module.

Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1

## B1D9B–SEAT HORIZONTAL FRONT STOP NOT LEARNED

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the seat motor is activated.
- **Set Condition:**  
Seat becomes de-standardized. If the seat is not standardized, an Easy Exit/Entry function can not be performed. If seat is standardized (learn seat cushion horizontal front hardstop) and then becomes de-standardized (conditions are: seat cushion motor is 5% past the expected hard stop position or seat cushion hall sensor failure is occurred), a DTC is logged.

Possible Causes
OTHER DIAGNOSTIC TROUBLE CODES SET IN THE MEMORY SEAT MODULE
SEAT STANDERDIZATION ROUTINE NOT PERFORMED

### Diagnostic Test

#### 1. CHECK FOR RELATED DIAGNOSTIC TROUBLE CODES

Turn the ignition on.

With the scan tool, read DTC's.

**Does the scan tool display any seat position sensor or circuit performance DTC's?**

**Yes** >> Diagnose and repair the other DTC(s) first. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

#### 2. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Move the seat in the full forward horizontal position.

With the scan tool, read DTC's.

**Does the scan tool display B1D9B–SEAT HORIZONTAL FRONT STOP NOT LEARNED?**

**Yes** >> With the scan tool, perform the MSM Standard Routine.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**B210D-BATTERY VOLTAGE LOW**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**Engine running, during seat motor operation.
- **Set Condition:**This code is set immediately after the Seat Memory Module receives a low charging system voltage message over the CAN B Bus or detects voltage under 9.5 volts on the (A110) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLTAGE LOW (A110) FUSED B(+) CIRCUIT SEAT MEMORY MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

**Are there any Charging System DTC's set in the Powertrain Control Module?**

- Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.
- No** >> Go To 2  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.

**2. VERIFY THAT DTC B210D-BATTERY VOLTAGE LOW IS ACTIVE**

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and operate the driver power seat.

With the scan tool, read DTC's.

**Does the DTC B210D-BATTERY VOLTAGE LOW reset?**

- Yes** >> Go To 3
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.

**B210D-BATTERY VOLTAGE LOW (CONTINUED)****3. CHECK THE VOLTAGE ON THE (A110) FUSED B(+) CIRCUIT**

Disconnect the Memory Seat Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Start the engine and let idle.

Measure the voltage on the (A110) Fused B(+) circuit at the MSM connector and compare to voltage at the vehicle battery.

**Is the voltage at the MSM connector the same as measured at the battery?**

- Yes** >> Replace the Memory Seat Module in accordance with the service information.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.
- No** >> Repair the (A110) Fused B(+) circuit as necessary.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.

**B210E-BATTERY VOLTAGE HIGH**

For the Heated Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Engine running, during seat operation.
- **Set Condition:** This code is set immediately after the Memory Seat Module receives a high charging system voltage message over the CAN B Bus or detects voltage over 16.5 volts on the (A110) Fused B(+) circuit.

Possible Causes
CHARGING SYSTEM VOLTAGE HIGH (A110) FUSED B(+) CIRCUIT MEMORY SEAT MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. CHECK PCM FOR CHARGING SYSTEM DTC**

With the scan tool, read Powertrain Control Module DTC's.

**Are there any Charging System DTC's set in the Powertrain Control Module?**

**Yes** >> (Refer to 8 - ELECTRICAL/CHARGING - DIAGNOSIS AND TESTING) for Charging System diagnostic procedures.

**No** >> Go To 2

**2. VERIFY THAT DTC B210E-BATTERY VOLTAGE HIGH IS ACTIVE**

With the scan tool, record and erase DTC's

Turn the ignition switch to the Off position then start the engine and let run for one minute.

Attempt to operate the driver power seat.

With the scan tool, read DTC's.

**Does the DTC B210E-BATTERY VOLTAGE HIGH reset?**

**Yes** >> Go To 3

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)****3. CHECK THE VOLTAGE ON THE (A110) FUSED B(+) CIRCUIT**

Disconnect the Seat Memory Module connector.

**Note: Check connectors - Clean and repair as necessary.**

Start the engine and let idle.

Measure the voltage on the (A110) Fused B(+) circuit at the MSM connector and compare to voltage at the vehicles battery.

**Is the voltage at the MSM connector the same as measured at the battery?**

- Yes** >> Replace the Memory Seat Module in accordance with the service information.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.
- No** >> Repair the (A110) Fused B(+) circuit as necessary.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.

## B221C- MEMORY SEAT MODULE INTERNAL

For the Power Seat System circuit diagram (Refer to 8 - ELECTRICAL/HEATED SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:** Ignition on.
- **Set Condition:** This code is set immediately if the Memory Seat Module internal self test fails.

Possible Causes
MEMORY SEAT MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

### Diagnostic Test

#### 1. VERIFY THAT DTC B221C- MEMORY SEAT MODULE INTERNAL IS ACTIVE

With the scan tool, record and erase DTC's

Cycle the ignition switch off then back on.

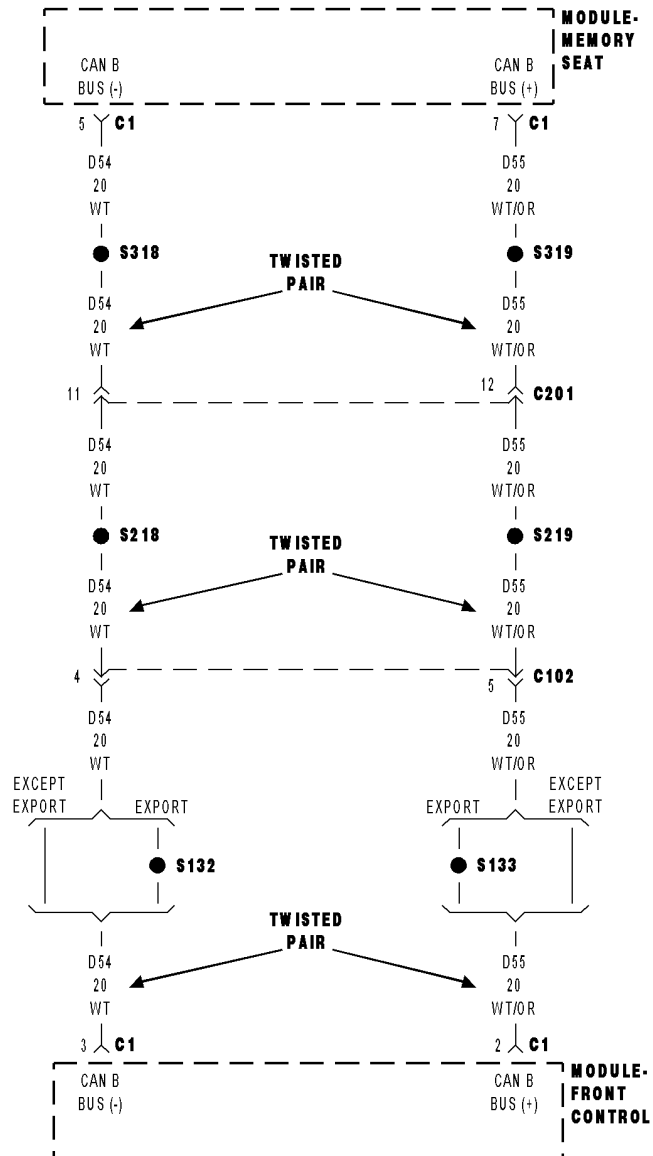

With the scan tool, read DTC's.

**Does the DTC B221C-MEMORY SEAT MODULE INTERNAL reset?**

- Yes** >> Replace the Memory Seat Module.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform POWER SEAT SYSTEM VERIFICATION TEST – VER 1.

## U0020-CAN B BUS OFF PERFORMANCE

**U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
The Memory Seat Module detects the (D55) CAN B Bus (+) circuit or (D54) CAN B Bus (-) circuit open.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN MEMORY SEAT MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase MSM DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active MSM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module C1 harness connector.

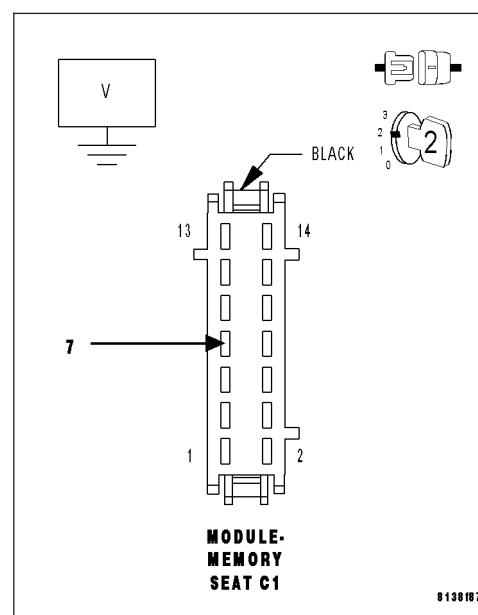

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Memory Seat Module in accordance with the service information.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)****3. (D54) CAN B BUS (-) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module C1 harness connector.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

**Is there any voltage present?**

- Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Memory Seat Module in accordance with the service information.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.
- No** >> Repair the (D54) CAN B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

# U0021-CAN B BUS (+) CIRCUIT OPEN

**U0021-CAN B BUS (+) CIRCUIT OPEN (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
The Memory Seat Module detects the (D55) CAN B Bus (+) circuit is open.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT OPEN MEMORY SEAT MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase MSM DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active MSM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

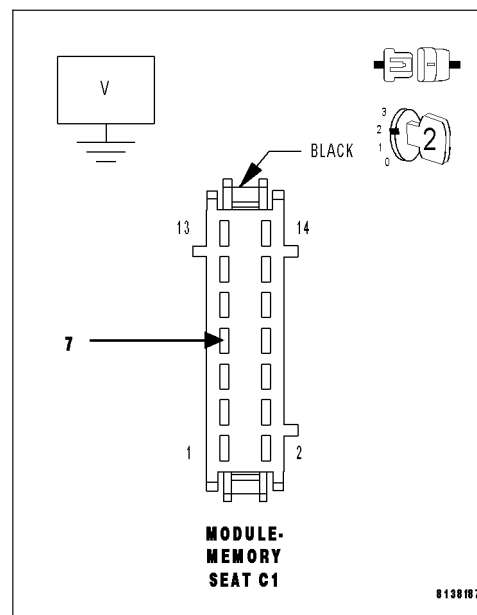

Disconnect the Memory Seat Module C1 harness connector.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Memory Seat Module in accordance with the service information.  
Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

## **U0022-CAN B BUS (+) CIRCUIT LOW**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0023-CAN B BUS (+) CIRCUIT HIGH**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## U0024-CAN B BUS (-) CIRCUIT OPEN

**U0024-CAN B BUS (-) CIRCUIT OPEN (CONTINUED)**

For the Power Seat System circuit diagram(Refer to 8 - ELECTRICAL/POWER SEATS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
The Memory Seat Module detects the (D54) CAN B Bus (-) circuit is open.

Possible Causes
(D54) CAN B BUS (-) CIRCUIT OPEN MEMORY SEAT MODULE

**Theory of Operation****Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase MSM DTC's

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active MSM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. (D54) CAN B BUS (-) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module C1 harness connector.

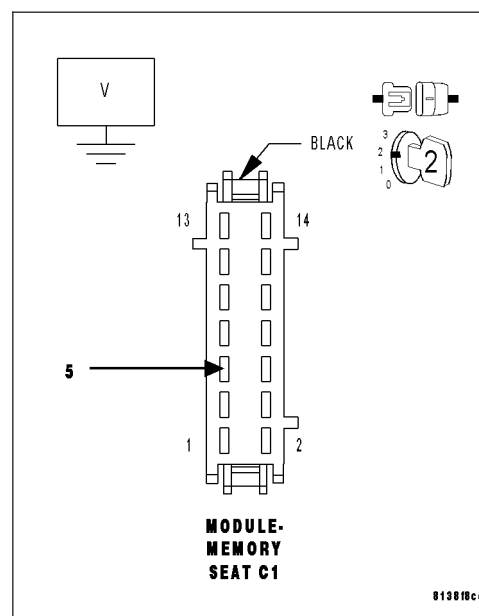

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

**Is there any voltage present?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Memory Seat Module in accordance with the service information.

Perform POWER SEAT SYSTEM VERIFICATION TEST - VER 1.

**No** >> Repair the (D54) CAN B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

## **U0025-CAN B BUS (-) CIRCUIT LOW**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0026-CAN B BUS (-) CIRCUIT HIGH**

For a complete wiring diagram Refer to Section 8W.

(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

## **U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram Refer to Section 8W.

## **U0212-LOST COMMUNICATION WITH SCCM**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## POWER SEAT SYSTEM VERIFICATION TEST – VER 1

### Diagnostic Test

#### 1. Perform Power Seat System Verification Test

Disconnect all jumper wires and reconnect all previously disconnected components and connectors.

Ensure that all accessories are turned off.

Ensure that the battery is fully charged.

Turn the ignition on.

If either the Memory Seat Module or the Driver Horizontal Seat Adjuster Motor/Seat Track was replaced, the MSM Standard Routine must be performed using the scan tool.

With the scan tool, record and erase DTCs from all modules.

Operate the driver seat in all positions.

With the Memory Switch on the Driver's Door, program the Driver's Seat #1 Button to a desired position and Driver #2 Button to a different position.

Verify that both Memory positions can be recalled from the RKE transmitter and the Memory Switch on the Driver's Door.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, select ECU View.

Check for DTCs in the modules.

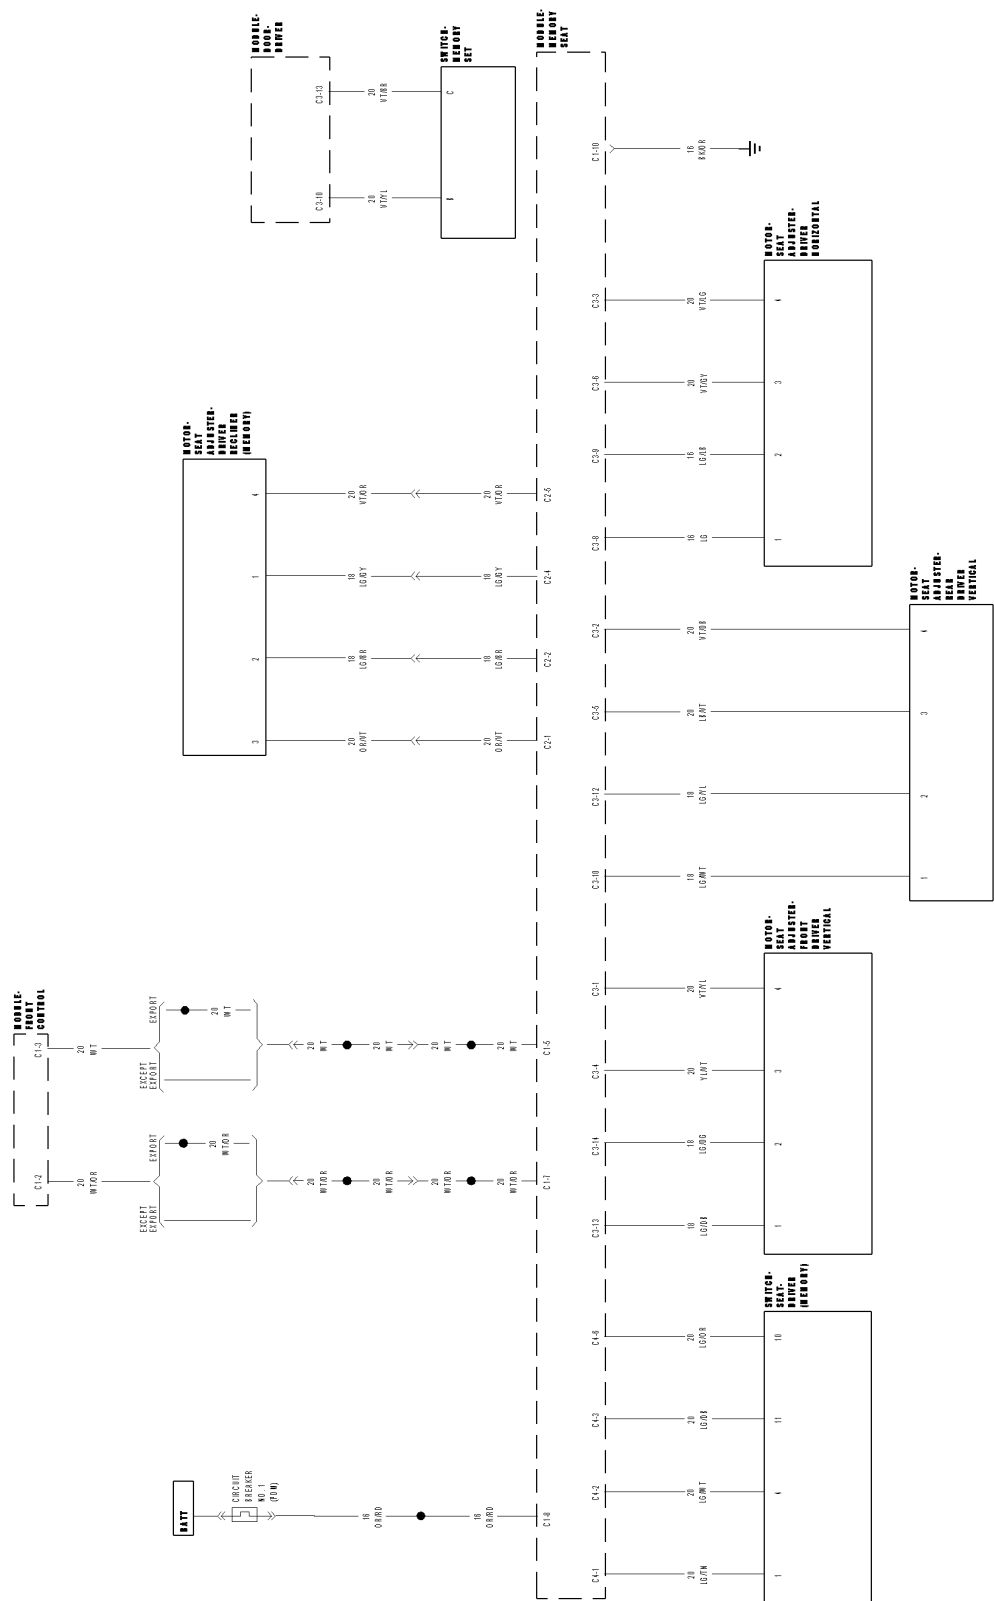

#### **Are DTCs present in any of the modules or is the original condition still present?**

**Yes** >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

**No** >> The repair is complete.

## POWER SEATS - SERVICE INFORMATION

### DESCRIPTION

#### POWER SEAT SYSTEM

**WARNING:** The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the front seat passenger if the vehicle is involved in an accident. The following requirements must be strictly adhered to:

- Do not modify the front passenger seat assembly or components in any way.
- Do not modify the front seat center console or center position seat in any way.
- Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.
- Do not replace the seat trim cover with an aftermarket trim cover.
- Do not add a secondary trim cover other than those approved by DaimlerChrysler/Mopar.
- At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by DaimlerChrysler/Mopar.

The power seat system allows the driver and front seat passenger to electrically adjust their seating positions using the power seat switches located on the outboard seat cushion side shield of each front seat.

A driver side eight-way power seat includes a six-way adjustable seat cushion track and a two-way power seat back. The driver power seat can be adjusted up, down, front up, front down, forward, rearward, recliner forward, and recliner rearward. A passenger side six-way power seat includes a six-way adjustable seat cushion track and a manual seat back recliner. The passenger power front seat can be adjusted up, down, front up, front down, forward and rearward. The power seat system is also available with the heated seat option and memory seat option that automatically positions the driver power seat for two different drivers (Refer to 8 - ELECTRICAL/HEATED SEATS - DESCRIPTION ) and MEMORY SEAT SYSTEM below.

The power seat system for this vehicle includes the following major components:

- **Power Seat Adjuster** - The power seat adjuster is made up of the upper and lower power seat adjuster assemblies. The upper power seat adjuster contains two reversible motors that are connected to worm-drive gearboxes that move the seat adjuster through a combination of screw-type drive units. These motors are the height adjust motor and the front tilt motor. On vehicles equipped with non-memory power seats, each motor contains a self-resetting circuit breaker to protect it from overload. On vehicles equipped with memory power seats the motor overload protection is a function of the Memory Seat Module (MSM). Consecutive or frequent resetting of the circuit breakers may damaged the motors. The height adjust motor is located on the rear of the upper power seat adjuster assembly and controls the up and down movement of the entire seat. The height adjust motor can be serviced separately from the power seat adjuster assembly.

The front tilt motor is located on the front of the upper power seat adjuster assembly and controls the up and down movement of the seat front only. The front tilt motor can be serviced separately from the power seat adjuster assembly.

The lower power seat adjuster contains one reversible motor that is connected to a worm-drive gearbox that moves the seat adjuster through a screw-type drive unit. On vehicles equipped with non-memory power seats, the motor will contain a self-resetting circuit breaker to protect it from overload. On vehicles equipped with memory power seats the motor overload protection is a function of the Memory Seat Module (MSM). The motor is part of the lower power seat track unit and must be replaced as an assembly, (Refer to 23 - BODY/SEATS/SEAT ADJUSTERS - REMOVAL).

- **Power Seat Recliner** - The power seat recliner replaces the manual seat recliner on the driver seat only.

The driver power seat option includes an electrically operated power seat back recliner mechanism. The power seat recliner switch is integral to the power seat switch assembly, but is actuated with a separate switch knob.

The power seat recliner motor cannot be repaired. If the unit is inoperative or damaged, the seat back frame must be replaced, (Refer to 8 - ELECTRICAL/POWER SEATS/POWER SEAT MOTOR - REMOVAL).

- **Power Seat Switches** - Vehicles may be equipped with driver only, or driver and passenger power seat switches. One seat switch is used for each front seat. The power seat switches are paddle-type levers mounted on the outboard seat side shields. Movement of the seat cushions and backs mimics the action of the switch paddles. (Refer to 8 - ELECTRICAL/POWER SEATS/SEAT SWITCH - DESCRIPTION) for additional information.

## MEMORY SEAT SYSTEM

An electronic memory seat system is available on certain models. The memory system is able to store and recall all driver side power seat positions, outside mirror positions, power tilt/telescopic steering column positions and power adjustable pedal position. The system can be set for two different drivers. On vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network, the memory system is also able to store and recall up to twelve radio station presets (six AM and six FM), also for two drivers. The memory system will also store and recall the last station listened to for each driver, even if it is not one of the twelve preset stations.

The memory system will automatically recall all of these settings when a button of the memory switch is depressed, or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter (if enabled). If the vehicle has more than two drivers the RKE transmitter recall of memory features can be disabled. This is a customer programmable feature of the Electronic Vehicle Information Center (EVIC) set through the use of the appropriate steering wheel switches. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE/ELECTRONIC VEHICLE INFO CENTER - OPERATION) for additional information on the customer programmable features.

The memory system also has an "Easy Entry and /Exit" feature that provides the driver with more room to enter or exit the vehicle. When the seat is in a memorized position, it will move rearward 55 millimeters or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is also a customer programmable feature of the Electronic Vehicle Information Center (EVIC) set through the use of the appropriate steering wheel switches.

The memory system also has a "Tilt in Reverse" feature that tilts the outside mirrors down a fixed, incremental angle when the vehicle is shifted into REVERSE with the ignition switch in the RUN position. This feature provides the customer with a better view of the ground and vehicle in the area of the rear tires when backing up. The mirrors move back to their previous position when the vehicle is shifted out of REVERSE.

The memory system includes the following components:

- **Memory Selector Switch** - located in the driver door trim panel.
- **Driver Door Module (DDM)** - located in the driver door, behind the trim panel.
- **Passenger Door Module (PDM)** - located in the passenger door, behind the trim panel.
- **Hall Effect Sensors - Outside Mirror** - The hall effect sensor is permanently installed on the outside mirror motor. This hall effect sensor is used to provide a reference signal to the memory heated seat mirror module, letting the module know the exact position of the mirror.
- **Sentry Key Remote Entry Module (SKREEM)** - located at ignition key cylinder.
- **Remote Keyless Entry (RKE) Transmitter** - located with ignition key.
- **Memory Seat Module (MSM)** - located underneath the driver seat and also controls the Adjustable Pedals.
- **Hall Effect Sensors - Seat Track** - These hall effect sensors are permanently installed in each of the power seat track motors. They are used to provide a reference signal to the memory heated seat mirror module, letting the module know the exact position of the seat cushion and recliner.
- **Radio** - located in the instrument panel center stack.
- **Automatic Temperature Control (ATC)** - located in the instrument panel center stack.

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of these electronic modules or of the CAN bus, the use of a scan tool and the proper diagnostic information are needed.

## OPERATION

### POWER SEAT SYSTEM

The power seat system receives battery current through a 50 amp fuse in the Power Distribution Center (PDC) so that the power seats remain operational, regardless of the ignition switch position.

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the power seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor is reversed through the switch contacts. This causes the motor to run in the opposite direction.

## MEMORY SEAT SYSTEM

The Memory Seat Module (MSM) receives battery current through a 25 amp circuit breaker in the Power Distribution Center (PDC) so that the power seats remain operational, regardless of the ignition switch position. When the driver memory seat switch control knob is actuated, a resistance signal is sent to the MSM via the Controller Area Network (CAN) bus circuit. The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor. The adjuster motor operates to move the power seat adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached.

The MSM receives memory set/position switch input through the CAN bus circuit. The MSM also receives hard wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors and the driver side view mirror motor. The programmed software in the module allows it to know where the seat/mirror is located in its designed travel by a pulse count generated from the hall effect sensors. This way, when the memory switch is depressed the module will power the seat adjuster/mirror motors until the correct preset location is achieved. The module will prevent the seat memory recall function from being initiated, if the transmission gear selector lever is not in the Park position, or if the vehicle is moving. These inputs are monitored over the Controller Area Network (CAN) bus circuit by the MSM.

A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within 5 seconds of pressing the "set" button.

A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" Remote Keyless Entry (RKE) transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in a position other than Park or the seat belt is latched.

## DIAGNOSIS AND TESTING

### MEMORY SEAT SYSTEM

In order to obtain conclusive testing of the power seats with and without the memory system option, the Controller Area Network (CAN) bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. Use a scan tool and the proper diagnostic information to accurately diagnose the power seat/memory seat systems.

**Note: Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.0v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.**

Before any testing of the power seat system is attempted, the battery should be fully-charged.

### POWER SEAT ADJUSTER

Operate the power seat switch and move the seat in all directions. The seat should move in each of the selected directions.

If the power seat adjuster fails to operate in more than one direction, proceed as follows:

1. Inspect the power seat adjuster motors to ensure the electrical connectors are fully seated to the motors. If OK, go to Step 2. If not OK, connect the electrical connector to the fully seated position.
2. Check the power seat fuse in the power distribution center. If OK, go to Step 3. If not OK, replace the inoperative fuse.
3. Remove the power seat switch from the seat cushion side panel. Check for battery voltage at the fused B(+) circuit cavity of the power seat switch wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit to the power distribution center as required.
4. Check for continuity between the ground circuit cavity of the power seat switch wire harness connector and a good ground. There should be continuity. If OK, go to Step 5. If not OK, repair the open circuit to ground as required.
5. (Refer to 8 - ELECTRICAL/POWER SEATS/SEAT SWITCH - DIAGNOSIS AND TESTING). If the switch tests OK, check the wire harness between the power seat switch and the motor. If the circuits check OK, replace the faulty power seat adjuster assembly. If the circuits are not OK, repair the wire harness as required.

## STANDARD PROCEDURE

### MEMORY SYSTEM PROGRAMMING

The Memory Seat Module (MSM) interfaces with the Remote Keyless Entry (RKE) system via the Controller Area Network (CAN) bus. The proper procedure of setting and recalling a memory position using the RKE is as follows:

1. Press and release memory switch 1 or 2 to recall memory position 1 or 2.
2. Adjust the seat, recliner, adjustable pedal position, set radio station presets, set HVAC temperature preset, and the side view mirrors to the desired position.
3. Press momentarily and release memory switch S.
4. Within five seconds, press momentarily and release memory switch 1 or 2.
5. To link the RKE transmitter: within ten seconds, press and release the "LOCK" button on one of the RKE transmitters

To program the second driver's position, repeat the above procedure using memory switch 2. The second RKE transmitter can be programmed in the same fashion as indicated in step 5 Step 5.

**Note:** The module will abort a recall if the transmission is moved out of park or if any seat movement is activated whether manually or by memory recall. The module will also abort a recall if any movement of the adjustable pedals is detected.

To recall either of the programmed positions momentarily press and release either memory selector switch 1 or 2. If using RKE, just press and release the "UNLOCK" button on the proper transmitter for either position 1 or 2.

A recall is possible any time the vehicle transmission is in PARK and the seatbelt is unbuckled. This condition is monitored by the MSM.

## MOTOR-SEAT ADJUSTER

### REMOVAL

**WARNING:** A seat structure that has seen significant load may have the locking mechanism activated and may exhibit the following symptoms:

- Locking pawl (2) loose
- Locking pawl (2) engaged into the seat frame sidemember (1)
- Height adjuster only works on outboard side
- Broken or missing shear pin (3)

If any one or more of these symptoms exist replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in personal injury or death.

## FRONT TILT MOTOR

1. Disconnect and isolate the battery negative cable.
2. Remove the affected seat with the inoperative motor (1) (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL).
3. Remove the seat cushion and pan (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).

4. Disconnect the motor electrical connector.

5. Remove the fasteners holding the motor to the seat adjuster (1).
6. Remove motor from seat adjuster (2).

## HEIGHT ADJUST MOTOR

**WARNING:** Use caution when removing the height adjust motor (3) if the motor is inoperative, and the power seat is not in the full up position. The seat adjuster assembly (2) is under load from the height adjust spring and may cause the motor to rotate under pressure when the fasteners are removed. The seat adjuster assembly also may spring upward when the motor is removed. If the height adjust motor is operative, move the power seat to the full up position prior to disconnecting the battery.

1. Disconnect and isolate the battery negative cable.
2. Remove the affected seat with the inoperative motor (3) (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL).
3. Remove the seat cushion and pan (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).

4. Disconnect the motor electrical connector.

5. Remove the fasteners (1) holding the motor (3) to the seat adjuster (2).

6. Remove screw and washer from the motor shaft.

7. Remove motor (3) from seat adjuster (2).

## INSTALLATION

**WARNING:** A seat structure that has seen significant load may have the locking mechanism activated and may exhibit the following symptoms:

- Locking pawl (2) loose
- Locking pawl (2) engaged into the seat frame sidemember (1)
- Height adjuster only works on outboard side
- Broken or missing shear pin (3)

If any one or more of these symptoms exist replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in personal injury or death.

**FRONT TILT MOTOR**

1. Position motor (1) on seat adjuster (2).

2. Install the fasteners (1) holding the motor to the seat adjuster (2). Tighten the screws to 5 N·m (44 in. lbs.).

3. Connect the motor electrical connector.
4. Install the seat cushion (Refer to 23 - BODY/ SEATS/SEAT CUSHION COVER - INSTALLATION).
5. Clip the wire harness to cushion pan.
6. Install the seat assembly (Refer to 23 - BODY/ SEATS/SEAT - INSTALLATION).
7. Connect the battery negative cable.
8. Verify normal operation of the power seat assembly.

## HEIGHT ADJUST MOTOR

1. Ensure the seat adjuster (2) is in the full up position by pulling upward on the upper adjuster assembly.
2. Position motor (3) on seat adjuster (2).
3. Install the motor shaft screw and washer and tighten until snug. **Do not torque screw at this time.**

4. Install the screws (1) holding the motor (3) to the seat adjuster (2). **It may be necessary to twist the motor slightly to align the fastener holes.**
5. Starting with the bottom screw, tighten the motor screws (1) to 9 N·m (80 in. lbs.).
6. Tighten the motor shaft screw and washer to 6.5 N·m (57.5 in. lbs.).

7. Connect the motor electrical connector.
8. Install the seat cushion (Refer to 23 - BODY/ SEATS/SEAT CUSHION COVER - INSTALLATION).
9. Clip the wire harness to cushion pan.
10. Install the seat assembly (Refer to 23 - BODY/ SEATS/SEAT - INSTALLATION).
11. Connect the battery negative cable.
12. Verify normal operation of the power seat assembly.

## POWER SEAT RECLINER

### REMOVAL

1. Remove the seat back frame assembly(Refer to 23 - BODY/SEATS/SEAT BACK CUSHION/COVER - REMOVAL).
2. Remove any parts that will need to be installed on new seat back frame assembly.

### INSTALLATION

1. Install parts from old seat back assembly as necessary.
2. Install the seat back (1) (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION/COVER - INSTALLATION).

## SWITCH-SEAT

### DESCRIPTION

The driver power seat can be adjusted in eight different ways using the power seat switch. The passenger power seat can be adjusted in six different ways. The power seat switch is located on the lower outboard side of the seat cushion on the seat cushion side shield on all models.

The individual switches in the power seat switch assembly cannot be repaired. If one switch is damaged or faulty, the entire power seat switch must be replaced.

### OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power seat adjuster or recliner adjuster motor. The selected adjuster motor operates to move the seat or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

On vehicles equipped with memory system, a resistance signal is sent to the Memory Seat Module (MSM) via the Controller Area Network (CAN) bus circuit, when the driver memory seat switch control knob is actuated. The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor. The adjuster motor operates to move the power seat adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

### DIAGNOSIS AND TESTING

#### POWER SEAT SWITCH

##### DRIVER WITHOUT MEMORY SEAT SYSTEM

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat (Refer to 8 - ELECTRICAL/POWER SEATS/SEAT SWITCH - REMOVAL).
3. Use an ohmmeter to test the continuity of the power seat switch. Refer to DRIVER POWER SEAT SWITCH WITHOUT MEMORY SEAT SYSTEM CONTINUITY table. If not OK, replace the faulty power seat switch. If switch tests OK (Refer to 8 - ELECTRICAL/POWER SEATS/POWER SEAT ADJUSTER - DIAGNOSIS AND TESTING).

**DRIVER POWER SEAT SWITCH WITHOUT MEMORY SEAT SYSTEM CONTINUITY**

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-2, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-2, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-2, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-2, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-2, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-1, 7-2, 7-3, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-1, 7-2, 7-3, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-1, 7-2, 7-3, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-1, 7-2, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10

**PASSENGER SEAT**

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat (Refer to 8 - ELECTRICAL/POWER SEATS/SEAT SWITCH - REMOVAL).
3. Use an ohmmeter to test the continuity of the power seat switch. Refer to PASSENGER POWER SEAT SWITCH CONTINUITY table. If not OK, replace the faulty power seat switch. If switch tests OK (Refer to 8 - ELECTRICAL/POWER SEATS/POWER SEAT ADJUSTER - DIAGNOSIS AND TESTING).

8132c253

**PASSENGER POWER SEAT SWITCH CONTINUITY**

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-5, 7-8, 7-9, 7-10, 7-11
FRONT TILT DOWN	6-5, 7-4, 7-8, 7-9, 7-10, 7-11
FRONT TILT UP	6-9, 7-4, 7-5, 7-8, 7-10, 7-11
REAR TILT DOWN	6-10, 7-4, 7-5, 7-8, 7-9, 7-11
REAR TILT UP	6-11, 7-4, 7-5, 7-8, 7-9, 7-10

## DRIVER WITH MEMORY SEAT SYSTEM

1. Disconnect and isolate the battery negative cable.
2. Remove the power seat switch from the power seat (Refer to 8 - ELECTRICAL/POWER SEATS/SEAT SWITCH - REMOVAL).
3. Use an ohmmeter to test the resistance of the power seat switch. Refer to DRIVER POWER SEAT SWITCH WITH MEMORY SEAT SYSTEM CONTINUITY table. If not OK, replace the faulty power seat switch. If switch tests OK (Refer to 8 - ELECTRICAL/POWER SEATS/POWER SEAT ADJUSTER - DIAGNOSIS AND TESTING).

8132c26a

## DRIVER POWER SEAT SWITCH WITH MEMORY SEAT SYSTEM CONTINUITY

SWITCH POSITION	CONTINUITY BETWEEN	RESISTANCE VALUE
OFF	10-4	OPEN
OFF	10-11	OPEN
OFF	1-4	47 OHMS
OFF	1-11	47 OHMS
REAR TILT UP	10-11	169 OHMS
REAR TILT DOWN	10-11	76 OHMS
HORIZONTAL FORWARD	10-11	43 OHMS
HORIZONTAL REARWARD	10-11	10 OHMS
RECLINER UP	10-4	43 OHMS
RECLINER DOWN	10-4	10 OHMS
FRONT TILT UP	10-4	169 OHMS
FRONT TILT DOWN	10-4	76 OHMS
ALL RESISTANCE VALUES ARE $\pm$ FIVE PERCENT		

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the seat cushion side panel from the seat and disconnect the electrical harness connector.
3. Using a small flat bladed tool, gently release the four mounting tabs that secure the power seat switch and separate switch from trim panel.

## INSTALLATION

1. Position the power seat switch on the seat cushion side panel. Gently apply pressure to the switch until the four mounting tabs that secure the switch snap into place.
2. Connect the power seat switch electrical connector.
3. Install the seat cushion side panel on the seat.
4. Connect the battery negative cable.
5. Verify normal operation of the power seat assembly.

POWER TOP - ELECTRICAL DIAGNOSIS

DIAGNOSIS AND TESTING

## B1841–SUNROOF OPEN SWITCH INPUT CIRCUIT HIGH

**B1841–SUNROOF OPEN SWITCH INPUT CIRCUIT HIGH (CONTINUED)**

For the Sunroof circuit diagram (Refer to 8 - ELECTRICAL/POWER TOP - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The Sunroof Motor/Module supplies a 12 volt supply circuit to the sunroof switch. When the switch is closed to any of the 3 sense circuits (open, close or vent), it sends that command back to the module.

- **When Monitored:**  
Whenever the Sunroof module is awake.
- **Set Condition:**  
Whenever the module has determined that the open switch has been applied for over 15 seconds or there is a short to voltage on the Sunroof Open Switch Sense circuit, this code will set.

Possible Causes
(Q3) SUNROOF OPEN SWITCH SENSE CIRCUIT SHORT TO VOLTAGE (Q3) SUNROOF OPEN SWITCH SENSE CIRCUIT SHORT TO (Q6) SUNROOF SWITCH SUPPLY CIRCUIT SUNROOF SWITCH SHORTED SUNROOF MOTOR/MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Press and release the Sunroof Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1841–SUNROOF OPEN SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Check the switch for any binding conditions and using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**B1841–SUNROOF OPEN SWITCH INPUT CIRCUIT HIGH (CONTINUED)****2. SUNROOF SWITCH SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Sunroof Switch connector.

Turn the ignition on and wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1841–SUNROOF OPEN SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Sunroof Switch.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**3. (Q3) SUNROOF OPEN SWITCH SENSE CIRCUIT SHORT TO VOLTAGE**

**Note:** To further diagnose the sunroof, it is necessary to lower or remove the headliner.

Turn the ignition off.

Lower the headliner to gain access to the Sunroof Motor/Module connector.

Disconnect the Sunroof Motor/Module connector.

**Note:** Ensure the A-Pillar connector is connected before proceeding.

Turn the ignition on.

Measure the voltage between the (Q3) Sunroof Open Switch Sense circuit and Ground.

**Is the voltage above 0.4 volts?**

**Yes** >> Repair the (Q3) Sunroof Open Switch Sense circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1841-SUNROOF OPEN SWITCH INPUT CIRCUIT HIGH (CONTINUED)****4. (Q3) SUNROOF OPEN SWITCH SENSE CIRCUIT SHORT TO (Q6) SUNROOF SWITCH SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the A-Pillar connector.

Measure the resistance between the (Q3) Sunroof Open Switch Sense circuit and the (Q6) Sunroof Switch Supply circuit in the Sunroof Motor/Module connector.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q3) Sunroof Open Switch Sense circuit for a short to the (Q6) Sunroof Switch Supply circuit.

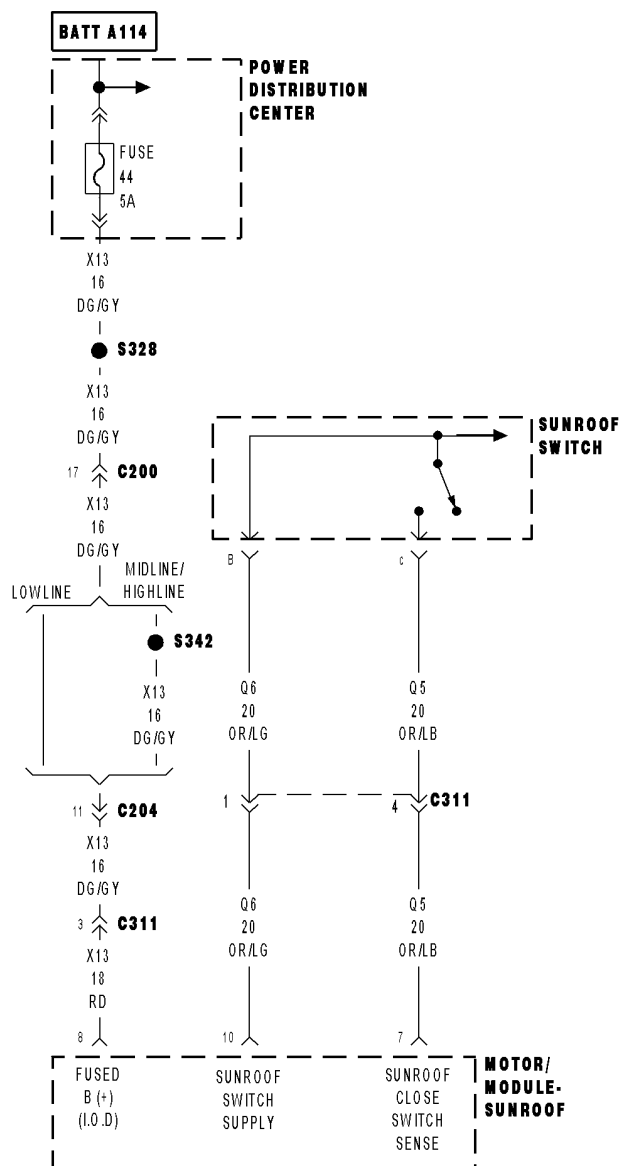

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Sunroof Motor/Module.

Perform the Sunroof Position Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION). Perform the Excessive Force Limitation Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION CALIBRATION).

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1844–SUNROOF CLOSE SWITCH INPUT CIRCUIT HIGH**

**B1844-SUNROOF CLOSE SWITCH INPUT CIRCUIT HIGH (CONTINUED)**

For the Sunroof circuit diagram (Refer to 8 - ELECTRICAL/POWER TOP - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The Sunroof Motor/Module supplies a 12 volt supply circuit to the sunroof switch. When the switch is closed to any of the 3 sense circuits (open, close or vent), it sends that command back to the module.

- **When Monitored:**  
Whenever the Sunroof module is awake.
- **Set Condition:**  
Whenever the module has determined that the close switch has been applied for over 15 seconds or there is a short to voltage on the Sunroof Close Switch Sense circuit, this code will set.

Possible Causes
(Q5) SUNROOF CLOSE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE (Q5) SUNROOF CLOSE SWITCH SENSE CIRCUIT SHORT TO (Q6) SUNROOF SWITCH SUPPLY CIRCUIT SUNROOF SWITCH SHORTED SUNROOF MOTOR/MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Press and release the Sunroof Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1844-SUNROOF CLOSE SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Check the switch for any binding conditions and using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**B1844-SUNROOF CLOSE SWITCH INPUT CIRCUIT HIGH (CONTINUED)****2. SUNROOF SWITCH SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Sunroof Switch connector.

Turn the ignition on and wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1844-SUNROOF CLOSE SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Sunroof Switch.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**3. (Q5) SUNROOF CLOSE SWITCH SENSE CIRCUIT SHORT TO VOLTAGE**

**Note: To further diagnose the sunroof, it is necessary to lower or remove the headliner.**

Turn the ignition off.

Lower the headliner to gain access to the Sunroof Motor/Module connector.

Disconnect the Sunroof Motor/Module connector.

**Note: Ensure the A-Pillar connector is connected before proceeding.**

Turn the ignition on.

Measure the voltage between the (Q5) Sunroof Close Switch Sense circuit and Ground.

**Is the voltage above 0.4 volts?**

**Yes** >> Repair the (Q5) Sunroof Close Switch Sense circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1844-SUNROOF CLOSE SWITCH INPUT CIRCUIT HIGH (CONTINUED)****4. (Q5) SUNROOF CLOSE SWITCH SENSE CIRCUIT SHORT TO (Q6) SUNROOF SWITCH SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the A-Pillar connector.

Measure the resistance between the (Q5) Sunroof Close Switch Sense circuit and the (Q6) Sunroof Switch Supply circuit in the Sunroof Motor/Module connector.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q5) Sunroof Close Switch Sense circuit for a short to the (Q6) Sunroof Switch Supply circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Sunroof Motor/Module.

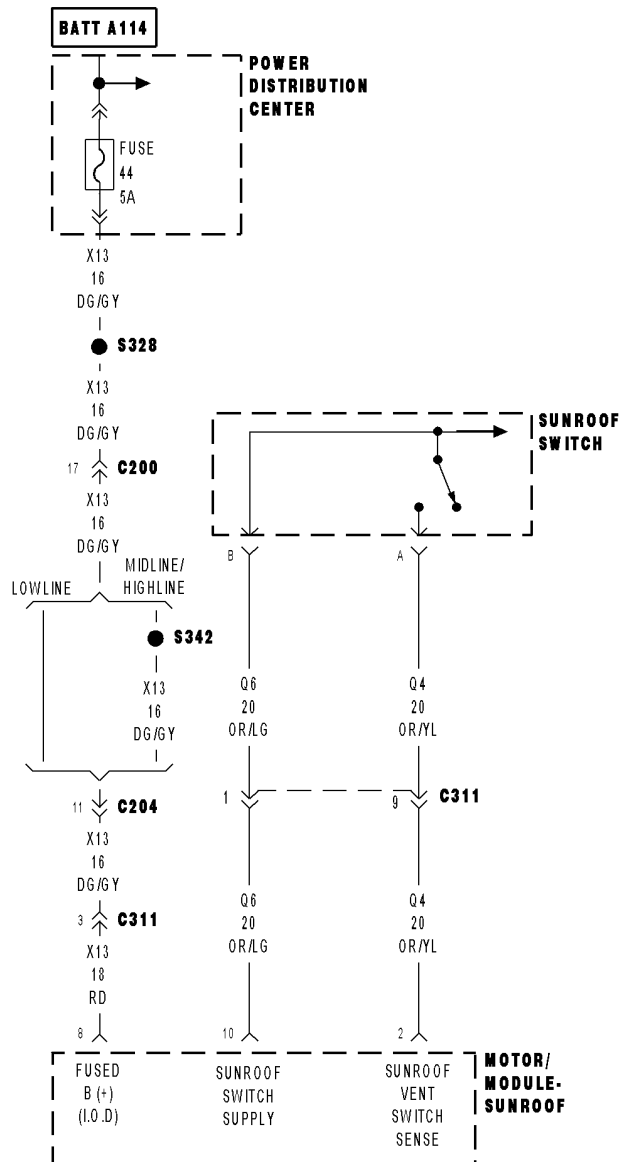

Perform the Sunroof Position Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION). Perform the Excessive Force Limitation Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION CALIBRATION).

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

## B1847-SUNROOF VENT SWITCH INPUT CIRCUIT HIGH

**B1847–SUNROOF VENT SWITCH INPUT CIRCUIT HIGH (CONTINUED)**

For the Sunroof circuit diagram (Refer to 8 - ELECTRICAL/POWER TOP - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The Sunroof Motor/Module supplies a 12 volt supply circuit to the sunroof switch. When the switch is closed to any of the 3 sense circuits (open, close or vent), it sends that command back to the module.

- **When Monitored:**  
Whenever the Sunroof module is awake.
- **Set Condition:**  
Whenever the module has determined that the vent switch has been applied for over 15 seconds or there is a short to voltage on the Sunroof Vent Switch Sense circuit, this code will set.

Possible Causes
(Q4) SUNROOF VENT SWITCH SENSE CIRCUIT SHORT TO VOLTAGE (Q4) SUNROOF VENT SWITCH SENSE CIRCUIT SHORT TO (Q6) SUNROOF SWITCH SUPPLY CIRCUIT SUNROOF SWITCH SHORTED SUNROOF MOTOR/MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Press and release the Sunroof Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1847–SUNROOF VENT SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Check the switch for any binding conditions and using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**B1847-SUNROOF VENT SWITCH INPUT CIRCUIT HIGH (CONTINUED)****2. SUNROOF SWITCH SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Sunroof Switch connector.

Turn the ignition on and wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1847-SUNROOF VENT SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Sunroof Switch.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**3. (Q4) SUNROOF VENT SWITCH SENSE CIRCUIT SHORT TO VOLTAGE**

**Note:** To further diagnose the sunroof, it is necessary to lower or remove the headliner.

Turn the ignition off.

Lower the headliner to gain access to the Sunroof Motor/Module connector.

Disconnect the Sunroof Motor/Module connector.

**Note:** Ensure the A-Pillar connector is connected before proceeding.

Turn the ignition on.

Measure the voltage between the (Q4) Sunroof Vent Switch Sense circuit and Ground.

**Is the voltage above 0.4 volts?**

**Yes** >> Repair the (Q4) Sunroof Vent Switch Sense circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1847-SUNROOF VENT SWITCH INPUT CIRCUIT HIGH (CONTINUED)****4. (Q4) SUNROOF VENT SWITCH SENSE CIRCUIT SHORT TO (Q6) SUNROOF SWITCH SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the A-Pillar connector.

Measure the resistance between the (Q4) Sunroof Vent Switch Sense circuit and the (Q6) Sunroof Switch Supply circuit in the Sunroof Motor/Module connector.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q4) Sunroof Vent Switch Sense circuit for a short to the (Q6) Sunroof Switch Supply circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Sunroof Motor/Module.

Perform the Sunroof Position Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION). Perform the Excessive Force Limitation Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION CALIBRATION).

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1849–SUNROOF MOTOR CONTROL CIRCUIT/PERFORMANCE (STALLED)**

For the Sunroof circuit diagram (Refer to 8 - ELECTRICAL/POWER TOP - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the Sunroof motor/module is in motion.
- **Set Condition:**  
Whenever the sunroof motor/module is attempting to move the sunroof in response to the input switches (or in response to an obstacle), and it doesn't appear to be responding correctly. This code is usually set when there is some type of binding in the sunroof mechanism.

Possible Causes
SUNROOF MOTOR/MODULE
MECHANICAL BINDING, STICKING OR CABLES OUT OF CALIBRATION

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Sunroof Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1849–SUNROOF MOTOR CONTROL CIRCUIT/PERFORMANCE (STALLED)?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Check for any binding or sticking conditions.

**B1849-SUNROOF MOTOR CONTROL CIRCUIT/PERFORMANCE (STALLED) (CONTINUED)****2. SUNROOF MOTOR**

**Note:** To further diagnose the sunroof, it is necessary to lower or remove the headliner.

**Note:** Any time the Sunroof Motor is removed, it is necessary to perform the Position Calibration when the motor is re-installed.

Turn the ignition off.

Lower the headliner to gain access to the Sunroof Motor/Module.

Remove the Sunroof Motor/Module from the sunroof.

**Note:** Ensure the A-Pillar connector is connected before proceeding.

Turn the ignition on.

While holding the motor firmly in your hand, have an assistant press the sunroof switch Open and after the motor stops press Close (NOT VENT) several times and observe the motor operation.

**Did the motor operate smoothly and powerful ?**

**Yes** >> Repair or replace the sunroof mechanism as necessary in accordance with Service Information. Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Sunroof Motor Module.  
Perform the Sunroof Position Calibration. (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE) Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST – VER 1.

---

## B2227–SUNROOF ECU INTERNAL

For the Sunroof circuit diagram (Refer to 8 - ELECTRICAL/POWER TOP - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the Sunroof module is awake.
- **Set Condition:**  
Whenever the module has determined that there is a motor or electronic malfunction, this code will set.

Possible Causes
SUNROOF MOTOR/MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Sunroof Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

#### Does the scan tool display B2227–SUNROOF ECU INTERNAL?

**Yes** >> Replace the Sunroof Motor/Module.

Perform the Sunroof Position Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION). Perform the Excessive Force Limitation Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION CALIBRATION).

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> The conditions that caused this code to set are not present at this time. Operate the Sunroof several times and recheck for DTC's. If the code reappears now or later, replace the Sunroof Motor/Module.

## **U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

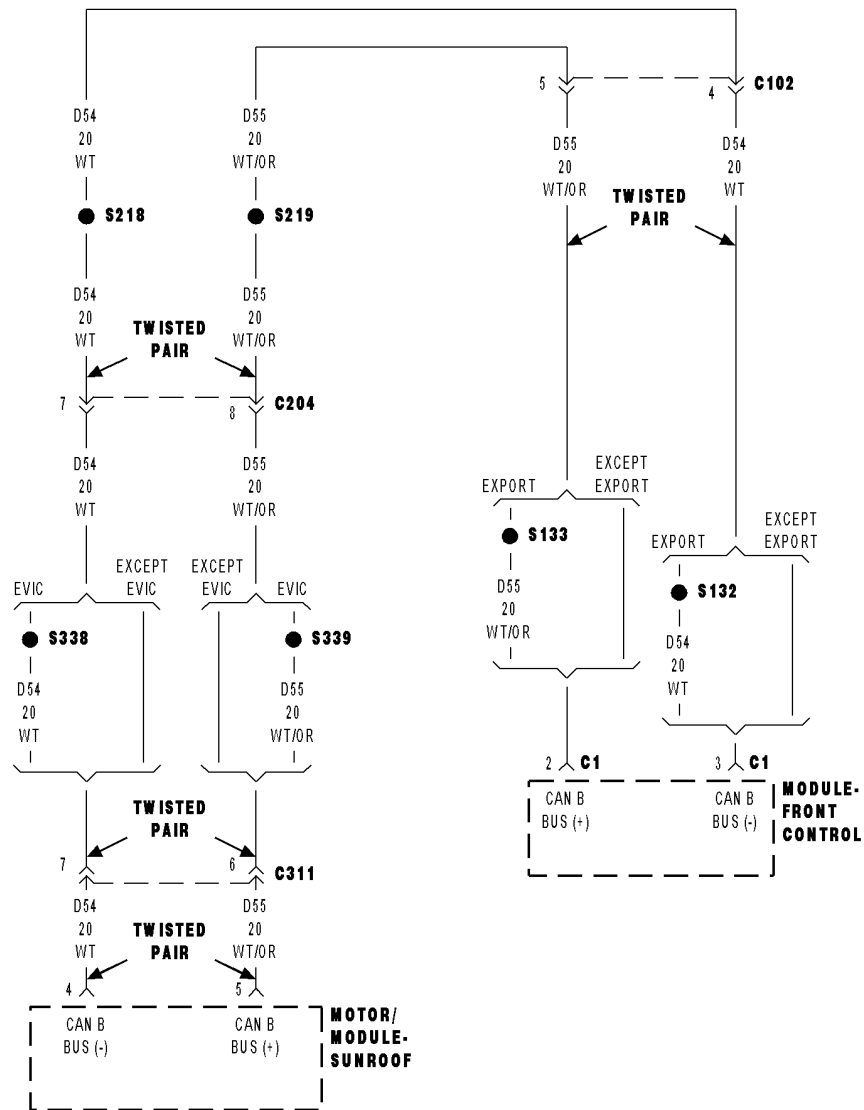

## **U0155-LOST COMMUNICATION WITH CLUSTER/CCN**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## U0019—CAN B BUS

**U0019-CAN B BUS (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage or shorted to ground.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN SUNROOF MOTOR/MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTCs**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

Turn the ignition off and wait 30 seconds.

Turn the ignition on.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition.  
Visually inspect the related wiring harness connectors.  
Look for broken, bent, pushed out, or corroded terminals.

**2. CHECK FRONT CONTROL MODULE DTC's**

With the scan tool, read Front Control Module active DTC's

**Does the scan tool display any CAN B BUS DTC's – ACTIVE?**

**Yes** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

**No** >> Go To 3

**U0019-CAN B BUS (CONTINUED)****3. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the Sunroof Motor/Module connector.

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 connector and the Sunroof Motor/Module connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

8138bdce

**4. (D54) CAN B BUS (–) CIRCUIT OPEN**

Measure the resistance of the (D54) CAN B Bus (–) circuit between the Front Control Module C1 connector and the Sunroof Motor/Module connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the Sunroof Motor/Module in accordance with the service information.

Perform the Sunroof Position Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION). Perform the Excessive Force Limitation Calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION CALIBRATION).

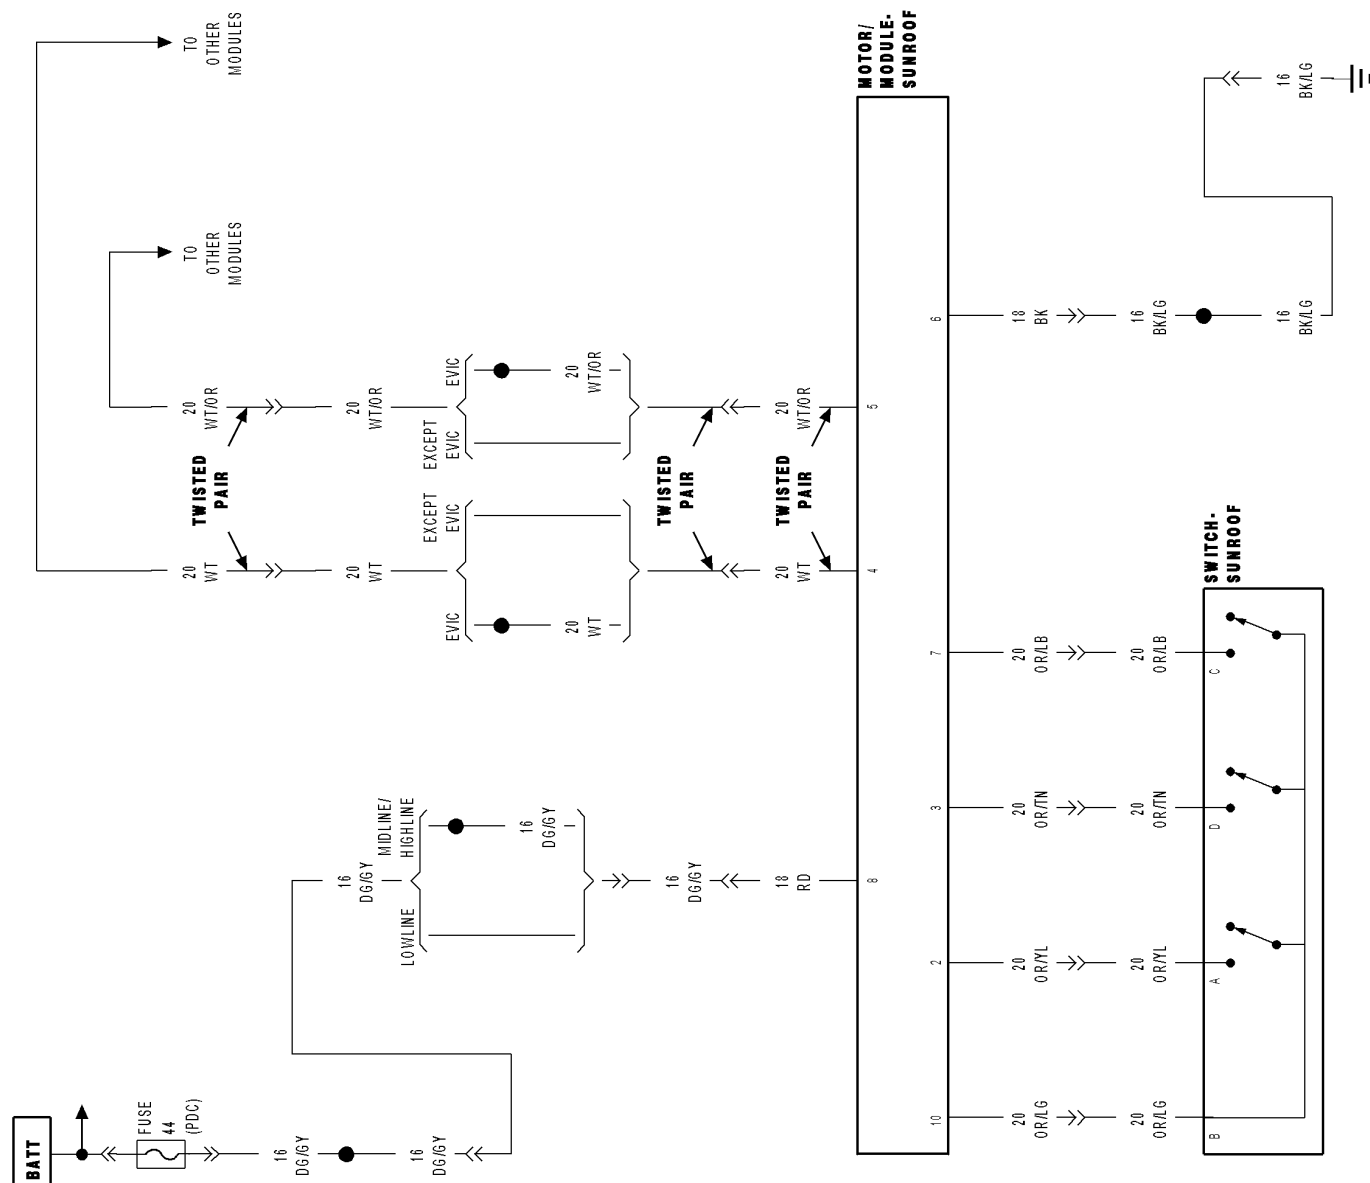

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (D54) CAN B Bus (–) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

8138bdcf

## POWER TOP - SUNROOF SERVICE INFO

### DESCRIPTION

813eab57

**EXPLODED VIEW**

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

14 - WIND DEFLECTOR  
15 - RIGHT SUNROOF GLASS GUIDE  
16 - WIND DEFLECTOR STRAP SCREWS (2)

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

## OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active. If the sunroof is moving when the key is turned to the START position (crank engine), all motions stop until the key is released, then the previously requested sunroof motion will resume. The sunroof will also complete a requested motion if the Accessory Delay system goes inactive while the motion is in progress.

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - OPERATION) for additional information.

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. Pressing the "open" or "close" end of the rocker switch moves the sunroof glass panel to the full open or full closed position, respectively. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.
2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

The motor/module is programmed to learn the speed required to drive the panel based on position and recalibrates itself as needed. If the sunroof becomes uncalibrated, it will only respond to the vent switch. If the vent switch is pressed, the glass will move toward vent; if the switch is released, all motion stops. In the event that the sunroof system becomes uncalibrated perform the sunroof position calibration procedure, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE -SUNROOF POSITION CALIBRATION).

## DIAGNOSIS AND TESTING

### POWER TOP - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**Refer to the appropriate diagnostic information.**

## MOTOR/MODULE-SUNROOF

### DIAGNOSIS AND TESTING

#### MOTOR/MODULE - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**Refer to the appropriate diagnostic information.**

## STANDARD PROCEDURE

### SUNROOF POSITION CALIBRATION

Press the power sunroof switch (Open, Closed, and Vent). If no movement occurs when either the open switch or closed switch is pressed, but the system does move when the vent button is pressed and held, the system is not calibrated. Perform the following procedure to position calibrate the power sunroof system.

1. Turn the ignition to the RUN position.
2. Press the vent button on the power sunroof switch and hold until the sunroof glass panel has moved to the full vent position and the motor movement has stopped for at least 1 second.
3. Press the close switch on the power sunroof switch and hold for a moment (at least 100ms) and release. The sunroof glass panel should continue travel to the full close position. If the sunroof glass panel does not return to the full close position, refer to the appropriate diagnostic information for full system diagnosis.
4. Verify proper system operation.

### EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION

**Note:** Verify the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor/module drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the Excessive Force Limitation (EFL) function will not be properly calibrated.

1. Turn the ignition to the RUN position.
2. Press the vent button on the power sunroof switch and hold until the sunroof glass panel has moved to the full vent position and the motor movement has stopped for at least 1 second.
3. Press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the first sunroof closed position in a series of four sunroof closes.**
4. Press the vent button on the power sunroof switch and release. The sunroof glass panel should move to the full vent position. After the sunroof motor/module has stopped, press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the second sunroof closed position in a series of four sunroof closes.**
5. Continue to move the sunroof glass to the “vent” then “closed” positions two more times so that the sunroof glass has moved to the closed position a total of four times starting with the first sunroof close in step 3.
6. Press the open position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full open position.
7. Press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the first sunroof closed position in a series of five sunroof closes.**
8. Press the open position on the power sunroof switch and release. The sunroof glass panel should move to the full open position. After the sunroof motor/module has stopped, press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **Continue to move the sunroof glass to the “open” then “closed” position four more times so that the sunroof glass has moved to the closed position a total of five times starting with the first sunroof close in step 7.**

Verify proper EFL calibration by placing a standard pencil at the front of the sunroof and then moving the sunroof to the full closed position. The sunroof should reverse direction upon contact without damage to the pencil.

## REMOVAL

**WARNING:** The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION) for the appropriate procedure.

1. Disconnect the battery negative cable.
2. Remove the vehicle headliner, (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Remove the power sunroof motor/module electrical connector (2).
4. Remove the retaining screws (3) and remove the motor/module (1) from the vehicle.

## INSTALLATION

**WARNING:** The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION) for the appropriate procedure.

1. Position the power sunroof motor/module (1) in the vehicle.
2. Install the motor/module retaining screws (3). Tighten the screws to 4 N·m (35 in. lbs.).
3. Connect the motor/module electrical connector (2).
4. Connect the battery negative cable and move the sunroof through one open and close cycle to confirm proper system operation.
5. Install the vehicle headliner, (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
6. Perform the sunroof position calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION).
7. Perform the Excessive Force Limitation (EFL) calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION).
8. Verify proper operation of the power sunroof system.

## SWITCH - SUNROOF

### DESCRIPTION

The power sunroof switch (3) is a combination push-button and rocker switch module mounted in the overhead console. The sunroof switch is a direct contact unit that is directly wired to the sunroof motor/module assembly. The sunroof switch performs the following functions:

- Power sunroof open (back of switch pushed)
- Power sunroof closed (front of switch pushed)
- Power sunroof vent (switch center button pushed)

The power sunroof switch is part of the overhead console assembly and cannot be replaced separately. If the switch is damaged or inoperative the overhead console must be replaced, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).

### OPERATION

The power sunroof switch is hard wired to the sunroof motor/module assembly. The switch receives battery current from the motor/module when the ignition switch is in the RUN and ACCESSORY positions or the vehicle Accessory Delay System is active. When one of the switch positions is pressed it sends battery current back to the motor/module, signaling it to move the power sunroof to the appropriate position. The motor/module will perform one of the following functions:

- Power sunroof open (back of switch pushed)
- Power sunroof closed (front of switch pushed)
- Power sunroof vent (switch center button pushed)

DIAGNOSIS AND TESTING

SWITCH - POWER SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus circuit is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor/module assembly is being sent the proper hard wired output by the sunroof switch.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. If completing the appropriate diagnostic information results in the sunroof switch being inoperative, perform the following test prior to switch replacement.

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console, (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
3. Disconnect the power sunroof switch wire harness connector.
4. Using an ohmmeter, test the continuity of the power sunroof switch in each switch position. Refer to the POWER SUNROOF SWITCH CONTINUITY TABLE . If OK, inspect the wiring harness and connectors for damage. Use a scan tool and the proper Diagnostic Procedures Information to complete diagnosis of the power sunroof system. If not OK, replace the overhead console.

POWER SUNROOF SWITCH CONTINUITY TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY
SUNROOF OPEN	B & D
SUNROOF CLOSED	B & C
SUNROOF VENT	B & A

## POWER WINDOWS - ELECTRICAL DIAGNOSTICS

## DIAGNOSIS AND TESTING

B1852–DRIVER WINDOW SWITCH CIRCUIT STUCK – DDM

**B1852-DRIVER WINDOW SWITCH CIRCUIT STUCK – DDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When the Driver Window Driver Express Switch Mux circuit is below 3.5 volts for over 30 seconds.

Possible Causes
(Q221) DRIVER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO GROUND
(Q221) DRIVER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO THE (Z421) DRIVER EXPRESS SWITCH RETURN CIRCUIT
WINDOW/DOOR LOCK SWITCH SHORT TO GROUND
DRIVER DOOR MODULE (DDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Window Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1852-DRIVER WINDOW SWITCH CIRCUIT STUCK?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1852-DRIVER WINDOW SWITCH CIRCUIT STUCK – DDM (CONTINUED)****2. DRIVER WINDOW SWITCH SHORTED**

With the scan tool, erase DTC's.

Disconnect the Driver Window/Door Lock Switch C2 connector.

With the scan tool, read DTC's.

**Does the scan tool display B1852-DRIVER WINDOW SWITCH CIRCUIT STUCK?**

**No** >> Replace the Driver Express Window/Door Lock Switch.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (Q221) DRIVER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Driver Door Module C2 connector.

Measure the resistance between ground and the (Q221) Driver Window Driver Express Switch Mux circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q221) Driver Window Driver Express Switch Mux circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 4

**B1852-DRIVER WINDOW SWITCH CIRCUIT STUCK – DDM (CONTINUED)****4. (Q221) DRIVER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO (Z421) DRIVER EXPRESS SWITCH RETURN CIRCUIT**

Measure the resistance between the (Q221) Driver Window Driver Express Switch Mux circuit and the (Z421) Driver Express Switch Return circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q221) Driver Window Driver Express Switch Mux circuit for a short to the (Z421) Driver Express Switch Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Driver Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1868–DRIVER PASSENGER WINDOW SWITCH CIRCUIT STUCK – DDM

**B1868-DRIVER PASSENGER WINDOW SWITCH CIRCUIT STUCK – DDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When the Passenger Window Driver Express Switch Mux circuit is below 3.5 volts for over 30 seconds.

**Possible Causes**

(Q222) PASSENGER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO GROUND  
(Q222) PASSENGER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO THE (Z421) DRIVER EXPRESS SWITCH RETURN CIRCUIT  
WINDOW/DOOR LOCK SWITCH SHORT TO GROUND  
DRIVER DOOR MODULE (DDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Passenger Window Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1868-DRIVER PASSENGER WINDOW SWITCH CIRCUIT STUCK?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1868-DRIVER PASSENGER WINDOW SWITCH CIRCUIT STUCK – DDM (CONTINUED)****2. DRIVER WINDOW SWITCH SHORTED**

With the scan tool, erase DTC's.

Disconnect the Driver Window/Door Lock Switch C2 connector.

With the scan tool, read DTC's.

**Does the scan tool display B1868-DRIVER PASSENGER WINDOW SWITCH CIRCUIT STUCK?**

**No** >> Replace the Driver Express Window/Door Lock Switch.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to  
BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (Q222) PASSENGER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Driver Door Module C2 connector.

Measure the resistance between ground and the (Q222) Passenger Window Driver Express Switch Mux circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q222) Passenger Window Driver Express Switch Mux circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to  
BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1868-DRIVER PASSENGER WINDOW SWITCH CIRCUIT STUCK – DDM (CONTINUED)****4. (Q222) PASSENGER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO (Z421) DRIVER EXPRESS SWITCH RETURN CIRCUIT**

Measure the resistance between the (Q222) Passenger Window Driver Express Switch Mux circuit and the (Z421) Driver Express Switch Return circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q222) Passenger Window Driver Express Switch Mux circuit for a short to the (Z421) Driver Express Switch Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Driver Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1854–DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW – DDM

**B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW – DDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When both Driver Window Driver circuits (Up and Down) are grounded during a window movement command, this code will set.

Possible Causes
(Q321) DRIVER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND
(Q311) DRIVER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND
(Q321) DRIVER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORTED TO THE (Q311) DRIVER WINDOW EXPRESS UP DRIVER CIRCUIT
WINDOW MOTOR SHORTED
DRIVER DOOR MODULE (DDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW – DDM (CONTINUED)****2. WINDOW MOTOR SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Driver Window Motor connector.

Turn the ignition on.

Operate the driver window switch up and down several times.

With the scan tool, read DTC's.

**Does the scan tool display B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW?**

**No** >> Replace the Window Motor.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to  
BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (Q321) DRIVER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Driver Door Module C1 connector.

Measure the resistance between Ground and the (Q321) Driver Window Express Down Driver circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q321) Driver Window Express Down Driver circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to  
BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1854-DRIVER WINDOW MOTOR CONTROL CIRCUIT LOW – DDM (CONTINUED)****4. (Q311) DRIVER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND**

Measure the resistance between Ground and the (Q311) Driver Window Express Up Driver circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q311) Driver Window Express Up Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go TO 5

**5. (Q321) DRIVER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO (Q311) DRIVER WINDOW EXPRESS UP DRIVER CIRCUIT**

Measure the resistance between the (Q321) Driver Window Express Down Driver circuit and the (Q311) Driver Window Express Up Driver circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q321) Driver Window xpress Down Driver circuit for a short to the (Q311) Driver Window Express Up Driver circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Driver Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1855–DRIVER WINDOW MOTOR CONTROL CIRCUIT HIGH – DDM

**B1855-DRIVER WINDOW MOTOR CONTROL CIRCUIT HIGH – DDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When both Driver Window Driver circuits (Up and Down) are supplied with voltage during a window movement command, this code will set.

Possible Causes
(Q321) DRIVER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE
(Q311) DRIVER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE
DRIVER DOOR MODULE (DDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1855-DRIVER WINDOW MOTOR CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**2. (Q321) DRIVER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Driver Door Module C1 connector.

Turn the ignition on.

Measure the voltage between the (Q321) Driver Window Express Down Driver circuit and Ground.

**Is there any voltage present?**

**Yes** >> Repair the (Q321) Driver Window Express Down Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

**B1855-DRIVER WINDOW MOTOR CONTROL CIRCUIT HIGH – DDM (CONTINUED)****3. (Q311) DRIVER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE**

Measure the voltage between the (Q311) Driver Window Express Up Driver circuit and Ground.

**Is there any voltage present?**

**Yes** >> Repair the (Q311) Driver Window Express Up Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Driver Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

## B1858—DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW – DDM

**B1858-DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW – DDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When the Driver Window Hall Sensor Supply circuit falls below 1.4 volts for over 315 ms., this code will set.

Possible Causes
(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND WINDOW MOTOR SHORTED DRIVER DOOR MODULE (DDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1858-DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1858-DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW – DDM (CONTINUED)****2. WINDOW MOTOR SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Driver Window Motor connector.

Turn the ignition on.

Operate the driver window switch up and down several times.

With the scan tool, read DTC's.

**Does the scan tool display B1858-DRIVER WINDOW POSITION SENSOR POWER SUPPLY LOW?**

- No** >> Replace the Window Motor.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- Yes** >> Go To 3

**3. (Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Driver Door Module C2 connector.

Measure the resistance between Ground and the (Q305) Driver Window Hall Sensor Supply circuit.

**Is the resistance below 1000.0 ohms?**

- Yes** >> Repair the (Q305) Driver Window Hall Sensor Supply circuit for a short to ground.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- No** >> Replace the Driver Door Module.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1859–DRIVER WINDOW POSITION SENSOR POWER SUPPLY HIGH – DDM

**B1859-DRIVER WINDOW POSITION SENSOR POWER SUPPLY HIGH – DDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the power is turned off to the module and it goes from being awake to sleep mode.

- **Set Condition:**

When the Driver Window Hall Sensor Supply circuit is above 0.96 volts for over 15 ms. and the power to the module has been turned off, this code will set.

Possible Causes
(Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE DRIVER DOOR MODULE (DDM)

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read the stored DTC's.

**Does the scan tool display B1859-DRIVER WINDOW POSITION SENSOR POWER SUPPLY HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1859-DRIVER WINDOW POSITION SENSOR POWER SUPPLY HIGH – DDM (CONTINUED)****2. (Q305) DRIVER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Driver Door Module C2 connector.

Turn the ignition on.

Measure the voltage between the (Q305) Driver Window Hall Sensor Supply circuit and Ground.

**Is there any voltage present?**

**Yes** >> Repair the (Q305) Driver Window Hall Sensor Supply circuit for a short to voltage.

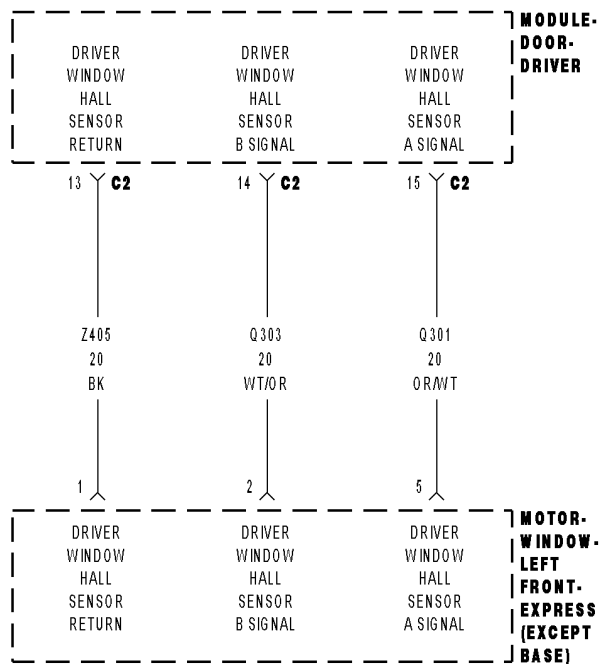

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Driver Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

## B185A-DRIVER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - DDM

**B185A-DRIVER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - DDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When one or both of the window motor hall sensors does not generate a signal during a window movement, this code will set.

Possible Causes
(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORT TO GROUND
(Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORT TO GROUND
(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE (Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT
(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE (Z405) DRIVER WINDOW HALL SENSOR RETURN CIRCUIT
(Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORTED TO THE (Z405) DRIVER WINDOW HALL SENSOR RETURN CIRCUIT
(Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN
(Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT OPEN
WINDOW MOTOR MALFUNCTION

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Driver Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B185A-DRIVER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B185A-DRIVER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - DDM (CONTINUED)****2. (Q301) DRIVER WINDOW HALL SENSOR A SIGNAL SHORT TO GROUND**

Turn the ignition off.

Disconnect the Driver Window Motor connector.

Disconnect the Driver Door Module C2 connector.

Measure the resistance between Ground and the Driver Window Hall Sensor A Signal circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the Driver Window Hall Sensor A signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

**3. (Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORT TO GROUND**

Measure the resistance between Ground and the (Q303) Driver Window Hall Sensor B Signal circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q303) Driver Window Hall Sensor B Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B185A-DRIVER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - DDM (CONTINUED)****4. (Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN**

Measure the resistance of the (Q301) Driver Window Hall Sensor A Signal circuit between the Motor connector and the Module C2 connector.

**Is the resistance below 1.0 ohms?**

**No** >> Repair the (Q301) Driver Window Hall Sensor A Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 5

**5. (Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT OPEN**

Measure the resistance of the (Q303) Driver Window Hall Sensor B Signal circuit between the Motor connector and the Module C2 connector.

**Is the resistance below 1.0 ohms?**

**No** >> Repair the (Q303) Driver Window Hall Sensor B Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go TO 6

**B185A-DRIVER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - DDM (CONTINUED)****6. (Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORTED TO THE (Z405) DRIVER WINDOW HALL SENSOR RETURN**

Measure the resistance between the (Q303) Driver Window Hall Sensor B Signal circuit and the (Z405) Driver Window Hall Sensor Return circuit.

**Is the resistance below 10000.0 ohms?**

**No** >> Repair the (Q303) Driver Window Hall Sensor B Signal circuit for a short to the Driver Window Hall Sensor Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go TO 7

**7. (Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE (Z405) DRIVER WINDOW HALL SENSOR RETURN**

Measure the resistance between the (Q301) Driver Window Hall Sensor A Signal circuit and the (Z405) Driver Window Hall Sensor Return circuit.

**Is the resistance below 10000.0 ohms?**

**No** >> Repair the (Q301) Driver Window Hall Sensor A Signal circuit for a short to the (Z405) Driver Window Hall Sensor Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go TO 8

**B185A-DRIVER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - DDM (CONTINUED)****8. (Q301) DRIVER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORT TO (Q303) DRIVER WINDOW HALL SENSOR B SIGNAL CIRCUIT**

Measure the resistance between the (Q301) Driver Window Hall Sensor A Signal circuit and the (Q303) Driver Window Hall Sensor B Signal circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q301) Driver Window Hall Sensor A Signal circuit for a short to the (Q303) Driver Window Hall Sensor B Signal circuit.

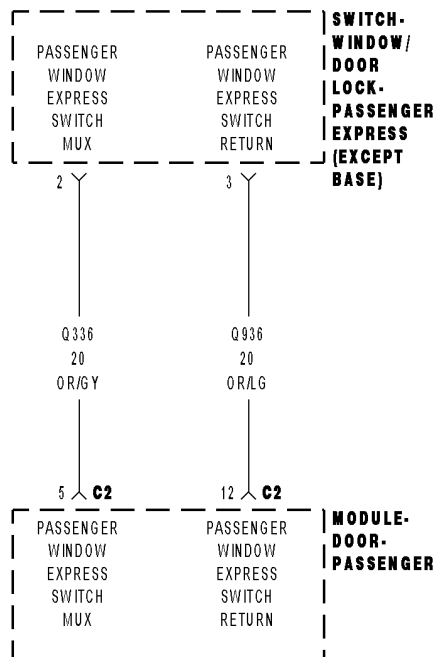

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Window Motor.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

## B185D-PASSENGER WINDOW SWITCH CIRCUIT STUCK - PDM

**B185D-PASSENGER WINDOW SWITCH CIRCUIT STUCK - PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When the Passenger Window Express Switch Mux circuit is below 3.5 volts for over 30 seconds.

Possible Causes
(Q336) PASSENGER WINDOW EXPRESS SWITCH MUX CIRCUIT SHORT TO GROUND (Q336) PASSENGER WINDOW DRIVER EXPRESS SWITCH MUX CIRCUIT SHORT TO THE (Q936) PASSENGER WINDOW EXPRESS SWITCH RETURN CIRCUIT WINDOW/DOOR LOCK SWITCH SHORT TO GROUND PASSENGER DOOR MODULE (PDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window Switch in all positions several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B185D-PASSENGER WINDOW SWITCH CIRCUIT STUCK?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Check for a sticking switch and using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B185D-PASSENGER WINDOW SWITCH CIRCUIT STUCK - PDM (CONTINUED)****2. DRIVER WINDOW SWITCH SHORTED**

With the scan tool, erase DTC's.

Disconnect the Passenger Window/Door Lock Switch connector.

With the scan tool, read DTC's.

**Does the scan tool display B185D-PASSENGER WINDOW SWITCH CIRCUIT STUCK?**

**No** >> Replace the Passenger Express Window/Door Lock Switch.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (Q336) PASSENGER WINDOW EXPRESS SWITCH MUX CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Passenger Door Module C2 connector.

Measure the resistance between ground and the (Q336) Passenger Window Express Switch Mux circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q336) Passenger Window Express Switch Mux circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**4. (Q336) PASSENGER WINDOW EXPRESS SWITCH MUX CIRCUIT SHORT TO (Q936) PASSENGER EXPRESS SWITCH RETURN CIRCUIT**

Measure the resistance between the (Q336) Passenger Window Express Switch Mux circuit and the (Q936) Passenger Express Switch Return circuit.

**Is the resistance below 10000.0 ohms?**

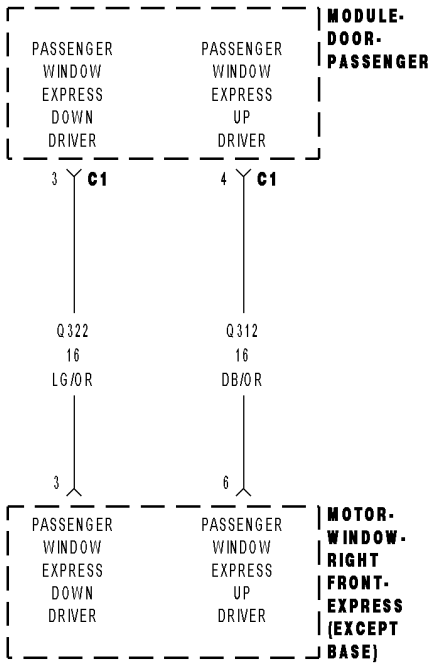

**Yes** >> Repair the (Q336) Passenger Express Switch Mux circuit for a short to the (Q936) Passenger Window Express Switch Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Passenger Door Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW – PDM

**B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW – PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When both Passenger Window Driver circuits (Up and Down) are grounded during a window movement command, this code will set.

Possible Causes
(Q322) PASSENGER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND
(Q312) PASSENGER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND
(Q322) PASSENGER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORTED TO THE (Q312) PASSENGER WINDOW EXPRESS UP DRIVER CIRCUIT
WINDOW MOTOR SHORTED
PASSENGER DOOR MODULE (PDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW – PDM (CONTINUED)****2. WINDOW MOTOR SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window Motor connector.

Turn the ignition on.

Operate the passenger window switch up and down several times.

With the scan tool, read DTC's.

**Does the scan tool display B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW?**

- No** >> Replace the Window Motor.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- Yes** >> Go To 3

**3. (Q322) PASSENGER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Passenger Door Module C1 connector.

Measure the resistance between Ground and the (Q322) Passenger Window Express Down Driver circuit.

**Is the resistance below 1000.0 ohms?**

- Yes** >> Repair the (Q322) Passenger Window Express Down Driver circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- No** >> Go To 4

**B185F-PASSENGER WINDOW MOTOR CONTROL CIRCUIT LOW – PDM (CONTINUED)****4. (Q312) PASSENGER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO GROUND**

Measure the resistance between Ground and the (Q312) Passenger Window Express Up Driver circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (Q312) Passenger Window Express Up Driver circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go TO 5

**5. (Q322) PASSENGER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO (Q312) PASSENGER WINDOW EXPRESS UP DRIVER CIRCUIT**

Measure the resistance between the (Q322) Passenger Window Express Down Driver circuit and the (Q312) Passenger Window Express Up Driver circuit.

**Is the resistance below 1000.0 ohms?**

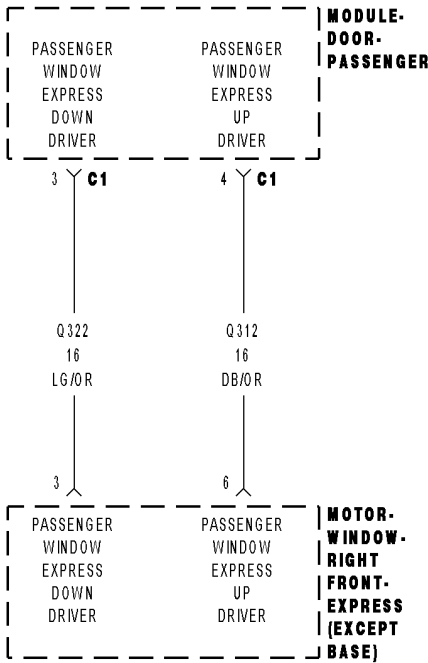

**Yes** >> Repair the (Q322) Passenger Window Express Down Driver circuit for a short to the (Q312) Passenger Window Express Up Driver circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Passenger Door Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1860-PASSENGER WINDOW MOTOR CONTROL CIRCUIT HIGH – PDM

**B1860-PASSENGER WINDOW MOTOR CONTROL CIRCUIT HIGH – PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When both Passenger Window Driver circuits (Up and Down) are supplied with voltage during a window movement command, this code will set.

Possible Causes
(Q322) PASSENGER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE
(Q312) PASSENGER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE
PASSENGER DOOR MODULE (DDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1860-PASSENGER WINDOW MOTOR CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**2. (Q322) PASSENGER WINDOW EXPRESS DOWN DRIVER CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Passenger Door Module C1 connector.

Turn the ignition on.

Measure the voltage between the (Q322) Passenger Window Express Down Driver circuit and Ground.

**Is there any voltage present?**

**Yes** >> Repair the (Q322) Passenger Window Express Down Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

**B1860-PASSENGER WINDOW MOTOR CONTROL CIRCUIT HIGH – PDM (CONTINUED)****3. (Q312)PASSENGER WINDOW EXPRESS UP DRIVER CIRCUIT SHORT TO VOLTAGE**

Measure the voltage between the (Q312) Passenger Window Express Up Driver circuit and Ground.

**Is there any voltage present?**

**Yes** >> Repair the (Q312) Passenger Window Express Up Driver circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Passenger Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

## B1863-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY LOW – PDM

**B1863-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY LOW – PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Whenever the module is awake.
- **Set Condition:**  
When the Passenger Window Hall Sensor Supply circuit falls below 1.4 volts for over 315 ms., this code will set.

Possible Causes
(Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND
WINDOW MOTOR SHORTED
PASSENGER DOOR MODULE (PDM)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1863-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1863-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY LOW – PDM (CONTINUED)****2. WINDOW MOTOR SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window Motor connector.

Turn the ignition on.

Operate the passenger window switch up and down several times.

With the scan tool, read DTC's.

**Does the scan tool display B1863-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY LOW?**

- No** >> Replace the Window Motor.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- Yes** >> Go To 3

**3. (Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Disconnect the Passenger Door Module C2 connector.

Measure the resistance between Ground and the (Q306) Passenger Window Hall Sensor Supply circuit.

**Is the resistance below 1000.0 ohms?**

- Yes** >> Repair the (Q306) Passenger Window Hall Sensor Supply circuit for a short to ground.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- No** >> Replace the Passenger Door Module.  
 Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1864-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY HIGH – PDM

**B1864-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY HIGH – PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the power is turned off to the module and it goes from being awake to sleep mode.

- **Set Condition:**

When the Passenger Window Hall Sensor Supply circuit is above 0.96 volts for over 15 ms. and the power to the module has been turned off, this code will set.

Possible Causes
(Q306) P[ASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE
PASSENGER DOOR MODULE (PDM)

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read the stored DTC's.

**Does the scan tool display B1864-PASSENGER WINDOW POSITION SENSOR POWER SUPPLY HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

### 2. (Q306) PASSENGER WINDOW HALL SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the Passenger Door Module C2 connector.

Turn the ignition on.

Measure the voltage between the (Q306) Passenger Window Hall Sensor Supply circuit and Ground.

**Is there any voltage present?**

**Yes** >> Repair the (Q306) Passenger Window Hall Sensor Supply circuit for a short to voltage.

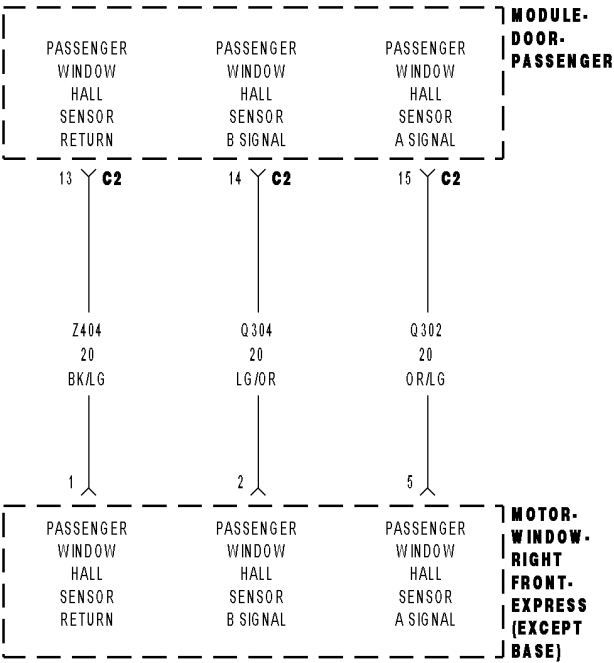

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Passenger Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B1865-PASSENGER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - PDM

**B1865-PASSENGER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the module is awake.

- **Set Condition:**

When one or both of the window motor hall sensors do not generate a signal within 1.25 ms during a window movement, this code will set.

Possible Causes
(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORT TO GROUND
(Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORT TO GROUND
(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE (Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT
(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO THE (Z404) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT
(Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORTED TO THE (Z404) PASSENGER WINDOW HALL SENSOR RETURN CIRCUIT
(Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN
(Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT OPEN
WINDOW MOTOR MALFUNCTION

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Try to operate the Passenger Window up and down several times.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B1865-PASSENGER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B1865-PASSENGER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - PDM (CONTINUED)****2. (Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL SHORT TO GROUND**

Turn the ignition off.

Disconnect the Passenger Window Motor connector.

Disconnect the Passenger Door Module C2 connector.

Measure the resistance between Ground and the Passenger Window Hall Sensor A Signal circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the Passenger Window Hall Sensor A signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

**3. (Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORT TO GROUND**

Measure the resistance between Ground and the (Q304) Passenger Window Hall Sensor B Signal circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q304) Passenger Window Hall Sensor B Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B1865-PASSENGER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - PDM (CONTINUED)****4. (Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT OPEN**

Measure the resistance of the (Q302) Passenger Window Hall Sensor A Signal circuit between the Motor connector and the Module C2 connector.

**Is the resistance below 1.0 ohms?**

**No** >> Repair the (Q302) Passenger Window Hall Sensor A Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 5

**5. (Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT OPEN**

Measure the resistance of the (Q304) Passenger Window Hall Sensor B Signal circuit between the Motor connector and the Module C2 connector.

**Is the resistance below 1.0 ohms?**

**No** >> Repair the (Q304) Passenger Window Hall Sensor B Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go TO 6

**B1865-PASSENGER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - PDM (CONTINUED)****6. (Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT SHORTED TO (Z404) PASSENGER WINDOW HALL SENSOR RETURN**

Measure the resistance between the (Q304) Passenger Window Hall Sensor B Signal circuit and the (Z404) Passenger Window Hall Sensor Return circuit in the PDM C2 connector.

**Is the resistance below 10000.0 ohms?**

**No** >> Repair the (Q304) Passenger Window Hall Sensor B Signal circuit for a short to the (Z404) Passenger Window Hall Sensor Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go TO 7

**7. (Q302) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORTED TO (Z404) PASSENGER WINDOW HALL SENSOR RETURN**

Measure the resistance between the (Q302) Passenger Window Hall Sensor A Signal circuit and the (Z404) Passenger Window Hall Sensor Return circuit in the PDM C2 connector.

**Is the resistance below 10000.0 ohms?**

**No** >> Repair the (Q302) Passenger Window Hall Sensor A Signal circuit for a short to the (Z404) Passenger Window Hall Sensor Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go TO 8

**B1865-PASSENGER WINDOW POSITION SENSOR CIRCUIT PERFORMANCE - PDM (CONTINUED)****8. (Q304) PASSENGER WINDOW HALL SENSOR A SIGNAL CIRCUIT SHORT TO (Q304) PASSENGER WINDOW HALL SENSOR B SIGNAL CIRCUIT**

Measure the resistance between the (Q302) Passenger Window Hall Sensor A Signal circuit and the (Q304) Passenger Window Hall Sensor B Signal circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (Q302) Passenger Window Hall Sensor A Signal circuit for a short to the (Q304) Passenger Window Hall Sensor B Signal circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Window Motor.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

## B210D-BATTERY VOLTAGE LOW – DDM/PDM

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
At all times.
- **Set Condition:**  
Anytime the module senses voltage input below 9.5 volts, this code will set.

POSSIBLE CAUSES
LOW VOLTAGE ENGINE DTC
DRIVER OR PASSENGER DOOR MODULE

## Diagnostic Test

### 1. CHECK ENGINE DTC's

With the scan tool, read ENGINE DTC's

**Are there any ENGINE DTC's present?**

**No** >> Go to 2

**Yes** >> Refer to symptom list for problems related to ENGINE.

**B210D-BATTERY VOLTAGE LOW – DDM/PDM (CONTINUED)****2. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Start the engine and run for 2 minutes.

With the scan tool, read DTC's.

**Does the scan tool display B210D-BATTERY VOLTAGE LOW?**

**Yes** >> Replace the appropriate Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

---

**B210E-BATTERY VOLTAGE HIGH – DDM/PDM**

For the Power Window circuit diagram

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
At all times.
- **Set Condition:**  
Anytime the module senses voltage input above 15.9 volts, this code will set.

POSSIBLE CAUSES
HIGH VOLTAGE ENGINE DTC
DRIVER OR PASSENGER DOOR MODULE

**Diagnostic Test****1. CHECK ENGINE DTC's**

With the scan tool, read ENGINE DTC's

**Are there any ENGINE DTC's present?**

**No** >> Go to 2

**Yes** >> Refer to symptom list for problems related to ENGINE.

**2. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase DTC's

Start the engine and run for 2 minutes.

With the scan tool, read DTC's.

**Does the scan tool display B210E-BATTERY VOLTAGE HIGH?**

**Yes** >> Replace the appropriate Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B2218, B2219—DRIVER/PASSENGER DOOR MODULE INTERNAL – DDM/PDM**

For the Power Windows circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
At all times
- **Set Condition:**  
Whenever the module detects an EEPROM failure

POSSIBLE CAUSES
DRIVER OR PASSENGER DOOR MODULE

**Diagnostic Test****1. Replace the Door Module**

**Note:** Anytime this code is logged, the module must be replaced.

**Repair**

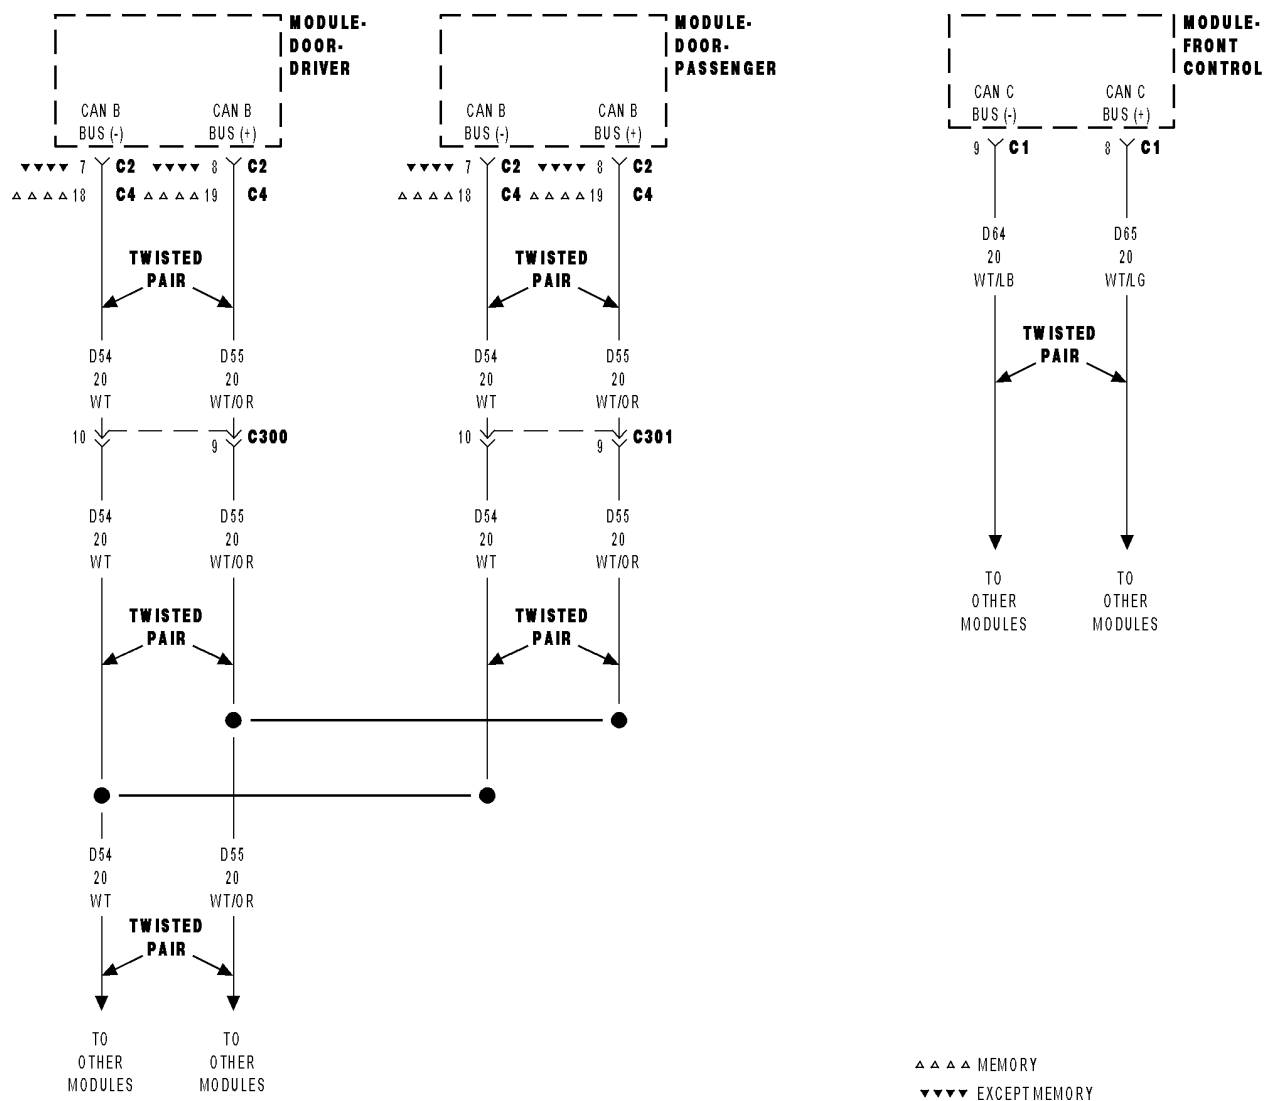

Replace the appropriate Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

---

## U0019-CAN B BUS-DDM/PDM

MODULE-DOOR-DRIVER C2

MODULE-DOOR-PASSENGER C2

MODULE-DOOR-DRIVER C4 (MEMORY)

MODULE-DOOR-PASSENGER C4 (MEMORY)

MODULE-FRONT CONTROL C1

**U0019-CAN B BUS-DDM/PDM (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the CAN B Bus (+) or CAN B Bus (-) circuit is open.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN DRIVER OR PASSENGER DOOR MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTCs**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**2. CHECK FRONT CONTROL MODULE DTC's**

With the scan tool, read Front Control Module active DTC's

**Does the scan tool display any CAN B BUS DTC's – ACTIVE?**

**Yes** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

**No** >> Go To 3

**3. MEMORY SYSTEM EQUIPPED?**

**IS THIS VEHICLE EQUIPPED WITH THE MEMORY SYSTEM?**

**No** Go To 4

**Yes** >> Go To 6

**U0019-CAN B BUS-DDM/PDM (CONTINUED)****4. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the appropriate Door Module C2 connector.

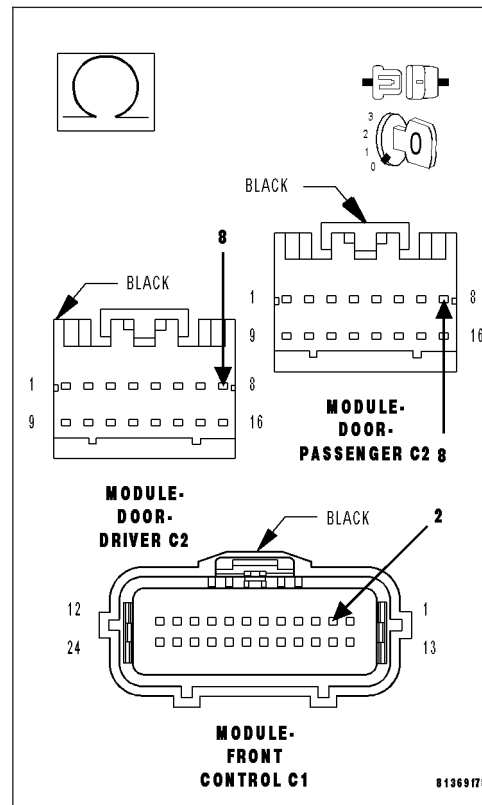

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 connector and the Door Module C2 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**5. (D54) CAN B BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D54) CAN B Bus (-) circuit between the Front Control Module C1 connector and the Door Module C2 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the appropriate Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (D54) CAN B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**U0019-CAN B BUS-DDM/PDM (CONTINUED)****6. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the appropriate Door Module C4 connector.

Disconnect the Front Control Module C1 connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 connector and the Door Module C4 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**7. (D54) CAN B BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D54) CAN B Bus (-) circuit between the Front Control Module C1 connector and the Door Module C4 connector.

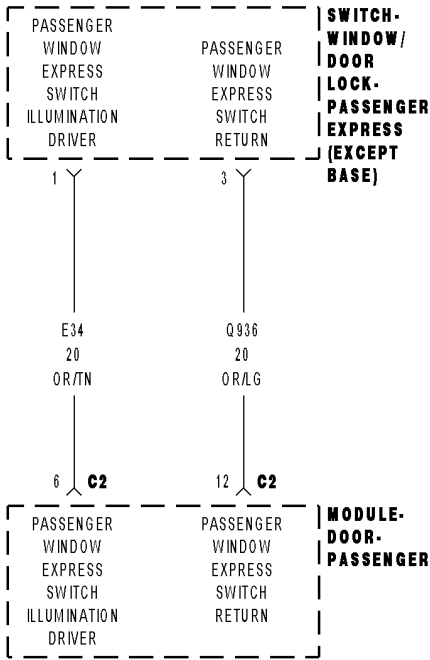

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the appropriate Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (D54) CAN B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW – PDM

**B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW – PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the module is awake, the park lamps are on and the window lock out switch is on.

- **Set Condition:**

When the Passenger Window Express Switch Illumination Driver circuit falls below 3.0 volts for over 25 ms. and the above conditions are met, this code will set.

Possible Causes
(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO GROUND
(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO (Q936) PASSENGER WINDOW EXPRESS SWITCH RETURN
WINDOW/DOOR LOCK SWITCH SHORTED
PASSENGER DOOR MODULE (PDM)

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Ensure the passenger window lock out switch is on.

Turn the park lights on.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW – PDM (CONTINUED)****2. WINDOW/DOOR LOCK SWITCH SHORTED**

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window/Door Lock Switch connector.

Turn the ignition on.

Operate the passenger window lock out switch several times.

With the scan tool, read DTC's.

**Does the scan tool display B16a4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW?**

**No** >> Replace the Window/Door Lock Switch.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**3. (E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO GROUND**

Turn the ignition off.

Turn the park lamps off.

Disconnect the Passenger Door Module C2 connector.

Measure the resistance between Ground and the (E34) Passenger Window Express Switch Illumination Driver circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (E34) Passenger Window Express Switch Illumination Driver circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Go To 4

**B16A4-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT LOW – PDM (CONTINUED)****4. (E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO (Q936) PASSENGER WINDOW EXPRESS SWITCH RETURN**

Measure the resistance between the (E34) Passenger Window Express Switch Illumination Driver circuit and the (Q936) Passenger Window Express Switch Return circuit.

**Is the resistance below 10000.0 ohms?**

**Yes** >> Repair the (E34) Passenger Window Express Switch Illumination Driver circuit for a short to the (Q936) Passenger Window Express Switch Return circuit.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**No** >> Replace the Passenger Door Module.

Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH – PDM

**B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH – PDM (CONTINUED)**

For the Power Window circuit diagram (Refer to 8 - ELECTRICAL/POWER WINDOWS - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Whenever the power is turned off to the module and it goes from awake to sleep mode.

- **Set Condition:**

When the Passenger Window Express Switch Illumination Driver circuit is above 2.5 volts for over 15 ms. and the switch illumination output is turned off.

Possible Causes
(E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO VOLTAGE WINDOW/DOOR LOCK SWITCH SHORTED PASSENGER DOOR MODULE (PDM)

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

With the scan tool, record and erase DTC's

Ensure the passenger window lock out switch is off.

Wait 30 seconds.

With the scan tool, read DTC's.

**Does the scan tool display B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

### 2. WINDOW/DOOR LOCK SWITCH SHORTED

With the scan tool, erase DTC's.

Turn the ignition off.

Disconnect the Passenger Window/Door Lock Switch connector.

Turn the ignition on.

Operate the passenger window lock out switch several times.

With the scan tool, read DTC's.

**Does the scan tool display B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH?**

**No** >> Replace the Window/Door Lock Switch.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

**Yes** >> Go To 3

**B16A5-PASSENGER WINDOW SWITCH BACKLIGHTING CIRCUIT HIGH – PDM (CONTINUED)****3. (E34) PASSENGER WINDOW EXPRESS SWITCH ILLUMINATION DRIVER CIRCUIT SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Passenger Door Module C2 connector.

Measure the voltage between the (E34) Passenger Window Express Switch Illumination Driver circuit and Ground.

**Is there any voltage present?**

- Yes** >> Repair the (E34) Passenger Window Express Switch Illumination Driver circuit for a short to voltage.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.
- No** >> Replace the Passenger Door Module.  
Perform BODY VERIFICATION TEST - VER 1.(Refer to BODY VERIFICATION TEST – VER 1.

## POWER WINDOWS - SERVICE INFORMATION

### DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel allows the driver to raise or lower each of the passenger door windows and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed through a circuit breaker in the Junction Block (JB), only when the ignition switch is in the ON position.

The power window system includes the power window switches on each door trim panel, circuit breaker, door modules and the power window motors inside each door.

The window motors are replaced with the window regulator assembly. If the window motors require replacement, the window regulator must be replaced.

### OPERATION

#### POWER WINDOW SWITCH

The power windows are controlled by a window/lock switch on the trim panel of each front door. Switches in the driver door window/lock switch allows the driver to control the passenger windows.

The power window switch for the driver side front door window has a second detent position beyond the normal Down position that provides an automatic one-touch window down feature.

Some vehicles may be equipped with an express closing feature (front windows only). During an express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's fingers, etc. Modules in the doors are programmed to compare the position of the glass to the amount of current that is being used to drive up the glass.

The system also includes various features to manage the perceived forces on the glass as it travels up. If the express closing calibration is lost, the system will self-calibrate itself after the windows are moved up and down two cycles.

The power window switches control the battery and ground feeds to the power window motors. All of the passenger door power window switches receive their battery and ground feeds through the circuitry of the window/lock switch. When the power window lockout switch is in the Lock position, the battery feed for the individual passenger door power window switches is interrupted.

#### POWER WINDOW MOTOR

A permanent magnet reversible motor moves the window regulator through an integral gearbox mechanism. A positive and negative battery connection to the two motor terminals will cause the motor to rotate in one direction. Reversing the current through these same two connections will cause the motor to rotate in the opposite direction.

In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads.

## DIAGNOSIS AND TESTING

### POWER WINDOWS

Any diagnosis of the Power Windows system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

## POWER WINDOW SWITCH

### REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - REMOVAL).
3. Remove switch (1) from door trim panel (2).

### INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Install switch (1) to rear door trim panel (2).
2. Install rear door trim panel (Refer to 23 - BODY/DOORS - REAR/TRIM PANEL - INSTALLATION).
3. Connect battery negative cable.

## RESTRAINTS - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

**B1203-SRS WARNING INDICATOR CIRCUIT/PERFORMANCE**

**B1203-SRS WARNING INDICATOR CIRCUIT/PERFORMANCE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the CAN B bus for a message from the Instrument Cluster containing the airbag warning indicator status. The ORC requests the warning lamp status from the Instrument Cluster once every second.

- **Set Condition:**

This DTC will set immediately if the indicator status is LOW or HIGH.

Possible Causes
INSTRUMENT CLUSTER ACTIVE DTCs
ORC

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read ORC DTCs.

**Select DTC type.**

**Active**

Go To 2

**Stored**

Go To 4

**2. CHECK FOR INSTRUMENT CLUSTER DTCs**

With the scan tool, read Instrument Cluster DTCs.

**Does the scan tool display any Instrument Cluster DTCs?**

**Yes** >> Refer to the symptom list for problems related to the Instrument Cluster.

Perform the ORC VERIFICATION TEST-VER 1.

**No** >> Go To 3

**B1203-SRS WARNING INDICATOR CIRCUIT/PERFORMANCE (CONTINUED)****3. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Repair**

Replace the ORC in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

**4. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

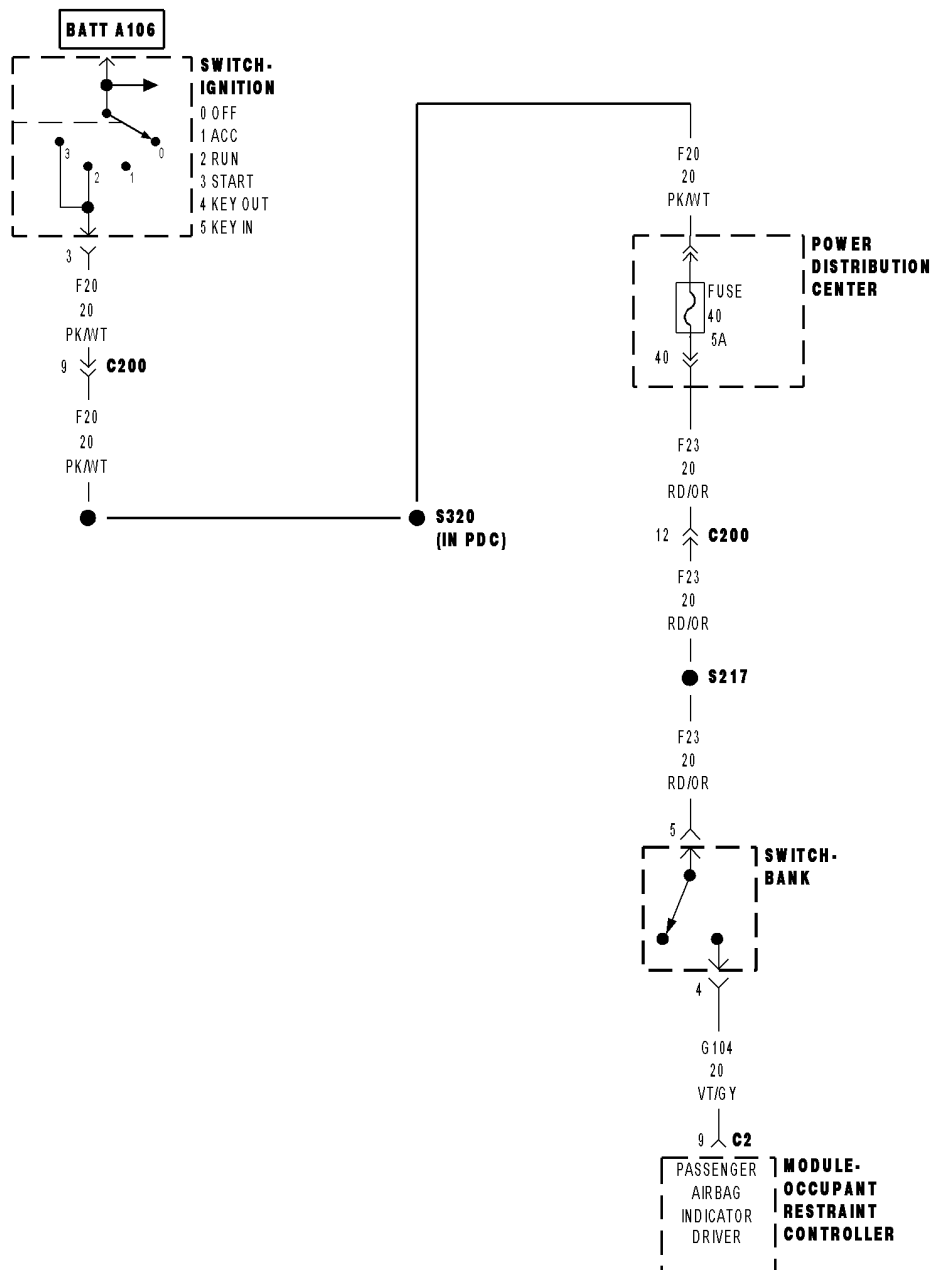

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

# B1204-PASSENGER AIRBAG INDICATOR CIRCUIT LOW

**B1204-PASSENGER AIRBAG INDICATOR CIRCUIT LOW (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).  
For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the Occupant Restraint Controller (ORC) cannot detect voltage on the (G104) Passenger Airbag Indicator Driver circuit.

Possible Causes
(G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT SHORTED TO GROUND PASSENGER AIRBAG ON/OFF INDICATOR LAMP ORC

**Diagnostic Test**

**1. VERIFY THAT DTC B1204 PASSENGER AIRBAG INDICATOR CIRCUIT LOW IS ACTIVE**

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1204 PASSENGER AIRBAG INDICATOR CIRCUIT LOW?**

- Yes**    >> Go To 2
- No**    >> Go To 5

**B1204-PASSENGER AIRBAG INDICATOR CIRCUIT LOW (CONTINUED)****2. CHECK FOR ACTIVE DTC B1204 PASSENGER AIRBAG INDICATOR CIRCUIT LOW WITH SWITCH BANK CONNECTOR DISCONNECTED**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Switch Bank connector.

**Note:** Check connectors - Clean and repair as necessary.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, erase ORC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1204 PASSENGER AIRBAG INDICATOR CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag On/Off Indicator Lamp in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1.

**3. CHECK (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the ORC C2 connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the appropriate Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (G104) Passenger Airbag Indicator Driver circuit between ground and the ORC Adaptor.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (G104) Passenger Airbag Indicator Driver circuit for a short to ground.  
Perform ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1204-PASSENGER AIRBAG INDICATOR CIRCUIT LOW (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Repair**

Replace the ORC in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

**5. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

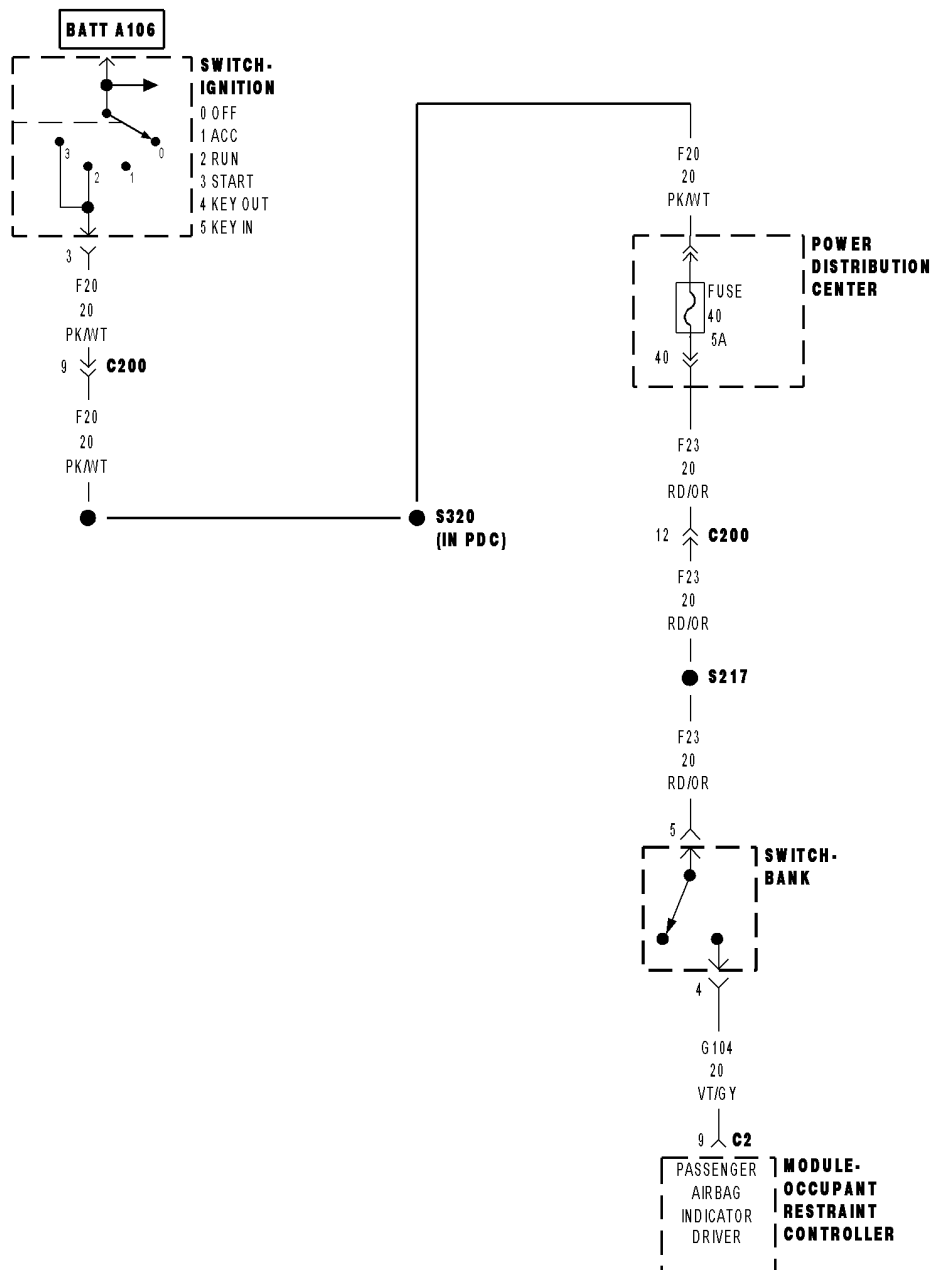

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

# B1205-PASSENGER AIRBAG INDICATOR CIRCUIT HIGH

**B1205-PASSENGER AIRBAG INDICATOR CIRCUIT HIGH (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).  
For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the Occupant Restraint Controller (ORC) senses a low resistance to battery voltage on the (G104) Passenger Airbag Indicator Driver circuit.

Possible Causes
(G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT SHORTED TO (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT
(G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT SHORTED TO VOLTAGE
PASSENGER AIRBAG ON/OFF INDICATOR LAMP
ORC

**Diagnostic Test**

**1. VERIFY THAT DTC B1205 PASSENGER AIRBAG INDICATOR CIRCUIT HIGH IS ACTIVE**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.
- Turn the ignition on.
- With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1205 PASSENGER AIRBAG INDICATOR CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> Go To 6

**B1205-PASSENGER AIRBAG INDICATOR CIRCUIT HIGH (CONTINUED)****2. CHECK (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT FOR A SHORT TO (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Remove the Airbag Run-Start Fuse from the PDC.

Disconnect the ORC C1 and C2 connectors.

Disconnect the OCM C1 connector.

Disconnect the Switch Bank connector.

**Note: Check connectors - Clean and repair as necessary.**

Connect the appropriate Load Tool ORC Adaptor to the ORC connectors.

Measure the resistance between the (G104) Passenger Airbag Indicator Driver circuit and the (F23) Fused Ignition Switch Output (Run-Start) circuit in the Switch Bank connector.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (G104) Passenger Airbag Indicator Driver circuit for a short to the (F23) Fused Ignition Switch Output (Run-Start) circuit.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (G104) Passenger Airbag Indicator Driver circuit.

**Is there any voltage present?**

**Yes** >> Repair the (G104) Passenger Airbag Indicator Driver circuit for a short to voltage.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1205-PASSENGER AIRBAG INDICATOR CIRCUIT HIGH (CONTINUED)****4. CHECK FOR ACTIVE DTC B1205 PASSENGER AIRBAG INDICATOR CIRCUIT HIGH WITH SWITCH BANK CONNECTOR DISCONNECTED**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Remove the Load Tool ORC Adaptor from the ORC connectors.

Reconnect the ORC C1 and C2 connectors.

Reconnect the OCM C1 connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, erase ORC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1205 PASSENGER AIRBAG INDICATOR CIRCUIT HIGH?**

**Yes** >> Go To 5

**No** >> Replace the Passenger Airbag On/Off Indicator Lamp in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1.

**5. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Repair**

Replace the ORC in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

**B1205-PASSENGER AIRBAG INDICATOR CIRCUIT HIGH (CONTINUED)****6. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

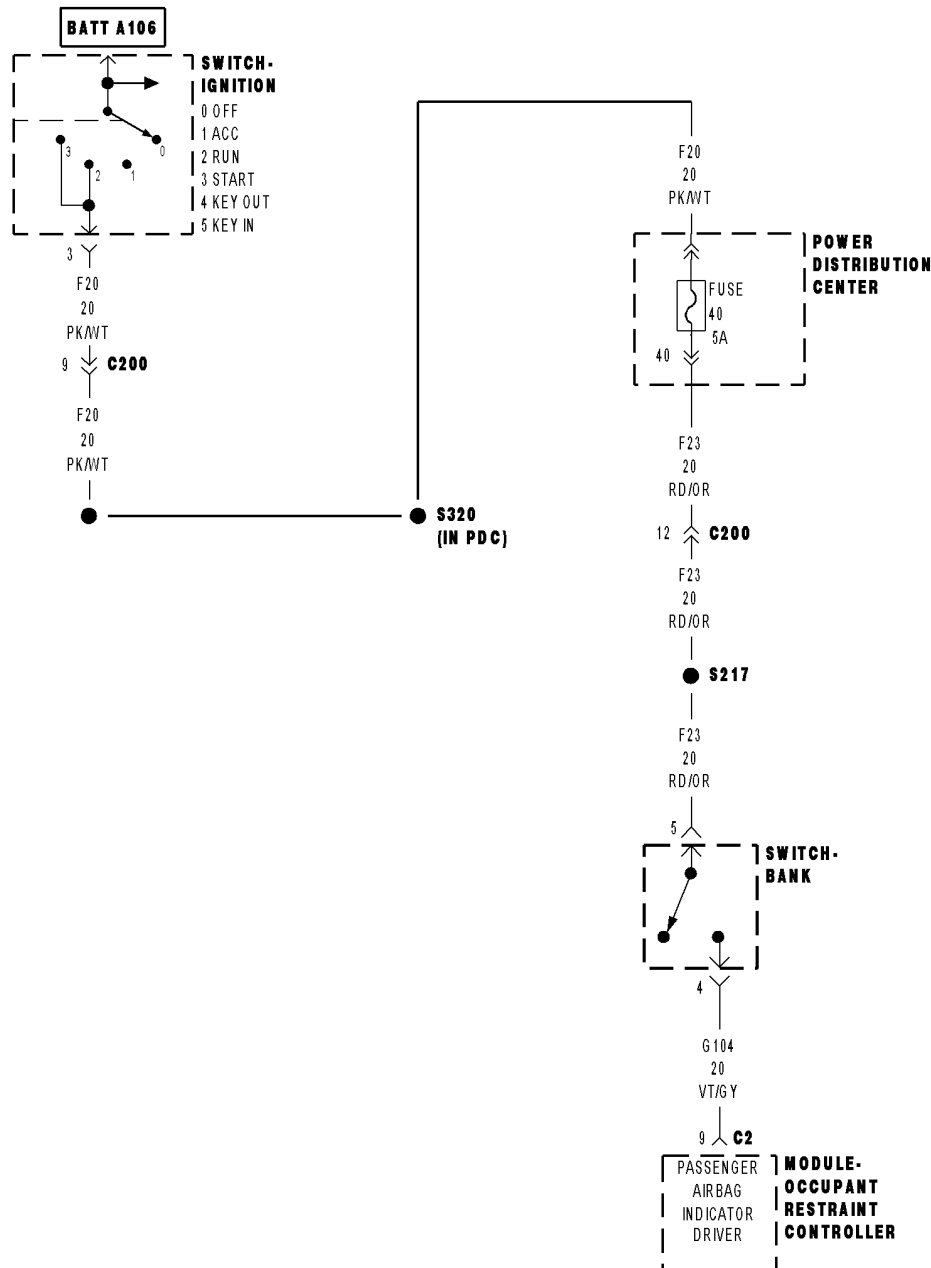

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B1206-PASSENGER AIRBAG INDICATOR CIRCUIT OPEN**

**B1206-PASSENGER AIRBAG INDICATOR CIRCUIT OPEN (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the Occupant Restraint Controller (ORC) cannot detect voltage on the (G104) Passenger Airbag Indicator Driver circuit.

Possible Causes
SWITCH BANK CONNECTOR DISCONNECTED (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT OPEN PASSENGER AIRBAG ON/OFF INDICATOR LAMP ORC

**Diagnostic Test****1. VERIFY THAT DTC B1206 PASSENGER AIRBAG INDICATOR CIRCUIT OPEN IS ACTIVE**

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1206 PASSENGER AIRBAG INDICATOR CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> Go To 6

**2. VERIFY THAT SWITCH BANK CONNECTOR IS CONNECTED**

Turn the ignition off.

Gain access to the Switch Bank connector.

**Is the Switch Bank connected to the dash harness?**

**Yes** >> Go To 3

**No** >> Connect the Switch Bank to the dash harness.  
Perform ORC VERIFICATION TEST - VER 1.

**B1206-PASSENGER AIRBAG INDICATOR CIRCUIT OPEN (CONTINUED)****3. CHECK (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT OPERATION**

Disconnect the Switch Bank connector.

Connect a Test Light between the (G104) Passenger Airbag Indicator Driver circuit and the (F23) Fused Ignition Switch Output (Run-Start) circuit in the Switch Bank connector.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1206 PASSENGER AIRBAG INDICATOR CIRCUIT OPEN?**

**Yes** >> Go To 4

**No** >> Replace the Passenger Airbag On/Off Indicator Lamp in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1.

**4. CHECK (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT FOR AN OPEN**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC C2 connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the appropriate Load Tool ORC Adaptor to the ORC connector.

Measure the resistance of the (G104) Passenger Airbag Indicator Driver circuit between the ORC Adaptor and the Switch Bank connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (G104) Passenger Airbag Indicator Driver circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1.

**B1206-PASSENGER AIRBAG INDICATOR CIRCUIT OPEN (CONTINUED)****5. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Repair**

Replace the ORC in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

**6. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B1207-PASSENGER AIRBAG INDICATOR CIRCUIT SHORTED TOGETHER**

**MODULE-OCCUPANT RESTRAINT CONTROLLER C2**

**SWITCH-BANK**

**SWITCH-IGNITION**

**B1207-PASSENGER AIRBAG INDICATOR CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Occupant Restraint Controller (ORC) detects over current on the (G104) Passenger Airbag Indicator Driver circuit.

Possible Causes
(G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT SHORTED TO (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT
(G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT SHORTED TO VOLTAGE
PASSENGER AIRBAG ON/OFF INDICATOR LAMP
ORC

**Diagnostic Test****1. VERIFY THAT DTC B1207 PASSENGER AIRBAG INDICATOR CIRCUIT SHORTED TOGETHER IS ACTIVE**

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1207 PASSENGER AIRBAG INDICATOR CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> Go To 6

**B1207-PASSENGER AIRBAG INDICATOR CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT FOR A SHORT TO (F23) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** If the Occupant Classification Module (OCM) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Remove the Airbag Run-Start Fuse from the PDC.

Disconnect the ORC C1 and C2 connectors.

Disconnect the OCM C1 connector.

Disconnect the Switch Bank connector.

**Note: Check connectors - Clean and repair as necessary.**

Connect the appropriate Load Tool ORC Adaptor to the ORC connectors.

Measure the resistance between the (G104) Passenger Airbag Indicator Driver circuit and the (F23) Fused Ignition Switch Output (Run-Start) circuit in the Switch Bank connector.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (G104) Passenger Airbag Indicator Driver circuit for a short to the (F23 Fused Ignition Switch Output (Run-Start) circuit.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK (G104) PASSENGER AIRBAG INDICATOR DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (G104) Passenger Airbag Indicator Driver circuit.

**Is there any voltage present?**

**Yes** >> Repair the (G104) Passenger Airbag Indicator Driver circuit for a short to voltage.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1207-PASSENGER AIRBAG INDICATOR CIRCUIT SHORTED TOGETHER (CONTINUED)****4. CHECK FOR ACTIVE DTC B1207 PASSENGER AIRBAG INDICATOR CIRCUIT SHORTED TOGETHER WITH SWITCH BANK CONNECTOR DISCONNECTED**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Remove the Load Tool ORC Adaptor from the ORC connectors.

Reconnect the ORC C1 and C2 connectors.

Reconnect the OCM C1 connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, erase ORC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

With the scan tool, read ORC DTCs.

## B1B00-DRIVER AIRBAG SQUIB 1 CIRCUIT LOW

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C2**

**MODULE-  
STEERING CONTROL**

**AIRBAG-  
DRIVER  
SQUIB 1**

**B1B00-DRIVER AIRBAG SQUIB 1 CIRCUIT LOW (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits.
- **Set Condition:**  
The ORC has detected low resistance on the Driver Squib 1 circuits.

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT OR (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND CLOCKSPRING DRIVER AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 6

**B1B00-DRIVER AIRBAG SQUIB 1 CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B00 DRIVER AIRBAG SQUIB 1 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool Jumper from the Driver Airbag Squib connectors.

Remove the Steering Control Module from the steering column in accordance with the Service Information.

Disconnect the Steering Control Module connector.

**Note:** Check connectors - Clean and repair as necessary.

With the Steering Control Module Connector attached to the steering column, connect the 8443 Load Tool and appropriate Jumper to the Steering Control Module connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B00 DRIVER AIRBAG SQUIB 1 CIRCUIT LOW?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B00-DRIVER AIRBAG SQUIB 1 CIRCUIT LOW (CONTINUED)****4. CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT AND (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance of the (R43) Driver Squib 1 Line 2 circuit between ground and the Steering Column Module connector.

Measure the resistance of the (R45) Driver Squib 1 Line 1 circuit between ground and the Steering Column Module connector.

**Is the resistance below 10K ohms for either measurement?**

**Yes** >> Repair the Driver Squib 1 circuits with a resistance below 10K ohms for a short to ground.

Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 5

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B00-DRIVER AIRBAG SQUIB 1 CIRCUIT LOW (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Driver Squib 1 circuits.

- **Set Condition:**

The ORC has detected voltage on the Driver Squib 1 circuits.

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT OR (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY CLOCKSPRING DRIVER AIRBAG ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 6

**B1B01-DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B01 DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Remove the Steering Control Module from the steering column in accordance with the Service Information.

Disconnect the Steering Control Module connector.

**Note:** Check connectors - Clean and repair as necessary.

With the Steering Control Module Connector attached to the steering column, connect the 8443 Load Tool and appropriate Jumper to the Steering Control Module connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B01 DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B01-DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)****4. CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT AND (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R43) Driver Squib 1 Line 2 circuit between the Steering Control Module connector and ground.

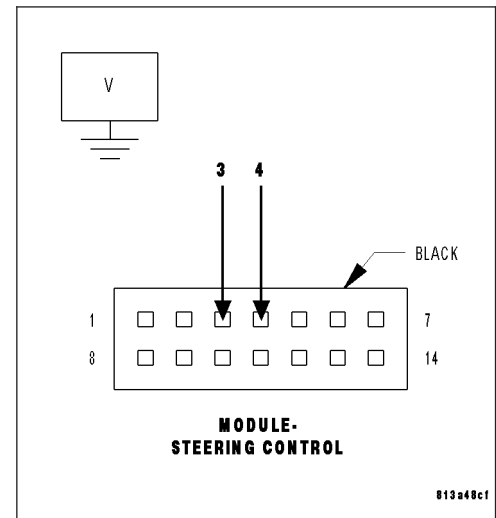

Measure the voltage of the (R45) Driver Squib 1 Line 1 circuit between the Steering Control Module connector and ground.

**Is there any voltage present for either measurement?**

**Yes** >> Repair the Driver Squib 1 circuits with voltage present for a short to Battery.

Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 5

**5. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B01-DRIVER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC's in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B02-DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN

**MODULE-OCCUPANT RESTRAINT CONTROLLER C2**

**MODULE-STEERING CONTROL**

**AIRBAG-DRIVER SQUIB 1**

**B1B02-DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits.
- **Set Condition:**  
The ORC has detected an open or high resistance on the Driver Squib 1 circuits.

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT OPEN (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT OPEN CLOCKSPRING DRIVER AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 7

**B1B02-DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)****2. CHECK FOR OPEN SQUIB CIRCUITS IN DRIVER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B02 DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**3. CHECK CLOCKSPring SQUIB CIRCUITS FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Remove the Steering Control Module from the steering column in accordance with the Service Information.

Disconnect the Steering Control Module connector.

**Note:** Check connectors - Clean and repair as necessary.

With the Steering Control Module Connector attached to the steering column, connect the 8443 Load Tool and appropriate Jumper to the Steering Control Module connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B02 DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B02-DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)****4. CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector. Measure the resistance of the (R43) Driver Squib 1 Line 2 circuit between the Steering Control Module connector and the ORC Load Tool Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the (R43) Driver Squib 1 Line 2 circuit for an open. Then, Go To 5

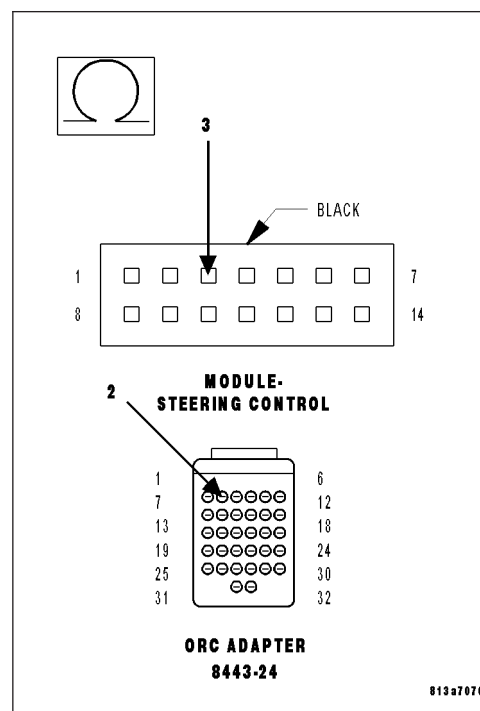

**5. CHECK (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R45) Driver Squib 1 Line 1 circuit between the Steering Control Module connector and the ORC Load Tool Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R45) Driver Squib 1 Line 1 circuit for an open. Perform ORC VERIFICATION TEST - VER 1

**B1B02-DRIVER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)****6. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**7. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER

**MODULE-OCCUPANT RESTRAINT CONTROLLER C2**

**MODULE-STEERING CONTROL**

**AIRBAG-DRIVER SQUIB 1**

**B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 1 circuits.

- **Set Condition:**

The ORC has detected low resistance between the Driver Squib 1 circuits.

Possible Causes
(R43) DRIVER SQUIB 1 LINE 2 CIRCUIT SHORTED TO (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT
CLOCKSPRING
DRIVER AIRBAG
ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 6

## B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)

## 2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

Disconnect the Driver Airbag Squib connectors.

**Note: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool and appropriate Jumper to the Driver Air-bag Squib connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B03 DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

### 3. CHECK CLOCKSPring SQUIB CIRCUITS FOR A SHORT TOGETHER

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool ORC from the Driver Airbag Squib connectors.

Remove the Steering Control Module from the steering column in accordance with the Service Information.

Disconnect the Steering Control Module connector.

**Note: Check connectors - Clean and repair as necessary.**

With the Steering Control Module Connector attached to the steering column, connect the 8443 Load Tool and appropriate Jumper to the Steering Control Module connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B03 DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****4. CHECK (R43) DRIVER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO (R45) DRIVER SQUIB 1 LINE 1 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance between the (R43) Driver Squib 1 Line 2 circuit and the (R45) Driver Squib 1 Line 1 circuit at the Steering Control Module connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R43) Driver Squib 1 Line 2 circuit for a short to the (R45) Driver Squib 1 Line 1 circuit.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 5

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B03-DRIVER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits.
- **Set Condition:**  
The ORC has detected low resistance on the Driver Squib 2 circuits.

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT OR (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND CLOCKSPRING DRIVER AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 6

**B1B04-DRIVER AIRBAG SQUIB 2 CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

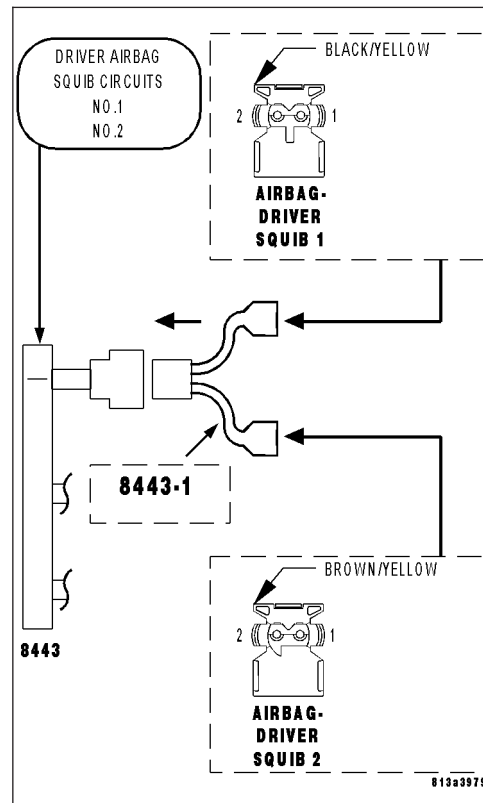

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B04 DRIVER AIRBAG SQUIB 2 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool Jumper from the Driver Airbag Squib connectors.

Remove the Steering Control Module from the steering column in accordance with the Service Information.

Disconnect the Steering Control Module connector.

**Note:** Check connectors - Clean and repair as necessary.

With the Steering Control Module Connector attached to the steering column, connect the 8443 Load Tool and appropriate Jumper to the Steering Control Module connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B04 DRIVER AIRBAG SQUIB 2 CIRCUIT LOW?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B04-DRIVER AIRBAG SQUIB 2 CIRCUIT LOW (CONTINUED)****4. CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT AND (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance of the (R63) Driver Squib 2 Line 1 circuit between ground and the Steering Column Module connector.

Measure the resistance of the (R61) Driver Squib 2 Line 2 circuit between ground and the Steering Column Module connector.

**Is the resistance below 10K ohms for either measurement?**

**Yes** >> Repair the Driver Squib 2 circuits with a resistance below 10K ohms for a short to ground.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 5

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B04-DRIVER AIRBAG SQUIB 2 CIRCUIT LOW (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B05-DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH

**B1B05-DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Driver Squib 2 circuits.

- **Set Condition:**

The ORC has detected voltage on the Driver Squib 2 circuits.

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT OR (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT SHORTED TO BATTERY CLOCKSPRING DRIVER AIRBAG ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The Scan Tool, SRS Airbag Load Tool MRL 8443 and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 6

**B1B05-DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B05 DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**3. CHECK CLOCKSPRING SQUIB CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Driver Airbag Squib connectors.

Remove the Steering Control Module from the steering column in accordance with the Service Information.

Disconnect the Steering Control Module connector.

**Note:** Check connectors - Clean and repair as necessary.

With the Steering Control Module connector attached to the steering column, connect the 8443 Load Tool and appropriate Jumper to the Steering Control Module connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B05 DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B05-DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH (CONTINUED)****4. CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT AND (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R63) Driver Squib 2 Line 1 circuit between the Steering Control Module connector and ground.

Measure the voltage of the (R61) Driver Squib 2 Line 2 circuit between the Steering Control Module connector and ground.

**Is there any voltage present for either measurement?**

**Yes** >> Repair the Driver Squib 2 circuits with voltage present for a short to Battery.

Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 5

**5. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B05-DRIVER AIRBAG SQUIB 2 CIRCUIT HIGH (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC's in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**No** >> Replace the Clockspring in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**B1B06-DRIVER AIRBAG SQUIB 2 CIRCUIT OPEN (CONTINUED)****4. CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note: Check connectors - Clean and repair as necessary.**

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector. Measure the resistance of the (R63) Driver Squib 2 Line 1 circuit between the Steering Control Module connector and the ORC Load Tool Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the (R63) Driver Squib 2 Line 1 circuit for an open.  
Then, Go To 5  
Perform ORC VERIFICATION TEST - VER 1

**5. CHECK (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R61) Driver Squib 2 Line 2 circuit between the Steering Control Module connector and the ORC Load Tool Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R61) Driver Squib 2 Line 2 circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1

**B1B06-DRIVER AIRBAG SQUIB 2 CIRCUIT OPEN (CONTINUED)****6. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**7. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B07-DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER

**B1B07-DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Squib 2 circuits.

- **Set Condition:**

The ORC has detected low resistance between the Driver Squib 2 circuits.

Possible Causes
(R63) DRIVER SQUIB 2 LINE 1 CIRCUIT SHORTED TO (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT CLOCKSPRING DRIVER AIRBAG ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The Scan Tool, SRS Airbag Load Tool MRL 8443 and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 6

**B1B07-DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN DRIVER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

Disconnect the Driver Airbag Squib connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Airbag Squib connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

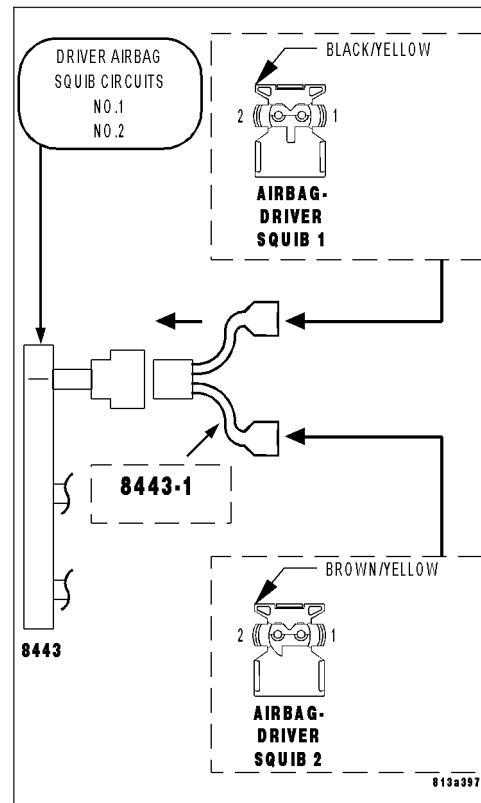

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B07 DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 3

**No** >> Replace the Driver Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**3. CHECK CLOCKSPring SQUIB CIRCUITS FOR A SHORT TOGETHER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the 8443 Load Tool ORC from the Driver Airbag Squib connectors.

Remove the Steering Control Module from the steering column in accordance with the Service Information.

Disconnect the Steering Control Module connector.

**Note:** Check connectors - Clean and repair as necessary.

With the Steering Control Module connector attached to the steering column, connect the 8443 Load Tool and appropriate Jumper to the Steering Control Module connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B07 DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 4

**No** >> Replace the Clockspring in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B07-DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER (CONTINUED)****4. CHECK (R63) DRIVER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO (R61) DRIVER SQUIB 2 LINE 2 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Steering Control Module connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance between the (R63) Driver Squib 2 Line 1 circuit and the (R61) Driver Squib 2 Line 2 circuit at the Steering Control Module connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R63) Driver Squib 2 Line 1 circuit for a short to the (R61) Driver Squib 2 Line 2 circuit.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 5

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**B1B07-DRIVER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B08-PASSENGER AIRBAG SQUIB 1 CIRCUIT LOW

**B1B08-PASSENGER AIRBAG SQUIB 1 CIRCUIT LOW (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 1 circuits.
- **Set Condition:**  
The ORC has detected low resistance on the Passenger Squib 1 circuits.

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT OR (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT SHORTED TO GROUND
PASSENGER AIRBAG
ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B08-PASSENGER AIRBAG SQUIB 1 CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B08 PASSENGER AIRBAG SQUIB 1 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT AND (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance of the (R42) Passenger Squib 1 Line 2 circuit between ground and the Passenger Airbag Squib connector.

Measure the resistance of the (R44) Passenger Squib 1 Line 1 circuit between ground and the Passenger Airbag Squib connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Passenger Squib 1 circuits with a resistance below 10K ohms for a short to ground.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B08-PASSENGER AIRBAG SQUIB 1 CIRCUIT LOW (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

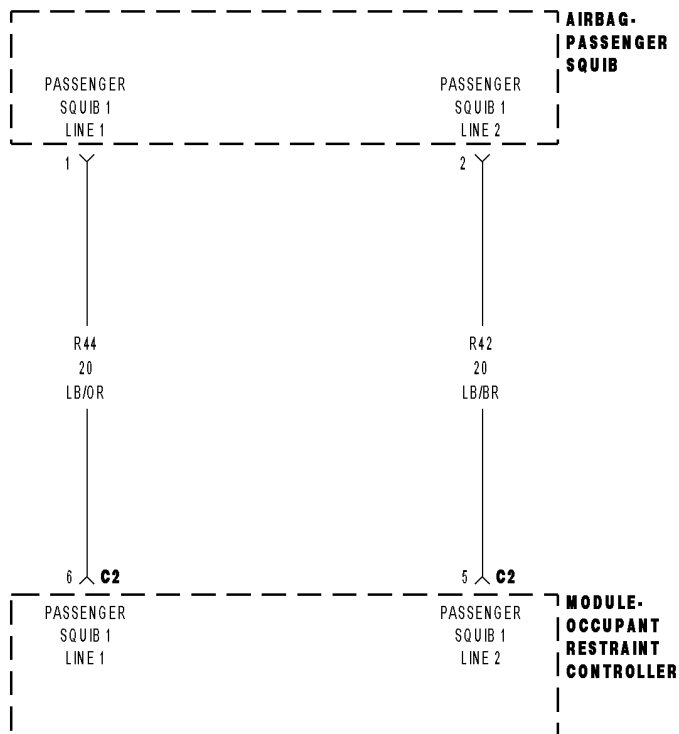

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B09-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH

**B1B09-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Passenger Squib 1 circuits.
- **Set Condition:**  
When the ORC has detected voltage on the Passenger Squib 1 circuits.

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT OR (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT SHORTED TO BATTERY PASSENGER AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B09-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

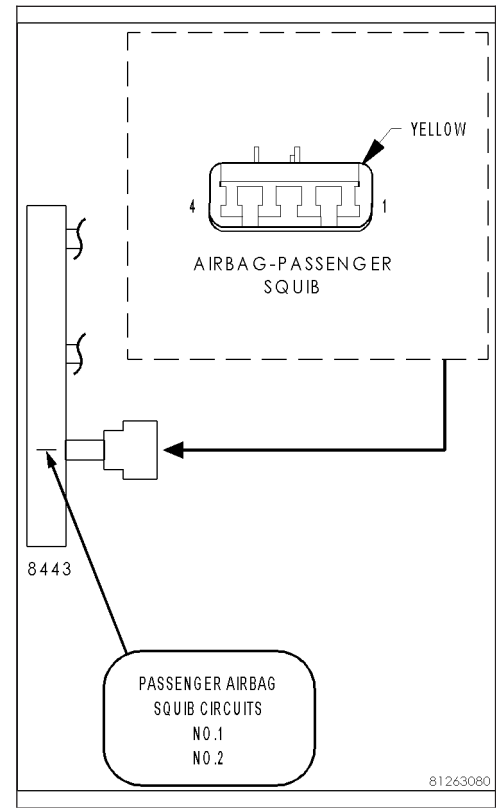

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B09 PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT AND (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the voltage of the (R42) Passenger Squib 1 Line 2 circuit between the Passenger Airbag Squib connector and ground.

Measure the voltage of the (R44) Passenger Squib 1 Line 1 circuit between the Passenger Airbag Squib connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Passenger Squib 1 circuits with voltage present for a short to battery.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B09-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B0A-PASSENGER AIRBAG SQUIB 1 CIRCUIT OPEN

**B1B0A-PASSENGER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 1 circuits.
- **Set Condition:**  
The ORC has detected an open or high resistance on the Passenger Squib 1 circuits.

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT OPEN (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT OPEN PASSENGER AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 6

**B1B0A-PASSENGER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)****2. CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Passenger Airbag Squib connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

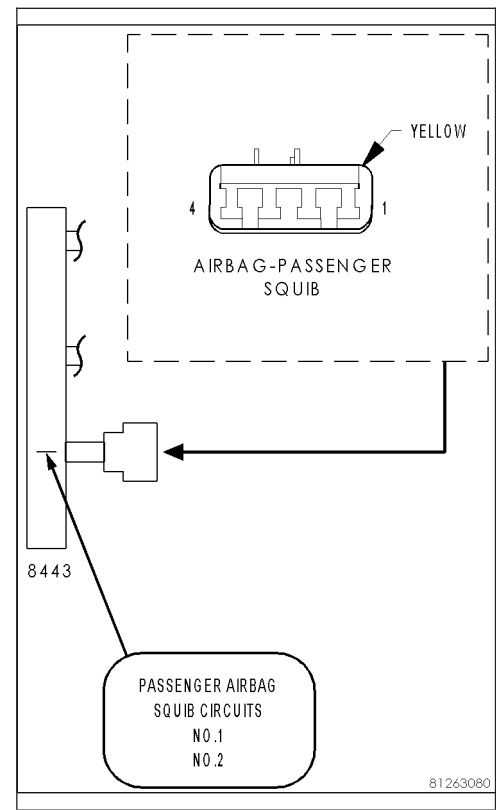

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B0A PASSENGER AIRBAG SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance of the (R42) Passenger Squib 1 Line 2 circuit between the Passenger Airbag Squib connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the (R42) Passenger Squib 1 Line 2 circuit for and open. Then, Go To 4

**B1B0A-PASSENGER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)****4. CHECK (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R44) Passenger Squib 1 Line 1 circuit between the Passenger Airbag Squib connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the (R44) Passenger Squib 1 Line 1 circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

If there are no possible causes remaining, view repair.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**B1B0A-PASSENGER AIRBAG SQUIB 1 CIRCUIT OPEN (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

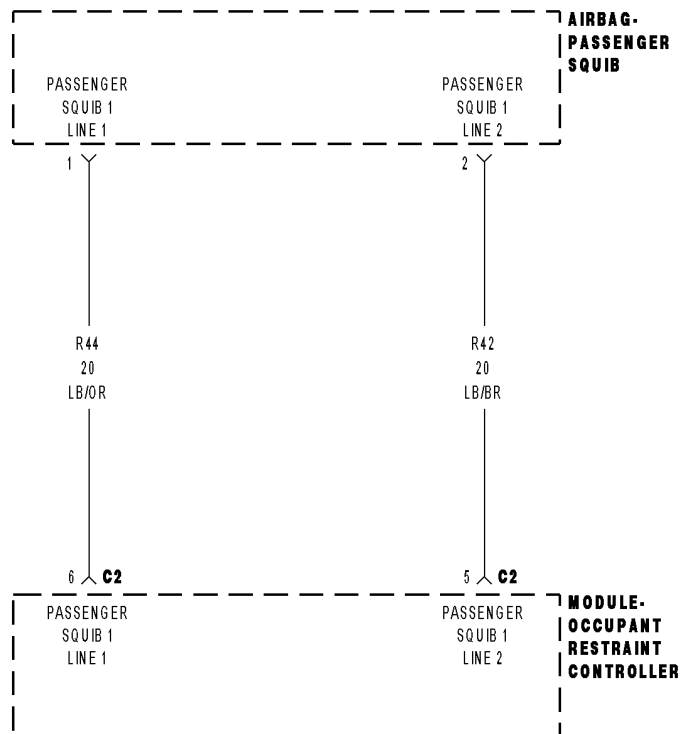

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B1B0B-PASSENGER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER**

**B1B0B-PASSENGER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 1 circuits.

- **Set Condition:**

The ORC has detected low resistance between the Passenger Squib 1 circuits.

Possible Causes
(R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT SHORTED TO (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT PASSENGER AIRBAG ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B0B-PASSENGER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Airbag Squib connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B0B PASSENGER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R42) PASSENGER SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO (R44) PASSENGER SQUIB 1 LINE 1 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.  
Measure the resistance between the (R42) Passenger Squib 1 Line 2 circuit and the (R44) Passenger Squib 1 Line 1 circuit at the Passenger Airbag Squib connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R42) Passenger Squib 1 Line 2 circuit for a short to the (R44) Passenger Squib 1 Line 1 circuit.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B0B-PASSENGER AIRBAG SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

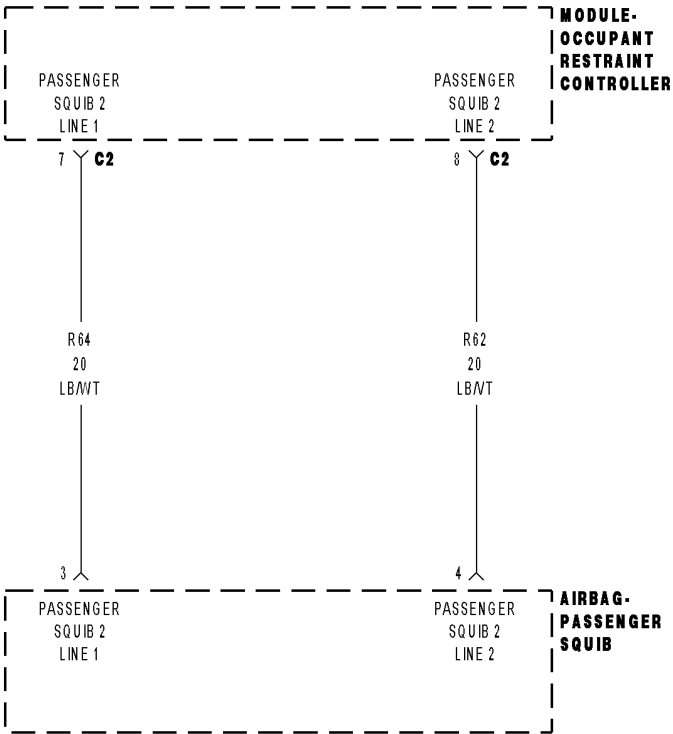

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B0C-PASSENGER AIRBAG SQUIB 2 CIRCUIT LOW

**B1B0C-PASSENGER AIRBAG SQUIB 2 CIRCUIT LOW (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits.

- **Set Condition:**

The ORC has detected low resistance on the Passenger Squib 2 circuits.

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OR (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO GROUND
PASSENGER AIRBAG
ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B0C-PASSENGER AIRBAG SQUIB 2 CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B0C PASSENGER AIRBAG SQUIB 2 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between ground and the Passenger Airbag Squib connector.

Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between ground and the Passenger Airbag Squib connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Passenger Squib 2 circuits with a resistance below 10K ohms for a short to ground.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B0C-PASSENGER AIRBAG SQUIB 2 CIRCUIT LOW (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

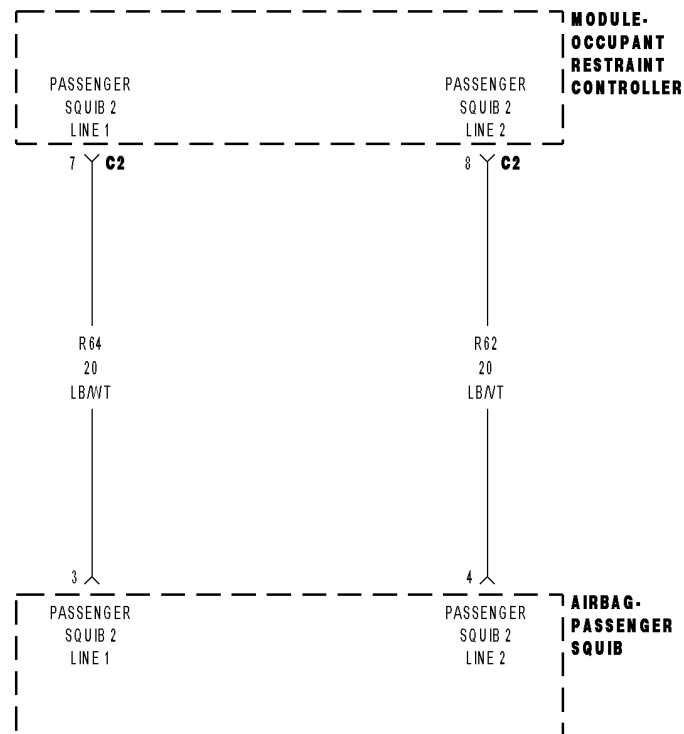

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

# B1B0D-PASSENGER AIRBAG SQUIB 2 CIRCUIT HIGH

**B1B0D-PASSENGER AIRBAG SQUIB 2 CIRCUIT HIGH (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage of the Passenger Squib 2 circuits.

- **Set Condition:**

The ORC has detected voltage on the Passenger Squib 2 circuits.

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OR (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT SHORTED TO BATTERY
PASSENGER AIRBAG
ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B0D-PASSENGER AIRBAG SQUIB 2 CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

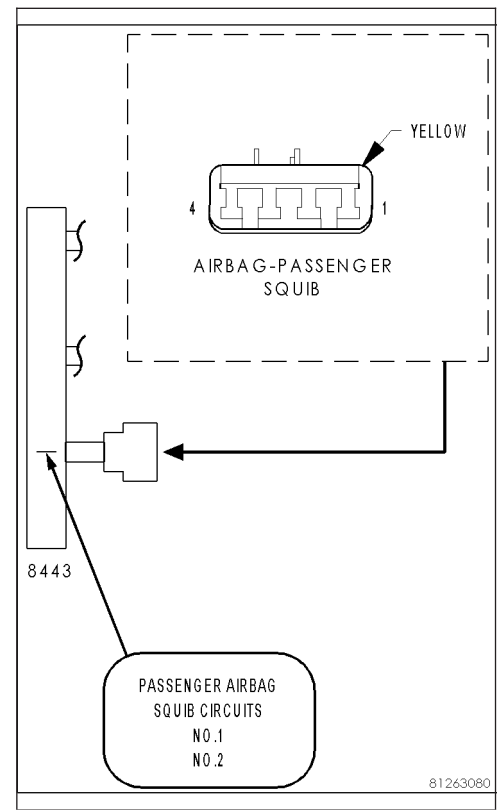

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B0D PASSENGER AIRBAG SQUIB 2 CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT AND (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

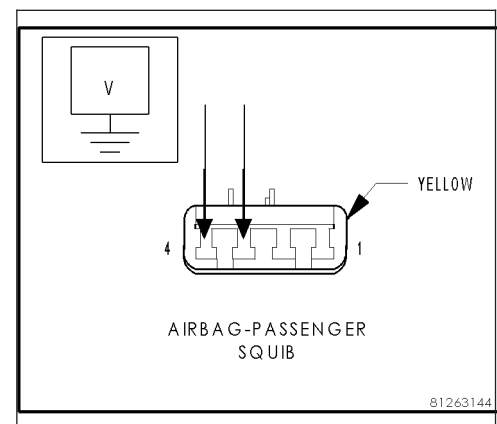

Measure the voltage of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib connector and ground.

Measure the voltage of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Passenger Squib 2 circuits with voltage present for a short to battery.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B0D-PASSENGER AIRBAG SQUIB 2 CIRCUIT HIGH (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

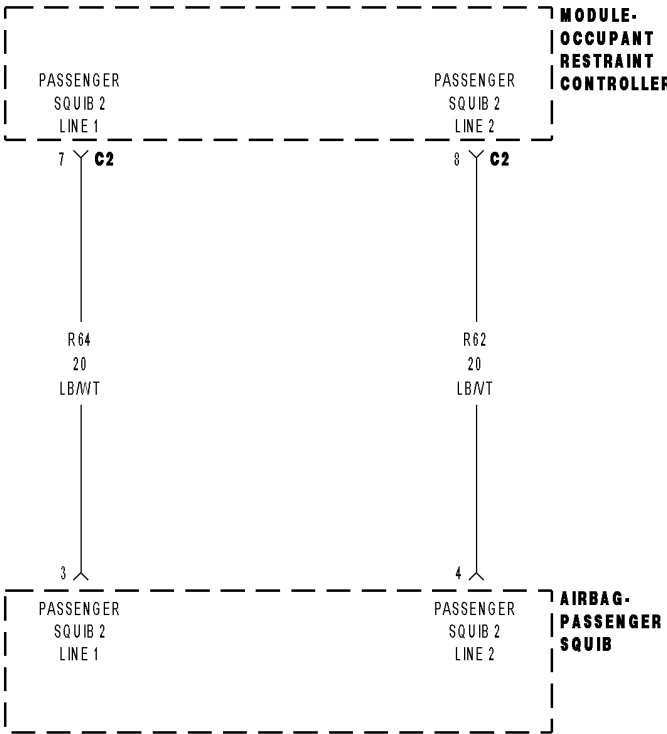

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B0E-PASSENGER AIRBAG SQUIB 2 CIRCUIT OPEN

**B1B0E-PASSENGER AIRBAG SQUIB 2 CIRCUIT OPEN (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits.

- **Set Condition:**

The ORC has detected an open or high resistance on the Passenger Squib 2 circuits.

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT OPEN (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT OPEN PASSENGER AIRBAG ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 6

**B1B0E-PASSENGER AIRBAG SQUIB 2 CIRCUIT OPEN (CONTINUED)****2. CHECK FOR OPEN SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B0E PASSENGER AIRBAG SQUIB CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.

Measure the resistance of the (R64) Passenger Squib 2 Line 1 circuit between the Passenger Airbag Squib connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go to 4

**No** >> Repair the (R64) Passenger Squib 2 Line 1 circuit for an open. Then, Go To 4

**B1B0E-PASSENGER AIRBAG SQUIB 2 CIRCUIT OPEN (CONTINUED)****4. CHECK (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R62) Passenger Squib 2 Line 2 circuit between the Passenger Airbag Squib connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the (R62) Passenger Squib 2 Line 2 circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**B1B0E-PASSENGER AIRBAG SQUIB 2 CIRCUIT OPEN (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Passenger Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

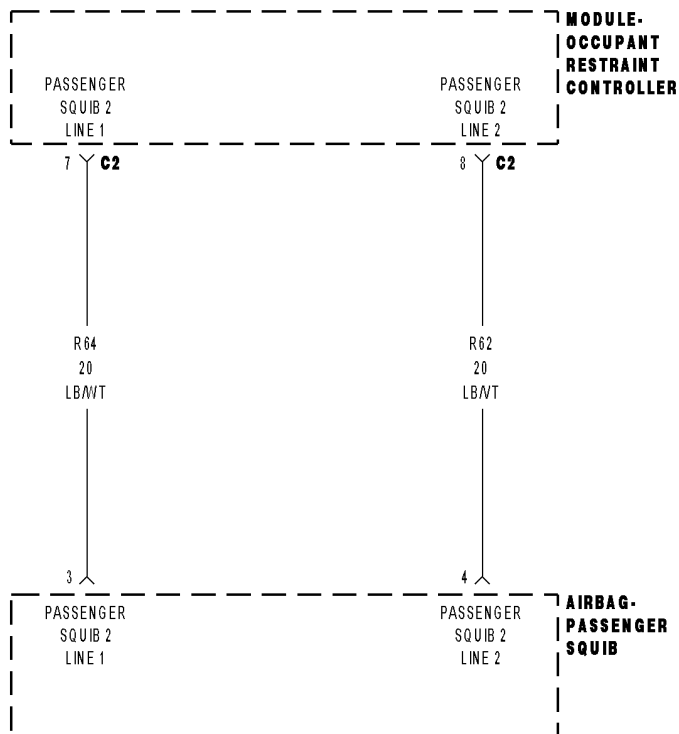

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B0F-PASSENGER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER

**B1B0F-PASSENGER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Squib 2 circuits.
- **Set Condition:**  
The ORC has detected low resistance between the Passenger Squib 2 circuits.

Possible Causes
(R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT SHORTED TO (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT PASSENGER AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**  
Go To 2

**ORC - STORED DTC**  
Go To 5

**B1B0F-PASSENGER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN PASSENGER AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Airbag Squib connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool to the Passenger Airbag Squib connector.

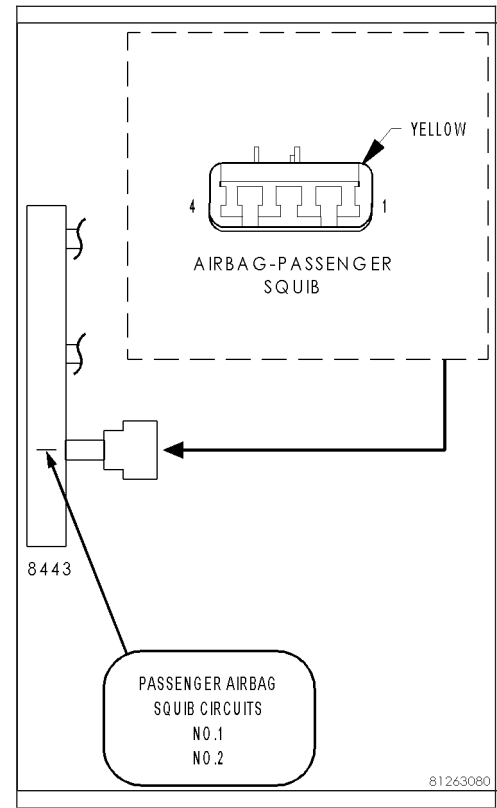

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B0F PASSENGER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R64) PASSENGER SQUIB 2 LINE 1 CIRCUIT FOR A SHORT TO (R62) PASSENGER SQUIB 2 LINE 2 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool from the Passenger Airbag Squib connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C2 connector.  
Measure the resistance between the (R64) Passenger Squib 2 Line 1 circuit and the (R62) Passenger Squib 2 Line 2 circuit at the Passenger Airbag Squib connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R64) Passenger Squib 2 Line 1 circuit for a short to the (R62) Passenger Squib 2 Line 2 circuit.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go to 4

**B1B0F-PASSENGER AIRBAG SQUIB 2 CIRCUIT SHORTED TOGETHER (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes**    >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No**    >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B18-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT LOW

**MODULE-OCCUPANT RESTRAINT CONTROLLER C1**

**AIRBAG-SIDE CURTAIN-LEFT**

**B1B18-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT LOW (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits.
- **Set Condition:**  
The ORC has detected low resistance of the Left Curtain Squib 1 circuits.

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND LEFT SIDE CURTAIN AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B18-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B18 LEFT SIDE CURTAIN SQUIB 1 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between ground and the Left Side Curtain Airbag connector.

Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between ground and the Left Side Curtain Airbag connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Left Curtain Squib 1 circuits with a resistance below 10K ohms for a short to ground.

Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B18-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT LOW (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

IF only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B19-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C1**

**AIRBAG-  
SIDE CURTAIN-  
LEFT**

**B1B19-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Left Curtain Squib 1 circuits.
- **Set Condition:**  
The ORC has detected voltage on the Left Curtain Squib 1 circuits.

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY
LEFT SIDE CURTAIN AIRBAG
ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B19-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B19 LEFT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the voltage of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag connector and ground.

Measure the voltage of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Left Curtain Squib 1 circuits with voltage present for a short to battery.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B19-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off then disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B1A-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN

**MODULE-OCCUPANT RESTRAINT CONTROLLER C1**

**AIRBAG-SIDE CURTAIN-LEFT**

**B1B1A-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits.
- **Set Condition:**  
The ORC has detected an open or high resistance on the Left Curtain Squib 1 circuits.

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT OPEN (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT OPEN LEFT SIDE CURTAIN AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 6

**B1B1A-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)****2. CHECK FOR OPEN SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B1A LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R3) Left Curtain Squib 1 Line 1 circuit between the Left Side Curtain Airbag connector and the Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the (R3) Left Curtain Squib 1 Line 1 circuit for an open. Then, Go To 4

**B1B1A-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)****4. CHECK (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R1) Left Curtain Squib 1 Line 2 circuit between the Left Side Curtain Airbag connector and the Load Tool ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the (R1) Left Curtain Squib 1 Line 2 circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**B1B1A-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

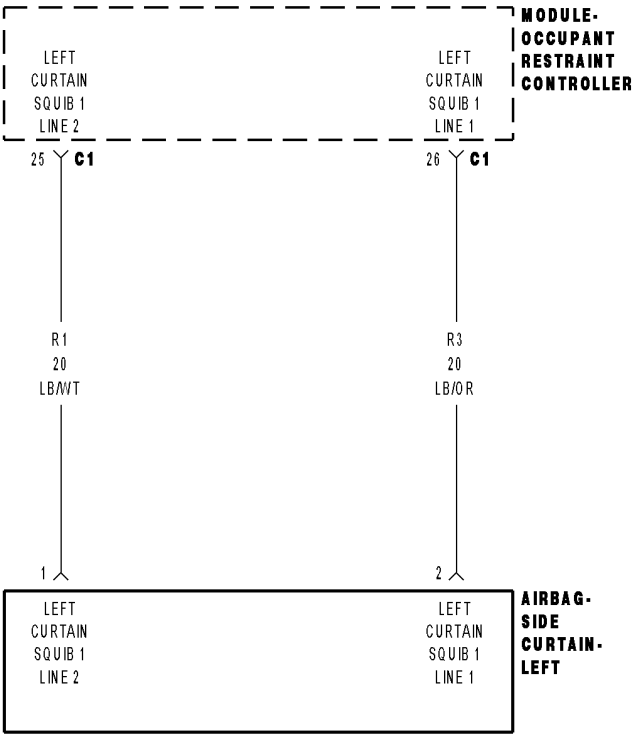

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B1B-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER

**B1B1B-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Left Curtain Squib 1 circuits.

- **Set Condition:**

The ORC has detected low resistance between the Left Curtain Squib 1 circuits.

Possible Causes
(R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT LEFT SIDE CURTAIN AIRBAG ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B1B-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN LEFT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Left Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B1B LEFT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 3

**No** >> Replace the Left Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R3) LEFT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R1) LEFT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Left Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance between the (R3) Left Curtain Squib 1 Line 1 circuit and the (R1) Left Curtain Squib 1 Line 2 circuit at the Left Side Curtain Airbag connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R3) Left Curtain Squib 1 Line 1 circuit for a short to the (R1) Left Curtain Squib 1 Line 2 circuit.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B1B-LEFT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

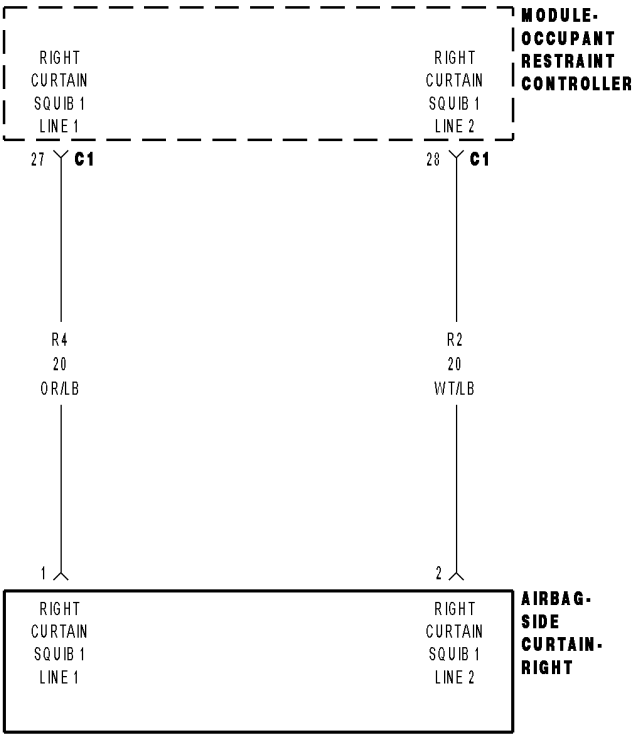

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B20-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT LOW

**B1B20-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT LOW (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits.

- **Set Condition:**

The ORC has detected low resistance on the Right Curtain Squib 1 circuits.

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO GROUND RIGHT SIDE CURTAIN AIRBAG ORC

**Diagnostic Test****1. DETERMINE ACTIVE OR STORED DTC**

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

**Is the DTC active or stored?**

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B20-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact undeployed curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B20 RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between ground and the Right Side Curtain Airbag connector.

Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between ground and the Right Side Curtain Airbag connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Right Curtain Squib 1 circuits with a resistance below 10K ohms for a short to ground.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go to 4

**B1B20-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT LOW (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B21-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH

**B1B21-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Right Curtain Squib 1 circuits.

- **Set Condition:**

When the ORC detects voltage on the Right Curtain Squib 1 circuits.

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT OR (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT SHORTED TO BATTERY RIGHT SIDE CURTAIN AIRBAG ORC

**Diagnostic Test****1. DETERMINE ACTIVE OR STORED DTC**

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B21-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B21 RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT AND (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the voltage of the (R4) Right Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag connector and ground.

Measure the voltage of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side Curtain Airbag connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Right Curtain Squib 1 circuits with voltage present for a short to battery.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go to 4

**B1B21-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT HIGH (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

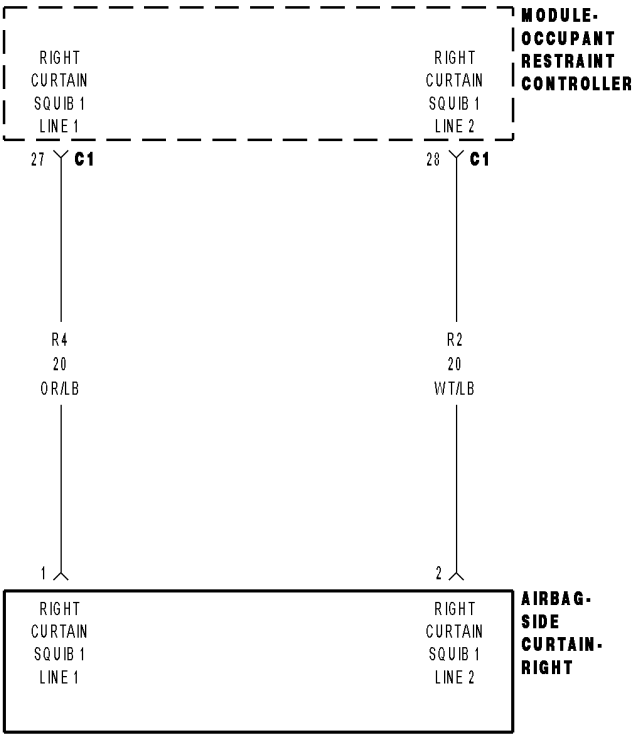

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer

B1B22-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN

**B1B22-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits.

- **Set Condition:**

When the ORC has detects an open or high resistance on the Right Curtain Squib 1 circuits.

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT OPEN (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT OPEN RIGHT SIDE CURTAIN AIRBAG ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

**Is the DTC active or stored?**

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 6

**B1B22-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)****2. CHECK FOR OPEN SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B22 RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN?**

**Yes** >> Go to 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R4) Right Curtain Squib 1 Line 1 circuit between the Right Side Curtain Airbag connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the (R4) Right Curtain Squib 1 Line 1 circuit for an open. Then, Go To 4

**B1B22-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)****4. CHECK (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R2) Right Curtain Squib 1 Line 2 circuit between the Right Side Curtain Airbag connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the (R2) Right Curtain Squib 1 Line 2 circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**B1B22-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT OPEN (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B23-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER

**MODULE-OCCUPANT RESTRAINT CONTROLLER C1**

**AIRBAG-SIDE CURTAIN-RIGHT C1**

**B1B23-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Right Curtain Squib 1 circuits.
- **Set Condition:**  
The ORC has detected low resistance between the Right Curtain Squib 1 circuits.

Possible Causes
(R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT SHORTED TO (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT RIGHT SIDE CURTAIN AIRBAG ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B23-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK FOR SHORTED SQUIB CIRCUITS IN RIGHT SIDE CURTAIN AIRBAG**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, do not place an intact uncoupled curtain airbag face down on a hard surface, the airbag will propel into the air if accidentally deployed.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Right Side Curtain Airbag connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B23 RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go to 3

**No** >> Replace the Right Side Curtain Airbag in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R4) RIGHT CURTAIN SQUIB 1 LINE 1 CIRCUIT FOR A SHORT TO (R2) RIGHT CURTAIN SQUIB 1 LINE 2 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Right Side Curtain Airbag connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance between the (R4) Right Curtain Squib 1 Line 1 circuit and the (R2) Right Curtain Squib 1 Line 2 circuit at the Right Side Curtain Airbag connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R4) Right Curtain Squib 1 Line 1 circuit for a short to the (R2) Right Curtain Squib 1 Line 2 circuit.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go to 4

**B1B23-RIGHT SIDE CURTAIN SQUIB 1 CIRCUIT SHORTED TOGETHER (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

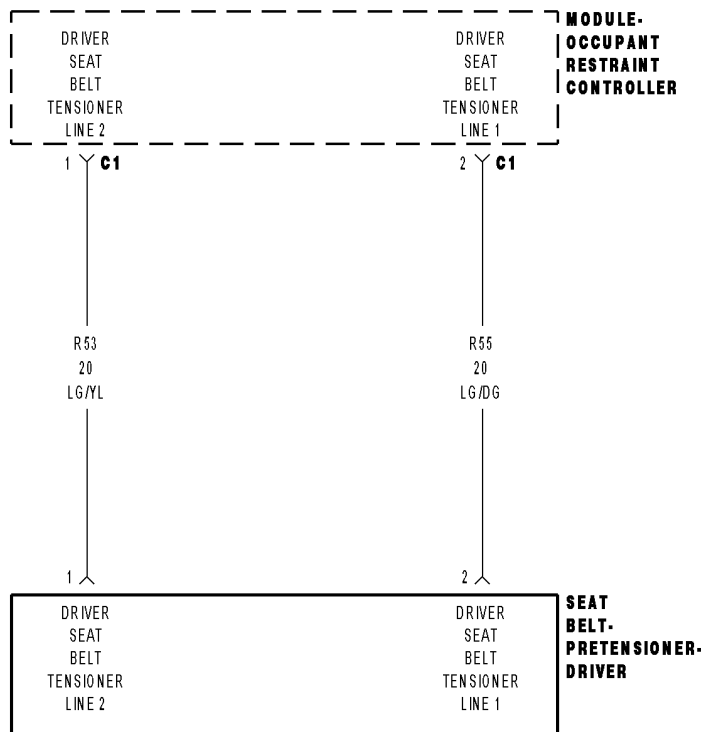

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B28-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT LOW

**MODULE-OCCUPANT RESTRAINT CONTROLLER C1**

**SEAT BELT-PRETENSIONER-DRIVER**

**B1B28-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT LOW (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Driver Seat Belt Tensioner circuits.
- **Set Condition:**  
The ORC has detected low resistance on the Driver Seat Belt Tensioner circuits.

Possible Causes
(R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND DRIVER SEAT BELT PRETENSIONER ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B28-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED DRIVER SEAT BELT PRETENSIONER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Seat Belt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B28 1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R55) Driver Seat Belt Tensioner Line 1 circuit between ground and the Driver Seat Belt Pretensioner connector.

Measure the resistance of the (R53) Driver Seat Belt Tensioner Line 2 circuit between ground and the Driver Seat Belt Pretensioner connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Driver Seat Belt Tensioner circuits with a resistance below 10K ohms for a short to ground.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B28-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT LOW (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B29-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH

**MODULE-OCCUPANT RESTRAINT CONTROLLER C1**

**SEAT BELT-PRETENSIONER-DRIVER**

**B1B29-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Driver Seat Belt Tensioner circuits.
- **Set Condition:**  
The ORC detects voltage on the Driver Seat Belt Tensioner circuits.

Possible Causes
(R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO BATTERY DRIVER SEAT BELT PRETENSIONER ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B29-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED DRIVER SEAT BELT PRETENSIONER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Seat Belt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B29 1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the voltage of the (R55) Driver Seat Belt Tensioner Line 1 circuit between the Driver Seat Belt Pretensioner connector and ground.

Measure the voltage of the (R53) Driver Seat Belt Tensioner Line 2 circuit between the Driver Seat Belt Pretensioner connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Driver Seat Belt Tensioner circuits with voltage present for a short to battery.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B29-PASSENGER AIRBAG SQUIB 1 CIRCUIT HIGH (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

---

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

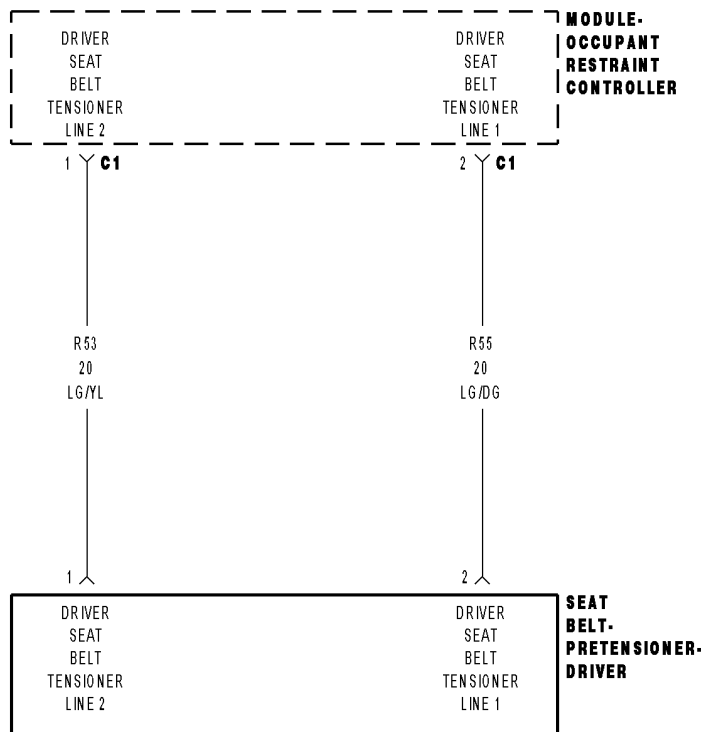

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Seat Belt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B2A 1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R55) Driver Seat Belt Tensioner Line 1 circuit between the Driver Seat Belt Pretensioner connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the (R55) Driver Seat Belt Tensioner Line 1 circuit for and open. Then Go To 4

**B1B2A-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT OPEN (CONTINUED)****4. CHECK (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R53) Driver Seat Belt Tensioner Line 2 circuit between the Driver Seat Belt Pretensioner connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 5

**No** >> Repair the (R53) Driver Seat Belt Tensioner Line 2 circuit for and open.  
Perform ORC VERIFICATION TEST - VER 1

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**B1B2A-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT OPEN (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: TO AVOID PERSONAL INJURY OR DEATH, TURN THE IGNITION OFF, DISCONNECT THE BATTERY AND WAIT TWO MINUTES BEFORE PROCEEDING.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: TO AVOID PERSONAL INJURY OR DEATH, TURN THE IGNITION ON, THEN RECONNECT THE BATTERY.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

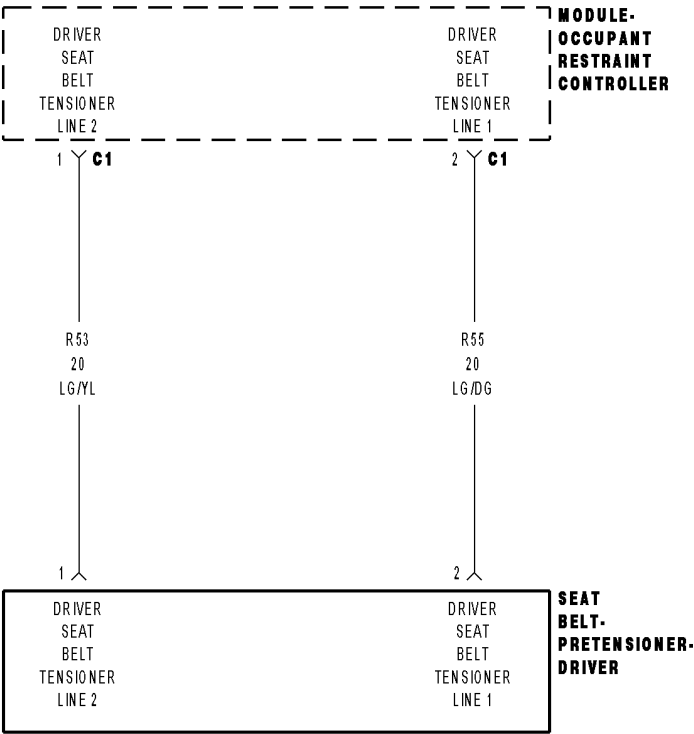

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B2B-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER

(R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT SHORTED TO (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT
DRIVER SEAT BELT PRETENSIONER
ORC

## Diagnostic Test

### 1. SELECT ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B2B-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK FOR SHORTED DRIVER SEAT BELT PRETENSIONER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Seatbelt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Driver Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B2B 1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 3

**No** >> Replace the Driver Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R55) DRIVER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR A SHORT TO (R53) DRIVER SEAT BELT TENSIONER LINE 2 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Driver Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance between the (R55) Driver Seat Belt Tensioner Line 1 circuit and the (R53) Driver Seat Belt Tensioner Line 2 circuit at the Driver Seat Belt Pretensioner connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R55) Driver Seat Belt Tensioner Line 1 circuit for a short to the (R53) Driver Seat Belt Tensioner Line 2 circuit.

Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B2B-1st ROW DRIVER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

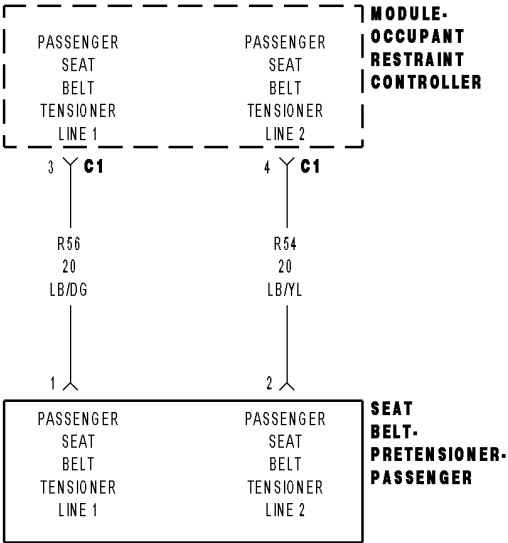

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B1B2C-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT LOW (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Tensioner circuits.

- **Set Condition:**

The ORC has detected low resistance on the Passenger Seat Belt Tensioner circuits.

Possible Causes
(R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO GROUND PASSENGER SEAT BELT PRETENSIONER ORC

**Diagnostic Test****1. DETERMINE ACTIVE OR STORED DTC**

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B2C-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT LOW (CONTINUED)****2. CHECK FOR SHORTED PASSENGER SEAT BELT PRETENSIONER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Passenger Seat Belt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B2C 1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R56) Passenger Seat Belt Tensioner Line 1 circuit between ground and the Passenger Seat Belt Pretensioner connector.

Measure the resistance of the (R54) Passenger Seat Belt Tensioner Line 2 circuit between ground and the Passenger Seat Belt Pretensioner connector.

**Is the resistance below 10K ohms on either circuit?**

**Yes** >> Repair the Passenger Seat Belt Tensioner circuits with a resistance below 10k ohms for a short to ground.

Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B2C-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT LOW (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

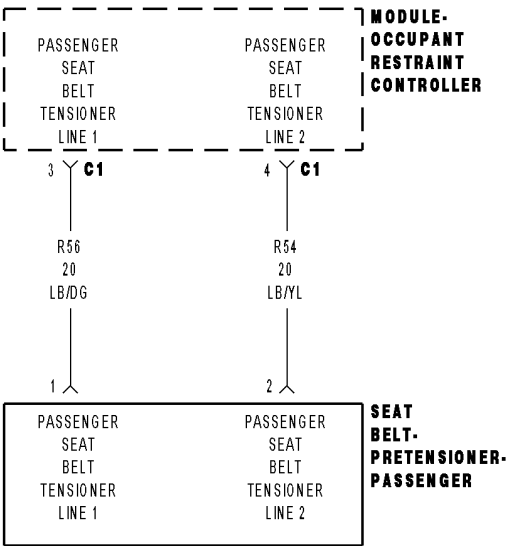

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

B1B2D-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT HIGH

**B1B2D-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT HIGH (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the voltage on the Passenger Seat Belt Tensioner circuits.

- **Set Condition:**

The ORC detects voltage on the Passenger Seat Belt Tensioner circuits.

Possible Causes
(R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT SHORTED TO BATTERY PASSENGER SEAT BELT PRETENSIONER ORC

## Diagnostic Test

### 1. DETERMINE ACTIVE OR STORED DTC

**Note:** Ensure the battery is fully charged.

**Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

Select Active or Stored DTC.

Is the DTC active or stored?

**ORC - ACTIVE DTC**

Go To 2

**ORC - STORED DTC**

Go To 5

**B1B2D-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT HIGH (CONTINUED)****2. CHECK FOR SHORTED PASSENGER SEAT BELT PRETENSIONER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Seat Belt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B2D 1st ROW PASSENGER SEAT BELT TENSIONER CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT AND (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R56) Passenger Seat Belt Tensioner Line 1 circuit between the Passenger Seat Belt Pretensioner connector and ground.

Measure the voltage of the (R54) Passenger Seat Belt Tensioner Line 2 circuit between the Passenger Seat Belt Pretensioner connector and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Repair the Passenger Seat Belt Tensioner circuits with voltage present for a short to battery.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go To 4

**B1B2D-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT HIGH (CONTINUED)****4. OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

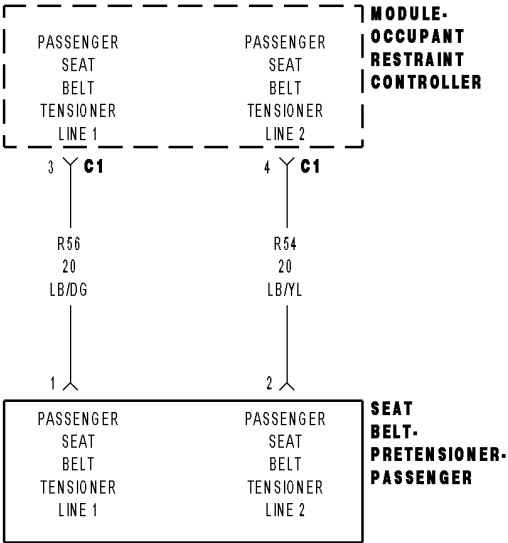

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer

B1B2E-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT OPEN

**B1B2E-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT OPEN (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Tensioner circuits.

- **Set Condition:**

The ORC has detected an open or high resistance on the Passenger Seat Belt Tensioner circuits.

Possible Causes
(R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT OR (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT OPEN PASSENGER SEAT BELT PRETENSIONER ORC

**Diagnostic Test****1. DETERMINE ACTIVE OR STORED DTC**

**Note:** Ensure the battery is fully charged.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Passenger Seat Belt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B2E 1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance of the (R56) Passenger Seat Belt Tensioner Line 1 circuit between the Passenger Seat Belt Pretensioner connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go To 4

**No** >> Repair the (R56) Passenger Seat Belt Tensioner Line 1 circuit for an open. Then Go To 4

**B1B2E-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT OPEN (CONTINUED)****4. CHECK (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT FOR AN OPEN**

Measure the resistance of the (R54) Passenger Seat Belt Tensioner Line 2 circuit between the Passenger Seat Belt Pretensioner connector and the 8443 ORC Adaptor.

**Is the resistance below 1.0 ohm?**

**Yes** >> Go to 5

**No** >> Repair the (R54) Passenger Seat Belt Tensioner Line 2 circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1

**5. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**B1B2E-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT OPEN (CONTINUED)****6. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

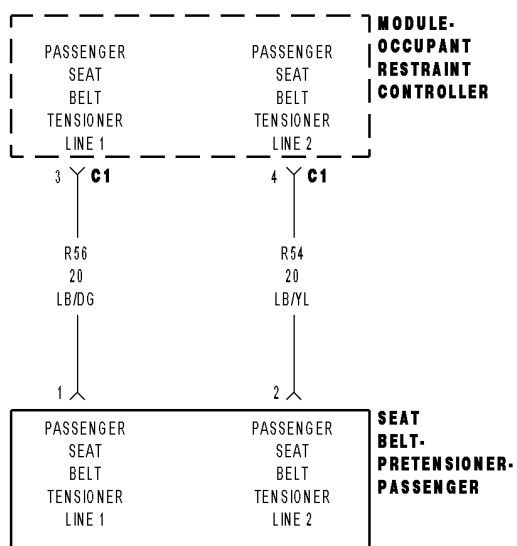

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B2F-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER

**MODULE-OCCUPANT  
RESTRAINT  
CONTROLLER C1**

**SEAT BELT-  
PRETENSIONER-  
PASSENGER**

**B1B2F-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, the Occupant Restraint Controller (ORC) monitors the resistance of the Passenger Seat Belt Tensioner circuits.
- **Set Condition:**  
The ORC has detected low resistance between the Passenger Seat Belt Tensioner circuits.

Possible Causes
(R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT SHORTED TO (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT PASSENGER SEAT BELT PRETENSIONER ORC

**Diagnostic Test**

**1. DETERMINE ACTIVE OR STORED DTC**

- Note:** Ensure the battery is fully charged.
- Note:** The scan tool, SRS Airbag Load Tool MRL 8443, and DVOM are required to perform the following test.
- Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.
- Select Active or Stored DTC.

- Is the DTC active or stored?
- ORC - ACTIVE DTC**  
Go To 2
- ORC - STORED DTC**  
Go To 5

**B1B2F-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER (CONTINUED)****2. CHECK FOR SHORTED PASSENGER SEAT BELT PRETENSIONER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the Passenger Seat Belt Pretensioner connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool and appropriate Jumper to the Passenger Seat Belt Pretensioner connector.

**WARNING:** To avoid personal injury or death, turn the ignition on then reconnect the battery.

With the scan tool, read the active ORC DTC's.

**Does the scan tool display: B1B2F 1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 3

**No** >> Replace the Passenger Seat Belt Pretensioner in accordance with the Service Information.  
Perform ORC VERIFICATION TEST - VER 1

**3. CHECK (R56) PASSENGER SEAT BELT TENSIONER LINE 1 CIRCUIT FOR A SHORT TO THE (R54) PASSENGER SEAT BELT TENSIONER LINE 2 CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.  
Disconnect the 8443 Load Tool and Jumper from the Passenger Seat Belt Pretensioner connector.

Disconnect the ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the 8443 Load Tool ORC Adaptor to the ORC C1 connector. Measure the resistance between the (R56) Passenger Seat Belt Tensioner Line 1 circuit and the (R54) Passenger Seat Belt Tensioner Line 2 circuit at the Passenger Seat Belt Pretensioner connector.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (R56) Passenger Seat Belt Tensioner Line 1 circuit for a short to the (R54) Passenger Seat Belt Tensioner Line 2 circuit.  
Perform ORC VERIFICATION TEST - VER 1

**No** >> Go to 4

**B1B2F-1st ROW PASSENGER SEAT BELT PRETENSIONER CIRCUIT SHORTED TOGETHER (CONTINUED)****4. REPLACE THE ORC**

**WARNING:** If the Occupant Restraint Controller (ORC) is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Note:** When reconnecting airbag system components the Ignition must be turned off and the Battery must be disconnected.

**Repair**

Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1

**5. STORED ORC DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

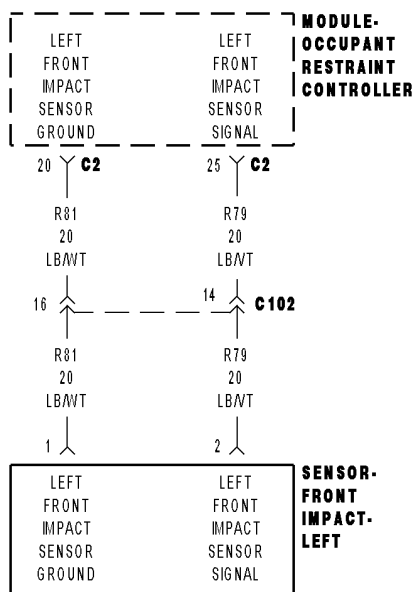

**Are any ACTIVE DTC's present?**

**Yes** >> Select the appropriate diagnostic procedure from the Table of Contents in this section.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C2**

**SENSOR-  
FRONT IMPACT-  
LEFT**

**B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).  
For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Occupant Restraint Controller (ORC) continuously communicates with the Front Left Impact Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.
- **Set Condition:**  
This code will set, if the ORC and the Front Left Impact Sensor do not establish and maintain valid data communications.

Possible Causes
(R79) SIGNAL CIRCUIT SHORTED TO BATTERY (R79) SIGNAL CIRCUIT SHORTED TO GROUND (R79, R81) FRONT LEFT IMPACT SENSOR CIRCUITS SHORTED TOGETHER (R81) FRONT LEFT IMPACT SENSOR GROUND CIRCUIT OPEN (R79) FRONT LEFT IMPACT SENSOR SIGNAL CIRCUIT OPEN ORC, FRONT LEFT IMPACT SENSOR

**Diagnostic Test**

**1. VERIFY THAT DTC B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL IS ACTIVE**

**Note:** Ensure the battery is fully charged.  
**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.  
Turn the ignition on.  
With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL?**

- Yes**     >> Go To 2  
**No**     >> Go To 9

**B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****2. CHECK THE (R79, R81) FRONT LEFT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Front Left Impact Sensor connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R79) Front Left Impact Sensor Signal circuit and (R81) Sensor Ground circuit at the Front Left Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R79, R81) Front Left Impact Sensor circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R79) FRONT LEFT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Measure the resistance of the (R79) Front Left Impact Sensor Signal circuit between the Front Left Impact Sensor connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R79) Front Left Impact Sensor Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****4. CHECK THE (R79, R81) FRONT LEFT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R79) Front Left Impact Sensor Signal and (R81) Sensor Ground circuits at the Front Left Impact Sensor connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R79, R81) Front Left Impact Sensor circuits shorted together.  
Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R81) FRONT LEFT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Restraint Control Module connector.

Measure the resistance of the (R81) Front Left Impact Sensor Ground circuit between the Front Left Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R81) Front Left Impact Sensor 1 Ground circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****6. CHECK THE (R79) FRONT LEFT IMPACT SENSOR CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R79) Front Left Impact Sensor Ground circuit between the Front Left Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R79) Front Left Impact Sensor Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE FRONT LEFT IMPACT SENSOR**

Replace the Front Left Impact Sensor.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Front Left Impact Sensor DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B70-UP-FRONT LEFT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Information.

Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

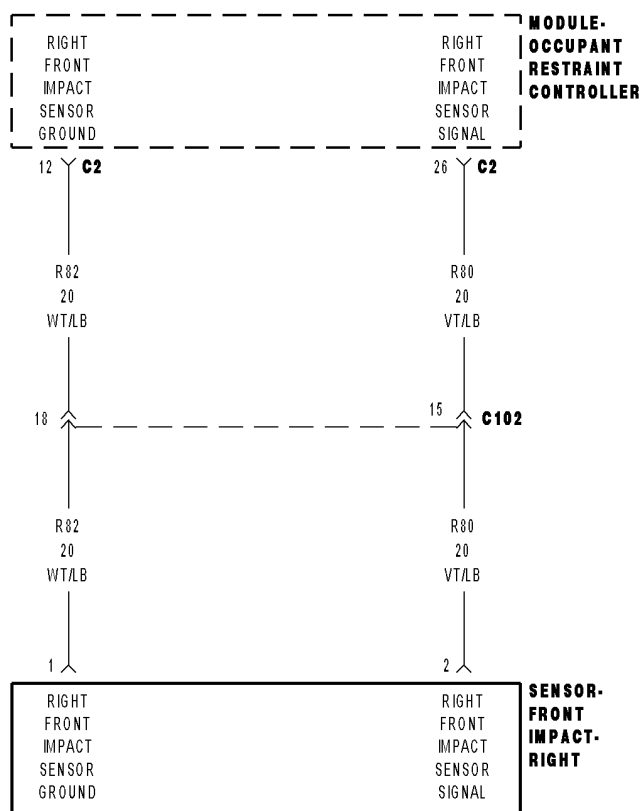

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL

**MODULE-OCCUPANT RESTRAINT CONTROLLER C2**

**SENSOR-FRONT IMPACT-RIGHT**

**B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Occupant Restraint Controller (ORC) continuously communicates with the Front Right Impact Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

- **Set Condition:**

This code will set, if the ORC and the Front Right Impact Sensor do not establish and maintain valid data communications.

Possible Causes
(R80) SIGNAL CIRCUIT SHORTED TO BATTERY
(R80) SIGNAL CIRCUIT SHORTED TO GROUND
(R80, R82) FRONT RIGHT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R82) FRONT RIGHT IMPACT SENSOR GROUND CIRCUIT OPEN
(R80) FRONT RIGHT IMPACT SENSOR SIGNAL CIRCUIT OPEN
ORC, FRONT RIGHT IMPACT SENSOR

**Diagnostic Test****1. VERIFY THAT DTC B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL IS ACTIVE**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL?**

**Yes**     >> Go To 2

**No**     >> Go To 9

**B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****2. CHECK THE (R80, R82) FRONT RIGHT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Front Right Impact Sensor connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R80) Front Right Impact Sensor Signal circuit and (R82) Sensor Ground circuit at the Front Right Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R80, R82) Front Right Impact Sensor circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R80) FRONT RIGHT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn ignition on, then reconnect the battery.

Measure the resistance of the (R80) Front Right Impact Sensor Signal circuit between the Front Right Impact Sensor connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R80) Front Right Impact Sensor Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****4. CHECK THE (R80, R82) FRONT RIGHT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R80) Front Right Impact Sensor Signal and (R82) Sensor Ground circuits at the Front Right Impact Sensor connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R80, R82) Front Right Impact Sensor circuits shorted together.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R82) FRONT RIGHT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Control Module connector.

Measure the resistance of the (R82) Front Right Impact Sensor Ground circuit between the Front Right Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R82) Front Right Impact Sensor 2 Ground circuit for an open or high resistance.

Perform the ORC VERIFICATION TEST - VER 1.

**B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****6. CHECK THE (R80) FRONT RIGHT IMPACT SENSOR CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R80) Front Right Impact Sensor Signal circuit between the Front Right Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R80) Front Right Impact Sensor Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE FRONT RIGHT IMPACT SENSOR**

Replace the Front Right Impact Sensor.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Front Right Impact Sensor DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B71-UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR INTERNAL (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C1**

**SENSOR-  
SIDE IMPACT-  
LEFT 1**

**B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).  
For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.
- **Set Condition:**  
This code will set, if the ORC and the Left Side Impact Sensor 1 do not establish and maintain valid data communications.

Possible Causes
(R13) SIGNAL CIRCUIT SHORTED TO BATTERY (R13) SIGNAL CIRCUIT SHORTED TO GROUND (R13, R15) LEFT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN ORC, LEFT SIDE IMPACT SENSOR 1

**Diagnostic Test**

**1. VERIFY THAT DTC B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL 1 IS ACTIVE**

**Note:** Ensure the battery is fully charged.  
**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.  
Turn the ignition on.  
With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL?**

- Yes**    >> Go To 2  
**No**    >> Go To 9

**B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****2. CHECK THE (R13, R15) LEFT SIDE IMPACT SENSOR 1 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left front Impact Sensor 1 connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R13) Left Side Impact Sensor 1 Signal circuit and (R15) Sensor Ground circuit at the Left Side Impact Sensor 1 connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R13, R15) Left Side Impact Sensor 1 circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn ignition on, then reconnect the battery.

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****4. CHECK THE (R13, R15) LEFT SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R13) Left Side Impact Sensor 1 Signal and (R15) Sensor Ground circuits at the Left Side Impact Sensor 1 connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R13, R15) Left Side Impact Sensor 1 circuits shorted together.  
Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R15) LEFT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Control Module connector.

Measure the resistance of the (R15) Left Side Impact Sensor 1 Ground circuit between the Left Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R15) Left Side Impact Sensor 1 Ground circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****6. CHECK THE (R13) LEFT SIDE IMPACT SENSOR 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R13) Left Side Impact Sensor 1 Signal circuit between the Left Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R13) Left Side Impact Sensor 1 Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 1**

Replace the Left Side Impact Sensor 1.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Left Side Impact Sensor 1 DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B72-LEFT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C1**

**SENSOR-  
SIDE IMPACT-  
LEFT 2**

**B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).  
For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Occupant Restraint Controller (ORC) continuously communicates with the Left Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.
- **Set Condition:**  
This code will set, if the ORC and the Left Side Impact Sensor 2 do not establish and maintain valid data communications.

Possible Causes
(R17) SIGNAL CIRCUIT SHORTED TO BATTERY (R17) SIGNAL CIRCUIT SHORTED TO GROUND (R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER (R19) LEFT SIDE IMPACT SENSOR 2 GROUND CIRCUIT OPEN (R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT OPEN ORC, LEFT SIDE IMPACT SENSOR 2

**Diagnostic Test**

**1. VERIFY THAT DTC B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL IS ACTIVE**

**Note:** Ensure the battery is fully charged.  
**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.  
Turn the ignition on.  
With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL?**

- Yes**    >> Go To 2  
**No**    >> Go To 9

**B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****2. CHECK THE (R17, R19) LEFT SIDE IMPACT SENSOR 2 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left front Impact Sensor 2 connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R17) Left Side Impact Sensor 2 Signal circuit and (R19) Sensor Ground circuit at the Left Side Impact Sensor 2 connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R17, R19) Left Side Impact Sensor 2 circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R17) LEFT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn ignition on, then reconnect the battery.

Measure the resistance of the (R17) Left Side Impact Sensor 2 Signal circuit between the Left Side Impact Sensor 2 connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R17) Left Side Impact Sensor 2 Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****4. CHECK THE (R17, R19) LEFT SIDE IMPACT SENSOR 2 CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R17) Left Side Impact Sensor 2 Signal and (R19) Sensor Ground circuits at the Left Side Impact Sensor 2 connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R17, R19) Left Side Impact Sensor 2 circuits shorted together.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R19) LEFT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Control Module connector.

Measure the resistance of the (R19) Left Side Impact Sensor 2 Ground circuit between the Left Side Impact Sensor 2 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R19) Left Side Impact Sensor 2 Ground circuit for an open or high resistance.

Perform the ORC VERIFICATION TEST - VER 1.

**B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****6. CHECK THE (R17) LEFT SIDE IMPACT SENSOR 2 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R17) Left Side Impact Sensor 2 Signal circuit between the Left Side Impact Sensor 2 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R17) Left Side Impact Sensor 2 Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE LEFT SIDE IMPACT SENSOR 2**

Replace the Left Side Impact Sensor 2.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Left Side Impact Sensor 2 DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B73-LEFT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

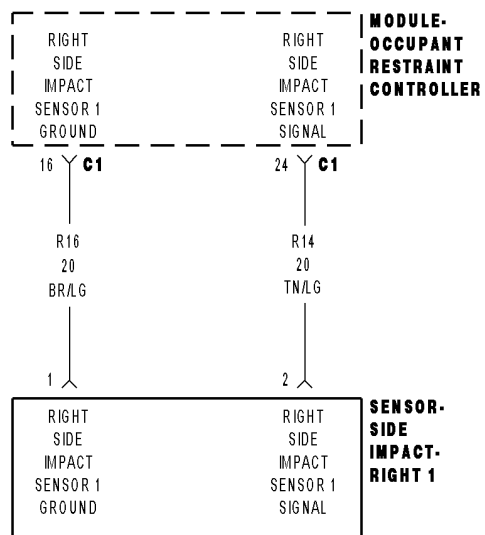

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C1**

**SENSOR-  
SIDE IMPACT-  
RIGHT 1**

**B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 1 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

- **Set Condition:**

This code will set, if the ORC and the Right Side Impact Sensor 1 do not establish and maintain valid data communications.

Possible Causes
(R14) SIGNAL CIRCUIT SHORTED TO BATTERY
(R14) SIGNAL CIRCUIT SHORTED TO GROUND
(R14, R16) RIGHT SIDE IMPACT SENSOR 1 CIRCUITS SHORTED TOGETHER
(R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT OPEN
(R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT OPEN
ORC, RIGHT SIDE IMPACT SENSOR 1

**Diagnostic Test****1. VERIFY THAT DTC B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL?**

**Yes**     >> Go To 2

**No**     >> Go To 9

**B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****2. CHECK THE (R14, R16) RIGHT SIDE IMPACT SENSOR 1 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right front Impact Sensor 1 connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R14) Right Side Impact Sensor 1 Signal circuit and (R16) Sensor Ground circuit at the Right Side Impact Sensor 1 connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R14, R16) Right Side Impact Sensor 1 circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn ignition on, then reconnect the battery.

Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****4. CHECK THE (R14, R16) RIGHT SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R14) Right Side Impact Sensor 1 Signal and (R16) Sensor Ground circuits at the Right Side Impact Sensor 1 connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R14, R16) Right Side Impact Sensor 1 circuits shorted together.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R16) RIGHT SIDE IMPACT SENSOR 1 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Control Module connector.

Measure the resistance of the (R16) Right Side Impact Sensor 1 Ground circuit between the Right Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R16) Right Side Impact Sensor 1 Ground circuit for an open or high resistance.

Perform the ORC VERIFICATION TEST - VER 1.

**B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****6. CHECK THE (R14) RIGHT SIDE IMPACT SENSOR 1 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R14) Right Side Impact Sensor 1 Signal circuit between the Right Side Impact Sensor 1 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R14) Right Side Impact Sensor 1 Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 1**

Replace the Right Side Impact Sensor 1.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Right Side Impact Sensor 1 DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B75-RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 INTERNAL (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.  
Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C1**

**SENSOR-  
SIDE IMPACT-  
RIGHT 2**

**B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

- **Set Condition:**

This code will set, if the ORC and the Right Side Impact Sensor 2 do not establish and maintain valid data communications.

Possible Causes
(R18) SIGNAL CIRCUIT SHORTED TO BATTERY
(R18) SIGNAL CIRCUIT SHORTED TO GROUND
(R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R20) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT OPEN
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT OPEN
ORC, RIGHT SIDE IMPACT SENSOR 2

**Diagnostic Test****1. VERIFY ACTIVE B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL**

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

**Does the scan tool display an active: B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL?**

**Yes**     >> Go To 2

**No**     >> Go To 9

**B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****2. CHECK THE (R18, R20) RIGHT SIDE IMPACT SENSOR 2 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right front Impact Sensor 2 connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R18) Right Side Impact Sensor 2 Signal circuit and (R20) Sensor Ground circuit at the Right Side Impact Sensor 2 connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R18, R20) Right Side Impact Sensor 2 circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the Right Side Impact Sensor 2 connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R18) Right Side Impact Sensor 2 Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****4. CHECK THE (R18, R20) RIGHT SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R18) Right Side Impact Sensor 2 Signal and (R20) Sensor Ground circuits at the Right Side Impact Sensor 2 connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R18, R20) Right Side Impact Sensor 2 circuits shorted together.  
Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Restraint Controller C2 connector.

Measure the resistance of the (R20) Right Side Impact Sensor 2 Ground circuit between the Right Side Impact Sensor 2 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R20) Right Side Impact Sensor 2 Ground circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****6. CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the Right Side Impact Sensor 2 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R18) Right Side Impact Sensor 2 Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2**

Replace the Right Side Impact Sensor 2.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Right Side Impact Sensor 2 DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**B1B76-RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 INTERNAL (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.  
Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE

**MODULE-OCCUPANT CLASSIFICATION C2**

**SENSOR-SEAT WEIGHT-LEFT FRONT**

**B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When CAN ignitions status is Run or SNA, during auto zero and while performing the Occupant Classification Module System Verification Test.
- **Set Condition:**  
During the occupant classification verification test: if the module detects that the sensor input is less than 1.4 volts or greater than 3.6 volts. During auto zero: if the module detects that the sensor input is less than 1 volt or greater than 4 volts.

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED LEFT-FRONT PASSENGER SEAT WEIGHT SENSOR DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test**

**1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

- Yes**
- >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.
- No**
- >> Go To 2

**B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE (CONTINUED)****2. VERIFY THAT DTC B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 5

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE (CONTINUED)****4. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR PERFORMANCE DTCs?**

**Yes** >> Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.  
Perform OCS VERIFICATION TEST - VER 1.

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

---

**B1B78-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT PERFORMANCE (CONTINUED)****5. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

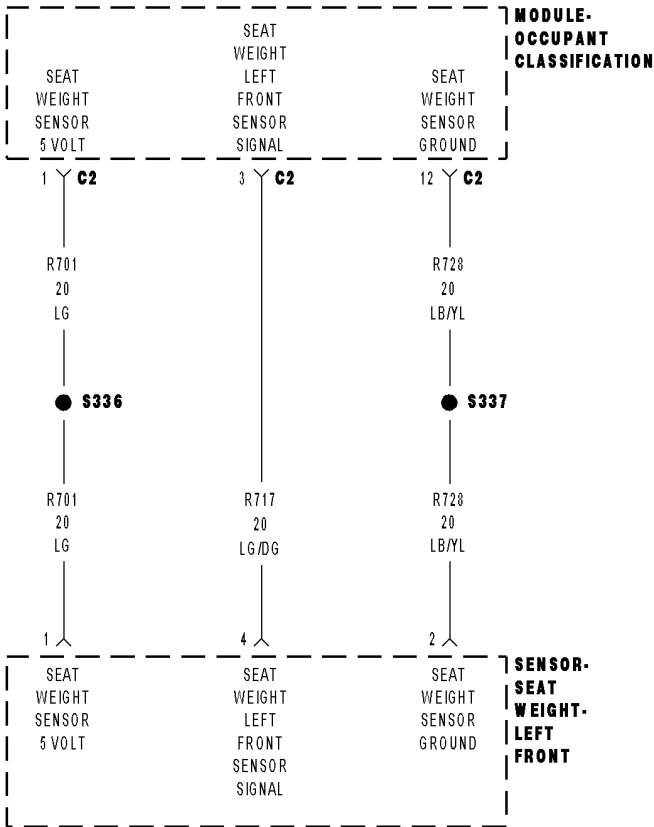

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW

**B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.

- **Set Condition:**

If the module detects that the sensor input is less than  $3.4 \pm .6\%$  of the (R701) Seat Weight Sensor 5 Volt circuit voltage. This DTC will also set if the (R701) Seat Weight Sensor 5 Volt circuit is shorted to ground. However, this condition would prevent communication with the OCM and cause a Lost Communication With OCM DTC to set in other modules.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT OPEN (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT OPEN LEFT-FRONT SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW (CONTINUED)****2. VERIFY THAT DTC B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Go To 10

---

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

---

**4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

**Is the Passenger Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Passenger Seat Harness as necessary. Then, Go To 5

---

**B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW (CONTINUED)****5. CHECK IF MORE THAN ONE PASSENGER SEAT WEIGHT SENSOR DTC IS ACTIVE**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes - More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active.**

Perform the Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1

**Yes - Only DTC B1B79 Is Active.**

Go To 6

**No - But Other DTCs Present.**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present.**

Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left-Front Seat Weight Sensor connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the voltage above 4.8 volts?**

**Yes** >> Go To 7

**No** >> Go To 9

**B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW (CONTINUED)****7. CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the OCM C2 connector.

Measure the resistance of the (R717) LT-FT Seat Weight Sensor Signal circuit between ground and the OCM C2 connector.

**Is the resistance below 10k ohms?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Measure the resistance of the (R717) LT-FT Seat Weight Sensor Signal circuit between the OCM C2 connector and the Left-Front Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Left-Front Seat Weight Sensor in accordance with the Service Information. Perform OCS VERIFICATION TEST - VER 1. If DTC B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW (CONTINUED)****9. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector and the Left-Front Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B79-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT LOW (CONTINUED)****10. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

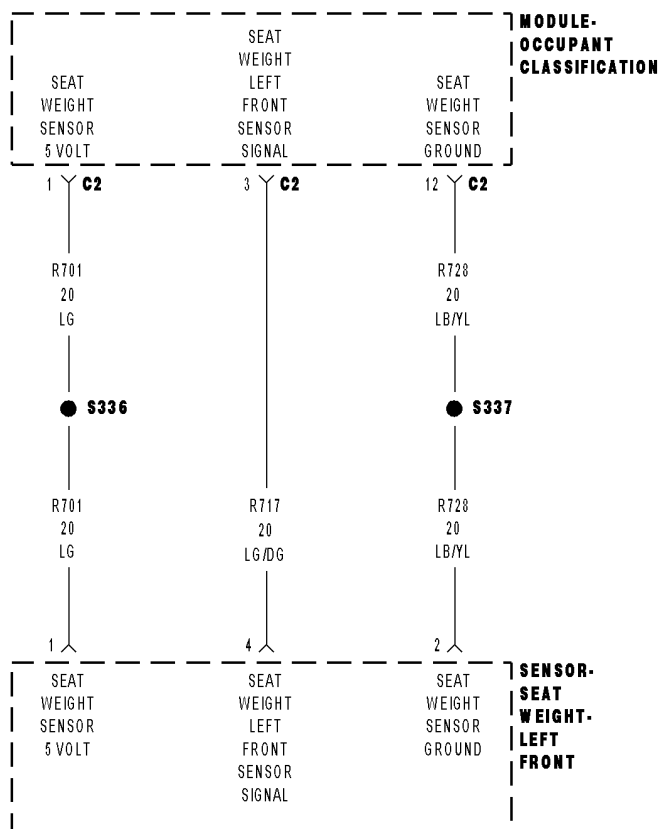

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH

**MODULE-OCCUPANT CLASSIFICATION C2**

**SENSOR-SEAT WEIGHT-LEFT FRONT**

**B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.
- **Set Condition:**  
If the module detects that the sensor input is greater than 96 ± 0.6% of the (R701) Seat Weight Sensor 5 Volt circuit voltage.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN LEFT-FRONT SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test**

**1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

- Yes**
- >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.
- No**
- >> Go To 2

**B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH (CONTINUED)****2. VERIFY THAT DTC B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Go To 9

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

**Is the Passenger Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Passenger Seat Harness as necessary.

Perform OCS VERIFICATION TEST - VER 1.

**B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH (CONTINUED)****5. CHECK IF MORE THAN ONE PASSENGER SEAT WEIGHT SENSOR DTC IS ACTIVE**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes - More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active**

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Yes - Only DTC B1B7A Is Active**

Go To 6

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH (CONTINUED)****6. CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the OCM C2 connector.

Measure the voltage of the (R717) LT-FT Seat Weight Sensor Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK (R717) LT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

Disconnect the Left-Front Seat Weight Sensor connector.

Measure the resistance between the (R717) LT-FT Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the resistance below 10K ohms?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH (CONTINUED)****8. CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN**

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Left-Front Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B7A-PASSENGER SEAT WEIGHT SENSOR 3 - LEFT FRONT INPUT CIRCUIT HIGH (CONTINUED)****9. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

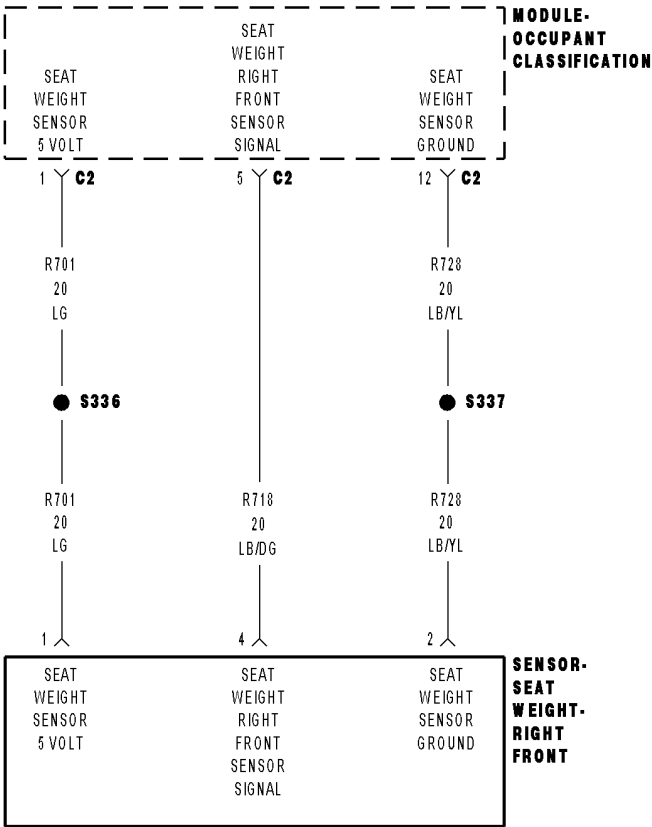

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE

**MODULE-  
OCCUPANT  
CLASSIFICATION C2**

**SENSOR-  
SEAT WEIGHT-  
RIGHT FRONT**

**B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When CAN ignitions status is Run or SNA, during auto zero and while performing the Occupant Classification Module System Verification Test.

- **Set Condition:**

During the occupant classification verification test: if the module detects that the sensor input is less than 1.4 volts or greater than 3.6 volts. During auto zero: if the module detects that the sensor input is less than 1 volt or greater than 4 volts.

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN
PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
RIGHT-FRONT PASSENGER SEAT WEIGHT SENSOR
DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN
OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE (CONTINUED)****2. VERIFY THAT DTC B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 5

---

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

---

**B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE (CONTINUED)****4. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR PERFORMANCE DTCs?**

**Yes** >> Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.  
Perform OCS VERIFICATION TEST - VER 1.

**No, But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**B1B7D-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT PERFORMANCE (CONTINUED)****5. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

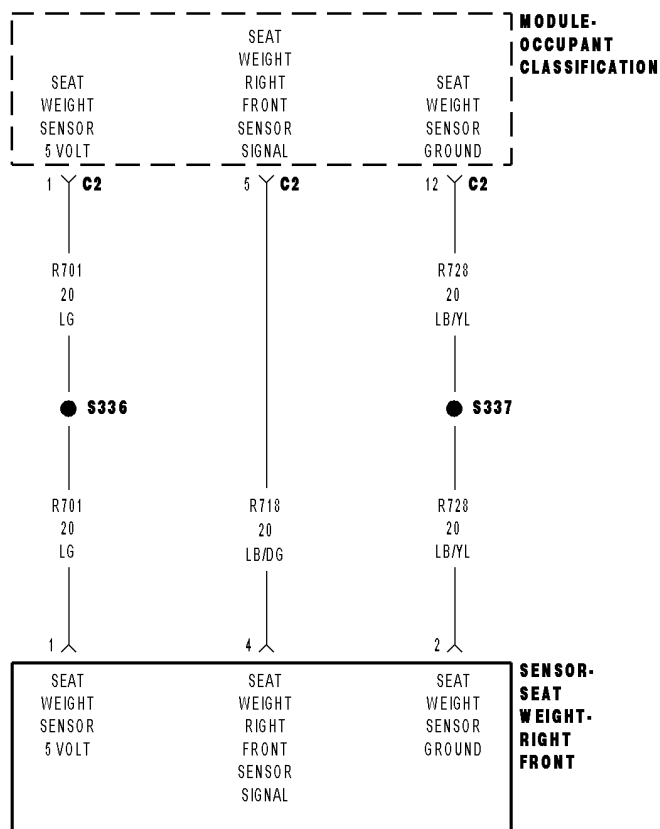

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW

**MODULE-OCCUPANT CLASSIFICATION C2**

**SENSOR-SEAT WEIGHT-RIGHT FRONT**

**B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.
- **Set Condition:**  
If the module detects that the sensor input is less than 3.4 ± 0.6% of the (R701) Seat Weight Sensor 5 Volt circuit voltage. This DTC will also set if the (R701) Seat Weight Sensor 5 Volt circuit is shorted to ground. However, this condition would prevent communication with the OCM and cause a Lost Communication With OCM DTC to set in other modules.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT OPEN (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT OPEN RIGHT-FRONT SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test**

**1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

- Yes**
- >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.
- No**
- >> Go To 2

**B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW (CONTINUED)****2. VERIFY THAT DTC B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Go To 10

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

**Is the Passenger Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Passenger Seat Harness as necessary. Then, Go To 5

**B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW (CONTINUED)****5. CHECK IF MORE THAN ONE PASSENGER SEAT WEIGHT SENSOR DTC IS ACTIVE**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes - More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active**

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Yes - Only DTC B1B7E Is Active**

Go To 6

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right-Front Seat Weight Sensor connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the voltage above 4.8 volts?**

**Yes** >> Go To 7

**No** >> Go To 9

**B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW (CONTINUED)****7. CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the OCM C2 connector.

Measure the resistance of the (R718) RT-FT Seat Weight Sensor Signal circuit between ground and the OCM C2 connector.

**Is the resistance below 10k ohms?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Measure the resistance of the (R718) RT-FT Seat Weight Sensor Signal circuit between the OCM C2 connector and the Right-Front Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Right-Front Seat Weight Sensor in accordance with the Service Information. Perform OCS VERIFICATION TEST - VER 1. If DTC B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW (CONTINUED)****9. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector and the Right-Front Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B7E-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT LOW (CONTINUED)****10. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH

**MODULE-  
OCCUPANT  
CLASSIFICATION C2**

**SENSOR-  
SEAT WEIGHT-  
RIGHT FRONT**

**B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.

- **Set Condition:**

If the module detects that the sensor input is greater than  $96 \pm 0.6\%$  of the (R701) Seat Weight Sensor 5 Volt circuit voltage.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN RIGHT-FRONT SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH (CONTINUED)****2. VERIFY THAT DTC B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Go To 9

---

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

---

**4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

**Is the Passenger Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Passenger Seat Harness as necessary.

Perform OCS VERIFICATION TEST - VER 1.

---

**B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH (CONTINUED)****5. CHECK IF MORE THAN ONE PASSENGER SEAT WEIGHT SENSOR DTC IS ACTIVE**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes, More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active**

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Yes, Only DTC B1B7F Is Active**

Go To 6

**No, But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the voltage of the (R718) RT-FT Seat Weight Sensor Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH (CONTINUED)****7. CHECK (R718) RT-FT SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

Disconnect the Right-Front Seat Weight Sensor connector.

Measure the resistance between the (R718) RT-FT Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the resistance below 10K ohms?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN**

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Right-Front Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B7F-PASSENGER SEAT WEIGHT SENSOR 2 - RIGHT FRONT INPUT CIRCUIT HIGH (CONTINUED)****9. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B82-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR PERFORMANCE

**MODULE-  
OCCUPANT  
CLASSIFICATION C2**

**SENSOR-  
SEAT WEIGHT-  
LEFT REAR**

**B1B82-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR PERFORMANCE (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When CAN ignitions status is Run or SNA, during auto zero and while performing the Occupant Classification Module System Verification Test.

- **Set Condition:**

During the occupant classification verification test: if the module detects that the sensor input is less than 1.4 volts or greater than 3.6 volts. During auto zero: if the module detects that the sensor input is less than 1 volt or greater than 4 volts.

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED LEFT-REAR PASSENGER SEAT WEIGHT SENSOR DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B82-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR PERFORMANCE (CONTINUED)****2. VERIFY THAT DTC B1B82-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B82-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 5

---

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

---

**B1B82-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR PERFORMANCE (CONTINUED)****4. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR PERFORMANCE DTCs?**

**Yes** >> Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**B1B82-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR PERFORMANCE (CONTINUED)****5. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW

**MODULE-OCCUPANT CLASSIFICATION C2**

**SENSOR-SEAT WEIGHT-LEFT REAR**

**B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.

- **Set Condition:**

If the module detects that the sensor input is less than  $3.4 \pm 0.6\%$  of the (R701) Seat Weight Sensor 5 Volt circuit voltage. This DTC will also set if the (R701) Seat Weight Sensor 5 Volt circuit is shorted to ground. However, this condition would prevent communication with the OCM and cause a Lost Communication With OCM DTC to set in other modules.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT OPEN (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT OPEN LEFT-REAR SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes**    >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No**    >> Go To 2

**B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW (CONTINUED)****2. VERIFY THAT DTC B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Go To 10

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

**Is the Passenger Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Passenger Seat Harness as necessary.

Perform OCS VERIFICATION TEST - VER 1.

**B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW (CONTINUED)****5. CHECK IF MORE THAN ONE PASSENGER SEAT WEIGHT SENSOR DTC IS ACTIVE**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes - More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active**

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Yes - Only DTC B1B83 Is Active**

Go To 6

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Left-Rear Seat Weight Sensor connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the voltage above 4.8 volts?**

**Yes** >> Go To 7

**No** >> Go To 9

**B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW (CONTINUED)****7. CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R705) LT-RR Seat Weight Sensor Signal circuit between ground and the OCM C2 connector.

**Is the resistance below 10k ohms?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Measure the resistance of the (R705) LT-RR Seat Weight Sensor Signal circuit between the OCM C2 connector and the Left-Rear Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Left-Rear Seat Weight Sensor in accordance with the Service Information. Perform OCS VERIFICATION TEST - VER 1. If DTC B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW (CONTINUED)****9. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector and the Left-Rear Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B83-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT LOW (CONTINUED)****10. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

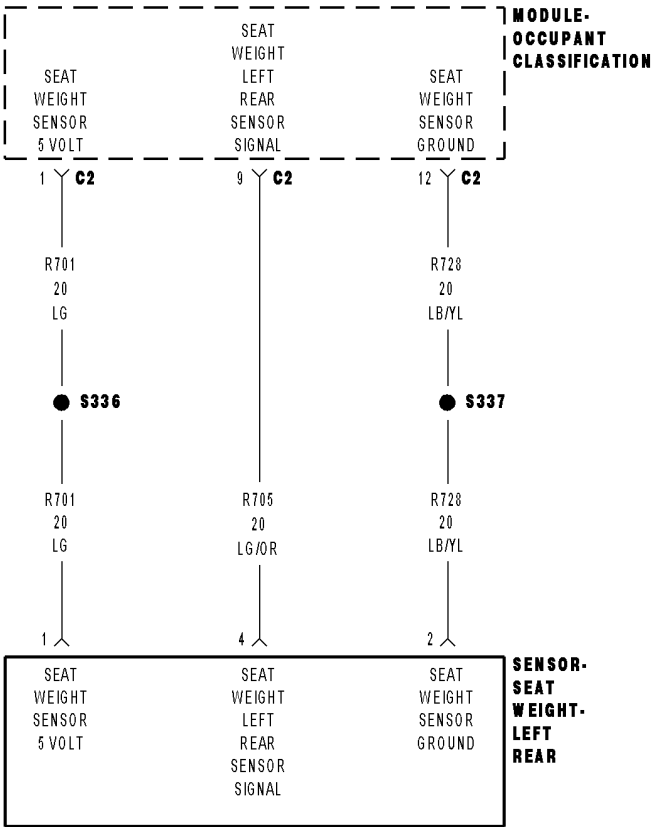

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH

**MODULE-  
OCCUPANT  
CLASSIFICATION C2**

**SENSOR-  
SEAT WEIGHT-  
LEFT REAR**

**B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.

- **Set Condition:**

If the module detects that the sensor input is greater than  $96 \pm 0.6\%$  of the (R701) Seat Weight Sensor 5 Volt circuit voltage.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN LEFT-REAR SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH (CONTINUED)****2. VERIFY THAT DTC B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH IS ACTIVE**

With the scan tool, read OCM DTCs.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes - More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active**

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Yes - Only DTC B1B84 Is Active**

Go To 6

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the voltage of the (R705) LT-RR Seat Weight Sensor Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH (CONTINUED)****7. CHECK (R705) LT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

Disconnect the Left-Rear Seat Weight Sensor connector.

Measure the resistance between the (R705) LT-RR Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the resistance below 10K ohms?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN**

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Left-Rear Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B84-PASSENGER SEAT WEIGHT SENSOR 4 - LEFT REAR INPUT CIRCUIT HIGH (CONTINUED)****9. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

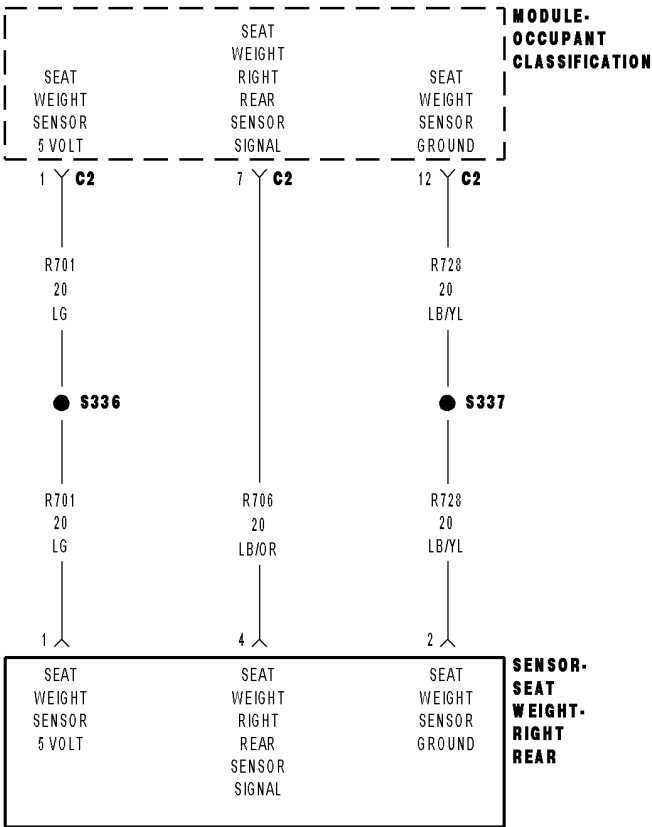

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE

**B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

When CAN ignitions status is Run or SNA, during auto zero and while performing the Occupant Classification Module System Verification Test.

- **Set Condition:**

During the occupant classification verification test: if the module detects that the sensor input is less than 1.4 volts or greater than 3.6 volts. During auto zero: if the module detects that the sensor input is less than 1 volt or greater than 4 volts.

Possible Causes
PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED RIGHT-REAR PASSENGER SEAT WEIGHT SENSOR DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE (CONTINUED)****2. VERIFY THAT DTC B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 5

---

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

---

**B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE (CONTINUED)****4. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR PERFORMANCE DTCs?**

**Yes** >> Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.  
Perform OCS VERIFICATION TEST - VER 1.

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**B1B87-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR PERFORMANCE (CONTINUED)****5. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

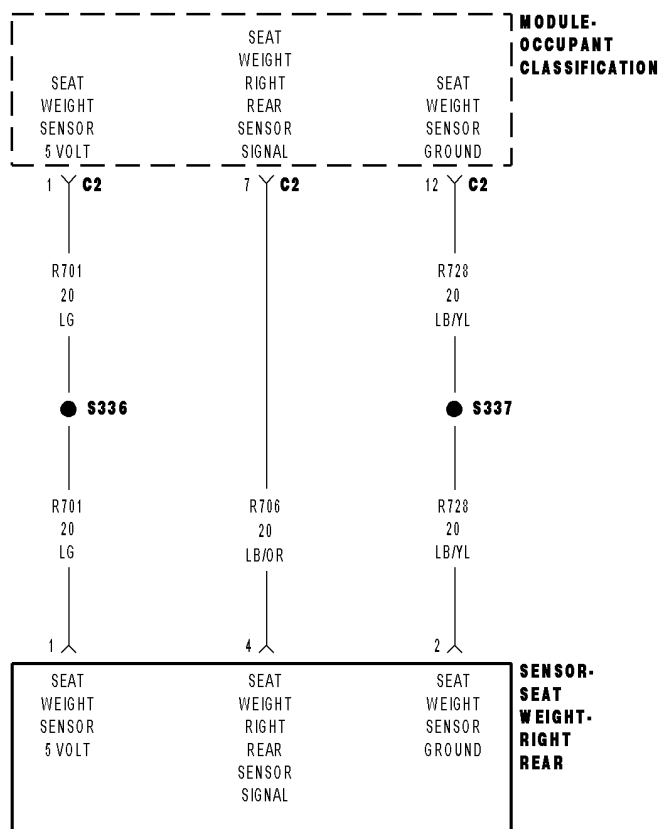

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW

**MODULE-  
OCCUPANT  
CLASSIFICATION C2**

**SENSOR-  
SEAT WEIGHT-  
RIGHT REAR**

**B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.
- **Set Condition:**  
If the module detects that the sensor input is less than 3.4 ± 0.6% of the (R701) Seat Weight Sensor 5 Volt circuit voltage. This DTC will also set if the (R701) Seat Weight Sensor 5 Volt circuit is shorted to ground. However, this condition would prevent communication with the OCM and cause a Lost Communication With OCM DTC to set in other modules.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO GROUND (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT OPEN (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT OPEN RIGHT-REAR SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test**

**1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

- Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**
- Yes**    >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.
- No**     >> Go To 2

**B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW (CONTINUED)****2. VERIFY THAT DTC B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Go To 10

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

**Is the Passenger Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Passenger Seat Harness as necessary.

Perform OCS VERIFICATION TEST - VER 1.

**B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW (CONTINUED)****5. CHECK IF MORE THAN ONE PASSENGER SEAT WEIGHT SENSOR DTC IS ACTIVE**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes, More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active**

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Yes - Only DTC B1B88 Is Active**

Go To 6

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK VOLTAGE OF (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right-Rear Seat Weight Sensor connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the voltage above 4.8 volts?**

**Yes** >> Go To 7

**No** >> Go To 9

**B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW (CONTINUED)****7. CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R706) RT-RR Seat Weight Sensor Signal circuit between ground and the OCM C2 connector.

**Is the resistance below 10k ohms?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Measure the resistance of the (R706) RT-RR Seat Weight Sensor Signal circuit between the OCM C2 connector and the Right-Rear Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Right-Rear Seat Weight Sensor in accordance with the Service Information. Perform OCS VERIFICATION TEST - VER 1. If DTC B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW returns active, replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW (CONTINUED)****9. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the resistance of the (R701) Seat Weight Sensor 5 Volt circuit between the OCM C2 connector and the Right-Rear Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B88-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT LOW (CONTINUED)****10. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH

MODULE-  
OCCUPANT  
CLASSIFICATION C2

SENSOR-  
SEAT WEIGHT-  
RIGHT REAR

**B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.

- **Set Condition:**

If the module detects that the sensor input is greater than  $96 \pm 0.6\%$  of the (R701) Seat Weight Sensor 5 Volt circuit voltage.

Possible Causes
PASSENGER SEAT HARNESS IMPROPERLY ROUTED PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT SHORTED TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT OPEN RIGHT-REAR SEAT WEIGHT SENSOR OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH (CONTINUED)****2. VERIFY THAT DTC B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Go To 9

---

**3. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

---

**4. VERIFY THAT PASSENGER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Passenger Seat Harness is routed correctly.

**Is the Passenger Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Passenger Seat Harness as necessary.

Perform OCS VERIFICATION TEST - VER 1.

---

**B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH (CONTINUED)****5. CHECK IF MORE THAN ONE PASSENGER SEAT WEIGHT SENSOR DTC IS ACTIVE**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR DTCs?**

**Yes - More Than One PASSENGER SEAT WEIGHT SENSOR DTC Is Active**

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Yes - Only DTC B1B89 Is Active**

Go To 6

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C2 connector.

Measure the voltage of the (R706) RT-RR Seat Weight Sensor Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH (CONTINUED)****7. CHECK (R706) RT-RR SEAT WEIGHT SENSOR SIGNAL CIRCUIT FOR A SHORT TO (R701) SEAT WEIGHT SENSOR 5 VOLT CIRCUIT**

Disconnect the Right-Rear Seat Weight Sensor connector.

Measure the resistance between the (R706) RT-RR Seat Weight Sensor Signal circuit and the (R701) Seat Weight Sensor 5 Volt circuit.

**Is the resistance below 10K ohms?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK (R728) SEAT WEIGHT SENSOR GROUND CIRCUIT FOR AN OPEN**

Measure the resistance of the (R728) Seat Weight Sensor Ground circuit between the OCM C2 connector and the Right-Rear Seat Weight Sensor connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B1B89-PASSENGER SEAT WEIGHT SENSOR 1 - RIGHT REAR INPUT CIRCUIT HIGH (CONTINUED)****9. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

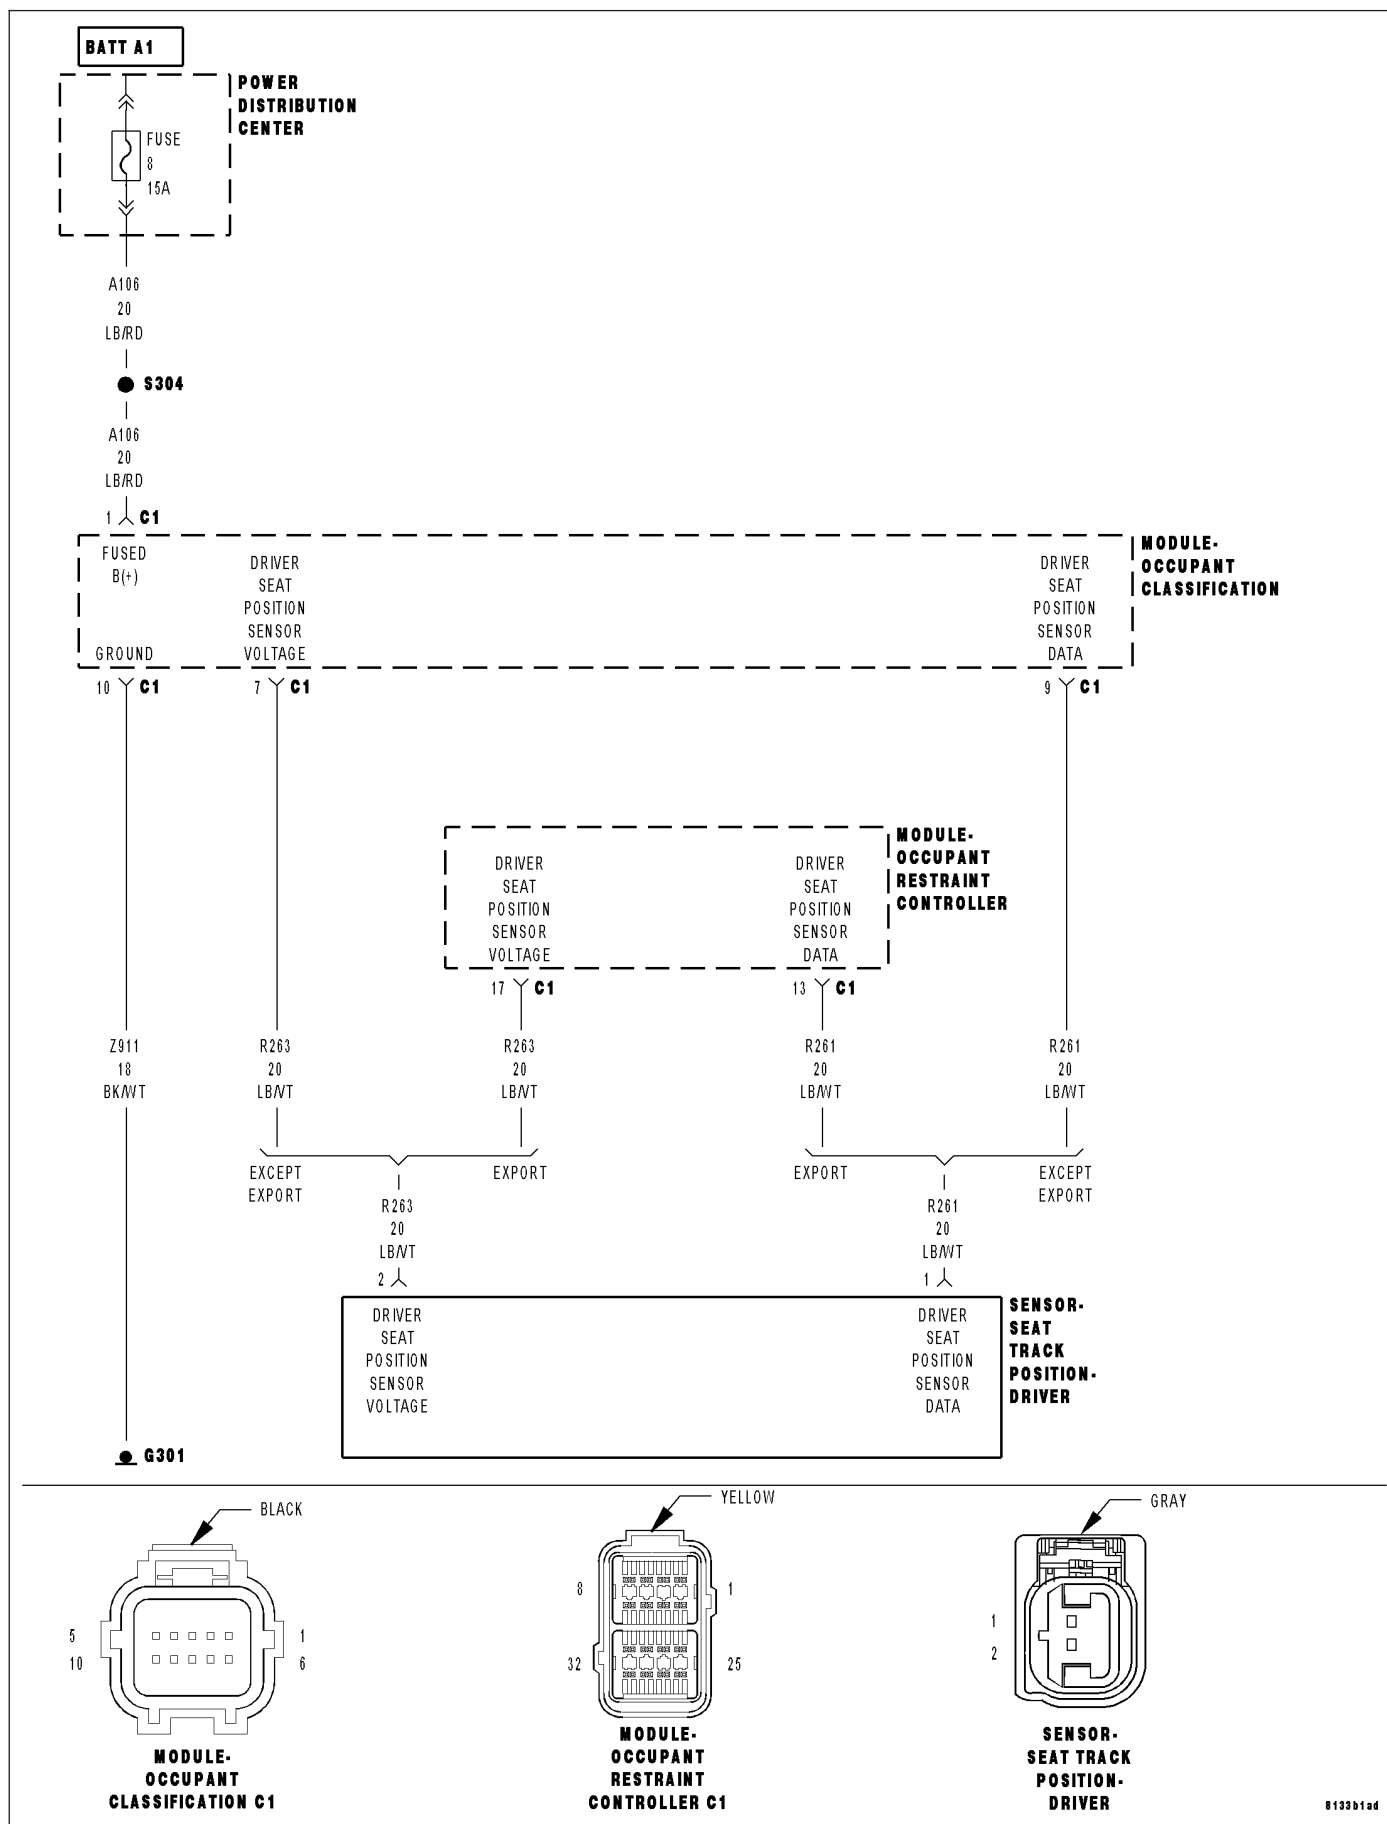

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE

**B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.

- **Set Condition:**

If the module detects that the sensor input is between 8 and 12 mA.

Possible Causes
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, BATTERY FAULTS, & SEAT TRACK POSITION SENSOR CIRCUIT HIGH OR LOW FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, battery faults, or Seat Track Position Sensor Circuit High or Low faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE (CONTINUED)****2. VERIFY THAT B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 4

**3. PERFORM SEAT TRACK POSITION SENSOR PERFORMANCE TEST**

With the scan tool, erase OCM DTCs.

Turn the ignition off, wait 10 seconds and then turn the ignition on.

Cycle the driver seat to the full forward position and then to the full rearward position.

Return the driver seat to its approximate original position.

Wait two minutes, and then with the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE?**

**Yes** >> Replace the Driver Seat Track Position Sensor in accordance with the Service Information.

Perform the OCS VERIFICATION TEST-VER 1. If DTC B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE returns active, replace the OCM in accordance with the Service Information.

**No** >> Perform the OCS VERIFICATION TEST-VER 1.

**B1B8C-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT PERFORMANCE (CONTINUED)****4. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW**

**B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW (CONTINUED)**

For the Occupant Classification circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN and the module is configured for a Seat Track Position Sensor, the module checks the sensor input current ranges.

- **Set Condition:**

If the module detects that the sensor input is less than or equal to 0.3 ma. This DTC may set when the current is between 0.3 mA and 2.0 mA.

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT SHORTED TO GROUND
(R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT SHORTED TO GROUND
(R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT OPEN
(R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT OPEN
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW (CONTINUED)****2. VERIFY THAT DTC B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Go To 7

---

**3. INSPECT DRIVER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Driver Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Driver Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

---

**4. VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Driver Seat Harness is routed correctly.

**Is the Driver Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Driver Seat Harness as necessary.

Perform OCS VERIFICATION TEST - VER 1.

---

**B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW (CONTINUED)****5. CHECK (R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT & (R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (R261) Seat Position Sensor Data-Driver circuit.

Measure the resistance between ground and the (R263) Seat Position Sensor Voltage-Driver circuit.

**Is the resistance below 10k ohms on either circuit?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Driver Seat Harness in accordance with the service information.

Perform the OCS VERIFICATION TEST-VER 1.

**No** >> Go To 6

**6. CHECK (R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT & (R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT FOR AN OPEN**

Disconnect the OCM C1 connector.

Measure the resistance of the (R261) Seat Position Sensor Data-Driver circuit between the OCM C1 connector and the Driver Seat Track Position Sensor connector.

Measure the resistance of the (R263) Seat Position Sensor Voltage-Driver circuit between the OCM C1 connector and the Driver Seat Track Position Sensor connector.

**Is the resistance of either circuit above 5.0 ohms?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Driver Seat Harness in accordance with the Service Information.

Perform the OCS VERIFICATION TEST-VER 1.

**No** >> Replace the OCM in accordance with the service information.

Perform the OCS VERIFICATION TEST-VER 1.

**B1B8D-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT LOW (CONTINUED)****7. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

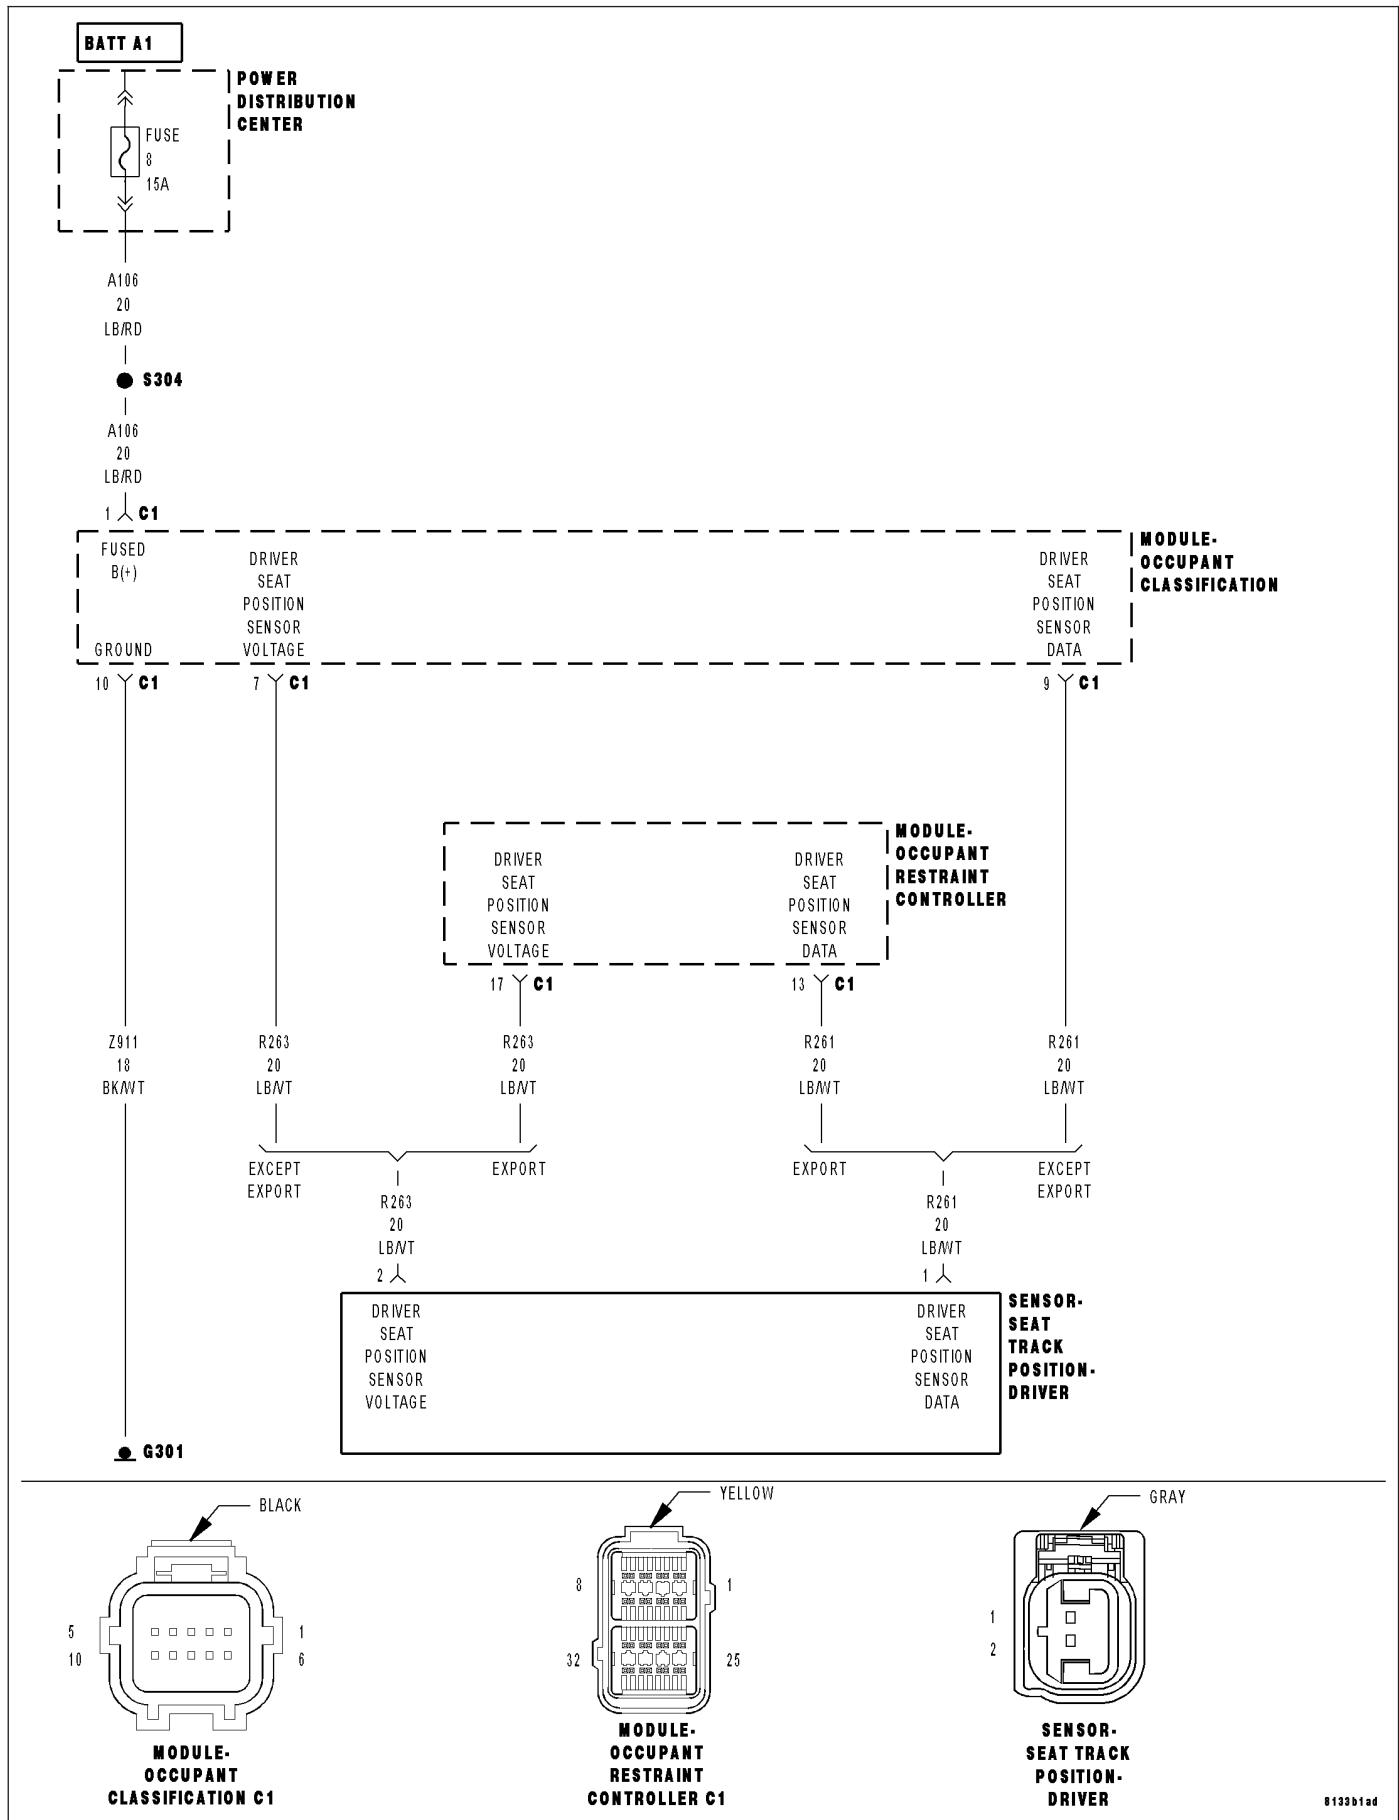

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH

**B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN and the module is configured for a Seat Track Position Sensor, the module checks the sensor input current ranges.

- **Set Condition:**

If the module detects that the sensor input is greater than or equal to 20.5 mA. This DTC may set when the current is between 17 mA and 20.5 mA.

Possible Causes
DRIVER SEAT HARNESS IMPROPERLY ROUTED
DRIVER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN
DRIVER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT, PUSHED OUT, SPREAD, CORRODED, CONTAMINATED
(R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT SHORTED TO VOLTAGE
(R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT SHORTED TO VOLTAGE
(R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT SHORTED TO (R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT
DRIVER SEAT TRACK POSITION SENSOR
OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH (CONTINUED)****2. VERIFY THAT DTC B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH?**

**Yes** >> Go To 3

**No** >> Go To 8

**3. INSPECT DRIVER SEAT HARNESS WIRES & CONNECTORS**

With the scan tool, erase OCM DTCs.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the Driver Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Driver Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**4. VERIFY THAT DRIVER SEAT HARNESS IS ROUTED CORRECTLY**

Verify that the Driver Seat Harness is routed correctly.

**Is the Driver Seat Harness routed correctly?**

**Yes** >> Go To 5

**No** >> Reroute the Driver Seat Harness as necessary.

Perform OCS VERIFICATION TEST - VER 1.

**B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH (CONTINUED)****5. CHECK FOR DTC B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH WITH DRIVER SEAT TRACK POSITION SENSOR DISCONNECTED**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Driver Seat Track Position Sensor connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Wait two minutes, and then with the scan tool, read OCM DTCs.

**Does the scan tool display: B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH?**

**Yes** >> Go To 6

**No** >> Replace the Driver Seat Track Position Sensor in accordance with the service information.  
Perform the OCS VERIFICATION TEST-VER 1.

**6. CHECK (R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT & (R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT FOR A SHORT TO VOLTAGE**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C1 connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R261) Seat Position Sensor Data-Driver circuit.

Measure the voltage of the (R263) Seat Position Sensor Voltage-Driver circuit.

**Is the voltage above 0.2 volts on either circuit?**

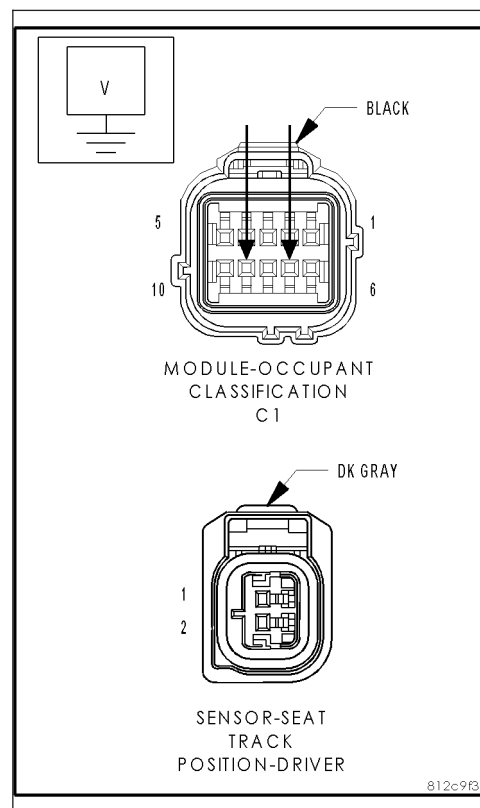

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Driver Seat Harness in accordance with the Service Information.

Perform the OCS VERIFICATION TEST-VER 1.

**No** >> Go To 7

**B1B8E-DRIVER SEAT TRACK POSITION SENSOR CIRCUIT HIGH (CONTINUED)****7. CHECK (R261) SEAT POSITION SENSOR DATA-DRIVER CIRCUIT FOR A SHORT TO (R263) SEAT POSITION SENSOR VOLTAGE-DRIVER CIRCUIT**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Measure the resistance between the (R261) Seat Position Sensor Data-Driver circuit and the (R263) Seat Position Sensor Voltage-Driver circuit.

**Is the resistance below 10k ohms?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Driver Seat Harness in accordance with the service information.

Perform the OCS VERIFICATION TEST-VER 1.

**No** >> Replace the OCM in accordance with the Service information.

Perform the OCS VERIFICATION TEST-VER 1.

**8. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

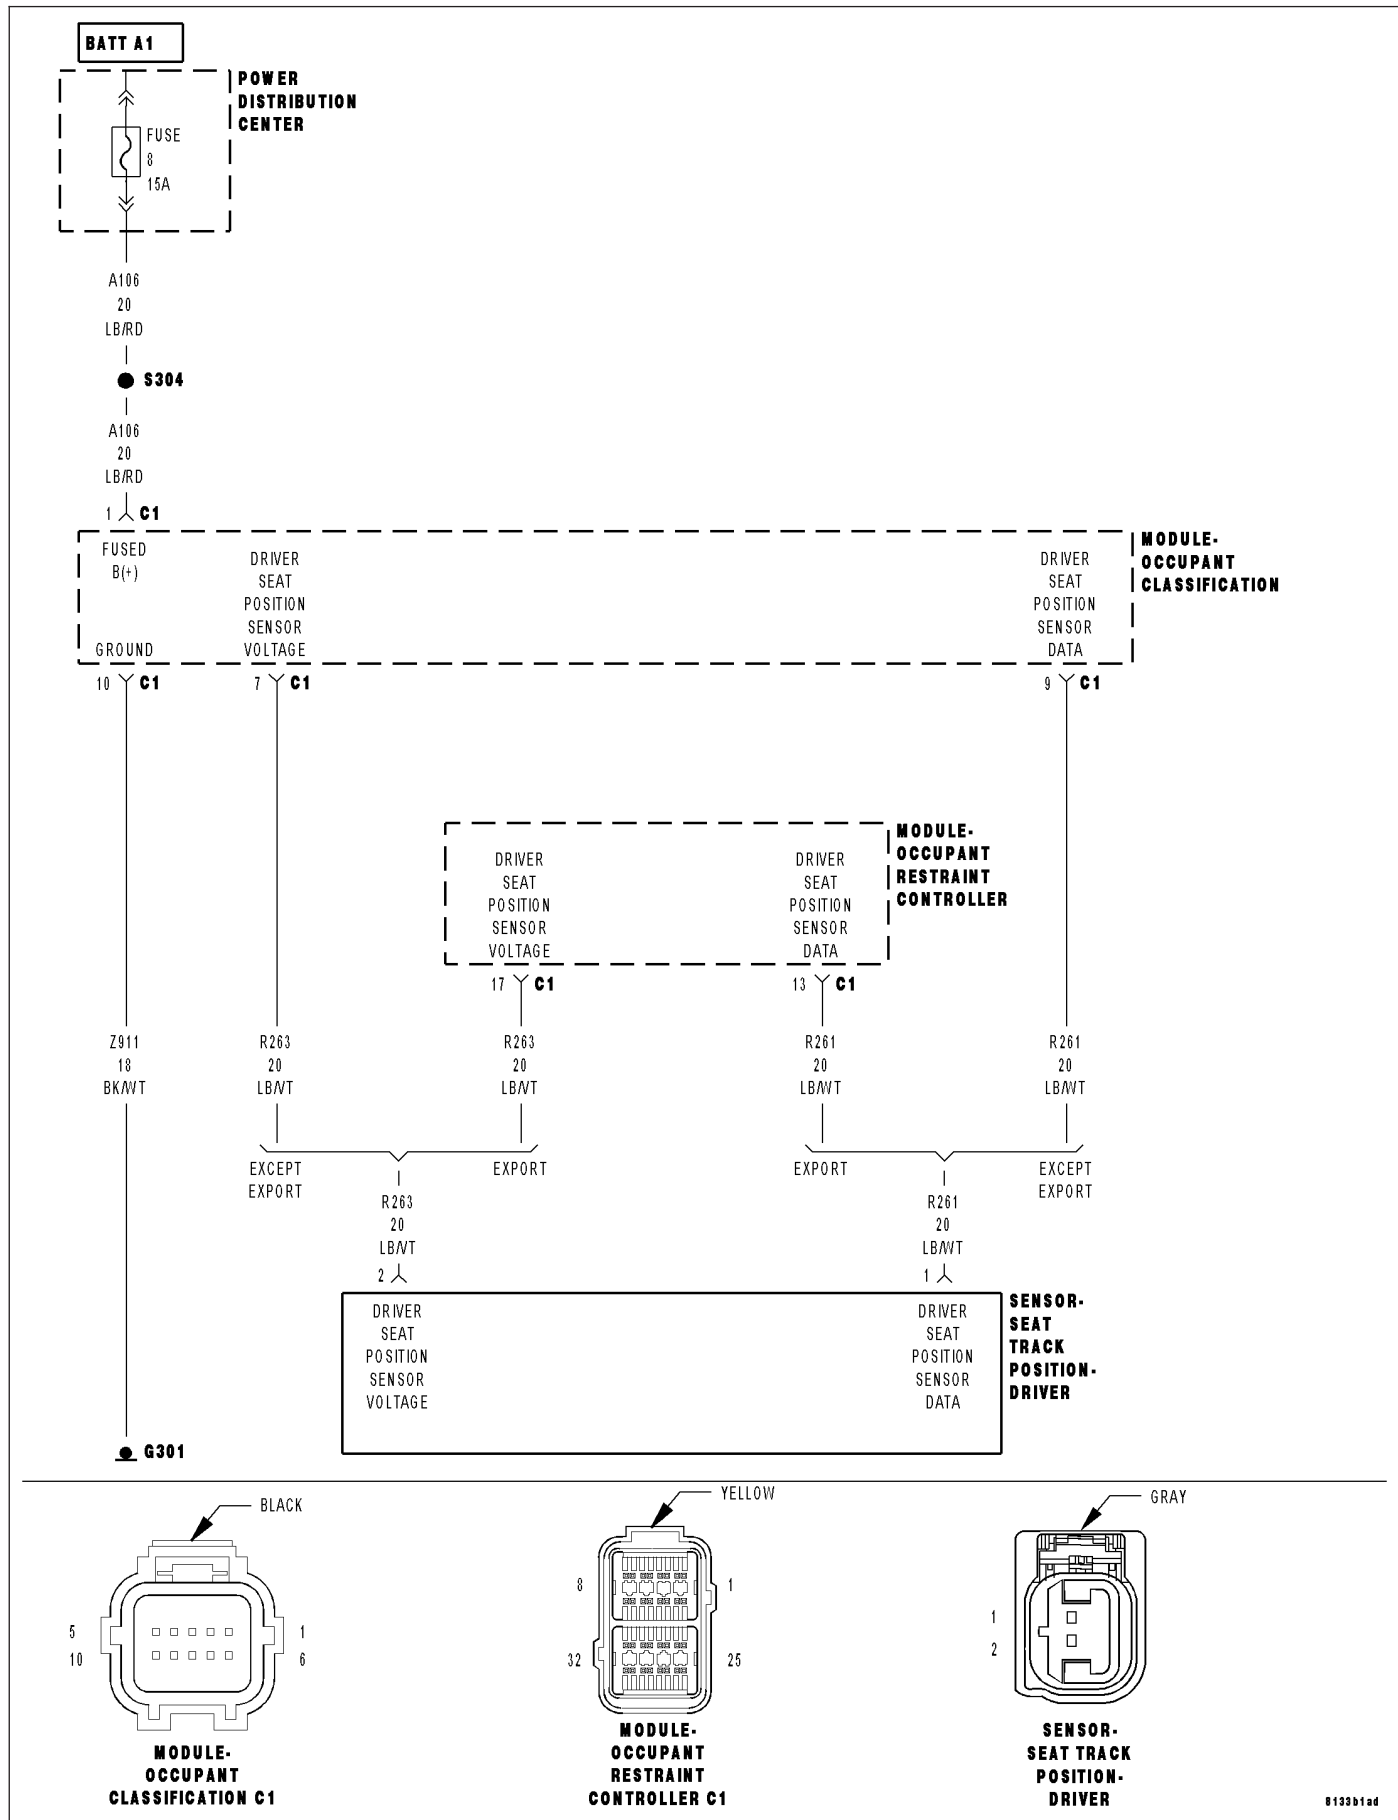

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B1B91-DRIVER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH**

**B1B91-DRIVER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on the OCM monitors the Seat Track Position Sensors circuits.

- **Set Condition:**

If the module detects current on the Seat Track Position Sensors circuits and the module is not configured for STPS.

Possible Causes
SENSORS
WIRING
OCCUPANT CLASSIFICATION MODULE (OCM)

## Diagnostic Test

### 1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 2

**B1B91-DRIVER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH (CONTINUED)****2. VERIFY THAT B1B91-DRIVER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH IS ACTIVE**

With the scan tool, erase OCM DTCs.

Turn the ignition off, wait 10 seconds and then turn the ignition on.

Wait 2 minutes, and then with the scan tool, read OCM DTCs.

**Does the scan tool display active: B1B91-DRIVER SEAT TRACK POSITION SENSOR CONFIGURATION MISMATCH?**

**Yes** >> Go To 3

**No** >> Perform the OCS VERIFICATION TEST-VER. 1

---

**3. VERIFY WIRING**

Turn the ignition off.

Inspect the driver and passenger seat wiring for Seat Position Sensors.

**Are Seat Position Sensor(s) present?**

**Yes** >> Replace the OCM in accordance with the Service Information.  
Perform the OCS VERIFICATION TEST-VER. 1

**No** >> Perform the OCS VERIFICATION TEST-VER. 1

---

## B1BA5-AIRBAG SQUIB CONFIGURATION MISMATCH

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If an Occupant Restraint Controller (ORC) configured for vehicles without side airbags is installed in a vehicle with side airbags.

Possible Causes
POWERTRAIN CONTROL MODULE (PCM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

### Diagnostic Test

#### 1. VERIFY THAT DTC B1BA5 AIRBAG SQUIB CONFIGURATION MISMATCH IS ACTIVE

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: B1BA5 AIRBAG SQUIB CONFIGURATION MISMATCH?**

**Yes** >> Go To 2

**No** >> Go To 5

#### 2. VERIFY THAT VEHICLE IS EQUIPPED WITH OCCUPANT CLASSIFICATION SYSTEM (OCS)

Vehicles equipped with a Occupant Classification System (OCS) will have a Passenger Airbag On/Off Indicator Lamp mounted to the dashboard. Verify that the vehicle is equipped with this indicator lamp.

With the scan tool, select ECU View and check that the Occupant Classification Module (OCM) is active on the bus.

**Is the vehicle equipped with an Occupant Classification System (OCS)?**

**Yes** >> Go To 3

**No** >> Replace the ORC in accordance with Service Information.  
Perform ORC VERIFICATION TEST - VER 1.

**B1BA5-AIRBAG SQUIB CONFIGURATION MISMATCH (CONTINUED)****3. CHECK ORC PART NUMBER WITH SCAN TOOL**

With the scan tool, select ECU View, select ORC, select ECU Details, and read the ORC part number.

**Is the part number correct for the vehicle?**

**Yes** >> Go To 4

**No** >> Replace the ORC in accordance with Service Information.  
Perform ORC VERIFICATION TEST - VER 1.

---

**4. CHECK VIN WITH SCAN TOOL**

With the scan tool, read the VIN.

**Is the correct VIN displayed?**

**Yes** >> Replace the ORC in accordance with Service Information.  
Perform ORC VERIFICATION TEST - VER 1.

**No** >> Replace the Powertrain Control Module (PCM) in accordance with Service Information.  
Perform ORC VERIFICATION TEST - VER 1.

**B1BA5-AIRBAG SQUIB CONFIGURATION MISMATCH (CONTINUED)****5. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B1BA5-AIRBAG SQUIB CONFIGURATION MISMATCH (CONTINUED)**  
**B1BA6-OCCUPANT CLASSIFICATION UNDETERMINED**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on or off.

- **Set Condition:**

Because other DTCs have made occupant detection impossible. This DTC will set in addition to all sensor and module DTCs and will be erased when the repairs are completed.

Refer to **B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED** for the diagnostic test procedure.

## B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED

### OCCUPANT CLASSIFICATION SEAT WEIGHTS

8129faa2

**B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED (CONTINUED)**

- **When Monitored:**

With the CAN ignition status as IGN\_RUN, the module tries to detect potentially damaging events and monitors the CAN Bus for the X Impact messages (crash event causing one or more airbag or pretensioner to deploy) or upon detecting an Offset Event (if equipped).

- **Set Condition:**

This DTC will set if the module detects a potentially damaging event or the X Impact messages from the CAN Bus input.

Possible Causes
B1BA7-OCS VERIFICATION REQUIRED DTC ACTIVE

**Diagnostic Test****1. CHECK FOR OCCUPANT CLASSIFICATION MODULE (OCM) ACTIVE DTCs:**

- ACTIVE INTERNAL FAULTS
- IGNITION FAULTS
- BATTERY FAULT
- SEAT WEIGHT SENSOR DTCs

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display any active DTCs listed above?**

**Yes**    >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No**    >> Go To 2

**2. VERIFY THAT DTC B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED?**

**Yes**    >> Go To 3

**No**    >> Go To 4

**B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED (CONTINUED)****3. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**Note:** Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1BA7-OCCUPANT CLASSIFICATION SYSTEM VERIFICATION REQUIRED?**

**Yes** >> Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.  
Perform OCS VERIFICATION TEST - VER 1.

**No, But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**4. CHECK FOR ACTIVE DTC B1BA8-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1BA8-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Perform OCS VERIFICATION TEST - VER 1.

## B1BA8-OCM SYSTEM OUT OF CALIBRATION/NOT CALIBRATED

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
While the CAN bus ignition status is IGN\_RUN or SNA.
- **Set Condition:**  
This DTC will set if the module has initiated a rezero and did not successfully complete the system verification.

### Diagnostic Test

#### 1. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**Note:** Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active DTCs?**

**Yes - B1BA8 DTC Returned**

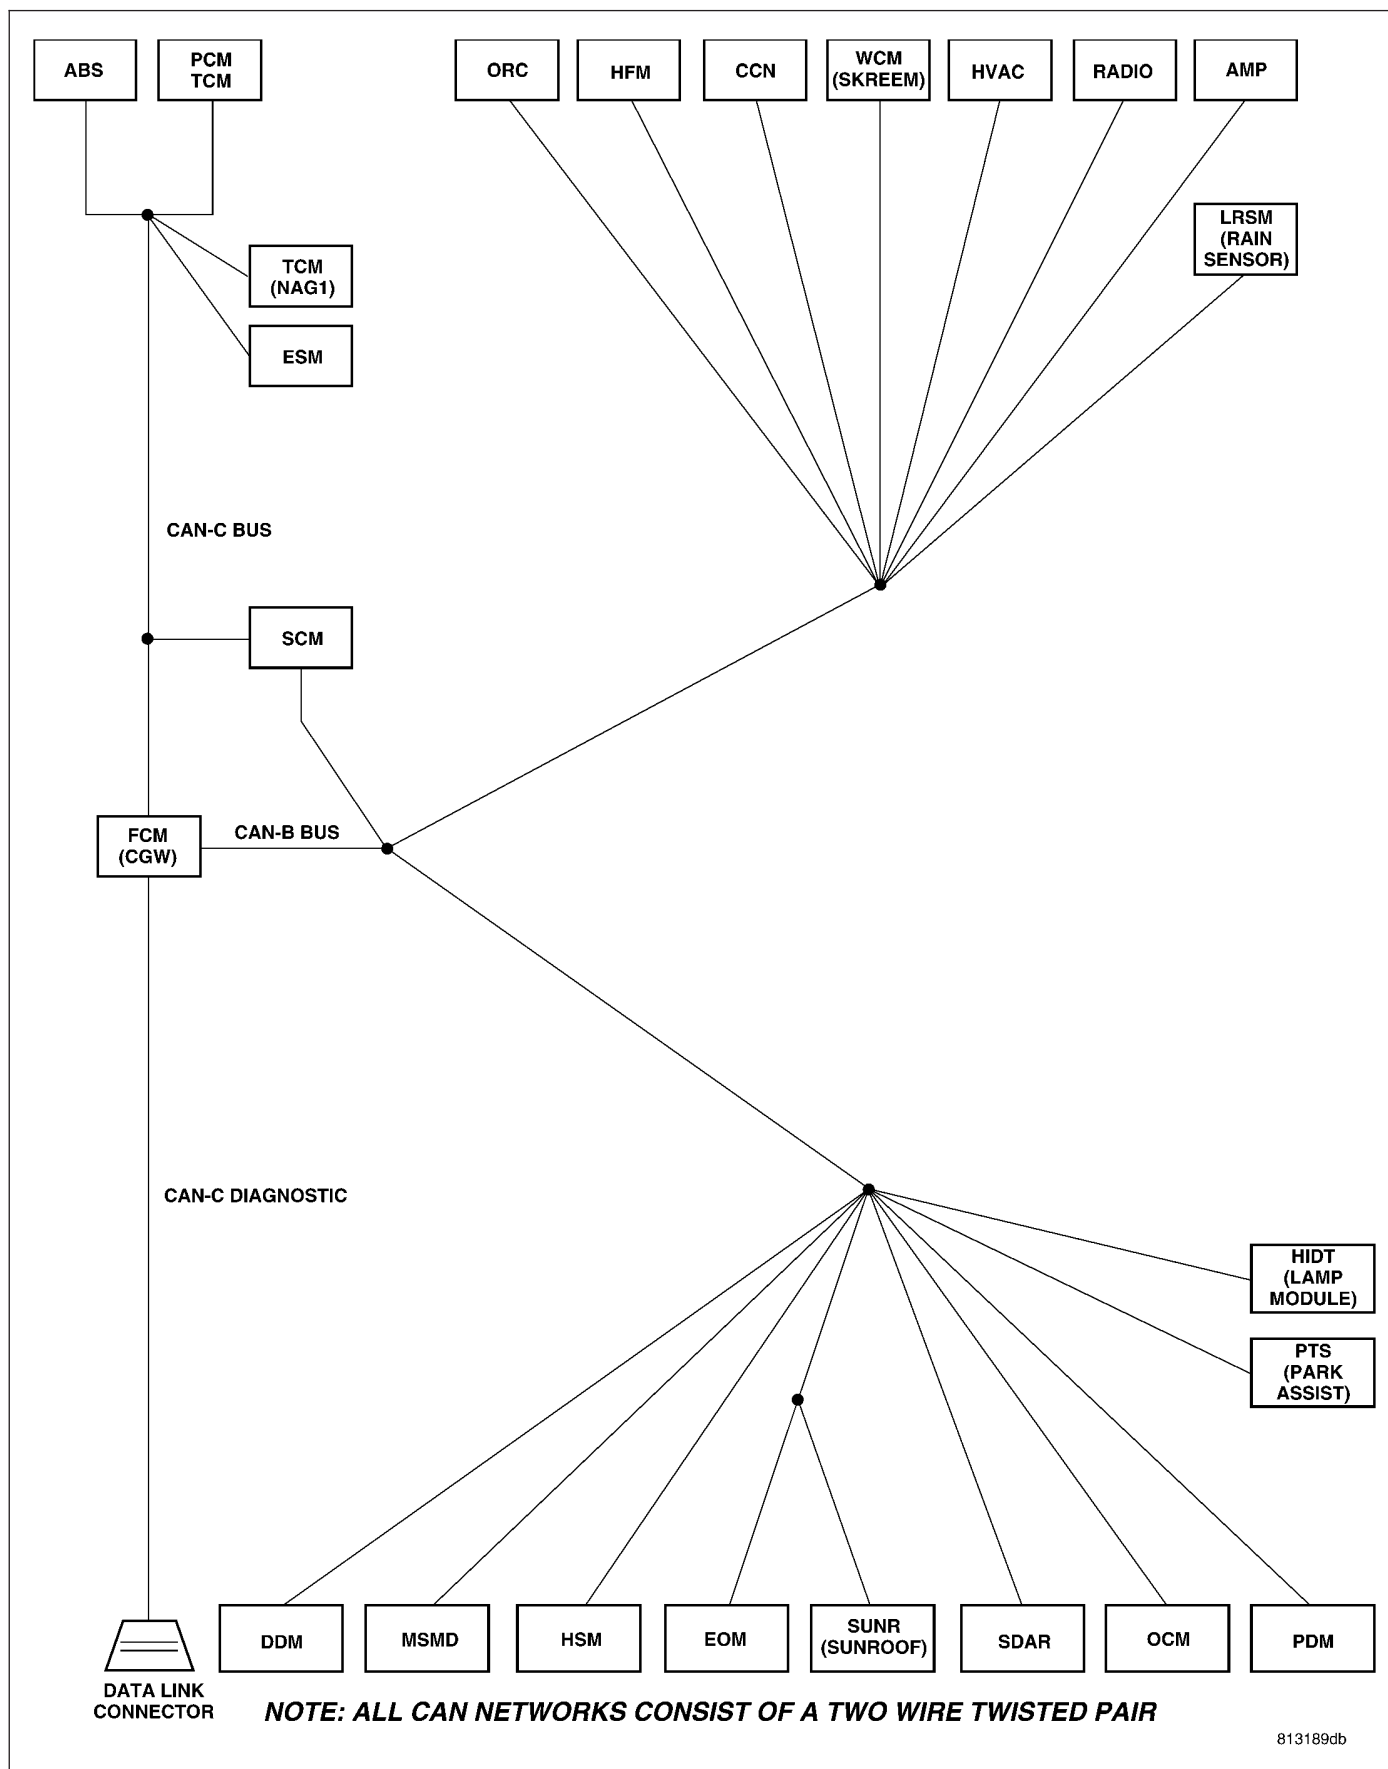

Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

**Yes - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**B1BB8-SRS WARNING INDICATOR STATUS MISMATCH**

**B1BB8-SRS WARNING INDICATOR STATUS MISMATCH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
After the Instrument Cluster bulb check is completed, the ORC compares the lamp request by the ORC (On or Off) and the Lamp On request by the Instrument Cluster (On or Off) Can bus messages. Each message is transmitted one time per second or when a change in the lap state occurs.
- **Set Condition:**  
If the lamp request by the ORC (On or Off), and the Lamp On by the Instrument Cluster (On or Off), messages do not match, this code will set.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER, INSTRUMENT CLUSTER MESSAGE MISMATCH INSTRUMENT CLUSTER OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test**

**1. CHECK FOR AN ACTIVE DTC**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

- Select DTC type.**
- Active**                      Go To 2
- Stored**                      Go To 5

**B1BB8-SRS WARNING INDICATOR STATUS MISMATCH (CONTINUED)****2. CHECK FOR ACTIVE INSTRUMENT CLUSTER DTCs**

With the scan tool, read Instrument Cluster DTCs.

**Does the scan tool display and active Instrument Cluster DTCs?**

- Yes** >> Refer to symptom list for problems related to the Instrument Cluster.  
Perform the ORC VERIFICATION TEST-VER 1.
- No** >> Go To 3

**3. CHECK THE ORC AND INSTRUMENT CLUSTER FOR LAMP STATUS**

With the scan tool view the Instrument Cluster Data Display.

Cycle the ignition key and observe the SRS Indicator Lamp Request status (Set/Not Set) during the Instrument Cluster bulb check.

With the scan tool view the ORC Data Display.

Cycle the ignition key and observe the SRS Indicator Lamp Status (Lamp On/Lamp Off) during the Instrument Cluster bulb check.

**Did the Data Display information match the operation of the lamp?**

- Yes** >> Go To 4
- No** >> Replace the Instrument Cluster in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

**4. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

**B1BB8-SRS WARNING INDICATOR STATUS MISMATCH (CONTINUED)****5. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

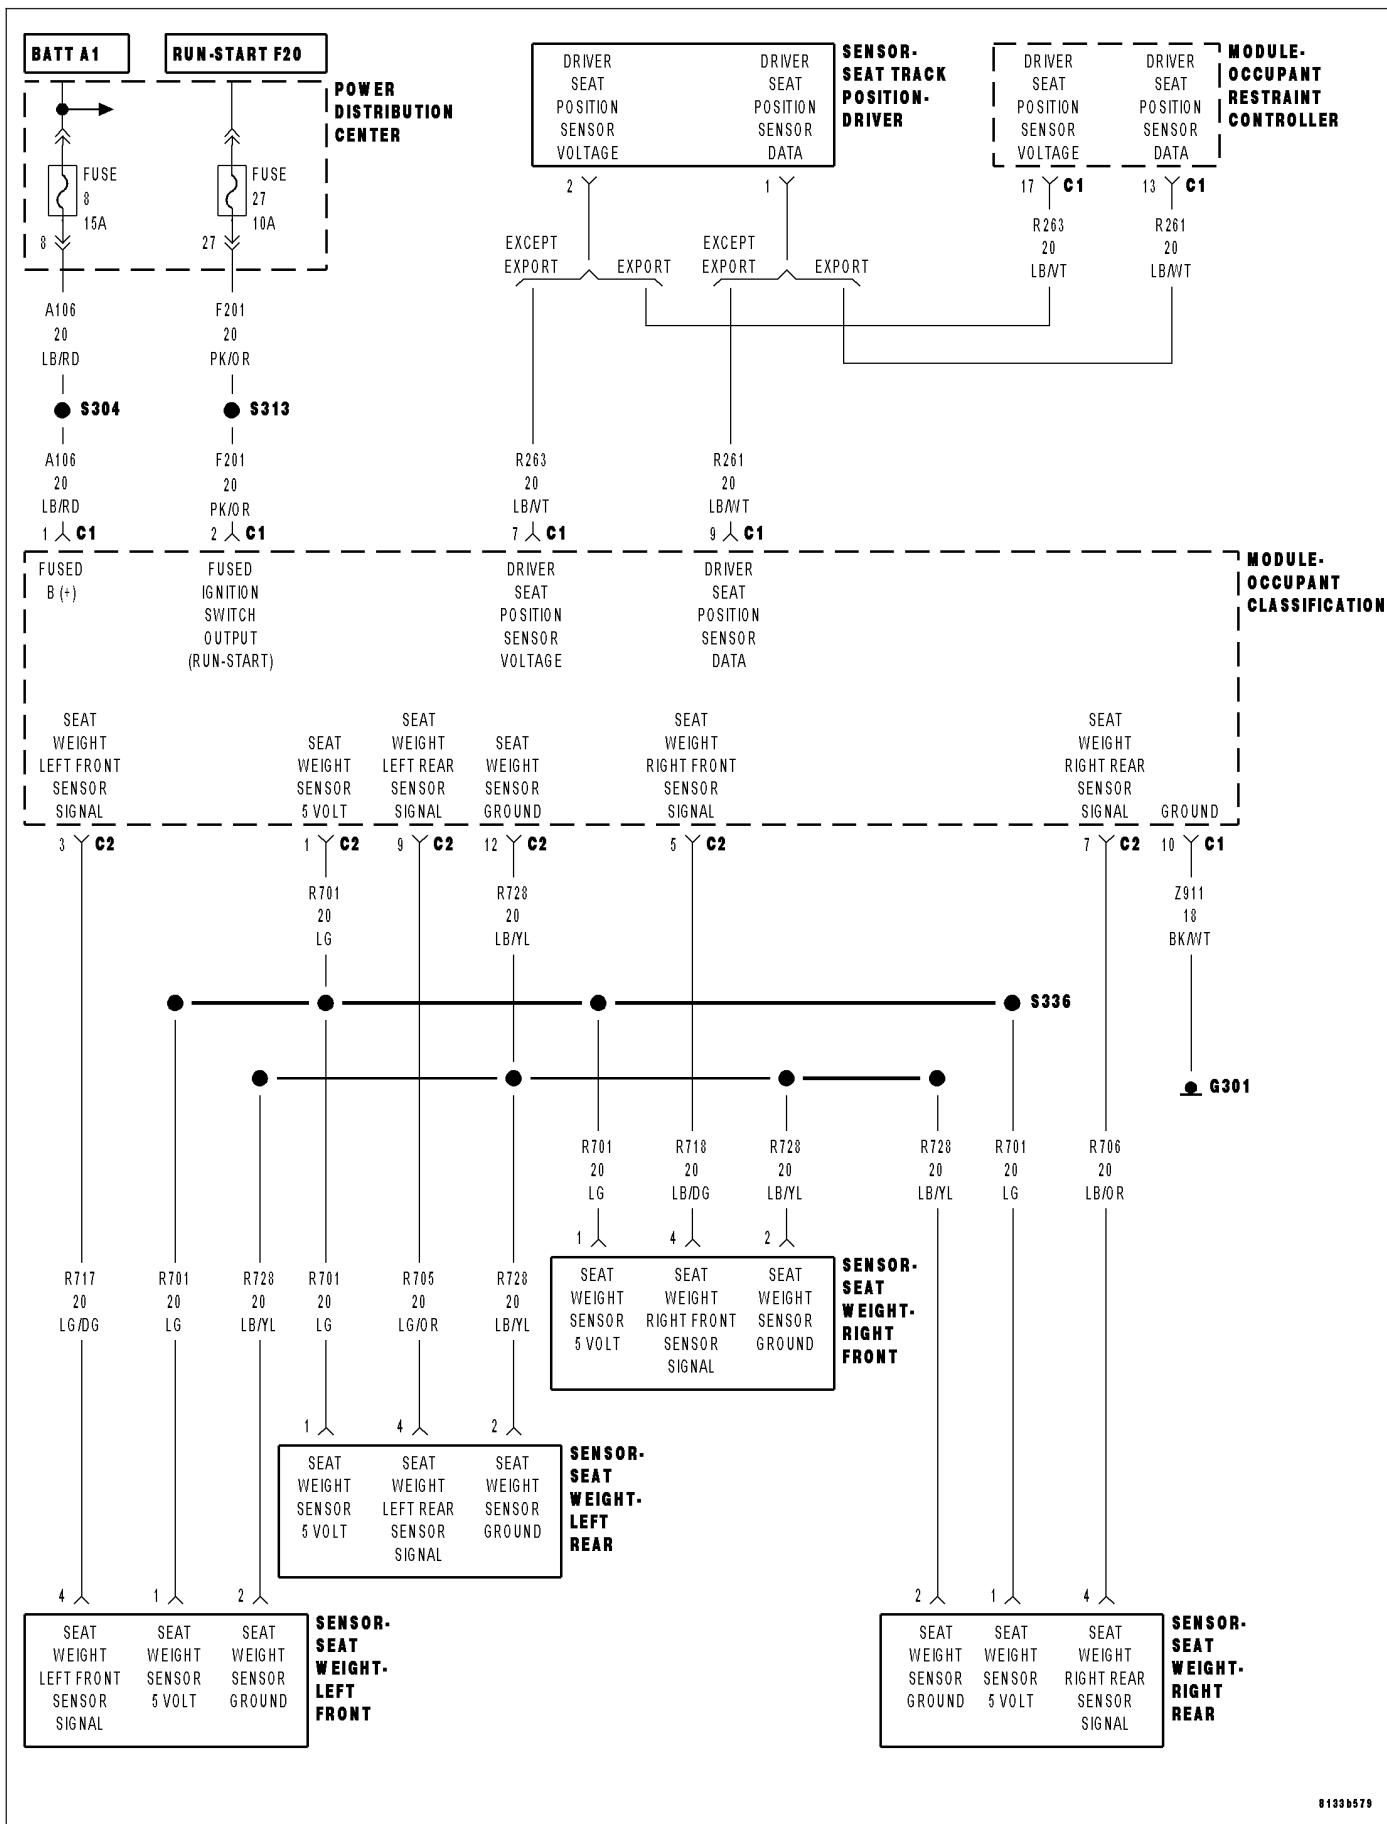

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT

**B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**  
While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor supply.
- **Set Condition:**  
If the OCM detects that the sensor supply shorted. **Note: A shorted supply circuit will cause a 'NO RESPONSE FROM OCM' condition.**

Possible Causes
OCS SUPPLY CIRCUIT SHORTED
OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test**

**1. VERIFY THAT B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT DTC IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT?**

- Yes**
- >> Replace the OCM in accordance with the Service Information.  
Perform the OCS VERIFICATION REQUIRED procedure.
- No**
- >> Go To 2

**2. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

- Yes**
- >>
- Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.  
Replace the Passenger Seat Harness in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.
- No**
- >> Go To 3

**B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT (CONTINUED)****3. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

The diagram illustrates the electrical connections for the Occupant Restraint Controller (ORC). It is divided into several functional sections:

- POWER DISTRIBUTION CENTER:** Shows connections for BATT A1 (8A, 15A) and RUN-START F20 (27A, 10A). Fuses are indicated for each circuit. The BATT A1 circuit includes a fuse and a connection to the ORC. The RUN-START F20 circuit includes a fuse and a connection to the ORC.
- SENSOR-SEAT TRACK POSITION-DRIVER:** Shows connections for DRIVER SEAT POSITION SENSOR VOLTAGE and DRIVER SEAT POSITION SENSOR DATA. The voltage signal is connected to the ORC via a 2-pin connector. The data signal is connected to the ORC via a 1-pin connector.
- SENSOR-SEAT TRACK POSITION-DRIVER:** Shows connections for DRIVER SEAT POSITION SENSOR VOLTAGE and DRIVER SEAT POSITION SENSOR DATA. The voltage signal is connected to the ORC via a 17-pin connector (C1). The data signal is connected to the ORC via a 13-pin connector (C1).
- MODULE-OCCUPANT RESTRAINT CONTROLLER:** Shows connections for DRIVER SEAT POSITION SENSOR VOLTAGE and DRIVER SEAT POSITION SENSOR DATA. The voltage signal is connected to the ORC via a 17-pin connector (C1). The data signal is connected to the ORC via a 13-pin connector (C1).
- MODULE-OCCUPANT CLASSIFICATION:** Shows connections for SEAT WEIGHT LEFT FRONT SENSOR SIGNAL, SEAT WEIGHT LEFT REAR SENSOR SIGNAL, SEAT WEIGHT RIGHT FRONT SENSOR SIGNAL, SEAT WEIGHT RIGHT REAR SENSOR SIGNAL, and GROUND. These signals are connected to the ORC via various connectors (C2, C1).
- SENSOR-SEAT WEIGHT-LEFT REAR:** Shows connections for SEAT WEIGHT SENSOR 5 VOLT, SEAT WEIGHT LEFT REAR SENSOR SIGNAL, and SEAT WEIGHT SENSOR GROUND. These signals are connected to the ORC via a 1-pin connector (C2).
- SENSOR-SEAT WEIGHT-LEFT FRONT:** Shows connections for SEAT WEIGHT LEFT FRONT SENSOR SIGNAL, SEAT WEIGHT SENSOR 5 VOLT, and SEAT WEIGHT SENSOR GROUND. These signals are connected to the ORC via a 3-pin connector (C2).
- SENSOR-SEAT WEIGHT-RIGHT FRONT:** Shows connections for SEAT WEIGHT RIGHT FRONT SENSOR SIGNAL, SEAT WEIGHT SENSOR 5 VOLT, and SEAT WEIGHT SENSOR GROUND. These signals are connected to the ORC via a 5-pin connector (C2).
- SENSOR-SEAT WEIGHT-RIGHT REAR:** Shows connections for SEAT WEIGHT RIGHT REAR SENSOR SIGNAL, SEAT WEIGHT SENSOR 5 VOLT, and SEAT WEIGHT SENSOR GROUND. These signals are connected to the ORC via a 7-pin connector (C2).

The diagram uses standard automotive symbols for fuses, connectors, and ground points. Wire colors and gauges are indicated throughout the diagram.

**B1BBB-PASSENGER SEAT WEIGHT SENSOR INPUTS SHORTED TOGETHER (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**

While the CAN bus ignition status is in IGN\_RUN.

- **Set Condition:**

If the OCM detects any two sensors voltages below 20mV for 10 minutes while any other sensor is greater than 40mV. Note: 1 a/d count is equal to 5mV. **Note: A shorted supply circuit will cause a 'NO RESPONSE FROM OCM' condition.**

Possible Causes
OCS SENSOR CIRCUITS SHORTED TOGETHER
OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test****1. VERIFY THAT B1BBA-PASSENGER SEAT WEIGHT SENSOR SUPPLY CIRCUIT DTC IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1BBB-PASSENGER SEAT WEIGHT SENSOR INPUTS SHORTED TOGETHER ?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform the OCS VERIFICATION REQUIRED procedure.

**No** >> Go To 2

**2. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**B1BBB-PASSENGER SEAT WEIGHT SENSOR INPUTS SHORTED TOGETHER (CONTINUED)****3. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from the OCM.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1BBC-OCS NEGATIVE SYSTEM WEIGHT

### OCCUPANT CLASSIFICATION SEAT WEIGHTS

B1BBC-OCS NEGATIVE SYSTEM WEIGHT (CONTINUED)

- **When Monitored:**  
While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.
- **Set Condition:**  
If the module detects a seat weight sensor input with the total seat weight below -6.5 kg +/- 1kg.

Possible Causes
DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN
OBJECT UNDER SEAT OR REAR SEAT FOLDED DOWN AND RESTING AGAINST PASSENGER SEAT
OCCUPANT CLASSIFICATION MODULE (OCM)

Diagnostic Test

1. TEST CONDITIONS

- ACTIVE INTERNAL DTC
- IGNITION DTC
- BATTERY DTC
- SEAT WEIGHT SENSOR DTC

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

- Does the scan tool display any active DTCs listed above?
- Yes**    >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.
- No**      >> Go To 2

2. ACTIVE OR STORED DTC

With the scan tool, read OCM DTCs.

- Does the scan tool display active: B1BBC–NEGATIVE SYSTEM WEIGHT?
- Yes**    >> Go To 3
- No**      >> Go To 4

**B1BBC-OCS NEGATIVE SYSTEM WEIGHT (CONTINUED)****3. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**Note: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.**

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1BA8-OCS NOT CALIBRATED DTC?**

**Yes** >> Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.  
Perform OCS VERIFICATION TEST - VER 1.

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

---

**B1BBC-OCS NEGATIVE SYSTEM WEIGHT (CONTINUED)****4. STORED B1BBC-OCS NEGATIVE SYSTEM WEIGHT DTC**

With the scan tool, record and erase all DTC's from all Airbag System Modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool monitor active codes as you work through the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

IF only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTC's present?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## B1BBD-OCM CURRENT CONFIGURATION TABLE UNPROGRAMMED

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

If the Configuration Table is not programmed at the supplier or when the checksum is invalid.

- **Set Condition:**

This DTC will set if the module was received unprogrammed from the supplier, the vehicle line was not identified correctly or if the flash procedure was not completed successfully

Possible Causes
NEW OCCUPANT CLASSIFICATION MODULE
INTERNAL CHECKSUM FAILURE

## Diagnostic Test

### 1. MODULE CONFIGURATION

**Does the scan tool display B1BBD-OCM CURRENT CONFIGURATION TABLE UNPROGRAMMED?**

**Yes** >> Perform the B1BA7-OCS VERIFICATION REQUIRED diagnostic procedure.

**No** >> Replace the Occupant Classification Module in accordance with the service information.  
With the scan tool, perform the OCM SYSTEM VERIFICATION procedure.

B1BC7-DEPLOYMENT DATA RECORD FULL

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

Diagnostic Test

1. CHECK FOR ACTIVE DTC

Turn the ignition on.  
With the scan tool, read ORC DTCs.

- Is the Deployment Data Record Full DTC active?
- Yes**    >> Go To 2
- No**    >> Perform the ORC VERIFICATION TEST-VER. 1.

2. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

- View repair.
- Repair**
- Replace the Occupant Restraint Controller in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

## B1BC8-PASSENGER SEAT WEIGHT SENSORS PERFORMANCE

### OCCUPANT CLASSIFICATION SEAT WEIGHTS

**B1BC8-PASSENGER SEAT WEIGHT SENSORS PERFORMANCE (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
While the CAN bus ignition status is in IGN\_RUN, the module checks the sensor input ranges.
- **Set Condition:**  
If the module detects the difference between 2 sensors is less than 3 A/D (15 mV) counts for 10 consecutive minutes while at least one sensor count is changing and greater than 8 A/D (40 mV) counts.

Possible Causes
OTHER SEAT WEIGHT SENSOR FAULTS ACTIVE IN THE OCM PASSENGER SEAT HARNESS WIRES CHAFFED, PIERCED, PINCHED, PARTIALLY BROKEN PASSENGER SEAT HARNESS CONNECTOR TERMINALS BROKEN, BENT PUSHED OUT, SPREAD, CORRODED, CONTAMINATED PASSENGER SEAT WEIGHT SENSORS DAMAGE TO THE PASSENGER SEAT STRUCTURE, RISER ASSEMBLY, CROSSMEMBERS, SEAT TRACKS, FLOOR PAN OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test**

**1. CHECK FOR ACTIVE INTERNAL FAULTS, IGNITION FAULTS, & BATTERY FAULTS IN THE OCCUPANT CLASSIFICATION MODULE (OCM)**

- Note:** Ensure the battery is fully charged.
- Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.
- Turn the ignition on, then off, and then on again.
- Note:** This DTC will take 10 minutes to mature, allow plenty of time for the code to mature between as you work through the test steps.
- With the scan tool, read Occupant Classification Module (OCM) DTCs.

- Does the scan tool display any active DTCs relating to internal faults, ignition faults, or battery faults?**
- Yes**    >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.
- No**     >> Go To 2

**B1BC8-PASSENGER SEAT WEIGHT SENSORS PERFORMANCE (CONTINUED)****2. VERIFY THAT DTC B1BC8-PASSENGER SEAT WEIGHT SENSORS PERFORMANCE IS ACTIVE**

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B1BC8-PASSENGER SEAT WEIGHT SENSORS PERFORMANCE?**

**Yes** >> Go To 3

**No** >> Go To 6

**3. CHECK FOR OTHER ACTIVE PASSENGER SEAT WEIGHT SENSOR FAULTS IN THE OCM**

With the scan tool, read OCM DTCs.

**Does the scan tool display any other active Seat Weight Sensor DTCs?**

**Yes** >> Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Go To 4

**B1BC8-PASSENGER SEAT WEIGHT SENSORS PERFORMANCE (CONTINUED)****4. INSPECT PASSENGER SEAT HARNESS WIRES & CONNECTORS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the Passenger Seat Harness wiring and connectors. Look for chafed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

**Are any of these conditions present?**

**Yes** >>

**Note:** Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.

Replace the Passenger Seat Harness in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

**Note:** Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, wait two minutes, and then proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active PASSENGER SEAT WEIGHT SENSOR PERFORMANCE DTCs?**

**Yes** >> Perform the \*Diagnosis/Checkout Procedure For Seat Weight Sensors.

Perform OCS VERIFICATION TEST - VER 1.

**Other DTCs ACTIVE**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Perform OCS VERIFICATION TEST - VER 1.

**B1BC8-PASSENGER SEAT WEIGHT SENSORS PERFORMANCE (CONTINUED)****6. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**Note: This DTC will take 10 minutes to mature, allow plenty of time for the code to mature between as you work through the test steps.**

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

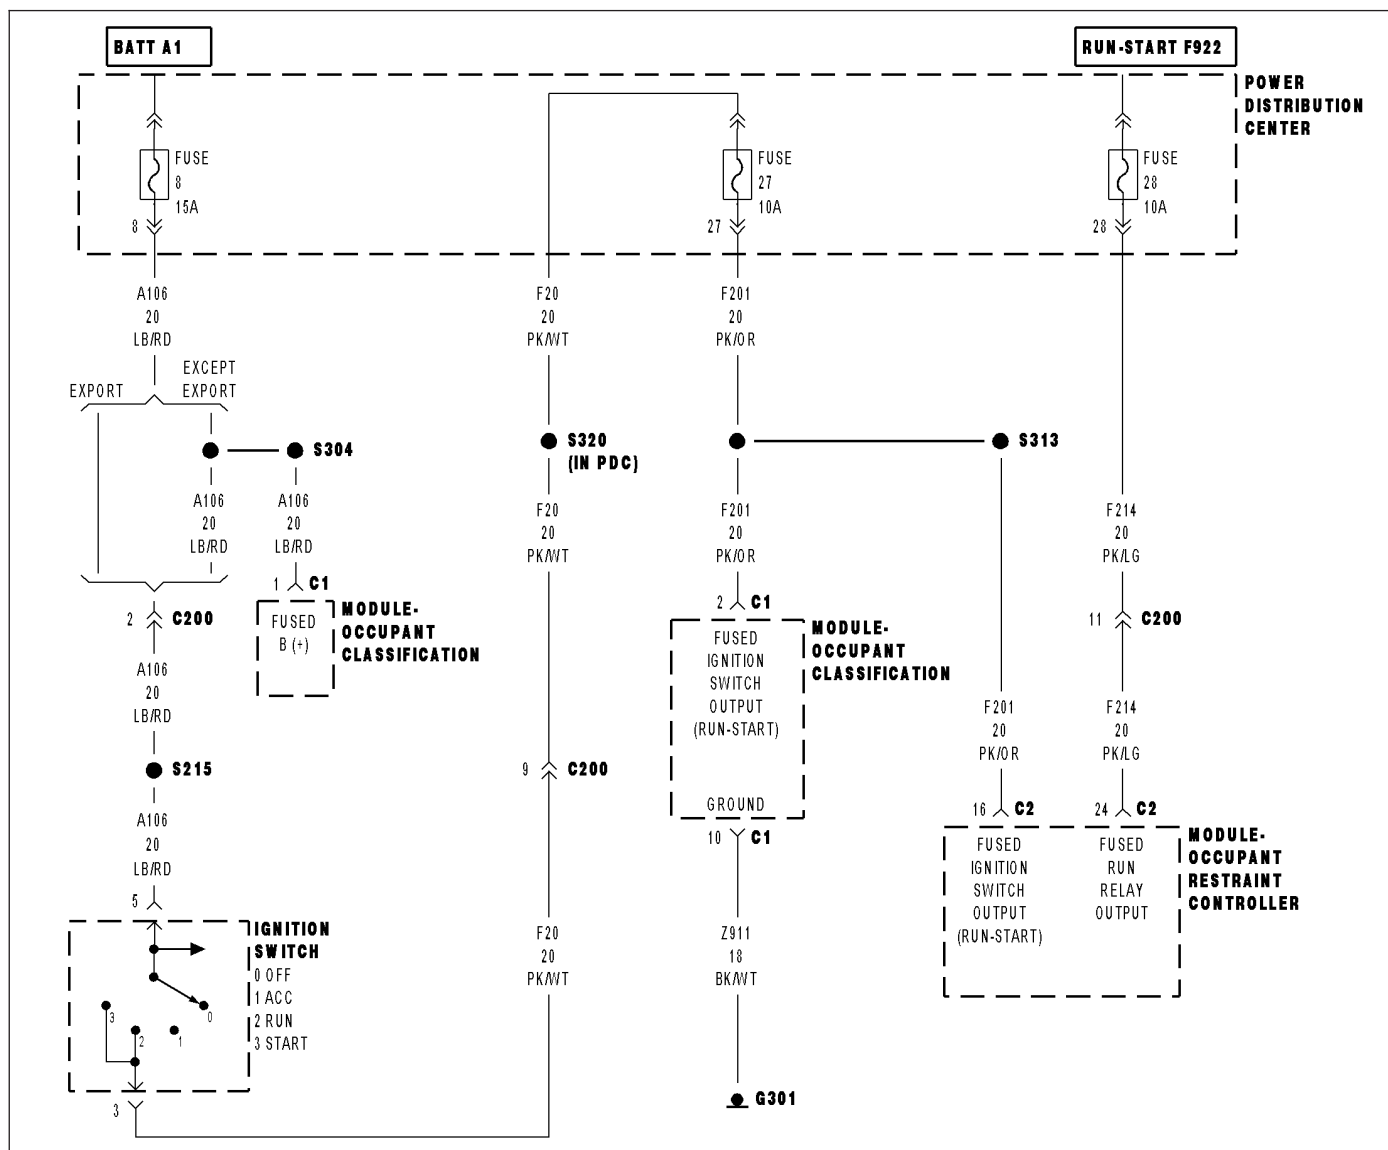

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**B2101-IGNITION RUN/START INPUT CIRCUIT LOW**

**B2101-IGNITION RUN/START INPUT CIRCUIT LOW (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus is RUN or SNA and the IOD status is "IN". The module checks the (F201) Fused Ignition Switch Output (Run-Start) circuit voltage input range.

- **Set Condition:**

With the ignition on, if voltage on the (F201) Fused Ignition Switch Output (Run-Start) circuit is equal to or below  $6.25 \pm 0.25$  volts. Within 60 seconds of turning the ignition off, if the (F201) Fused Ignition Switch Output (Run-Start) circuit is 2.4 to 5.0 volts.

Possible Causes
(F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN
(F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORTED TO GROUND
OPEN FUSE (27)
(F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN
OCCUPANT CLASSIFICATION MODULE (OCM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

## Diagnostic Test

### 1. VERIFY THAT DTC B2101 IGNITION RUN/START INPUT CIRCUIT LOW IS ACTIVE IN THE ORC.

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

**Does the scan tool display active: B2101 IGNITION RUN/START INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Go To 2

**B2101-IGNITION RUN/START INPUT CIRCUIT LOW (CONTINUED)****2. CHECK FOR ACTIVE DTC B2101 IGNITION RUN/START INPUT CIRCUIT LOW IN OCM.**

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display active: B2101 IGNITION RUN/START INPUT CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Go To 11

**3. INSPECT AIRBAG RUN-START FUSE**

Turn the ignition off.

Remove the Airbag Run-Start Fuse from the rear Power Distribution Center and inspect the fuse.

**Note: Check connectors - Clean and repair as necessary.**

**Is the Run/Start fuse open?**

**Yes** >> Go To 4

**No** >> Go To 7

**4. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT RESISTANCE**

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between ground and the Airbag Run-Start fuse terminal (output side).

**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 5

**No** >> Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Replace Airbag Run-Start Fuse.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1.

**B2101-IGNITION RUN/START INPUT CIRCUIT LOW (CONTINUED)****5. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT RESISTANCE WITH ORC CONNECTORS DISCONNECTED**

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the both ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-24 Adaptor to the ORC C2 connector.

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between 8443-24 adaptor and ground).

**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 6

**No** >> Replace the ORC in accordance with the Service Information.  
Replace the Airbag Run-Start Fuse.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT RESISTANCE WITH OCM C1 CONNECTOR DISCONNECTED**

**WARNING:** If the Occupant Classification Module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

Disconnect the OCM C1 connector.

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between ground and the Occupant Classification Module C1 connector.

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (F201) Fused Ignition Switch Output (Run-Start) circuit for a short to ground.  
Replace the Airbag Run-Start Fuse.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**No** >> Replace the OCM in accordance with the Service Information.  
Replace the Airbag Run-Start Fuse.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**B2101-IGNITION RUN/START INPUT CIRCUIT LOW (CONTINUED)****7. CHECK (F201) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN**

Turn the ignition on.

Measure the voltage of the (F20) Ignition Switch Output (Run-Start) circuit at the Airbag Run-Start fuse terminal (supply side).

**Is the voltage above 6.0 volts?**

**Yes** >> Go To 8

**No** >> Repair the open (F20) Ignition Switch Output (Run-Start) circuit.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1.

**8. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Reinstall the Airbag Run-Start Fuse.

Disconnect the both ORC connectors.

**Note: Check connectors - Clean and repair as necessary.**

Install the Airbag Load tool ORC 8443-24 adaptor to the ORC C2 connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Measure the voltage of the (F201) Fused Ignition Switch Output (Run-Start) Circuit between the 8443-24 connector and ground.

**Is the voltage above 6.0 volts?**

**Yes** >> Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B2101 IGNITION RUN/START INPUT CIRCUIT LOW was Active in the OCM.

**No** >> Repair the open (F201) Fused Ignition Switch Output (Run-Start) circuit.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B2101 IGNITION RUN/START INPUT CIRCUIT LOW was Active in the OCM.

**B2101-IGNITION RUN/START INPUT CIRCUIT LOW (CONTINUED)****9. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Reinstall the Airbag Run-Start Fuse.

Disconnect the both Occupant Classification Module (OCM) connectors.

**Note:** Check connectors - Clean and repair as necessary.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (F201) Fused Ignition Switch Output (Run-Start) Circuit between the OCM connector and ground.

**Is the voltage above 6.0 volts?**

**Yes** >> Go To 10

**No** >> Repair the open (F201) Fused Ignition Switch Output (Run-Start) circuit between the OCM and the splice.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**10. VERIFY THAT DTC B2101 IGNITION RUN/START INPUT LOW DTC IS ACTIVE.**

Reconnect both Occupant Restraints Controller (ORC) connectors.

Reconnect both Occupant Classification Module (OCM) connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs and Occupant Classification Module (OCM) DTCs.

**Select the module displaying the active: B2101 IGNITION RUN/START INPUT CIRCUIT LOW?**

**Occupant Restraint Controller (ORC)**

Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B2101 IGNITION RUN/START INPUT CIRCUIT LOW was Active in the OCM.

**Occupant Classification Module (OCM)**

Replace the Occupant Classification Module (OCM) in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B2101 IGNITION RUN/START INPUT CIRCUIT LOW was Active in the OCM.

**B2101-IGNITION RUN/START INPUT CIRCUIT LOW (CONTINUED)****11. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

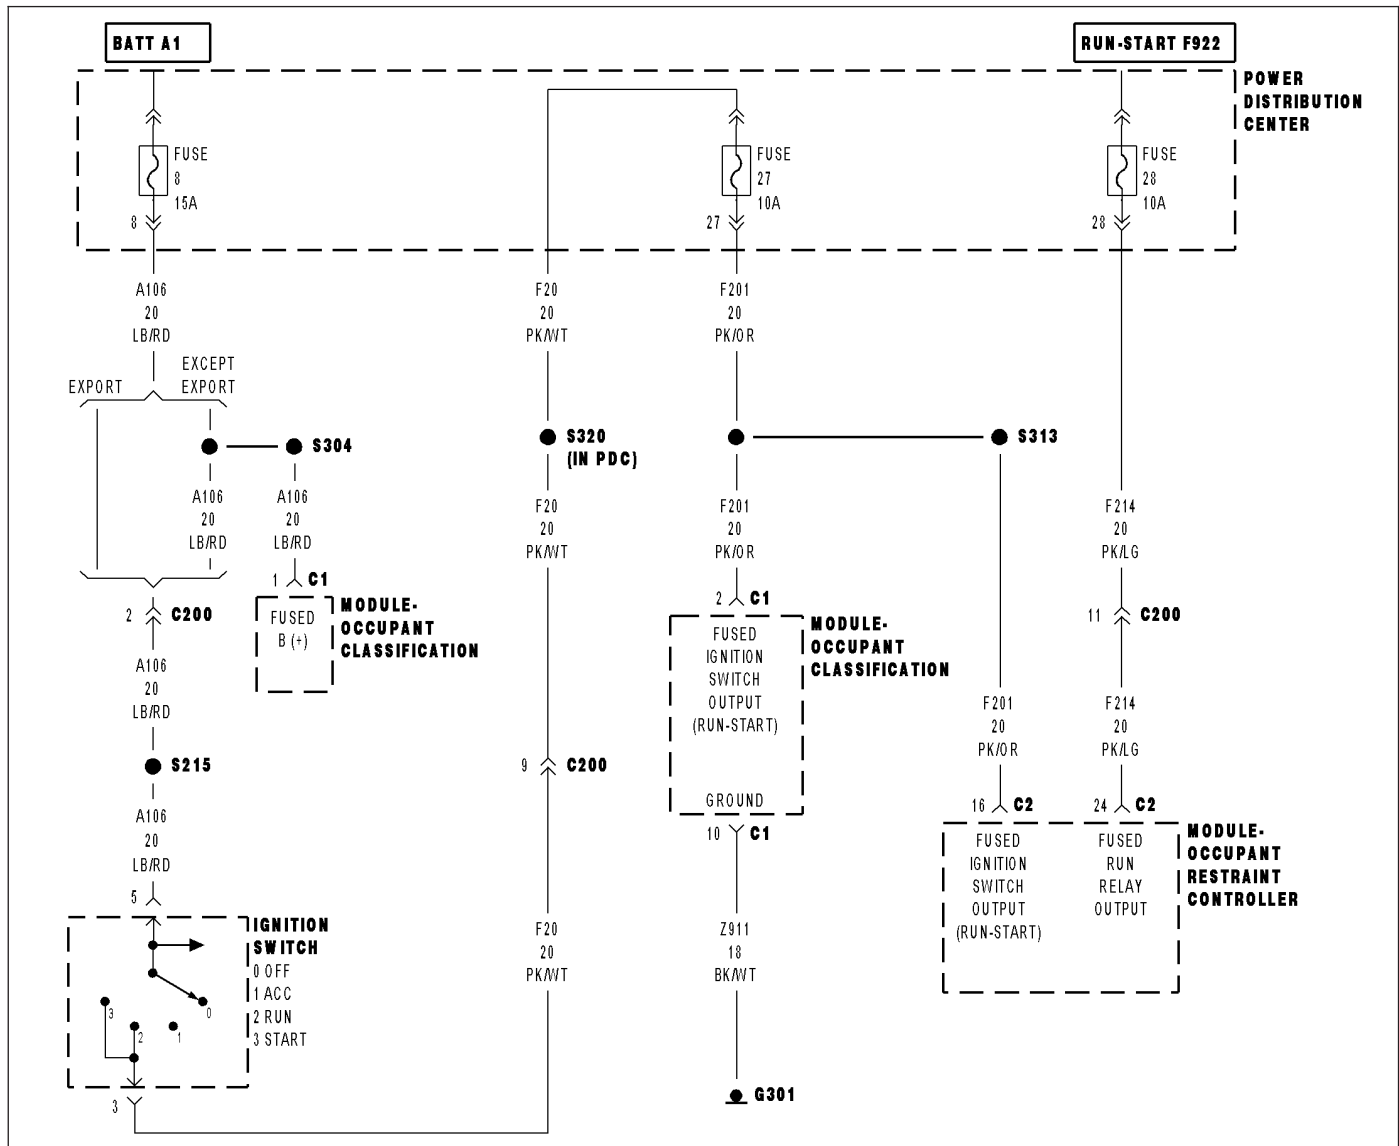

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found Erase all codes before returning vehicle to customer.

# B2102-IGNITION RUN/START INPUT CIRCUIT HIGH

**B2102-IGNITION RUN/START INPUT CIRCUIT HIGH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
While the CAN bus ignition status is RUN or SNA and the IOD status is "IN". The module checks the (F201) Fused Ignition Switch Output (Run-Start) circuit voltage input range.
- **Set Condition:**  
If the module detects that the ignition voltage is greater than 24.25 volts  $\pm$ 0.25 volts for 10 seconds.

Possible Causes
VEHICLE CHARGING SYSTEM VEHICLE WIRING & HARNESS CONNECTORS OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test**

**1. VERIFY THAT DTC B2102-IGNITION RUN/START INPUT CIRCUIT HIGH IS ACTIVE**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on, then off, and then on again.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

- Does the scan tool display active: B2102-IGNITION RUN/START INPUT CIRCUIT HIGH?**
- Yes**    >> Go To 2
- No**    >> Go To 3

**B2102-IGNITION RUN/START INPUT CIRCUIT HIGH (CONTINUED)****2. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)**

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

**Does the scan tool display any Charging System related DTCs?**

- Yes** >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- No** >> Replace the ORC in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.

**3. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

- Yes** >> Select appropriate symptom from Symptom List.
- No** >> No problem found Erase all codes before returning vehicle to customer.

**B210D-BATTERY VOLTAGE LOW**

**B210D-BATTERY VOLTAGE LOW (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

OCM-While the CAN bus ignition status received is RUN or SNA, the module checks the (A106) Fused B+ circuit voltage input range and the (F214) Fused Run Relay Output (RUN only) circuit voltage input range.

- **Set Condition:**

OCM-If the module detects that the battery voltage is less than or equal to 6.25 volts  $\pm 0.25$  volts.

- **When Monitored:**

ORC-While the CAN bus ignition status received is RUN or SNA, the module checks the (F201) Fused Ignition Switch Output (RUN/START) circuit and the (F214) Fused Run Relay Output (RUN only) circuit voltage input range.

- **Set Condition:**

ORC-If the module detects that the battery voltage is less than or equal to 6.25 volts  $\pm 0.25$  volts on either the F201 or F214 circuits.

Possible Causes
OCM (A106) FUSED B(+) CIRCUIT
ORC (F201) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN
ORC (F214) FUSED RUN RELAY OUTPUT CIRCUIT OPEN
VEHICLE CHARGING SYSTEM
OCCUPANT CLASSIFICATION MODULE
OCCUPANT RESTRAINT CONTROLLER

## Diagnostic Test

### 1. CHECK FOR AN ACTIVE DTC

**Note:** Ensure the battery is fully charged.

**Note:** Troubleshoot any PCM charging/cranking DTCs before proceeding.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

**Select module and DTC type.**

**OCM Active**

Go To 2

**OCM Stored**

Go To 4

**ORC Active**

Go To 3

**ORC Stored**

Go To 4

**B210D-BATTERY VOLTAGE LOW (CONTINUED)****2. TEST THE VOLTAGE OF OCM (A106) FUSED B(+) AND (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUITS.**

**WARNING: WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the OCM C1 connector.

**WARNING: WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (A201) Fused Ignition Switch Output (Run-Start) circuit.

Measure the voltage of the (A106) Fused B+ circuit.

**Is the voltage above 6.75 volts on both circuits?**

**Yes** >> Replace the OCM in accordance with the service information. Perform the Occupant Classification Module System Verification Test.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Repair the (A106) FUSED B(+) and/or (F201) Fused Ignition Switch Output (Run-Start) circuits for an open.

Perform OCS VERIFICATION TEST - VER 1.

**3. MEASURE THE VOLTAGE OF ORC (F201) FUSED IGNITION SWITCH OUTPUT (RUN/START) AND (F214) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUITS**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC C1 connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the F201 and F214 circuits.

**Is the voltage above 6.75 volts on both circuits?**

**Yes** >> Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Repair the appropriate circuit or circuits for an open.

Perform ORC VERIFICATION TEST - VER 1.

**B210D-BATTERY VOLTAGE LOW (CONTINUED)****4. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

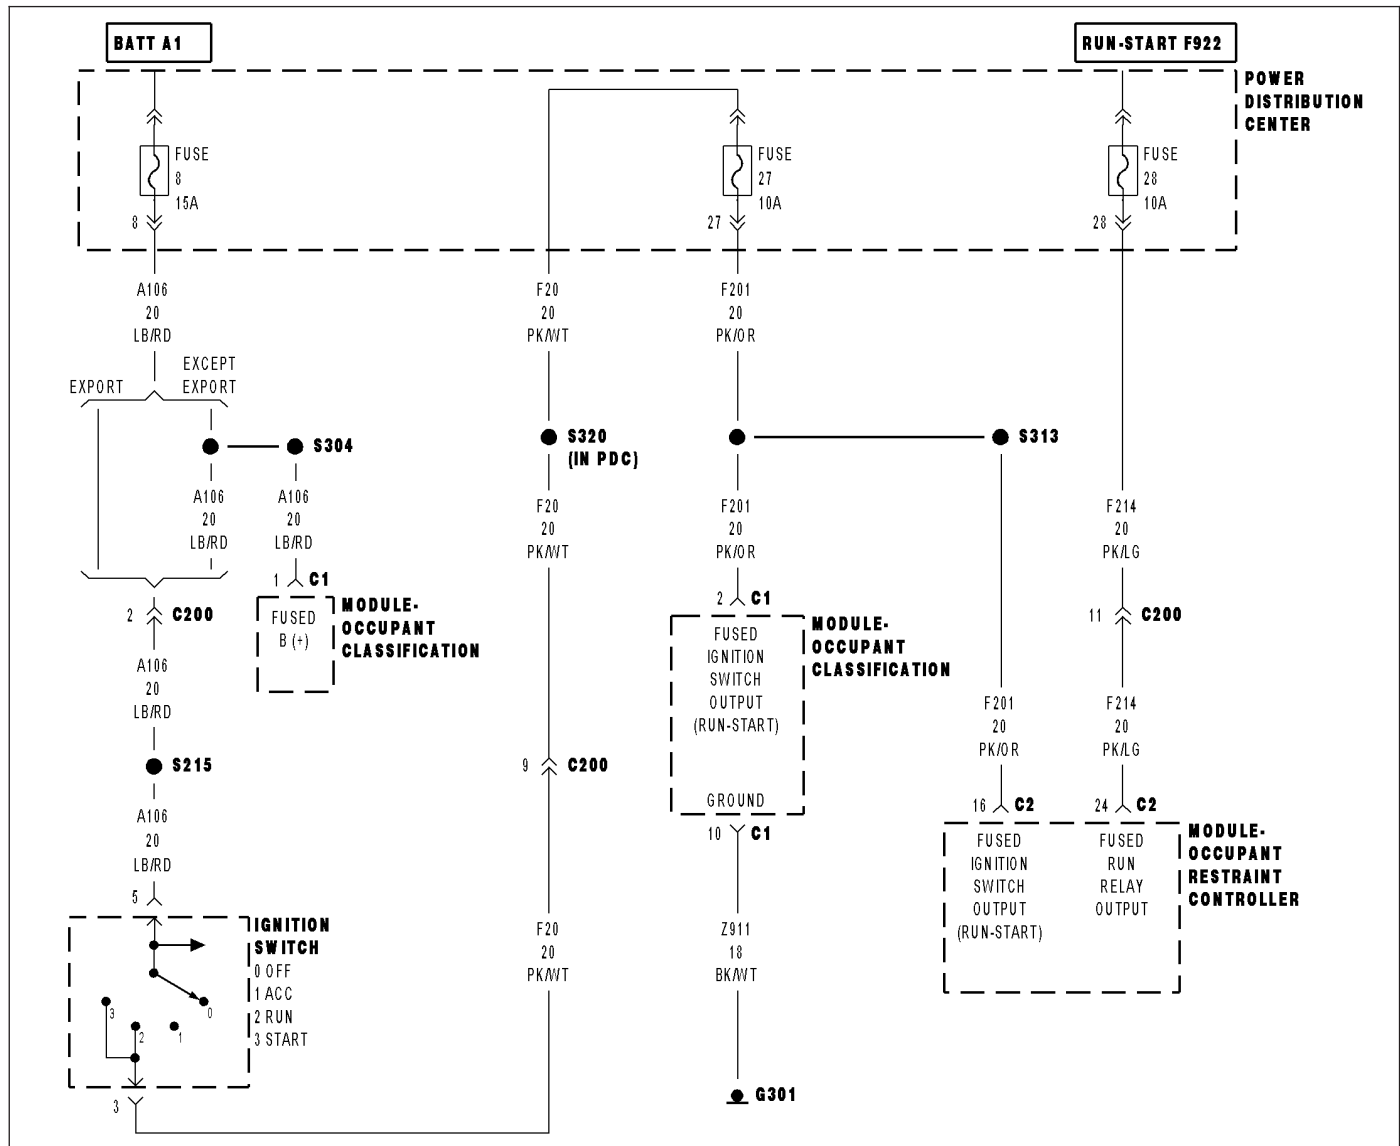

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found Erase all codedxcxs before returning vehicle to customer.

**B210E-BATTERY VOLTAGE HIGH**

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

While the CAN bus ignition status received is RUN or SNA, the module checks the (A106) Fused B+ circuit voltage input range.

- **Set Condition:**

If the module detects that the battery voltage is greater than or equal to 24.25 volts  $\pm 0.25$  volts for 10 seconds.

Possible Causes
VEHICLE CHARGING SYSTEM
OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test****1. CHECK FOR AN ACTIVE DTC**

Turn the ignition on, then off, and then on again.

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B210E-BATTERY VOLTAGE HIGH?**

**Yes** >> Go To 2

**No** >> Go To 4

**2. CHECK THE BATTERY VOLTAGE TO THE OCCUPANT CLASSIFICATION MODULE**

With the scan tool in Data Display, read OCM battery voltage.

**Is the battery voltage greater than 24.25 volts  $\pm 0.25$  volts?**

**Yes** >> Go To 3—

**No** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)****3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)**

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

**Does the scan tool display any Charging System related DTCs?**

- Yes** >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- No** >> Replace the OCM in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.

**4. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

- Yes** >> Select appropriate symptom from Symptom List.
- No** >> No problem found Erase all codes before returning vehicle to customer.

# B212C-IGNITION RUN/START INPUT CIRCUIT OPEN

**B212C-IGNITION RUN/START INPUT CIRCUIT OPEN (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition in the Run-Start position.
- **Set Condition:**  
If voltage on the (F201) Fused Ignition Switch Output (Run-Start) circuit drops below 6.0 volts.

Possible Causes
(F20) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN
(F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORTED TO GROUND
OPEN FUSE (27)
(F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN
OCCUPANT CLASSIFICATION MODULE (OCM)
OCCUPANT RESTRAINT CONTROLLER (ORC)

**Diagnostic Test****1. VERIFY THAT DTC B212C IGNITION RUN/START INPUT CIRCUIT OPEN IS ACTIVE IN THE ORC.**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

**Does the scan tool display active: B212C IGNITION RUN/START INPUT CIRCUIT OPEN?**

**Yes**     >> Go To 3

**No**     >> Go To 2

**B212C-IGNITION RUN/START INPUT CIRCUIT OPEN (CONTINUED)****2. CHECK FOR ACTIVE DTC B212C IGNITION RUN/START INPUT CIRCUIT OPEN IN OCM.**

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display active: B212C IGNITION RUN/START INPUT CIRCUIT OPEN?**

**Yes** >> Go To 3

**No** >> Go To 11

**3. INSPECT AIRBAG RUN-START FUSE**

Turn the ignition off.

Remove the Airbag Run-Start Fuse from the rear Power Distribution Center and inspect the fuse.

**Note: Check connectors - Clean and repair as necessary.**

**Is the Run/Start fuse open?**

**Yes** >> Go To 4

**No** >> Go To 7

**4. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT RESISTANCE**

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between ground and the Airbag Run-Start fuse terminal (output side).

**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 5

**No** >> Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Replace Airbag Run-Start Fuse.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1.

**B212C-IGNITION RUN/START INPUT CIRCUIT OPEN (CONTINUED)****5. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT RESISTANCE WITH ORC CONNECTORS DISCONNECTED**

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the both ORC connectors.

**Note:** Check connectors - Clean and repair as necessary.

Connect the Load Tool ORC 8443-24 Adaptor to the ORC C2 connector.

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between 8443-24 adaptor and ground).

**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 6

**No** >> Replace the ORC in accordance with the Service Information.  
Replace the Airbag Run-Start Fuse.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**6. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT RESISTANCE WITH OCM C1 CONNECTOR DISCONNECTED**

**WARNING:** If the Occupant Classification Module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

Disconnect the OCM C1 connector.

Measure the resistance of the (F201) Fused Ignition Switch Output (Run-Start) circuit between ground and the Airbag Run-Start fuse terminal (output side).

**Is the resistance below 100.0 ohms?**

**Yes** >> Repair the (F201) Fused Ignition Switch Output (Run-Start) circuit for a short to ground.  
Replace the Airbag Run-Start Fuse.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**No** >> Replace the OCM in accordance with the Service Information.  
Replace the Airbag Run-Start Fuse.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**B212C-IGNITION RUN/START INPUT CIRCUIT OPEN (CONTINUED)****7. CHECK (F201) IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN**

Turn the ignition on.

Measure the voltage of the (F20) Ignition Switch Output (Run-Start) circuit at the Airbag Run-Start fuse terminal (supply side).

**Is the voltage above 6.0 volts?**

**Yes** >> Go To 8

**No** >> Repair the open (F20) Ignition Switch Output (Run-Start) circuit.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1.

**8. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN**

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Reinstall the Airbag Run-Start Fuse.

Disconnect the both ORC connectors.

**Note: Check connectors - Clean and repair as necessary.**

Install the Airbag Load tool ORC 8443-24 adaptor to the ORC C2 connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Measure the voltage of the (F201) Fused Ignition Switch Output (Run-Start) Circuit between the 8443-24 connector and ground.

**Is the voltage above 6.0 volts?**

**Yes** >> Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B210C IGNITION RUN/START INPUT CIRCUIT OPEN was Active in the OCM.

**No** >> Repair the open (F201) Fused Ignition Switch Output (Run-Start) circuit.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B210C IGNITION RUN/START INPUT CIRCUIT OPEN was Active in the OCM.

**B212C-IGNITION RUN/START INPUT CIRCUIT OPEN (CONTINUED)****9. CHECK (F201) FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Reinstall the Airbag Run-Start Fuse.

Disconnect the both Occupant Classification Module (OCM) connectors.

**Note:** Check connectors - Clean and repair as necessary.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (F201) Fused Ignition Switch Output (Run-Start) Circuit between the OCM connector and ground.

**Is the voltage above 6.0 volts?**

**Yes** >> Go To 10

**No** >> Repair the open (F201) Fused Ignition Switch Output (Run-Start) circuit between the OCM and the splice.  
Perform ORC VERIFICATION TEST - VER 1.  
Perform OCS VERIFICATION TEST - VER 1.

**10. VERIFY THAT DTC B212C IGNITION RUN/START DTC IS ACTIVE.**

Reconnect both Occupant Restraints Controller (ORC) connectors.

Reconnect both Occupant Classification Module (OCM) connectors.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs and Occupant Classification Module (OCM) DTCs.

**Select the module displaying the active: B212C IGNITION RUN/START INPUT CIRCUIT OPEN?**

**Occupant Restraint Controller (ORC)**

Replace the Occupant Restraint Controller (ORC) in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B212C IGNITION RUN/START INPUT CIRCUIT OPEN was Active in the OCM.

**Occupant Classification Module (OCM)**

Replace the Occupant Classification Module (OCM) in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

Perform OCS VERIFICATION TEST - VER 1 if DTC B212C IGNITION RUN/START INPUT CIRCUIT OPEN was Active in the OCM.

**B212C-IGNITION RUN/START INPUT CIRCUIT OPEN (CONTINUED)****11. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

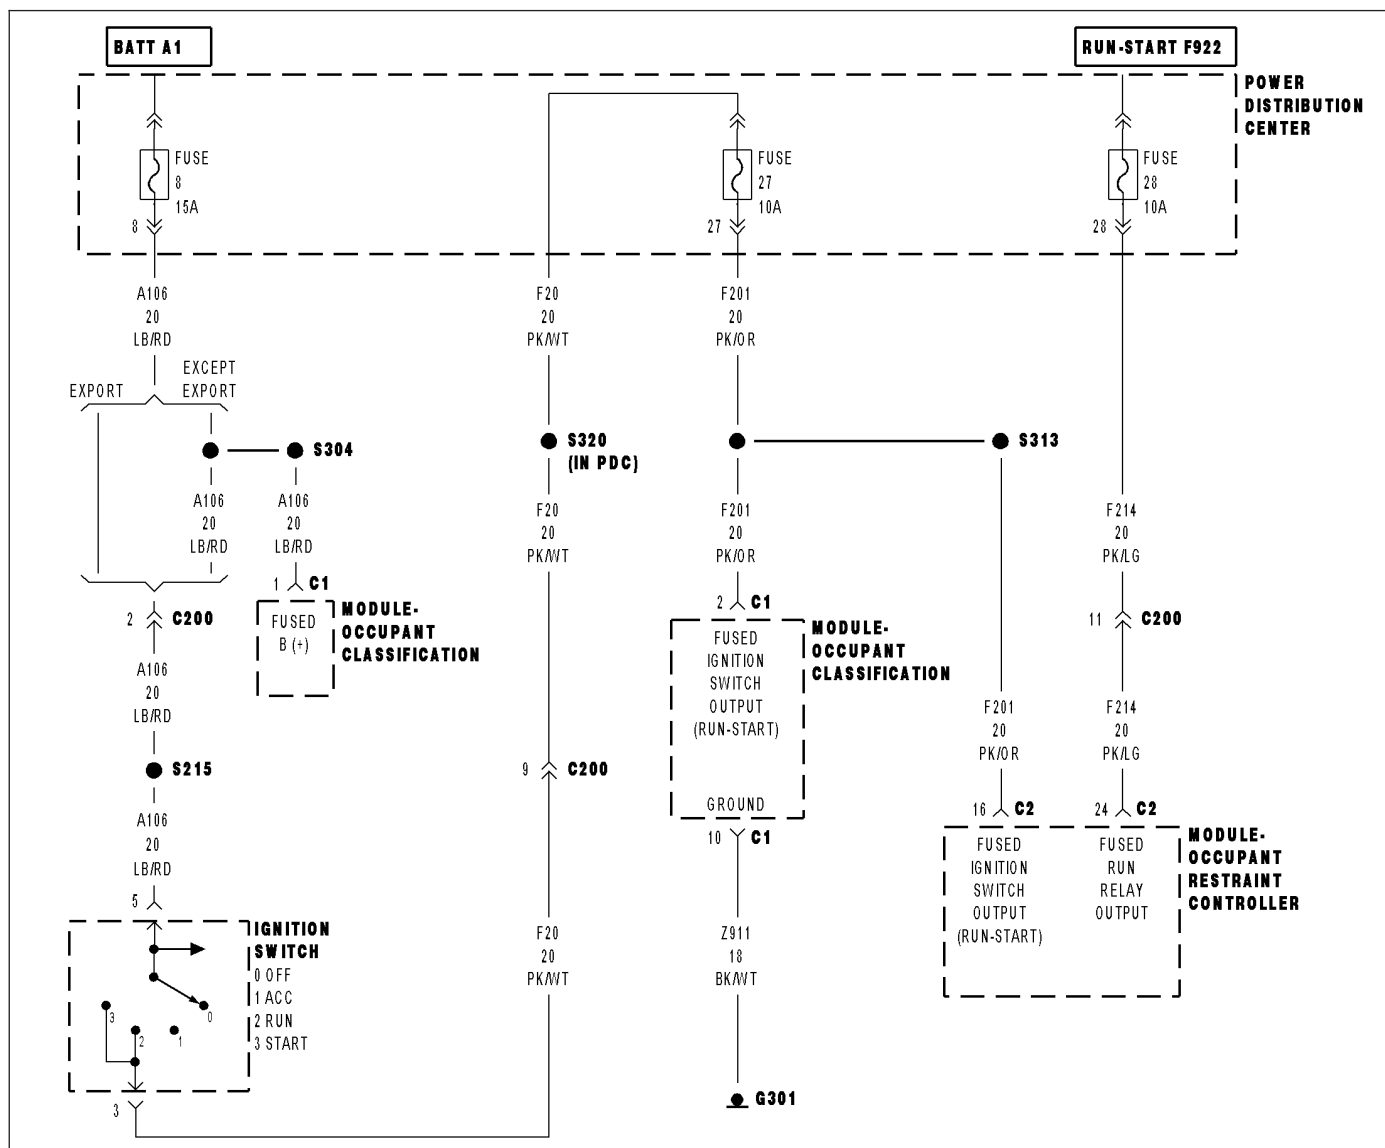

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found Erase all codes before returning vehicle to customer.

**B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN**

**B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition in the Run position.
- **Set Condition:**  
If voltage on the (F214) Fused Run Relay Output circuit drops below 6.0 volts.

Possible Causes
RUN RELAY CONTROL CIRCUIT RUN RELAY INOPERATIVE OR OPEN TERMINAL 87 POWER DISTRIBUTION CENTER (F922) RUN RELAY CIRCUIT OPEN FUSE 28 OPEN (F214) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED TO GROUND OCCUPANT RESTRAINT CONTROLLER (ORC)

**Diagnostic Test****1. VERIFY THAT DTC B212D IGNITION RUN ONLY INPUT CIRCUIT OPEN IS ACTIVE**

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

**Does the scan tool display active: B212D IGNITION RUN ONLY INPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> Go To 9

**B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN (CONTINUED)****2. CHECK FOR ACTIVE FCM RUN RELAY CONTROL CIRCUIT DTC**

With the scan tool, read Front Control Module (FCM) DTCs.

**Does the scan tool display active: B2122, B2123 or B2124 DTC's?**

**Yes** >> (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING - B2122), (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING - B2123), (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING - B2124).

**No** >> Go To 3

**3. INSPECT AIRBAG RUN CIRCUIT FUSE**

Turn the ignition off.

Remove the Airbag Run Circuit Fuse No. 28 from the Power Distribution Center and inspect the fuse.

**Note: Check connectors - Clean and repair as necessary.**

**Is the fuse open?**

**Yes** >> Go To 4

**No** >> Go To 6

**4. CHECK (F214) FUSED RUN RELAY OUTPUT CIRCUIT RESISTANCE**

Measure the resistance of the (F214) Run Relay Output circuit between the Airbag Run Relay Output Circuit fuse No. 28 (supply side) terminal and ground.

**Is the resistance below 100.0 ohms?**

**Yes** >> Go To 5

**No** >> Using the wiring diagram/schematic as a guide, inspect the related wiring and connectors. Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

Replace Airbag Run Circuit Fuse.

Perform ORC VERIFICATION TEST - VER 1.

**B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN (CONTINUED)****5. CHECK (F214 ) FUSED RUN RELAY OUTPUT CIRCUIT RESISTANCE WITH ORC C2 CONNECTOR DISCONNECTED**

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the ORC C1 connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the appropriate Load Tool ORC 8443-24 Adaptor to the ORC connector.

Measure the resistance of the (F214) Fused Run Relay Output circuit between 8443-24 adaptor and ground.

**Is the resistance below 100.0 ohms?**

- Yes** >> Repair the (F214) Fused Run Relay Output circuit for a short to ground.  
 Replace the Airbag Run Circuit Fuse.  
 Perform ORC VERIFICATION TEST - VER 1.
- No** >> Replace the ORC in accordance with the Service Information.  
 Replace the Airbag Run Circuit Fuse.  
 Perform ORC VERIFICATION TEST - VER 1.

**6. CHECK (F922) RUN RELAY OUTPUT CIRCUIT VOLTAGE**

Turn the ignition on.

Measure the voltage of the (F922) Run Relay Output circuit at the Airbag Run Circuit fuse terminal (supply side).

**Is the voltage above 6.0 volts?**

- Yes** >> Go To 7
- No** >> Go To 8

**B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN (CONTINUED)****7. CHECK (F214) FUSED RUN RELAY OUTPUT CIRCUIT FOR AN OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Reinstall the Airbag Run Circuit Fuse.

Disconnect the ORC C1 connector.

**Note:** Check connectors - Clean and repair as necessary.

Connect the Airbag Load Tool ORC 8443-24 Adaptor to the ORC C1 harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (F214) Fused Run Relay Output Circuit between the 8443-24 adaptor and ground.

**Is the voltage above 6.0 volts?**

**Yes** >> Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Repair the open (F214) Fused Run Relay Output circuit.

Perform ORC VERIFICATION TEST - VER 1.

**8. CHECK RUN RELAY INOPERATIVE OR OPEN OUTPUT**

Turn the ignition off.

Reinstall the Airbag Run Circuit Fuse.

Disconnect the Run Relay.

**Note:** Check connectors - Clean and repair as necessary.

Replace the Run Relay with a known good relay.

Turn the ignition on.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

**Does the scan tool display active: B212D IGNITION RUN ONLY INPUT CIRCUIT OPEN?**

**Yes** >> Repair the open (F922) Run Relay Output circuit.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Remove the test relay and Replace the Airbag Run Relay.

Perform ORC VERIFICATION TEST - VER 1.

**B212D-IGNITION RUN ONLY INPUT CIRCUIT OPEN (CONTINUED)****9. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTCs from all Airbag modules. If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING: To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.**

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

With the scan tool, monitor active codes as you work through the following steps.

**WARNING: To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.**

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return, continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting the active DTC in question.

**Does the scan tool display any ACTIVE DTCs?**

**Yes** >> Select appropriate symptom from Symptom List.

**No** >> No problem found Erase all codes before returning vehicle to customer.

## B2201-CALIBRATION MISMATCH

- **When Monitored:**

With the Ignition on.

- **Set Condition:**

This DTC will be set when the VIN stored in the PCM does not match the VIN stored in the Occupant Restraint Controller (ORC). The ORC does not support a stored B2201 DTC.

Possible Causes
INCORRECT PCM
OCCUPANT RESTRAINT CONTROLLER (ORC)

### Diagnostic Test

#### 1. VERIFY THAT DTC B2201-CALIBRATION MISMATCH IS ACTIVE

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Does the scan tool display active: B2201-CALIBRATION MISMATCH?

**Yes**    >> Go To 2

**No**    >> Test Complete.

#### 2. CHECK VIN IN PCM

With the scan tool compare the VIN that is programmed into the PCM to the VIN stored in the ORC.

Does the VIN programmed into the PCM match the VIN stored in the ORC?

**Yes**    >> Go To 3

**No**    >> Replace and program the Powertrain Control Module in accordance with the service information. Ensure the PCM is replaced with the correct vehicle line PCM.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

## B2201-CALIBRATION MISMATCH (CONTINUED)

### 3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

View repair.

#### Repair

Replace the Occupant Restraint Controller in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

---

## B2205-ORIGINAL VIN MISSING/MISMATCH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Occupant Restraint Controller will receive and monitor the VIN message from the PCM and record the VIN if different from the last VIN.

Possible Causes
INCORRECT VIN PROGRAMMED IN PCM
OCCUPANT RESTRAINT CONTROLLER

### Diagnostic Test

#### 1. VERIFY THAT DTC B2205-ORIGINAL VIN MISSING/MISMATCH

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

**Does the scan tool display active :B2205-ORIGINAL VIN MISSING/MISMATCH?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition.  
Visually inspect the related wiring harness connectors.  
Look for broken, bent, pushed out, or corroded terminals.

#### 2. CHECK VIN IN PCM

With the scan tool compare the VIN that is programmed into the PCM to the VIN on the vehicle.

**Does the VIN programmed into the PCM match the vehicles VIN?**

**Yes** >> Go To 3

**No** >> Replace the Powertrain Control Module in accordance with Service Information.  
Perform the (NGC) POWERTRAIN VERIFICATION TEST-VER. 1

**B2205-ORIGINAL VIN MISSING/MISMATCH (CONTINUED)**

**3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**View repair.**

**Repair**

Replace the Occupant Restraint Controller in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

---

**B2206-CURRENT VIN MISSING/MISMATCH****OCCUPANT CLASSIFICATION SEAT WEIGHTS**

8129faa2

**B2206-CURRENT VIN MISSING/MISMATCH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
During power-up, the ORC/OCM monitors the CAN bus for the VIN message.
- **Set Condition:**  
This DTC will set if the VIN information received from the PCM is different from the stored VIN.

Possible Causes
INCORRECT VIN PROGRAMMED INTO THE PCM OCCUPANT CLASSIFICATION MODULE (OCM) OCCUPANT RESTRAINT CONTROLLER (ORC)

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

**Note:** Troubleshoot any Ignition, Battery, Seat Weight Sensor, or OCM Internal DTCs **BEFORE** proceeding

**Note:** Ensure that the battery is fully charged.

With the scan tool, read DTCs.

Select the module and DTC type.

**OCM-Active**

Go To 2

**OCM-Stored**

Erase code with scan tool, test complete.

**ORC-Active**

Go To 4

**ORC-Stored**

Erase code with scan tool, test complete.

**2. CHECK THE VIN STORED IN THE PCM**

With the scan tool, compare the VIN that is stored in the PCM to the VIN of the vehicle's VIN plate.

**Does the VIN that is stored in the PCM match the vehicle's VIN?**

**Yes** >> Go To 3

**No** >> Replace and Configure the Powertrain Control Module in accordance with the service information.

Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

**B2206-CURRENT VIN MISSING/MISMATCH (CONTINUED)****3. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**Note:** Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display active: B2206-CURRENT VIN MISSING/MISMATCH?**

**Yes** >> Replace the OCM in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.

**No - But Other DTCs Present**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No - No Active DTCs Present**

Perform OCS VERIFICATION TEST - VER 1.

**4. CHECK THE VIN STORED IN THE PCM**

With the scan tool, compare the VIN that is stored in the PCM to the VIN of the vehicle's VIN plate.

**Does the VIN that is stored in the PCM match the vehicle's VIN?**

**Yes** >> Go To 5

**No** >> Replace and Configure the Powertrain Control Module in accordance with the service information.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).

**B2206-CURRENT VIN MISSING/MISMATCH (CONTINUED)**

**5. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**View repair.**

**Repair**

Replace the Occupant Restraint Controller in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

---

B2207-OCCUPANT RESTRAINT CONTROLLER INTERNAL 1

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

Diagnostic Test

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

Repair

- Replace the Occupant Restraint Controller in accordance with the Service Information.
- Perform the ORC VERIFICATION TEST-VER. 1.

**B2208-OCCUPANT RESTRAINT CONTROLLER INTERNAL 2**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test****1. REPLACE OCCUPANT RESTRAINT CONTROLLER**

Turn the ignition on.

With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the Service Information.

Perform the ORC VERIFICATION TEST-VER. 1.

B2209-OCCUPANT RESTRAINT CONTROLLER INTERNAL 3

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

Diagnostic Test

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.

With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

Repair

- Replace the Occupant Restraint Controller in accordance with the Service Information.
- Perform the ORC VERIFICATION TEST-VER. 1.

**B220A-OCCUPANT RESTRAINT CONTROLLER INTERNAL 4**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test****1. REPLACE OCCUPANT RESTRAINT CONTROLLER**

Turn the ignition on.

With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions could result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the Service Information.

Perform the ORC VERIFICATION TEST-VER. 1.

B220B-OCCUPANT RESTRAINT CONTROLLER FIRING STORED ENERGY

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

Diagnostic Test

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.  
With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions can result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the Service Information.  
Perform the ORC VERIFICATION TEST-VER. 1.

**B220C-OCCUPANT RESTRAINT CONTROLLER ACCELEROMETER 1 INTERNAL**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test****1. REPLACE OCCUPANT RESTRAINT CONTROLLER**

Turn the ignition on.

With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions can result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the Service Information.

Perform the ORC VERIFICATION TEST-VER. 1.

**B220D-OCCUPANT RESTRAINT CONTROLLER ACCELEROMETER 2 INTERNAL**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test**

**1. REPLACE OCCUPANT RESTRAINT CONTROLLER**

Turn the ignition on.  
With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions can result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the Service Information.  
Perform the ORC VERIFICATION TEST-VER. 1.

**B220F-OCCUPANT RESTRAINT CONTROLLER CONTROL DRIVER 1**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test****1. REPLACE OCCUPANT RESTRAINT CONTROLLER**

Turn the ignition on.

With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions can result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the Service Information.

Perform the ORC VERIFICATION TEST-VER. 1

B2210-OCCUPANT RESTRAINT CONTROLLER CONTROL DRIVER 2

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. The module's on board diagnostics continuously performs internal circuit tests.
- **Set Condition:**  
This DTC will set if the module identifies an out of range internal circuit.

Possible Causes
OCCUPANT RESTRAINT CONTROLLER

Diagnostic Test

1. REPLACE OCCUPANT RESTRAINT CONTROLLER

Turn the ignition on.  
With the scan tool, erase and read ORC DTCs.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take proper precautions can result in accidental airbag deployment and personal injury or death.

When this code is set, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with the Service Information.  
Perform the ORC VERIFICATION TEST-VER. 1

## B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL

### OCCUPANT CLASSIFICATION SEAT WEIGHTS

8129faa2

**B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
While the IGN status is RUN or SNA, while the CAN bus system voltage is between 10 and 16 volts, and during the OCS Verification Test.
- **Set Condition:**  
This DTC will set if the module detects an internal failure.

Possible Causes
OCCUPANT CLASSIFICATION MODULE

**Diagnostic Test**

**1. PERFORM THE OCCUPANT CLASSIFICATION MODULE VERIFICATION TEST**

**Note:** Ensure that the passenger seat is empty.

**Note:** Ensure that all seat and strain gauge sensor bolts are properly torqued.

With the scan tool, erase OCM DTCs.

Turn the ignition off, wait 10 seconds and turn ignition on.

With the scan tool, read OCM DTCs.

**Did the DTC: B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL reset?**

- Yes**    >> Go To 2
- No**    >> Perform the OCS VERIFICATION TEST-VER 1.

**B2212-OCCUPANT CLASSIFICATION MODULE INTERNAL (CONTINUED)****2. PERFORM OCCUPANT CLASSIFICATION MODULE SYSTEM VERIFICATION TEST**

Verify that the passenger seat is empty.

Verify that all of the Seat Weight Sensor mounting screws are torqued to specification. Refer to 23 - BODY/SEATS.

**Note: Failure to follow the test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.**

With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed on the scan tool. When the test is complete, proceed as follows.

With the scan tool, read OCM DTCs.

**Does the scan tool display any active DTCs?**

**Yes - B2212 is ACTIVE**

Replace the Occupant Classification Module in accordance with the service information.

**Yes - other DTCs ACTIVE**

Diagnose and repair the DTCs. Refer to the Table of Contents in this Section for a complete list of symptoms.

**No** >> Perform OCS VERIFICATION TEST - VER 1.

---

**B223B-VEHICLE CONFIGURATION MISMATCH**

**B223B-VEHICLE CONFIGURATION MISMATCH (CONTINUED)**

For the Airbag circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module sends a message to the Occupant Restraint Controller (ORC) that the vehicle is not equipped with an Occupant Classification Module (OCM) but the ORC is receiving OCM messages over the Can B bus.

Possible Causes
INCORRECT PCM
OCCUPANT RESTRAINT CONTROLLER

**Diagnostic Test****1. VERIFY THAT DTC B223B-VEHICLE CONFIGURATION MISMATCH IS ACTIVE**

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

**Does the scan tool display active: B223B-VEHICLE CONFIGURATION MISMATCH?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals. Perform the ORC VERIFICATION TEST-VER. 1

**B223B-VEHICLE CONFIGURATION MISMATCH (CONTINUED)****2. COMPARE STORED VINS IN THE PCM AND ORC**

With the scan tool, read and record the VIN that is stored in the PCM.

With the scan tool, read and record the VIN that is stored in the ORC.

**Do the VINs stored in the PCM and ORC match?**

**Yes** >> Go To 3

**No** >> Replace and program the Powertrain Control Module in accordance with the Service Information. Ensure the PCM is replaced with the correct VIN.

**3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

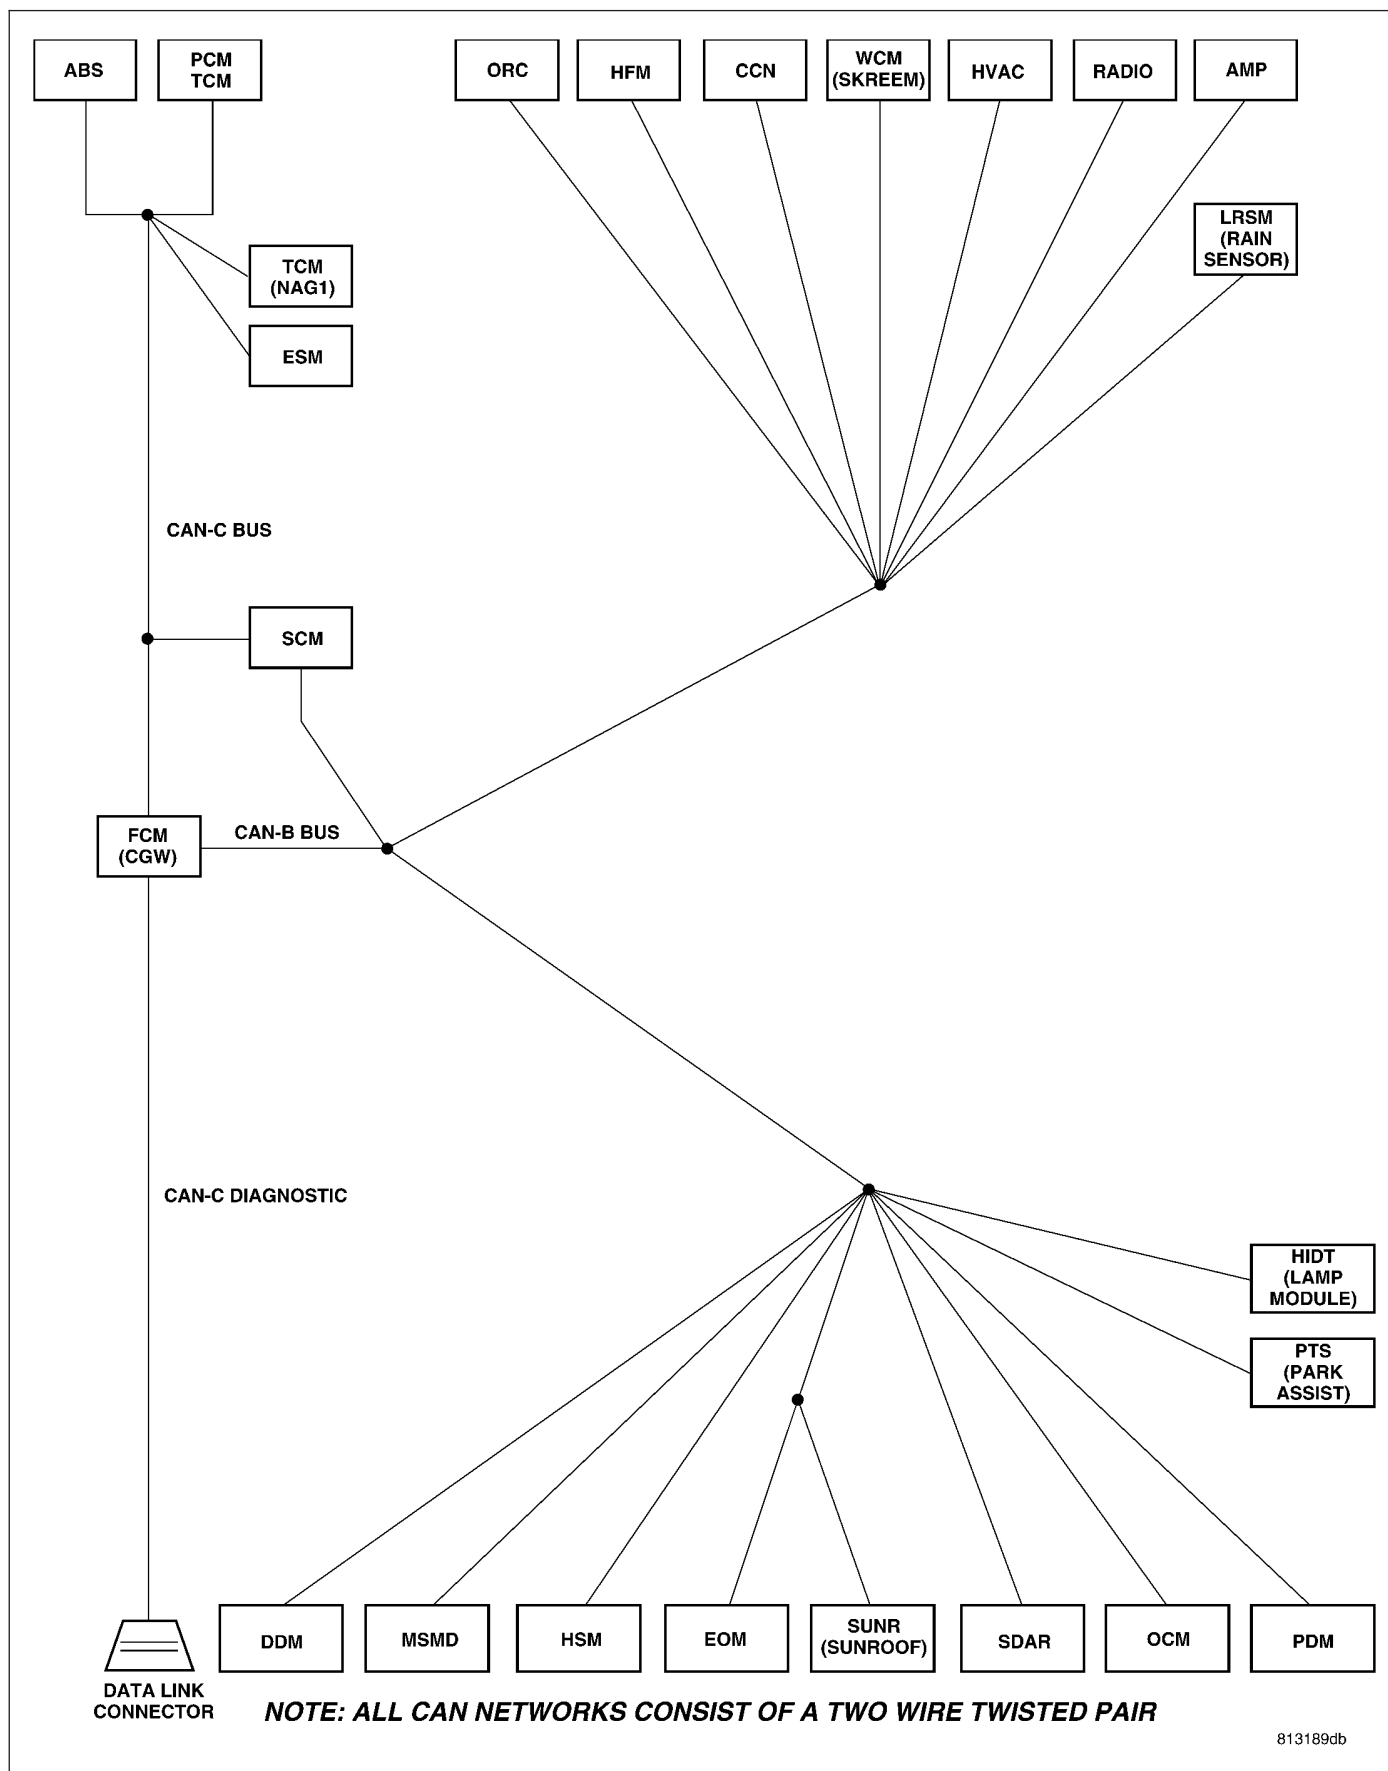

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**View repair.**

**Repair**

Replace the Occupant Restraint Controller in accordance with the service information.  
Perform the ORC VERIFICATION TEST-VER 1.

**B223D-OCCUPANT CLASSIFICATION MODULE DTC PRESENT**

**B223D-OCCUPANT CLASSIFICATION MODULE DTC PRESENT (CONTINUED)**

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if the ORC receives a bus message with the active OCM DTC Present bit set.

Possible Causes
ACTIVE DTC IN OCCUPANT CLASSIFICATION MODULE
OCCUPANT RESTRAINT CONTROLLER (ORC)

**Diagnostic Test****1. ACTIVE OR STORED DTC**

With the scan tool, read the OCCUPANT RESTRAINT CONTROLLER active DTCs.

**Is the B223D-OCCUPANT CLASSIFICATION MODULE DTC active?**

**Yes** >> Go To 2

**No** >> With the scan tool, perform the ORC VERIFICATION TEST VER-1.

**2. ACTIVE DTC IN OCCUPANT CLASSIFICATION MODULE**

With the scan tool, read the OCCUPANT CLASSIFICATION MODULE active DTCs.

**Are there any active DTC present?**

**Yes** >> Refer to the symptom list for problems related to the OCCUPANT CLASSIFICATION MODULE (OCM).

**No** >> Go To 3

**B223D-OCCUPANT CLASSIFICATION MODULE DTC PRESENT (CONTINUED)**

**3. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform the ORC VERIFICATION TEST - VER 1.

---

## U0019-CAN B BUS

**U0019–CAN B BUS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes
ACTIVE U0019 CAN B BUS DTC IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN OCCUPANT RESTRAINT CONTROLLER (ORC)

**Diagnostic Test****1. VERIFY DTC U0019–CAN B BUS IS ACTIVE**

Turn the ignition on.

With the scan tool, read Occupant Restraint Controller (ORC) DTCs.

**Does the scan tool display active: U0019–CAN B BUS?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform ORC VERIFICATION TEST – VER 1.

**U0019-CAN B BUS (CONTINUED)****2. CHECK FOR ACTIVE CAN B BUS RELATED DTCS IN THE FRONT CONTROL MODULE (FCM)**

With the scan tool, read Front Control Module (FCM) DTCs

**Does the scan tool display any active CAN B BUS related DTCs?**

**Yes** >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)

**No** >> Go To 3

**3. CHECK (D55) CAN B BUS (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the ORC C2 connector.

Disconnect the Front Control Module (FCM) C1 connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 connector and the ORC C2 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1.

**U0019-CAN B BUS (CONTINUED)****4. CHECK (D54) CAN B BUS (-) CIRCUIT FOR AN OPEN**

Measure the resistance of the (D54) CAN B Bus (-) circuit between the Front Control Module C1 connector and the ORC C2 connector.

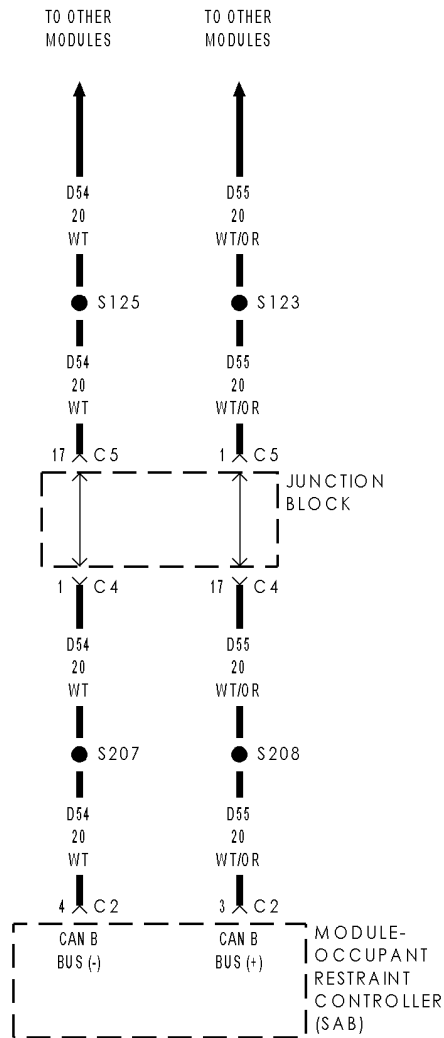

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the ORC in accordance with the Service Information.

Perform ORC VERIFICATION TEST - VER 1.

**No** >> Repair the (D54) CAN B Bus (-) circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1.

**U0020-CAN B BUS OFF PERFORMANCE**

**U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)**

For the Air Bag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes
ACTIVE U0020 CAN B BUS DTC IN OCCUPANT CLASSIFICATION MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN OCCUPANT CLASSIFICATION MODULE (OCM)

**Diagnostic Test****1. VERIFY DTC U0020-CAN B BUS IS ACTIVE**

Turn the ignition on.

With the scan tool, read Occupant Classification Module (OCM) DTCs.

**Does the scan tool display active: U0019-CAN B BUS?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform ORC VERIFICATION TEST – VER 1.

**U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)****2. CHECK FOR ACTIVE CAN B BUS RELATED DTCS IN THE FRONT CONTROL MODULE (FCM)**

With the scan tool, read Front Control Module (FCM) DTCs

**Does the scan tool display any active CAN B BUS related DTCs?**

**Yes** >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

**No** >> Go To 3

**3. CHECK (D55) CAN B BUS (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the OCM C1 connector.

Disconnect the Front Control Module (FCM) C1 connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 connector and the OCM C1 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform ORC VERIFICATION TEST - VER 1.

**U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)****4. CHECK (D54) CAN B BUS (-) CIRCUIT FOR AN OPEN**

Measure the resistance of the (D54) CAN B Bus (-) circuit between the Front Control Module C1 connector and the OCM C1 connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the OCM in accordance with the Service Information.

Perform OCS VERIFICATION TEST - VER 1.

**No** >> Repair the (D54) CAN B Bus (-) circuit for an open.

Perform ORC VERIFICATION TEST - VER 1.

## **U0022-CAN B BUS (+) CIRCUIT LOW**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0023-CAN B BUS (+) CIRCUIT HIGH**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0026-CAN B BUS (-) CIRCUIT HIGH**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE SYSTEM (ABS) CONTROL MODULE**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0155-LOST COMMUNICATION WITH CLUSTER/CCN**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0156-LOST COMMUNICATION WITH EOM**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

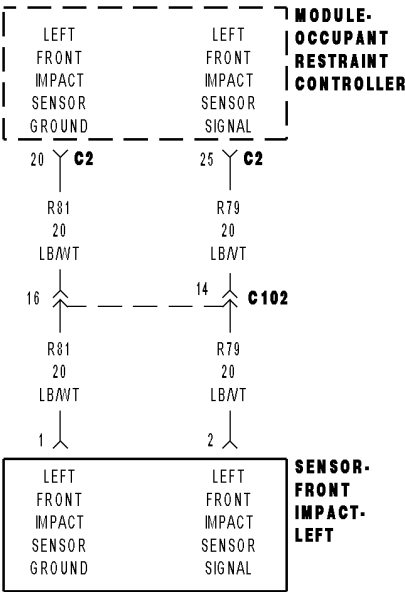

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR

**U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Occupant Restraint Controller (ORC) continuously communicates with the Front Left Impact Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

- **Set Condition:**

This code will set, if the ORC and the Front Left Impact Sensor do not establish and maintain valid data communications.

Possible Causes
(R79) SIGNAL CIRCUIT SHORTED TO BATTERY
(R79) SIGNAL CIRCUIT SHORTED TO GROUND
(R79, R81) FRONT LEFT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R81) FRONT LEFT IMPACT SENSOR GROUND CIRCUIT OPEN
(R79) FRONT LEFT IMPACT SENSOR SIGNAL CIRCUIT OPEN
ORC, FRONT LEFT IMPACT SENSOR

## Diagnostic Test

### 1. VERIFY THAT DTC U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR IS ACTIVE

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active:U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR?**

**Yes** >> Go To 2

**No** >> Go To 9

**U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR (CONTINUED)****2. CHECK THE (R79, R81) FRONT LEFT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Front Left Impact Sensor connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R79) Front Left Impact Sensor Signal circuit and (R81) Sensor Ground circuit at the Front Left Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R79, R81) Front Left Impact Sensor circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R79) FRONT LEFT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Measure the resistance of the (R79) Front Left Impact Sensor Signal circuit between the Front Left Impact Sensor connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R79) Front Left Impact Sensor Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR (CONTINUED)****4. CHECK THE (R79, R81) FRONT LEFT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R79) Front Left Impact Sensor Signal and (R81) Sensor Ground circuits at the Front Left Impact Sensor connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R79, R81) Front Left Impact Sensor circuits shorted together.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R81) FRONT LEFT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Restraint Control Module connector.

Measure the resistance of the (R81) Front Left Impact Sensor Ground circuit between the Front Left Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R81) Front Left Impact Sensor 1 Ground circuit for an open or high resistance.

Perform the ORC VERIFICATION TEST - VER 1.

**U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR (CONTINUED)****6. CHECK THE (R79) FRONT LEFT IMPACT SENSOR CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R79) Front Left Impact Sensor Ground circuit between the Front Left Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R79) Front Left Impact Sensor Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE FRONT LEFT IMPACT SENSOR**

Replace the Front Left Impact Sensor.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Front Left Impact Sensor DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**U0170-LOST COMMUNICATION W/UP-FRONT LEFT SATELLITE ACCELERATION SENSOR (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Information.  
Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

## U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR

**MODULE-OCCUPANT RESTRAINT CONTROLLER C2**

**SENSOR-FRONT IMPACT-RIGHT**

**U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Occupant Restraint Controller (ORC) continuously communicates with the Front Right Impact Sensor over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

- **Set Condition:**

This code will set, if the ORC and the Front Right Impact Sensor do not establish and maintain valid data communications.

Possible Causes
(R80) SIGNAL CIRCUIT SHORTED TO BATTERY
(R80) SIGNAL CIRCUIT SHORTED TO GROUND
(R80, R82) FRONT RIGHT IMPACT SENSOR CIRCUITS SHORTED TOGETHER
(R82) FRONT RIGHT IMPACT SENSOR GROUND CIRCUIT OPEN
(R80) FRONT RIGHT IMPACT SENSOR SIGNAL CIRCUIT OPEN
ORC, FRONT RIGHT IMPACT SENSOR

## Diagnostic Test

### 1. VERIFY THAT DTC U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR IS ACTIVE

**Note:** Ensure the battery is fully charged.

**Note:** When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Does the scan tool display active: U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR?**

**Yes** >> Go To 2

**No** >> Go To 9

**U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR (CONTINUED)****2. CHECK THE (R80, R82) FRONT RIGHT IMPACT SENSOR SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Front Right Impact Sensor connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R80) Front Right Impact Sensor Signal circuit and (R82) Sensor Ground circuit at the Front Right Impact Sensor connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R80, R82) Front Right Impact Sensor circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R80) FRONT RIGHT IMPACT SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

**WARNING:** To avoid personal injury or death, turn ignition on, then reconnect the battery.

Measure the resistance of the (R80) Front Right Impact Sensor Signal circuit between the Front Right Impact Sensor connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R80) Front Right Impact Sensor Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR (CONTINUED)****4. CHECK THE (R80, R82) FRONT RIGHT IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R80) Front Right Impact Sensor Signal and (R82) Sensor Ground circuits at the Front Right Impact Sensor connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R80, R82) Front Right Impact Sensor circuits shorted together.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R82) FRONT RIGHT IMPACT SENSOR GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Control Module connector.

Measure the resistance of the (R82) Front Right Impact Sensor Ground circuit between the Front Right Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R82) Front Right Impact Sensor 2 Ground circuit for an open or high resistance.

Perform the ORC VERIFICATION TEST - VER 1.

**U0171-LOST COMMUNICATION W/UP-FRONT RIGHT SATELLITE ACCELERATION SENSOR (CONTINUED)****6. CHECK THE (R80) FRONT RIGHT IMPACT SENSOR CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R80) Front Right Impact Sensor Signal circuit between the Front Right Impact Sensor connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R80) Front Right Impact Sensor Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE FRONT RIGHT IMPACT SENSOR**

Replace the Front Right Impact Sensor.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Front Right Impact Sensor DTC return?**

Replace the Right Side Impact Sensor 1.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Right Side Impact Sensor 1 DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**U0175-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 1 (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

If there are no possible causes remaining, view repair.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.

Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR AN INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

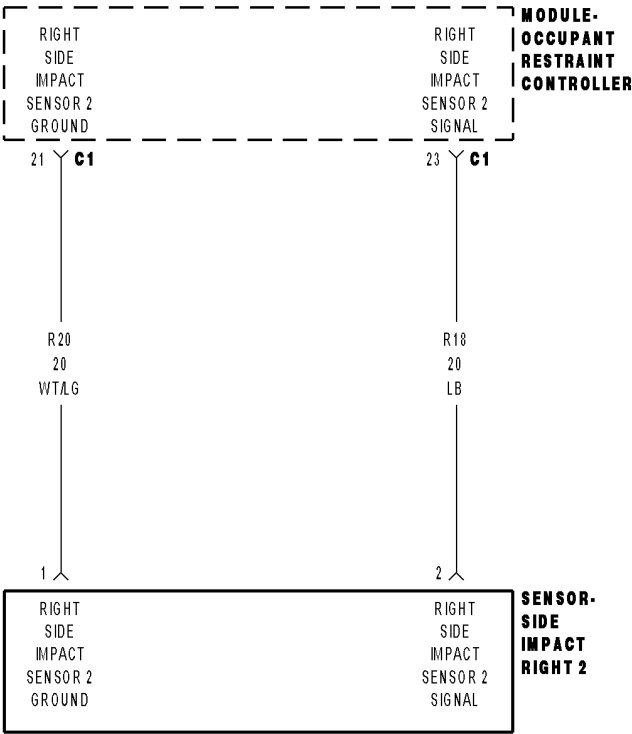

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2

**U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 (CONTINUED)**

For the Airbag System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Occupant Restraint Controller (ORC) continuously communicates with the Right Side Impact Sensor 2 over the sensor signal circuit. The sensor communication and on board diagnostics are powered by the ORC signal.

- **Set Condition:**

This code will set, if the ORC and the Right Side Impact Sensor 2 do not establish and maintain valid data communications.

Possible Causes
(R18) SIGNAL CIRCUIT SHORTED TO BATTERY
(R18) SIGNAL CIRCUIT SHORTED TO GROUND
(R18, R20) RIGHT SIDE IMPACT SENSOR 2 CIRCUITS SHORTED TOGETHER
(R20) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT OPEN
(R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT OPEN
ORC, RIGHT SIDE IMPACT SENSOR 2

## Diagnostic Test

### 1. VERIFY ACTIVE DTC U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2

Turn the ignition on.

With the scan tool, read ORC DTCs.

**Note: Ensure the battery is fully charged.**

**Note: When reconnecting Airbag system components, the ignition must be turned off and the battery must be disconnected.**

**Does the scan tool display an active: U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2?**

**Yes** >> Go To 2

**No** >> Go To 9

**U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 (CONTINUED)****2. CHECK THE (R18, R20) RIGHT SIDE IMPACT SENSOR 2 SIGNAL AND GROUND CIRCUITS FOR A SHORT TO BATTERY**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Right front Impact Sensor 2 connector.

Disconnect the ORC connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Measure the voltage of the (R18) Right Side Impact Sensor 2 Signal circuit and (R20) Sensor Ground circuit at the Right Side Impact Sensor 2 connector and ground.

**Is there any voltage present?**

**Yes** >> Repair the (R18, R20) Right Side Impact Sensor 2 circuits for a short to battery.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the Right Side Impact Sensor 2 connector and ground.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R18) Right Side Impact Sensor 2 Signal circuit for a short to ground.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 4

**U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 (CONTINUED)****4. CHECK THE (R18, R20) RIGHT SIDE IMPACT SENSOR CIRCUITS FOR A SHORT TOGETHER**

Measure the resistance between the (R18) Right Side Impact Sensor 2 Signal and (R20) Sensor Ground circuits at the Right Side Impact Sensor 2 connector.

**Is the resistance below 100K ohms?**

**Yes** >> Repair the (R18, R20) Right Side Impact Sensor 2 circuits shorted together.

Perform the ORC VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 GROUND CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Connect the 8443 Load Tool ORC Adaptor to the Occupant Restraint Controller C2 connector.

Measure the resistance of the (R20) Right Side Impact Sensor 2 Ground circuit between the Right Side Impact Sensor 2 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 6

**No** >> Repair the (R20) Right Side Impact Sensor 2 Ground circuit for an open or high resistance.

Perform the ORC VERIFICATION TEST - VER 1.

**U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 (CONTINUED)****6. CHECK THE (R18) RIGHT SIDE IMPACT SENSOR 2 CIRCUIT FOR AN OPEN OR HIGH RESISTANCE**

Measure the resistance of the (R18) Right Side Impact Sensor 2 Signal circuit between the Right Side Impact Sensor 2 connector and the 8443 Load Tool ORC Adaptor.

**Is the resistance below 1 ohm?**

**Yes** >> Go To 7

**No** >> Repair the (R18) Right Side Impact Sensor 2 Signal circuit for an open or high resistance.  
Perform the ORC VERIFICATION TEST - VER 1.

**7. CHECK OPERATION OF THE RIGHT SIDE IMPACT SENSOR 2**

Replace the Right Side Impact Sensor 2.

Reconnect the vehicle body harness to the impact sensor.

Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: To avoid personal injury or death, turn the ignition on, then reconnect the battery.**

Connect the scan tool to the Data Link Connector - use the most current software available.

Use the scan tool and erase the stored codes in all airbag system modules.

Turn the Ignition Off, and wait 15 seconds before turning the Ignition On.

Wait one minute, and read active codes and if there are none present read the stored codes.

**Did the active Right Side Impact Sensor 2 DTC return?**

**Yes** >> Go To 8

**No** >> Repair is complete.  
Perform the ORC VERIFICATION TEST - VER 1.

**U0176-LOST COMMUNICATION W/RIGHT SIDE SATELLITE ACCELERATION SENSOR 2 (CONTINUED)****8. REPLACE THE OCCUPANT RESTRAINT CONTROLLER**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

**WARNING:** If the airbag control module is dropped at any time, it must be replaced. Failure to take the proper precautions can result in accidental airbag deployment and personal injury or death.

**Repair**

Replace the Occupant Restraint Controller in accordance with Service Instructions.  
Perform the ORC VERIFICATION TEST - VER 1.

**9. TEST FOR INTERMITTENT CONDITION**

With the scan tool, record and erase all DTC's from all Airbag modules.

If any ACTIVE codes are present they must be resolved before diagnosing any stored codes.

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

Look for chaffed, pierced, pinched, or partially broken wires and broken, bent, pushed out, spread, corroded, or contaminated terminals.

The following additional checks may assist you in identifying a possible intermittent problem.

Reconnect any disconnected components and harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

With the scan tool monitor active codes as you work through the following steps.

**WARNING:** To avoid personal injury or death, maintain a safe distance from all airbags while performing the following steps.

Wiggle the wiring harness and connectors of the related airbag circuit or component.

If codes are related to the Driver Airbag circuits, rotate the steering wheel from stop to stop.

If only stored codes return continue the test until the problem area has been isolated.

In the previous steps you have attempted to recreate the conditions responsible for setting active DTC in question.

**Are any ACTIVE DTCs present?**

**Yes** >> Select the appropriate symptom from Symptom List.

**No** >> No problem found at this time. Erase all codes before returning vehicle to customer.

**\*DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS**

**OCCUPANT CLASSIFICATION SEAT WEIGHTS**

**\*DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS (CONTINUED)****1. VERIFY COMPLAINT**

Turn the ignition off.

Move the front passenger seat to the full rear position. Verify that the seat is empty, the seat back is in the normal upright position, and that the seat is not interfering with any interior components.

Verify that all related connectors are properly seated and locked.

Turn the ignition on.

With the scan tool in OCM, select Data Display and note the Passenger Seat Weight Sensor voltage for all four sensors (Left Front, Right Front, Left Rear and Right Rear).

Move the front passenger seat to the mid track position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors.

Move the front passenger seat to the full forward position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor in each position (full rear, mid track, and full forward).

**Is any sensor's voltage reading out of the acceptable range in any position?**

**Yes** >> Go To 2

**No** >> Perform test B1BA7 Occupant Classification System Verification Required. If the test passes, the seat weight sensing system is working properly. Return to the procedure that directed you to this procedure.

**2. CHECKING FOR BENT FLOOR PAN**

Turn the ignition off.

Loosen all of the mounting screws retaining the front passenger seat to the vehicle crossmembers, but do not remove them. Verify that the seat is loose and that no binding exists between the seat and the crossmembers.

Move the front passenger seat to the full rear position and then to the full forward position.

Tighten all of the mounting screws to specification. Refer to 23 - BODY/SEATS.

Move the front passenger seat to the full rear position.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors.

Move the front passenger seat to the mid track position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors.

Move the front passenger seat to the full forward position.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor in each position.

**Is any sensor's voltage reading out of the acceptable range in any position?**

**Yes** >> Go To 3

**No** >> Perform test B1BA7 Occupant Classification System Verification Required. If the test passes, the seat weight sensing system is working properly. Return to the procedure that directed you to this procedure.

**\*DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS (CONTINUED)****3. CHECKING SEAT TO RISER STRESS**

Turn the ignition off.

Loosen all of the mounting screws retaining the front passenger seat track to the riser, but do not remove them. Verify that the seat track is loose and that no binding exists between the seat track and the risers.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.5 to 3.5 volts for each sensor.

**Is any sensor's voltage reading out of the acceptable range?**

**Yes** >> Go To 4

**No** >> Visually inspect for damaged or bent risers and crossmembers. Also, verify that the riser holes line up with the seat mounts in the crossmembers.

If riser damage is apparent, replace the risers in accordance with the Service Information. Then, reinstall the Seat Weight Sensors, and Go To 6.

**Note: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.**

If crossmember or floorpan damage is present, repair or replace the components as necessary in accordance with the Service Information. Reinstall the seat in the vehicle in accordance with the Service Information. Turn the ignition on. With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the directions displayed on the scan tool. When the test is complete, Go To 1.

**4. TEST SEAT FRAME**

Turn the ignition off.

Remove the front passenger seat from the risers in accordance with the Service Information. Return the risers to their normal mounting position.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

**Is any sensor's voltage reading out of the acceptable range?**

**Yes** >> Go To 5

**No** >> Visually inspect for damaged or bent risers, a damaged or bent seat and seat structure, and damaged or bent seat tracks. Also, verify that the holes in the center of the sensors line up with the seat track holes and that the seat track position locating tabs are locked in the same parallel slots. If riser damage is apparent, replace the risers in accordance with the Service Information. Then, reinstall the Seat Weight Sensors, and Go To 6.

If seat or seat track damage is present, replace the components as necessary in accordance with the Service Information. Then, Go To 7

**\*DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS (CONTINUED)****5. TEST SENSOR**

Turn the ignition off.

Loosen the mounting screws of all of the Seat Weight Sensors, but do not remove them. Verify that the sensors are loose and that no binding exists between the sensors and the risers.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

**Is any sensor's voltage reading out of the acceptable range?**

- Yes** >> Replace any Seat Weight Sensors that have an unacceptable voltage reading in accordance with the Service Information. Then, Go To 6.
- No** >> Replace the risers in accordance with the Service Information. Then, reinstall the Seat Weight Sensors, and Go To 6

**6. CHECKING FOR IMPROPER SEAT WEIGHT SENSOR TORQUE**

Turn the ignition off.

Tighten all of the Seat Weight Sensor mounting screws to specification. Refer to 23 - BODY/SEATS.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

**Is any sensor's voltage reading out of the acceptable range?**

- Yes** >> Loosen the mounting screws of all Seat Weight Sensors with an unacceptable voltage reading, and repeat Steps 5 and 6.
- No** >> Go To 7

**\*DIAGNOSIS AND CHECKOUT PROCEDURE FOR SEAT WEIGHT SENSORS (CONTINUED)****7. TEST SEAT TRACKS**

Turn the ignition off.

Mount the front passenger seat on the risers in accordance with service information.

Turn the ignition on.

Using the scan tool, note the Passenger Seat Weight Sensor voltage for all four sensors. The voltage should be from 1.4 to 3.6 volts for each sensor.

**Is any sensor's voltage reading out of the acceptable range?**

**Yes** >> Replace the seat track in accordance with the Service Information. Verify that no binding exists between the seat and risers. Then, repeat Steps 6 and 7.

**No** >>

**Note: Failure to follow test instructions or aborting the test will cause faults to set when performing the Occupant Classification Module System Verification Test. To prevent faults due to process errors: Verify That All Tests Steps That Led You Here Were Performed As Directed; Verify That The Ignition Is In Run; Wait 30 Seconds After Changing The Seat Weight Before Proceeding To Allow The System To Stabilize; Only Press Scan Tool Buttons When Directed To Do So; & Perform The Occupant Classification Module System Verification Test To Completion.**

Reinstall the seat in the vehicle in accordance with the Service Information. Turn the ignition on. With the scan tool in OCM, select More Options, select System Tests, and select Occupant Classification Module System Verification Test. Run the test by following the instructions displayed by the scan tool. When the test is complete, Go To 1

**\*OCS VERIFICATION TEST - VER 1**

**OCCUPANT CLASSIFICATION SEAT WEIGHTS**

**\*OCS VERIFICATION TEST - VER 1 (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

**1.**

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: TO AVOID PERSONAL INJURY OR DEATH, TURN THE IGNITION ON THEN RECONNECT THE BATTERY.**

2. Connect the scan tool to the Data Link Connector - use the most current software available.

3. With the scan tool to erase stored DTCs in all airbag system modules.

4. Turn the ignition off, and wait 15 seconds, then turn the ignition on.

5. Wait one minute, and read active codes and if there are none present read the stored codes.

6. Note: Read the DTC's in all airbag system related modules.

7. If the scan tool shows any active or stored codes, return to the Table of Content and follow path specified for that trouble code. If no active or stored codes are present, the repair is complete.

**Are any DTC's present or is the original condition still present?**

**Yes** >> Repair is not complete, refer to appropriate symptom list.

**No** >> Repair is complete.

**\*ORC VERIFICATION TEST - VER 1**

For a complete wiring diagram **Refer to Section 8W.**

**1.**

1. Remove any special tools or jumper wires and reconnect all previously disconnected components - except the Battery.

**WARNING: TO AVOID PERSONAL INJURY OR DEATH, TURN THE IGNITION ON THEN RECONNECT THE BATTERY.**

2. Connect the scan tool to the Data Link Connector - use the most current software available.

3. With the scan tool to erase stored DTCs in all airbag system modules.

4. Turn the ignition off, and wait 15 seconds, then turn the ignition on.

5. Wait one minute, and read active codes and if there are none present read the stored codes.

6. Note: If equipped with Airbag On - Off switch, read the DTC's in all switch positions.

7. Note: Read the DTC's in all airbag system related modules.

8. If the scan tool shows any active or stored codes, return to the Table of Contents and follow path specified for that trouble code. If no active or stored codes are present, the repair is complete.

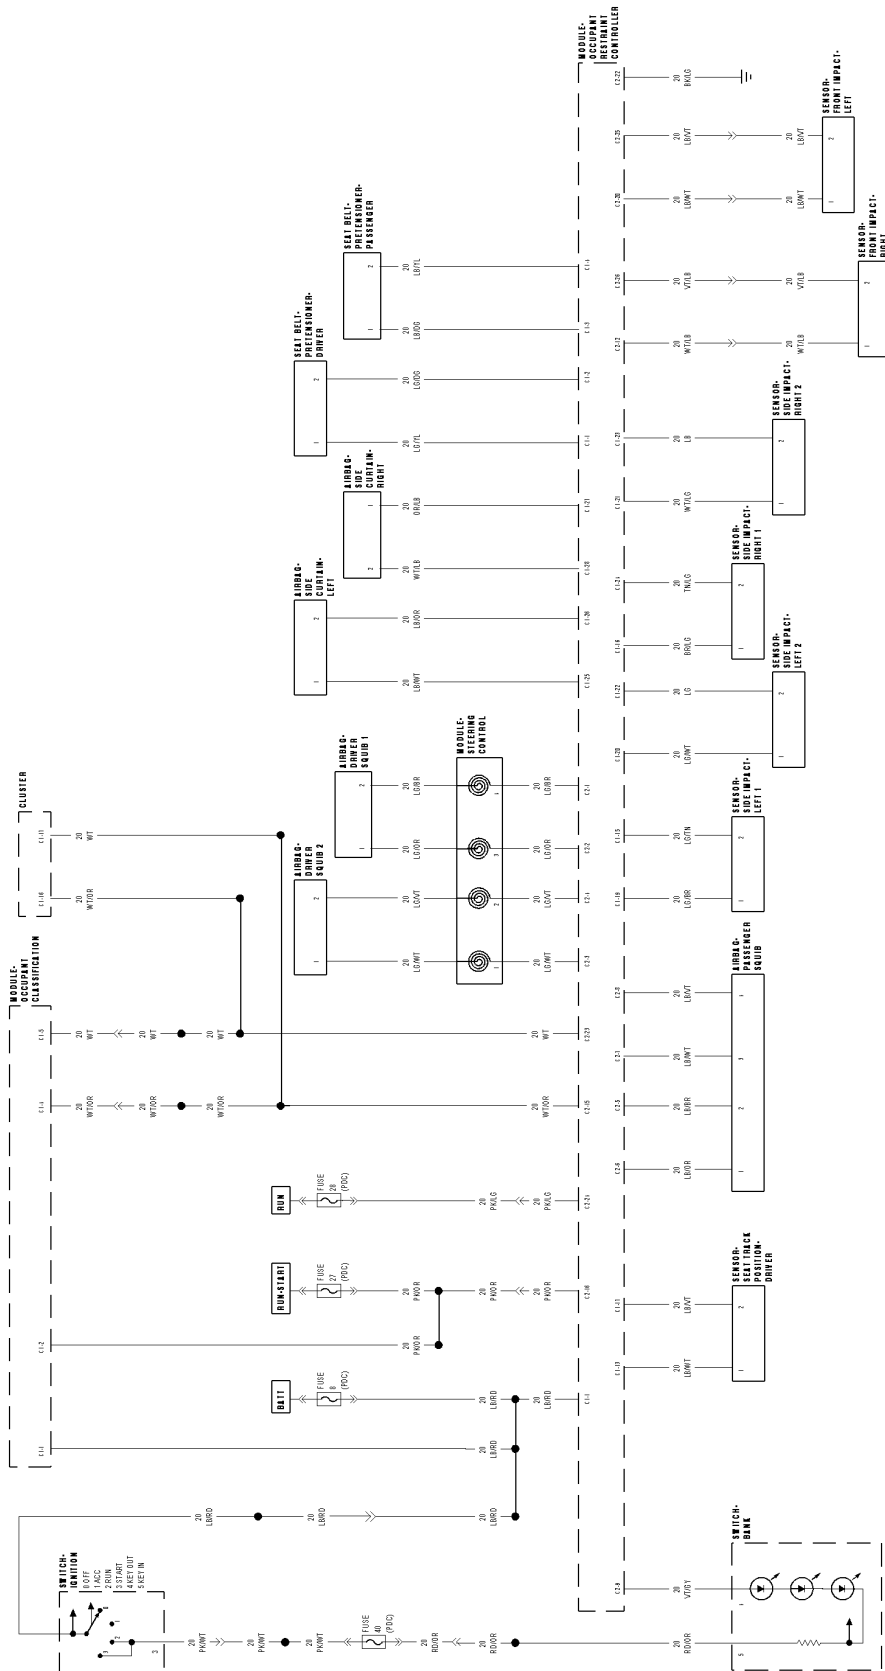

**Are any DTC's present or is the original condition still present?**

**Yes** >> Repair is not complete, refer to appropriate symptom list.

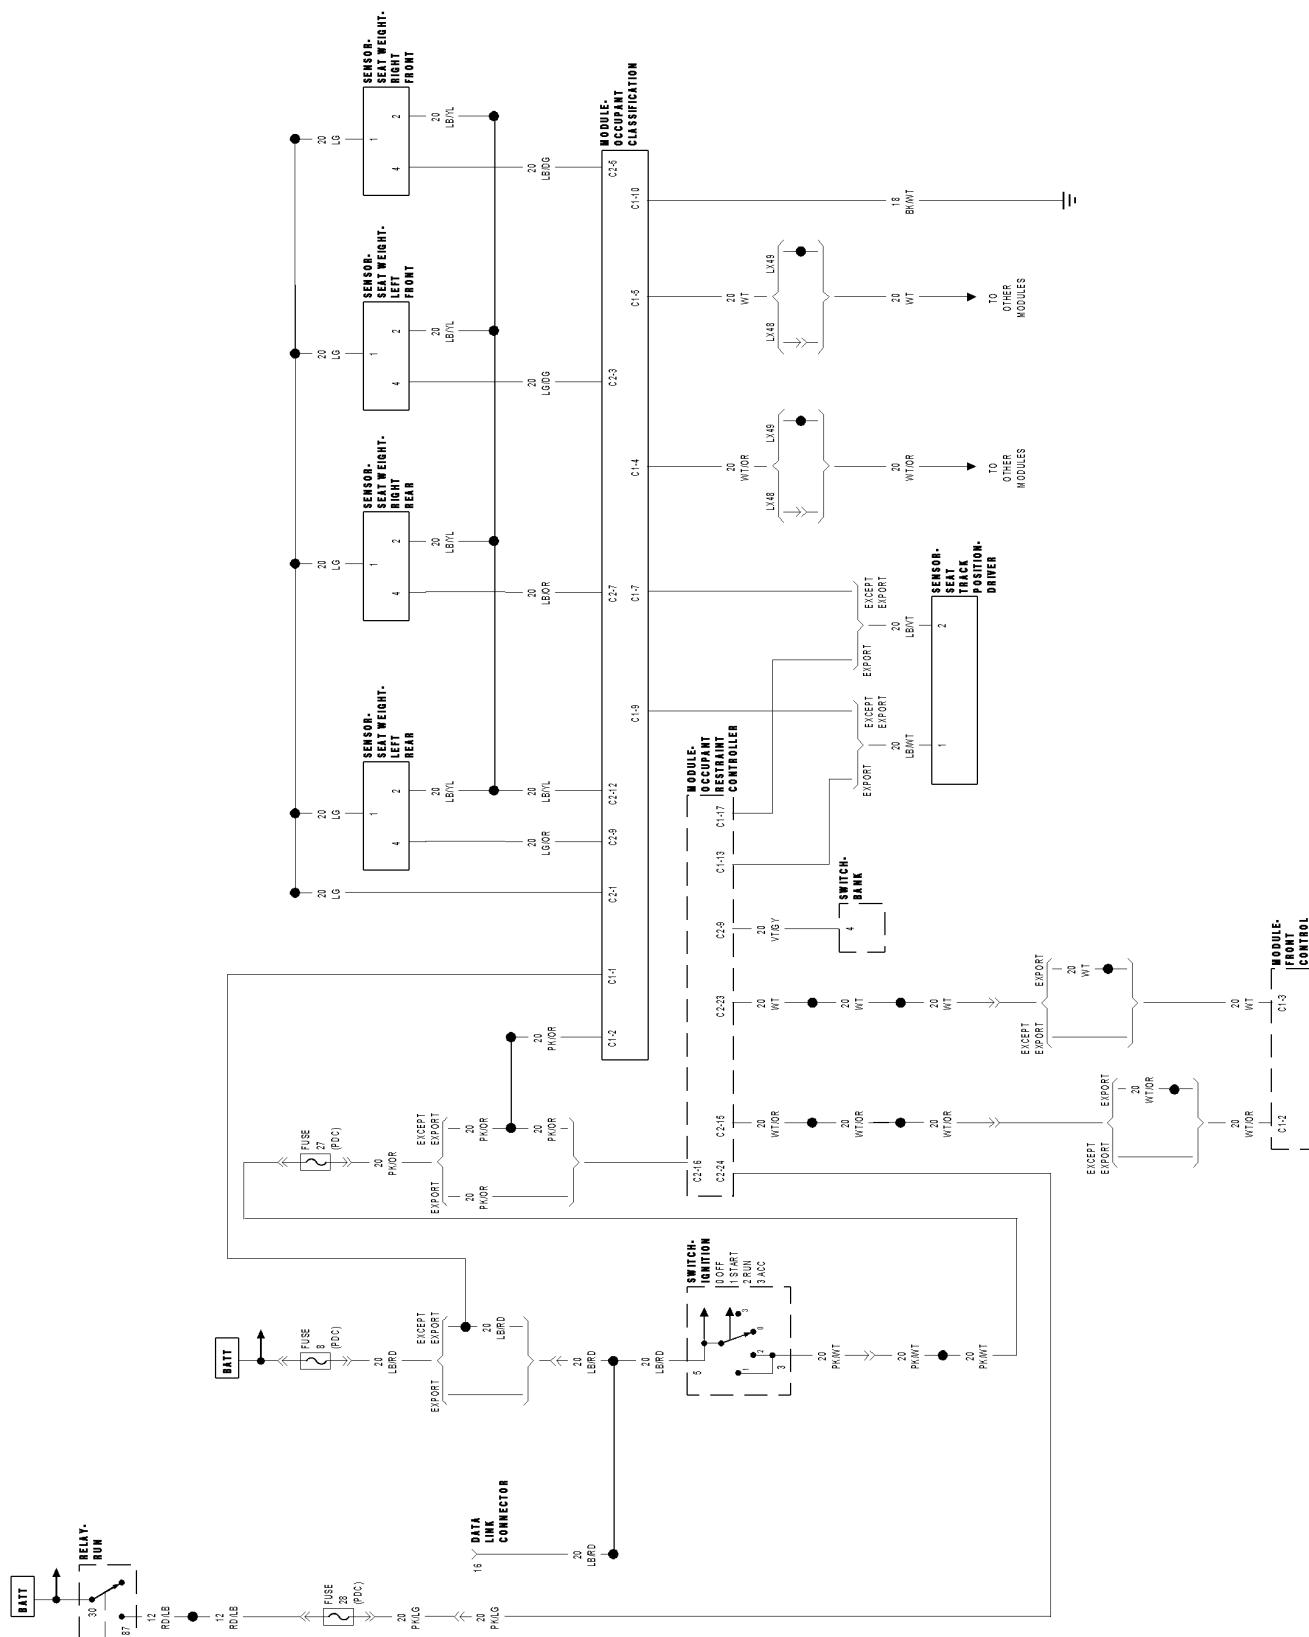

**No** >> Repair is complete.

## RESTRAINTS - SERVICE INFORMATION

## DESCRIPTION

The Occupant Restraint System include both active and passive types. Active restraints are those which require the vehicle occupants to take some action to employ, such as fastening a seat belt; while passive restraints require no action by the vehicle occupants to be employed.

## ACTIVE RESTRAINTS

The active restraints include:

- **Front Seat Belts** - Both front seating positions are equipped with three-point seat belt systems employing lower B-pillar mounted inertia latch-type emergency locking retractors, height-adjustable upper B-pillar mounted turning loops, a traveling lower seat belt anchor secured to the outboard side of the seat frame, and a traveling end-release seat belt buckle secured to the inboard side of the seat frame. The driver side front seat belt retractor includes an integral seat belt switch that detects whether the driver side front seat belt has been fastened.
- **Second Row Seat Belts** - All three second row seating positions are equipped with three-point seat belt systems. The outboard seating position belts employ lower C-pillar mounted inertia latch-type emergency locking retractors, self-cinching latch plates for compatibility with child seats, fixed lower seat belt anchors secured to the floor panel. The center position retractor is secured within the center rear seat back panel, and the fixed lower seat belt anchor and the fixed end-release buckle are both secured to the floor panel.
- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position, child seat upper tether anchors for the second row seating. These upper anchors are integral to the rear shelf panel on sedans, and the back of each second row seat back on wagons. Two lower anchors are also provided for each second row seating position. These lower anchors are accessed from the front of the rear seat where the seat back meets the seat cushion.

## PASSIVE RESTRAINTS

The passive restraints include the following:

- **Dual Front Airbags** - Multistage driver and front passenger airbags are standard in this model. This airbag system is a passive, inflatable, Supplemental Restraint System (SRS) and vehicles with this equipment can be readily identified by the "SRS - AIRBAG" logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the top of the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which will illuminate in the Electro-Mechanical Instrument Cluster (EMIC) for about seven seconds as a bulb test each time the ignition switch is turned to the On position. A pyrotechnic-type seat belt tensioner is also integral to the driver and passenger front seat belt retractors to work in conjunction with the dual front airbags.
- **Occupant Classification System** - Vehicles manufactured for sale in North America (except Mexico) also include an Occupant Classification System (OCS) with components that are located on the front seats. These components include an Occupant Classification Module (OCM) and four seat weight sensors on the passenger seat, and a seat track position sensor on the driver seat. Vehicles equipped with the OCS components can be readily identified by a passenger airbag disabled indicator located just above the radio, between the a/c outlets on the instrument panel.
- **Curtain Airbags** - Curtain airbags are available when it is also equipped with dual front airbags. This airbag system is a passive, inflatable, Supplemental Restraint System (SRS) and can be readily identified by a molded identification trim button with the "SRS - AIRBAG" logo located on the headliner above each B-pillar.

The supplemental restraint system includes the following major components, which are described in further detail elsewhere in this service information:

- **Airbag Indicator** - The airbag indicator is integral to the ElectroMechanical Instrument Cluster (EMIC), which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Curtain Airbag** - In vehicles equipped with this option, a curtain airbag is secured to each inside roof side rail, and extends from the A-pillar to the D-pillar. The curtain airbags are concealed above the headliner trim.
- **Driver Airbag** - The driver airbag is located in the center of the steering wheel, beneath the driver airbag trim cover.
- **Driver Knee Blocker** - The driver knee blocker is a structural unit secured to the back side of and integral to the instrument panel steering column opening cover.
- **Front Impact Sensor** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the back side of each vertical member of the radiator support.
- **Occupant Classification Module** - Vehicles equipped with the Occupant Classification System (OCS) include an Occupant Classification Module (OCM) which is secured to the underside of the passenger side front seat cushion frame.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) is located on a mount on the floor panel transmission tunnel in front of the transmission gear selector, and is concealed below the instrument panel.
- **Passenger Airbag** - The passenger airbag is located in the instrument panel, beneath the passenger airbag door on the top of the instrument panel above the glove box on the passenger side of the vehicle.
- **Passenger Airbag Disabled Indicator** - The Occupant Classification System (OCS) includes a passenger airbag disabled indicator which is located just above the radio in the instrument panel center stack, between the a/c outlets.
- **Passenger Knee Blocker** - The passenger knee blocker is a structural reinforcement that is integral to and concealed within the glove box door.
- **Seat Belt Tensioner** - A seat belt tensioner is integral to both front seat belt retractor units on vehicles equipped with dual front airbags. The seat belt retractor and tensioner units are secured to the right and left inner B-pillars and concealed beneath the lower B-pillar trim.
- **Seat Track Position Sensor** - The Occupant Classification System (OCS) includes two seat track position sensors. One sensor is located on the inboard side of the outboard seat adjuster track on both the driver and the passenger front seats.
- **Seat Weight Sensor** - Vehicles equipped with the Occupant Classification System (OCS) include four seat weight sensors, one on each corner of the passenger side front seat between the seat cushion frame and the seat adjuster tracks.
- **Side Impact Sensor** - Four side impact sensors are used on vehicles equipped with the curtain airbags, two on each side of the vehicle. One sensor is located near each right and left side B-pillar and C-pillar concealed behind the interior trim.

The ORC, the OCM, and the EMIC each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of communication is used by the ORC for control of the airbag indicator in the EMIC. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - DESCRIPTION).

## OPERATION

### ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as an active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them. See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the factory-installed active restraints.

### PASSIVE RESTRAINTS

The passive restraints are referred to as a supplemental restraint system because they were designed and are intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed supplemental restraint system.

The supplemental restraint system electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) illuminates for about seven seconds as a bulb test each time the ignition switch is turned to the On or Start positions. Following the bulb test, the airbag indicator is turned on or off by the ORC to indicate the status of the supplemental restraint system. If the airbag indicator comes on at any time other than during the bulb test, it indicates that there is a problem in the supplemental restraint system electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the supplemental restraints depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; rather, deployment is based upon the rate of deceleration as measured by the forces of gravity (G force) upon the impact sensors. When an impact is severe enough, the microprocessor in the ORC signals the inflator of the appropriate airbags to deploy their cushions. The front seat belt tensioners are provided with a deployment signal by the ORC in conjunction with the front airbags.

During a frontal vehicle impact, the knee blockers work in concert with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance that the driver and front seat passenger are properly positioned and restrained for an airbag deployment.

The airbag deployment and deflation occur very rapidly. In a typical 48 kilometer-per-hour (30 mile-per-hour) barrier impact, from the moment of impact until the airbags are fully inflated takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times will vary somewhat, depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ORC monitors a problem in any of the dual front airbag system circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the EMIC to turn on the airbag indicator. Proper testing of the supplemental restraint system components, the Controller Area Network (CAN) data bus, the electronic message inputs to and outputs from the EMIC or the ORC, as well as the retrieval or erasure of a DTC from the ORC or the EMIC requires the use of a diagnostic scan tool and the appropriate diagnostic information.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of all of the passive restraints.

### OCCUPANT CLASSIFICATION SYSTEM

In vehicles equipped with the Occupant Classification System (OCS), the OCS automatically suppresses or enables passenger airbag and seat belt tensioner operation based upon whether or not the passenger front seat is occupied and, if the seat is occupied, classifies the size of the occupant and whether the seat is occupied by a child seat.

The OCS has an Occupant Classification Module (OCM) that monitors inputs from the seat weight sensors under the passenger side front seat cushion and from the seat track position sensors on the passenger side and driver side seat adjuster tracks. Based upon those inputs the microprocessor within the OCM classifies the occupant of the passenger front seat, and the proximity of each front seat to the front airbags. The OCM then sends electronic occupant classification messages to the Occupant Restraint Controller (ORC). The microprocessor and programming of the ORC determines whether to enable or disable the deployment circuits for the passenger airbag and seat belt tensioner; and, if enabled, what force level should be used to deploy each front airbag.

The OCS electrical circuits and components are continuously monitored by the OCM, and the OCM is continuously monitored by the ORC. A passenger airbag disabled indicator is located in the instrument panel center stack just above the radio, between the a/c outlets. This indicator receives battery current whenever the ignition switch is in the On or Start positions, and illuminates only when the ORC pulls the indicator control circuit to ground. The indicator illuminates for about seven seconds as a bulb test each time the ignition switch is turned to the On or Start positions. Following the bulb test, the indicator is turned on or off by the ORC based upon the electronic occupant classification messages received from the OCM. This indicator is illuminated whenever the seat is occupied and passenger airbag and seat belt tensioner operation has been suppressed, and is turned off whenever the seat is empty or when the seat is occupied and the passenger airbag and seat belt tensioner are enabled.

When the OCM monitors a problem in any of the OCS circuits or components, it stores a fault code or DTC in its memory circuit and sends an electronic message to the ORC. The ORC then sends an electronic message to the Electro-Mechanical Instrument Cluster (EMIC) to turn on the airbag indicator. If for any reason the OCM is unable to classify the occupant it sends an electronic message to the ORC, and the ORC suppresses passenger airbag and seat belt tensioner operation. Proper testing of the OCS components, the Controller Area Network (CAN) data bus, the electronic message inputs to and outputs from the OCM, the EMIC or the ORC, as well as the retrieval or erasure of a DTC from the OCM, the ORC or the EMIC requires the use of a diagnostic scan tool and the appropriate diagnostic information.

See the owner's manual in the vehicle glove box for more information on the features, use and operation of the OCS.

## **WARNING**

**Disconnect and isolate the battery negative cable before beginning any airbag system component diagnosis, testing, removal, or installation procedures. Allow system capacitor to discharge for two minutes before beginning any component service. This will disable the airbag system. Failure to disable the airbag system may result in accidental airbag deployment, personal injury, or death.**

**Do not place an intact undeployed airbag face down on a solid surface. The airbag will propel into the air if accidentally deployed and may result in personal injury or death.**

**When carrying or handling an undeployed airbag, the trim side (face) of the airbag should be pointing towards the body to minimize possibility of injury if accidental deployment occurs. Failure to do this may result in personal injury or death.**

**Replace airbag system components with Mopar® replacement parts. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to do so may result in occupant personal injury or death.**

**Wear safety glasses, rubber gloves, and long sleeved clothing when cleaning powder residue from vehicle after an airbag deployment. Powder residue emitted from a deployed airbag can cause skin irritation. Flush affected area with cool water if irritation is experienced. If nasal or throat irritation is experienced, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.**

**Do not use a replacement airbag that is not in the original packaging. This may result in improper deployment, personal injury, or death.**

**The factory installed fasteners, screws and bolts used to fasten airbag components have a special coating and are specifically designed for the airbag system. Do not use substitute fasteners. Use only original equipment fasteners listed in the parts catalog when fastener replacement is required.**

**During, and following, any child restraint anchor service, due to impact event or vehicle repair, carefully inspect all mounting hardware, tether straps, and anchors for proper installation, operation, or damage. If a child restraint anchor is found damaged in any way, the anchor must be replaced. Failure to do this may result in personal injury or death.**

**Deployed and nondeployed airbags may or may not have live pyrotechnic material within the airbag inflator. Do not dispose of driver/passenger/curtain airbags or seat belt tensioners unless you are sure of complete**

deployment. Refer to the Hazardous Substance Control System for proper disposal. Dispose of deployed airbags and tensioners consistent with state, provincial, local, and federal regulations.

After any airbag component testing or service, do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

If the vehicle is equipped with the Occupant Classification System (OCS), do not connect the battery negative cable before performing the OCS Verification Test using the scan tool and the appropriate diagnostic information. Personal injury or death may result if the system test is not performed properly.

Never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one, then perform the Airbag System test (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM) before replacing the other. Both the ORC and the OCM store Occupant Classification System (OCS) calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules and the OCS may malfunction and cause personal injury or death.

If equipped with OCS, the Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to do so may result in occupant injury or death.

If equipped with OCS, the front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative, could result in occupant injury, or possibly death.

If equipped with OCS, when the passenger front seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative, could result in occupant injury, or possibly death.

## DIAGNOSIS AND TESTING

### AIRBAG SYSTEM

1. With the battery negative cable disconnected, connect the scan tool to the Data Link Connector (DLC).
2. Turn the ignition key to the ON position, then exit vehicle with the scan tool.
3. After checking that no one is inside the vehicle, connect the battery negative remote terminal.
4. Read and record the **ACTIVE** Diagnostic Trouble Code (DTC) data.
5. Read and record any **STORED** DTC's.
6. Refer to the proper diagnostic information if any DTC's are found in Step 4 and Step 5.
7. If the airbag warning lamp either fails to light, or goes ON and stays ON, there is a system malfunction. To test the airbag warning lamp (bulb) operation in the cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Refer to the appropriate diagnostic information for any other system problems.

## STANDARD PROCEDURE

### HANDLING AIRBAGS

#### DEPLOYED AIRBAG

**WARNING:** The vehicle interior may contain a very small amount of powder, a by-product of airbag deployment. This powder can irritate the skin, eyes, nose and throat. Wear safety glasses, rubber gloves, and long sleeved clothing when cleaning any of the powder residue from the vehicle. If you find that the cleanup is irritating your skin, run cool water over the affected area. Also, if you experience nasal or throat irritation, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.

## UNDEPLOYED AIRBAG

**WARNING:** The airbags must be stored in its original special container until used for service. At no time should a source of electricity be permitted near the inflator on the back of an airbag. When carrying or handling an undeployed airbag, the trim side of the airbag should be pointing toward the body to minimize the possibility of personal injury or death if accidental deployment occurs. Do not place undeployed airbag face down on a solid surface, the airbag will propel into the air if accidental deployment occurs.

## SERVICE AFTER AN AIRBAG DEPLOYMENT

### DRIVER AIRBAG

After a Driver Airbag has been deployed due to a collision, the following **MUST** be replaced:

- Driver Airbag
- Clockspring Assembly
- Steering Wheel
- Complete Steering Column Assembly w/Lower Steering Column Coupler

All other airbag and vehicle components should be closely inspected following any airbag deployment, and should be replaced when visible damage is incurred.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

### PASSENGER AIRBAG

After a Passenger Airbag has been deployed due to a collision. the following **MUST** be replaced:

- Passenger Airbag
- Instrument Panel and Pad Assembly

All other airbag and vehicle components should be closely inspected following any airbag deployment, and should be replaced when visible damage is incurred.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

### CURTAIN AIRBAG

After a Curtain Airbag has been deployed due to a collision. the following **MUST** be replaced:

- Curtain Airbag Assembly
- Headliner
- A, B, and C-Pillar Trim on deployed side.

All other airbag and vehicle components should be closely inspected following any airbag deployment, and should be replaced when visible damage is incurred.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

## OCCUPANT CLASSIFICATION SYSTEM (OCS)

After an impact event, either front, rear, or side, the OCS system components need to be inspected and replaced if found to be damaged.

This includes:

- Occupant Classification Module (OCM)
- Passenger Airbag Disabled Indicator

- Seat Weight Sensor

**WARNING:** Never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one, then perform the Airbag System test (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM) before replacing the other. Both the ORC and the OCM store Occupant Classification System (OCS) calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules and the OCS may malfunction and result in personal injury or death.

Whether replaced or not, the OCS must be re-zeroed to make sure that the system is within proper parameters to sense the occupants weight correctly.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

**WARNING:** Following successful completion of the Airbag System test procedure, the Occupant Classification System Verification Test must be done using a scan tool and the appropriate diagnostic information. Personal injury or death may result if the system test is not performed.

## SEAT BELTS AND TENSIONERS

After a frontal impact where an airbag has been deployed due to a collision, the following **MUST** be replaced:

- Front Seat Belt and Retractor (driver and passenger) with integral Tensioners.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

All other seat belts should be closely inspected for cuts, tears, fraying, or damage in any way following any frontal impact or airbag deployment. The other seat belts are to be replaced when visible damage is incurred. Inspect the Lower Anchors and Tether for CHildren (LATCH) child restraint anchors for damage after an impact event and replace as needed.

## CLEAN UP PROCEDURE

Roll or fold the airbag towards its mounting point (i.e. instrument panel, steering wheel, knee blocker, curtain, or seat back). Then tape the ripped cover over the deployed airbag if applicable.

Use a vacuum cleaner to remove any residual powder from the vehicle interior. Work from the outside in to avoid kneeling or sitting in a contaminated area. Vacuum the heater and A/C outlets as well. If the heater or air conditioner was in RECIRC mode at time of airbag deployment, operate blower motor on low speed and vacuum powder residue expelled from the heater and A/C outlets. Multiple vacuum cleaning may be necessary to decontaminate the interior of the vehicle.

## CHILD RESTRAINT ANCHOR

### DESCRIPTION

The Lower Anchors and Tether for Children, or LATCH child restraint anchorage system provides for the installation of suitable child restraints in certain seating positions without using the seat belt provided for that seating position. The second row seats are equipped with a fixed-position child restraint upper tether anchor for both the center and the two outboard seating positions, and child restraint lower anchors for all three seating positions.

The three upper tether anchors are integral to the rear shelf panel on sedans and the seat back frame on wagons. These anchors are each constructed from a heavy-gauge steel wire loop. The child restraint upper tether anchors cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

The lower anchors (1) are permanently mounted to the rear floor pan beneath the seat. These anchors are also constructed from a heavy-gauge steel wire loop welded to the floor pan. They are each accessed from the front of their respective seats, at each side where the seat back meets the seat cushion. These lower anchors cannot be adjusted or repaired and, if faulty or damaged, they must be replaced as a unit.

## OPERATION

See the owner's manual in the vehicle glove box for more information on the proper use of all of the factory-installed child restraint anchors.

## CLOCKSPRING

### DESCRIPTION

The clockspring assembly is secured with three screws (1) onto the top of the Steering Column Control Module (SCCM) (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - DESCRIPTION) near the top of the steering column behind the steering wheel.

The clockspring consists of a flat, round molded plastic case. Within the plastic case is a spool-like molded plastic rotor with a hub. The surface of the rotor hub has a large center hole. Within the plastic case and wound around the rotor spool is a long ribbon-like tape that consists of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tape terminates at the connector terminals that align themselves into the SCCM self-docking connector that faces the instrument panel, while the inner end of the tape terminates at the pigtail wires and connector receptacles on the hub of the clockspring rotor that face the steering wheel.

Service replacement clocksprings are shipped pre-centered and with the screws backed out and holding the clockspring into place. If reusing a clockspring or installing a new one that you are unsure if it is centered or not, (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

The clockspring cannot be repaired. If the clockspring is faulty, damaged, or if the driver airbag has been deployed, the clockspring must be replaced.

## OPERATION

The clockspring is a mechanical electrical circuit component that is used to provide continuous electrical continuity between the fixed instrument panel wire harness and the electrical components mounted on or in the rotating steering wheel. On this model the rotating electrical components include the:

- Driver Airbag
- Horn Switch
- Steering Wheel Switches (if the vehicle is so equipped)

The clockspring case is positioned and secured to Steering Column Control Module (SCCM) mounting housing near the top of the steering column. The connector terminals on the tail of the fixed clockspring case connect the clockspring to the vehicle electrical system through the self-docking connector in the instrument panel wire harness.

The clockspring rotor is movable and is keyed to the steering column shaft that is molded onto the rotor hub. The lobe on the turn signal cancel cam on the lower surface of the clockspring rotor hub contact a turn signal cancel actuator of the multi-function switch to provide automatic turn signal cancellation.

Two short, yellow-sleeved pigtail wires on the upper surface of the clockspring rotor connect the clockspring to the multistage driver airbag, while a steering wheel wire harness connects the two connector receptacles on the upper surface of the clockspring rotor to the horn switch feed pigtail wire connector and, if the vehicle is so equipped, to the optional steering wheel switches on the steering wheel.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the clockspring is removed from the steering column or if the steering shaft is disconnected from the steering gear, the clockspring spool can change position relative to the movable steering components. The clockspring must be re-centered following completion of this service or the tape may be damaged.

Service replacement clocksprings are shipped pre-centered. The screws that retain the clockspring to the SCCM should not be removed until the clockspring has been installed on the SCCM. If the screws have been removed before the clockspring is installed on the SCCM, the clockspring centering procedure must be performed (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - STANDARD PROCEDURE - CLOCKSPRING CENTERING).

The clockspring is located within the SCCM. If the clockspring has to be replaced (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - DISASSEMBLY).

## STANDARD PROCEDURE

### CLOCKSPRING CENTERING

If the rotating tape (wire coil) in the clockspring is not positioned properly with the steering wheel and the front wheels, the clockspring may fail. The following procedure **MUST BE USED** to center the clockspring if it is not known to be properly positioned, or if the front wheels were moved from the straight ahead position.

**Note:** Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight-ahead position.

1. Position steering wheel and front wheels straight ahead.
2. Remove the Steering Column Control Module (SCCM) (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - REMOVAL).

3. Remove the clockspring (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - DISASSEMBLY).
4. The clockspring can rotate approximately 5 3/4 turns from lock to lock. To be properly centered, rotate the clockspring rotor clockwise until the rotor stops. Do not apply excessive force.
5. From the end of travel, rotate the rotor counter-clockwise two turns and then keep going a little more until the wires end up on the right side of the column shaft (at the 3 o'clock position).

6. Install the SCCM (Refer to 19 - STEERING/COLUMN/STEERING COLUMN CONTROL MODULE - INSTALLATION)

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING). Personal injury or death may result if the system test is not performed properly.

## CURTAIN AIRBAG

### DESCRIPTION

Curtain airbags are available when also equipped with dual front airbags. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components, and can be readily identified by a molded identification trim button with the "SRS - AIRBAG" logo located near the top of each upper B-pillar trim panel. This system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision.

8098029e

Curtain airbags have two individually controlled curtain airbags. These airbags are concealed and mounted above the headliner where they are each secured to one of the roof side rails. Each folded airbag cushion extends along the roof rail from the A-pillar at the front of the vehicle to the D-pillar at the rear of the vehicle. The airbag cushion is initially secured during installation with plastic push-in fasteners to the roof rail.

81350231

A long tether extends down the A-pillar from the front of the airbag cushion. A short tether is secured near the top of the D-pillar.

The hybrid-type inflator for each airbag is secured to the roof rail at the rear of airbag, back by the C and D-pillars. The entire assembly is secured to the inside of the roof rail with screws.

An airbag squib harness connector is routed up to the rear of the airbag inflator. The body harness then connects the curtain airbag to the Occupant Restraint Controller (ORC).

The curtain airbag cannot be adjusted or repaired and must be replaced if deployed, faulty, or in any way damaged. Once a curtain airbag has been deployed, the complete airbag, the headliner, the upper A, B, C and D-pillar trim, and all other visibly damaged components must be replaced.

81366d83

## OPERATION

Each curtain airbag is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through squib circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded curtain airbag cushion, causing the cushion to inflate. As the airbag cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision.

The front and rear tethers keep the airbag cushion taut to the side of the vehicle, thus ensuring that the bag will deploy in the proper position. Following the airbag deployment, the airbag cushion quickly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the roof rail.

## REMOVAL

**Note:** The sedan and wagon curtain airbags are mounted similar and are removed the same way.

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove the headliner from the vehicle (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Disconnect the curtain airbag squib connector (2) from the inflator (3).

4. Remove the screws (1) that secure the curtain airbag to the spring nuts in the roof side rail.
5. Remove the push pin and unclip the front tether (2) from the A-pillar (1).

6. Remove the bolt (2) holding the inflator to the C/D-pillar.

7. The curtain airbag will be held in place with push pins. Release the push pins and remove bag from vehicle.

## INSTALLATION

**Note:** The sedan and wagon curtain airbags are mounted similar and are removed the same way.

1. Position the curtain airbag in vehicle along roof side rail and install by fastening to roof side rail with integral push fasteners.

2. Install the bolt (2) holding the inflator to the C/D-pillar. Torque bolt to 11 N·m (97 in. lbs.).

3. Clip the front tether (2) to the A-pillar (1) and install push fastener.

4. Install the screws (1) that secure the curtain airbag to the spring nuts in the roof side rail. Torque screws to 5 N·m (44 in. lbs.).
5. Connect the curtain airbag squib connector (2) to the inflator (3).
6. Install the headliner into the vehicle (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

**WARNING: Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.**

## DRIVER AIRBAG

### DESCRIPTION

The driver airbag protective trim cover (1) is the most visible part of the driver airbag. The driver airbag is located in the center of the steering wheel (1), where it is secured with two screws to the armature of the four-spoke steering wheel. Concealed beneath the driver airbag trim cover are the horn switch, the folded airbag cushion, the airbag cushion retainer, the airbag housing, the airbag inflator, and the retainers that secure the inflator to the airbag housing.

The airbag cushion, housing, and inflator are secured within the trim cover.

The vertical walls of this trim cover have small windows with blocking tabs that are engaged by hook formations around the perimeter of the airbag housing. Each hook is inserted through one of the windows and the blocking tab in each window keeps the hook properly engaged with the trim cover, locking the trim cover securely into place on the airbag housing.

The resistive membrane-type horn switch is secured with heat stakes to the inside surface of the driver airbag trim cover, between the trim cover and the folded airbag cushion.

The airbag used in this model is a multistage, Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. A radial deploying fabric cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit with four mounting studs and is secured to the stamped metal airbag housing by four flanged hex nuts. Two keyed and color-coded connector receptacles on the driver airbag inflator connect the two inflator initiators to the vehicle electrical system through two yellow-jacketed, two-wire pigtail harnesses of the clockspring.

The driver airbag unit cannot be repaired, and must be replaced if deployed or in any way damaged. The driver airbag trim cover and horn switch unit may be disassembled from the driver airbag unit, and is available for separate service replacement.

## OPERATION

The multistage driver airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of three delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the airbag housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the driver airbag trim cover will split at predetermined breakout lines, then fold back out of the way along with the horn switch unit. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event.

The inert gas that is produced when the chemicals are burned is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breath. If the irritation is not alleviated by these actions, contact a physician.

## REMOVAL

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. From behind the steering wheel (instrument panel side) remove the two screws (1) to the driver airbag (2).

3. Pull airbag rearward and disconnect the two airbag squib connectors (1) and the steering wheel controls connector (2).
4. Separate driver airbag from steering column.

**Note:** The driver airbag trim cover is available for service separately. If the horn switch is faulty or the trim cover is damaged, the airbag cushion assembly may be transferred to a new trim cover. If the airbag is defective, the entire driver airbag and driver airbag trim cover must be replaced as an assembly.

## INSTALLATION

**Note:** The driver airbag trim cover is available for service separately. If the horn switch is faulty or the trim cover is damaged, the airbag cushion assembly may be transferred to a new trim cover. If the airbag is defective, the entire driver airbag and driver airbag trim cover must be replaced as an assembly.

1. Position driver airbag in steering column near mounting location.

2. Connect the two airbag squib connectors (1) and the steering wheel controls connector (2).

3. Position the driver airbag (2) into the steering wheel. From behind the steering wheel (instrument panel side) install the two screws (1) to the driver airbag. Torque the two screws (1) to 10 N·m (89 in. lbs.).

**WARNING: Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.**

## DRIVER AIRBAG TRIM COVER

### REMOVAL

1. Disconnect and isolate the battery negative cable.

**WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.**

2. Remove the driver airbag (2) (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. With driver airbag removed, pick a corner and push down on the inflator (1) or latch hook mounting plate until the latch hooks (2) push out of the driver airbag cover (3).
4. Remove driver airbag from driver airbag cover.
5. The membrane type horn switch is integral to the driver airbag trim cover. If inoperative, the entire trim cover must be replaced.

## INSTALLATION

1. Place the driver airbag into new driver airbag trim cover. Be careful not to pinch the airbag cushion between the latch hook mounting plate and the trim cover.

**Note:** Make sure that the horn switch wire harness is routed through the cut-out on the side of the trim cover and positioned in the hook on the back of the housing. Attach connector to the housing.

2. Push down on the latch hook mounting plate and guide the latch hooks into the slots on the driver airbag cover.

3. Once all the latch hooks have been started, pull the driver airbag cover away from the driver airbag to fully seat the latch hooks.
4. Install the driver airbag (2) (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - INSTALLATION). Torque the two screws (1) to 10 N·m (89 in. lbs.).

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

## FRONT SEAT BELT HEIGHT ADJUSTER

## REMOVAL

1. Remove the upper turning loop (3) trim cover (2).
2. Remove the upper turning loop retaining bolt (4).

2. Remove the upper turning loop retaining bolt (4).

3. Remove the upper B-pillar trim (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

4. Remove the two bolts (1) to the seat belt height adjuster (2).

## INSTALLATION

1. Position height adjuster making sure that indexing tab is in the proper hole.
2. Install the two mounting bolts (1). Torque bolts to 32 N·m (24 ft. lbs.).

3. Install the upper B-pillar trim (Refer to 23 - BODY/ INTERIOR/B-PILLAR TRIM - INSTALLATION).

4. Position the upper turning loop (3) and install the retaining bolt (4). Torque bolt to 40 N·m (30 ft. lbs.).
5. Install the upper turning loop (3) trim cover (2).

## IMPACT SENSOR

### DESCRIPTION

#### FRONT IMPACT SENSORS

Two front impact sensors (1) are used on this model, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each front sensor is secured with two screws (2) to the backs of the right and left vertical members of the radiator support within the engine compartment.

The right and left front impact sensors are identical in construction and calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. Potting material fills the cavity to seal and protect the internal electronic circuitry and components.

The impact sensors cannot be repaired or adjusted and, if damaged or faulty, they must be replaced.

## SIDE IMPACT SENSORS

Four side impact sensors are used on this model when it is equipped with the curtain airbags, two each for the left and right sides of the vehicle. The sedan and wagon side impact sensor locations are identical. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with two screws to the inner right or left B-pillar and C-pillar within the passenger compartment.

The right and left side impact sensors are identical in construction and calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. Potting material fills the cavity to seal and protect the internal electronic circuitry and components.

The impact sensors cannot be repaired or adjusted and, if damaged or faulty, they must be replaced.

## OPERATION

### FRONT IMPACT SENSORS

The front impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The most reliable, efficient, and accurate means to diagnose the impact sensors, the ORC, and the electronic message communication between the sensors and the ORC requires the use of a scan tool and the appropriate diagnostic information.

### SIDE IMPACT SENSORS

The side impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the side passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through the same left or right sensor plus and minus circuits in a series arrangement from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The most reliable, efficient, and accurate means to diagnose the impact sensors, the ORC, and the electronic message communication between the sensors and the ORC requires the use of a scan tool and the appropriate diagnostic information.

## REMOVAL

### FRONT IMPACT SENSOR

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

**Note:** If replacing the left front impact sensor, the air intake system needs to be removed (Refer to 9 - ENGINE/AIR INTAKE SYSTEM - REMOVAL).

2. Disconnect the electrical connector (3).
3. Remove the two mounting screws (2).

### SIDE IMPACT SENSOR

#### B-PILLAR MOUNTED SIDE IMPACT SENSOR

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove the B-pillar trim panel (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).
3. Disconnect the electrical connector (1).
4. Remove the two retaining screws (2).

**C-PILLAR MOUNTED SIDE IMPACT SENSOR**

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove the C-pillar trim panel (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
3. Disconnect the electrical connector (3).
4. Remove the two retaining screws (2).

**INSTALLATION****FRONT IMPACT SENSOR**

1. Position the front impact sensor in the correct mounting location and install the two mounting screws (2). Torque screws (2) to 7 N·m (62 in. lbs.).
2. Connect the electrical connector (3).

**Note:** If replacing the left front impact sensor, the air intake system needs to be installed (Refer to 9 - ENGINE/AIR INTAKE SYSTEM - INSTALLATION).

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

## SIDE IMPACT SENSOR

### B-PILLAR MOUNTED SIDE IMPACT SENSOR

1. Position the B-pillar mounted impact sensor in the correct mounting location and install the two mounting screws (2). Torque screws (2) to 7 N·m (62 in. lbs.).
2. Connect the electrical connector (1).
3. Install the B-pillar trim panel (Refer to 23 - BODY/ INTERIOR/B-PILLAR TRIM - INSTALLATION).

**WARNING: Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.**

### C-PILLAR MOUNTED SIDE IMPACT SENSOR

1. Position the C-pillar mounted impact sensor in the correct mounting location and install the two mounting screws (2). Torque screws (2) to 7 N·m (62 in. lbs.).
2. Connect the electrical connector (3).
3. Install the C-pillar trim panel (Refer to 23 - BODY/ INTERIOR/C-PILLAR TRIM - INSTALLATION).

**WARNING: Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.**

## OCCUPANT CLASSIFICATION MODULE

### DESCRIPTION

The Occupant Classification Module (OCM) is secured with two screws to a mount on the underside of the passenger side front seat cushion frame near the out-board front corner. Concealed within a hollow in the center of the molded plastic OCM housing is a micro-processor and the other electronic circuitry of the module. The module housing is sealed to enclose and protect the internal electronic circuitry. The OCM software is flash programmable.

A non-calibrated OCM is available for service replacement. The OCM and all of the other components of the Occupant Classification System (OCS) including the passenger front seat, the seat weight sensors, the passenger or driver seat track position sensor and the seat adjusters, cushion, back, frame, foam, springs, and wiring harness are a factory-calibrated and assembled unit. Any time any one of these components is removed or replaced for any reason, the OCM must be re-calibrated using a diagnostic scan tool, the Occupant Classification Seat Weight special tool, and the Occupant Classification System Verification Test. Refer to the appropriate diagnostic procedures.

The OCM cannot be adjusted or repaired and, if damaged or faulty, it must be replaced.

### OPERATION

The microprocessor in the Occupant Classification Module (OCM) (2) contains the Occupant Classification System (OCS) logic circuits. The OCM uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is also used for OCS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The OCM (2) provides voltage to the four seat weight sensors located on the corners of the passenger front seat (1, 3, and 4), and to the seat track position sensors on the outboard passenger and driver front seat upper seat tracks. The OCM then monitors return inputs from each of the sensors on dedicated hard wired data communication circuits. The seat weight sensor input allows the OCM to determine whether the passenger side front seat is occupied and the relative size of the occupant by providing a weight-sensing reference to the load on the seat. The seat track position sensor provides an additional logic input to the OCM micro-processor that allows it to determine the position of the front seat passenger and driver relative to the front airbags.

Pre-programmed decision algorithms and OCS calibration allow the OCM microprocessor to determine when passenger airbag protection is appropriate based upon the seat load as signaled by the seat weight sensors. When the programmed conditions are met, the OCM sends the proper electronic occupant classification messages over the CAN data bus to the Occupant Restraint Controller (ORC), and the ORC enables or disables the deployment circuits for the passenger front supplemental restraints. The ORC also provides a control output for the Passenger Airbag Disabled (PAD) Indicator in the instrument panel based upon the electronic occupant classification messages it receives from the OCM.

The OCM also sends electronic driver and passenger seat track position messages to the ORC over the CAN data bus. The ORC uses the seat track position data as an additional logic input for determining the force level with which to deploy the multistage front airbags.

The OCM microprocessor continuously monitors all of the OCS electrical circuits and components to determine the system readiness. If the OCM detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends the appropriate electronic messages to the ORC over the CAN data bus. Then the ORC sets a DTC and sends messages to control the airbag indicator operation accordingly. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the OCM and the ORC. For some DTC's, if a fault does not recur for a number of ignition cycles, the OCM will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

The OCM receives battery current on a fused ignition switch output (run-start) circuit. The OCM receives ground through a ground circuit and take out of the body wire harness. These connections allow the OCM to be operational whenever the ignition switch is in the Start or On positions.

The most reliable, efficient, and accurate means to diagnose the OCM, the CAN data bus network, and the electronic message inputs to and outputs from the OCM requires the use of a diagnostic scan tool and the appropriate diagnostic information.

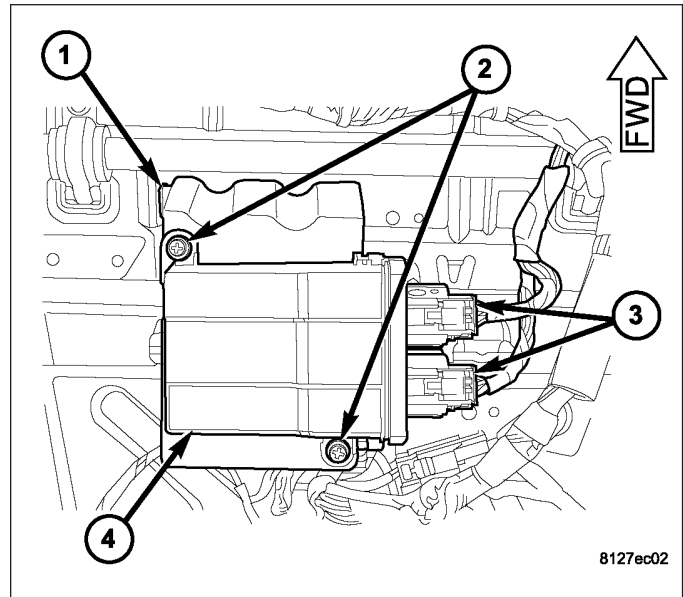

## REMOVAL

**WARNING:** Never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one, then perform the Airbag System test (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM) before replacing the other. Both the ORC and the OCM store Occupant Classification System (OCS) calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules and the OCS may malfunction and cause personal injury or death.

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Reach under the front edge of the passenger front seat cushion to access and disconnect the two harness connectors (3) from the Occupant Classification Module (OCM) (4).
3. Remove the two screws (2) that secure the OCM to the OCM bracket (1).
4. Remove the OCM from under the passenger front seat.

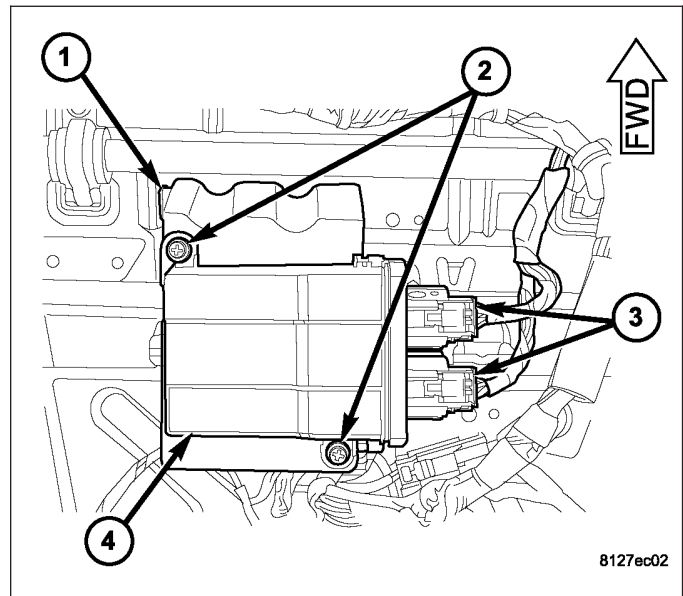

## INSTALLATION

**WARNING:** Never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one, then perform the Airbag System test (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM) before replacing the other. Both the ORC and the OCM store Occupant Classification System (OCS) calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules and the OCS may malfunction and cause personal injury or death.

1. Carefully position the Occupant Classification Module (OCM) (4) to the OCM bracket (1).
2. Install and tighten the two screws (2) that secure the OCM to the OCM bracket. Tighten the screws to 2 N·m (20 in. lbs.).
3. Connect the two harness connectors (3) to the OCM.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

**WARNING:** Following successful completion of the Airbag System test procedure, the Occupant Classification System Verification Test must be done using a scan tool and the appropriate diagnostic information.

## OCCUPANT RESTRAINT CONTROLLER

### DESCRIPTION

The Occupant Restraint Controller (ORC) (2), sometimes referred to as the Airbag Control Module (ACM), is secured with three screws to a stamped steel mounting bracket welded onto the top of the floor panel transmission tunnel underneath the instrument panel center stack, beneath the center floor console in the passenger compartment of the vehicle. Concealed within a hollow in the center of the die cast aluminum ORC housing is the electronic circuitry of the ORC which includes a microprocessor, an electronic impact sensor, an electronic safing sensor, and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing with four screws to enclose and protect the internal electronic circuitry and components.

The ORC housing has integral mounting flanges in three locations. Two molded plastic electrical connectors (1 and 2) exit the rearward facing side of the ORC housing. These terminal pins connect the ORC to the vehicle electrical system through two connectors.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. The ORC cannot be repaired or adjusted and, if damaged or faulty, it must be replaced.

### OPERATION

The microprocessor in the Occupant Restraint Controller (ORC) contains the supplemental restraint system logic circuits and controls all of the supplemental restraint system components. The ORC uses On-Board Diagnostics (OBD) and can communicate with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) and for supplemental restraint system diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The ORC microprocessor continuously monitors all of the supplemental restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the EMIC over the CAN data bus to turn on the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the ORC. For some DTC's, if a

fault does not recur for a number of ignition cycles, the ORC will automatically erase the stored DTC. For other internal faults, the stored DTC is latched forever.

On models equipped with the Occupant Classification System (OCS), the ORC communicates with the Occupant Classification Module (OCM) over the CAN data bus. The ORC will internally disable the passenger airbag and seat belt tensioner deployment circuits if the OCM detects that the passenger front seat is unoccupied or that it is occupied by a load that is inappropriate for an airbag deployment. The ORC also provides a control output to the passenger airbag disabled indicator through the passenger airbag indicator driver circuit. The OCM notifies the ORC when it has detected a monitored system fault and stored a DTC in its memory for any faulty OCS component or circuit, then the ORC sets a DTC and controls the airbag indicator operation accordingly.

The ORC receives battery current through two circuits; a fused ignition switch output (run) circuit and a fused ignition switch output (run-start) circuit. The ORC receives ground through a ground circuit of the instrument panel wire harness. These connections allow the ORC to be operational whenever the ignition switch is in the Start or On positions.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the Start or On positions, this capacitor is continually being charged with enough electrical energy to deploy the front supplemental restraint components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup supplemental restraint system protection in case there is a loss of battery current supply to the ORC during an impact.

Two sensors are contained within the ORC, an electronic impact sensor and a safing sensor. The ORC also monitors inputs from two remote front impact sensors located on the back of the right and left vertical members of the radiator support near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. On vehicles equipped with curtain airbags, the ORC also monitors inputs from four additional remote impact sensors located on the left and right inner B-pillars and C-pillars to control deployment of the curtain airbags.

The safing sensor is an electronic accelerometer sensor within the ORC that provides an additional logic input to the ORC microprocessor. The safing sensor is used to verify the need for a supplemental restraint deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the airbags to deploy. Vehicles equipped with curtain airbags, feature a second safing sensor within the ORC to provide confirmation to the ORC microprocessor of side impact forces. This second safing sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ORC microprocessor determine when the deceleration rate as signaled by the impact sensors and the safing sensors indicate an impact that is severe enough to require supplemental restraint system protection and, based upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and, if the vehicle is so equipped, either curtain airbag. For vehicles equipped with the OCS, the passenger airbag and seat belt tensioner will be deployed by the ORC only if enabled by the OCM messages (passenger airbag disabled indicator Off) at the time of the impact.

The most reliable, efficient, and accurate means to diagnose the ORC, the CAN data bus, and the electronic message inputs to and outputs from the ORC requires the use of a diagnostic scan tool and the appropriate diagnostic information.

## REMOVAL

**WARNING:** Never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one, then perform the Airbag System test (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM) before replacing the other. Both the ORC and the OCM store Occupant Classification System (OCS) calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules and the OCS may malfunction and cause personal injury or death.

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove the center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).

3. Disconnect the two electrical connectors (1 and 2).

4. Move the sound deadening material (1) as needed to access the Occupant Restraint Controller (ORC) mounting screws.

5. Remove the three mounting screws (1) to the ORC (2).

## INSTALLATION

**WARNING:** Do not install ORC if mounting location is deformed or damaged. This will cause the ORC to be improperly located and could result in occupant personal injury or death.

**WARNING:** Never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one, then perform the Airbag System test (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM) before replacing the other. Both the ORC and the OCM store Occupant Classification System (OCS) calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules and the OCS may malfunction and result in personal injury or death.

1. Position the ORC (2) into position and install the three mounting screws (1). Tighten the screws to 11 N·m (97 in. lbs.).

2. Make sure to reinstall the sound deadening material (1) over the ORC.

3. Connect the two electrical connectors (1 and 2).

4. Install the center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

## PASSENGER AIRBAG

### DESCRIPTION

The horizontal surface of the injection molded, thermo-plastic passenger airbag door (2) is the most visible part of the passenger airbag. The passenger airbag door is located above the glove box opening on the top of the instrument panel, in front of the front seat passenger seating position.

Located below the passenger airbag door within the instrument panel is the passenger airbag. The passenger airbag housing fits into a molded receptacle on the back of the airbag door, where twelve stamped hook formations on the forward and rearward edges of the airbag housing are engaged in mating small window openings on the forward and rearward flanges of the receptacle to secure the airbag door to the airbag housing. These airbag door fasteners and mounting provisions are all concealed beneath the instrument panel base trim.

The passenger airbag is secured by four screws (1) through a stamped mounting bracket to the instrument panel cover/pad and two bolts (2) to the instrument panel structural support.

The passenger airbag used in this model is a multi-stage, Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The passenger airbag consists of a stamped and welded metal housing, the airbag cushion, the airbag inflator, and a stamped metal airbag cushion retainer plate that is secured to the airbag housing. The airbag housing contains the airbag inflator and the folded airbag cushion. A rectangular fabric cushion is used.

The airbag inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. A short four-wire pigtail harness with a keyed, yellow connector insulator connects the two inflator initiators to the vehicle electrical system through the instrument panel wire harness.

This passenger airbag cannot be repaired, and must be replaced if deployed, faulty, or in any way damaged.

## OPERATION

The multistage passenger airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the passenger airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of three delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the passenger airbag door will split at predetermined tear seam lines concealed on the inside surface of the door, then the door will pivot up over the top of the instrument panel and out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas through vent holes within the fabric used to construct the back (windshield side) of the airbag cushion. Typically, both initiators are used during an airbag deployment event.

## REMOVAL

### DEPLOYED PASSENGER AIRBAG

For deployed passenger airbags, the entire instrument panel must be replaced.

1. Open hood.
2. Disconnect and isolate the battery negative cable.

**WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.**

3. Remove instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
4. Disconnect the passenger airbag electrical connector (3).
5. Remove the four left and right passenger airbag mounting screws (1).
6. Remove the two lower passenger airbag mounting bolts (2).
7. Separate passenger airbag from instrument panel.
8. Remove and inspect all reusable components from the instrument panel and transfer to the new instrument panel.
9. Clean powder residue from interior of vehicle (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER AN AIRBAG DEPLOYMENT).

## NONDEPLOYED PASSENGER AIRBAG

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove the right side silencer pad (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).

3. Remove the glove box assembly (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).

4. Remove the two inboard mounting screws (2) to the passenger airbag just below the distribution duct (1) and to the left of the distribution housing.

5. Remove the two outboard mounting screws (1) to the passenger airbag just below the distribution duct.

6. Remove the two passenger airbag mounting bolts (2) to the crosscar beam.
7. Disconnect the passenger airbag electrical connector (3).

8. Maneuver the passenger airbag down in a way to clear any obstacles that may impede the removal of the airbag.

## INSTALLATION

### DEPLOYED PASSENGER AIRBAG

**Note:** For deployed passenger airbags, the entire instrument panel must be replaced.

1. Clean powder residue from interior of vehicle (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - SERVICE AFTER AN AIRBAG DEPLOYMENT).
2. Inspect and transfer all reusable components from the old instrument panel to the new instrument panel.
3. Position new passenger airbag into instrument panel cavity.

4. Install the two lower passenger airbag mounting bolts (2). Torque bolts to 11.6 N-m (103 in. lbs.).
5. Install the four left and right passenger airbag mounting screws (1). Torque screws to 2.8 N-m (25 in. lbs.).
6. Connect the passenger airbag electrical connector (3).
7. Install new instrument panel assembly (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

## NONDEPLOYED PASSENGER AIRBAG

1. Maneuver the passenger airbag up into the instrument panel in a way to clear any obstacles that may impede the installation of the airbag.

2. Place the passenger into the cavity of the passenger airbag door.

3. Install the two passenger airbag mounting bolts (2) to the crosscar beam. Torque bolts to 11.6 N·m (103 in. lbs.).
4. Connect the passenger airbag electrical connector (3).

5. Install the two inboard mounting screws (2) to the passenger airbag just below the distribution duct (1) and to the left of the distribution housing. Torque screws to 2.8 N·m (25 in. lbs.).

6. Install the two outboard mounting screws (1) to the passenger airbag just below the distribution duct. Torque screws to 2.8 N·m (25 in. lbs.).

7. Install the glove box assembly (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).

8. Install the right side silencer pad (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

## SEAT BELT & RETRACTOR

### REMOVAL

#### FRONT

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove trim cover (3) from the seat cushion out-board trim cover.
3. Remove seat belt (1) lower anchor nut (2) from seat cushion frame.

4. Remove the upper turning loop (3) trim cover (2).
5. Remove the upper turning loop retaining bolt (4).
6. Remove the lower B-pillar trim (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).

7. Remove the one screw (2) to the front seat belt web guide (3).

8. Disconnect the tensioner (2) squib connector (3).

9. Remove the one screw between the upper retractor indexing tabs in B-pillar.
10. Remove the one front seat belt retractor (4) retaining bolt (3).
11. Pull the retractor inboard and release the indexing tabs (2) from the B-pillar (1).

## REAR - SEDAN

1. Remove the lower seat belt anchor (2) bolt (3).

2. Remove the upper C-pillar trim panel (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).

3. Remove the one upper turning loop retaining bolt (2).

4. Remove the one seat belt retractor (4) mounting bolt (3).
5. Pull retractor inboard and drop down to release tabs from slots.

**REAR - WAGON**

1. Remove the lower seat belt anchor (2) bolt (3).

2. Remove the quarter trim panel.
3. Remove the one rear seat belt retractor (4) retaining nut (2).

**REAR CENTER - SEDAN**

1. Remove the rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
2. Remove the one nut (3) to the seat belt lower anchor.

3. Remove the rear shelf trim panel (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - REMOVAL).

4. Remove the one retaining nut (1) to the center seat belt retractor (2).

## REAR CENTER - WAGON

1. Remove the left seat back trim cover (60% portion of the rear folding seats) (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION/COVER - REMOVAL).
2. Disconnect the rear seat back latching cable from seat frame.

**Note: If the seat back is not fully latched, the center seat belt will not release from the retractor.**

3. Remove the one bolt (2) holding the rear center seat belt retractor.

## INSTALLATION

### FRONT

1. Position the retractor in the B-pillar (1) with the indexing tabs (2).
2. Install the one front seat belt retractor (4) retaining bolt (3). Torque bolt to 32 N·m (24 ft. lbs.).

3. Install the one screw between the upper retractor indexing tabs (2) in B-pillar.
4. Connect the tensioner (2) squib connector (3).

5. Install the one screw (2) to the front seat belt web guide (3). Torque screw to 3 N·m (20 in. lbs.).

6. Position the upper turning loop (3) and install the retaining bolt (4). Torque bolt to 40 N·m (30 ft. lbs.).
7. Install the upper turning loop (3) trim cover (2).

8. Install the lower B-pillar trim (Refer to 23 - BODY/ INTERIOR/B-PILLAR TRIM - INSTALLATION).

9. Position the seat belt (1) onto the stud on the seat cushion frame and install the lower anchor nut (2). Torque nut to 37 N·m (27 ft. lbs.).
10. Install the trim cover (3) onto the seat cushion outboard trim cover.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

## REAR - SEDAN

1. Position the retractor (4) on the C-pillar to the indexing tab slips up into the pillar.
2. Install the retractor mounting bolt (3). Torque bolt to 32 N·m (24 ft. lbs.).

3. Install the one upper turning loop retaining bolt (2).  
Torque bolt to 40 N·m (30 ft. lbs.).

4. Install the upper C-pillar trim panel (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).

5. Install the lower seat belt anchor (2) bolt (3).  
Torque bolt to 32 N·m (24 ft. lbs.).

**REAR - WAGON**

1. Place the one rear seat belt retractor (4) so that the indexing tab is in its slot.
2. Install the retaining nut (2). Torque nut to 34 N·m (25 ft. lbs.).
3. Install the quarter trim panel.

4. Install the lower seat belt anchor (2) bolt (3). Torque bolt to 32 N·m (24 ft. lbs.).

**REAR CENTER - SEDAN**

1. Place the rear center retractor (2) into position and install the one retaining nut (1). Torque nut to 34 N·m (25 ft. lbs.).

2. Install the rear shelf trim panel (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - INSTALLATION).

3. Install the one nut (3) to the seat belt lower anchor. Torque nut to 34 N·m (25 ft. lbs.).
4. Install the rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).

## REAR CENTER - WAGON

1. Position the rear center retractor into position in the seat back.
2. Install the one bolt (2) holding the rear center seat belt retractor. Torque nut to 34 N·m (25 ft. lbs.).
3. Install the left seat back trim cover (60% portion of the rear folding seats) (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

## SEAT BELT BUCKLE

### REMOVAL

#### FRONT SEAT BELT BUCKLE

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove center console from vehicle (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
3. Remove the inner side shield from the front seat cushion.
4. Disconnect the one electrical connector.
5. Remove the one nut to the buckle assembly.

#### REAR SEAT BELT BUCKLE

1. Remove the rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
2. Remove the one nut (2) to the seat belt buckle.

## INSTALLATION

### FRONT SEAT BELT BUCKLE

1. Position the front seat belt buckle onto the stud near the rear of the inboard seat cushion frame.
2. Install the retaining nut onto seat cushion frame. Tighten the nut to 43 N·m (32 ft. lbs.)
3. Connect the seat belt buckle electrical connector.
4. Install the seat cushion side shield.
5. Install floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

**WARNING:** Following successful completion of the Airbag System test procedure, the Occupant Classification System Verification Test must be done using a scan tool and the appropriate diagnostic information.

### REAR SEAT BELT BUCKLE

1. Position the rear seat belt buckle onto mounting studs (3).
2. Install retaining nut. Torque nut to 34 N·m (25 ft. lbs.).
3. Install rear seat cushion (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).

## SEAT BELT TENSIONER

### DESCRIPTION

Seat Belt Tensioners supplement the dual front airbags. The seat belt tensioners are integral to the front seat belt retractors (2), which are secured to the inner B-pillar (1) on the right and left sides of the vehicle. The retractor is concealed beneath the lower B-pillar trim. The seat belt tensioner consists primarily of a sprocket/pinion, a steel tube, a cast metal housing, numerous steel balls, a stamped metal ball trap, a torsion bar, a small pyrotechnically activated gas generator, and a short pigtail wire. All of these components are located on one side of the retractor spool on the outside of the retractor housing except for the torsion bar, which serves as the spindle upon which the retractor spool rides. The seat belt tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through the body wire harness (3).

The seat belt tensioners cannot be repaired and, if faulty or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags

have been deployed, the seat belt tensioners have also been deployed. The seat belt tensioners are not intended for reuse and must be replaced following any front airbag deployment. A growling or grinding sound while attempting to operate the seat belt retractor is a sure indication that the seat belt tensioner has been deployed and requires replacement. Refer to the proper Body Diagnostic Procedures manual for diagnosis and testing.

### OPERATION

The seat belt tensioners are deployed in conjunction with the front airbags by a signal generated by the Occupant Restraint Controller (ORC) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator. The gas generator is installed in one end of a steel tube that contains numerous steel balls. As the gas expands, it pushes the steel balls through the tube into a cast metal housing, where a ball guide directs the balls into engagement with the teeth of a sprocket that is geared to one end of the retractor spool. As the balls drive past the sprocket, the sprocket turns and drives the seat belt retractor spool causing the slack to be removed from the front seat belts. The ball trap captures the balls as they leave the sprocket and are expelled from the housing.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupant might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel and/or windshield. Also, the seat belt tensioner torsion bar that the retractor spool rides upon is designed to deform in order to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

The ORC monitors the condition of the seat belt tensioners through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. For proper diagnosis of the seat belt tensioners, a scan tool is required and the appropriate body diagnostic information.

## SEAT TRACK POSITION SENSOR

### DESCRIPTION

The seat track position sensor (1) is a Hall Effect-type sensor. This sensor consists of a Hall Effect Integrated Circuit (IC) chip encased in potting material within a cavity of the molded plastic sensor housing. The sensor housing has two integral snap features (3) and snaps into a stamped metal bracket located on the lower outboard seat adjuster track. A molded connector (2) integral to the sensor housing is connected to the vehicle electrical system through the driver seat wire harness.

The seat track position sensor cannot be adjusted or repaired and, if faulty or damaged, the entire sensor must be replaced.

### OPERATION

The seat track position sensor is designed to provide a seat position data input to the Occupant Classification Module (OCM) indicating whether the driver front seat is in a forward or rearward position. The OCM sends electronic seat position messages to the Occupant Restraint Controller (ORC) over the Controller Area Network (CAN) data bus. The ORC uses this data as an additional logic input for use in determining the appropriate deployment force to be used when deploying the multistage front airbags.

The seat track position sensor receives a nominal five volt supply from the OCM. The sensor communicates the seat position by modulating the voltage returned to the OCM on a sensor data circuit. The OCM also monitors the condition of the sensor circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected, then send messages to the ORC to illuminate the airbag indicator in the instrument cluster. For proper diagnosis of the seat track position sensor, a diagnostic scan tool is required and the appropriate diagnostic information.

### REMOVAL

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Reach under the front edge of the front seat cushion to access the seat track position sensor (3) in a bracket (1) located on the lower outboard seat track (5).
3. Disconnect the electrical connector (4) from the sensor.
4. Using a small screwdriver, depress the snap feature (2) and pull the sensor out of the bracket.

## INSTALLATION

1. Position the seat track position sensor (3) on the end of the bracket (1) located on the lower out-board seat track (5).
2. Push the sensor firmly into the bracket until the snap feature (2) locks into place.
3. Connect the electrical connector (4) to the sensor.

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

**WARNING:** Following successful completion of the Airbag System test procedure, the Occupant Classification System Verification Test must be done using a scan tool and the appropriate diagnostic information.

## SEAT WEIGHT SENSOR

### DESCRIPTION

The seat weight sensors (4) are strain gauge-type units. The electronic elements of the sensor are encased in a potting material within the molded plastic sensor housing. Four sensors (4) are used in the Occupant Classification System (OCS). A sensor is located at each corner of the passenger side front seat.

The strain gauge for each sensor is secured by three screws and nuts (2) between the seat cushion frame and the seat adjusters (3). A molded connector receptacle (1) integral to each sensor housing is connected to the vehicle electrical system through a dedicated connector and take out of the passenger seat wire harness beneath the seat cushion frame.

The seat weight sensors cannot be adjusted or repaired and, if faulty or damaged, the entire sensor must be replaced.

**WARNING:** The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to do so may result in occupant injury or death.

**WARNING:** The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative, could result in occupant injury, or possibly death.

**WARNING:** When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative, could result in occupant injury, or possibly death.

## OPERATION

The seat weight sensor units are designed to sense the relative weight of a load applied to the passenger side front seat, which provides a logic input to the microprocessor of the Occupant Classification Module (OCM). When a load is applied to the seat, the strain gauge of each sensor is flexed causing a change of electrical resistance through the strain gauge. These changes in resistance are measured by the sensor and the internal sensor circuitry changes the sensor output voltage.

Each weight sensor receives a nominal five volts and a ground through parallel hard wired circuits from the OCM. The OCM then monitors the output voltage of each sensor on dedicated hard wired data communication circuits. The hard wired circuits between the sensors and the OCM may be diagnosed and tested using conventional diagnostic tools and procedures. However, the most reliable, efficient, and accurate means to diagnose the seat weight sensor inputs to the OCM, and the electronic message communication between the OCM and the Occupant Restraint Controller (ORC) requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## REMOVAL

**WARNING:** The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to do so may result in occupant injury or death.

**WARNING:** The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative, could result in occupant injury, or possibly death.

**WARNING:** When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative, could result in occupant injury, or possibly death.

## MANUAL PASSENGER FRONT SEAT

1. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

2. Remove front passenger seat (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

3. Remove the adjuster to riser mounting bolt (3). For additional information (Refer to 23 - BODY/SEATS/ SEAT RISER - REMOVAL).

4. Remove the two nuts (2) holding the seat weight sensor (4) to the seat riser.
5. Disconnect the one electrical connector (1).

## POWER FRONT PASSENGER SEAT

**Note:** If the vehicle is equipped with a power front passenger seat, to remove the adjuster from the riser it is necessary to have battery power to move the seat forward and rearward to access the mounting bolts.

1. Remove front passenger seat mounting bolts (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).

2. Remove the adjuster to riser mounting bolt (3). For additional information (Refer to 23 - BODY/SEATS/SEAT RISER - REMOVAL).
3. Disconnect and isolate the battery negative cable.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

4. Remove the two nuts (2) holding the seat weight sensor (4) to the seat riser.
5. Disconnect the one electrical connector (1).

## INSTALLATION

**WARNING:** The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to do so may result in occupant injury or death.

**WARNING:** The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative, could result in occupant injury, or possibly death.

**WARNING:** When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative, could result in occupant injury, or possibly death.

## MANUAL PASSENGER FRONT SEAT

1. Position the seat weight sensor onto passenger front seat riser.
2. Install the two nuts (2) holding the seat weight sensor (4) to the seat riser. Torque nuts to 40 N·m (30 ft. lbs.).
3. Connect the one electrical connector (1).

4. Install the adjuster to riser mounting bolt (3). Torque nuts to 45 N·m (33 ft. lbs.). For additional information (Refer to 23 - BODY/SEATS/SEAT RISER - INSTALLATION).

5. Install the front passenger seat (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

**WARNING:** Following successful completion of the Airbag System test procedure, the Occupant Classification System Verification Test must be done using a scan tool and the appropriate diagnostic information.

## POWER FRONT PASSENGER SEAT

**Note:** If the vehicle is equipped with a power front passenger seat, to remove the adjuster from the riser it is necessary to have battery power to move the seat forward and rearward to access the mounting bolts.

1. Position the seat weight sensor onto passenger front seat riser.
2. Install the two nuts (2) holding the seat weight sensor (4) to the seat riser. Torque nuts to 40 N·m (30 ft. lbs.).
3. Connect the one electrical connector (1).

4. Install the adjuster to riser mounting bolt (3). Torque nuts to 45 N·m (33 ft. lbs.). For additional information (Refer to 23 - BODY/SEATS/SEAT RISER - INSTALLATION).

5. Install the front passenger seat bolts (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

**WARNING:** Do not connect the battery negative cable (Refer to 8 - ELECTRICAL/RESTRAINTS - DIAGNOSIS AND TESTING - AIRBAG SYSTEM). Personal injury or death may result if the system test is not performed first.

**WARNING:** Following successful completion of the Airbag System test procedure, the Occupant Classification System Verification Test must be done using a scan tool and the appropriate diagnostic information.

# SPEED CONTROL

## TABLE OF CONTENTS

	page		page
<b>SPEED CONTROL</b>		<b>OPERATION</b>	1
DESCRIPTION	1		

### SPEED CONTROL

#### DESCRIPTION

The speed control system is fully and electronically controlled by the Powertrain Control Module (PCM). **A cable and a vacuum controlled servo are not used. This is a servo-less system.** The switche is labeled: ON/OFF, RES/ACCEL, SET, COAST, and CANCEL.

#### OPERATION

When speed control is selected by depressing the ON switch, the PCM allows a set speed to be stored in its RAM for speed control. To store a set speed, depress the SET switch while the vehicle is moving at a speed between 35 and 85 mph. In order for the speed control to engage, the brakes cannot be applied, nor can the gear selector be indicating the transmission is in Park or Neutral.

The speed control can be disengaged manually by:

- Stepping on the brake pedal
- Depressing the OFF switch
- Depressing the CANCEL switch.

**Note: Depressing the OFF switch or turning off the ignition switch will erase the set speed stored in the PCM (the ECM with a diesel engine).**

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- An indication of Park or Neutral
- A rapid increase rpm (indicates that the clutch has been disengaged)
- Excessive engine rpm (indicates that the transmission may be in a low gear)
- The speed signal increases at a rate of 10 mph per second (indicates that the coefficient of friction between the road surface and tires is extremely low)
- The speed signal decreases at a rate of 10 mph per second (indicates that the vehicle may have decelerated at an extremely high rate)

Once the speed control has been disengaged, depressing the RES/ACCEL switch (when speed is greater than 30 mph) restores the vehicle to the target speed that was stored in the PCM (the ECM with a diesel engine).

While the speed control is engaged, the driver can increase the vehicle speed by depressing the RES/ACCEL switch. The new target speed is stored in the PCM (the ECM with a diesel engine) when the RES/ACCEL is released. The PCM (the ECM with a diesel engine) also has a "tap-up" feature in which vehicle speed increases at a rate of approximately 2 mph for each momentary switch activation of the RES/ACCEL switch.

A "tap down" feature is used to decelerate without disengaging the speed control system. To decelerate from an existing recorded target speed, momentarily depress the COAST switch. For each switch activation, speed will be lowered approximately 1 mph.

## VEHICLE THEFT SECURITY - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

**B1A24-KEY NOT PROGRAMMED**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.

Possible Causes
KEY NOT PROGRAMMED
SKREEM

**Diagnostic Test****1. KEY NOT PROGRAMMED**

Turn the ignition on.

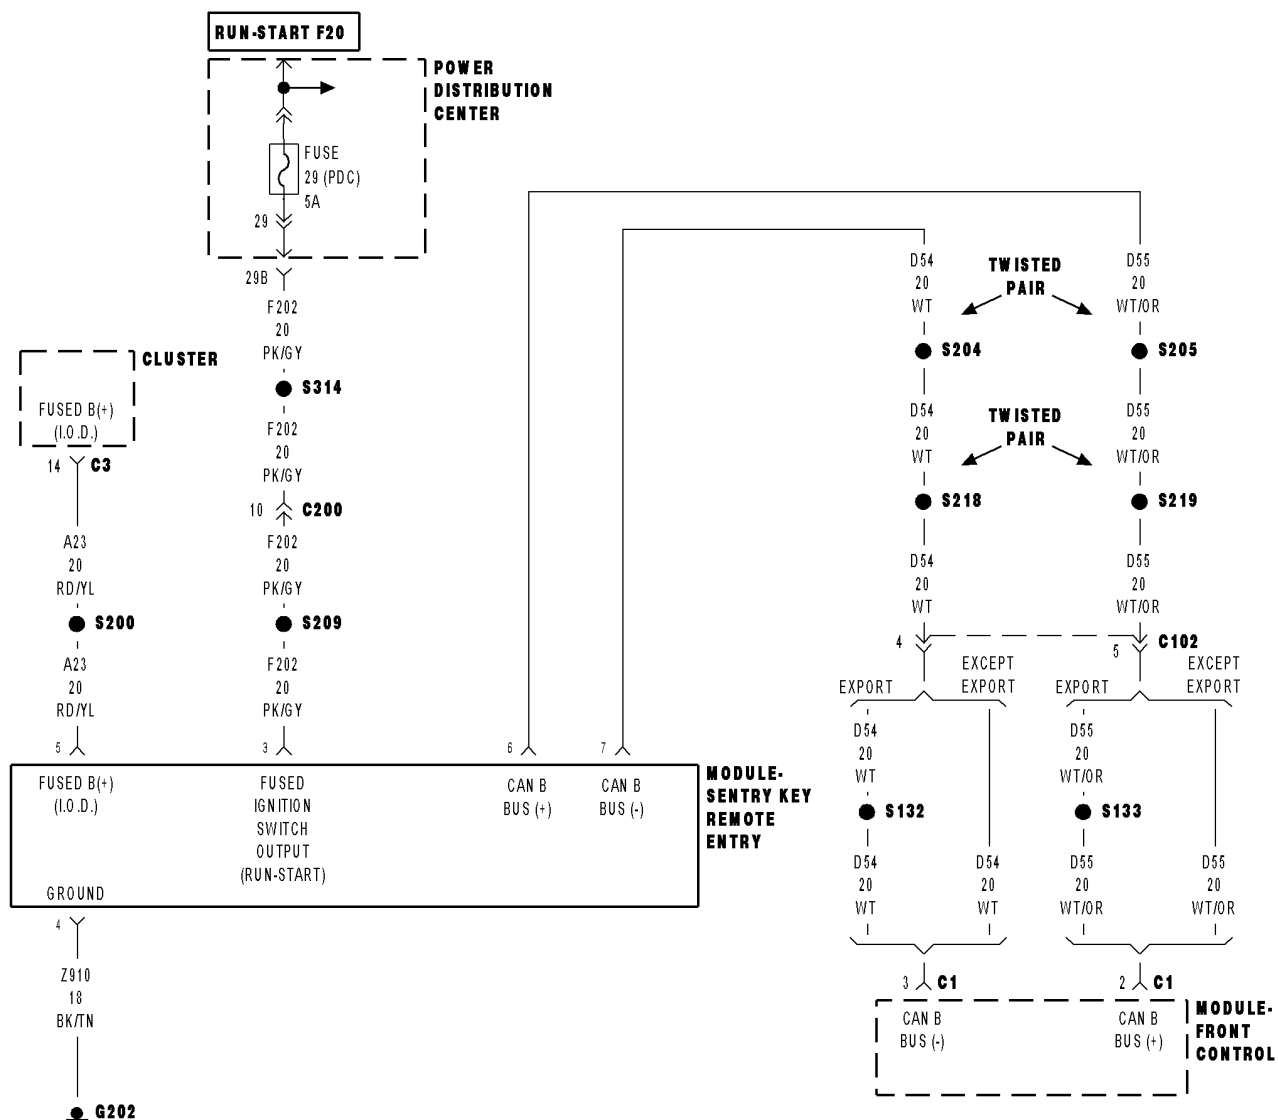

Using a scan tool, attempt to program the key(s) into the SKREEM.

**Was the programming of the key(s) successful?**

- Yes** >> Programming of the key(s) were successful. Test complete.  
Perform SKREEM VERIFICATION TEST.
- No** >> Replace the ignition key and attempt to program it into the SKREEM. If the DTC resets, replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

# B1A25-INVALID KEY

**B1A25-INVALID KEY (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
At ignition on and during Key Programming Mode.
- **Set Condition:**  
When the SKREEM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

Possible Causes
MULTIPLE KEY OPERATION IGNITION KEY SKREEM INTERMITTENT WIRING HARNESS PROBLEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

With the scan tool, read and record the SKREEM DTCs.

With the scan tool, erase the SKREEM DTCs

**Note: Perform the following test several times to ensure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the scan tool display the DTC that was previously erased?**

**Yes** >> Go To 2

**No** >> Go To 6

**2. CHECKING FOR MULTIPLE KEYS**

**Are there multiple vehicle ignition keys available?**

**Yes** >> Go To 3

**No** >> Go To 4

**B1A25-INVALID KEY (CONTINUED)****3. MULTIPLE KEY OPERATION**

**Note:** Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys, one at a time.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Replace the ignition key(s) that cause the SKIM DTC.  
Perform SKREEM VERIFICATION TEST.

---

**4. REPROGRAM KEY**

With the scan tool, attempt to reprogram the ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Go To 5

**No** >> Test complete.

---

**5. PROGRAM NEW IGNITION KEY**

Replace the ignition key with a new key.

With the scan tool, program the new ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST

**No** >> Test complete.

---

**B1A25-INVALID KEY (CONTINUED)**

**6. INTERMITTENT WIRING HARNESS PROBLEM**

Turn the ignition off.

**Note:** Check the following items:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

**Were any problems found?**

**Yes**    >> Repair wiring harness/connectors as necessary.  
            Perform SKREEM VERIFICATION TEST

**No**      >> Test Complete.

---

**B1A26-MAXIMUM NUMBER OF KEYS PROGRAMMED**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.
- **Set Condition:**  
When the maximum number of key (8) have been programmed into the SKREEM

Possible Causes
MAXIMUM AMOUNT OF KEY PROGRAMMED INTO SKREEM
SKREEM

**Diagnostic Test****1. MAXIMUM AMOUNT OF KEYS PROGRAMMED INTO SKREEM**

**Note:** The below procedure has you clearing all the key information within the SKREEM. It is important to obtain all the customer's ignition key(s) so they may be reprogrammed into the module.

Turn the ignition on.

Using a scan tool, clear all the key information in the SKREEM.

Program the all the customer key(s) into the SKREEM (up to eight only)

**Was the “Maximum Number of Keys Programmed” display again?**

- Yes** >> Replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.
- No** >> Programming of the key(s) were successful. Test complete.  
Perform SKREEM VERIFICATION TEST.

B1A27-SKREEM PROGRAMMING PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition switch on.

Possible Causes
SKREEM

Diagnostic Test

1. SKREEM

**Note:** Before continuing review and check the following conditions.

- Review the repair history of the vehicle. Ensure the vehicle has the correct PCM and SKREEM installed. Check the part numbers.
- Using a scan tool, ensure the PCM and SKREEM have been programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINS match.

Turn the ignition on.  
With the scan tool, clear DTC(s).  
Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.  
Using the scan tool, read DTC(s).

- Does the DTC reset?**
- Yes**

>> Replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.
- No**

>> The DTC is not active at this time. Test complete.

## B1A28-ECM MISMATCH WITH SKIM

**B1A28-ECM MISMATCH WITH SKIM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

- **Set Condition:**

When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

Possible Causes
VERIFYING PCM VIN REPLACE SKREEM AND CHECK DTC'S INTERMITTENT WIRING HARNESS PROBLEM PCM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on and wait 2 minutes.

With the scan tool, read the SKREEM DTCs.

**Does the scan tool display the DTC that was previously erased?**

**Yes** >> Go To 2

**No** >> Go To 4

**2. VERIFYING THE PCM VIN**

Turn the ignition on.

With the scan tool, select Engine system from the main menu.

Display and record the Vehicle Identification Number.

**Note:** Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.

**Does the VIN recorded from the PCM match the VIN of the vehicle?**

**Yes** >> Go To 3

**No** >> Perform the PCM replaced to update the VIN in the PCM.  
Perform SKREEM VERIFICATION TEST

**B1A28-ECM MISMATCH WITH SKIM (CONTINUED)****3. REPLACE SKREEM AND CHECK DTC'S**

Turn the ignition off.

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, display and clear all PCM and SKREEM DTC's.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM DTCs.

**Does the scan tool display the same DTC?**

**Yes** >> Replace and program the Powertrain Control Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST

**No** >> The repair is complete.  
Perform SKREEM VERIFICATION TEST

---

**4. INTERMITTENT**

Turn the ignition off.

**Note:** Check for the following conditions:

- **Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.**
- **Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.**
- **Refer to any Technical Service Bulletins (TSB) that may apply.**

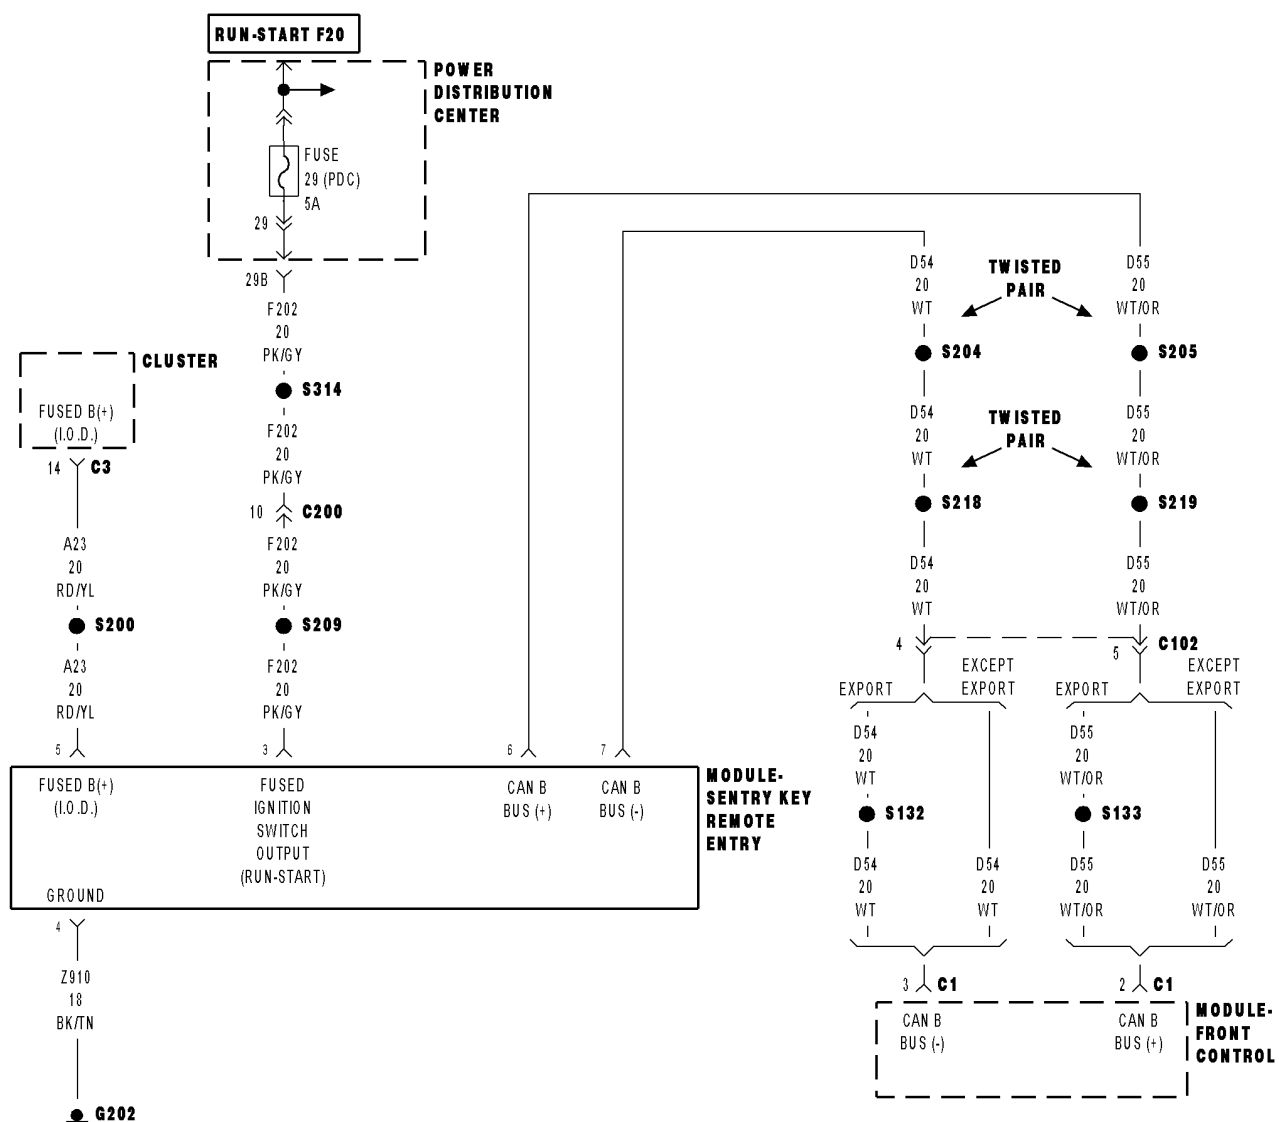

**Were any problems found?**

**Yes** >> Repair wiring harness/connectors as necessary.  
Perform SKREEM VERIFICATION TEST

**No** >> Test Complete.

---

## B1A29-SKIM BASESTATION MISMATCH

**B1A29-SKIM BASESTATION MISMATCH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

- **Set Condition:**

When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

Possible Causes
VERIFYING PCM VIN REPLACE SKREEM AND CHECK DTC'S INTERMITTENT WIRING HARNESS PROBLEM PCM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on and wait 2 minutes.

With the scan tool, read the SKREEM DTCs.

**Does the scan tool display the DTC that was previously erased?**

**Yes** >> Go To 2

**No** >> Go To 4

**2. VERIFYING THE PCM VIN**

Turn the ignition on.

With the scan tool, select Engine system from the main menu.

Display and record the Vehicle Identification Number.

**Note:** Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.

**Does the VIN recorded from the PCM match the VIN of the vehicle?**

**Yes** >> Go To 3

**No** >> Perform the PCM replaced to update the VIN in the PCM.  
Perform SKREEM VERIFICATION TEST

**B1A29-SKIM BASESTATION MISMATCH (CONTINUED)****3. REPLACE SKREEM AND CHECK DTC'S**

Turn the ignition off.

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, display and clear all PCM and SKREEM DTC's.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM DTCs.

**Does the scan tool display the same DTC?**

**Yes** >> Replace and program the Powertrain Control Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST

**No** >> The repair is complete.  
Perform SKREEM VERIFICATION TEST

---

**4. INTERMITTENT**

Turn the ignition off.

**Note:** Check for the following conditions:

- **Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.**
- **Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.**
- **Refer to any Technical Service Bulletins (TSB) that may apply.**

**Were any problems found?**

**Yes** >> Repair wiring harness/connectors as necessary.  
Perform SKREEM VERIFICATION TEST

**No** >> Test Complete.

---

# B1A2A-KEY 1 COMMUNICATION ERROR

B1A2A-KEY 1 COMMUNICATION ERROR (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
At ignition on and during Key Programming Mode.
- **Set Condition:**  
When the SKREEM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

Possible Causes
MULTIPLE KEY OPERATION IGNITION KEY SKREEM INTERMITTENT WIRING HARNESS PROBLEM

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

With the scan tool, read and record the SKREEM DTCs.  
With the scan tool, erase the SKREEM DTCs.

**Note:** Perform the following test several times to ensure the DTC is current.

Turn the ignition off.  
Wait 10 seconds.  
Turn the ignition on.  
With the scan tool, read the SKREEM DTCs.

**Does the scan tool display the DTC that was previously erased?**

- Yes**    >> Go To 2  
**No**    >> Go To 6

2. CHECKING FOR MULTIPLE KEYS

**Are there multiple vehicle ignition keys available?**

- Yes**    >> Go To 3  
**No**    >> Go To 4

**B1A2A-KEY 1 COMMUNICATION ERROR (CONTINUED)****3. MULTIPLE KEY OPERATION**

**Note:** Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys, one at a time.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on

With the scan tool, read the SKREEM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Replace the ignition key(s) that cause the SKIM DTC.  
Perform SKREEM VERIFICATION TEST.

---

**4. REPROGRAM KEY**

With the scan tool, attempt to reprogram the ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Go To 5

**No** >> Test complete.

---

**5. PROGRAM NEW IGNITION KEY**

Replace the ignition key with a new key.

With the scan tool, program the new ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST

**No** >> Test complete.

---

**B1A2A-KEY 1 COMMUNICATION ERROR (CONTINUED)**

**6. INTERMITTENT WIRING HARNESS PROBLEM**

Turn the ignition off.

**Note:** Check the following items:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

**Were any problems found?**

**Yes**    >> Repair wiring harness/connectors as necessary.  
             Perform SKREEM VERIFICATION TEST

**No**     >> Test Complete.

---

**B1A2BA-KEY 2 COMMUNICATION ERROR (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
At ignition on and during Key Programming Mode.
- **Set Condition:**  
When the SKREEM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

Possible Causes
MULTIPLE KEY OPERATION IGNITION KEY SKREEM INTERMITTENT WIRING HARNESS PROBLEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

With the scan tool, read and record the SKREEM DTCs.

With the scan tool, erase the SKREEM DTCs

**Note: Perform the following test several times to ensure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the scan tool display the DTC that was previously erased?**

**Yes** >> Go To 2

**No** >> Go To 6

**2. CHECKING FOR MULTIPLE KEYS**

**Are there multiple vehicle ignition keys available?**

**Yes** >> Go To 3

**No** >> Go To 4

**B1A2BA-KEY 2 COMMUNICATION ERROR (CONTINUED)****3. MULTIPLE KEY OPERATION**

**Note:** Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys one at a time.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on

With the scan tool, read the SKREEM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Replace the ignition key(s) that cause the SKIM DTC.  
Perform SKREEM VERIFICATION TEST.

---

**4. REPROGRAM KEY**

With the scan tool, attempt to reprogram the ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Go To 5

**No** >> Test complete.

---

**5. PROGRAM NEW IGNITION KEY**

Replace the ignition key with a new key.

With the scan tool, program the new ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Test complete.

---

**B1A2BA-KEY 2 COMMUNICATION ERROR (CONTINUED)**

**6. INTERMITTENT WIRING HARNESS PROBLEM**

Turn the ignition off.

**Note:** Check the following items:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

**Were any problems found?**

**Yes**    >> Repair wiring harness/connectors as necessary.  
             Perform SKREEM VERIFICATION TEST

**No**      >> Test Complete.

---

**B1A2C-KEY 3 COMMUNICATION ERROR**

B1A2C-KEY 3 COMMUNICATION ERROR (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
At ignition on and during Key Programming Mode.
- **Set Condition:**  
When the SKREEM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

Possible Causes
MULTIPLE KEY OPERATION IGNITION KEY SKREEM INTERMITTENT WIRING HARNESS PROBLEM

Diagnostic Test

1. DETERMINING IF DTC IS CURRENT

With the scan tool, read and record the SKREEM DTCs.

With the scan tool, erase the SKREEM DTCs

**6. INTERMITTENT WIRING HARNESS PROBLEM**

Turn the ignition off.

**Note:** Check the following items:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

**Were any problems found?**

**Yes**    >> Repair wiring harness/connectors as necessary.  
             Perform SKREEM VERIFICATION TEST.

**No**      >> Test Complete.

---

## B1A35-UNIDENTIFIED KEY COMMUNICATION ERROR

**B1A35-UNIDENTIFIED KEY COMMUNICATION ERROR (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
At ignition on and during Key Programming Mode.
- **Set Condition:**  
When the SKREEM does not receive a transponder response after 8 consecutive transponder read attempts within 2.0 seconds.

Possible Causes
MULTIPLE KEY OPERATION IGNITION KEY SKREEM INTERMITTENT WIRING HARNESS PROBLEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

With the scan tool, read and record the SKREEM DTCs.

With the scan tool, erase the SKREEM DTCs

**Note: Perform the following test several times to ensure the DTC is current.**

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the scan tool display the DTC that was previously erased?**

**Yes** >> Go To 2

**No** >> Go To 6

**2. CHECKING FOR MULTIPLE KEYS**

**Are there multiple vehicle ignition keys available?**

**Yes** >> Go To 3

**No** >> Go To 4

**B1A35-UNIDENTIFIED KEY COMMUNICATION ERROR (CONTINUED)****3. MULTIPLE KEY OPERATION**

**Note:** Perform the following steps using one of the vehicle ignition keys. When finished, repeat the procedure using each of the other vehicle keys, one at a time.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Is the DTC present for all ignition keys?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Replace the ignition key(s) that cause the SKIM DTC.  
Perform SKREEM VERIFICATION TEST.

---

**4. REPROGRAM KEY**

With the scan tool, attempt to reprogram the ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Go To 5

**No** >> Test complete.

---

**5. PROGRAM NEW IGNITION KEY**

Replace the ignition key with a new key.

With the scan tool, program the new ignition key to the SKREEM.

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on.

With the scan tool, read the SKREEM DTCs.

**Does the DTC set again?**

**Yes** >> Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Test complete.

---

**B1A35-UNIDENTIFIED KEY COMMUNICATION ERROR (CONTINUED)**

**6. INTERMITTENT WIRING HARNESS PROBLEM**

Turn the ignition off.

**Note:** Check the following items:

- Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.
- Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
- Refer to any Technical Service Bulletins (TSB) that may apply.

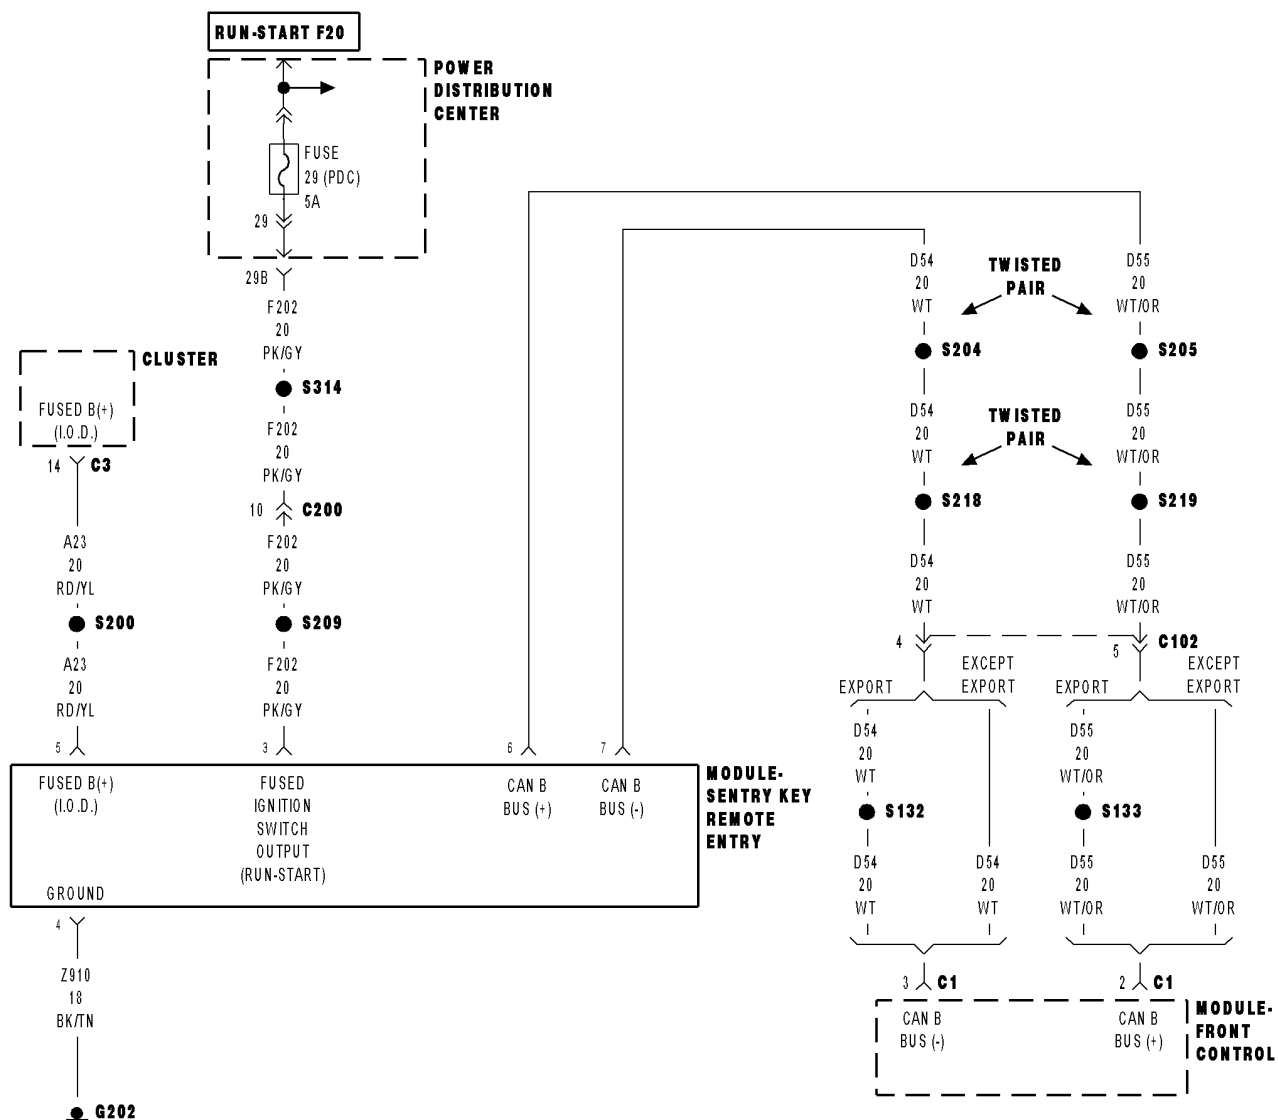

**Were any problems found?**

**Yes**     >> Repair wiring harness/connectors as necessary.  
             Perform SKREEM VERIFICATION TEST.

**No**       >> Test Complete.

---

# B2101-IGNITION RUN/START INPUT LOW

**B2101-IGNITION RUN/START INPUT LOW (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition switch on.
- **Set Condition:**  
The SKREEM has detected the ignition switch input voltage below a calibrated value.

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN SKREEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

**Note:** Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Go To 3

**No** >> Go to 2

**2. INTERMITTENT CONDITION**

**Note:** Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Repair the wiring as necessary.

Perform SKREEM VERIFICATION TEST.

**No** >> DTC is not active at this time. Test complete.

**B2101-IGNITION RUN/START INPUT LOW (CONTINUED)****3. FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPENED**

**Note:** Check the related fuses to the Fused Ignition Switch Output (Run-Start) circuit. If the fuse is found to be open, repair the circuit for a shorted condition.

Turn the ignition off.

Disconnect the SKREEM harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the Fused Ignition Switch Output (Run-Start) circuit in the SKREEM harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Go to 4

**No** >> Repair the Fused Ignition Switch Output (Run-Start) circuit for an open.  
Perform SKREEM VERIFICATION TEST.

---

**4. SKREEM**

**Note:** A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Reconnect the SKREEM connector

Back probe the Fused Ignition Switch Output (Run-Start) circuit.

Start the engine.

Using the scan tool, view battery voltage under Data Display in the Engine category.

Compare the voltage on the scan tool to the voltage reading on the voltmeter.

**Is the voltage on the scan tool equal to the voltmeter reading +/- .5 volt?**

**Yes** >> Replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Repair the Fused Ignition Switch Output (Run-Start) circuit for high resistance.  
Perform SKREEM VERIFICATION TEST.

---

[illegible]

**B2102-IGNITION RUN/START INPUT HIGH (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition switch on.
- **Set Condition:**  
The SKREEM has detected the ignition switch input voltage above a calibrated value.

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SKREEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

**Note:** Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Go To 3

**No** >> Go to 2

**2. INTERMITTENT CONDITION**

**Note:** Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Repair the wiring as necessary.

Perform SKREEM VERIFICATION TEST.

**No** >> DTC is not active at this time. Test complete.

**B2102-IGNITION RUN/START INPUT HIGH (CONTINUED)****3. FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORTED TO BATTERY VOLTAGE**

**Note:** A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Disconnect the SKREEM harness connector.

Using a 12 volt test light connected to ground, probe the Fused Ignition Switch Output (Run-Start) circuit in the SKREEM harness connector.

**Does the test light illuminate brightly?**

- Yes**    >> Repair the Fused Ignition Switch Output (Run-Start) circuit for a short to voltage.  
            Perform SKREEM VERIFICATION TEST.
- No**      >> Replace and program the SKREEM in accordance with the Service Information.  
            Perform SKREEM VERIFICATION TEST.
-

**B210A-SYSTEM VOLTAGE LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.
- **Set Condition:**  
The SKREEM has detected the system voltage is below a calibrated value.

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN
FUSED (B+) CIRCUIT OPEN
SKREEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

**Note:** Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Go To 3

**No** >> Go to 2

**2. INTERMITTENT CONDITION**

**Note:** Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Repair the wiring as necessary.  
Perform SKREEM VERIFICATION TEST.

**No** >> DTC is not active at this time. Test complete.

**B210A-SYSTEM VOLTAGE LOW (CONTINUED)****3. FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT OPEN**

**Note:** Check the related fuses to the Fused Ignition Switch Output (Run-Start) circuit. If the fuse is found to be open repair the circuit for a shorted condition.

Turn the ignition off.

Disconnect the SKREEM harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the Fused Ignition Switch Output (Run-Start) circuit in the SKREEM harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Go to 4

**No** >> Repair the Fused Ignition Switch Output (Run-Start) circuit for an open.  
Perform SKREEM VERIFICATION TEST.

---

**4. FUSED (B+) CIRCUIT OPEN**

Turn the ignition off.

Using a 12 volt test light connected to ground, probe the Fused (B+) circuit in the SKREEM harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Go to 5

**No** >> Repair the Fused (B+) circuit for an open.  
Perform SKREEM VERIFICATION TEST.

---

**5. SKREEM**

**Note:** Repeat the below procedure for both the Fused Ignition Switch Output (Run-Start) circuit and the Fused (B+) circuit.

**Note:** A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Reconnect the SKREEM connector.

Back probe the Fused Ignition Switch Output (Run-Start) circuit and then the Fused (B+) circuit.

Start the engine.

Using the scan tool, view battery voltage under Data Display in the Engine category.

Compare the voltage on the scan tool to the voltage reading on the voltmeter.

**Is the voltage on the scan tool equal to the voltmeter reading +/- .5 volt?**

**Yes** >> Replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Repair the circuit(s) that indicated the incorrect voltage.  
Perform SKREEM VERIFICATION TEST.

---

## B210D-SYSTEM VOLTAGE HIGH

**B210D-SYSTEM VOLTAGE HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.
- **Set Condition:**  
The SKREEM has detected the system voltage above a calibrated value.

Possible Causes
FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SKREEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

**Note:** Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Go To 3

**No** >> Go to 2

**2. INTERMITTENT CONDITION**

**Note:** Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Repair the wiring as necessary.

Perform SKREEM VERIFICATION TEST.

**No** >> DTC is not active at this time. Test complete.

**B210D-SYSTEM VOLTAGE HIGH (CONTINUED)****3. FUSED IGNITION SWITCH OUTPUT (RUN-START) CIRCUIT SHORTED TO BATTERY VOLTAGE**

**Note:** A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Disconnect the SKREEM harness connector.

Using a 12 volt test light connected to ground, probe the Fused Ignition Switch Output (Run-Start) circuit in the SKREEM harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Repair the Fused Ignition Switch Output (Run-Start) circuit for a short to voltage.  
Perform SKREEM VERIFICATION TEST.

**No** >> Replace and reprogram the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

---

# B210D-BATTERY VOLTAGE LOW

**B210D-BATTERY VOLTAGE LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.
- **Set Condition:**  
The SKREEM has detected the Fused (B+) input voltage below a calibrated value.

Possible Causes
FUSED (B+) CIRCUIT OPEN
SKREEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

**Note:** Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Go To 3

**No** >> Go to 2

**2. INTERMITTENT CONDITION**

**Note:** Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground
- Dirty (partial ) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Repair the wiring as necessary.

Perform SKREEM VERIFICATION TEST.

**No** >> DTC is not active at this time. Test complete.

**B210D-BATTERY VOLTAGE LOW (CONTINUED)****3. FUSED (B+) CIRCUIT OPEN**

**Note:** Check the related fuses to the Fused (B+) circuit. If the fuse is found to be open repair the circuit for a shorted condition.

Turn the ignition off.

Disconnect the SKREEM harness connector.

Turn the ignition on.

Using a 12 volt test light connected to ground, probe the Fused (B+) circuit in the SKREEM harness connector.

**Does the test light illuminate brightly?**

**Yes** >> Go to 4

**No** >> Repair the Fused (B+) circuit for an open.  
Perform SKREEM VERIFICATION TEST.

---

**4. SKREEM**

**Note:** A dirty (partial) ground can cause abnormal conditions within a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Reconnect the SKREEM connector

Back probe the Fused (B+) circuit.

Start the engine.

Using the scan tool, view battery voltage under Data Display in the Engine category.

Compare the voltage on the scan tool to the voltage reading on the voltmeter.

**Is the voltage on the scan tool equal to the voltmeter reading +/- .5 volt?**

**Yes** >> Replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> Repair the Fused (B+) circuit for high resistances.  
Perform SKREEM VERIFICATION TEST.

---

**B210E-BATTERY VOLTAGE HIGH**

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.
- **Set Condition:**  
The SKREEM has detected the Fused (B+) input voltage above a calibrated value.

Possible Causes
FUSED (B+) CIRCUIT SKREEM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

**Note:** Diagnose any related Powertrain DTC(s) before continuing.

With a scan tool, read and record DTC(s).

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Go To 3

**No** >> Go to 2

**2. INTERMITTENT CONDITION**

**Note:** Check for any of the follow conditions:

- Poor wire to terminal connection
- Corroded terminals
- Backed out or loose terminals
- Broken wire internal to the insulation
- Dirty (partial) module ground

With the ignition on, wiggle the related wires.

Using a scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Repair the wiring as necessary.

Perform SKREEM VERIFICATION TEST.

**No** >> DTC is not active at this time. Test complete.

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)****3. SKREEM**

**Note:** A dirty (partial) ground can cause abnormal conditions with a system. Ensure the module has a good ground before continuing.

Turn the ignition off.

Back probe the Fused (B+) circuit in the SKREEM harness connector.

Start the engine.

Using a scan tool, view the battery voltage under Data Display in the Engine category.

Compare the voltage on the scan tool to the voltage reading on the voltmeter.

**Is the voltage on the scan tool equal to the voltmeter reading +/- .5 volt?**

**Yes** >> Replace and program the SKREEM in accordance with the Service Information. Perform SKREEM VERIFICATION TEST.

**No** >> Repair the Fused (B+) circuit. Perform SKREEM VERIFICATION TEST.

---

## B2204-ECU CONFIGURATION MISMATCH

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.

Possible Causes
SKREEM

## Diagnostic Test

### 1. SKREEM

**Note:** Before continuing review and check the following conditions.

- Review the repair history of the vehicle. Ensure the vehicle has the correct PCM and SKREEM installed. Check the part numbers.
- Using a scan tool, ensure the PCM and SKREEM have been programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINS match.

Turn the ignition on.

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

#### Does the DTC reset?

**Yes** >> Replace and program the SKREEM in accordance with the Service Information.

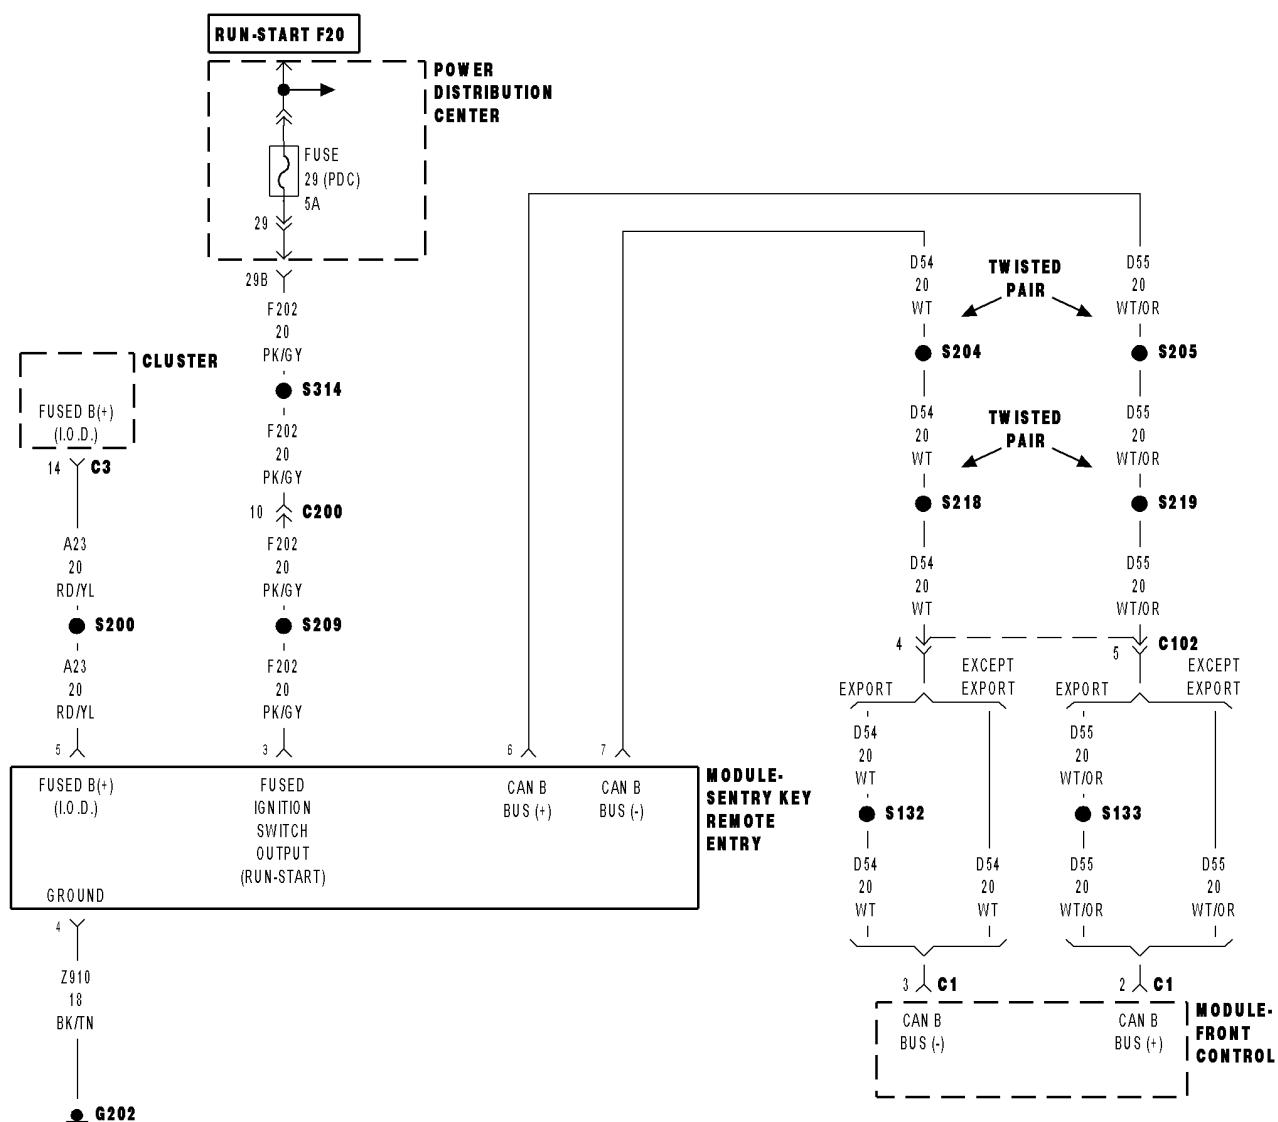

Perform SKREEM VERIFICATION TEST.

**No** >> The DTC is not active at this time. Test complete.

## B2205-ORIGINAL VIN MISSING/MISMATCH

**B2205-ORIGINAL VIN MISSING/MISMATCH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

At ignition on, after ignition on during any rolling code handshake that occurs with the PCM due to a SKIM or PCM reset.

- **Set Condition:**

When a PCM STATUS message with a Valid Key status is not received by the SKIM within 3.5 seconds of transmitting the last Valid Key Code message to the PCM.

Possible Causes
VERIFYING PCM VIN REPLACE SKREEM AND CHECK DTC'S INTERMITTENT WIRING HARNESS PROBLEM PCM

**Diagnostic Test****1. DETERMINING IF DTC IS CURRENT**

With the scan tool, erase the SKREEM DTCs.

Turn the ignition off.

Wait 10 seconds.

Turn the ignition on and wait 2 minutes.

With the scan tool, read the SKREEM DTCs.

**Does the scan tool display the DTC that was previously erased?**

**Yes** >> Go To 2

**No** >> Go To 4

**2. VERIFYING THE PCM VIN**

Turn the ignition on.

With the scan tool, select Engine system from the main menu.

Display and record the Vehicle Identification Number.

**Note:** Ensure that a VIN has been programmed into the PCM. If a VIN is not displayed, attempt to program the PCM with the correct VIN before continuing.

**Does the VIN recorded from the PCM match the VIN of the vehicle?**

**Yes** >> Go To 3

**No** >> Perform the PCM replaced to update the VIN in the PCM.  
Perform SKREEM VERIFICATION TEST

**B2205-ORIGINAL VIN MISSING/MISMATCH (CONTINUED)****3. REPLACE SKREEM AND CHECK DTC'S**

Turn the ignition off.

Replace and program the Sentry Key Remote Entry Module in accordance with the Service Information.

Turn the ignition on.

With the scan tool, display and clear all PCM and SKREEM DTC's.

Perform 5 ignition key cycles leaving the ignition key on for 90 seconds per cycle.

With the scan tool, check for SKREEM DTCs.

**Does the scan tool display the same DTC?**

**Yes** >> Replace and program the Powertrain Control Module in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST

**No** >> The repair is complete.  
Perform SKREEM VERIFICATION TEST

---

**4. INTERMITTENT**

Turn the ignition off.

**Note:** Check for the following conditions:

- **Visually inspect the related wiring harness. Look for any chafed, pierced, pinched, or partially broken wires.**
- **Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.**
- **Refer to any Technical Service Bulletins (TSB) that may apply.**

**Were any problems found?**

**Yes** >> Repair wiring harness/connectors as necessary.  
Perform SKREEM VERIFICATION TEST

**No** >> Test Complete.

---

**B2224-SKREEM INTERNAL**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.

Possible Causes
SKREEM

**Diagnostic Test****1. SKREEM**

**Note:** Before continuing review and check the following conditions.

- Review the repair history of the vehicle. Ensure the vehicle has the correct PCM and SKREEM installed. Check the part numbers.
- Using a scan tool, ensure the PCM and SKREEM have been programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINS match.

Turn the ignition on.

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

**Does the DTC reset?**

**Yes** >> Replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

**No** >> The DTC is not active at this time. Test complete.

B2228-SKREEM INTERNAL - RKE RECEIVER

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition switch on.

Possible Causes
SKREEM

Diagnostic Test

1. SKREEM

**Note:** Before continuing review and check the following conditions.

- Review the repair history of the vehicle. Ensure the vehicle has the correct PCM and SKREEM installed. Check the part numbers.
- Using a scan tool, ensure the PCM and SKREEM have been programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINS match.

Turn the ignition on.

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

- Does the DTC reset?

Yes

>> Replace and program the SKREEM in accordance with the Service Information.  
Perform SKREEM VERIFICATION TEST.

No

>> The DTC is not active at this time. Test complete.

**B2229-SKREEM INTERNAL - SKIM IMMOBILIZER**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition switch on.

Possible Causes
SKREEM

**Diagnostic Test****1. SKREEM**

**Note:** Before continuing review and check the following conditions.

- Review the repair history of the vehicle. Ensure the vehicle has the correct PCM and SKREEM installed. Check the part numbers.
- Using a scan tool, ensure the PCM and SKREEM have been programmed correctly. Compare the PCM VIN to the SKREEM VIN and ensure the two VINS match.

Turn the ignition on.

With the scan tool, clear DTC(s).

Perform 5 ignition cycles, leaving the ignition switch on for a minimum of 90 seconds per cycle.

Using the scan tool, read DTC(s).

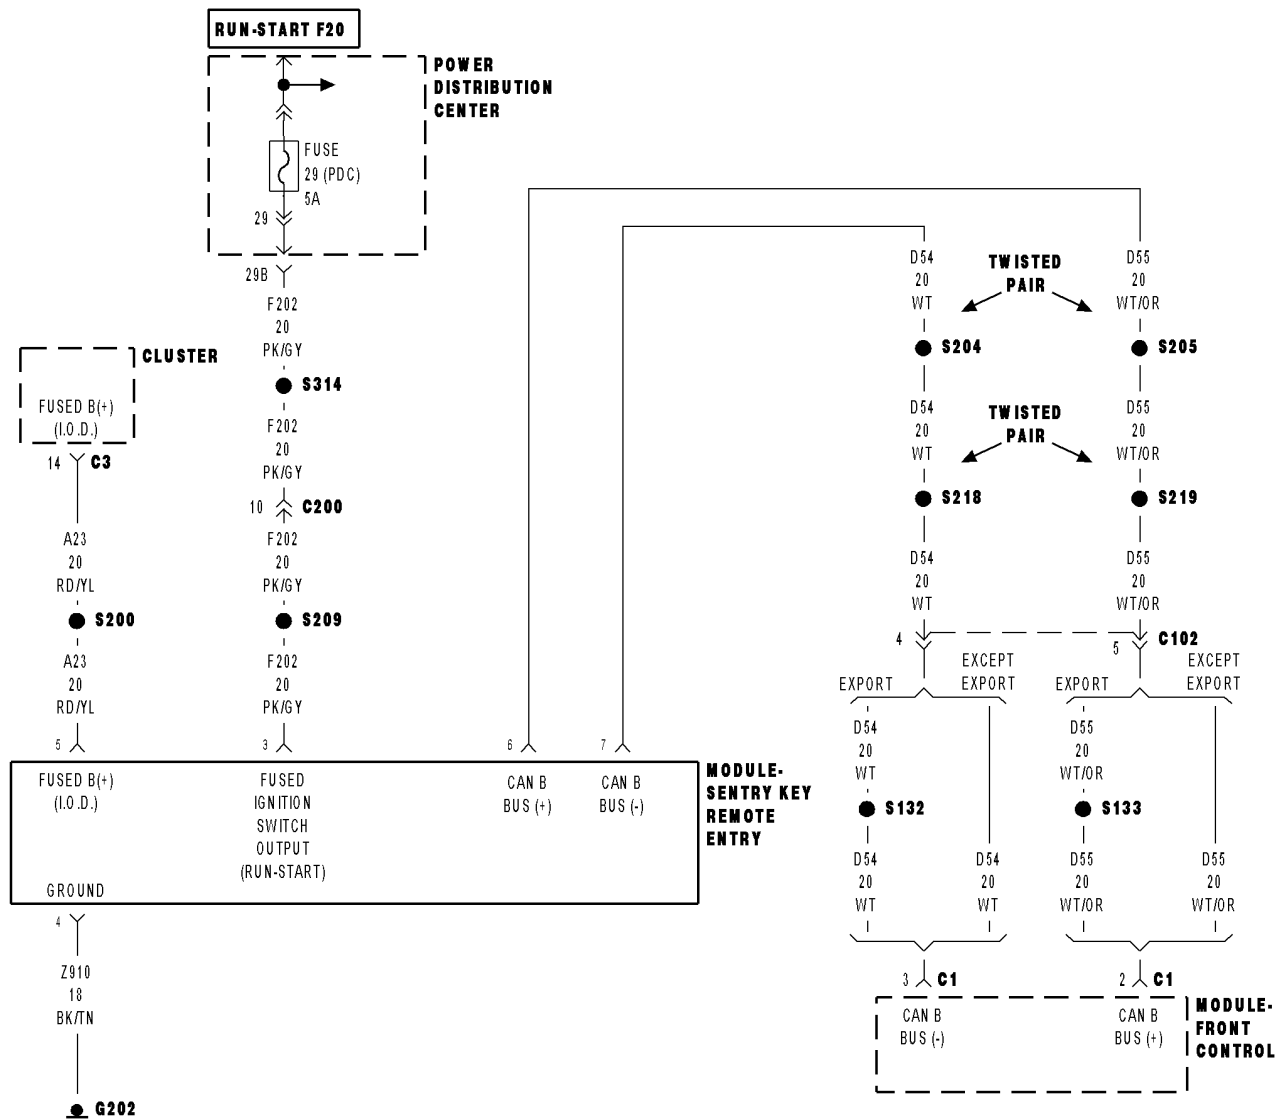

**Does the DTC reset?**

**Yes** >> Replace and program the SKREEM in accordance with the Service Information.  
Perform VERIFICATION TEST.

**No** >> The DTC is not active at this time. Test complete.

## U0019-CAN B BUS

**U0019-CAN B BUS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
Whenever the CAN B Bus (+) or CAN B Bus (–) circuit is open, shorted to voltage or shorted to ground.

Possible Causes
CAN B BUS DTC's IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (–) CIRCUIT OPEN SKREEM

**Diagnostic Test****1. CHECK FOR ACTIVE DTC's**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. CHECK FRONT CONTROL MODULE DTC's**

With the scan tool, read Front Control Module active DTC's

**Does the scan tool display any CAN B BUS DTC's - ACTIVE?**

**Yes** >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING.

**No** >> Go To 3

---

**3. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the SKREEM connector.

Disconnect the Front Control Module connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module harness connector and the SKREEM harness connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

---

**U0019-CAN B BUS (CONTINUED)**

**4. (D54) CAN B BUS (–) CIRCUIT OPEN**

Measure the resistance of the (D54) CAN B Bus (–) circuit between the Front Control Module harness connector and the SKREEM harness connector.

**Is the resistance below 2.0 ohms?**

- Yes**    >> Replace the SKREEM in accordance with the service information.  
             Perform BODY VERIFICATION TEST - VER 1.
- No**      >> Repair the (D54) CAN B Bus (–) circuit for an open.  
             Perform BODY VERIFICATION TEST - VER 1.
-

## **U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0146-LOST COMMUNICATION WITH CENTRAL GATEWAY**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** and perform the P0141-Lost Communication With Front Control Module test for the diagnostic test procedure.

## **U0155-LOST COMMUNICATION WITH CLUSTER/CCN**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## SKREEM VERIFICATION

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

#### 1. SKREEM VERIFICATION

**Note:** When entering the PIN, care should be taken because the SKREEM will only allow 3 consecutive attempts to enter the correct PIN. If 3 consecutive incorrect PIN's are entered the SKREEM will Lock Out the scan tool. To exit Lock Mode, the ignition key must remain the Run position for 1 hour. All accessories must be off. A battery charger connected to the battery during this time period is recommended.

1. Reconnect the previously disconnected components and connectors.
2. Obtain the vehicle's unique Personal Identification Number (PIN) assigned to it's original SKREEM. This number can be obtained from the vehicle invoice or from the DaimlerChrysler Customer Center (Phone 1-800-992-1997).
3. With the scan tool, select Miscellaneous Functions, WCM/Wireless Control Module. Then select the desired procedure and follow the display on the scan tool.
4. If the SKREEM was replaced, ensure all the customer's key have been programmed to the new module.
5. With the scan tool, ease all DTCs. Perform 5 ignition key cycles, leaving the key on for at least 90 seconds per cycle.
6. With the scan tool, read SKREEM DTC(s).

#### Are there any SKREEM DTC(s) present?

**Yes**    >> Repair not complete, refer to the appropriate symptom.

**No**     >> Repair is complete.

## VEHICLE THEFT SECURITY - SERVICE INFORMATION

### DESCRIPTION

#### VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System (VTSS) protects the vehicle from theft by monitoring door-ajar switches, the ignition circuit and trunk/liftgate ajar for unauthorized entry. If a switch or sensor is triggered, the horn blows intermittently and turn signal lamps flash for up to three minutes after that, the turn signal lamps continue to flash for up to 15 minutes to deter theft of the vehicle. If the alarm was triggered but the warning signals have timed out, the park and tail lamps flash three times instead of the normal twice when unlocking the vehicle with the RKE to alert the driver. Locking the doors in any of the following ways automatically arms the VTSS:

- With an interior power lock switch.
- With a valid RKE transmitter.

The Vehicle Theft Security System (VTSS) is designed to provide perimeter protection against unauthorized use or tampering by monitoring the vehicle door and liftgate ajar circuits, the power lock and unlock circuits, and the ignition switch circuit. If unauthorized use or tampering is detected, the system responds by pulsing the horn for up to about three minutes and flashing the hazard warning lamps for up to about eighteen minutes.

The VTSS includes the following major components, which are described in further detail elsewhere in this service information:

- **Door Ajar Switches** - A door ajar switch is integral to the door latch mechanism of each front and rear door.
- **Front Control Module** - The Front Control Module (FCM) is integral to the Integrated Power Module (IPM). The FCM/IPM is located in the engine compartment, near the battery and the Power Distribution Center (PDC) (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION - DESCRIPTION).
- **Horn Relay** - The horn relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery (Refer to 8 - ELECTRICAL/HORN/HORN RELAY - DESCRIPTION).
- **Ignition Switch** - The ignition switch is located on the steering column in the passenger compartment (Refer to 8 - ELECTRICAL/IGNITION CONTROL/IGNITION SWITCH - DESCRIPTION).
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Control Node (CCN) in this vehicle. The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DESCRIPTION).
- **Liftgate Ajar Switch - Wagon only** - A liftgate ajar switch is integral to the latch mechanism of the liftgate.
- **Security Indicator** - The security indicator is integral to the instrument cluster (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - OPERATION).

## SENTRY KEY REMOTE ENTRY SYSTEM

The Sentry Key Remote Entry System (SKREES) is designed to provide passive protection against unauthorized vehicle use by disabling the engine, after two (2) seconds of running, whenever an invalid key is used to start the vehicle. The SKREES is active whenever the ignition is on and does not require any customer intervention. The primary components of the system are the Sentry Key Remote Entry Module (SKREEM), Sentry Key (ignition key with a transponder molded into the head), indicator light, Body Control Module (BCM), and the Next Generation Controller (NGC). The SKREEM is mounted on the ignition switch/lock cylinder assembly with the molded, integral antenna mounted around the ignition housing. The indicator light, is located instrument panel switch pod, just to the right of the instrument cluster.

The SKREES is available as a factory-installed standard option on this model. Vehicles equipped with this option can be readily identified by the illumination of the security indicator in the instrument cluster for about three seconds after the ignition switch is turned to the On position as a SKIS bulb test.

The SKREES includes the following major components, which are described in further detail elsewhere in this service information:

- **Powertrain Control Module** - The Powertrain Control Module (PCM) is located in the engine compartment.
- **Sentry Key Remote Entry Module** - The Sentry Key Remote Entry Module (SKREEM) is located on the right side of the steering column near the ignition lock cylinder housing and an integral molded plastic antenna ring circles the ignition lock cylinder like a halo. The SKREEM and its antenna are concealed beneath the instrument panel steering column shrouds.
- **Sentry Key Transponder** - The Sentry Key transponder is contained within the Remote Keyless Entry (RKE) transmitter on the ignition key.
- **Security Indicator** - The security indicator is integral to the ElectroMechanical Instrument Cluster. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - OPERATION).

## OPERATION

The ElectroMechanical Instrument Cluster (EMIC) is used on this model to control and integrate many of the functions and features included in the Vehicle Theft Security System (VTSS). In the VTSS, the EMIC receives inputs indicating the status of the door ajar switches, the liftgate ajar switch and the ignition switch. The EMIC will process the information from all of these inputs, internally control the security indicator as appropriate, and send electronic messages to the Front Control Module (FCM) over the Controller Area Network (CAN) data bus. The FCM internally controls the output to the hazard warning lamps and sends a control output to energize or de-energize the horn relay as appropriate.

Following are paragraphs describing the operation of each of the VTSS features.

### ENABLING

The EMIC must have the VTSS function electronically enabled in order for the VTSS to perform as designed. The logic in the EMIC keeps its VTSS function dormant until it is enabled using a diagnostic scan tool. The VTSS function of the EMIC is enabled on vehicles equipped with the VTSS option at the factory, but a service replacement EMIC must be VTSS-enabled by the dealer using a diagnostic scan tool. Refer to the appropriate diagnostic information.

### ARMING

Passive arming of the VTSS occurs when the vehicle is exited with the key removed from the ignition switch, the headlamps are turned off, and the doors are locked while they are open using the power lock switch. Active arming occurs when the "Lock" button on the Remote Keyless Entry (RKE) transmitter is depressed to lock the vehicle. For active arming to occur, the doors must be closed and the ignition switch must be in the Off position when the RKE transmitter "Lock" button is depressed. The power lock switch will not function if the key is in the ignition switch or the headlamps are turned on with the driver side front door open.

Pre-arming of the VTSS is initiated when a door or the liftgate is open when the vehicle is locked using a power door lock switch or when the RKE transmitter "Lock" button is depressed. Pre-arming will not occur if the key is in the ignition switch or the headlamps are turned on with the driver side front door open. When the VTSS is pre-armed, the arming sequence is delayed until all of the doors and the liftgate have been closed. The VTSS will remain in "Pre-Armed" mode for up to seventeen seconds after all doors and the liftgate have been closed.

Once the VTSS begins the passive or active arming sequence, the security indicator in the instrument cluster will flash rapidly for about seventeen seconds. This indicates that VTSS arming is in progress. If the ignition switch is turned to the On position, a door or the liftgate is opened, a door or the liftgate is unlocked by any means, or the RKE "Panic" button is depressed during the seventeen second arming process, the security indicator will stop flashing and the arming process will abort. Once the seventeen second arming sequence is successfully completed, the security indicator will flash at a slower rate, indicating that the VTSS is armed.

## DISARMING

Since this model is not equipped with lock cylinder switches, passive disarming of the VTSS is only possible if the vehicle is equipped with the optional Sentry Key Immobilizer System (SKIS). On vehicles with SKIS, turning the ignition switch to the On position using a valid SKIS key will passively disarm VTSS. Active disarming of the VTSS occurs when the vehicle is unlocked by depressing the "Unlock" button of the RKE transmitter. Once the alarm has been activated, either disarming method will also deactivate the alarm. Depressing the "Panic" button on the RKE transmitter will **not** disarm the VTSS.

## POWER-UP MODE

When the armed VTSS senses that the battery has been disconnected and reconnected, it enters its power-up mode. In the power-up mode the alarm system remains armed following a battery failure or disconnect. If the VTSS was armed prior to a battery disconnect or failure, the technician or vehicle operator will have to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode will also apply if the battery goes dead while the system is armed, and battery jump-starting is attempted. The VTSS will be armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTSS is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

## TAMPER ALERT

The VTSS tamper alert feature will sound the horn three times upon disarming, if the alarm was triggered and has since timed-out (about eighteen minutes) or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator that the VTSS alarm was activated while the vehicle was unattended.

## SENTRY KEY IMMOBILIZER SYSTEM

The Sentry Key Immobilizer System (SKIS) is designed to provide passive protection against unauthorized vehicle use by disabling the engine after about two seconds of running, whenever any method other than a valid Sentry Key is used to start the vehicle. The SKIS is considered a passive protection system because it is always active when the ignition system is energized and does not require any customer intervention. The SKIS uses Radio Frequency (RF) communication to obtain confirmation that the key in the ignition switch is a valid key for operating the vehicle. The microprocessor-based SKIS hardware and software also uses electronic messages to communicate with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/COMMUNICATION - OPERATION).

Pre-programmed Sentry Key transponders are provided with the vehicle from the factory. Each Sentry Key REmote Entry Module (SKREEM) will recognize a maximum of eight Sentry Keys. If the customer would like additional keys other than those provided with the vehicle, they may be purchased from any authorized dealer. These additional keys must be programmed to the SKREEM in the vehicle in order for the system to recognize them as valid keys. This can be done by the dealer using a diagnostic scan tool or, if Customer Learn programming is an available SKIS feature in the market where the vehicle was purchased, the customer can program the additional keys, as long as at least two valid Sentry Keys are already available. (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY - STANDARD PROCEDURE - TRANSPONDER PROGRAMMING).

The SKREEM performs a self-test of the SKIS each time the ignition switch is turned to the On position, and will store fault information in the form of a Diagnostic Trouble Code (DTC) if a system malfunction is detected. The SKIS can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

## DIAGNOSIS AND TESTING

### VEHICLE THEFT SECURITY SYSTEM/SENTRY KEY REMOTE ENTRY SYSTEM

#### SENTRY KEY REMOTE ENTRY SYSTEM

Conventional diagnostic methods may not prove conclusive in the diagnosis of the Sentry Key Remote Entry Module (SKREEM) and the Sentry Key Remote Entry System (SKREES), the ElectroMechanical Instrument Cluster (EMIC), the Powertrain Control Module (PCM), the Controller Area Network (CAN) data bus, or the electronic message inputs used to provide the electronic features of the SKREES. The most reliable, efficient, and accurate means to diagnose the SKREEM, the EMIC, the PCM, the CAN data bus, and the electronic message inputs for the SKREES requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

#### SENTRY KEY REMOTE ENTRY SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSES	CORRECTION
SECURITY INDICATOR FAILS TO LIGHT DURING BULB TEST	<ol style="list-style-type: none"><li>1. Light-Emitting Diode (LED) faulty.</li><li>2. Fuse faulty.</li><li>3. Ground path faulty.</li><li>4. Battery feed faulty.</li><li>5. Ignition feed faulty.</li></ol>	<ol style="list-style-type: none"><li>1. Perform the instrument cluster actuator test. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING - ACTUATOR TEST)..</li><li>2. Check the SKREEM fused B(+) fuse and the fused ignition switch output (run-start) fuse in the Junction Block (JB). Replace fuses, if required.</li><li>3. Check for continuity to ground at the connector for the SKREEM. Repair wiring, if required.</li><li>4. Check for battery voltage at the connector for the SKREEM. Repair wiring, if required.</li><li>5. Check for battery voltage at the connector for the SKREEM with the ignition switch in the On position. Repair wiring, if required.</li></ol>
SECURITY INDICATOR FLASHES FOLLOWING BULB TEST	<ol style="list-style-type: none"><li>1. Invalid key in ignition switch lock cylinder.</li><li>2. Key-related fault.</li></ol>	<ol style="list-style-type: none"><li>1. Replace the key with a known valid key.</li><li>2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.</li></ol>
SECURITY INDICATOR LIGHTS SOLID FOLLOWING BULB TEST	<ol style="list-style-type: none"><li>1. SKREES system malfunction/fault detected.</li><li>2. SKREES system inoperative.</li></ol>	<ol style="list-style-type: none"><li>1. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.</li><li>2. Use a diagnostic scan tool and the appropriate diagnostic information for further diagnosis.</li></ol>

#### VEHICLE THEFT SECURITY SYSTEM

However, conventional diagnostic methods may not prove conclusive in the diagnosis of the ElectroMechanical Instrument Cluster (EMIC), the Front Control Module (FCM), the Controller Area Network (CAN) data bus, or the electronic message inputs used to provide the electronic features of the VTSS. The most reliable, efficient, and accurate means to diagnose the EMIC, the FCM, the CAN data bus, and the electronic message inputs for the VTSS requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## SENTRY KEY REMOTE ENTRY MODULE

### DESCRIPTION

The Sentry Key Remote Entry Module (SKREEM) (3) performs the functions of what used to be the Sentry Key Immobilizer Module (SKIM), the Remote Keyless Entry (RKE) Module, and the Tire Pressure Monitoring (TPM) System.

The SKREEM is located on and around (antenna ring) (4) the ignition key cylinder (2) along with the ignition switch (1). It is accessible only from behind the instrument panel, to the left of the steering column. Serviceability requires lock cylinder removal to access the complete unit.

### SENTRY KEY IMMOBILIZER

The Sentry Key Immobilizer System (SKIS) authenticates an electronically coded Transponder Key placed into the ignition and sends a valid/invalid key message to the Powertrain Control Module (PCM) based upon the results. The "VALID/INVALID KEY" message communication is performed using a rolling code algorithm via the Programmable Communication Interface (PCI) data bus. A "VALID KEY" message must be sent to the Powertrain Control Module (PCM) within two seconds of ignition ON to free the engine from immobilization.

### REMOTE KEYLESS ENTRY (RKE)

The RKE transmitter uses radio frequency signals to communicate with the SKREEM. The SKREEM is on the Controller Area Network (CAN) data bus network. When the operator presses a button on the transmitter, it sends a specific request to the SKREEM. In turn the SKREEM sends the appropriate request over the CAN bus to the Integrated Power Module (IPM) to activate the park lamps, the headlamps, and the horn for horn chirp.

### TIRE PRESSURE MONITORING (TPM)

If equipped with the Tire Pressure Monitoring (TPM) System, each of the vehicles four wheels will have a valve stem with a pressure sensor and radio transmitter built in. Signals from the tire pressure sensor/transmitter are received and interpreted by the SKREEM.

A sensor/transmitter in a mounted wheel will broadcast its detected pressure once per minute when the vehicle is moving faster than 15 mph (24 km/h). Each sensor/transmitter's broadcast is uniquely coded so that the SKREEM can determine the location.

OPERATION

SENTRY KEY IMMOBILIZER

The Sentry Key Remote Entry Module (SKREEM) receives an encrypted Radio Frequency (RF) signal from the transponder key. The SKREEM then decrypts the signal and broadcasts the requested remote commands to the appropriate modules in the vehicle over the Controller Area Network (CAN) data bus. A valid transponder key ID must be incorporated into the RF signal in order for the SKREEM to pass the message on to the appropriate modules.

Automatic transponder key synchronization is done by the SKREEM if a valid transponder key is inserted into the ignition cylinder, and the ignition is turned ON. This provides a maximum operation window for RKE functions.

Each Sentry Key Remote Entry System (SKREES) consists of a SKREEM and a transponder key. Each system has a secret key code unique to that system. The secret key is electronically coded in the SKREEM and in all programmed transponder keys. It is used for immobilization and RKE functions for data security. In addition, each transponder key will have a unique identification.

REMOTE KEYLESS ENTRY

After pressing the lock button on the RKE transmitter, all of the door locks will lock, the illuminated entry will turn off (providing all doors are closed), and the Vehicle Theft Security System (VTSS) (if equipped) will arm. After pressing the unlock button, on the RKE transmitter, one time, the driver door lock will unlock, the illuminated entry will turn on the courtesy lamps, and the VTSS (if equipped) will disarm. After pressing the unlock button a second time, the remaining door locks will unlock. The Electronic Vehicle Information Center (EVIC) or a scan tool can reprogram this feature to unlock all of the door locks with one press of the unlock button. If the vehicle is equipped with the memory system, the memory message will identify which transmitter (1 or 2) sent the signal. Refer to Overhead Console/Electronic Vehicle Information Center for more information on customer programmable features.

The SKREEM is capable of retaining up to 8 individual access codes (8 transmitters). If the PRNDL is in any position except park, the SKREEM will disable the RKE. The 4 button transmitter uses 1-CR2032 battery. The minimum battery life is approximately 4.7 years based on 20 transmissions a day at 84°F (25°C). Use a scan tool or the Miller Tool 9001 RF Detector to test the RKE transmitter. Use a scan tool or the customer programming method to program the RKE system. However, the SKREEM will only allow RKE programming when the ignition is in the ON position, the PRNDL is in park position, and the VTSS (if equipped) is disarmed.

TIRE PRESSURE MONITORING (TPM)

The SKREEM monitors the signals from the tire pressure sensor/transmitters and determines if any tire has gone below the low pressure threshold LOW TIRE PRESSURE THRESHOLDS table.

LOW TIRE PRESSURE THRESHOLDS

SYSTEM STATUS INDICATOR	TIRE PRESSURE
ON	172 kPa (25 PSI)
OFF	207 kPa (30 PSI)

CRITICAL AND NON-CRITICAL SYSTEM ALERTS

**CRITICAL:** A critical alert will be triggered when a tire pressure has gone below a set threshold pressure. The SKREEM will send a message to the cluster to display “X TIRE(S) LOW PRESSURE”. “X” will be the number of tires reporting low pressure. The message will display for the duration of the current ignition cycle or until an EVIC button is pressed. If the display is removed without correcting the condition, it will reappear 300 seconds to warn the driver of the low pressure condition.

**NON-CRITICAL:** A non-critical alert will be triggered when no signal is received from a sensor/transmitter or when a sensor/transmitter low battery condition is detected. The cluster will display “SERVICE TIRE PRESS. SYSTEM.”

## DIAGNOSIS AND TESTING

### SENTRY KEY REMOTE ENTRY MODULE

For proper diagnosis and testing of the Sentry Key Remote Entry Module (SKREEM), Remote Keyless Entry (RKE) System, and the Tire Pressure Monitoring (TPM), use a scan tool and appropriate diagnostic information.

### REMOVAL

1. Disconnect and isolate the battery negative cable.
- 2.

**WARNING:** Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, personal injury or death.

3. Remove the instrument cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
4. Remove the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - REMOVAL).
5. Reach up behind the left side of the center stack and disconnect the ignition switch (6) and SKREEM (5) electrical connectors.

6. From underneath the ignition switch/lock assembly, loosen the lower retaining screw (2).
7. Remove the two mounting nuts (1) from the front of the instrument panel.
8. Push the ignition switch/lock assembly (3) inward toward the bulkhead.
9. Remove the SKREEM mounting screw (1) on the ignition lock assembly and separate the SKREEM from the ignition lock assembly.

## INSTALLATION

1. Position the SKREEM on the ignition lock housing and install the retaining screw (1).

2. Position the ignition switch/lock assembly (3) up in behind the instrument panel and push rearward.
3. Install the two mounting nuts to the front of the instrument panel (1).
4. From underneath the ignition switch/lock assembly, tighten the lower retaining screw (3).
5. Reach up behind the left side of the center stack and connect the ignition switch (6) and SKREEM (5) electrical connectors.
6. Install the cluster bezel (Refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL).
7. Install the steering column opening cover (Refer to 23 - BODY/INSTRUMENT PANEL/STEERING COLUMN OPENING COVER - INSTALLATION).
8. Connect the battery negative cable.

## TRANSPONDER KEY

### DESCRIPTION

Each ignition key (2) used in the Sentry Key Remote Entry System (SKREES) has a transponder chip included on the circuit board (4) beneath the cover (1) of the integral Remote Keyless Entry (RKE) transmitter (3). In addition to having to be cut to match the mechanical coding of the ignition lock cylinder and programmed for operation of the RKE system, each new Sentry Key has a unique transponder identification code that is permanently programmed into it by the manufacturer, and which must be programmed into the Sentry Key REMote Entry Module (SKREEM) to be recognized by the SKREES as a valid key.

The Sentry Key transponder cannot be adjusted or repaired. If faulty or damaged, the entire key and RKE transmitter unit must be replaced.

### OPERATION

When the ignition switch is turned to the On position, the Sentry Key REMote Entry Module (SKREEM) communicates through its antenna with the Sentry Key transponder using a Radio Frequency (RF) signal. The SKREEM then listens for a RF response from the transponder through the same antenna. The Sentry Key transponder chip is within the range of the SKREEM transceiver antenna ring when it is inserted into the ignition lock cylinder. The SKREEM determines whether a valid key is present in the ignition lock cylinder based upon the response from the transponder. If a valid key is detected, that fact is communicated by the SKREEM to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to continue running. If the PCM receives an invalid key message, or receives no message from the SKREEM over the CAN data bus, the engine will be disabled after about two seconds of operation. The ElectroMechanical Instrument Cluster (EMIC) will also respond to the invalid key message on the CAN data bus by flashing the security indicator on and off.

Each Sentry Key has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the SKREEM has a unique Secret Key code programmed into it by the manufacturer. When a Sentry Key is programmed into the memory of the SKREEM, the SKREEM stores the transponder identification code from the Sentry Key, and the Sentry Key learns the Secret Key code from the SKREEM. Once the Sentry Key learns the Secret Key code of the SKREEM, it is permanently stored in the memory of the transponder. Therefore, once a Sentry Key has been programmed to a particular vehicle, it cannot be used on any other vehicle (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/TRANSPONDER KEY - STANDARD PROCEDURE).

The Sentry Key REmote Entry System (SKREES) performs a self-test each time the ignition switch is turned to the On position, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in SKREEM memory if a Sentry Key transponder problem is detected. The Sentry Key transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic information.

Common communication problems:

- Two transponder keys too close together.
- Speed Pass too close to transponder key.

Solid indicator that there is a system failure.

- Loss of PCM communication.
- Failed antenna circuit.

## STANDARD PROCEDURE

### TRANSPONDER PROGRAMMING

All Sentry Keys included with the vehicle are pre-programmed to work with the Sentry Key Remote Entry System (SKREES) when it is shipped from the factory. The Sentry Key REmote Entry Module (SKREEM) can be programmed to recognize up to a total of eight Sentry Keys. When programming a blank Sentry Key transponder, the key must first be cut to match the ignition switch lock cylinder in the vehicle for which it will be used. Once the additional or new key has been cut, the SKREEM must be programmed to recognize it as a valid key. There are two possible methods to program the SKREEM to recognize a new or additional valid key, the Secured Access Method and the Customer Learn Method. Following are the details of these two programming methods.

### SECURED ACCESS METHOD

The Secured Access method applies to all vehicles. This method requires the use of a diagnostic scan tool. This method will also require that you have access to the unique four-digit PIN code that was assigned to the original SKREEM. The PIN code **must** be used to enter the Secured Access Mode in the SKREEM. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the DaimlerChrysler Customer Center. Refer to the appropriate diagnostic information for the proper Secured Access method programming procedures.

**Note: The Remote Keyless Entry (RKE) Transmitter will also be programmed during this procedure.**

### CUSTOMER LEARN METHOD

The Customer Learn feature is only available on domestic vehicles, or those vehicles which have a U.S. country code designator. This programming method also requires access to at least two valid Sentry Keys. If two valid Sentry Keys are not available, or if the vehicle does not have a U.S. country code designator, the Secured Access Method **must** be used to program new or additional valid keys to the SKREEM. The Customer Learn programming method procedures are as follows:

1. Obtain the blank Sentry Key(s) that are to be programmed as valid keys for the vehicle. Cut the blank key(s) to match the ignition switch lock cylinder mechanical key codes.
2. Insert one of the two valid Sentry Keys into the ignition switch and turn the ignition switch to the On position.
3. After the ignition switch has been in the On position for longer than three seconds, but no more than fifteen seconds, cycle the ignition switch back to the Off position. Replace the first valid Sentry Key in the ignition switch lock cylinder with the second valid Sentry Key and turn the ignition switch back to the On position. The second valid Sentry Key must be inserted in the lock cylinder within fifteen seconds of removing the first valid key.
4. About ten seconds after the completion of Step 3, the security indicator in the instrument cluster will start to flash to indicate that the system has entered the Customer Learn programming mode.
5. Within sixty seconds of entering the Customer Learn programming mode, turn the ignition switch to the Off position, replace the valid Sentry Key with a blank Sentry Key transponder, and turn the ignition switch back to the On position.
6. About ten seconds after the completion of Step 5, the security indicator will stop flashing, stay on solid for three seconds, then turn off to indicate that the blank Sentry Key has been successfully programmed. The SKREES will immediately exit the Customer Learn programming mode. After the ignition is cycled the vehicle may be started using the newly programmed valid Sentry Key.

**Note:** The Remote Keyless Entry (RKE) Transmitter will also be programmed during this procedure.

Each of these steps must be repeated and completed in their entirety for each additional Sentry Key that is to be programmed. If the above steps are not completed in the given sequence, or within the allotted time, the SKREEM will exit the Customer Learn programming mode and the programming will be unsuccessful. The SKREEM will also automatically exit the Customer Learn programming mode if it sees a non-blank Sentry Key transponder when it should see a blank, if it has already programmed eight (8) valid Sentry Keys, or if the ignition switch is turned to the Off position for more than about fifty seconds.

**Note:** If an attempt is made to start the vehicle while in the Customer Learn mode (security indicator flashing), the SKIS will respond as though the vehicle were being started with an invalid key. In other words, the engine will stall after about two seconds of operation. No faults will be set.

**Note:** Once a Sentry Key has been programmed as a valid key to a vehicle, it cannot be programmed as a valid key for use on any other vehicle.

## VTSS/SKIS INDICATOR LAMP

### DESCRIPTION

The Sentry Key Remote Entry System (SKREES) uses an indicator light to convey information on the status of the system to the customer. This light is shared with the Vehicle Theft Security System (VTSS). The light is located in the instrument panel switch pod, just to the right of the cluster. The indicator light is controlled by the Cab Compartment Node (CCN), via the Controller Area Network (CAN) data bus based upon messages it receives from the Sentry Key Remote Entry Module (SKREEM) on the CAN data bus, and is hard wired to the cluster.

### OPERATION

The VTSS/SKREES lamp is controlled according to Sentry Key Remote Entry (SKREEM) messages. Then, the SKREEM sends messages to the Cab Compartment Node (CCN) to operate the light based upon the results of the SKREES self tests. The light may be actuated in two possible ways, flashing or on solid. If the light comes on and stays on solid after a power-up test, this indicates that the SKREEM has detected a system malfunction. If the SKREEM detects an invalid key when the ignition switch is moved to the ON position, it sends a message on the CAN bus to the CCN, to flash the light. The SKREEM can also send a message to flash the light and generate a single audible chime at the same time. These two events occurring simultaneously indicate that the SKREES has been placed into the "Customer Learn" mode (Refer to 8 - ELECTRICAL/VEHICLE THEFT SECURITY/TRANSPONDER KEY - STANDARD PROCEDURE). If the light comes on and stays on after the power-up test, diagnosis of the SKREES should be performed using a scan tool and the appropriate diagnostic information. The light is not a serviceable component.

## WIPERS/WASHERS - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

**B2301-WIPER MODE SWITCH INPUT CIRCUIT LOW**

**B2301-WIPER MODE SWITCH INPUT CIRCUIT LOW (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the Instrument Cluster detects a short/LOW condition.

Possible Causes
MULTIFUNCTION SWITCH SENSE CIRCUIT SHORTED LOW INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all CCN DTC's.

Turn the Wipers ON then OFF.

With the Scan Tool, read the Wiper DTC's.

**Does the Scan Tool read: B2301-WIPER MODE SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST — VER 1.

**2. MULTIFUNCTION SWITCH**

Turn the ignition off.

Disconnect the Multifunction Switch harness connector.

Ensure the switch is in the OFF position.

Measure the internal resistance of the Multifunction Switch between the G902 and W52 circuits.

**Does the Switch measure more than 5.0 ohms?**

**Yes** >> Replace the Multifunction Switch in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B2301-WIPER MODE SWITCH INPUT CIRCUIT LOW (CONTINUED)****3. INSTRUMENT CLUSTER**

Turn the ignition off.

Disconnect the Multifunction Switch connector.

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance of the (W2) MUX circuit to ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (W2) MUX circuit for a short to ground condition.

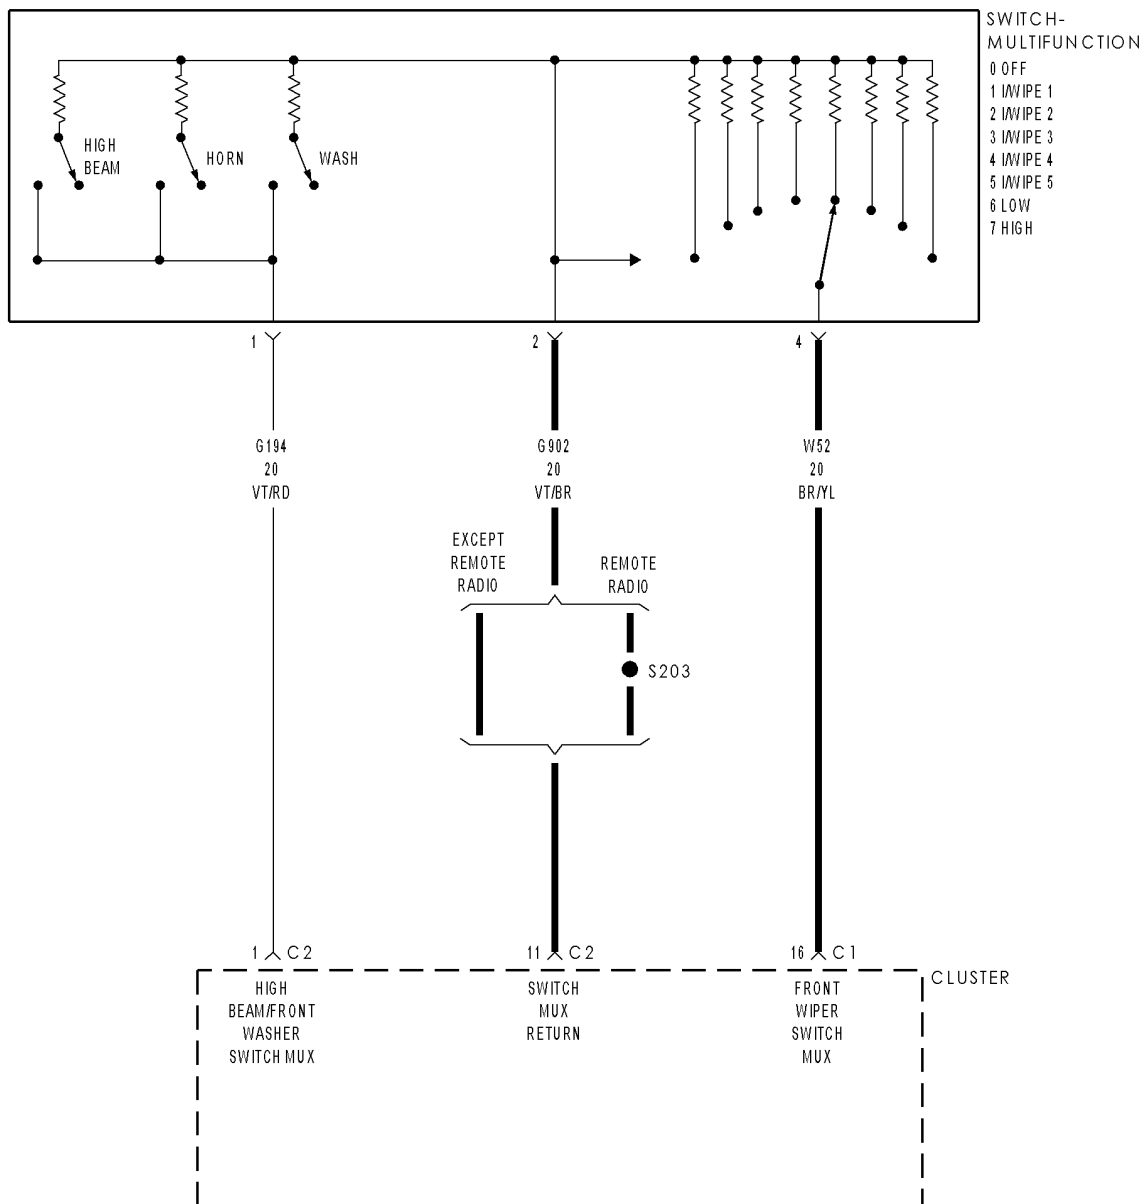

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

# B2302-WIPER MODE SWITCH INPUT CIRCUIT HIGH

**B2302-WIPER MODE SWITCH INPUT CIRCUIT HIGH (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the Instrument Cluster detects a short/HIGH condition.

Possible Causes
MULTIFUNCTION SWITCH SENSE CIRCUIT OPEN INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

Turn the ignition on.  
With the Scan Tool, clear all CCN DTC's.  
Turn the Wipers ON then OFF.  
With the Scan Tool, read the Wiper DTC's.

**Does the Scan Tool read: B2302-WIPER MODE SWITCH INPUT CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. MULTIFUNCTION SWITCH**

Turn the ignition off.  
Disconnect the Multifunction Switch harness connector.  
Ensure the switch is in the OFF position.  
Measure the internal resistance of the Multifunction Switch between the G902 and W52 circuits.

**Does the Switch measure more than 5.0 ohms?**

- Yes**    >> Replace the Multifunction Switch in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.
- No**    >> Go To 3

**B2302-WIPER MODE SWITCH INPUT CIRCUIT HIGH (CONTINUED)****3. INSTRUMENT CLUSTER**

Turn the ignition off.

Disconnect the Multifunction Switch connector.

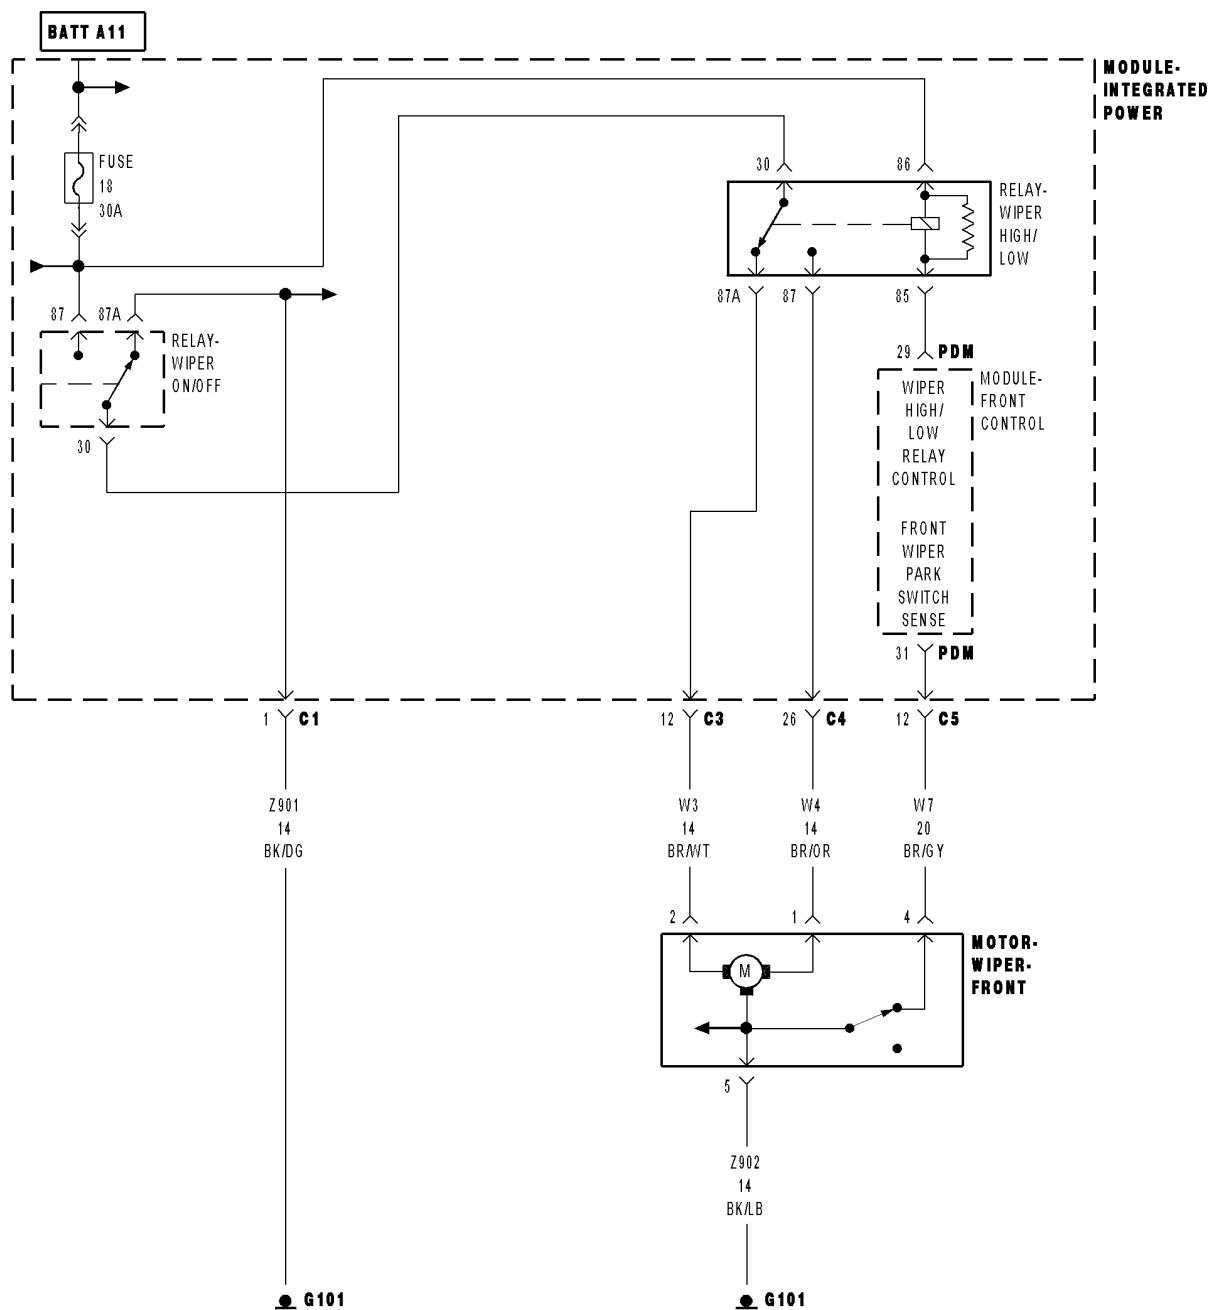

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance of the (W2) MUX circuit.

**Is the resistance above 5.0 ohms?**

- Yes** >> Repair the (W2) MUX circuit for an open condition.  
Perform the BODY VERIFICATION TEST — VER 1.
- No** >> Replace the Instrument Cluster in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**B2304-WIPER PARK SWITCH INPUT CIRCUIT LOW**

**B2304-WIPER PARK SWITCH INPUT CIRCUIT LOW (CONTINUED)**

For the Front/Rear Wipers/Washers circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
MULTIFUNCTION SWITCH (W7) FRONT WIPER PARK SWITCH SENSE CIRCUIT LOW FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Wipers on.

With the Scan Tool, read the Wiper DTC's.

**Does the Scan Tool read: B2304-WIPER PARK SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST — VER 1.

**2. MULTIFUNCTION SWITCH**

Turn the ignition off.

Disconnect the Multifunction Switch connector.

Measure the internal resistance of the Multifunction Switch between cavity 1 and 4 of the switch.

**Is the resistance above 5.0 ohms?**

**Yes** >> Replace the Multifunction Switch in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B2304-WIPER PARK SWITCH INPUT CIRCUIT LOW (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Multifunction Switch connector.

Disconnect the FCM C1 harness connector.

Measure the resistance between ground and the (W7) Front Wiper Park Switch Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (W7) Front Wiper Park Switch Sense circuit for a short condition.

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

# B2305-WIPER PARK SWITCH INPUT CIRCUIT HIGH

**B2305-WIPER PARK SWITCH INPUT CIRCUIT HIGH (CONTINUED)**

For the Rear Wipers/Washers circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
MULTIFUNCTION SWITCH (W7) FRONT WIPER PARK SWITCH SENSE CIRCUIT HIGH FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

Turn the ignition on.  
With the Scan Tool, clear all FCM DTC's.  
Turn the Front Wipers on.  
With the Scan Tool, read the Front Wiper DTC's.

**Does the Scan Tool read: B2305-WIPER PARK SWITCH INPUT CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. MULTIFUNCTION SWITCH**

Turn the ignition off.  
Disconnect the Multifunction Switch connector.  
Measure the internal resistance of the Multifunction Switch between cavity 2 and 4 of the switch.

**Is the resistance above 5.0 ohms?**

- Yes**    >> Replace the Multifunction Switch in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.
- No**    >> Go To 3

**B2305-WIPER PARK SWITCH INPUT CIRCUIT HIGH (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Multifunction Switch connector.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (W7) Front Wiper Park Switch Sense circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (W7) Front Wiper Park Switch Sense circuit for an open condition.

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**SWITCH-MULTIFUNCTION**

SWITCH-MULTIFUNCTION

CLUSTER C2

812cfe9

**B2307-WASHER SWITCH INPUT CIRCUIT LOW (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the Instrument Cluster detects a short condition.

Possible Causes
MULTIFUNCTION SWITCH (G194) SWITCH MUX CIRCUIT OPEN INSTRUMENT CLUSTER

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all CCN DTC's.

Turn the Washers ON then OFF.

With the Scan Tool, read the Washer DTC's.

**Does the Scan Tool read: B2301-WIPER MODE SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. MULTIFUNCTION SWITCH**

Turn the ignition off.

Disconnect the Multifunction Switch harness connector.

Ensure the switch is in the OFF position.

Measure the internal resistance of the Multifunction Switch between the G902 and G194 circuits.

**Does the Switch measure more than 5.0 ohms?**

**Yes** >> Replace the Multifunction Switch in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B2307-WASHER SWITCH INPUT CIRCUIT LOW (CONTINUED)****3. INSTRUMENT CLUSTER**

Turn the ignition off.

Disconnect the Multifunction Switch connector.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance of the (G194) MUX circuit to ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (G194) MUX circuit for a short to ground condition.

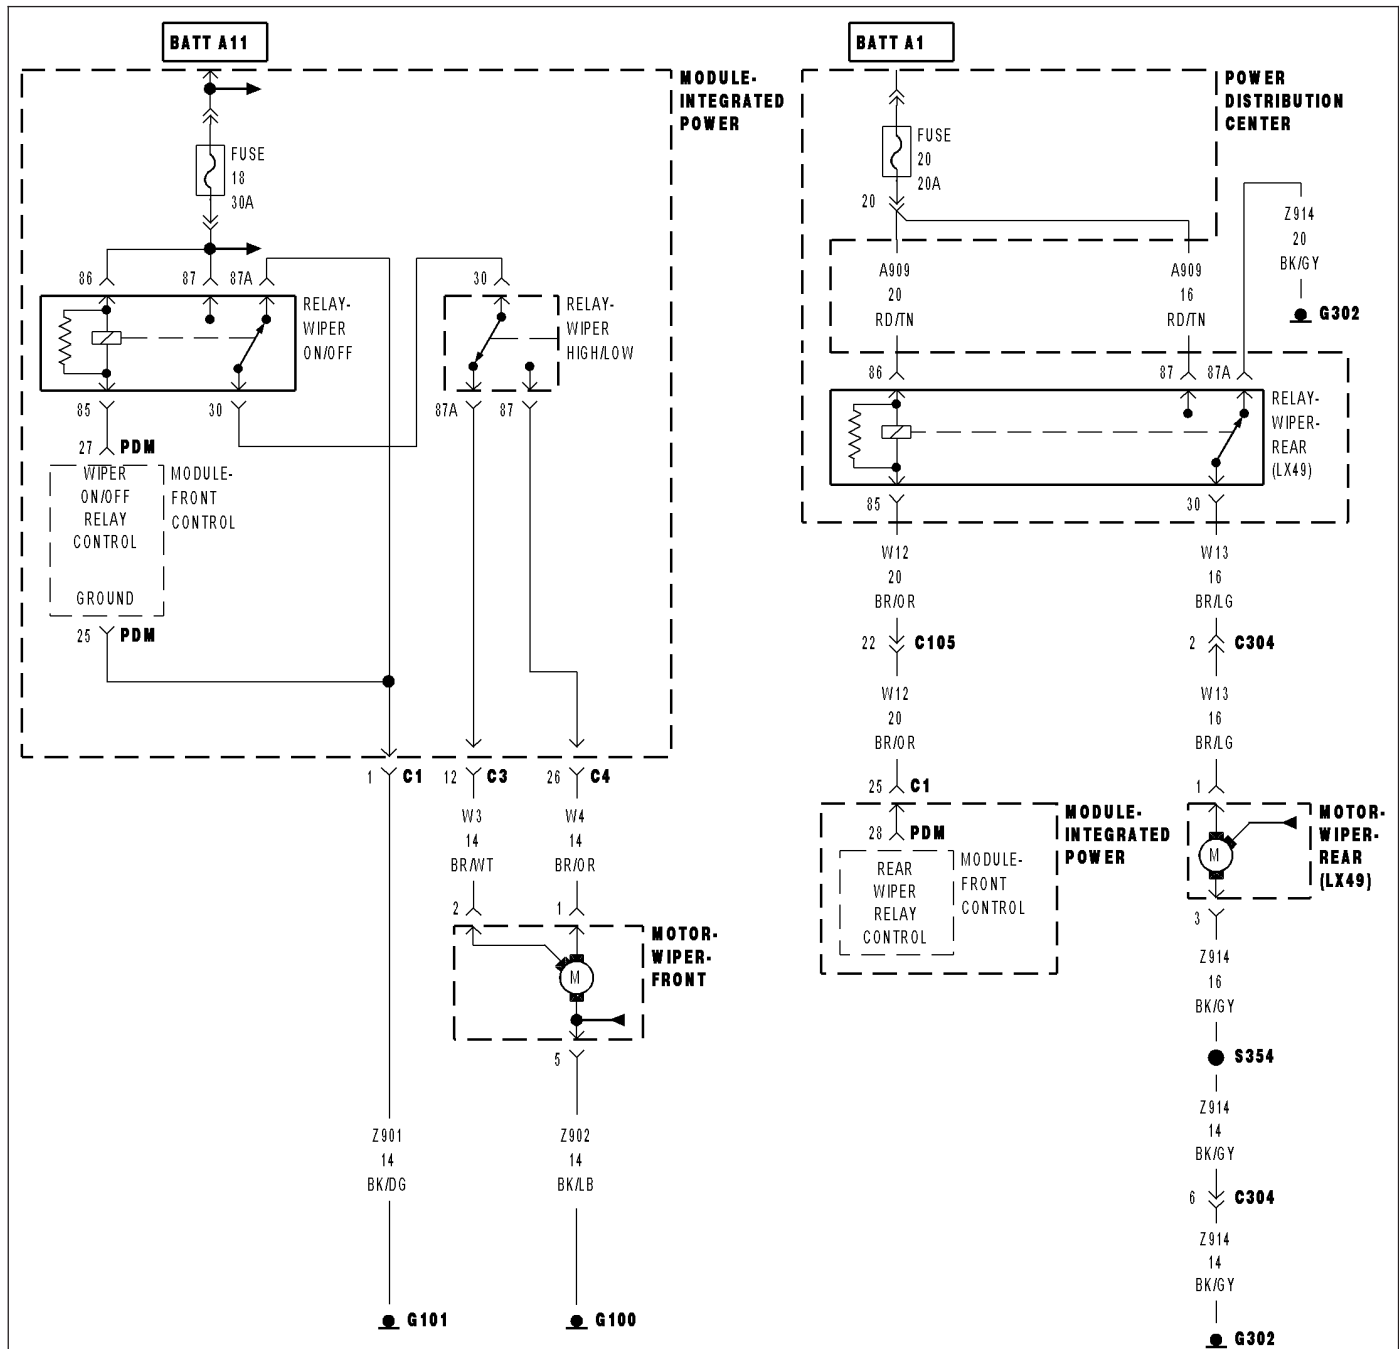

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Instrument Cluster in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

## B2313-WIPER ON/OFF CONTROL CIRCUIT LOW

**B2313-WIPER ON/OFF CONTROL CIRCUIT LOW (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the FCM detects a short/low condition.

Possible Causes
WIPER ON/OFF RELAY
POWER DISTRIBUTION CENTER
FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Wipers ON then OFF.

With the Scan Tool, read the Wiper DTC's.

**Does the Scan Tool read: B2313-WIPER ON/OFF CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WIPER ON/OFF RELAY**

Turn the ignition off.

Install a substitute relay in place of the Wiper On/Off Relay.

Turn the ignition on.

With the Scan Tool, read the DTC's.

**Does the Scan Tool read: B2313-WIPER ON/OFF CONTROL CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Wiper On/Off Relay in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**B2313-WIPER ON/OFF CONTROL CIRCUIT LOW (CONTINUED)****3. Front Control Module**

Turn the ignition off.

Remove the Wiper On/Off Relay.

Disconnect the FCM C3 harness connector.

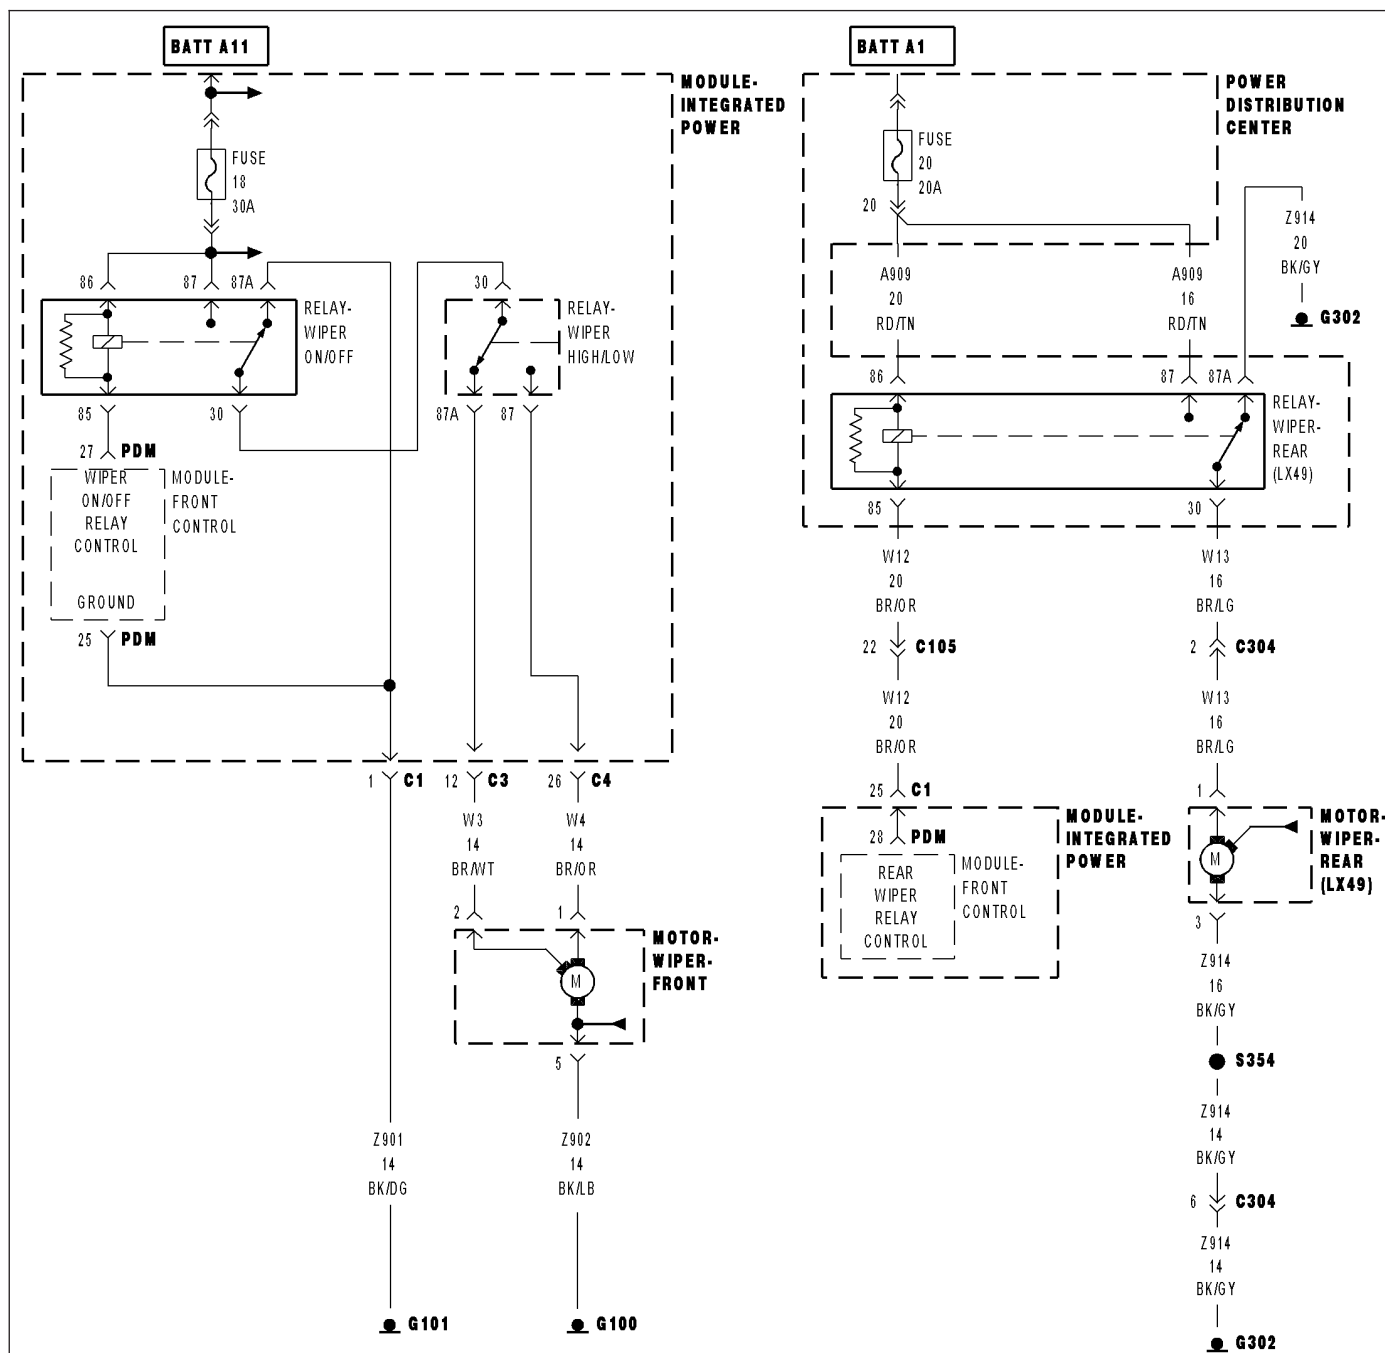

Measure the resistance between ground and the Wiper On/Off Relay Control circuit in the PDC.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Power Distribution Center in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.
- No** >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

## B2314-WIPER ON/OFF CONTROL CIRCUIT HIGH

MODULE-FRONT CONTROL PDM

**B2314-WIPER ON/OFF CONTROL CIRCUIT HIGH (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the FCM detects a short/HIGH condition.

Possible Causes
WIPER ON/OFF RELAY
POWER DISTRIBUTION CENTER
FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Wipers ON then OFF.

With the Scan Tool, read the Wiper DTC's.

**Does the Scan Tool read: B2314-WIPER ON/OFF CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WIPER ON/OFF RELAY**

Turn the ignition off.

Remove the Wiper On/Off Relay.

Turn the ignition on.

Activate the Wiper Switch to all speed positions.

With the Scan Tool, read the DTC's.

**Does the Scan Tool read: B2314-WIPER ON/OFF CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the Wiper On/Off Relay in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B2314-WIPER ON/OFF CONTROL CIRCUIT HIGH (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Remove the Wiper On/Off Relay.

Disconnect the FCM C3 harness connector.

Measure the voltage between ground and the Wiper On/Off Relay Control circuit in the PDC.

**Is there any voltage present?**

**Yes** >> Replace the Power Distribution Center in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**B2317-WIPER HI/LOW CONTROL CIRCUIT LOW (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the FCM detects a short/low condition.

Possible Causes
WIPER HIGH/LOW RELAY POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Wipers from High to Low.

With the Scan Tool, read the Wiper DTC's.

**Does the Scan Tool read: B2317-WIPER HI/LOW CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WIPER HI/LOW RELAY**

Turn the ignition off.

Install a substitute relay in place of the Wiper Hi/Low Relay.

Turn the ignition on.

With the Scan Tool, read the DTC's.

**Does the Scan Tool read: B2317-WIPER HI/LOW CONTROL CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the Wiper Hi/Low Relay in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**B2317-WIPER HI/LOW CONTROL CIRCUIT LOW (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Remove the Wiper Hi/Low Relay.

Disconnect the FCM C3 harness connector.

Measure the resistance between ground and the Wiper Hi/Low Relay Control circuit in the PDC.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Power Distribution Center in accordance with the service information.

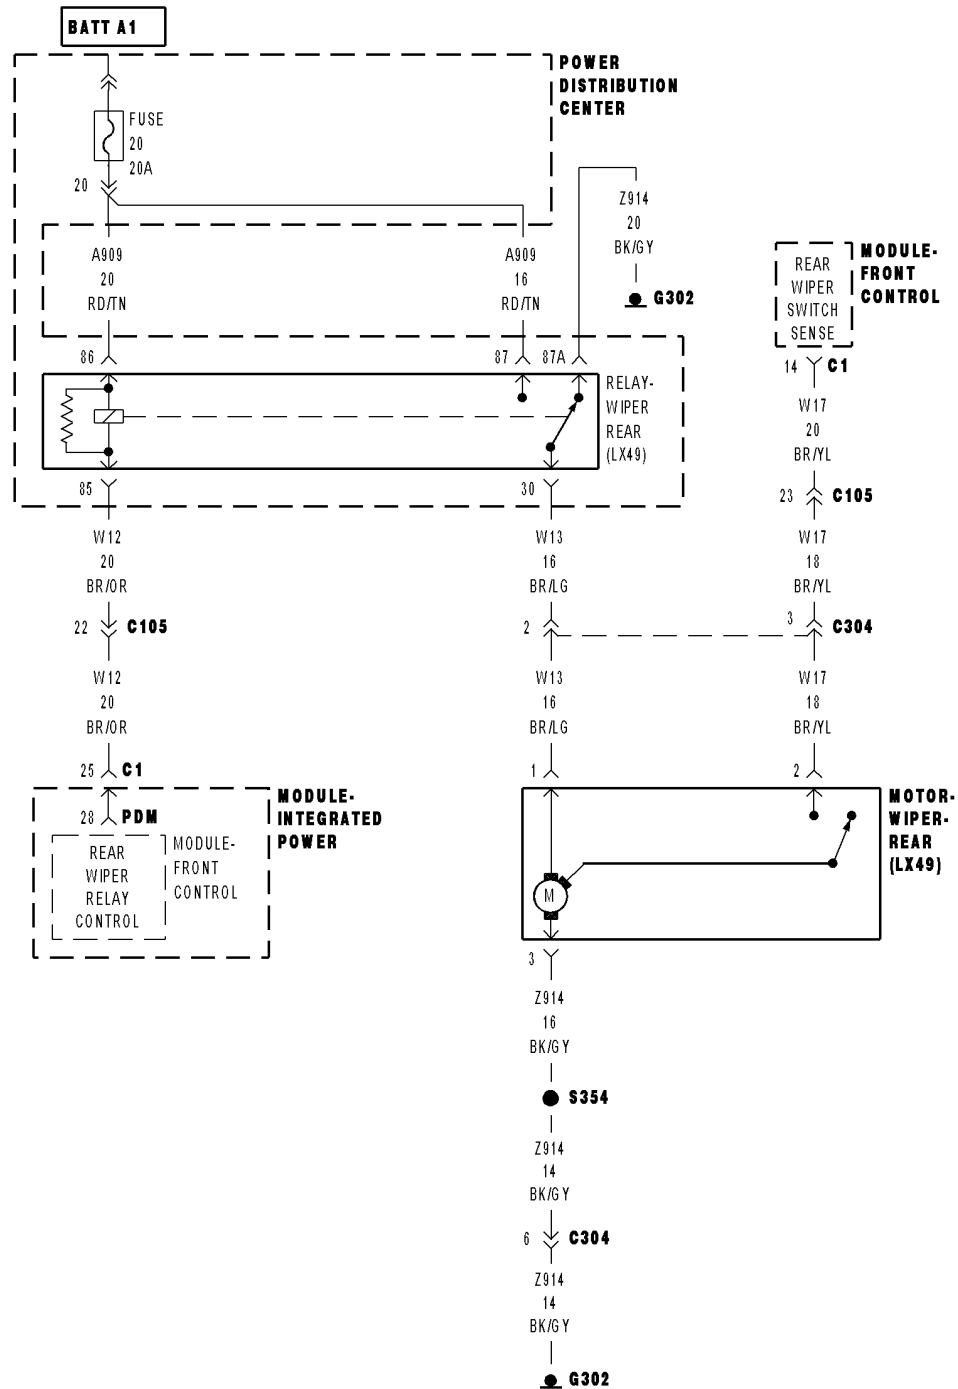

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**B2318-WIPER HI/LOW CONTROL CIRCUIT HIGH**

**B2318-WIPER HI/LOW CONTROL CIRCUIT HIGH (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the FCM detects a short/HIGH condition.

Possible Causes
WIPER HIGH/LOW RELAY POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Wipers to Low then High.

With the Scan Tool, read the Wiper DTC's.

**Does the Scan Tool read: B2318-WIPER HI/LOW CONTROL CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WIPER HIGH/LOW RELAY**

Turn the ignition off.

Remove the Wiper Hi/Low Relay.

Turn the ignition on.

Activate the Wiper Switch to all speed positions.

With the Scan Tool, read the DTC's.

**Does the Scan Tool read: B2318-WIPER HI/LOW CONTROL CIRCUIT HIGH?**

**Yes** >> Replace the Wiper Hi/Low Relay in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B2318-WIPER HI/LOW CONTROL CIRCUIT HIGH (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Remove the Wiper Hi/Low Relay.

Disconnect the FCM C3 harness connector.

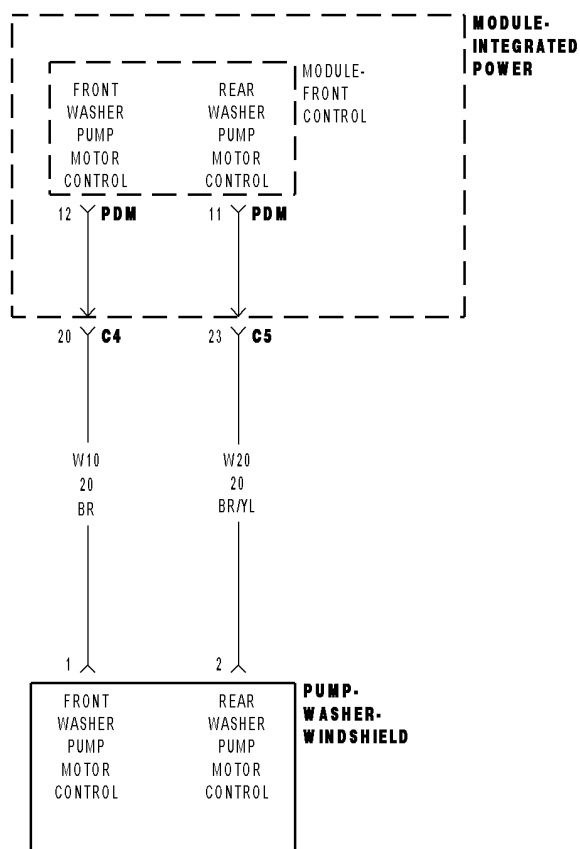

Measure the voltage between ground and the (W2) Wiper Hi/Low Relay Control circuit in the PDC.

**Is there any voltage present?**

- Yes** >> Replace the Power Distribution Center in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.
- No** >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

## B231F-FRONT/REAR WASHER MOTOR CONTROL CIRCUIT LOW

**B231F-FRONT/REAR WASHER MOTOR CONTROL CIRCUIT LOW (CONTINUED)**

For the Wiper/Washer system circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on.
- **Set Condition:**
- When the FCM detects a short/low condition on the washer Pump Motor Control circuit.

Possible Causes
(W10)/(W20) WASHER PUMP MOTOR CONTROL CIRCUIT WIPER WASHER PUMP POWER DISTRIBUTION CENTER FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Washers on.

With the Scan Tool, read the Wiper/Washers DTC's.

**Does the Scan Tool read: B231F-FRONT/REAR WASHER MOTOR CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WASHER PUMP MOTOR**

Turn the ignition off.

Disconnect the Washer Pump Motor connector.

Turn the ignition on.

With the Scan Tool, read the DTC's.

**Does the Scan Tool read: B231F-FRONT/REAR WASHER MOTOR CONTROL CIRCUIT LOW?**

**Yes** >> Replace the Washer Pump Motor in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B231F-FRONT/REAR WASHER MOTOR CONTROL CIRCUIT LOW (CONTINUED)****3. WASHER PUMP MOTOR CONTROL CIRCUIT**

Turn the ignition off.

Disconnect the Washer Pump Motor harness connector.

Disconnect the FCM C3 harness connector.

Measure the resistance between ground and the (W10) Washer Pump Motor Control circuit in the.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the Washer Pump Motor Control circuit.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 4

**4. FRONT CONTROL MODULE**

Turn the ignition off.

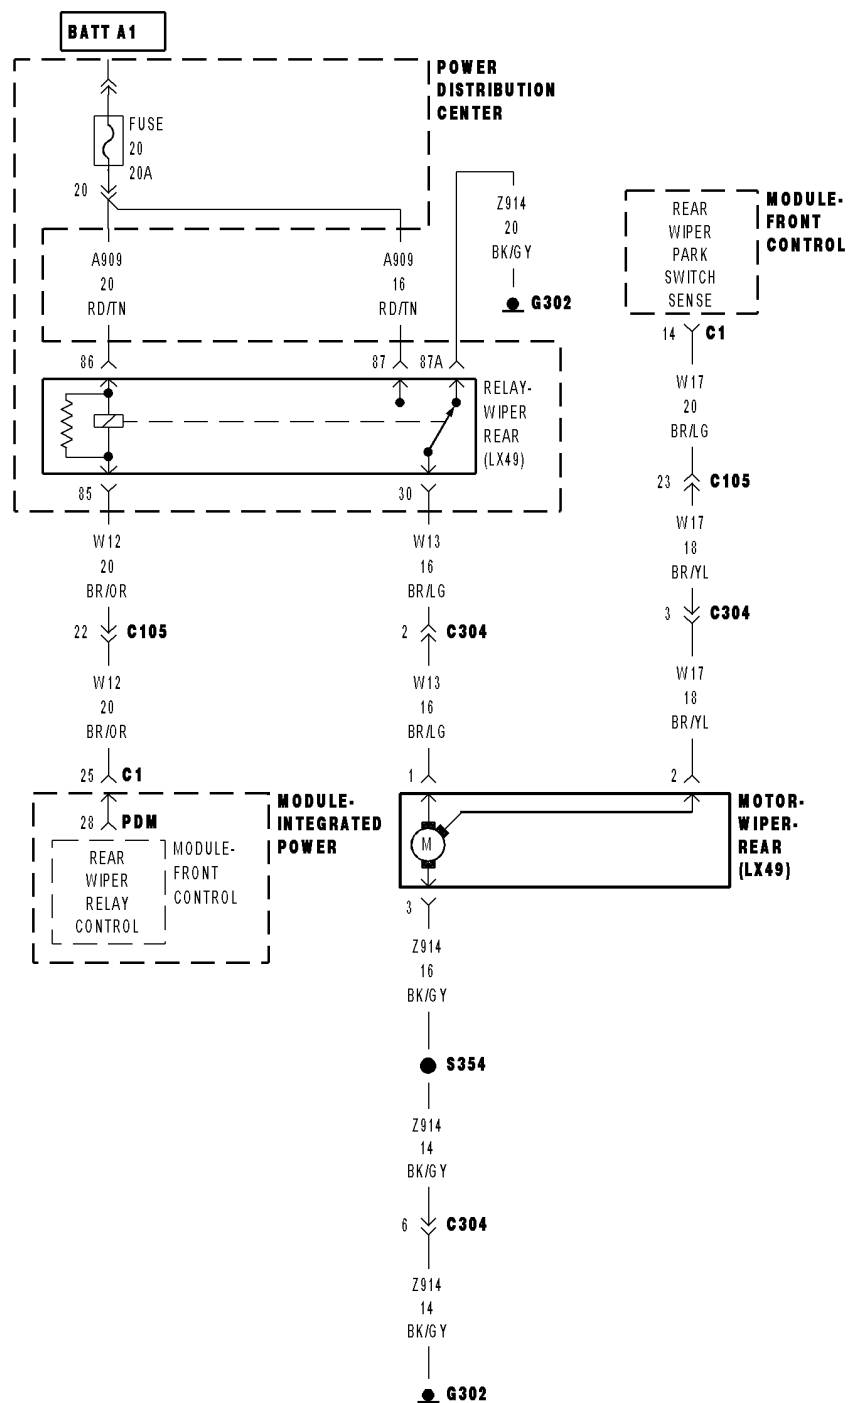

Disconnect the FCM from the PDC.

Measure the resistance between ground and the (W10) Washer Pump Motor Control circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Power Distribution Center in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**B230D-REAR WIPER PARK SWITCH INPUT CIRCUIT LOW**

**B230D-REAR WIPER PARK SWITCH INPUT CIRCUIT LOW (CONTINUED)**

For the Rear Wipers/Washers circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
WIPER/WASHER SWITCH (W17) REAR WIPER PARK SWITCH SENSE CIRCUIT LOW FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Rear Wipers on.

With the Scan Tool, read the Rear Wiper DTC's.

**Does the Scan Tool read: B230D-REAR WIPER PARK SWITCH INPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WIPER/WASHER SWITCH**

Turn the ignition off.

Disconnect the Rear Wiper/Washer Switch connector.

Measure the internal resistance of the Wiper/Washer Switch between cavity 1 and 2 of the switch.

**Is the resistance above 5.0 ohms?**

**Yes** >> Replace the Rear Wiper/Washer Switch in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B230D-REAR WIPER PARK SWITCH INPUT CIRCUIT LOW (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Rear Wiper/Washer Switch connector.

Disconnect the FCM C1 harness connector.

Measure the resistance between ground and the (W17) Rear Wiper Park Switch Sense circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (W17) Rear Wiper Park Switch Sense circuit for a short condition.

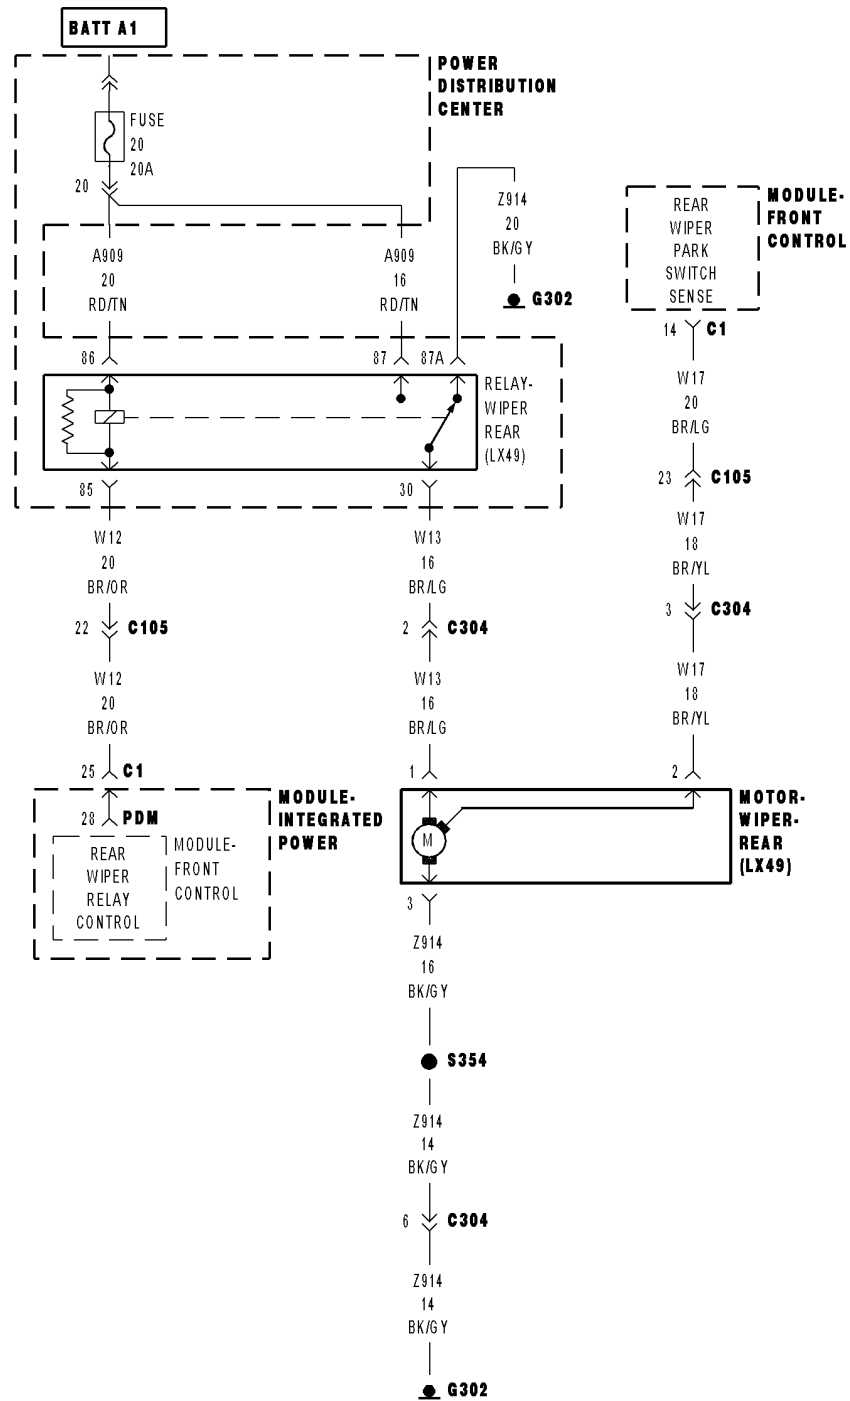

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

## B230E-REAR WIPER PARK SWITCH INPUT CIRCUIT OPEN

**B230E-REAR WIPER PARK SWITCH INPUT CIRCUIT OPEN (CONTINUED)**

For the Rear Wipers/Washers circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
WIPER/WASHER SWITCH (W17) REAR WIPER PARK SWITCH SENSE CIRCUIT HIGH FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Rear Wipers on.

With the Scan Tool, read the Rear Wiper DTC's.

**Does the Scan Tool read: B230E-REAR WIPER PARK SWITCH INPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WIPER/WASHER SWITCH**

Turn the ignition off.

Disconnect the Rear Wiper/Washer Switch connector.

Measure the internal resistance of the Wiper/Washer Switch between cavity 1 and 2 of the switch.

**Is the resistance above 5.0 ohms?**

**Yes** >> Replace the Rear Wiper/Washer Switch in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**B230E-REAR WIPER PARK SWITCH INPUT CIRCUIT OPEN (CONTINUED)****3. FRONT CONTROL MODULE**

Turn the ignition off.

Disconnect the Wiper/Washer Switch connector.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (W17) Rear Wiper Park Switch Sense circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Repair the (W17) Rear Wiper Park Switch Sense circuit for an open condition.

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Replace the Front Control Module in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

The diagram illustrates the electrical circuit for the rear wiper system. It begins with **BATT A1**, which passes through a **FUSE 20 20A** to a **POWER DISTRIBUTION CENTER**. From the PDC, a **Z914 20 BK/GY** wire leads to a **G302** ground point. The circuit then splits into two main paths:

- Module-Front Control Path:** This path includes a **REAR WIPER PARK SWITCH SENSE** connected to **C1** (pin 14, W17 20 BR/YL). This is followed by a **C105** connector (pin 23, W17 18 BR/YL) and another **C105** (pin 22, W12 20 BR/OR). The circuit then passes through a **C1** connector (pin 25, W12 20 BR/OR) to a **PDM** (pin 28, W12 20 BR/OR). The PDM is labeled as **MODULE-FRONT CONTROL** and includes **REAR WIPER RELAY CONTROL**.
- Motor-Wiper-Rear (LX49) Path:** This path starts from the PDC, passing through a **RELAY-WIPER-REAR (LX49)** and a **G302** ground point. It then goes through a **C304** connector (pin 3, W13 16 BR/LG) and another **C304** (pin 2, W13 16 BR/LG). The circuit then passes through a **S354** switch (pin 3, Z914 16 BK/GY) and another **C304** (pin 6, Z914 14 BK/GY) to a final **G302** ground point. The motor is labeled **MOTOR-WIPER-REAR (LX49)**.

At the bottom of the page, two connector diagrams are shown:

- MODULE-FRONT CONTROL PDM:** A 28-pin connector with pins 9, 29, 49 on the left and 1, 10, 30 on the right. A **BLACK** wire is connected to pin 1.
- MOTOR-WIPER-REAR (LX49):** A 30-pin connector with pins 3, 1, 30 on the left and 1, 30 on the right. A **BLACK** wire is connected to pin 1.

**B231B-REAR WIPER MOTOR CONTROL CIRCUIT LOW (CONTINUED)**

For the Rear Wipers/Washers circuit diagram (Refer to 8 - ELECTRICAL/WIPERS/WASHERS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
WIPER MOTOR MODULE POWER DISTRIBUTION (W13) REAR WIPER CONTROL CIRCUIT LOW FRONT CONTROL MODULE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all FCM DTC's.

Turn the Rear Wipers on.

With the Scan Tool, read the Rear Wiper DTC's.

**Does the Scan Tool read: B231B-REAR WIPER MOTOR CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST — VER 1.

**2. WIPER MOTOR REAR**

Turn the ignition off.

Disconnect the Rear Wiper Motor connector.

Measure the internal resistance of the Wiper Motor between cavity 1 and 2 of the Motor.

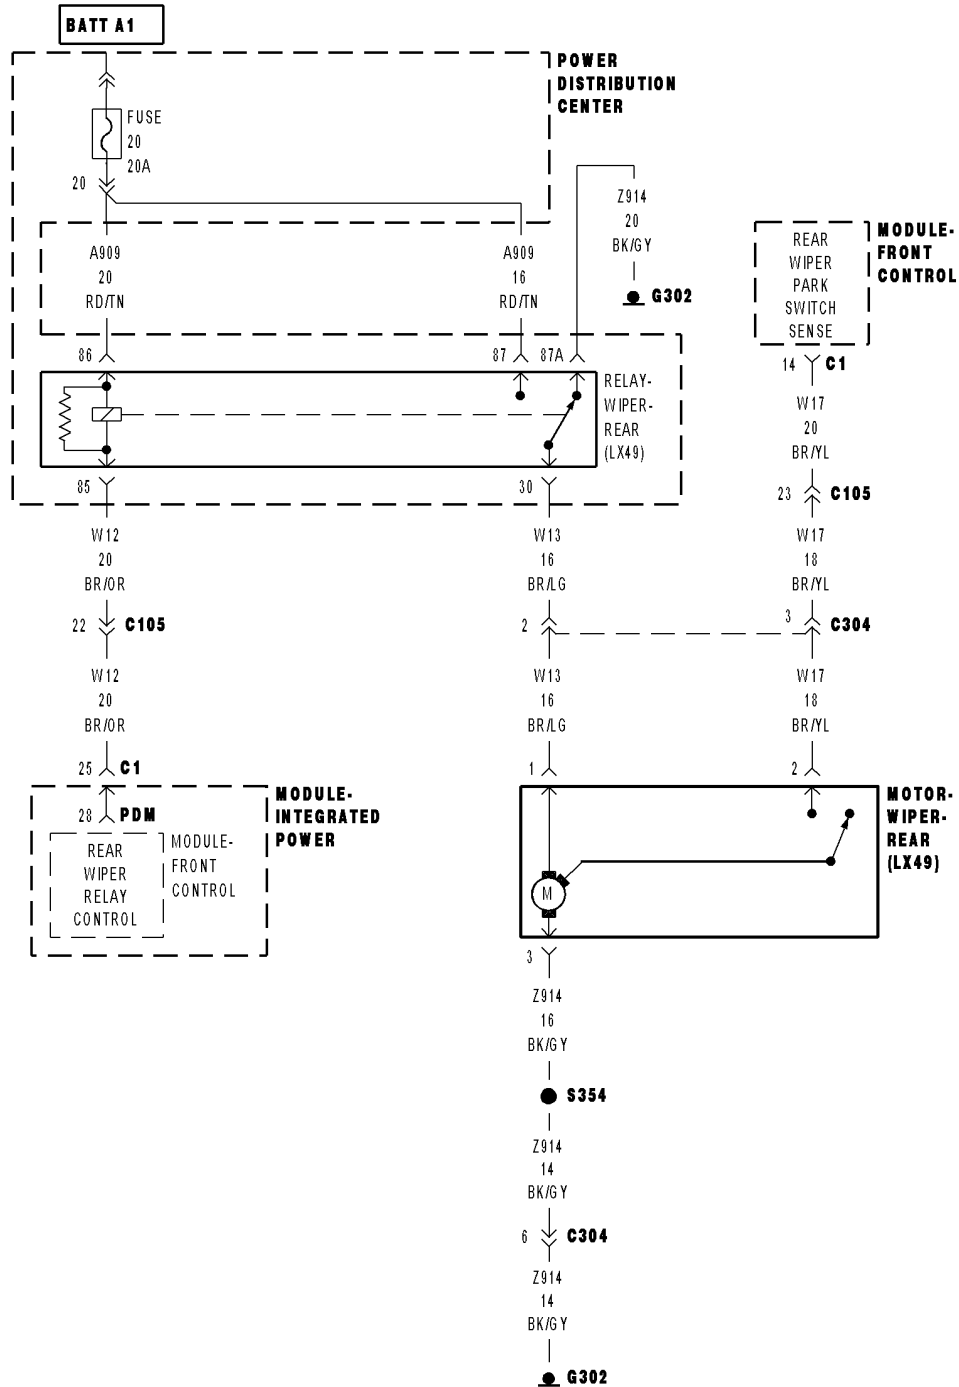

**Is the resistance above 5.0 ohms?**

**Yes** >> Replace the Rear Wiper Motor in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Go To 3

**No**      >> Replace the Front Control Module in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.

## WIPERS/WASHERS - SERVICE INFORMATION

## DESCRIPTION

## FRONT WIPER/WASHER SYSTEM

The wiper and washer system includes the following major components:

- **Front Control Module** - The Front Control Module (FCM) is integral to the Integrated Power Module (IPM). The FCM/IPM is located in the engine compartment, near the right shock tower.(Refer to 8 - ELECTRICAL/ POWER DISTRIBUTION - DESCRIPTION).
- **Front Washer Nozzle** - Two washer nozzles with integral check valves are secured to the hood panel near the base of the windshield.
- **Front Washer Plumbing** - The plumbing for the washer system consists of nylon hoses and molded plastic fittings. The plumbing is routed within the engine compartment from the washer reservoir. The front washer hose is routed across the underside of the hood panel to the washer nozzles.
- **Front Wiper Arms** - The two wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl panel located near the base of the windshield.
- **Front Wiper Blade** - The two wiper blades are secured to the two wiper arms with an integral latch, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation.
- **Front Wiper Module** - The wiper pivot shafts are the only visible components of the front wiper module. The remainder of the module is concealed within the engine compartment beneath the cowl panel. The wiper module includes a cast aluminum wiper module bracket, two rubber-isolated wiper module mounts, one dowel on the underside of the wiper motor, the wiper motor crank arm, the two wiper drive links, the two powered wiper pivots.

- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN). The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DESCRIPTION).
- **Multi-Function Switch** - The multi-function switch is located on the steering column, just behind the steering wheel. A control stalk that extends from the left side of the switch that is dedicated to providing all of the driver controls for the front wiper and washer systems, turn signal, and high and low beam functions (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/MULTI-FUNCTION SWITCH - DESCRIPTION).
- **Rain Sensor** - Vehicles equipped with the automatic wiper feature have a Rain Sensor located just below the inside rear view mirror button. The sensor bracket is bonded to the inside surface of the windshield glass.
- **Washer Fluid Level Switch** - The washer fluid level switch is located in a dedicated hole on the lower portion of the washer reservoir, ahead of the right front wheel house splash shield.
- **Washer Pump/Motor** - The reversible electric washer pump/motor is located in the lower portion of the washer reservoir, ahead of the right front wheel house splash shield. The washer pump/motor is a reversible motor (wagon only) and provides washer fluid to either the front or rear (wagon only) washer system plumbing, depending upon the direction of the pump motor rotation.
- **Washer Reservoir** - The washer reservoir is mounted just in front of the right front wheel splash shield. The filler neck is located in the right front corner of the engine compartment.
- **Wiper High/Low Relay** - The wiper high/low relay is an International Standards Organization (ISO) micro relay located in the Power Distribution Center (PDC) in the engine compartment.
- **Wiper On/Off Relay** - The wiper on/off relay is an International Standards Organization (ISO) micro relay located in the Power Distribution Center (PDC) in the engine compartment.

## HEADLAMP WASHERS

The headlamp washers on this vehicle (if equipped) work in conjunction with the windshield washers. The headlamp washers are enabled with the headlamps "ON" and the windshield washers activated. With the windshield washers activated the headlamp washers will spray once for a predetermined amount of time.

## REAR WIPER/WASHER SYSTEM - WAGON ONLY

The rear wiper and washer system includes the following major components:

- **Front Control Module** - The Front Control Module (FCM) is integral to the Integrated Power Module (IPM). The FCM/IPM is located on the side of engine compartment.(Refer to 8 - ELECTRICAL/POWER DISTRIBUTION - DESCRIPTION).
- **Instrument Panel Switch Pod** - The rear wiper/washer switch is part of the instrument panel switch pod. The pod contains the rear wipe/wash switch, the hazard switch, the passenger airbag disabled (PAD) indicator, and the electronic stability program (ESP) off switch. The instrument panel switch pod is located in the instrument panel center bezel, just above the radio and in between the A/C outlets.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN). The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DESCRIPTION).
- **Rear Washer Nozzle** - A rear washer nozzle is secured to a mounting hole in the liftgate panel
- **Rear Washer Plumbing** - The plumbing for the washer system consists of nylon hoses and molded plastic fittings. The rear washer hose is routed through the dash panel from the engine compartment into the passenger compartment, along the right side body harness, then up the c-pillar and into the liftgate.
- **Rear Wiper Arm** - The single rear wiper arm is secured by a nut directly to the rear wiper motor output shaft, which extends through the center of the liftgate outer panel near the base of the liftgate glass.
- **Rear Wiper Blade** - The single rear wiper blade is secured to the rear wiper arm with an integral latch, and is parked near the bottom of the liftgate glass when the rear wiper system is not in operation.
- **Rear Wiper Motor** - The rear wiper motor output shaft is the only visible component of the rear wiper motor. The remainder of the motor is concealed within the liftgate beneath the liftgate. The rear wiper motor includes the motor bracket, the rear wiper motor, and the rear wiper motor park switch.
- **Rear Wiper Relay** - The rear wiper relay is located in the Power Distribution Center (PDC) in the engine compartment near the battery.
- **Washer Reservoir** - The rear washer system shares a single reservoir and reversible pump with the front washer system, but has its own dedicated plumbing.

## OPERATION

### FRONT WIPER/WASHER SYSTEM

All front wiper and washer system functions are initiated with the control knob on the end of the multi-function switch control stalk that extends from the left side of the steering column, just behind the steering wheel. Rotating the control knob on the end of the control stalk, selects the Off, Intermittent, Auto (on models equipped with automatic wipers), Low, or High front wiper system operating modes. In the Intermittent mode, the control knob also allows the vehicle operator to select from one of six intermittent wipe intervals. In the Auto mode, the control knob also allows the vehicle operator to select from one of six automatic wiper sensitivity levels. Pressing in on the end of the control stalk momentarily activates the Mist Wipe. Pressing it in all the way will activate the windshield washers. In the Auto mode, as you increase the sensitivity of the wipers (less delay between wipes), the result will be a corresponding acknowledgment wipe to let you know you made an adjustment to the system. The multi-function switch provides hard wired resistor multiplexed inputs to the Steering Column Control Module (SCCM), for all of the wiper and washer system functions. The SCCM then sends electronic messages to the Front Control Module (FCM) over the Controller Area Network (CAN) data bus requesting the appropriate front wiper and washer system operating modes.

All the front wiper and washer system operation is controlled by the FCM logic circuits, and that logic will only allow these systems to operate when the ignition switch is in the Accessory or On positions. Battery current is directed from a B(+) fuse in the Integrated Power Module (IPM) to the wiper on/off relay and the wiper high/low relay in the PDC through a fused B(+) circuit. The FCM uses low side drivers to control wiper system operation by energizing or de-energizing the wiper high/low and wiper on/off relays. The FCM uses both high side and low side drivers to control the operation of the washer pump/motor unit. The multi-function switch circuitry receives a clean ground output from the SCCM on a multi-function switch return circuit, then provides resistor multiplexed inputs to the SCCM on an intermittent wipe mux circuit to indicate the selected wiper system mode and on a wash/beam select mux circuit to indicate the selected washer system mode.

### AUTOMATIC WIPE MODE

In models equipped with the automatic wiper feature, the internal circuitry of both the multi-function switch, the rain sensor, and the CCN work in concert to provide an automatic wiper mode with five sensitivity selections. When selected, this switch position will automatically operate the front wipers at the designated sensitivity setting and maintain visibility through the windshield glass at that predetermined sensitivity setting.

With automatic wipers, when the control knob on the control stalk of the multi-function switch is moved to one of the six Auto sensitivity positions, the SCCM sends an electronic message to the Rain Sensor over the Controller Area Network (CAN) data bus network indicating the selected position. The sensor monitors an area within the wipe pattern of the windshield glass for the accumulation of moisture. Based upon internal programming and the selected sensitivity level, when sufficient moisture has accumulated the rain sensor sends the appropriate electronic wipe command messages to the FCM over the CAN data bus and the FCM operates the front wiper system accordingly.

As the sensitivity level is set higher, the rain sensor is more sensitive to moisture accumulation and will send wipe commands more frequently. The SCCM logic is also programmed to provide an immediate wipe cycle each time the control knob on the multi-function switch is moved from a non-automatic wipe position to one of the six Auto sensitivity positions, and another immediate wipe cycle each time the control knob is moved from a lower Auto sensitivity position to a higher Auto sensitivity position.

### CONTINUOUS WIPE MODE

When the Low position of the control knob on the control stalk of the multi-function switch is selected, the SCCM sends an electronic wiper switch low message to the FCM, then the FCM energizes the wiper on/off relay. This directs battery current through the normally open contacts of the energized wiper on/off relay and the normally closed contacts of the de-energized wiper high/low relay to the low speed brush of the wiper motor, causing the wipers to cycle at low speed.

When the High position of the control knob is selected, the SCCM sends an electronic wiper switch high message to the FCM, then the FCM energizes both the wiper on/off relay and the wiper high/low relay. This directs battery current through the normally open contacts of the energized wiper on/off relay and the normally open contacts of the energized wiper high/low relay to the high speed brush of the wiper motor, causing the wipers to cycle at high speed.

When the Off position of the multi-function switch control knob is selected, the SCCM sends an electronic wiper switch off message to the FCM. If the wiper motor was operating at high speed, the FCM immediately de-energizes the wiper high/low relay causing the wiper motor to return to low speed operation. Then one of two events will occur. The event that occurs depends upon the position of the wiper blades on the windshield at the moment that the control knob Off position is selected.

If the wiper blades are in the down position on the windshield when the Off position is selected, the park switch that is integral to the wiper motor is closed to ground and provides a hard wired park switch sense input to the FCM. The FCM then de-energizes the wiper on/off relay and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the Off position is selected, the park switch is an open circuit and the FCM keeps the wiper on/off relay energized, which causes the wiper motor to continue running at low speed until the wiper blades are in the down position on the windshield and the park switch input to the FCM is again closed to ground.

### HEADLAMPS ON WITH WIPERS MODE

The CCN provides an automatic headlamps on with wipers feature for models equipped automatic headlamps. This is a customer programmable feature. If this feature is enabled, the headlamps will turn on automatically whenever the windshield wipers are turned on; and, if the headlamps were turned on automatically when the wipers were turned on, they will also turn off automatically when the wipers are turned off. If this feature is enabled, when the automatic wiper mode is selected the headlamps will turn on automatically only after the wipers complete a minimum of five automatic wipe cycles within about sixty seconds, and they will turn off automatically after four minutes elapse without any wipe cycles.

### INTERMITTENT WIPE MODE

When the control knob on the control stalk of the multi-function switch is moved to one of the Intermittent interval positions the SCCM sends an electronic wiper switch delay message to the FCM, then the FCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input. The FCM monitors the changing state of the wiper motor park switch through a hard wired park switch sense input. This input allows the FCM to determine the proper intervals at which to energize and de-energize the wiper on/off relay to operate the wiper motor intermittently for one low speed cycle at a time.

The FCM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature the FCM monitors electronic vehicle speed messages from the Powertrain Control Module (PCM) and doubles the selected delay interval whenever the vehicle speed is approximately sixteen kilometers-per-hour (ten miles-per-hour) or less.

### PULSE WIPE MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary pulse wipe position for less than about one-half second, the SCCM sends an electronic switch message to the FCM, then the FCM energizes the wiper on/off relay for one complete wipe cycle. The FCM de-energizes the relay when the state of the park switch sense changes to ground, parking the wiper blades near the base of the windshield.

### WASH MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary Wash position for more than about one-half second, the SCCM sends an electronic washer switch message to the FCM, then the FCM directs battery current and ground to the washer pump/motor unit. This will cause the washer pump/motor unit to be energized for as long as the Wash switch is held closed up to about ten seconds, and to de-energize when the front Wash switch is released.

When the control knob is depressed to the momentary Wash position while the wiper system is operating in one of the intermittent interval positions, the washer pump/motor operation is the same. However, the FCM also energizes the wiper on/off relay to override the selected delay interval and operate the wiper motor in a continuous low speed mode for as long as the control knob is held depressed, then de-energizes the relay and reverts to the selected

delay mode interval several wipe cycles after the control knob is released. If the control knob is held depressed for more than about ten seconds, the FCM will suspend washer pump/motor operation until the knob is released. then cycled back to the Wash position if so desired.

The headlamp washer system (if equipped) utilizes a separate high pressure pump that is attached to the windshield washer reservoir. The headlamp washer pump feeds nozzles that are mounted in the front fascia of the vehicle. The nozzle bodies spray the headlamps with high pressure washer solvent when the system is activated.

To activate the headlamp washers, turn ON the headlamps and then press the windshield washer control knob. This will operate the windshield washers and direct two timed high pressure sprays onto the headlamp lens.

### WIPE-AFTER-WASH MODE

When the control knob on the control stalk of the multi-function switch is depressed to the momentary Wash position for more than about one-half second while the wiper system is not operating, the instrument cluster sends an electronic washer switch message to the FCM, then the FCM directs battery current and ground to the washer pump/motor unit and energizes the wiper on/off relay. This will cause the washer pump/motor unit to be energized and operate the wiper motor in a continuous low speed mode for as long as the Wash switch is held closed up to about ten seconds. When the control knob is released, the FCM de-energizes the washer pump/motor unit, but allows the wiper motor to operate for several additional wipe cycles before it de-energizes the wiper on/off relay and parks the wiper blades near the base of the windshield.

If the control knob is held depressed for more than about thirty seconds, the FCM will suspend washer pump/motor operation until the knob is released, then cycled back to the Wash position; however, the wipers will continue to operate for as long as the Wash switch is held closed. The FCM monitors the changing state of the wiper motor park switch through a hard wired wiper park switch sense circuit input. This input allows the FCM to count the number of wipe cycles that occur after the Wash switch is released, and to determine the proper interval at which to de-energize the wiper on/off relay to complete the wipe-after-wash mode cycle.

### REAR WIPER/WASHER SYSTEM - WAGON ONLY

All rear wiper and washer system functions are initiated with the rear wiper and washer switch in the instrument panel switch pod located on the instrument panel center bezel, just above the radio and below the a/c outlets (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - REMOVAL). Pushing the left side of the wiper/washer switch selects the rear wiper system operating mode (intermittent). it has fixed 10 seconds delay between wipe (not adjustable). indicator at bottom of the WIPE graphic will light up when the wipe switch is ON and goes away when the wipe is OFF. Depressing the momentary contact switch activates the rear washer system. When a rear wiper or washer mode is selected, the circuitry within the instrument panel switch pod sends an electronic rear wiper/washer switch status message over the Controller Area Network (CAN) data bus to the ElectroMechanical Instrument Cluster (EMIC) also referred to as the Cab Compartment Node (CCN). The CCN then sends electronic messages to the Front Control Module (FCM) over the CAN data bus requesting the appropriate rear wiper and washer system operating modes.

### INTERMITTENT WIPE MODE

When the rear wiper switch is pressed to the left, the instrument cluster sends an electronic wiper switch message to the FCM, then the FCM electronic wipe logic circuit responds by selecting a predetermined length of time between wiper sweeps.

### WASH MODE

When the rear washer control switch is depressed to the right in the momentary Wash position, the instrument cluster sends an electronic washer switch message to the FCM, then the FCM directs battery current and ground to the washer pump/motor. This will cause the washer pump/motor to be energized for as long as the Wash switch is held closed up to about ten seconds, and to de-energize when the rear wiper/washer switch is released.

## WIPE-AFTER-WASH MODE

When the rear washer switch is released from the momentary Wash position, the instrument cluster sends an electronic washer switch message to the FCM. The FCM de-energizes the washer pump/motor, but allows the rear wiper motor to operate for several wipe cycles before it de-energizes the rear wiper relay.

## OFF MODE

When the Off position of the rear wiper switch is selected, one of three events is possible. The event that will occur depends upon the position of the wiper blade on the liftgate glass and the mode the wiper motor is operating under at the moment that the Off position is selected. If the wiper blade is in the down position on the glass and the rear wiper system is operating in the intermittent cycle mode when the Off position is selected, the park switch is open and the FCM de-energizes the rear wiper relay control coil causing the rear wiper motor to cease to operate.

If the wiper blade is not in the down position on the glass and is operating in the intermittent cycle mode when the Off position is selected, the park switch is closed to ground and the FCM keeps the rear wiper relay control coil energized to operate the rear wiper motor until the rear wiper blade is in the down position on the glass and the park switch input is an open circuit.

The third event occurs with the rear wiper operating in the wipe-after-wash mode when the Off position is selected, in which case the FCM will continue to run the wiper motor until the completion of two wipes after wash before the rear wiper blade is parked. The FCM will also run the rear wiper motor to park the rear wiper blade if the ignition switch is turned to the Off position while the rear wiper system is still operating.

## CHECK VALVE

### REMOVAL

The rear washer check valve is located on the lower liftgate.

1. Disconnect and isolate the battery negative cable.
2. Remove the lower liftgate trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
3. Remove check valve by twisting washer hose at each end.

## INSTALLATION

1. Insert check valve into washer hose.
2. Install lower liftgate trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).
3. Connect battery negative cable.

## FRONT WIPER MODULE

### DESCRIPTION

The front wiper module is secured with screws through two rubber grommet-type insulators to the cowl plenum panel. The module is located in the rear of the engine compartment where it is concealed beneath the molded plastic cowl plenum grille panel. The ends of the pivot shafts protruding through openings in the cowl plenum cover/grille panel are the only visible components of the wiper module. The wiper module consists of the following major components:

- **Crank Arm** - The wiper motor crank arm is a stamped steel unit with an internally splined hole on the driven end that is secured to the wiper motor output shaft with a nut, and a long ball stud secured to the drive end to accept the wiper linkage.
- **Linkage** - The two wiper linkage members are each constructed of stamped steel. A driver side drive link with a plastic socket-type bushing in the left end, and a plastic sleeve-type bushing in the right end. The socket bushing is snap-fit over the pivot ball stud on the left pivot lever arm, while the sleeve bushing is fit over the longer pivot stud on the wiper motor crank arm. The passenger side drive link has a plastic socket-type bushing on each end. One end of this drive link is snap-fit over the ball stud on the right pivot lever arm, while the other end is snap-fit over the top of the driver side drive link on the ball stud of the wiper motor crank arm.
- **Motor** - The wiper motor is secured on the underside of the module bracket near the center with three screws. The wiper motor output shaft passes through a hole in the module bracket, where a nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal Positive Temperature Coefficient (PTC) circuit breaker.
- **Pivots** - This module features two pivots. The two wiper pivot shafts have lever arms with ball studs at their base to accept the wiper linkage. The upper end of all three pivot shafts has a threaded stud with a tapered and serrated area just below the threads to accept the left wiper arm or the right wiper arm links.

The front wiper module cannot be adjusted or repaired. The front wiper motor is available for separate service replacement. If any other component of the module is inoperative or damaged, the entire front wiper module unit must be replaced.

## OPERATION

The front wiper module operation is controlled by the battery current inputs received by the wiper motor through the wiper on/off and wiper high/low relays. The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately opens and closes the wiper park switch sense circuit to ground, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned Off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members, and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the wiper arms (1) and (2) (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

3. Remove the cowl panel (1) (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).

4. Disconnect the wiper motor electrical connector (1).

5. Remove the two retaining bolts (1 and 4) and remove wiper module (3) from vehicle.

## INSTALLATION

1. Inspect the grommet (1) that the wiper motor sits in. If cracked, brittle, or damaged, replace the grommet (1).

2. While positioning the wiper module in its mounting location, make sure that the dowel on the bottom of the wiper motor (1) slides into the mounting grommet (2) correctly.

3. Install the two retaining bolts (1 and 4). Torque bolts to 8 N·m (70 in. lbs.).

4. Connect the wiper motor electrical connector (1).

5. Install the cowl panel (1) (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - INSTALLATION).

6. Install the wiper arms (1) and (2) (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION). Torque nuts to 18 N·m (150 in. lbs.).
7. Connect the battery negative cable.

## FRONT WIPER MOTOR

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the front wiper module (3) (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).

3. With front wiper module on bench or in vise, remove the one nut attaching the bellcrank to the motor shaft.

4. Using a flat bladed tool, carefully pry the bellcrank from the wiper motor shaft.

5. Separate the bellcrank from the wiper motor shaft.

6. Remove the two motor mounting bolts (1).

**Note:** When separating the motor from the linkage, there are two pocket nuts that may fall out. Take care to keep these and reinstall them during installation.

7. Separate the wiper motor from the wiper module/linkage.

## INSTALLATION

1. Ensure that the shaft seal (3) is on the new motor shaft. If necessary, transfer the one on the old motor. If transferred, make sure the seal is in good shape (not brittle, free from cracks, and not damaged).

2. Ensure that the pocket nuts (1) are in place in the motor before assembly.

3. If needed to install pocket nut (1), align the nut with the pocket.

4. Drop nut (1) into pocket.

5. Place wiper motor in its mounting location making sure that the pocket nuts are in place.

6. Install and tighten the mounting bolts (1).

7. Position the bellcrank on the wiper motor shaft.

8. Align the bellcrank with the linkage arms.

9. Install and tighten the nut to the bellcrank.

10. Install the front wiper module (3) (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).

11. Connect the battery negative cable.

## HEADLAMP WASHER

### DESCRIPTION

The headlamp washers work in conjunction with the windshield washers. The headlamp washers are enabled with the headlamps "ON" and the front windshield washers activated. With the windshield washers activated the headlamp washers will spray twice for a predetermined amount of time.

## OPERATION

The headlamp washer system utilizes a separate high pressure pump that is attached to the windshield washer reservoir. The headlamp washer pump feeds nozzles that are mounted in the front fascia of the vehicle. The nozzles are aimed in front of the headlamp assembly. These nozzles spray the headlamps when the system is activated.

To activate the headlamp washers, turn ON the headlamps and then press the front windshield washer control knob. This will operate the windshield washers and direct one, timed high pressure sprays onto the headlamp lens.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Loosen front fascia as necessary on the side to be removed (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
3. Disconnect washer hose (2) from headlamp washer.
4. Remove headlamp washer from front fascia (1).

## INSTALLATION

1. Install headlamp washer to front fascia (1).
2. Attach washer hose (3) to headlamp washer.
3. Install front fascia (1) (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
4. Connect battery negative cable.

## HEADLAMP WASHER HOSE

### REMOVAL

The headlamp washer hose (2) is a special high pressure hose with specific fittings (3), and must be replaced as a unit.

1. Disconnect and isolate the battery negative cable.
2. Loosen up the fascia (1) on the side of the vehicle in which hose needs replacing (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
3. When disconnecting hose (2) , press down firmly on latch at headlamp washer pump motor and washer assembly (3) and pull apart.

### INSTALLATION

The headlamp washer hose is a special high pressure hose with specific fittings, and must be replaced as a unit.

1. Install the new high pressure headlamp washer hose (2) assembly. Push fitting (3) on until a snap is heard.
2. Install the fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
3. Connect the battery negative cable.

## HEADLAMP WASHER PUMP MOTOR

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.
3. Remove the washer reservoir (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).
4. Disconnect the high pressure headlamp washer pump hose by pressing down firmly on latch and pulling hose off.
5. Disconnect the high pressure headlamp washer pump motor electrical connector (1).
6. Remove pump from reservoir by pulling pump up and away from reservoir cavity and out of mounting grommet. Do not damage reservoir/pump sealing surface or puncture reservoir during removal.
7. Remove pump grommet and discard.

### INSTALLATION

1. Use new grommet when installing a new pump assembly.
2. Assure that the pump is aligned to and fully seated in the reservoir cavity.
3. Install the washer reservoir (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).
4. Connect the electrical harness connectors to the washer pump motors and the fluid level sensor.
5. Connect the high pressure headlamp washer hose by firmly pushing hose onto inlet until a snap is heard.
6. Refill the reservoir with fluid drained previously.
7. Connect the battery negative cable.

## SENSOR-RAIN

### DESCRIPTION

The Rain Sensor is the primary component of the automatic wiper system.

The rain sensor is located on the inside of the windshield, just below the rear view mirror mounting button (1).

Sliding cam locks (6) on each side of the top sides of the sensor (either side of the connector) secures the sensor to the mounting bracket (9) that is bonded (1) to the windshield glass. A small screwdriver can be used to push in the tabs until the slider protrudes from the opposing side of the sensor case (5). Concealed within the sensor housing (5) is the electronic circuitry (7) of the module, which includes four Infrared diodes, four photocells, and a microprocessor.

The rain sensor software is Flash compatible, which means it can be reprogrammed using Flash reprogramming procedures. However, if any of the hardware of the sensor is damaged or faulty, the entire rain sensor must be replaced. The rain sensor bracket (9) is serviced as a unit with the windshield glass. If the bracket is faulty, damaged, or separated from the windshield glass, the windshield must be replaced.

813ef54b

## OPERATION

The microprocessor-based Rain Sensor senses moisture in the wipe pattern (1) on the outside of the windshield glass and sends wipe commands to the Front Control Module (FCM). Four Infrared diodes within the sensor generate infrared light beams that are aimed by four of the convex optical lenses near the base of the sensor through the windshield glass. Four additional convex optical lenses near the top of the sensor are focused on the infrared light beams on the outside of the windshield glass and allow the four photocells within the sensor to sense changes in the intensity of these infrared light beams. When sufficient moisture accumulates within the wipe pattern (1) of the windshield glass, the sensor detects a change in the monitored infrared light beam intensity.

The internal programming of the sensor then sends the appropriate electronic wipe command messages to the FCM over the Controller Area Network (CAN) data bus. The FCM responds by activating or deactivating the front wiper system. The CCN sends electronic sensitivity level messages to the rain sensor over the CAN data bus based upon the driver-selected sensitivity setting of the control knob on the control stalk of the multi-function switch. The higher the selected sensitivity setting the more sensitive the rain sensor is to the accumulated moisture on the windshield glass, and the more frequently the sensor will send wipe commands to the FCM to operate the front wiper system.

The rain sensor operates on battery current received through a fuse in the Power Distribution Center (PDC) on a fused B+ circuit. The rain sensor receives ground at all times through the body wire harness. It is important to note that the default condition of the automatic wiper system is low. Therefore, if no message is received by the FCM from the rain sensor for more than about five seconds when in the Auto sensitivity wipe mode, the wipers will default to a constant low wipe state.

The rain sensor ground and battery current inputs may be diagnosed using conventional diagnostic tools and methods. The most reliable, efficient, and accurate means to diagnose the rain sensor requires the use of a scan tool and the appropriate diagnostic information.

813f05ae

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Disconnect the electrical connector.
3. Using a small screwdriver or equivalent, from the top (connector side) push in the tabs until the slider protrudes from the opposing (bottom) side of the sensor case.
4. Gently pull each slider (1) slightly more until the cam lock releases the sensor.

## INSTALLATION

1. Make sure that the slider locks are positioned correctly in the downward position, sticking out of the side opposite the connector.
2. Position the rain sensor below the inside rear view mirror, over the bracket and gently push down to seat it on the bracket.
3. Push the slider cam locks (1) inward until they are flush with the side of the sensor case.
4. Connect the wire harness connector to the sensor.
5. Connect the battery negative cable.

## REAR WIPER MOTOR - WAGON ONLY

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the rear wiper arm (3) (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).

3. Remove the liftgate trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).

4. Remove the three mounting fasteners (1).

5. Disconnect the electrical harness connector (5).  
6. Separate the wiper motor (3) from the liftgate.

7. Inspect the wiper motor shaft to liftgate seal (1).

## INSTALLATION

1. Inspect the shaft-to-liftgate seal (1) in liftgate.

2. If seal is damaged, brittle, or deformed in any way replace. Position shaft seal (1) with the arrow in the UP position.

3. Position wiper motor (3) in liftgate.

4. Install the mounting nuts (1). Torque nuts to 8 N·m (70 in. lbs).

5. Connect the electrical harness connector (5).

6. Install lower liftgate trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).

7. Install the rear wiper arm (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION). Torque nut to 18 N·m (13 ft. lbs.).

8. Connect the battery negative cable.

## WASHER FLUID LEVEL SWITCH

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.
3. Remove the washer reservoir (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).

4. Remove the washer fluid level switch by pulling out of reservoir. Inspect the grommet and if installing a new switch, always use a new grommet.

## INSTALLATION

1. Inspect grommet and if installing new switch, use a new grommet. Position the switch into opening and firmly press into place.

2. Install the washer reservoir (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).
3. Refill the reservoir with fluid drained previously.
4. Connect the battery negative cable.

## WASHER PUMP MOTOR

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Drain washer fluid from the reservoir and into a suitable clean container. This can be done by disconnecting the windshield washer hose from the front (outboard) washer pump and allowing the washer fluid to drain into a container through a temporary jumper hose connected to the front washer pump.
3. Remove the washer reservoir (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - REMOVAL).

4. Remove the washer pump motor by pulling out of reservoir. Inspect the grommet and if installing a new motor, always use a new grommet.

## INSTALLATION

1. Inspect grommet and if installing new motor, use a new grommet. Position the motor into opening and firmly press into place.

2. Install the washer reservoir (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WASHER RESERVOIR - INSTALLATION).
3. Refill the reservoir with fluid drained previously.
4. Connect the battery negative cable.

## WASHER RESERVOIR

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia (4) (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
3. Disconnect electrical harness connectors (1 and 3) from reservoir.
4. Disconnect hose from reservoir (2) and drain fluid into container.

5. Remove the rear mounting fastener (2).

6. Remove the remaining fasteners (1).

7. Remove the reservoir (4) from the vehicle.

## INSTALLATION

1. Position reservoir (4) in vehicle.

2. Install mounting fasteners (1). Torque fasteners to 7 N·m (62 in. lbs).

3. Install rear mounting fastener (2). Torque fastener to 7 N·m (62 in. lbs).

4. Connect electrical harness connectors (1 and 3) and hoses (2) to reservoir.

5. Install front fascia (4) (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
6. Connect the battery negative cable.
7. Fill reservoir.

## WIPER ARMS

### REMOVAL

#### FRONT WIPER ARM

1. Remove the nut caps (3).
2. Remove the retaining nuts (4).

3. Using a suitable two jaw puller (5), separate the wiper arm (7) from the wiper pivot.

4. Remove the wiper arms (1 and 2).

## REAR WIPER ARM - WAGON

1. Remove the nut cap (2).
2. Remove the retaining nut (1).
3. Gently rock the wiper arm from side to side to loosen it from the shaft.
4. Remove the wiper arm (3).

## INSTALLATION

### FRONT WIPER ARM

1. Install wiper arms (1) on wiper arm pivots.
2. Install retaining nuts (4). Torque nuts to 18 N·m (13 ft. lbs.).
3. Install nut caps (3).

### REAR WIPER ARM - WAGON

1. Install wiper arm (3).
2. Install retaining nut (1). Torque nut to 18 N·m (13 ft. lbs.).
3. install nut cap (2).

NAVIGATION/TELECOMMUNICATION - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

## B1411-HFM LEFT AUDIO OUTPUT CIRCUIT LOW

**B1411-HFM LEFT AUDIO OUTPUT CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Hands Free Module detects low voltage on the (X703) Left Audio Output circuit.

Possible Causes
(X703) LEFT AUDIO OUTPUT CIRCUIT OPEN (X703) LEFT AUDIO OUTPUT CIRCUIT SHORT TO GROUND (X795) COMMON AUDIO OUTPUT CIRCUIT OPEN (X703) LEFT AUDIO OUTPUT CIRCUIT SHORT TO (X795) COMMON AUDIO OUTPUT CIRCUIT HANDS FREE MODULE

**Diagnostic Test**

**1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.  
Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.  
With the scan tool, read the active DTC's.

- Does the scan tool display this DTC as active?**
- Yes**    >> Go To 2
- No**    >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
-

**B1411-HFM LEFT AUDIO OUTPUT CIRCUIT LOW (CONTINUED)****2. (X703) LEFT AUDIO OUTPUT CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C1 harness connector.

Measure the resistance of the (X703) Left Audio Output circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X703) Left Audio Output circuit for an open  
Perform BODY VERIFICATION TEST – VER 1. (Refer to  
BODY VERIFICATION TEST – VER 1).

**3. (X703) LEFT AUDIO OUTPUT CIRCUIT SHORT TO GROUND**

Measure the resistance between ground and the (X703) Left Audio Output circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (X703) Left Audio Output circuit for short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to  
BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**B1411-HFM LEFT AUDIO OUTPUT CIRCUIT LOW (CONTINUED)****4. (X795) COMMON AUDIO OUTPUT CIRCUIT OPEN**

Measure the resistance of the (X795) Common Audio Output circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (X795) Common Audio Output circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**5. (X703) LEFT AUDIO OUTPUT CIRCUIT SHORT TO (X795) COMMON AUDIO OUTPUT CIRCUIT**

Measure the resistance between the (X703) Left Audio Output circuit and the (X795) Common Audio Output circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (X703) Left Audio Output circuit for a short to the (X795) Common Audio Output circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B1412-HFM LEFT AUDIO OUTPUT CIRCUIT HIGH

**B1412-HFM LEFT AUDIO OUTPUT CIRCUIT HIGH (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Hands Free Module detects high voltage on the (X703) Left Audio Output circuit.

Possible Causes
(X703) LEFT AUDIO OUTPUT CIRCUIT OPEN
(X795) COMMON AUDIO OUTPUT CIRCUIT OPEN
(X703) LEFT AUDIO OUTPUT CIRCUIT SHORT TO VOLTAGE
HANDS FREE MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**2. (X703) LEFT AUDIO OUTPUT CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Disconnect the Radio C1 harness connector.

Measure the resistance of the (X703) Left Audio Output circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X703) Left Audio Output circuit for an open  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B1412-HFM LEFT AUDIO OUTPUT CIRCUIT HIGH (CONTINUED)****3. (X795) COMMON AUDIO OUTPUT CIRCUIT OPEN**

Measure the resistance of the (X795) Common Audio Output circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X795) Common Audio Output circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (X703) LEFT AUDIO OUTPUT CIRCUIT SHORT TO VOLTAGE**

Turn the ignition on.

Measure the voltage of the (X703) Left Audio Output circuit.

**Is the voltage above 1.0 volts?**

**Yes** >> Repair the (X703) Left Audio Output circuit for a short to voltage.

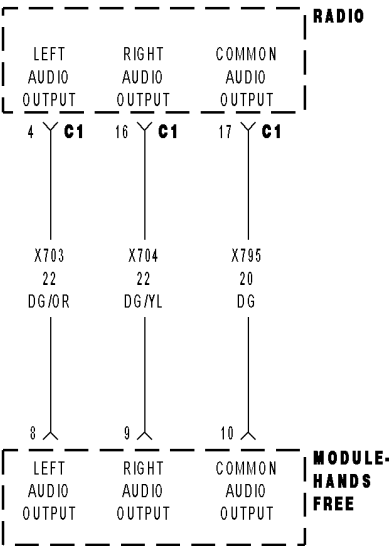

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Hands Free Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B1415-HFM RIGHT AUDIO OUTPUT CIRCUIT LOW

**B1415-HFM RIGHT AUDIO OUTPUT CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Hands Free Module detects low voltage on the (X704) Right Audio Output circuit.

Possible Causes
(X704) RIGHT AUDIO OUTPUT CIRCUIT OPEN (X704) RIGHT AUDIO OUTPUT CIRCUIT SHORT TO GROUND (X795) COMMON AUDIO OUTPUT CIRCUIT OPEN (X704) RIGHT AUDIO OUTPUT CIRCUIT SHORT TO (X795) COMMON AUDIO OUTPUT CIRCUIT HANDS FREE MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**B1415-HFM RIGHT AUDIO OUTPUT CIRCUIT LOW (CONTINUED)****2. (X704) RIGHT AUDIO OUTPUT CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

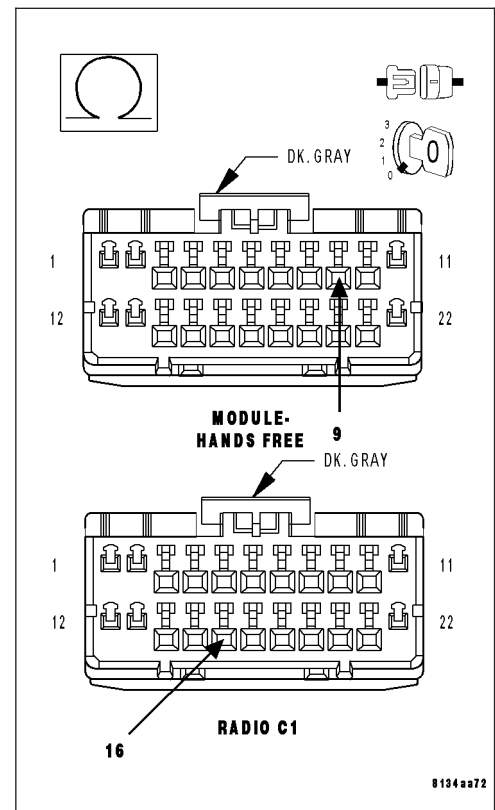

Disconnect the Radio C1 harness connector.

Measure the resistance of the (X704) Right Audio Output circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (X704) Right Audio Output circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**3. (X704) RIGHT AUDIO OUTPUT CIRCUIT SHORT TO GROUND**

Measure the resistance between ground and the (X704) Right Audio Output circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (X704) Right Audio Output circuit for short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**B1415-HFM RIGHT AUDIO OUTPUT CIRCUIT LOW (CONTINUED)****4. (X795) COMMON AUDIO OUTPUT CIRCUIT OPEN**

Measure the resistance of the (X795) Common Audio Output circuit between the HFM connector and the radio connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (X795) Common Audio Output circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**5. (X704) RIGHT AUDIO OUTPUT CIRCUIT SHORT TO (X795) COMMON AUDIO OUTPUT CIRCUIT**

Measure the resistance between the (X704) Right Audio Output circuit and the (X795) Common Audio Output circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (X704) Right Audio Output circuit for a short to the (X795) Common Audio Output circuit.
