### BODY CODE PLATE

#### DESCRIPTION

#### LOCATION AND DECODING

The Body Code Plate is located in the engine compartment on the front right side shock tower mounting front panel.

### BODY CODE PLATE LINE 3

There are seven lines of information on the body code plate. Lines 4, 5, 6, and 7 are not used to define service information. Information reads from left to right, starting with line 3 in the center of the plate to line 1 at the bottom of the plate.

#### DIGITS 1, 2, AND 3

Paint procedure

#### DIGIT 4

Open Space

#### DIGITS 5 THROUGH 7

Primary Paint

#### DIGIT 8 AND 9

Open Space

#### DIGITS 10 THROUGH 12

Secondary Paint

#### DIGIT 13 AND 14

Open Space

#### DIGITS 15 THROUGH 18

Interior Trim Code

#### DIGIT 19

Open Space

#### DIGITS 20, 21, AND 22

Engine Code

- EER = 2.7 L, Six Cylinder, 24 Valve, DOHC, Gasoline, Aluminum Block (MPI)
- EGG = 3.5 L, Six Cylinder, 24 Valve, SOHC, High Output, Gasoline, Aluminum Block (MPI)
- EZB = 5.7 L, V-8 Cylinder, HEMI, Multi-Displacement, Gasoline,

#### DIGIT 23

Open Space

**BODY CODE PLATE – LINE 2****DIGITS 1 THROUGH 12**

Vehicle Order Number

**DIGITS 13, THROUGH 15**

Vinyl Roof Code

**DIGITS 16 AND 17**

Open space

**DIGITS 18 AND 19**

Vehicle Shell Line

- LX

**DIGITS 20**

Carline

- C = Chrysler
- D = Dodge

**DIGIT 21**

Price Class

- E = Economy
- H = High Line
- L = Low Line
- M = Medium
- P = Premium
- S = Sport
- X = Special

**DIGITS 22 AND 23**

Body Type

- 48 = Four Door Sedan Tall
- 49 = Hatchback Tall

**BODY CODE PLATE LINE 1****DIGITS 1, 2, AND 3**

Transaxle Codes

- DG6 = 4-Speed Electronic Automatic Transaxle
- DGJ = 5-Speed Automatic Transaxle

**DIGIT 4**

Open Space

**DIGIT 5**

Market Code

- C = Canada
- B = International
- M = Mexico
- U = United States

**DIGIT 6**

Open Space

**DIGITS 7 THROUGH 23**

Vehicle Identification Number

- (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE IDENTIFICATION NUMBER - DESCRIPTION) for proper breakdown of VIN code.

**IF TWO BODY CODE PLATES ARE REQUIRED**

The last code shown on either plate will be followed by END. When two plates are required, the last code space on the first plate will indicate (CTD)

When a second plate is required, the first four spaces of each line will not be used due to overlap of the plates.

The SAE bolt strength grades range from grade 2 to grade 8. The higher the grade number, the greater the bolt strength. Identification is determined by the line marks on the top of each bolt head. The actual bolt strength grade corresponds to the number of line marks plus 2. The most commonly used metric bolt strength classes are 9.8 and 10.9. The metric strength class identification number is imprinted on the head of the bolt. The higher the class number, the greater the bolt strength. Some metric nuts are imprinted with a single-digit strength class on the nut face. Refer to the Fastener Identification and Fastener Strength Charts.

# HOW TO DETERMINE BOLT STRENGTH

	Mark	Class		Mark	Class
Hexagon head bolt	<div>  <p>Bolt head No.</p> <p>4 — 4T</p> <p>5 — 5T</p> <p>6 — 6T</p> <p>7 — 7T</p> <p>8 — 8T</p> <p>9 — 9T</p> <p>10 — 10T</p> <p>11 — 11T</p> </div>		Stud bolt	<div>  <p>No mark</p> <p>4T</p> </div>	
	<div>  <p>No mark</p> <p>4T</p> </div>				
Hexagon flange bolt w/washer hexagon bolt	<div>  <p>No mark</p> <p>4T</p> </div>		Welded bolt	<div>  <p>Grooved</p> <p>6T</p> </div>	
Hexagon head bolt	<div>  <p>Two protruding lines</p> <p>5T</p> </div>				
Hexagon flange bolt w/washer hexagon bolt	<div>  <p>Two protruding lines</p> <p>6T</p> </div>		Welded bolt		
Hexagon head bolt	<div>  <p>Three protruding lines</p> <p>7T</p> </div>			<div>  <p>4T</p> </div>	
Hexagon head bolt	<div>  <p>Four protruding lines</p> <p>8T</p> </div>				

## FASTENER USAGE

### DESCRIPTION

### FASTENER USAGE

**WARNING: USE OF AN INCORRECT FASTENER MAY RESULT IN COMPONENT DAMAGE OR PERSONAL INJURY.**

Fasteners and torque specifications references in this Service Manual are identified in metric and SAE format.

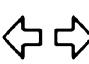

During any maintenance or repair procedures, it is important to salvage all fasteners (nuts, bolts, etc.) for reassembly. If the fastener is not salvageable, a fastener of equivalent specification must be used.

### THREADED HOLE REPAIR

Most stripped threaded holes can be repaired using a Helicoil®. Follow the vehicle or Helicoil® recommendations for application and repair procedures.

The graphic symbols illustrated in the following International Control and Display Symbols Chart are used to identify various instrument controls. The symbols correspond to the controls and displays that are located on the instrument panel.

## MANUFACTURE PLATE

### DESCRIPTION

The Manufacturer Plate is located in the engine compartment on the passenger side rear corner of the hood. The plate contains five lines of information:

1. Vehicle Identification Number (VIN)
2. Gross Vehicle Mass (GVM)
3. Gross Train Mass (GTM)
4. Gross Front Axle Rating (GFAR)
5. Gross Rear Axle Rating (GRAR)

Individual Torque Charts appear within many of the Groups. Refer to the Standard Torque Specifications Chart for torque references not listed in the individual torque charts.

## VECI LABEL

### DESCRIPTION

All vehicles are equipped with a combined VECI label. This label is located in the engine compartment.

The VECI label contains the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The label also contains an engine vacuum schematic. There are unique labels for vehicles built for sale in the state of California and the country of Canada. Canadian labels are written in both the English and French languages. These labels are permanently attached and cannot be removed without defacing information and destroying label.

## VEHICLE IDENTIFICATION NUMBER

### DESCRIPTION

The Vehicle Identification Number (VIN) plate is attached to the top left side of the instrument panel. The VIN contains 17 characters that provide data concerning the vehicle. Refer to the decoding chart to determine the identification of a vehicle.

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

813c5958

## VEHICLE CERTIFICATION LABEL

### DESCRIPTION

A vehicle certification label is attached to every DaimlerChrysler Corporation vehicle. The label certifies that the vehicle conforms to all applicable Federal Motor Vehicle Standards. The label also lists:

- Month and year of vehicle manufacture.
- Gross Vehicle Weight Rating (GVWR). The gross front and rear axle weight ratings (GAWR's) are based on a minimum rim size and maximum cold tire inflation pressure.
- Vehicle Identification Number (VIN).
- Type of vehicle.
- Type of rear wheels.
- Bar code.
- Month, Day and Hour (MDH) of final assembly.
- Paint and Trim codes.
- Country of origin.

The label is located on the driver-side door shut-face.

MFD BY	DAIMLER CHRYSLER CORPORATION	DATE OF MFR	1-96 C	GVWR	2268 KG (05000 LB)		
GAWR FRONT	1203 KG (2650 LB)	WITH TIRES	P195/75R14	RIMS AT	14 X 5.5	COLD	380 KPA(35 PSI)
GAWR REAR	1225 KG (2700 LB)	WITH TIRES	P195/75R14	RIMS AT	14 X 5.5	COLD	380 KPA(35 PSI)

THIS VEHICLE CONFORMS TO ALL APPLICABLE FEDERAL MOTOR VEHICLE SAFETY STANDARDS IN EFFECT ON THE DATE OF MANUFACTURE SHOWN ABOVE.

VIN: XXXXXXXXXXXXXXXX TYPE: SINGLE X DUAL

## FLUID TYPES

### DESCRIPTION

### ENGINE OIL AND LUBRICANTS

**WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.**

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

## API SERVICE GRADE CERTIFIED

Use an engine oil that is API Certified. Mopar® provides engine oils, meeting Material Standard MS-6395, that meet or exceed this requirement.

9400-9

## SAE VISCOSITY

SAE 5W-20 and SAE 5W-30 engine oils are recommended for all operating temperatures. These engine oils improve low temperature starting and vehicle fuel economy. Refer to the engine oil filler cap for the recommended engine oil viscosity for each vehicle. An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-20 or 5W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Select an engine oil that is best suited to your particular temperature range and variation.

81364ec7

## ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

## CONTAINER IDENTIFICATION

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). DaimlerChrysler only recommend API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar® or an equivalent oil meeting the specification MS-6395.

## SYNTHETIC ENGINE OILS

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

9400-9

## ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

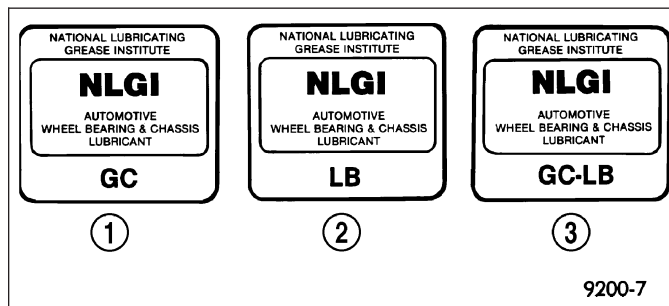

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

## GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

## LUBRICANTS AND GREASES

Lubricating grease is rated for quality and usage by the NLGI. All approved products have the NLGI symbol on the label. At the bottom NLGI symbol is the usage and quality identification letters. Wheel bearing lubricant is identified by the letter "G". Chassis lubricant is identified by the latter "L". The letter following the usage letter indicates the quality of the lubricant. The following symbols indicate the highest quality.

## SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate sections in this manual for the correct application of these lubricants.

## DESCRIPTION - AXLE

**Note:** DaimlerChrysler recommends the use of Mopar® lubricants. Fluid additives are not required for these axles.

### REAR AXLE

- 198 RII - Mopar® Synthetic Gear & Axle Lubricant 75W-140
- 210 RII - Mopar® Synthetic Gear & Axle Lubricant 75W-140

## AUTOMATIC TRANSMISSION FLUID

**Note:** Refer to Service Procedures in this group for fluid level checking procedures.

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for DaimlerChrysler automatic transmissions.

**Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.**

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

## FLUID ADDITIVES

DaimlerChrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid in detecting fluid leaks.

Various “special” additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of DaimlerChrysler and these additives **must not be used**. The use of transmission “sealers” should also be avoided, since they may adversely affect the integrity of transmission seals.

## OPERATION

### AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

## FLUID CAPACITIES

### SPECIFICATIONS - FLUID CAPACITIES

DESCRIPTION	SPECIFICATION
Fuel Tank - V6 Engine	68 L (18 gal.)
Fuel Tank - V8 Engine	72 L (19 gal.)
Engine Oil*	5.7 L (6.0 qts.)
Engine Oil* - 5.7L	6.6 L (7.0 qts.)
Cooling System - 2.7L **	10.0 L (10.5 qts.)
Cooling System - 3.5L **	10.5 L (11.0 qts.)
*(includes filter)	
**(includes heater and coolant recovery bottle filled to MAX level)	
AUTOMATIC TRANSMISSION	
Service Fill - NAG1	5.0 L (10.6 pts.)
O-haul Fill - NAG1	7.7 L (16.3 pts.)
Service Fill - 42RLE	3.8L (4.0 qts)
O-haul Fill - 42RLE	8.3L (17.6 pts)
Dry fill capacity Depending on type and size of internal cooler, length and inside diameter of cooler lines, or use of an auxiliary cooler, these figures may vary. (Refer to 21 - TRANSMISSION/AUTOMATIC/FLUID - STANDARD PROCEDURE)	
AXLE - REAR	
198 MM RII Axle	1.4L (1.5 qts.)
210 MM RII Axle	1.6L (1.7 qts.)

## FLUID FILL/CHECK LOCATIONS

### DESCRIPTION

The fluid check/fill points and lubrication locations are located in each applicable Sections.

## HOISTING

### STANDARD PROCEDURE - HOISTING

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

**WARNING: THE HOISTING AND JACK LIFTING POINTS PROVIDED ARE FOR A COMPLETE VEHICLE. WHEN THE ENGINE OR REAR SUSPENSION IS REMOVED FROM A VEHICLE, THE CENTER OF GRAVITY IS ALTERED MAKING SOME HOISTING CONDITIONS UNSTABLE. PROPERLY SUPPORT OR SECURE VEHICLE TO HOISTING DEVICE WHEN THESE CONDITIONS EXIST.**

**CAUTION: Do not position hoisting device on any suspension component, including the front or rear suspension crossmembers. Do not hoist on the front and rear bumpers, the lower liftgate crossmember, the lower radiator crossmember, or the front engine mount.**

813c36d6

## INTERNATIONAL SYMBOLS

### DESCRIPTION

DaimlerChrysler Corporation uses international symbols to identify engine compartment lubricant and fluid inspection and fill locations.

	ENGINE OIL		BRAKE FLUID
	AUTOMATIC TRANSMISSION FLUID		POWER STEERING FLUID
	ENGINE COOLANT		WINDSHIELD WASHER FLUID

8097ddb

## JUMP STARTING

### STANDARD PROCEDURE

### JUMP STARTING

**WARNING: REVIEW ALL SAFETY PRECAUTIONS AND WARNINGS IN THE BATTERY SYSTEM SECTION OF THE SERVICE MANUAL. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE)** Take care to avoid the radiator cooling fan whenever the hood is raised. It can start anytime the ignition switch is on. You can be hurt by the fan.

- DO NOT JUMP START A FROZEN BATTERY, PERSONAL INJURY CAN RESULT.
- IF EQUIPPED, DO NOT JUMP START WHEN MAINTENANCE FREE BATTERY INDICATOR DOT IS YELLOW OR BRIGHT COLOR.
- DO NOT JUMP START A VEHICLE WHEN THE BATTERY FLUID IS BELOW THE TOP OF LEAD PLATES.
- DO NOT ALLOW JUMPER CABLE CLAMPS TO TOUCH EACH OTHER WHEN CONNECTED TO A BOOSTER SOURCE.
- DO NOT USE OPEN FLAME NEAR BATTERY.
- REMOVE METALLIC JEWELRY WORN ON HANDS OR WRISTS TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.
- WHEN USING A HIGH OUTPUT BOOSTING DEVICE, DO NOT ALLOW BATTERY VOLTAGE TO EXCEED 16 VOLTS. REFER TO INSTRUCTIONS PROVIDED WITH DEVICE BEING USED.
- Do not attempt to push or tow your vehicle to get it started. Vehicles equipped with an automatic transmission cannot be started this way. Unburned fuel could enter the catalytic converter and once the engine has started, ignite and damage the converter and vehicle. If the vehicle has a discharged battery, booster cables may be used to obtain a start from another vehicle. This type of start can be dangerous if done improperly, so follow this procedure carefully.
- Battery fluid is a corrosive acid solution; do not allow battery fluid to contact eyes, skin or clothing. Don't lean over battery when attaching clamps or allow the clamps to touch each other. If acid splashes in eyes or on skin, flush contaminated area immediately with large quantities of water.
- A battery generates hydrogen gas which is flammable and explosive. Keep flame or spark away from the vent holes. Do not use a booster battery or any other booster source with an output that exceeds 12 volts.

**FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY.**

**CAUTION:** When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

**Note:** The battery is stored under an access cover in the trunk. Remote battery terminals are located in the engine compartment for jump starting.

**Note:** The battery in this vehicle has a vent hose that should not be disconnected and should only be replaced with a battery of the same type (vented).

### TO JUMP START A DISABLED VEHICLE:

- Wear eye protection and remove any metal jewelry such as watch bands or bracelets that might make an inadvertent electrical contact.
- When boost is provided by a battery in another vehicle, park that vehicle within booster cable reach and without letting the vehicles touch. Set the parking brake, place the automatic transmission in PARK and turn the ignition switch to the OFF (or LOCK) position for both vehicles.
- Turn off the heater, radio and all unnecessary electrical loads.
- Connect one end of the jumper cable RED clamp to the remote jump start positive battery post in the engine compartment of the disabled vehicle. Connect the other end of the jumper cable RED clamp to the positive terminal of the booster battery.
- Connect the jumper cable BLACK clamp, first to the negative terminal of the booster battery and then connect the other end of the jumper cable BLACK clamp to a suitable engine ground on the disabled vehicle battery. Make sure you have a good contact on the engine ground.

### DISCONNECT CABLE CLAMPS AS FOLLOWS:

- Disconnect BLACK cable clamp from engine ground on disabled vehicle.
- When using a booster vehicle, disconnect BLACK cable clamp from battery negative terminal. Disconnect RED cable clamp from battery positive terminal.
- Disconnect RED cable clamp from battery positive terminal on disabled vehicle.

## LUBRICATION POINTS

### DESCRIPTION

Lubrication point locations are located in each applicable Sections.

## MAINTENANCE SCHEDULES

### DESCRIPTION

#### DESCRIPTION - SEDAN

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **B**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule. Change the automatic transmission fluid and filter every 60,000 miles (96 000 km) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.

- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing. ◇
- Taxi, police, or delivery service (commercial service). ◇
- Off-road or desert operation.

**Note: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule B of the "Maintenance Schedules" section of this manual.**

**Note: Most vehicles are operated under the conditions listed for Schedule B.**

Second is Schedule **A**. It is for vehicles that are not operated under any of the conditions listed under Schedule B. Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**Note: Under no circumstances should oil change intervals exceed 6000 miles (10 000 km) or 6 months whichever comes first.**

**CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.**

#### ***At Each Stop for Fuel***

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

#### ***Once a Month***

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.
- Check rubber seals on each side of the radiator for proper fit.

#### ***At Each Oil Change***

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints and front and rear suspension components.
- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.

### **SCHEDULE B**

Follow schedule B if you usually operate your vehicle under one or more of the following conditions. Change the automatic transmission fluid and filter every 60,000 miles (96 000 km) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing. ◇

- Taxi, police or delivery service (commercial services). ◇
- Off-road or desert operation.
- **If equipped for and operating with E-85 (ethanol) fuel.**

**Note: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule “B” of the “Maintenance Schedules” section of this manual.**

Replace the air conditioning filter.		X		X		
Rotate the tires.	X	X	X	X		X

\* This maintenance is recommended by the manufacture to the owner but is not required to maintain the emissions warranty.

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

**WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**

## DESCRIPTION - WAGON

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **B**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule. Change the automatic transmission fluid and filter every 60,000 miles (96 000 km) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing. ◇
- Taxi, police, or delivery service (commercial service). ◇
- Off-road or desert operation.

**Note: If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule B of the "Maintenance Schedules" section of this manual.**

**Note: Most vehicles are operated under the conditions listed for Schedule B.**

Second is Schedule **A**. It is for vehicles that are not operated under any of the conditions listed under Schedule B. Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**Note:** Under no circumstances should oil change intervals exceed 6000 miles (10 000 km) or 6 months whichever comes first.

**CAUTION:** Failure to perform the required maintenance items may result in damage to the vehicle.

#### ***At Each Stop for Fuel***

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

#### ***Once a Month***

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.
- Check rubber seals on each side of the radiator for proper fit.

#### ***At Each Oil Change***

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints and front and rear suspension components.
- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.

### **SCHEDULE B**

Follow schedule B if you usually operate your vehicle under one or more of the following conditions. Change the automatic transmission fluid and filter every 60,000 miles (96 000 km) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 32° F (0° C).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16.2 km).
- More than 50% of your driving is at sustained high speeds during hot weather, above 90° F (32° C).
- Trailer towing. ◇
- Taxi, police or delivery service (commercial services). ◇
- Off-road or desert operation.
- **If equipped for and operating with E-85 (ethanol) fuel.**

**Note:** If ANY of these apply to you then change your engine oil every 3,000 miles (5 000 km) or 3 months, whichever comes first and follow schedule B of the "Maintenance Schedules" section of this manual.

<b>Miles (Kilometers)</b>	<b>3,000 (5 000)</b>	<b>6,000 (10 000)</b>	<b>9,000 (14 000)</b>	<b>12,000 (19 000)</b>	<b>15,000 (24 000)</b>	<b>18,000 (29 000)</b>

Replace the <b>engine timing belt</b> (Federal Emissions equipped vehicles only). 3.5L Engine						X
Replace the <b>engine timing belt</b> (California Emissions equipped vehicles only). 3.5L Engine						X
Flush and replace the engine coolant at 60 months or 102,000 miles.						X
Replace the air conditioning filter.		X		X		
Rotate the tires.	X	X	X	X		X

\* This maintenance is recommended by the manufacture to the owner but is not required to maintain the emissions warranty.

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

**WARNING: You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.**

## DESCRIPTION - EXPORT

There are two maintenance schedules that show the **required** service for your vehicle.

First is Schedule **A**. It is for vehicles that are not operated under any of the conditions listed under Schedule B.

**Note: Most vehicles are operated under the conditions listed for Schedule B.**

Second is Schedule **B**. It is for vehicles that are operated under the conditions that are listed below and at the beginning of the schedule. Change the automatic transmission fluid and filter every 96 000 km (60,000 miles) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 0° C (32° F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.
- Short trips of less than 16 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F ).
- Trailer towing. ◇
- Taxi, police, or delivery service (commercial service). ◇
- Off-road or desert operation.
- If equipped for and operating with E-85 (ethanol) fuel.

**Note: If ANY of these apply to you then change your engine oil every 5 000 km (3,000 miles) or 3 months, whichever comes first and follow schedule “B” of the “Maintenance Schedules” section of this manual.**

Use the schedule that best describes your driving conditions. Where time and mileage are listed, follow the interval that occurs first.

**CAUTION:** Failure to perform the required maintenance items may result in damage to the vehicle.

#### ***At Each Stop for Fuel***

- Check the engine oil level about 5 minutes after a fully warmed engine is shut off. Checking the oil level while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil only when the level is at or below the ADD or MIN mark.
- Check the windshield washer solvent and add if required.

#### ***Once a Month***

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, and transmission and add as needed.
- Check all lights and all other electrical items for correct operation.
- Check rubber seals on each side of the radiator for proper fit.

#### ***At Each Oil Change***

- Change the engine oil filter.
- Inspect the exhaust system.
- Inspect the brake hoses.
- Inspect the CV joints and front and rear suspension components.
- Check the automatic transmission fluid level.
- Check the coolant level, hoses, and clamps.

**Note:** If ANY of these apply to you then change your engine oil every 5 000 km (3,000 miles) or 3 months, whichever comes first and follow schedule B of the "Maintenance Schedules" section of this manual.

If none of these apply to you, then change your engine oil at every interval shown on schedule "A" of the "Maintenance Schedules" section of this manual.

**Note:** Under no circumstances should oil change intervals exceed 10 000 km (6000 miles) or 6 months whichever comes first.

### **SCHEDULE A**

Kilometers (Miles) [Months]	12 000 (7,500) [6]	24 000 (15,000) [12]	36 000 (22,500) [18]	48 000 (30,000) [24]	60 000 (37,500) [30]	72 000 (45,000) [36]

Change engine oil and engine oil filter.	X		X
Inspect the <b>air cleaner filter</b> and replace if required.*	X		X
Replace the <b>spark plugs</b> . 2.7L, 3.5L Engines.		X	
Check and Inspect the accessory drive belt and tensioner. Replace if required.			X
Flush and replace the engine coolant at 60 months or 160,000 km.		X	
Replace the air conditioning filter.			X
Rotate the tires.	X		X

\* This maintenance is recommended by the manufacture to the owner but is not required to maintain the emissions warranty.

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

## SCHEDULE B

Follow schedule B if you usually operate your vehicle under one or more of the following conditions.

Change the automatic transmission fluid and filter every 96 000 km (60,000 miles) if the vehicle is usually operated under one or more of the conditions marked with an ◇.

- Day or night temperatures are below 0° C (32° F).
- Stop and go driving.
- Extensive engine idling.
- Driving in dusty conditions.

- Short trips of less than 16.2 km (10 miles).
- More than 50% of your driving is at sustained high speeds during hot weather, above 32° C (90° F).
- Trailer towing. ◇
- Taxi, police or delivery service (commercial services). ◇
- Off-road or desert operation.
- **If equipped for and operating with E-85 (ethanol) fuel.**

Kilometers (Miles)	5 000 (3,000)	10 000 (6,000)	14 000 (9,000)	19 000 (12,000)	24 000 (15,000)	29 000 (18,000)
Change engine oil and engine oil filter.	X	X	X	X	X	X

\* This maintenance is recommended by the manufacture to the owner but is not required to maintain the emissions warranty.

‡ This maintenance is not required if previously replaced.

Inspection and service should also be performed anytime a malfunction is observed or suspected. Retain all receipts.

#### WARNING:

You can be badly injured working on or around a motor vehicle. Do only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic.

## PARTS & LUBRICANT RECOMMENDATION

### DESCRIPTION

#### DESCRIPTION - FLUID TYPES

When service is required, DaimlerChrysler Corporation recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing DaimlerChrysler Corporation vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler Corporation vehicle.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)

#### SAE VISCOSITY RATING

An SAE viscosity grade is used to specify the viscosity of engine oil. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range. Example SAE 5W-30 = multigrade engine oil.

DaimlerChrysler Corporation only recommends multigrade engine oils.

## API QUALITY CLASSIFICATION

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by DaimlerChrysler Corporation.

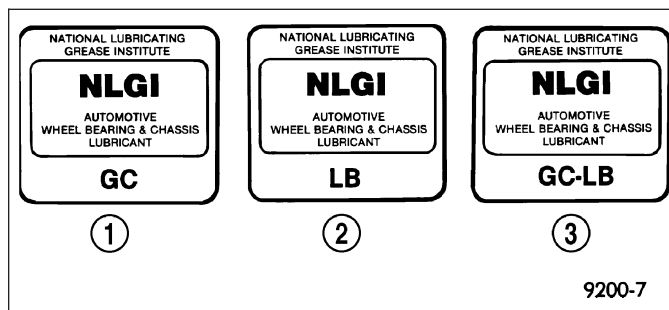

## GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricants usage. Such as API GL-5 and SAE 75W-90.

## LUBRICANTS AND GREASES

Lubricating grease is rated for quality and usage by the NLGI. All approved products have the NLGI symbol on the label. At the bottom NLGI symbol is the usage and quality identification letters. Wheel bearing lubricant is identified by the letter "G". Chassis lubricant is identified by the latter "L". The letter following the usage letter indicates the quality of the lubricant. The following symbols indicate the highest quality.

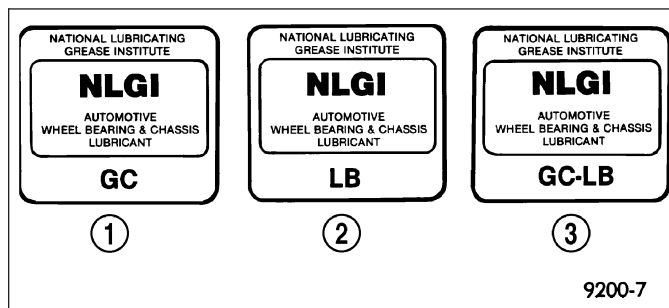

## SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate sections in this manual for the correct application of these lubricants.

## LUBRICANT RECOMMENDATIONS

### LUBRICANTS AND GREASEES

Lubricating grease is rated for quality and usage by the NLGI. All approved products have the NLGI symbol on the label. At the bottom NLGI symbol is the usage and quality identification letters. Wheel bearing lubricant is identified by the letter "G". Chassis lubricant is identified by the latter "L". The letter following the usage letter indicates the quality of the lubricant. The following symbols indicate the highest quality.

## SPECIALIZED LUBRICANTS AND OILS

Some maintenance or repair procedures may require the use of specialized lubricants or oils. Consult the appropriate sections in this manual for the correct application of these lubricants.

## Chassis

Component	Fluid, Lubricant, or Genuine Part
Steering Gear & Linkage, Ball Joints, Prop Shafts & Yokes, Wheel Bearings	Mopar® Multi-Purpose Lubricant NLGI Grade 2 EP, GC-LB

## Body

Component	Fluid, Lubricant, and Genuine Part
Hinges:	
Door & Hood	Mopar® Engine Oil
Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Latches: Door, Hood/Safety Catch, Swing Gate	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator & Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

## TOWING

### STANDARD PROCEDURE - TOWING

#### WARNINGS AND CAUTIONS

**WARNING: DO NOT ALLOW TOWING ATTACHMENT DEVICES TO CONTACT THE FUEL TANK OR LINES, FUEL LEAK CAN RESULT.**

**DO NOT LIFT OR TOW VEHICLE BY FRONT OR REAR BUMPER.**

**DO NOT GO UNDER A LIFTED VEHICLE IF NOT SUPPORTED PROPERLY ON SAFETY STANDS.**

**DO NOT ALLOW PASSENGERS TO RIDE IN A TOWED VEHICLE.**

**USE A SAFETY CHAIN THAT IS INDEPENDENT FROM THE TOWING ATTACHMENT DEVICE.**

**CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle.**

**Do not secure vehicle to towing device by the use of front or rear suspension or steering components.**

**Remove or secure loose or protruding objects from a damaged vehicle before towing.**

**Refer to state and local rules and regulations before towing a vehicle.**

**Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.**

#### RECOMMENDED TOWING EQUIPMENT

- FWD vehicles, use of a flat bed towing device or a wheel lift is recommended.
- AWD vehicles, a flat bed towing device is recommended.

When using a wheel lift towing device, be sure the disabled vehicle has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

**CAUTION:**

- Do not attempt to tow this vehicle from the front with sling type towing equipment. Damage to the front fascia and air dams will result.
- The only approved method of towing is with a flat bed truck.
- Do not tow the vehicle from the rear. Damage to the rear sheet metal, liftgate and fascia will occur.
- Do not push or tow this vehicle with another vehicle as damage to the bumper fascia and transmission may result.

**GROUND CLEARANCE**

**CAUTION:** If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

A towed vehicle should be raised until the lifted wheels are a minimum 100 mm (4 in.) from the ground. Be sure there is at least 100 mm (4 in.) clearance between the tail pipe and the ground. If necessary, remove the wheels from the front end of the vehicle and lower the front end closer to the ground, to increase the ground clearance at the rear of the vehicle. Install lug nuts on wheel attaching studs to retain brake rotors.

**LOCKED VEHICLE TOWING**

When a locked vehicle must be towed with the front wheels on the ground, use a towing dolly or flat bed hauler.

**FLAT BED TOWING TIE DOWNS**

**CAUTION:** Do not tie vehicle down by attaching chains or cables to suspension components or engine mounts, damage to vehicle can result.

The vehicle can be tied to a flat bed device using the pair of front transportation slots on the bottom surface of the rails, behind the front wheels. The rear transportation slots are on the bottom of the left bumper extension and in the bracket extending inboard of the right bumper extension.

**TOWING – FRONT WHEEL DRIVE**

Your vehicle may be towed under the following conditions: The gear selector must be in NEUTRAL, the distance to be traveled must not exceed 100 miles (160 km), and the towing speed must not exceed 44 mph (72 km/h). Exceeding these towing limits may cause a transmission gear train failure. If the transmission is not operative, or if the vehicle is to be towed more than 100 miles (160 km), the vehicle must be towed with the front wheels off the ground.

**TOWING – ALL WHEEL DRIVE**

Your vehicle may be towed under the following conditions: The gear selector must be in NEUTRAL, the distance to be traveled must not exceed 100 miles (160 km), the towing speed must not exceed 44 mph (72 km/h), and both front and rear wheels must be on the ground. If your vehicle must be towed farther or at a higher rate of speed, it must be transported on a flat bed truck.

**ALL TRANSMISSIONS**

- Do not attempt to tow this vehicle from the front with sling type towing equipment. Damage to the front fascia will result.
- The only approved method of towing is with a flat bed truck.
- Do not tow the vehicle from the rear. Damage to the rear sheet metal, liftgate and fascia will occur.
- Do not push or tow this vehicle with another vehicle as damage to the bumper fascia and transmission may result.

If it is necessary to use the accessories while being towed (wipers, defrosters, etc.), the key must be in the ON position, not the ACCESSORY position. Make certain the transmission remains in NEUTRAL.

## WITHOUT THE IGNITION KEY

Special care must be taken when the vehicle is towed with the ignition in the LOCK position. The only approved method of towing with out the ignition key is with a flat bed truck. Proper towing equipment is necessary to prevent damage to the vehicle.

## TOWING THIS VEHICLE BEHIND ANOTHER VEHICLE (Flat towing with all four wheels on the ground)

Flat towing of vehicles equipped with an automatic transmission, is only permitted within the limitations described in this section.

### FLAT TOWING WITH TOW BAR

- Four speed electronic automatic transaxle vehicles can be flat towed at speeds not to exceed 72 km/h (44 mph) for not more than 160 km (100 miles). The steering column must be unlocked and gear selector in neutral.
- AWD models should not be flat towed. For additional information, refer to **RECOMMENDED TOWING EQUIPMENT** in this section.

## TOWING THIS VEHICLE BEHIND ANOTHER VEHICLE WITH A TOW DOLLEY

The manufacture **does not recommend** that you tow an All-Wheel Drive (AWD) or front wheel drive vehicle on a tow dolly. Vehicle damage may occur.

# SUSPENSION

## TABLE OF CONTENTS

## HUB / BEARING

### DESCRIPTION

The front wheel bearing and wheel hub of this vehicle are a one piece sealed unit or hub and bearing unit type assembly. The hub and bearing (1) is mounted to the center of the spindle using a retaining nut. It has five wheel mounting studs (3) on the hub flange.

The wheel mounting studs used to mount the tire and wheel to the vehicle are the only replaceable components of the hub and bearing. Otherwise, the hub and bearing is serviced only as a complete assembly.

If a vehicle is equipped with antilock brakes, the tone wheel (2) for the wheel speed sensor is pressed onto the hub and bearing.

## DIAGNOSIS AND TESTING

### HUB AND BEARING

**Note:** The hub and bearing is designed for the life of the vehicle and should require no maintenance.

With wheel and brake rotor removed, rotate flanged outer ring of hub. Excessive roughness, lateral play or resistance to rotation may indicate dirt intrusion or bearing failure. If the rear wheel bearings exhibit these conditions during inspection, the hub and bearing assembly should be replaced.

Damaged bearing seals and resulting excessive grease loss may also require bearing replacement. Moderate grease loss from bearing is considered normal and should not require replacement of the hub and bearing assembly.

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Access and remove front brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)

4. Remove dust cap (2).
5. Remove hub nut (1).
6. Slide hub and bearing off knuckle spindle.

## INSTALLATION

1. Slide hub and bearing onto knuckle spindle.
2. Install hub nut (1) on end of spindle. Tighten hub nut to 250 N·m (184 ft. lbs.) torque.
3. Install brake rotor, then disc brake caliper and adapter assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - INSTALLATION)
4. Install dust cap (2) on hub and bearing.

5. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
6. Lower vehicle.
7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
8. Check and adjust brake fluid level as necessary.

## KNUCKLE

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

3. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
4. Remove wheel speed sensor cable routing clip (2) from brake flex hose routing bracket (5).

5. Remove screw (3) fastening brake flex hose routing bracket (2) to knuckle (4).
6. Access and remove front brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)

7. Remove nut (1) from outer tie rod end stud.

8. Using Puller (2), Special Tool 9360, separate tie rod stud (1) from knuckle.

9. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

**CAUTION:** In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool 9360, into place past seal boot.

10. Using Puller (2), Special Tool 9360, separate upper ball joint stud (1) from knuckle.

11. Remove nut (4) from end of upper ball joint stud (1).

12. Loosen nut (3) attaching tension strut (2) ball joint stud to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

**CAUTION:** In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool 9360, into place past seal boot.

13. Using Puller (1), Special Tool 9360, separate tension strut ball joint stud (2) from knuckle.

14. Remove nut (3) from end of tension strut (2) ball joint stud.
15. Loosen nut (5) attaching ball joint stud to lower control arm (4). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

**CAUTION:** In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool 9360, into place past seal boot.

16. Using Puller (1), Special Tool 9360, separate ball joint stud (2) from lower control arm.

17. Remove nut (5) from end of ball joint stud attaching lower control arm to knuckle.
18. Remove knuckle from vehicle.

19. If hub and bearing needs to be removed, perform the following:
  - a. Remove dust cap (2).
  - b. Remove hub nut (1).
  - c. Slide hub and bearing off knuckle spindle.
20. If shield needs to be removed from knuckle, remove 3 mounting screws, then shield.

## DISASSEMBLY - BALL JOINT

**Note:** To perform this procedure it works best to mount Press (3), Special Tool C-4212F, in a vise and hold the component in your hands.

1. Place Receiver (1), Special Tool 9320-5, into cup area of Press (3), Special Tool C-4212F, as shown and tighten set screw.
2. Place Remover (2), Special Tool 9320-3, onto end of screw-drive of Press (3), Special Tool C-4212F, as shown.

3. Using a pair of snap-ring pliers (2), remove snap-ring (3) from bottom of ball joint (1).

4. Install halves of Support Clamp (1), Special Tool 9320-1, over ball joint (2) and around knuckle surface (3) as shown. Install and snug Support Clamp (1) screws from underside.

5. Position knuckle (1) over tools guiding top of ball joint inside of Receiver (6), then hand tighten Press screw-drive (4) until Remover (3) comes into contact with bottom of ball joint (2).

**Note:** When positioning knuckle over tools, make sure Receiver, Special Tool 9320-5, sets into recessed area (4) of Support Clamp, Special Tool 9320-1.

6. Tighten Press screw-drive (4) forcing ball joint out of knuckle (1) and into Receiver (6).
7. Loosen screw-drive (4) and remove knuckle (1) from Press. Remove ball joint from Receiver (6).

8. Remove Support Clamp (1) from knuckle (3).

## ASSEMBLY - BALL JOINT

**Note:** To perform this procedure it works best to mount Press (3), Special Tool C-4212F, in a vise and hold the component in your hands.

1. Place Installer (1), Special Tool 9320-4, into cup area of Press (3), Special Tool C-4212F, as shown and tighten set screw.
2. Place Remover (2), Special Tool 9320-3, onto end of screw-drive of Press (3), Special Tool C-4212F, as shown. **Note: This is the reverse of how Remover is installed on screw-drive for removal.**

3. Start NEW ball joint (1) into bore of knuckle (2).

4. Position knuckle (1) over tools guiding top of ball joint inside of Installer (5) until outside flange of ball joint (4) comes into contact with Installer, then hand tighten Press screw-drive (3) until Remover (2) comes into contact with bottom of knuckle (1).
5. Using hand tools, tighten screw-drive (3), pressing ball joint into knuckle until flange (4) comes to a stop against the knuckle.
6. Loosen screw-drive and remove knuckle from Press.

7. Install snap-ring (3) into groove on bottom of ball joint.
8. Inspect ball joint for proper fit. Make sure seal boot is uniform and wire rings are in place.

## INSTALLATION

1. If shield needs to be installed on knuckle, place shield in place and attach to knuckle using 3 screws. Tighten screws to 10 N·m (89 in. lbs.) torque.
2. If hub and bearing needs to be installed on knuckle, perform the following:
  - a. Slide hub and bearing onto knuckle spindle.
  - b. Install hub nut (1) on end of spindle. Tighten hub nut to 250 N·m (184 ft. lbs.) torque.
  - c. Install dust cap (2).

3. Place knuckle (1) over lower ball joint studs on vehicle and loosely install NEW nuts by hand.

**CAUTION:** It is important to tighten nuts as described in following steps to avoid damaging ball stud joints.

4. Completely install NEW nut (5) on ball joint stud attaching lower control arm (4) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N·m + 90° turn (50 ft. lbs. + 90° turn) torque.
5. Completely install NEW nut (3) on ball joint stud attaching tension strut (2) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N·m + 90° turn (50 ft. lbs. + 90° turn) torque.

**CAUTION:** It is important to tighten nut as described in following step to avoid damaging ball stud joint.

6. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N·m + 90° turn (35 ft. lbs. + 90° turn) torque.

**CAUTION:** It is important to tighten nut as described in following step to avoid damaging ball stud joint.

7. Place outer tie rod stud through hole in knuckle (2) and install nut (1). Tighten nut by holding stud with a wrench while turning nut with another wrench. Tighten nut using crow foot wrench on torque wrench to 85 N·m (63 ft. lbs.) torque.
8. Install brake rotor, then disc brake caliper and adapter assembly. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - INSTALLATION)

9. Install screw (3) fastening brake flex hose routing bracket (2) to knuckle (4). Tighten screw to 12 N·m (106 in. lbs.) torque.

10. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N·m (95 in. lbs.) torque.
11. Attach wheel speed sensor cable and routing clip (2) to brake flex hose routing bracket (5).

12. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
13. Lower vehicle.
14. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
15. Check and adjust brake fluid level as necessary.
16. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## BALL JOINT - LOWER

### DESCRIPTION

There are two lower ball joints on the RWD version of this vehicle. One in for the lower control arm and the other for the tension strut. The ball joint for the lower control arm is pressed into the knuckle and the ball joint for the tension strut is part of the tension strut. The ball joints are both “sealed for life” components and cannot be maintenance lubricated. These ball joints are lubricated for life at the time of assembly. **No attempt should be made to ever add any lubrication to these ball joints.**

The ball joint for the lower control arm is a ball joint and seal boot cartridge type and can be replaced as a separate component of the knuckle. The boot cannot be serviced separately. To service this ball joint, (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - DISASSEMBLY).

Neither the ball joint, not the seal boot for the tension strut can be serviced as a separate component. They entire tension strut must be replaced if either are damaged.

The ball joint connection to the lower control arm and the ball joint connection at the knuckle is achieved by an interference fit created by the tapered stud of the ball joint and a tapered hole in the steering knuckle. The ball joint stud is retained in the steering knuckle using a locking nut.

### DIAGNOSIS AND TESTING

#### LOWER BALL JOINT

1. Raise vehicle on a drive-on hoist.

**Note: If a drive-on hoist is not available, use wooden blocks with jack stands to support the lower control arm in the ball joint area. Place the jack stands appropriately and lower the hoist placing weight on the lower control arm. The lower control arms should now be supporting the vehicle weight.**

2. Using a jack, lift the front end off the hoist and position a wooden block underneath lower control arm supporting that corner of the vehicles weight.
3. Remove tire and wheel assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)
4. If checking ball joint for lower control arm – Attach a dial indicator to base of lower control arm, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on knuckle near ball joint. Zero dial indicator.
5. If checking ball joint for tension strut – Attach a dial indicator to base of tension strut, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on knuckle near ball joint. Zero dial indicator.

**Note: Use care when applying the load to the knuckle so as to not damage components of suspension.**

6. Insert a pry bar and rest it against bottom of lower control arm or tension strut (depending on which is being tested) and use lever principle to push knuckle downward until dial indicator no longer moves.
7. Record any ball joint movement. If movement in the lower control arm exceeds 1.5 mm (.059 in.), the ball joint is faulty.
8. If the ball joint for the lower control arm needs replaced, it can be serviced separately. (Refer to 2 - SUSPENSION/FRONT/KNUCKLE - DISASSEMBLY)
9. If the tension strut ball joint needs replaced, the entire tension strut needs to be replaced. (Refer to 2 - SUSPENSION/FRONT/TENSION STRUT - REMOVAL)

## ARM - LOWER CONTROL

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Remove belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)

4. Remove screws (1) fastening stabilizer bar heat shield (3) on side of control arm repair.

5. Remove bolts (2) fastening stabilizer bar bushing retainer (1) in place on side of control arm repair.

6. Remove retainer halves (1)(2) from around stabilizer bar bushing (3).

7. Utilizing slit, remove bushing (1) from stabilizer bar (2).

**Note:** In the following step, the lower control arm cradle bolt (3) is accessed through the opening (2) created by removal of the bushing from the stabilizer bar (4).

**CAUTION:** If the lower control arm bolt at the engine cradle has a torx head, it is a special wheel alignment adjustment bolt and the bolt head must not be rotated in the vehicle or damage to the bolt and control arm bushing will result. While holding the bolt in place with a wrench, remove the nut, then slide the bolt out of the bushing and cradle taking note of bolt positioning in lower control arm bushing for reassembly purposes. The bolt needs to be installed in the same position as removed to make sure wheel camber and caster return to adjusted position.

8. Remove bolt and nut (1) securing lower control arm (2) to engine cradle. If the bolt has a torx head (see above note), remove the bolt and nut by holding the bolt in place with a wrench, removing the nut, then sliding the bolt out of the bushing and cradle while taking note of bolt positioning in lower control arm bushing for reassembly purposes.

9. Remove bolt (3) securing shock assembly (1) to lower control arm (4).

10. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
11. Remove wheel speed sensor cable routing clip (2) from brake flex hose routing bracket (5).

12. Loosen nut (5) attaching ball joint stud to lower control arm (4). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

**CAUTION:** In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool 9360, into place past seal boot.

13. Using Puller (1), Special Tool 9360, separate ball joint stud (2) from lower control arm.

14. Remove nut (5) from end of ball joint stud attaching lower control arm to knuckle.
15. Pry knuckle downward and slide ball joint stud out of lower control arm. Position knuckle outward, away from lower control arm.
16. Slide lower control arm out of engine cradle and remove from vehicle.

## INSTALLATION

**Note:** If installing a lower control arm engine cradle bolt that is a wheel alignment adjustment bolt (length-wise grooved shaft), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

1. Slide lower control arm (4) into position in engine cradle and install mounting bolt from rear.

2. Install nut (1) on lower control arm cradle bolt, but **do not tighten at this time.**

3. Pull knuckle (1) downward and position lower control arm (4) over ball joint stud. Release knuckle, guiding stud into lower control arm. Install NEW nut (5) on ball joint stud attaching lower control arm (4) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N·m + 90° turn (50 ft. lbs. + 90° turn) torque.

4. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N·m (95 in. lbs.) torque.
5. Attach wheel speed sensor cable and routing clip (2) to brake flex hose routing bracket (5).

6. Install lower shock mounting bolt (3) attaching shock assembly (1) to lower control arm (4). **Do not tighten bolt at this time.**

7. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
8. Lower vehicle.

**CAUTION:** Because stabilizer bar is disconnected at cradle it is important to use extra care while moving vehicle to alignment rack/drive-on lift.

9. Position vehicle on an alignment rack/drive-on lift.
10. Tighten lower shock mounting bolt (3) to 174 N·m (128 ft. lbs.) torque.

11. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

**CAUTION:** If the control arm engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft), be sure to only tighten the nut. Do not rotate the bolt or damage to the bushing will occur.

12. Once camber is found to be within specifications, using a crowfoot wrench, tighten lower control arm cradle bolt nut (1) to 176 N·m (130 ft. lbs.) torque while holding the bolt stationary.

**CAUTION:** Because of stabilizer bushing outer shape, it is very important to install bushings in position discussed in following step.

13. Utilizing slit in bushing, install stabilizer bar bushing (1) against locating collar on stabilizer bar (2) as shown. Make sure slit in bushing is positioned toward rear of vehicle.

14. Install stabilizer bar bushing retainer halves (1)(2) around bushing (3).

15. Install bolts (2) securing stabilizer bar bushing retainer halves (2) to cradle. Tighten bolts (2) to 60 N·m (44 ft. lbs.) torque.

16. Install stabilizer bar heat shield (3) over stabilizer bar bushing retainer. Install mounting screws (1).
17. Install belly pan. (Refer to 23 - BODY/EXTERIOR/ BELLY PAN - REMOVAL)

## SHOCK ASSEMBLY

### REMOVAL

1. Remove front shock tower cap (1) from top of shock assembly (4).
2. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).
3. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

5. Remove nut (2) fastening stabilizer link (3) to shock assembly (1). Slide link ball joint stem from shock assembly.

6. Remove bolt (3) securing shock assembly (1) to lower control arm (4).

7. Disconnect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

8. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

**CAUTION:** In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool 9360, into place past seal boot.

9. Using Puller (2), Special Tool 9360, separate upper ball joint stud (1) from knuckle.

10. Remove nut (4) from end of upper ball joint stud (1).
11. Tip top of knuckle outward using care not to over-extend bake flex hose.
12. Remove shock assembly from vehicle.

## DISASSEMBLY

The shock assembly must be removed from vehicle for it to be disassembled and assembled.

For shock assembly disassembly and assembly, use of shock Spring Compressor, Pentastar Service Equipment (PSE) tool W-7200, or equivalent, is recommended to compress coil spring. Follow manufacturer's instructions closely.

**WARNING: Do not remove shock shaft nut before coil spring is compressed. Coil spring is held under pressure and must be compressed, removing spring tension from upper and lower mounts, before shock removal.**

1. Position shock assembly coil spring (1) on hooks (2) of Compressor following manufacturers instructions. Install clamp securing shock to lower spring coil.

2. Position Compressor upper hooks (1) on upper coil spring (2) following manufacturers instructions. To ease installation, rotate shock as necessary positioning shock in compressor so that upper spring coil ends (step in upper mount) at straight outward position from Compressor.
3. Compress coil spring until all spring tension is removed from upper mount.

4. Position Wrench (2), Special Tool 9362, on shock shaft retaining nut. Next, insert 8 mm socket through Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, remove nut from shock shaft using Wrench.
5. Remove clamp from bottom of coil spring and remove shock and lower isolator out through bottom of coil spring.

**Note:** If upper mount or coil spring needs to be serviced, proceed with next step, otherwise, proceed with step 8.

6. Remove upper mount (1) from shock shaft and coil spring.

**Note:** Prior to removing spring from compressor, note location of lower spring coil end in relationship to compressor to ease assembly of components later.

7. Back off Compressor drive, releasing tension from coil spring. Push back compressor upper hooks and remove coil spring from Compressor.

8. Remove jounce bumper (4) from shock shaft by pulling straight up and off.
9. Remove lower isolator (2) from shock body by pulling straight up and off shock shaft.
10. Inspect shock assembly components for following and replace as necessary:
  - Inspect shock (3) for any condition of shaft binding over full stroke of shaft.
  - Inspect upper mount (5) for cracks and distortion and its retaining studs for any sign of damage.
  - Inspect upper spring isolator (5) for severe deterioration.
  - Inspect lower spring isolator (2) for severe deterioration.
  - Inspect dust shield for tears and deterioration.
  - Inspect coil spring (1) for cracks in the coating and corrosion.
  - Inspect jounce bumper (4) for cracks and signs of deterioration.

## ASSEMBLY

**CAUTION:** Use care not to damage coil spring coating during spring assembly. Damage to coating will jeopardize its corrosion protection.

**Note:** Left and right springs must not be interchanged.

**Note:** If coil spring has been removed from spring compressor, proceed with next step, otherwise, proceed with step 4.

1. Place coil spring (**part number tag end upward**) in compressor lower hooks following manufacturers instructions. To ease shock reassembly, rotate coil spring around until upper coil (1) ends at straight outward position from Compressor. Proper orientation of spring to upper mount (once installed) is necessary.
2. Position compressor upper hooks over coil spring following manufacturers instructions.
3. Compress coil spring far enough to allow shock installation.

4. If separated, install upper mount (1) onto coil spring (2). Match step in upper isolator to end of spring coil.

5. Install lower spring isolator (2) on shock body (3).  
6. Install jounce bumper (4) on shock shaft, small end first.

7. Install shock through bottom of coil spring until lower spring isolator (on shock) contacts lower end of coil spring. Match step built into isolator (1) to lower coil end (2). Once in this position, stabilizer bar bracket, or clevis key on AWD models, should point straight inward toward Compressor body. If not, rotate isolator on shock body until alignment is achieved when isolator is correctly positioned with lower spring coil.  
8. Install clamp to hold shock and coil spring together.

9. Install retaining nut (1) on shock shaft (2) as far as possible by hand. Make sure nut is installed far enough for 8 mm socket to grasp hex (2) on end of shaft for tightening.

10. Install Wrench (on end of a torque wrench), Special Tool 9362, on shock shaft retaining nut. Next, insert 8 mm socket through Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, tighten nut using Wrench to 90 N·m (66 ft. lbs.) torque.
11. Slowly release tension from coil spring by backing off Compressor drive fully. As tension is relieved, make sure shock components are properly in place.
12. Remove clamp from lower end of coil spring and shock. Push back spring compressor upper and lower hooks, then remove shock assembly from spring compressor.
13. Install shock assembly on vehicle. (Refer to 2 - SUSPENSION/FRONT/SHOCK - INSTALLATION)

## INSTALLATION

1. Place shock assembly into front suspension using reverse direction in which it was removed.

**CAUTION:** It is important to tighten nut as described in following step to avoid damaging ball stud joint.

2. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N·m + 90° turn (35 ft. lbs. + 90° turn) torque.

3. Connect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

4. Install lower shock mounting bolt (3) attaching shock assembly (1) to lower control arm (4). **Do not tighten bolt at this time.**

5. Slide stabilizer link (3) ball joint stem into shock assembly from front. Install nut fastening link (3) to shock assembly (1). Tighten nut by holding ball joint stud while turning nut. Tighten nut using crow foot wrench on torque wrench to 146 N·m (108 ft. lbs.) torque.

3. On each side of vehicle, remove screws (1) fastening stabilizer bar heat shield (3). Remove heat shield.

4. On each side of vehicle, remove bolts (2) fastening stabilizer bar isolator retainer (1) in place.

5. On each side of vehicle, remove retainer halves (1)(2) from around stabilizer bar isolator (3).

6. Utilizing slit, remove each isolator (1) from stabilizer bar (2).

7. On each side of vehicle, remove nut (5) fastening stabilizer link (3) to stabilizer bar (4). Slide link ball joint stem (1) from bar, then remove bar from vehicle.

## INSTALLATION

**Note:** When attaching stabilizer link to stabilizer bar, make sure link ball joint stem is pointed inboard toward engine cradle.

1. On each side of vehicle, raise stabilizer bar (4) to stabilizer link (3) and slide link ball joint stem (1) through mounting hole in bar. Loosely install nut (5) at this time.

**CAUTION:** Because of stabilizer isolator outer shape, it is very important to install isolators in position discussed in following step.

2. Utilizing slit in isolator, install each stabilizer bar isolator (1) on bar resting against locating collar (2) as shown. Make sure slit in isolator is positioned toward rear of vehicle.

3. On each side of vehicle, install stabilizer bar isolator retainer halves (1)(2) around isolator (3).

4. On each side of vehicle, install bolts (2) securing stabilizer bar isolator retainer halves (2) to cradle. Tighten bolts (2) to 60 N·m (44 ft. lbs.) torque.

5. On each side of vehicle, install stabilizer bar heat shield (3) over stabilizer bar isolator retainer. Install mounting screws (1).

6. While holding stem from rotating at hex (1) or flat (2) tighten stabilizer link nuts at each end of stabilizer bar (4) to 146 N·m (108 ft. lbs.) torque.

7. Install belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)  
8. Lower vehicle.

## STRUT - TENSION

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

6. Remove nut (3) from end of tension strut (2) ball joint stud.
7. Rotate knuckle outward and push ball joint upward, out of knuckle.

8. Remove nut and bolt (2) securing tension strut (1) to engine cradle (3).
9. Slide tension strut out of cradle bracket and remove from vehicle.

## INSTALLATION

**Note:** If installing a tension strut engine cradle bolt that is a wheel alignment adjustment bolt (lengthwise grooved shaft), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt, (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE).

1. Slide bushing end of tension strut (1) into cradle bracket (3).
2. Install mounting bolt (2) from front through cradle and bushing.
3. Install nut (2), but **do not tighten at this time**.

4. Insert tension strut (2) ball joint stud downward, into knuckle hole.
5. Completely install NEW nut (3) on ball joint stud attaching tension strut (2) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N·m + 90° turn (50 ft. lbs. + 90° turn) torque.

6. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
7. Lower vehicle.
8. Position vehicle on an alignment rack/drive-on lift.

9. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

**CAUTION:** If the tension strut engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft), be sure to only tighten the nut. Do not rotate the bolt or damage to the bushing will occur.

10. Once alignment is found to be within specifications, using a crowfoot wrench, tighten tension strut cradle bolt nut (2) to 176 N·m (130 ft. lbs.) torque while holding the bolt stationary.

11. Install belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)

## BALL JOINT - UPPER

### DESCRIPTION

The upper ball joint is pressed into the upper control arm. The ball joint is a “sealed for life” component and cannot be maintenance lubricated. This ball joint is lubricated for life at the time of assembly. **No attempt should be made to ever add any lubrication to this ball joint.**

Neither the upper ball joint, nor the seal boot can be serviced as a separate component. The entire upper control arm must be replaced if either are damaged.

The ball joint connection at the knuckle is achieved by an interference fit created by the tapered stud of the ball joint and a tapered hole in the steering knuckle. The ball joint stud is retained in the steering knuckle using a locking nut.

### DIAGNOSIS AND TESTING

#### UPPER BALL JOINT

1. Raise vehicle on a drive-on hoist.

**Note:** If a drive-on hoist is not available, use wooden blocks with jack stands to support the lower control arm in the ball joint area. Place the jack stands appropriately and lower the hoist placing weight on the lower control arm. The lower control arms should now be supporting the vehicle weight.

2. Using a jack, lift the front end off the hoist and position a wooden block underneath lower control arm supporting that corner of the vehicles weight.
3. Remove tire and wheel assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)
4. Attach a dial indicator to body of upper control arm, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on end of knuckle near ball joint. Zero dial indicator.

**Note:** Use care when applying the load to the knuckle so as to not damage components of suspension.

5. Insert a pry bar and rest it against top of upper control arm and use lever principle to push arm downward until dial indicator no longer moves.
6. Record any ball joint movement. If movement in the control arm exceeds 1.5 mm (.059 in.), the ball joint is faulty.
7. If the ball joint needs replaced, the entire upper control arm needs to be replaced. (Refer to 2 - SUSPENSION/FRONT/UPPER CONTROL ARM - REMOVAL)

## ARM - UPPER CONTROL

### REMOVAL

1. If removing left upper control arm, remove and reposition coolant recovery container. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - REMOVAL)
2. If removing right upper control arm, remove IPM from mount and reposition. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - REMOVAL)
3. Remove front shock tower cap (1) from top of shock assembly (4).
4. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).

5. remove nuts (2) from upper control arm mounting bolts (1).
6. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

7. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

8. Disconnect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

9. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

**CAUTION:** In following step, use care not to damage ball joint seal boot while sliding Puller, Special Tool 9360, into place past seal boot.

10. Using Puller (2), Special Tool 9360, separate upper ball joint stud (1) from knuckle.

11. Remove nut (4) from end of upper ball joint stud (1).
12. Pull shock assembly (3) downward until studs clear shock tower (2), then pull it outward allowing access to upper control arm mounting bolts.

13. Remove upper control arm mounting (flag) bolts (1).
14. Remove upper control arm (2) from bracket (3) in shock tower (4).

## INSTALLATION

1. Slide upper control arm (2) into bracket (3) located in shock tower (4).
2. Install upper control arm mounting (flag) bolts (1) through bracket, arm and tower. Position flags on bolt heads outward, toward wheel opening.

3. Move shock assembly (3) allowing studs to be inserted through shock tower (2) mounting holes.
4. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N·m + 90° turn (35 ft. lbs. + 90° turn) torque.

5. Connect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

6. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
7. Lower vehicle to curb position.

8. Install nuts (2) on upper control arm body mounting bolts (1). Tighten nuts to 75 N·m (55 ft. lbs.) torque.

9. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N·m (20 ft. lbs.) torque.
10. Align shock tower cap (1) with shock mounting nuts (2) and snap into place.

11. If installing left upper control arm, install coolant recovery container. (Refer to 7 - COOLING/ENGINE/COOLANT RECOVERY CONTAINER - INSTALLATION)
12. If installing right upper control arm, install IPM. (Refer to 8 - ELECTRICAL/POWER DISTRIBUTION/INTEGRATED POWER MODULE - INSTALLATION)

REAR

DESCRIPTION

This vehicle utilizes a five-link rear suspension including the following major components:

- Camber Link (1)
- Compression Link (5)
- Spring Link (2)
- Tension Link (6)
- Toe Link (3)
- Coil Spring
- Crossmember
- Hub And Bearing
- Knuckle (4)
- Shock Absorber
- Stabilizer Bar

The knuckle, camber link, compression link and tension link are **aluminum** castings. Extra care needs to be taken when servicing these components.

Service Procedures for the crossmember can be found in Frame And Bumpers. (Refer to 13 - FRAME & BUMPERS/FRAME/REAR CROSSMEMBER - REMOVAL)

## HUB / BEARING

### DESCRIPTION

The rear wheel bearing and wheel hub of this vehicle are a one piece sealed unit or hub and bearing unit type assembly. The hub and bearing (1) is mounted to the center of the knuckle using 4 bolts. It has five wheel mounting studs (2) on the hub flange.

The center of the hub and bearing is splined to match the axle half shaft.

The wheel mounting studs used to mount the tire and wheel to the vehicle are the only replaceable components of the hub and bearing. Otherwise, the hub and bearing is serviced only as a complete assembly.

### DIAGNOSIS AND TESTING

#### HUB AND BEARING

**Note:** The hub and bearing is designed for the life of the vehicle and should require no maintenance.

With wheel and brake rotor removed, rotate flanged outer ring of hub. Excessive roughness, lateral play or resistance to rotation may indicate dirt intrusion or bearing failure. If the rear wheel bearings exhibit these conditions during inspection, the hub and bearing assembly should be replaced.

Damaged bearing seals and resulting excessive grease loss may also require bearing replacement. Moderate grease loss from bearing is considered normal and should not require replacement of the hub and bearing assembly.

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the half shaft (2).

**Note:** In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

4. Remove two bolts (1) securing disc brake caliper adapter (3) to knuckle (2).
5. Remove disc brake caliper and adapter (3) from knuckle as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

6. Remove any clips (2) retaining brake rotor (3) to wheel mounting studs.
7. Slide brake rotor (3) off hub and bearing (1).

8. Loosen each hub and bearing mounting bolt (2) a turn or two at a time while pulling outward on hub and bearing to avoid bolt contact with half shaft outer joint. Once removed from threads in hub and bearing (but not knuckle), allow bolts to stay in and protrude through knuckle and brake support plate to keep brake support plate in place when hub and bearing is removed.
9. Slide hub and bearing off knuckle and half shaft.

## INSTALLATION

1. Position hub and bearing bolts through rear of knuckle and parking brake support just enough to hold support in place as hub and bearing is installed.
2. Slide hub and bearing onto half shaft. Place hub and bearing through brake support, onto knuckle, lining up mounting bolt holes with bolts.

3. Install four bolts (2) fastening hub and bearing in place. Tighten mounting bolts to 68 N·m (50 ft. lbs.) torque.

**Note: Inspect disc brake pads and parking brake shoes before brake rotor installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSPECTION)**

4. Install brake rotor (3) over wheel mounting studs and onto hub (1).

5. Install disc brake caliper and adapter assembly (3) over brake rotor.
6. Install mounting bolts (1) securing caliper adapter (3) to knuckle (2). Tighten bolts to 95 N·m (70 ft. lbs.) torque.

7. Install hub nut (1) on end of half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N·m (157 ft. lbs.) torque.
8. Verify proper adjustment of the parking brake shoes and adjust as necessary. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENT)

9. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
10. Lower vehicle.
11. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

12. Check and adjust brake fluid level in reservoir (1) as necessary.
13. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

## KNUCKLE

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Unclip wheel speed sensor cable at rear brake rotor shield (1).
3. Remove screw (2) fastening sensor head (3) to rear knuckle.
4. Remove wheel speed sensor head from knuckle.
5. Access and remove rear hub and bearing. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)
6. Remove parking brake shoes. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL)

7. If not removed, remove parking brake shoe actuator lever (1) from end of cable (2).
8. Remove shoe support from knuckle.

9. Remove parking brake cable bolt (3) at knuckle (2) and pull cable (1) out of knuckle.
10. Position under-hoist utility jack or jack stand under spring link. Raise jack head to contact spring link at shock mount secure in place.

11. Remove spring link-to-knuckle nut and bolt (3).

**CAUTION:** It is important to use Guide (2) , Special Tool 9361-2, when tapping sleeve in knuckle to help keep Tap (1) , Special Tool 9361-1, straight during use or damage to Tap may occur.

12. Place Guide 9361-2 (2) against sleeve (3) in knuckle to keep Tap 9361-1 (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

**Note:** Prior to using Special Tool 9361, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

13. Assemble Remover, Special Tool 9361, as shown.

- Bolt 9361-3
- Nut
- Spherical Washer
- Thrust Bearing
- Sleeve 9361-4 (RWD)
- Sleeve 9361-5 (AWD – Left Side)
- Sleeve 9361-6 (AWD – Right Side)

**Note:** When installing Thrust bearing on Remover, be sure to place hardened side against nut.

**Note:** It is important to use appropriate Sleeve on Remover to provide proper Tool-to-Knuckle contact. RWD sleeve can be used on either side while AWD knuckles require specific left or right side Sleeves.

14. Thread Remover Bolt 9361-3 (1) into tapped knuckle sleeve.
15. Rotate Nut down, matching Sleeve angled end with angled face of knuckle.
16. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

17. Remove bolt and nut fastening compression link (5) to knuckle (4).
18. Remove bolt fastening toe link (3) to knuckle (4).
19. Remove nut and bolt fastening stabilizer link to knuckle (4).
20. Remove nut and bolt fastening tension link (6) to knuckle (4).
21. Remove nut and bolt fastening camber link (1) to knuckle (4).
22. Remove knuckle (4).
23. Remove hub mounting bolts from knuckle.

## INSTALLATION

1. Install four hub mounting bolts through knuckle from inboard side allowing ends to protrude from opposite side.
2. Install bolt and nut fastening camber link (1) to knuckle (4) as shown. **Do not tighten bolt at this time.**
3. Install bolt and nut fastening tension link (6) to knuckle (4) as shown. **Do not tighten bolt at this time.**
4. Install bolt and nut fastening stabilizer link to knuckle (4). **Do not tighten bolt at this time.**
5. Install bolt fastening toe link (3) to knuckle (4). **Do not tighten bolt at this time.**
6. Install bolt and nut fastening compression link (5) to knuckle (4). **Do not tighten bolt at this time.**

**Note:** Prior to using Special Tool 9361, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

7. Place NEW knuckle sleeve (2) onto Installer Bolt 9361-7 (1), and slide it up to Bolt's head.

8. Slide Bolt 9361-7 (1) with sleeve (5) through knuckle (2) and spring link ball joint (3) starting from knuckle forward end.
9. Install thrust bearing and nut (4) on end of Bolt.
10. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not over-tighten Nut.**
11. Remove special tool.

12. Install spring link-to-knuckle bolt and nut as shown. While holding bolt head stationary, tighten nut to 138 N·m (102 ft. lbs.) torque.
13. Remove under-hoist utility jack or jack stand from under spring link.

14. Insert end of cable (1) through rear knuckle (2) and install mounting screw (3). Tighten screw to 8 N·m (71 in. lbs.) torque.
15. Install parking brake shoe support over hub and bearing mounting screws and onto face of knuckle.

16. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
17. Install parking brake shoes as well as all components necessary to access them. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION)

18. Install hub and bearing as well as all components necessary to access it. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)
19. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
20. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N·m (97 in. lbs.) torque.
21. Install sensor cable at rear brake rotor shield (1).
22. Lower vehicle.
23. Adjust parking brake shoes as necessary. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENTS)
24. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

25. Tighten fasteners at knuckle (vehicle at curb height) as follows:
- Camber Link (1) – 98 N·m (72 ft. lbs.) torque.
  - Compression Link (5) – 81 N·m (60 ft. lbs.) torque.
  - Stabilizer Link – 61 N·m (45 ft. lbs.) torque.
  - Tension Link (6) – 98 N·m (72 ft. lbs.) torque.
  - Toe Link (3) – 81 N·m (60 ft. lbs.) torque.
26. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## CAMBER LINK

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

**WARNING: Before opening fuel system, review all Warnings and Cautions.**

3. If servicing left side, remove fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - REMOVAL)
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
  - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
  - b. Disconnect exhaust isolators at muffler and resonators hangers.
  - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.
6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

7. Remove shock absorber (1) upper mounting screws (2).

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

**Note:** If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

**CAUTION:** When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow top of shock absorber to clear body flange.

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

**Note:** Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (2) mounting link to knuckle (3).
13. Remove nut and bolt (2) mounting link to crossmember (1).
14. Remove link.

## INSTALLATION

**Note:** When installing link (1), ensure following to avoid mis-installation:

- Heavier, thicker end goes toward crossmember.
- Fore-or-aft bow faces forward (curves around coil spring).
- Up-or-down bow faces downward.

1. Place link in bracket on crossmember (1). Install bolt and nut (2) at crossmember (1) as shown. **Do not tighten bolt at this time.**
2. Install bolt and nut (2) mounting link to knuckle (3) as shown. **Do not tighten bolt at this time.**

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

5. If vehicle is equipped with AWD, make sure spacers (1) on top of crossmember mount bushings (2) on side of repair are in position.

6. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
7. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N·m (38 ft. lbs.) torque.

**Note:** Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

8. Install crossmember mounting bolts (2 and 3). Snug, but do not fully tighten bolts at this time.

9. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

10. Tighten all crossmember mounting bolts (2 and 3) to 180 N·m (133 ft. lbs.) torque.

11. Remove jack (3) from under rear axle differential.  
12. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

13. If removed, install fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - INSTALLATION)

14. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

15. Tighten camber link fasteners (2) to:
- Bolt at crossmember – 85 N·m (63 ft. lbs.) torque.
  - Bolt nut at knuckle – 98 N·m (72 ft. lbs.) torque.

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N·m (53 ft. lbs.) torque.

17. Raise vehicle and remove jack stands (3).

18. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
19. Lower vehicle.
20. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## COMPRESSION LINK

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

3. Remove bolt and nut (2) mounting link (3) at knuckle.
4. Remove bolt and nut (1) mounting link (3) at cross-member.
5. Remove link (3).

### INSTALLATION

**Note:** Although the compression link is different end-to-end, there is no top and bottom.

1. Position link and install bolt and nut (1) mounting link (3) at crossmember. **Do not tighten bolt at this time.**
2. Install bolt and nut (2) mounting link (3) at knuckle. **Do not tighten bolt at this time.**

3. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
4. Lower vehicle.
5. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access link fasteners.
6. Tighten compression link fasteners to:
  - Bolt at crossmember – 85 N·m (63 ft. lbs.) torque.
  - Bolt at knuckle – 81 N·m (60 ft. lbs.) torque.
7. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## SPRING LINK

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Access and remove rear spring. (Refer to 2 - SUSPENSION/REAR/SPRING - REMOVAL)

3. Export Only – If servicing right spring link, disconnect headlamp leveling sensor (1) link at spring link (3).

4. Remove spring link-to-knuckle nut and bolt (3).

**CAUTION:** It important to use Guide (2) , Special Tool 9361-2, when tapping sleeve in knuckle to help keep Tap (1) , Special Tool 9361-1, straight during use or damage to Tap may occur.

5. Place Guide 9361-2 (2) against sleeve (3) in knuckle to keep Tap 9361-1 (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

**Note:** Prior to using Special Tool 9361, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

6. Assemble Remover, Special Tool 9361, as shown.

- Bolt 9361-3
- Nut
- Spherical Washer
- Thrust Bearing
- Sleeve 9361-4 (RWD)
- Sleeve 9361-5 (AWD – Left Side)
- Sleeve 9361-6 (AWD – Right Side)

**Note:** When installing Thrust bearing on Remover, be sure to place hardened side against nut.

**Note:** It is important to use appropriate Sleeve on Remover to provide proper Tool-to-Knuckle contact. RWD sleeve can be used on either side while AWD knuckles require specific left or right side Sleeves.

7. Thread Remover Bolt 9361-3 (1) into tapped knuckle sleeve.
8. Rotate Nut down, matching Sleeve angled end with angled face of knuckle.
9. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

10. Remove bolt and nut (1) fastening spring link (4) to crossmember.
11. Remove spring link (4).

## INSTALLATION

1. Guide ball joint end of spring link (4) into mounting pocket of knuckle, then swing opposite end up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

**Note:** Prior to using Special Tool 9361, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

2. Place NEW knuckle sleeve (2) onto Installer Bolt 9361-7 (1), and slide it up to Bolt's head.

813ce76b

3. Slide Bolt 9361-7 (1) with sleeve (5) through knuckle (2) and spring link ball joint (3) starting from knuckle forward end.
4. Install thrust bearing and nut (4) on end of Bolt.
5. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not over-tighten Nut.**
6. Remove special tool.

813cccc9

7. Install spring link-to-knuckle bolt and nut (3) as shown. While holding bolt head stationary, tighten nut to 138 N·m (102 ft. lbs.) torque.

810f0cc8

8. Export Only – If servicing right spring link, connect headlamp leveling sensor (1) link at spring link (3).
9. Install rear spring as well as all components necessary to access it. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)
10. Lower vehicle.
11. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.
12. Tighten spring link bolt at crossmember to 108 N·m (80 ft. lbs.) torque.
13. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## TENSION LINK

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

**WARNING:** Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side, remove fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - REMOVAL)
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
  - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
  - b. Disconnect exhaust isolators at muffler and resonators hangers.
  - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.
6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

7. Remove shock absorber (1) upper mounting screws (2).

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

**Note:** If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

**CAUTION:** When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow top of shock absorber to clear body flange.

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

**Note:** Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (4) mounting link to knuckle (3).  
 13. Remove nut and bolt (4) mounting link to crossmember (1).  
 14. Remove link.

## INSTALLATION

**Note:** When installing tension link, although link (6) is same end-to-end, make sure that center bow is facing downward.

1. Place link in bracket on crossmember (1). Install bolt and nut (4) at crossmember (1) as shown. **Do not tighten bolt at this time.**
2. Install bolt and nut (4) mounting link to knuckle (3) as shown. **Do not tighten bolt at this time.**

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

5. If vehicle is equipped with AWD, make sure spacers (1) on top of crossmember mount bushings (2) on side of repair are in position.

6. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
7. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N·m (38 ft. lbs.) torque.

**Note:** Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

8. Install crossmember mounting bolts (2 and 3). Snug, but do not fully tighten bolts at this time.

9. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

10. Tighten all crossmember mounting bolts (2 and 3) to 180 N·m (133 ft. lbs.) torque.

11. Remove jack (3) from under rear axle differential.  
 12. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

13. If removed, install fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - INSTALLATION)

14. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

15. Tighten tension link fasteners (4) to:
- Bolt nut at crossmember – 85 N·m (63 ft. lbs.) torque.
  - Bolt at knuckle – 98 N·m (72 ft. lbs.) torque.

## TOE LINK

### REMOVAL

#### LEFT LINK

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

**WARNING:** Before opening fuel system, review all Warnings and Cautions.

3. Remove fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - REMOVAL)
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust.
  - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
  - b. Disconnect exhaust isolators at muffler and resonators hangers.
  - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place.

7. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

**CAUTION:** When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

8. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle. If equipped with AWD, be sure to not to misplace spacers between crossmember mounts and body.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

9. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow toe link mounting bolt at crossmember.
10. If equipped, remove wheel speed sensor cable (2) from toe link.

11. While holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

12. Slide cam bolt (2) rearward out of crossmember and link (1).
13. Remove mounting bolt (3) and nut at knuckle.
14. Remove toe link (1).

## RIGHT LINK

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

3. If equipped, remove wheel speed sensor cable (2) from toe link.

4. While holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

5. Slide cam bolt (2) rearward out of crossmember and link (1).
6. Remove mounting bolt (3) and nut at knuckle.
7. Remove toe link (1).

## INSTALLATION

### LEFT LINK

1. Slide crossmember end of toe link (1) into box bracket on crossmember. Slide cam bolt (2) through bracket and link from rear.
2. Install bolt (3) and nut securing link to knuckle. **Do not tighten bolt at this time.**

3. While holding toe adjustment cam bolt from rotating (cam facing upward), Install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten nut at this time.**

4. If equipped, Attach wheel speed sensor cable (2) to toe link.

5. Carefully raise jack, guiding coil spring and lower end of shock absorber (4) into mounted positions.
6. When lower shock mounting bolt holes line up install bolt (2) and nut (4). **Do not tighten at this time.**

**Note:** Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Continue to raise crossmember in not already in mounted position, then install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N·m (133 ft. lbs.) torque.

10. Remove jack (3) from under rear axle differential.  
 11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

12. Install fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - INSTALLATION)

13. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
14. Lower vehicle.
15. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N·m (53 ft. lbs.) torque.

17. Tighten toe link (1) fasteners to:
  - Nut at crossmember – 108 N·m (80 ft. lbs.) torque (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.)
  - Bolt at knuckle – 81 N·m (60 ft. lbs.) torque.
18. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## RIGHT LINK

1. Slide crossmember end of toe link (1) into box bracket on crossmember. Slide cam bolt (2) through bracket and link from rear of vehicle.
2. Install bolt (3) and nut securing link to knuckle. **Do not tighten bolt at this time.**

3. While holding toe adjustment cam bolt from rotating (cam facing upward), Install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten nut at this time.**

4. If equipped, Attach wheel speed sensor cable (2) to toe link.
5. Raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
7. Lower vehicle.
8. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

9. Tighten toe link (1) fasteners to:
  - Nut at crossmember – 108 N·m (80 ft. lbs.) torque (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.)
  - Bolt at knuckle – 81 N·m (60 ft. lbs.) torque.
10. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## SHOCK ABSORBER

### DESCRIPTION

This vehicle is available with either standard gas-charged shock absorbers or Nivomat™ load-leveling shock absorbers for the rear suspension. Depending on options, the load-leveling shock absorbers may either be standard or optional equipment.

On the exterior, the load-leveling shock absorbers (1) are larger in diameter than the standard shock absorbers. Each load-leveling shock absorber is a self-leveling, self-contained vehicle leveling system and shock absorber combined. It does not require any external compressor, hoses, or height leveling sensors. When cargo or passengers are added, the load-leveling shock absorbers use normal ride motions during driving, even on smooth roads, to raise the rear of the vehicle automatically to the unloaded (or curb) height. When the load is removed, the vehicle maintains this rear ride height.

### REMOVAL

#### STANDARD

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

3. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

4. Remove shock absorber (1) upper mounting bolts (2).
5. Remove shock absorber (4).

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

7. Remove shock absorber (1) upper mounting screws (2).

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

**Note:** If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

**CAUTION:** When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow top of shock absorber to clear body flange.

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

## INSTALLATION

### STANDARD

1. Insert lower end of shock absorber (3) into well of spring link (4).

2. Raise upper end of shock absorber (4) up into mounted position on body (1) and install upper mounting screws (2). Tighten upper mounting screws to 52 N·m (38 ft. lbs.) torque.

3. Install lower shock mounting bolt (2) and nut (4).  
**Do not tighten at this time.**

4. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
5. Lower vehicle.
6. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting bolt.

7. Tighten shock absorber lower mounting bolt nut (4) to 72 N·m (53 ft. lbs.) torque.

## LOAD-LEVELING

1. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

2. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

3. If vehicle is equipped with AWD, make sure spacers (1) on top of crossmember mount bushings (2) on side of repair are in position.

4. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
5. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N·m (38 ft. lbs.) torque.

**Note: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.**

6. Install crossmember mounting bolts (2 and 3). Snug, but do not fully tighten bolts at this time.

7. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

8. Tighten all crossmember mounting bolts (2 and 3) to 180 N·m (133 ft. lbs.) torque.

9. Remove jack (3) from under rear axle differential.  
10. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

11. If removed, install fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - INSTALLATION)

12. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
13. Lower vehicle.
14. Position vehicle on alignment rack/drive-on lift. Raise lift as necessary to access lower mounting bolt.

15. Tighten shock absorber lower mounting bolt nut (4) to 72 N·m (53 ft. lbs.) torque.

## SPRING

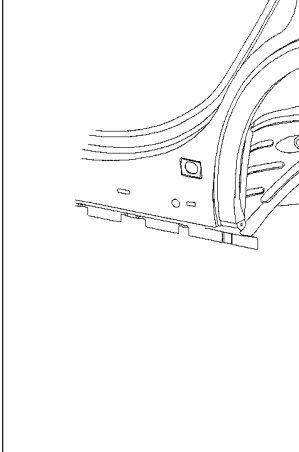

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

**WARNING:** Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side shock absorber, remove fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - REMOVAL)
  4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
  5. Perform following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
    - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
    - b. Disconnect exhaust isolators at muffler and resonators hangers.
    - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.
- 
- The diagram shows the rear three-quarter view of a vehicle's chassis. It highlights the engine cradle, which is supported by jack stands. The exhaust system, including the muffler and resonators, is shown with isolators at the hangers. The diagram illustrates the location where a jack or stand should be placed under the exhaust at the muffler for removal or installation.

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

7. Remove shock absorber (1) upper mounting screws (2).

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

**Note:** If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

**CAUTION:** When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow top of shock absorber to clear body flange.
11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).
12. Disconnect brake hose at bracket mounted to body to allow to avoid overextending hose, damaging it, during following step.
13. Slowly lower jack until crossmember is low enough to remove coil spring. **Do not lower jack any further than necessary to remove spring.**
14. Remove coil spring and isolators (1, 2 and 5).

## INSTALLATION

**Note:** Rear coil springs are interchangeable.

1. Install upper (1) and lower (5) isolators on coil spring (2).

**Note:** Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

2. Install coil spring with isolators into spring pocket of spring link (1) fitting lower isolator (2) to shape of pocket, then align top of spring with body mount.

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

5. If vehicle is equipped with AWD, make sure spacers (1) on top of crossmember mount bushings (2) on side of repair are in position.

6. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
7. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N·m (38 ft. lbs.) torque.

**Note:** Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

8. Install crossmember mounting bolts (2 and 3).  
**Snug, but do not fully tighten bolts at this time.**

9. Measure distance (1) between front tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

10. Tighten all crossmember mounting bolts (2 and 3) to 180 N·m (133 ft. lbs.) torque.

11. Remove jack (3) from under rear axle differential.
12. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

13. Install fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - INSTALLATION)

14. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
15. Lower vehicle.
16. Position vehicle on alignment rack/drive-on lift. Raise lift as necessary to access lower mounting bolt.

17. Tighten shock absorber lower mounting bolt nut (4) to 72 N·m (53 ft. lbs.) torque.

## BAR - STABILIZER

### REMOVAL

1. Disconnect and isolate battery negative cable (2) from battery post.

2. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

4. Remove rear exhaust system (2) (dual-outlet exhaust shown in figure). (Refer to 11 - EXHAUST SYSTEM - REMOVAL)

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

6. Remove three propeller shaft coupler-to-axle flange bolts and nuts.

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown.

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (2) at connector (1) to right rear parking brake cable.
9. Remove front parking brake cable (2) from equalizer (4).

## 10. On each rear disc brake:

- While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
- Remove brake caliper (1) from brake adapter (3) and pads.
- Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

**Note:** To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

- Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

12. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

13. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

14. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**

15. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
16. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

**WARNING:** Before opening fuel system, review all Warnings and Cautions.

17. Remove fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - REMOVAL)

**Note:** If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

18. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.

19. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow propeller shaft removal from rear axle differential. **Do not lower jack any further than necessary.** Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.

20. **Slowly** lower crossmember several inches.
21. Remove screw (2) fastening front parking brake cable routing bracket (2) to rear crossmember.
22. Continue to lower jack until crossmember is at a comfortable working level to access stabilizer bar fasteners.

23. On each end, remove bolt (3) and nut fastening stabilizer bar (4) to stabilizer link (2).
24. Remove bolts (1) fastening each stabilizer bar isolator retainer to crossmember.
25. Remove stabilizer bar (4) with isolators and retainers.
26. Remove retainers from isolators.
27. Remove isolators from stabilizer bar utilizing slits in bushings.

## INSTALLATION

1. Install isolators on stabilizer bar utilizing slits in bushings. Install each isolator so its slit faces forward and flat side is positioned toward crossmember once installed.
2. Install retainers on isolators.
3. Install stabilizer bar (4) with isolators and retainers on crossmember.
4. Install isolator retainer mounting bolts (1). **Do not tighten at this time.**
5. Install bolt (3) and nut fastening stabilizer bar ends to each stabilizer links (2). **Do not tighten at this time.**
6. Tighten isolator retainer mounting bolts (1) to 61 N·m (45 ft. lbs.) torque.

7. Remove coil springs (2) with isolators (1 and 5) from spring links (4).

8. Raise crossmember using jack until there is about 10 inches clearance to the to body mounting points.
9. Install screw (2) fastening front parking brake cable routing bracket (1) to rear crossmember.

10. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft onto rear axle differential flange and align shocks with pockets in spring links.

**Note:** There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

11. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

12. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

**Note:** Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

13. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

14. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
15. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

16. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

**Note:** There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

17. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
18. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

**CAUTION:** To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

19. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

**Note:** Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

20. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

21. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
22. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

23. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

**Note:** There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

24. Raise left side of crossmember (1) into mounted position. Install left side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

25. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

26. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

27. Tighten all four crossmember mounting bolts (2 and 3) to 180 N·m (133 ft. lbs.) torque.

28. Remove jack (3) from under rear axle differential.

29. Remove bungee cord (1) supporting propeller shaft (2).

30. Align propeller shaft index marks (3) placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N·m (60 ft. lbs.) torque.

31. Install fuel filler tube. (Refer to 14 - FUEL SYSTEM/FUEL DELIVERY/FUEL TANK FILLER TUBE - INSTALLATION)

32. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

33. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
34. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

35. On each rear disc brake:

- Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
- Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).

**CAUTION:** Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

- Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N·m (44 ft. lbs.) torque.
- Make sure brake hose is properly routed and will not come in contact with suspension components.

36. Route parking brake cable above rear crossmember, then slide cable (2) through equalizer (4) above rear differential.

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

37. Connect front parking brake cable (2) at connector (1) to right rear parking brake cable (6).

38. Install rear exhaust system (2) (dual-outlet exhaust shown in figure). (Refer to 11 - EXHAUST SYSTEM - INSTALLATION)

39. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
40. Lower vehicle until rear wheels are just above floor level.
41. Apply parking brake lever. Release lever, then reapply.
42. Check to make sure rear wheels will not rotate with lever applied.
43. Lower vehicle.

44. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
45. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

46. Tighten shock absorber lower mounting bolt nuts (4) to 72 N·m (53 ft. lbs.) torque.

47. Tighten stabilizer link fasteners (3) to 61 N·m (45 ft. lbs.) torque.
48. Perform wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

## WHEEL ALIGNMENT

### DESCRIPTION

Vehicle wheel alignment is the positioning of all interrelated front and rear suspension angles. These angles affect the handling and steering of the vehicle when it is in motion. Proper wheel alignment is essential for efficient steering, good directional stability, and proper tire wear.

The method of checking a vehicle's front and rear wheel alignment varies depending on the manufacturer and type of equipment used. The manufacturer's instructions should always be followed to ensure accuracy of the alignment, except when DaimlerChrysler Corporation's wheel alignment specifications differ.

On this vehicle, the suspension angles that can be adjusted are as follows:

#### FRONT:

- Camber (with cradle shift/service adjustment bolt package)
- Caster (with cradle shift/service adjustment bolt package)
- Toe

#### REAR:

- Toe

Check the wheel alignment and make all wheel alignment adjustments with the vehicle standing at its proper curb height specification. Curb height is the normal riding height of the vehicle. It is measured from a certain point on the vehicle to the ground or a designated area while the vehicle is sitting on a flat, level surface. Refer to Curb Height Measurement in this section for additional information.

Typical wheel alignment angles and measurements are described in the following paragraphs.

## CAMBER

Camber is the inward or outward tilt of the top of the tire and wheel assembly. Inward tilt (2) is negative camber. Outward tilt (1) is positive camber. Camber is measured in degrees of angle relative to a true vertical line. Camber is a tire wearing angle.

- Excessive negative camber will cause tread wear at the inside of the tire.
- Excessive positive camber will cause tread wear on the outside of the tire.

## CROSS CAMBER

Cross camber is the difference between left and right camber. To achieve the cross camber reading, subtract the right side camber reading from the left. For example, if the left camber is  $+0.3^\circ$  and the right camber is  $0.0^\circ$ , the cross camber would be  $+0.3^\circ$ .

## CASTER

Caster is the forward or rearward tilt of the steering knuckle in reference to the position of the upper and lower ball joints. Caster is measured in degrees of angle relative to a true vertical center line. This line is viewed from the side of the tire and wheel assembly.

- Forward tilt (upper ball joint ahead of lower) results in a negative caster angle.
- Rearward tilt (upper ball joint trailing lower) results in a positive caster angle.

Although caster does not affect tire wear, a caster imbalance between the two front wheels may cause the vehicle to lead to the side with the least positive caster.

## CROSS CASTER

Cross caster is the difference between left and right caster.

## TOE

Toe is the inward or outward angle of the wheels as viewed from above the vehicle.

- Toe-in (1) is produced when the front edges of the wheels on the same axle are closer together than the rear edges.
- Toe-out (2) is produced when the front edges of the wheels on the same axle are farther apart than the rear edges.

Toe-in and toe-out can occur at the front wheels and the rear wheels.

Toe is measured in degrees or inches. The measurement identifies the amount that the front of the wheels point inward (toe-in) or outward (toe-out). Toe is measured at the spindle height. Zero toe means the front and rear edges of the wheels on the same axle are equally distant.

## TOE-OUT ON TURNS

Toe-out on turns is the relative positioning of the front wheels while steering through a turn. This compensates for each front wheel's turning radius. As the vehicle encounters a turn, the outboard wheel must travel in a larger radius circle than the inboard wheel. The steering system is designed to make each wheel follow its particular radius circle. To accomplish this, the front wheels must progressively toe outward as the steering is turned from center. This eliminates tire scrubbing and undue tire wear when steering a vehicle through a turn.

## DYNAMIC TOE PATTERN

Dynamic toe pattern is the inward and outward toe movement of the front and rear tires through the suspension's jounce and rebound travel. As the vehicle's suspension moves up and down, the toe pattern varies. Toe pattern is critical in controlling the directional stability of the vehicle while in motion. Front and rear dynamic toe pattern is preset by the factory at the time the vehicle is assembled.

It is not necessary to check or adjust front or rear dynamic toe pattern when doing a normal wheel alignment. The only time dynamic toe pattern needs to be checked or adjusted is if the frame of the vehicle has been damaged.

## STEERING AXIS INCLINATION (S. A. I.)

Steering axis inclination is the angle between a true vertical line starting at the center of the tire at the road contact point and a line drawn through the center of the upper ball joint (or strut) and the lower ball joint (1). S.A.I. is built into the vehicle and is not an adjustable angle. If S.A.I. is not within specifications, a bent or damaged suspension component may be the cause.

## INCLUDED ANGLE (I. A.)

Included angle (3) is the sum of the S.A.I. angle (1) plus or minus the camber angle (2), depending on whether or not the wheel has positive or negative camber. If camber is positive (2), add the camber angle to the S.A.I. angle. If camber is negative, subtract the camber angle from the S.A.I. angle. Included angle is not adjustable, but can be used to diagnose a frame misalignment or bent suspension component (spindle, strut).

## THRUST ANGLE

Thrust angle is the averaged direction the rear wheels are pointing in relation to the vehicle's center line. The presence of negative or positive thrust angle causes the rear tires to track improperly to the left or right of the front tires (dog tracking).

- Negative thrust angle means the rear tires are tracking to the left of the front tires.
- Positive thrust angle means the rear tires are tracking to the right of the front tires.

Improper tracking can cause undue tire wear, a lead or pull and a crooked steering wheel. Excessive thrust angle can usually be corrected by adjusting the rear wheel toe so that each wheel has one-half of the total toe measurement.

Replace steering intermediate shaft/coupler</li> </ol>

## VEHICLE LEAD/PULL

To assure correct diagnosis, it is important to follow the steps outlined below in the order shown. Road test the vehicle before and after each step to verify that the lead condition has been corrected. When evaluating a vehicle, always drive the same road in both directions to get a feel for the effect of road crown and cross wind. A neutral vehicle will exhibit a small amount of drift on both right and left crowned roads (normal crown sensitivity). A vehicle with pronounced lead/pull may have one or more of the following conditions:

1. **UNEQUAL TIRE PRESSURE.** Adjust tire pressure to the pressure stated on door placard. Make sure the tire pressure is equal on all four tires and evaluate the car. Also verify that the tire size and type are correct and match each other. If the car still has a lead condition go to step (2).
2. **TIRE CONICITY.** Excessive tire conicity is one of the more frequent causes of vehicle lead. Cross-switch the front tires and evaluate the car. If the car still leads in the same direction or gets worse, return the front tires to their original position, then go to step (3).
3. **SUSPENSION ALIGNMENT.** Check and record the wheel alignment settings. Non-symmetrical front caster or camber can sometimes cause a lead condition or can be used to fix a lead condition. Adjust the wheel alignment as necessary to preferred settings (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE). If the car still leads, go to step (4).

4. **STEERING GEAR VALVE IMBALANCE.** Steering gear valve imbalance can sometimes cause a vehicle lead. Although there is no quick test or measurement that can be performed to verify a good or bad steering gear valve, generally the steering efforts will feel much lighter in the lead direction and heavier in the opposite direction with an unbalanced valve. Replace the steering gear only as a "last resort" to solve the problem. To replace the steering gear, (Refer to 19 - STEERING/GEAR - REMOVAL).

## STANDARD PROCEDURE

### WHEEL ALIGNMENT

#### PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to ensure proper alignment.

1. Verify that the fuel tank is full of fuel. If the tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment angles.
2. The vehicle's passenger and luggage compartments should be free of any load that is not factory equipment.
3. Check the tires on the vehicle. All tires must be the same size and in good condition with approximately the same amount of tread wear. Inflate all the tires to the recommended air pressure.
4. Check the wheel and tire assemblies for excessive radial runout.
5. Inspect lower ball joints and all steering linkage for looseness, binding, wear or damage. Repair as necessary.
6. Check suspension fasteners for proper torque and tighten as necessary.
7. Inspect all suspension component rubber bushings for signs of wear or deterioration. Replace any faulty bushings or components before aligning the vehicle.
8. Check the vehicle's curb height to verify it is within specifications. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE - CURB HEIGHT MEASUREMENT)

#### WHEEL ALIGNMENT SETUP

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

**Note:** Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced (suspension compressed/released). Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS)
4. If front camber and caster are not within specifications, proceed to CAMBER AND CASTER below. If caster and camber are within specifications, proceed to TOE which can be found following CAMBER AND CASTER. Rear camber and caster are not adjustable. If found not to be within specifications, reinspect for damaged suspension or body components and replace as necessary. If rear toe is not within specifications, adjust rear toe before proceeding to adjust front toe.

#### CAMBER AND CASTER

Camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as NET BUILD. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles. Camber and caster should be checked to ensure they meet vehicle specifications.

If individual front camber or caster is found not to meet alignment specifications, each can be adjusted by shifting the engine cradle if cross-camber and cross-caster are within specifications, or by using an available service adjustment bolt package. Always try to shift the cradle first **(if camber and caster are off slightly)** to correct the mis-

alignment before installing an adjustment bolt package. If an adjustment bolt package installation is necessary, inspect the suspension components for any signs of damage or bending first.

**CAUTION:** Do not attempt to adjust the vehicles wheel alignment by heating, bending or by performing any other modification to the vehicle's front suspension components or body.

### ADJUSTMENT BY SHIFTING CRADLE

**CAUTION:** Always use care when shifting cradle to avoid damaging other components on the vehicle.

1. Loosen the four bolts (1) fastening the engine cradle (2) to the frame just enough to allow movement of the cradle.
2. Shift cradle as necessary to bring camber or caster into specifications. When shifting cradle, use care not to move other angles (camber or caster) that are within specifications, out of specifications.
3. Tighten the four bolts (1) fastening the engine cradle (2) to the frame to specifications.
4. Jounce the rear, then front of the vehicle an equal amount of times.
5. Measure camber and caster. If camber and caster are within specifications, proceed to TOE. If camber or caster cannot be brought into specifications, perform the ADJUSTMENT BOLT PACKAGE INSTALLATION below.

### ADJUSTMENT BOLT PACKAGE INSTALLATION - RWD

The adjustment bolt package contains 2 special bolts (1). These bolts can be identified by the offset grooves cut into the thread section (2). These bolts are designed to replace the inboard mounting bolts of the lower control arm and tension strut. Each bolt allows approximately 0.3 degrees of movement. To adjust camber only, use both bolts, one at the tension strut and the other at the lower control arm. To adjust caster only, use one bolt at the tension strut only.

1. Raise the vehicle by the frame until the tires are not supporting the weight of the vehicle.
2. Remove the belly pan as necessary. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL)
3. Lower control arm bolt only:
  - a. Remove the screws fastening the heat shields covering the stabilizer bar bushing retainers to the cradle. Remove the heat shields.
  - b. Remove the four bolts (two each) fastening the stabilizer bar bushing retainers to the cradle.
  - c. Swing the stabilizer bar rearward and down out of the way of the control arm mounting bolts.

**CAUTION:** Wheel alignment adjustment bolts have offset grooves cut into the length of the bolt (2). If removing or installing lower control arm or tension strut mounting bolts that have these grooves, **DO NOT ROTATE THE BOLT**. To remove the bolt, hold the bolt head stationary and rotate the nut, then slide the bolt straight out of the bushing. This is necessary to avoid damaging the bat wings in the bushing inner metal or cradle.

813e6532

4. Hold the head of the control arm or tension strut mounting bolt stationary and remove the nut. Slide the bolt straight out of the bushing and discard.

**CAUTION:** When installing an adjustment bolt, be sure to install it in the correct direction. Lower control arm bolts must be installed from the rear-forward to avoid contact with the stabilizer bar upon installation. Tension strut bolts must be installed from the front-rearward.

**Note:** The grooves on the adjustment bolts are off-center forcing the bolt to be installed in one of two ways depending on whether more positive or negative camber or caster is necessary. The Bolts must be rotated 180° to achieve either more positive or negative camber or caster. **DO NOT** force the adjustment bolt.

**Note:** The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the “bat wings” (c).

5. Camber Adjustment – The adjustment bolts are designed to work in conjunction with “bat wing” holes that are formed into the inner metal of the lower control arm bushing (1) allowing for lower control arm movement approximately 0.3° in either direction.

- To achieve more positive camber, refer to (a) in the figure. Move the control arm or tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the round hole in engine cradle and bat wing hole (1) in the bushing inner metal.
- To achieve more negative camber, refer to (b) in the figure. Move the control arm or tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the round hole in engine cradle and bat wing hole (1) in the bushing inner metal.

8131a581

**Note:** The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the “bat wings” (c).

6. Caster Adjustment – The adjustment bolts are designed to work in conjunction with “bat wings” that are formed into the engine cradle (1) allowing for tension strut movement approximately 0.3° in either direction.

- To achieve more positive caster, refer to (a) in the figure. Move the tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in engine cradle (1) and round hole in the bushing inner metal.
- To achieve more negative caster, refer to (b) in the figure. Move the tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in engine cradle (1) and round hole in the bushing inner metal.

7. Start a NEW nut (and a washer on RWD vehicles) on the end of the mounting bolt by hand, then while holding the head of the bolt stationary, install the nut. **Do not tighten the nut at this time.**
8. Lower the vehicle to curb position. Jounce the rear, then the front of the vehicle an equal amount of times.
9. Using a crowsfoot wrench, tighten the adjustment bolt **nut** to 176 N·m (130 ft. lbs.) torque while holding the bolt stationary.
10. Reinstall the stabilizer bar and heat shields.
11. Measure camber and caster. If camber and caster are not within specifications, inspect the suspension components for any signs of damage or bending. If camber and caster (and cross-camber and cross-caster) are within specifications, proceed with TOE to check and adjust toe.
12. Install the belly pan. (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION)

## TOE

1. Center the steering wheel and lock in place using a steering wheel clamp.

**Note:** When performing the toe adjustment procedure, set rear toe to specifications before setting front toe.

## REAR TOE

**Note:** Perform the following procedure to each side of the vehicle as necessary.

1. Loosen the cam bolt nut securing the toe link to the rear crossmember (front of rear crossmember) just enough to rotate the cam bolt (1).

**Note:** When adjusting rear toe, the eccentric lobes on the toe adjustment cam bolts and washers are not to be facing downward. The lobes should only be facing upward or up to 90° to one side or the other from the 12 O'clock position.

2. Rotate the cam bolt head on the opposite side (rear) of the crossmember in either direction until the preferred specification is obtained. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS)
3. While holding the cam bolt (1) from turning, tighten the cam bolt nut to specifications.
4. Adjust rear toe on opposite side of vehicle using above procedure as necessary.

5. Once rear toe is set, proceed to FRONT TOE to set the vehicle's front toe.

## FRONT TOE

**Note:** Perform the following procedure to each side of the vehicle as necessary.

**CAUTION:** Do not twist inner tie rod-to-steering gear boots during front wheel Toe adjustment. Remove boot clamps at the inner tie rods and make sure boots moves freely on inner tie rod.

1. Loosen the jam nut (3) at the inner-to-outer tie rod (4-5) connection.

2. Grasp inner tie rod at hex and rotate as necessary to adjust front toe to preferred toe specification. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - SPECIFICATIONS)

3. Tighten tie rod jam nut (3) to 75 N·m (55 ft. lbs.) torque using care not to lose adjustment.
4. Make sure inner tie rod-to-steering gear boot is not twisted, then reinstall boot clamp at inner tie rod.
5. Adjust front toe on opposite side of vehicle using above procedure as necessary.

812d6dd3

2. Remove steering wheel clamp.
3. Remove alignment equipment.
4. Road test vehicle to verify steering wheel is straight and vehicle does not wander or pull.

## CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full of fuel, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

**Note: When measuring, the maximum left-to-right differential is not to exceed 12.5 mm (0.5 in.).**

1. Front – On each side of the vehicle, measure the distance (2) from the frame rail just behind the engine cradle rear mount (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.

812dcdb7

2. Rear – On each side of the vehicle, measure the distance (2) from the travel limiter (1) attached to the front rear crossmember mount bushing to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.

3. Compare the measurements to the specifications listed in the following Curb Height Specifications chart.

#### CURB HEIGHT SPECIFICATIONS

WHEEL DIAMETER	FRONT	REAR
AWD	353 mm $\pm$ 10 mm 13.90 in. $\pm$ 0.39 in	307 mm $\pm$ 10 mm 12.09 in. $\pm$ 0.39 in.
RWD	328 mm $\pm$ 10 mm 12.91 in. $\pm$ 0.39 in	296 mm $\pm$ 10 mm 11.65 in. $\pm$ 0.39 in.

## SPECIFICATIONS

### WHEEL ALIGNMENT

**Note:** All specifications are given in degrees.

**Note:** All wheel alignments are to be set at curb height. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

#### REAR WHEEL DRIVE

FRONT WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER - LEFT	−0.00°	−0.50° to +0.50°
CAMBER - RIGHT	−0.10°	−0.60° to +0.40°
Cross-Camber (Maximum side-to-side difference)	0.10°	1.00°
CASTER - LEFT	+11.10°	+9.00° to +12.10°
CASTER - RIGHT	+11.10°	+9.50° to +12.10°
Cross-Caster (Maximum side-to-side difference)	0.00°	2.00°
TOTAL TOE**	+0.20°	0.00° to +0.40°
Maximum side-to-side difference	0.00°	0.06°
REAR WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER*	−0.55°	−1.05° to −0.05°
Cross-Camber (Maximum side-to-side difference)	0.00°	1.00°
TOTAL TOE**	0.20°	−0.10° to +0.50°
THRUST ANGLE	0.0°	−0.15° to +0.15°
Notes:		
* For reference only. These are non-adjustable angles.		
** TOTAL TOE is the sum of both left and right wheel toe settings. TOTAL TOE must be equally split between each front wheel to ensure the steering wheel is centered after setting toe. Positive toe is toe-in and negative toe is toe-out

## PROPELLER SHAFT

### DESCRIPTION

**WARNING:** Due to propeller shaft imbalance concerns, propeller shaft service is limited to center support bearing and coupler replacement only. The rear segment single-cardan universal joint is not serviceable.

RWD Models utilize a “two-piece” propeller shaft design to transmit torque to the rear axle assembly. This two-piece design consists of:

- Front and rear shaft segments
- Center support bearing/bracket assembly
- Single-Cardan u-joint at rear segment/bearing interface
- Rubber couplers at transmission and rear axle flanges
- Fore-mounted vibration damper (V6 Models)

8131b678

*Propeller Shaft Assembly (V8 System Shown)*

- 1 - FRONT COUPLER
- 2 - FRONT SEGMENT
- 3 - BEARING/BACKET ASSEMBLY
- 4 - SINGLE-CARDAN U-JOINT
- 5 - REAR COUPLER
- 6 - REAR SEGMENT

The front shaft segment is designed with a collapsing feature, consisting of two concentric tubes secured by shear pins. This feature allows the tubes to telescope up to 200 mm (8 in.) during certain impacts.

The flexible rubber couplers at the transmission and axle flanges absorb vibration. The low-travel Single-Cardan universal joint permits the minimal axial and angular variations that occur with independent rear suspension.

Additionally, models equipped with the V6 engine utilize a vibration damper which is designed to absorb and isolate driveline vibrations and harmonics. This damper is mounted to the front segment, sandwiched between the coupler and propeller shaft.

## REMOVAL

**CAUTION:** Propeller shaft removal is a two-man operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

1. With vehicle in neutral, position on hoist.
2. Apply alignment index marks (3) on the transmission and axle flanges (2) and rubber couplers (1).

3. Remove crossmember (1).

4. Remove rear exhaust system (2).

5. Remove heat shield (1).

6. Remove propeller shaft front coupler-to-flange bolts.

7. Remove propeller shaft rear coupler-to-flange bolts.

8. Remove center bearing (1) mounting bolts.
9. With the aid of a helper, remove propeller shaft assembly.

## COUPLER/DAMPER SERVICE

1. Remove three coupler-to-propeller shaft bolt/nuts.
2. Separate coupler (1) and damper (3) (if equipped) from propeller shaft. Note orientation and direction of components. It is imperative that they are properly reinstalled.

## INSTALLATION

**CAUTION:** Propeller shaft installation is a two-man operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

**COUPLER/DAMPER SERVICE**

1. If coupler and/or damper (V6 Models) were removed, align index marks and reinstall. **Make sure protruding sleeve (2) is properly seated into propshaft or damper counterbores.**
2. Install three bolts with washers and nuts and torque to 81 N·m (60 ft. lbs.) torque.

1. Obtain helper and install propeller shaft into position at axle. Align index marks (3) placed upon removal. Install propeller shaft rear coupler-to-axle flange bolt/nuts by hand. Do not torque at this time.

2. Install propeller shaft into position at transmission flange. Align index marks placed upon removal. Install propeller shaft front coupler-to-transmission flange bolt/nuts by hand. Do not torque at this time.

3. Loosely install center bearing-to-body bolts. Do not torque at this time.

4. Torque propeller shaft front coupler-to-transmission flange bolt/nuts to 58 N·m (43 ft. lbs.)

5. Torque propeller shaft rear coupler-to-axle flange bolt/nuts to 58 N·m (43 ft. lbs.)

**Note:** Note: It is necessary to compress rear suspension to ride height before securing center bearing to body. Failure to compress suspension may result in objectionable noise and premature bearing wear.

6. Compress rear suspension with suitable jack stands (1).

7. Torque center bearing-to-body bolts to 31 N·m (23 ft. lbs.).

8. Install heat shield (1).

9. Install rear exhaust system (2)

10. Install crossmember (1).

## SPECIAL TOOLS – PROPELLER SHAFT

1130-80108ac3

***Bearing Splitter, 1130***

***Installer C-4735-1***

## CENTER BEARING

### REMOVAL

1. Remove propeller shaft from vehicle.

**Note:** To address propeller shaft imbalance concerns, the propeller shaft spline interface has a “skip-tooth” design allowing only one possible assembly orientation. Install reference marks only to aid in assembly.

2. Mark front and rear shaft segments (2,3) with installation reference marks (1).

3. Separate propeller shaft front and rear segments at bearing and remove boot (1)

4. Press center bearing (1) off of rear shaft segment using arbor press and Bearing Splitter 1130 (2).

## INSTALLATION

1. Install propeller shaft rear segment into press, supported on joint yoke (3).
2. Install bearing assembly as shown (2).
3. Using Tool C-4735-1 (1), press bearing assembly (2) onto shaft.

4. Remove propeller shaft from press.
5. Install boot (1) to rear shaft segment.

**Note:** To address propeller shaft imbalance concerns, the propeller shaft spline interface has a “skip-tooth” design allowing only one possible assembly orientation.

6. Align index marks placed upon disassembly and install front segment (1) to rear segment.
7. Install boot (2) to front segment, seating boot into groove (3).
8. Install propeller shaft into vehicle.

## HALF SHAFT - REAR

DESCRIPTION	14	SPECIFICATIONS - TORQUE	23
DIAGNOSIS AND TESTING - HALF SHAFT	14	SPECIAL TOOLS	24
REMOVAL	15		

## HALF SHAFT - REAR

### DESCRIPTION

The inner joints of both half shaft assemblies are cross-groove joints. The outer joints of both assemblies are Rzeppa Joints. The cross-groove joints are true constant velocity (CV) joint assemblies, which allow for the changes in half shaft length through the jounce and rebound travel of the rear suspension.

The inner cross-groove joint of both half shafts is splined into the rear differential assembly and retained by a snap ring. The outer CV joint has a stub shaft that is splined into the wheel hub and retained by a steel hub nut.

### DIAGNOSIS AND TESTING - HALF SHAFT

#### VEHICLE INSPECTION

1. Check for grease in the vicinity of the inboard cross-groove joint and outboard CV joint; this is a sign of inner or outer joint seal boot or seal boot clamp damage.

#### NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

- Damaged outer CV or inner cross-groove joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
- Noise may also be caused by another component of the vehicle coming in contact with the half shafts.

#### CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

- A torn seal boot on the inner or outer joint of the half shaft assembly.
- A loose or missing clamp on the inner or outer joint of the half shaft assembly.
- A damaged or worn half shaft CV joint.

#### SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

- A worn or damaged half shaft inner cross-groove joint.
- Improper wheel alignment. (Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - STANDARD PROCEDURE)

#### VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

- Foreign material (mud, etc.) packed on the backside of the wheel(s).
- Out of balance tires or wheels. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)
- Improper tire and/or wheel runout. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

## REMOVAL

**Note:** This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

**Note:** Halfshaft inner and outer boots are not serviceable separately. Boot replacement requires entire shaft assembly replacement.

**CAUTION:** Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to:
  - 198 Axle: 60 N·m (44 ft. lbs.)
  - 210 Axle: 50 N·m (37 ft. lbs.)
4. Remove rear exhaust system (2) on V8-equipped models.

5. Remove wheel/tire assembly (1) from sides that shaft is to be removed.

6. Remove wheel hub nut. (1)

7. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

8. Remove three (3) propeller shaft coupler-to-axle flange bolt/nuts.

9. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

10. If a drive-on hoist is used, position transmission jack(1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

11. Remove rear axle forward mount isolator (1) bolt/nut (2).

12. Remove two rear axle-to-crossmember bolts (1).

13. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

14. Lower axle just enough to remove halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.
15. Remove halfshaft from hub. Repeat on other side if necessary.

16. Remove axle seals using suitable screwdriver.

## INSTALLATION

1. Install new axle seal(s) (1) using Tool 9223 (2).

2. Install halfshaft (2) to wheel hub/knuckle assembly and start hub nut (1) by hand.

3. Using new circlip(s), install halfshaft (1) to rear axle assembly. Use care not to damage axle seals(2). Verify proper installation by pulling outward on joint by hand.

4. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

5. Install two rear axle-to-crossmember bolts (1) and torque to 220 N·m (162 ft. lbs.).

6. Install rear axle front mount isolator (1) as shown and torque bolt/nut to 65 N·m (48 ft. lbs.).

7. Again verify halfshaft inner joints are fully engaged to axle assembly.  
8. Remove transmission jack (1).  
9. If used, remove screw-type under-hoist jack stands (2).

10. Torque propeller shaft coupler-to-axle flange bolt/nuts to 58 N·m (43 ft. lbs.).

11. Using a 14mm hex, remove rear axle fill plug (1). Fill axle with 1.4L (1.5 qts.) of Mopar® 75W-140 Synthetic Gear & Axle Lubricant. Install fill plug and torque to 60 N·m (44 ft. lbs.).

12. Lower vehicle. Torque halfshaft hub nut (1) to 213 N·m (157 ft. lbs.). Install wheel center cap.

- 6 - DIFFERENTIAL
- 7 - RING, SNAP
- 8 - COVER, AXLE
- 9 - GEAR, RING

The 198 MM RII (Rear-Independent-Iron) axle is an independent assembly with a cast iron housing and differential. The 198 MM RII uses an open differential which is supported by two tapered roller bearings located on either side of the case. Differential bearing preload and ring gear backlash are controlled with select snap-rings located on the outside of the differential bearing cups. Pinion height is set with a select shim located under the rear pinion bearing cup.

The 198 axle is available only in V6 engine-equipped models in three available gear ratios: 3.08, 3.64 & 3.90:1.

## AXLE IDENTIFICATION

The 198 MM axle utilizes a barcoded label (1) which is adhered to the top of the axle housing as shown. The following information is found on the identification label:

- Traceability Code (Plant Use)
- Axle Part Number
- Axle Gear Ratio

**198 Axle Identification Label**

## DIAGNOSIS AND TESTING

### GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

### BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

## LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

## VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or CV joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rearend vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

## DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV joints.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

## DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Wheel Noise	<ol style="list-style-type: none"> <li>1. Wheel loose.</li> <li>2. Faulty, brinelled wheel bearing.</li> </ol>	<ol style="list-style-type: none"> <li>1. Tighten loose nuts.</li> <li>2. Replace bearing.</li> </ol>
Differential Cracked	<ol style="list-style-type: none"> <li>1. Improper differential side bearing preload.</li> <li>2. Excessive ring gear backlash.</li> <li>3. Vehicle overloaded.</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly.</li> <li>2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.</li> <li>3. Replace case and inspect gears and bearings for further damage. ## STANDARD PROCEDURE - FLUID DRAIN AND FILL

**Note:** Note: The fluid required for use in this axle is Mopar® Synthetic Gear and Axle Lubricant 75W-140.

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.
2. With vehicle in neutral, position and raise vehicle on hoist.
3. Remove rear axle drain plug and drain lubricant completely from the axle.
4. Install drain plug and tighten to 60 N·m (44 ft lbs).

5. Remove fill plug (1) and fill rear axle with 1.4 L (1.5 qts.) Mopar® Synthetic Gear & Axle Lubricant 75W-140.
6. Install fill plug and tighten to 60 N·m (44 ft lbs).

## REMOVAL

**Note:** This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

**CAUTION:** Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to 50 N·m (37 ft. lbs.) torque.

4. Remove rear exhaust system (2) on dual-outlet exhaust models.

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

6. Remove three (3) propeller shaft coupler-to-axle flange bolt/nuts.

7. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

8. If a drive-on hoist is used, position transmission jack(1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

9. Remove rear axle forward mount isolator (1) bolt/nut (2).

10. Remove two rear axle-to-crossmember bolts (1).

11. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

12. Lower axle just enough to remove both halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.

13. Remove axle assembly from vehicle and transfer to bench.
14. Using suitable screwdriver, remove axle seals and discard.

## INSTALLATION

1. Install new axle seal(s) (1) using Tool 9223 (2).

2. Using new circlip(s), install halfshaft (1) to rear axle assembly. Use care not to damage axle seals(2). Verify proper installation by pulling outward on joint by hand.

3. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

4. Install two rear axle-to-crossmember bolts (1) and torque to 220 N·m (162 ft. lbs.).

5. Install rear axle front mount isolator (1) as shown and torque bolt/nut to 65 N·m (48 ft. lbs.).

6. Again verify halfshaft inner joints are fully engaged to axle assembly.
7. Remove transmission jack (1).
8. If used, remove screw-type under-hoist jack stands (2).

9. Torque propeller shaft coupler-to-axle flange bolt/nuts to 58 N·m (43 ft. lbs.).

10. Using a 14mm hex, remove rear axle fill plug (1). Fill axle with 1.4L (1.5 qts.) of Mopar® 75W-140 Synthetic Gear & Axle Lubricant. Install fill plug and torque to 60 N·m (44 ft. lbs.).

## ADJUSTMENTS

### ADJUSTMENT - PINION DEPTH

#### PINION DEPTH VARIANCE

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus (+) number, minus (–) number or zero (0) along with the gear set sequence number (01 to 99) is on each gear. The pinion depth variance (1) is the amount the depth varies from the standard depth setting of a pinion marked with a (0). The remaining numbers (2) are the sequence number of the gear set. The standard depth provides the best gear tooth contact pattern.

Compensation for pinion depth variance is achieved with select shims (3). The shims are sandwiched between the pinion head bearing cup (4) and axle housing.

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim to compensate for the difference in the depth variances. The numbers represent deviation from the standard in microns. If the number is negative, subtract that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

**PINION GEAR DEPTH VARIANCE**

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance

**PINION DEPTH MEASUREMENT**

Pinion depth measurement is taken with the pinion head and tail bearing cups pressed into the axle housing without the shim.

1. Press pinion head bearing cup into housing using Tools C-4171 (1) and C-4310 (2).

2. Press pinion tail bearing cup into housing using Tools C-4171 (1) and D-146 (2).

3. Install Pinion Height Block 6739 (3), Pinion Gage Block 9227 (2), and pinion head bearing cone (1) onto Screw 6741. Install assembly into axle housing and through bearing cups.

4. Install pinion tail bearing and Cone 6740 (4). Tighten Cone 6740 by hand until 3.4 N·m (30 in. lbs.) of rotating torque is measured at Screw 6741 (5).

5. Install Arbor Discs 9228 (1).

6. Install Arbor Bar D-115-3 (1).

7. Verify pinion depth setup is as shown.

8. Install Dial Indicator 9524 (1) to Scooter Block D-115-2A (2). Secure with set-screw (3).

9. Install Indicator/Block assembly to top of Height Block 6739 (1). Zero indicator on top surface.

10. Slide indicator probe off of height block and onto Arbor Bar D-115-3 (2). As indicator contacts Arbor Bar (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of the arbor bar and record the highest reading.

11. Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number (1) written on the side of the pinion shaft. For example, if the depth variance is  $-1$ , subtract 0.025mm (0.001 in.) from dial indicator reading.

## ADJUSTMENT - SIDE BEARING PRELOAD AND RING GEAR BACKLASH

### DIFFERENTIAL SIDE BEARING PRELOAD MEASUREMENT/CORRECTION

Differential side bearing preload should be measured and adjusted after the following scenarios:

- Differential case replacement
- Differential side bearing replacement
- Axle housing replacement
- Loss or replacement of side bearing snap rings

If none of these situations apply, refer to Adjustment — Ring Gear Backlash

1. Install Spreader Adapter Plates 9226 (1) as shown

2. Mount axle housing to Spreader W-129-B (1).

3. Set up Dial Indicator Set C-3339-A as shown to measure axle housing spread:

- a. Clamp SP-5426 (1)
- b. Post SP-5425-B (2)
- c. Metric Dial Indicator 9524 (3)

4. If differential side bearing cups and snap rings are removed at this point, skip to Step 8. Otherwise, expand spreader to spread axle housing no more than 0.30 mm (0.012 in.).

5. Remove both differential side bearing snap rings (1). Tag snap ring to ensure replacement to original position.

6. Measure and record snap ring (2) thickness for later use.

7. Relax spreader (1) to relieve tension on axle housing.

8. Install right (pinion) side bearing cup and snap ring (1).

9. Zero dial indicator.
10. Expand spreader (1) to spread axle housing no more than 0.30 mm (0.012 in.).

11. Install left (ring gear) side bearing cup and snap ring (1).

12. Relax spreader (1) to relieve tension on axle housing.

13. Measurement showing on indicator is the axle housing retained spread. Proper differential side bearing preload is achieved with an axle housing retained spread of 0.18-0.23 mm (0.007-0.009 in.).
14. If retained spread is less than 0.18 mm (0.007 in.), increase snap ring thickness at each side in equal increments.
15. If retained spread is greater than 0.23 mm (0.009 in.), decrease snap ring thickness at each side in equal increments.

## RING GEAR BACKLASH MEASUREMENT/CORRECTION

Differential Ring Gear Backlash should be measured and adjusted after the following scenarios:

1. Ring and pinion gear replacement
2. Pinion head bearing replacement
3. Pinion depth (shim) adjustment
4. Differential case replacement
5. Differential side bearing replacement
6. Axle housing replacement

**Note:** If Spreader W-129-B is installed, make sure tension on axle housing is relieved.

7. Set up Dial Indicator Set C-3339-A as shown to measure ring gear backlash:
  - a. Clamp SP-5426 (1)
  - b. Post SP-5425-B (2)
  - c. Metric Dial Indicator 9524 (3)
8. Rotate ring gear one direction to take up clearance to pinion. Verify indicator tip is in contact with ring gear and zero indicator. Rotate ring gear back and forth and record measurement. Ring gear backlash should be 0.13-0.18 mm (0.005-0.007 in.). Verify back lash measurement in four (4) positions.

9. If backlash measurement is less than 0.13 mm (0.005 in.), it is necessary to decrease the snap ring thickness on the ring gear (left) side, and increase the thickness on the pinion (right) side.
10. If backlash measurement is greater than 0.18 mm (0.007 in.), it is necessary to increase the snap ring thickness on the ring gear (right) side, and decrease the thickness on the pinion (left) side.

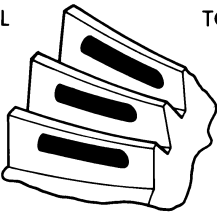

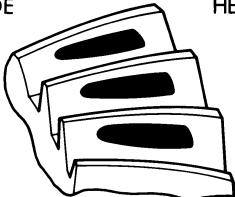

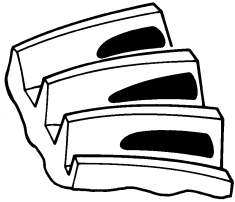

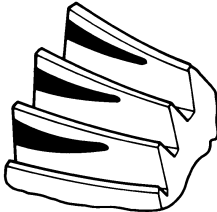

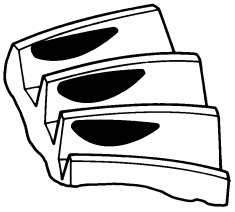

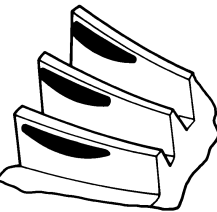

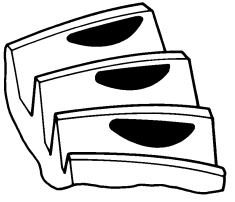

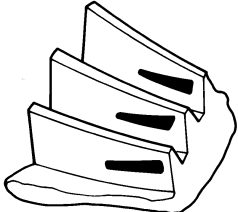

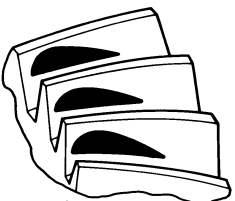

## GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

<p>DRIVE SIDE OF RING GEAR TEETH</p> <p>HEEL                      TOE</p> 	<p>COAST SIDE OF RING GEAR TEETH</p> <p>TOE                      HEEL</p> 	<p>DESIRABLE CONTACT PATTERN. PATTERN SHOULD BE CENTERED ON THE DRIVE SIDE OF TOOTH. PATTERN SHOULD BE CENTERED ON THE COAST SIDE OF TOOTH, BUT MAY BE SLIGHTLY TOWARD THE TOE. THERE SHOULD ALWAYS BE SOME CLEARANCE BETWEEN CONTACT PATTERN AND TOP OF THE TOOTH.</p>
		<p>RING GEAR BACKLASH CORRECT. <b>THINNER</b> PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>RING GEAR BACKLASH CORRECT. <b>THICKER</b> PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. <b>DECREASE</b> RING GEAR BACKLASH.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. <b>INCREASE</b> RING GEAR BACKLASH.</p>

J9003-24

**SPECIFICATIONS - 198 RII AXLE****SPECIFICATIONS**

DESCRIPTION	SPECIFICATION
Axle Ratios	3.08, 3.64, 3.90
Ring Gear Diameter	198 mm (7.8 in.)
Ring Gear Backlash	0.13-0.18 mm (0.005-0.007 in.)
Side Bearing Preload	6-8000 N
Axle Housing Retained Spread	0.18 mm to 0.23 mm (0.007 in. to 0.009 in.)
Select Snap Ring Size	3.60-4.50mm (0.14-0.17 in.) In 0.02mm (0.0007 in.) increments

## AXLE SHAFT SEALS

### REMOVAL

1. Remove halfshaft(s). (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)
2. Using suitable screwdriver (1), remove axle shaft seal (2).
3. Visually inspect halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc. Replace halfshaft if necessary.

### INSTALLATION

1. Using Tool 9223 (2), install **NEW** axle shaft seal (1). Lubricate the inside diameter with Mopar® Gear and Axle Lubricant 75W-140 to protect seal during halfshaft installation.
2. Install halfshaft(s). (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

3. Remove fill plug (1) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-140. Reinstall fill plug torque to 60 N·m (44 ft. lbs.) torque.

## PINION SEAL

### REMOVAL

1. Remove rear axle assembly from vehicle. Refer to Rear Axle Removal.
2. Measure axle assembly rotating torque and record measurement for reuse on assembly.

3. Using flange holder C-3281(1) and 41mm socket, remove pinion flange nut and discard.

**Note:** Due to axle imbalance concerns, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion flange.

4. Using puller 1026 (1), remove pinion flange (2) from pinion shaft.

5. Using suitable tool (1), remove pinion seal (2) and discard.

## INSTALLATION

1. Apply light coating of gear lubricant to the lip of the pinion seal.
2. Using Tool 9231A (1), install pinion seal until tool bottoms on carrier.

3. Install pinion flange into position. Align index marks to maintain assembly balance.
4. Using Installer 6448A (1), lightly tap on pinion flange (2) until adequate pinion shaft threads are exposed.

5. Install **new** pinion flange nut. Using flange holder tool C-3281(1) and 41mm socket, torque nut to 136 N·m (100 ft. lbs.).

6. Measure assembly turning torque. Axle assembly rotating torque must be should be equal to the reading recorded upon seal/flange removal.

7. If rotating torque is low, increase pinion flange nut torque in 7 N·m (5 ft. lbs.) increments. Repeat until proper rotating torque is received.

8. Stake pinion flange nut (1) as shown.  
9. Install rear axle assembly. Refer to Rear Axle Installation.

## DIFFERENTIAL

### REMOVAL

1. Clamp rear axle assembly into bench vise (1).

2. Remove drain plug (1) and drain fluid into container suitable for reuse.
3. Install drain plug and torque to 60 N·m (44 ft. lbs.).

4. Using suitable torque wrench (1), measure and record rear axle assembly total turning torque.

5. Using suitable screwdriver (1), remove both axle seals (2).

6. Remove twelve axle cover-to-housing bolts (1) and remove cover (2).

7. Install spreader adapters (1), Tool 9226, as shown. Adapters contain two hole patterns and are labeled accordingly.

8. Install spreader, Tool W-129-B (1), as shown.

9. Set up Dial Indicator Set C-3339-A to measure housing spread as shown.
- Clamp SP-5426 (1)
  - Post SP-5425-B (2)
  - Metric Dial Indicator 9524 (3)

10. Spread axle housing no more than 0.30 mm (0.012 in.).

**Note:** The differential side bearing snap rings are select-fit, and control ring gear backlash and differential side bearing preload. It is important to return original snap rings to their original position.

11. Using suitable snap ring pliers (2), compress and remove differential side bearing snap rings (1). Identify and tag for proper reuse.

12. Back off W-129-B spreader (1) to relax tension on housing.
13. Measure snap ring thickness and record for future use.

14. Install Tool 9522 (1) into one side of housing and push inward to release differential side bearing cup (2) from opposite side. Repeat for other bearing.

15. Remove differential assembly from axle housing.

**Note:** Note: If difficulty removing differential is encountered due to interference with W-129-B spreader and adapter plates, remove spreader and adapter plates to facilitate removal.

## DISASSEMBLY

1. Remove differential ring gear-to-case bolts (1).

2. Using brass drift (1), remove ring gear (2).

3. Remove bearings (2) from the differential case (3) with Puller/Press C-293-PA (5), Adapters C-293-37 (1) and Plug SP-3289 (4).

4. Drive out pinion shaft-to-case roll pin using hammer and suitable punch.

5. Using brass drift (2), drive out pinion shaft (1).

6. Install Tool 9631 (1) into differential side gear.

7. Rotate Tool 9631 (1) to gain access to and remove pinion gears and thrust washers.

8. Remove differential side gears (4) and thrust washers (5).

## ASSEMBLY

1. Lubricate all differential components with hypoid gear lubricant.
2. Install differential side gears (2) and thrust washers to Tools 9631 (1) as shown in illustration.

3. Install differential pinion gears (1) and thrust washers into position across from each other.

4. Rotate pinion gears into place using Tool 9631 and line up gear centers with pinion shaft bore.

5. Using a brass hammer, drive pinion shaft (3) into differential case (1), making sure to line up roll pin bores.
6. Using suitable punch (2), drive new roll pin into position.

7. Measure differential gear rotating torque as shown. Differential gear rotating torque should be 5-30 N·m (44-266 in. lbs.) Rotating torque is adjusted using select side gear thrust washers. Refer to the following chart.

Available Side Gear Thrust Washer Thicknesses	
	1.25 mm (0.049 in.)
	1.30 mm (0.051 in.)
	1.35 mm (0.053 in.)
	1.40 mm (0.055 in.)
	1.45 mm (0.057 in.)
	1.50 mm (0.059 in.)
	1.55 mm (0.061 in.)
	1.60 mm (0.063 in.)
	1.65 mm (0.065 in.)

8. Remove differential case from Tool 9630 (2).

9. Install ring gear to case. Lightly tap ring gear into position to facilitate starting of bolts.
10. Install **new** ring gear-to-case bolts and torque to 85 N·m (63 ft. lbs.).

11. Using Tool 9523 (2) and Handle C-4171 (1), press **new** differential side bearings (3) onto differential case.

## INSTALLATION

**Note:** If replacement differential side bearings or differential case are being installed, it is necessary to measure and adjust Differential Side Bearing Preload and Gear Backlash. Refer to Adjustments — Differential Side Bearing Preload and Gear Backlash to determine proper snap ring selection.

1. Install differential assembly (1) into axle housing.

2. Install differential side bearing cups (2).

3. Use Tool 9522 (1) to aid in seating side bearing cups (2).

4. Set up Dial Indicator Set C-3339-A to measure housing spread as shown:

- Clamp SP-5426 (1)
- Post SP-5425-B (2)
- Metric Dial Indicator 9524 (3)

5. Expand spreader W-129-B (1) to spread axle housing no more than 0.30 mm (0.012 in.).

**Note:** The differential side bearing snap rings are select-fit, and control ring gear backlash and differential side bearing preload. It is necessary to return snap rings to their original position. If replacement differential side bearings or differential case are being installed, refer to Adjustments — Differential Side Bearing Preload and Gear Backlash to determine proper snap ring selection.

6. Using suitable snap ring pliers (2), install differential side bearing snap rings (1).

7. Back off W-129-B spreader (1) to relax tension on housing.

8. Install axle seals (1) using Tool 9223 (2).

9. Remove spreader W-129-B and adapter plates 9226 (1).

10. Apply 4mm (0.157 in.) bead (2) of Mopar® Axle RTV to axle housing cover (1) as shown.

11. Install cover to axle housing. Install and torque cover-to-housing bolts to 30 N·m (22 ft. lbs.) + 90°.

## DIFFERENTIAL CASE BEARINGS

### REMOVAL

1. Remove differential assembly from axle. Refer to Differential Removal.

2. Remove bearings (2) from the differential case (3) with Puller/Press C-293-PA (5), Adapters C-293-37 (1) and Plug SP-3289 (4).

## INSTALLATION

1. Using Tool 9523 and Handle C-4171, press differential side bearings onto differential case.

2. Install differential and reassemble axle assembly.

## DIFFERENTIAL COVER

### REMOVAL

1. Remove axle assembly from vehicle.(Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 198MM - REMOVAL)
2. Remove axle housing cover bolts (1).
3. Using suitable screwdriver, remove axle housing cover (1).

### INSTALLATION

1. After thoroughly cleaning axle housing cover (1), apply a 4 mm (0.157 in.) bead (2) of Mopar® Axle RTV as shown.

2. Immediately install cover (2) to axle housing. Install and torque axle housing cover bolts (1) to 30 N·m (22 ft. lbs.) + 45°.
3. Install axle assembly to vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 198MM - INSTALLATION)

## PINION GEAR/RING GEAR

### REMOVAL

1. Remove differential assembly. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 198MM/ DIFFERENTIAL - REMOVAL)
2. Place differential case in a soft-jawed vise and remove ring gear-to-case bolts.

3. Remove ring gear from differential case with a brass drift and hammer.

4. Using 41mm socket and flange wrench Tool C-3281 (1), remove pinion nut and discard.

5. Using puller Tool 1026 (1), remove pinion flange (2).

6. Using a suitable screwdriver, remove and discard the pinion seal.
7. Remove pinion tail bearing cone.

8. Move axle housing to press and press out pinion shaft (1) as shown.

9. Remove collapsible spacer (1) and washers (2). Discard collapsible spacer.

10. Remove pinion head bearing (2) with Puller C-293-PA (1) and Adapters C-293-37 (3,4).

11. Using driver handle C-4171(2) and remover Tool 9084 (1), drive out pinion head bearing cup.

12. Remove pinion head shim. Measure and record shim thickness.

13. Using driver handle C-4171 (2) and remover Tool D-149 (1), drive out pinion tail bearing cup.

## INSTALLATION

1. Install selected pinion depth shim (1) into housing.

2. Press pinion head bearing cup into housing using Tools C-4171 (1) and C-4310 (2).

3. Press pinion tail bearing cup into housing using Tools C-4171 (1) and D-146 (2).

4. Press **new** pinion head bearing (2) onto pinion shaft using Tool C-3095-A (1).

5. Install washers (2) and **new** collapsible spacer (1) to pinion shaft.

6. Install pinion shaft (1) into housing and support on press table atop Tool 8255 (2). **Ensure pinion gear face is centered atop Tool 8255.**

7. Using Tool C-3095-A (1), press on **new** pinion tail bearing (2).

8. Install new pinion seal into position.  
9. Press pinion seal into housing using Tool 9231A (1).

10. Lightly lubricate pinion flange seal with axle lubricant for flange installation.
11. Align index marks and press pinion flange (2) on using Tool C-3095-A (1).

12. Install new pinion flange nut by hand.
13. Hold pinion flange with Tool C-3281 (1). Using a deep 41 mm socket, tighten pinion flange nut to an initial torque of 203 N·m (150 ft. lbs.).

14. Rotate pinion flange to ensure bearing is properly seated.
15. Measure pinion rotating torque using suitable torque wrench (1). **Pinion rotating torque should be 215-245 N. cm (19-22 in. lbs.).**
16. If pinion rotating torque exceeds the specified range, the pinion shaft must be removed and the crush sleeve replaced.

17. If pinion rotating torque is below the specified range, increase nut torque by 7 N·m (5 ft. lbs.) increments and recheck turning torque until rotating torque is within range.

18. Stake pinion flange nut (1) using hammer and suitable punch.

19. Install ring gear to differential case. Loosely install **new** ring-gear-to-differential case bolts.
20. Torque all ring gear-to-case bolts to 85 N·m (64 ft. lbs.)

21. Install differential and reassemble axle assembly.  
(Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR  
AXLE - 198MM/DIFFERENTIAL - INSTALLATION)

- 8 - COVER, AXLE
- 9 - GEAR, RING

The 210 MM RII (Rear-Independent-Iron) axle is an independent assembly with a cast iron housing and differential. The 210 MM RII uses an open differential which is supported by two tapered roller bearings located on either side of the case. Differential bearing preload and ring gear backlash are controlled with select snap-rings located on the outside of the differential bearing cups. Pinion height is set with a select shim located under the rear pinion bearing cup.

The 210 MM axle is available only in V8 engine-equipped models with a 2.82:1 gear ratio.

## AXLE IDENTIFICATION

The 210 MM axle utilizes a barcoded label which is adhered to the top of the axle housing as shown. The following information is found on the identification label:

- Traceability Code (Plant Use)
- Axle Part Number
- Axle Gear Ratio

## DIAGNOSIS AND TESTING

### GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

### BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

### LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

### VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or CV joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

**210 MM Axle Identification Tag**

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rearend vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

## DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV joints.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

## DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Wheel Noise	<ol style="list-style-type: none"> <li>1. Wheel loose.</li> <li>2. Faulty, brinelled wheel bearing.</li> </ol>	<ol style="list-style-type: none"> <li>1. Tighten loose nuts.</li> <li>2. Replace bearing.</li> </ol>
Differential Cracked	<ol style="list-style-type: none"> <li>1. Improper differential side bearing preload.</li> <li>2. Excessive ring gear backlash.</li> <li>3. Vehicle overloaded.</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly.</li> <li>2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly.</li> <li>3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.</li> </ol>
Differential Gears Scored	<ol style="list-style-type: none"> <li>1. Insufficient lubrication.</li> <li>2. Improper grade of lubricant.</li> <li>3. Excessive spinning of one wheel/tire.</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace scored gears. Fill differential with the correct fluid type and quantity.</li> <li>2. Replace scored gears. Fill differential with the proper fluid type and quantity.</li> <li>3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.</li> </ol>

CONDITION	POSSIBLE CAUSE	CORRECTION
Loss Of Lubricant	<ol style="list-style-type: none"> <li>1. Lubricant level too high.</li> <li>2. Worn axle shaft seals.</li> <li>3. Cracked axle housing.</li> <li>4. Worn pinion seal.</li> <li>5. Worn/scored pinion flange journal.</li> <li>6. Axle cover not properly sealed.</li> </ol>	<ol style="list-style-type: none"> <li>1. Drain lubricant to the correct level.</li> <li>2. Replace seals.</li> <li>3. Repair as necessary.</li> <li>4. Replace seal.</li> <li>5. Replace pinion flange and seal.</li> <li>6. Remove, clean, and re-seal cover.</li> </ol>
Axle Overheating	<ol style="list-style-type: none"> <li>1. Lubricant level low.</li> <li>2. Improper grade of lubricant.</li> <li>3. Bearing preload too high.</li> <li>4. Insufficient ring gear backlash.</li> </ol>	<ol style="list-style-type: none"> <li>1. Fill differential to correct level.</li> <li>2. Fill differential with the correct fluid type and quantity.</li> <li>3. Readjust bearing pre-load.</li> <li>4. Re-adjust ring gear backlash.</li> </ol>
Gear Teeth Broke	<ol style="list-style-type: none"> <li>1. Overloading.</li> <li>2. Ice-spotted pavement.</li> <li>3. Improper adjustments.</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace gears. Examine other gears and bearings for possible damage.</li> <li>2. Replace gears and examine remaining parts for damage.</li> <li>3. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.</li> </ol>
Axle Noise	<ol style="list-style-type: none"> <li>1. Insufficient lubricant.</li> <li>2. Improper ring gear and pinion adjustment.</li> <li>3. Unmatched ring gear and pinion.</li> <li>4. Worn teeth on ring gear and/or pinion.</li> <li>5. Loose pinion bearings.</li> <li>6. Loose differential bearings.</li> <li>7. Misaligned or sprung ring gear.</li> <li>8. Housing not machined properly.</li> </ol>	<ol style="list-style-type: none"> <li>1. Fill axle with the correct fluid type and quantity.</li> <li>2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.</li> <li>3. Replace gears with a matched ring gear and pinion.</li> <li>4. Replace ring gear and pinion.</li> <li>5. Adjust pinion bearing pre-load.</li> <li>6. Adjust differential bearing preload.</li> <li>7. Measure ring gear run-out. Replace components as necessary.</li> <li>8. Replace housing.</li> </ol>

## STANDARD PROCEDURE - FLUID DRAIN AND FILL

**Note:** The fluid required for use in this axle is Mopar® Synthetic Gear and Axle Lubricant 75W-140.

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.
2. With vehicle in neutral, position and raise vehicle on hoist.
3. Remove rear axle drain plug (1) and drain lubricant completely from the axle.
4. Install drain plug and tighten to 50 N·m (37 ft lbs).

5. Remove fill plug (1) and fill rear axle with 1.6 L (1.7 qts.) Mopar® Synthetic Gear & Axle Lubricant 75W-140.
6. Install fill plug and tighten to 50 N·m (37 ft lbs).

7.

## REMOVAL

**Note:** This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

**CAUTION:** Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to 50 N·m (37 ft. lbs.) torque.

4. Remove rear exhaust system (2) on dual-outlet exhaust models.

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

6. Remove three (3) propeller shaft coupler-to-axle flange bolt/nuts.

7. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

8. If a drive-on hoist is used, position transmission jack(1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

9. Remove rear axle forward mount isolator (1) bolt/nut (2).

10. Remove two rear axle-to-crossmember bolts (1).

11. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

12. Lower axle just enough to remove both halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.

13. Remove axle assembly from vehicle and transfer to bench.
14. Using suitable screwdriver, remove axle seals and discard.

## INSTALLATION

1. Install new axle seal(s) (1) using Tool 9223 (2).

2. Using new circlip(s), install halfshaft (1) to rear axle assembly. Use care not to damage axle seals(2). Verify proper installation by pulling outward on joint by hand.

3. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

4. Install two rear axle-to-crossmember bolts (1) and torque to 220 N·m (162 ft. lbs.).

5. Install rear axle front mount isolator (1) as shown and torque bolt/nut to 65 N·m (48 ft. lbs.).

6. Again verify halfshaft inner joints are fully engaged to axle assembly.  
7. Remove transmission jack (1).  
8. If used, remove screw-type under-hoist jack stands (2).

9. Torque propeller shaft coupler-to-axle flange bolt/nuts to 58 N·m (43 ft. lbs.).

10. Using a 14mm hex, remove rear axle fill plug (1). Fill axle with 1.6L (1.7 qts.) of Mopar® 75W-140 Synthetic Gear & Axle Lubricant. Install fill plug and torque to 50 N·m (37 ft. lbs.).

## ADJUSTMENTS

### ADJUSTMENT - PINION DEPTH MEASUREMENT

#### PINION DEPTH VARIANCE

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are etched into the pinion gear face. A plus (+) number, minus (–) number or zero (0) along with the gear set sequence number (01 to 99) is on each gear. The pinion depth variance (1) is the amount the depth varies from the standard depth setting of a pinion marked with a zero. The remaining numbers are the sequence number of the gear set. The standard depth provides the best gear tooth contact pattern.

Compensation for pinion depth variance is achieved with select shims. The shims (3) are sandwiched between the pinion head bearing cup and axle housing.

**Pinion Depth Shim and Collapsible Washer**

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim to compensate for the difference in the depth variances. The numbers represent deviation from the standard in microns. If the number is negative, subtract that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

#### PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	-04	-03	-02	-01	00	+01	+02	+03	+04
<b>+04</b>	-0.08	-0.07	-0.06	-0.05	-0.04	-0.03	-0.02	-0.01	0
<b>+03</b>	-0.07	-0.06	-0.05	-0.04	-0.03	-0.02	-0.01	0	+0.01
<b>+02</b>	-0.06	-0.05	-0.04	-0.03	-0.02	-0.01	0	+0.01	+0.02
<b>+01</b>	-0.05	-0.04	-0.03	-0.02	-0.01	0	+0.01	+0.02	+0.03
<b>00</b>	-0.04	-0.03	-0.02	-0.01	0	+0.01	+0.02	+0.03	+0.04
<b>-01</b>	-0.03	-0.02	-0.01	0	+0.01	+0.02	+0.03	+0.04	+0.05
<b>-02</b>	-0.02	-0.01	0	+0.01	+0.02	+0.03	+0.04	+0.05	+0.06
<b>-03</b>	-0.01	0	+0.01	+0.02	+0.03	+0.04	+0.05	+0.06	+0.07
<b>-04</b>	0	+0.01	+0.02	+0.03	+0.04	+0.05	+0.06	+0.07	+0.08

#### PINION DEPTH MEASUREMENT

Pinion depth measurement is taken with the pinion head and tail bearing cups pressed into the axle housing without the shim.

1. Press pinion head bearing cup into housing using Tools C-4171 (1) and C-4310 (2).

2. Press pinion tail bearing cup into housing using Tools C-4171 (1) and D-146 (2).

3. Install Pinion Height Block 6739 (3), Pinion Gage Block 9085 (2), and pinion head bearing cone (1) onto Screw 6741. Install assembly into axle housing and through bearing cups.

4. Install pinion tail bearing and Cone 6740 (4). Tighten Cone 6740 by hand until 3.4 N·m (30 in. lbs.) of rotating torque is measured at Screw 6741 (5).

5. Install Arbor Discs 9083 (1).

6. Install Arbor Bar D-115-3 (1).

7. Verify pinion depth setup is as shown.

8. Install Dial Indicator 9524 (1) to Scooter Block D-115-2A (2). Secure with set-screw (3).

9. Install Indicator/Block assembly to top of Height Block 6739 (1). Zero indicator on top surface.

10. Slide indicator probe off of height block and onto Arbor Bar D-115-3 (2). As indicator contacts Arbor Bar (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of the arbor bar and record the highest reading.

11. Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number etched into the pinion face (1). For example, if the depth variance is  $-01$ , subtract 0.01mm (0.0004 in.) from dial indicator reading.

12. Using Tool C-4171 (2) and Remover 9084 (1), drive out pinion head bearing cup and insert specified shim.

## ADJUSTMENT — SIDE BEARING PRELOAD AND RING GEAR BACKLASH

### DIFFERENTIAL SIDE BEARING PRELOAD MEASUREMENT/CORRECTION

Differential side bearing preload should be measured and adjusted after the following scenarios:

- Differential case replacement
- Differential side bearing replacement
- Axle housing replacement
- Loss or replacement of side bearing snap rings

If none of these situations apply, refer to Adjustment — Ring Gear Backlash

1. Install Spreader Adapter Plates 9226 (1).

2. Mount axle housing to Spreader W-129-B (1)

3. Set up Dial Indicator Set C-3339-A as shown to measure axle housing spread:

- a. Clamp SP-5426 (1)
- b. Post SP-5425-B (2)
- c. Metric Dial Indicator 9524 (3)

4. If differential side bearing cups and snap rings are already removed at this point, skip to Step 8. Otherwise, expand spreader (1) to spread axle housing no more than 0.30 mm (0.012 in.).

5. Remove both differential side bearing snap rings (1). Tag snap ring to ensure replacement to original position.

6. Measure and record snap ring (2) thickness for later use.

7. Relax spreader (1) to relieve tension on axle housing.

8. Install right (pinion) side bearing cup and snap ring (1).

9. Zero dial indicator.

10. Expand spreader (1) to spread axle housing no more than 0.30 mm (0.012 in.).

11. Install left (ring gear) side bearing cup and snap ring (1).

12. Relax spreader (1) to relieve tension on axle housing.

13. Measurement showing on indicator (3) is the axle housing retained spread. Proper differential side bearing preload is achieved with an axle housing retained spread of 0.11-0.17 mm (0.004-0.007 in.).
14. If retained spread is less than 0.11 mm (0.004 in.), increase snap ring thickness at each side in equal increments.
15. If retained spread is greater than 0.17 mm (0.007 in.), decrease snap ring thickness at each side in equal increments.

## RING GEAR BACKLASH MEASUREMENT/CORRECTION

Differential Ring Gear Backlash should be measured and adjusted after the following scenarios:

1. Ring and pinion gear replacement
2. Pinion head bearing replacement
3. Pinion depth (shim) adjustment
4. Differential case replacement
5. Differential side bearing replacement
6. Axle housing replacement

**Note: If Spreader W-129-B is installed, make sure tension on axle housing is relieved.**

7. Set up Dial Indicator Set C-3339-A as shown to measure ring gear backlash:
  - a. Clamp SP-5426 (1)
  - b. Post SP-5425-B (2)
  - c. Metric Dial Indicator 9524 (3)
8. Rotate ring gear one direction to take up clearance to pinion. Verify indicator tip is in contact with ring gear and zero indicator. Rotate ring gear back and forth and record measurement. Ring gear backlash should be 0.10-0.16 mm (0.004-0.006 in.). Verify back lash measurement in four (4) positions.

9. If backlash measurement is less than 0.10 mm (0.004 in.), it is necessary to decrease the snap ring thickness on the ring gear (left) side, and increase the thickness on the pinion (right) side.
10. If backlash measurement is greater than 0.16 mm (0.006 in.), it is necessary to increase the snap ring thickness on the ring gear (right) side, and decrease the thickness on the pinion (left) side.

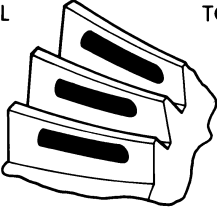

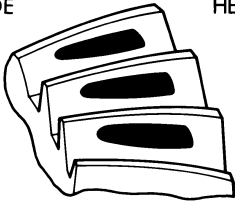

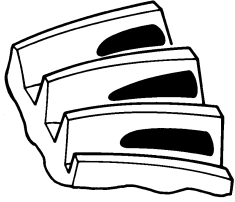

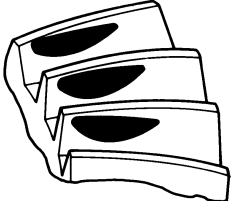

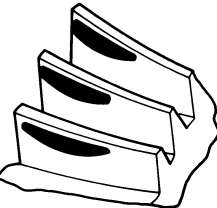

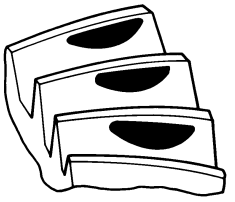

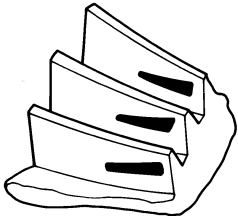

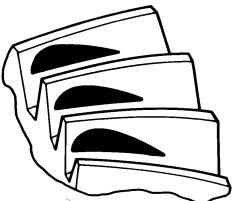

## GEAR CONTACT PATTERN

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.

The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary.

<p>DRIVE SIDE OF RING GEAR TEETH</p> <p>HEEL                      TOE</p> 	<p>COAST SIDE OF RING GEAR TEETH</p> <p>TOE                      HEEL</p> 	<p>DESIRABLE CONTACT PATTERN. PATTERN SHOULD BE CENTERED ON THE DRIVE SIDE OF TOOTH. PATTERN SHOULD BE CENTERED ON THE COAST SIDE OF TOOTH, BUT MAY BE SLIGHTLY TOWARD THE TOE. THERE SHOULD ALWAYS BE SOME CLEARANCE BETWEEN CONTACT PATTERN AND TOP OF THE TOOTH.</p>
		<p>RING GEAR BACKLASH CORRECT. <b>THINNER</b> PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>RING GEAR BACKLASH CORRECT. <b>THICKER</b> PINION GEAR DEPTH SHIM REQUIRED.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. <b>DECREASE</b> RING GEAR BACKLASH.</p>
		<p>PINION GEAR DEPTH SHIM CORRECT. <b>INCREASE</b> RING GEAR BACKLASH.</p>

J9003-24

## GEAR TOOTH CONTACT PATTERNS

## SPECIFICATIONS - 210 MM R11 AXLE

### SPECIFICATIONS

DESCRIPTION	SPECIFICATION
Axle Ratios	2.82
Ring Gear Diameter	210 mm (8.3 in.)
Ring Gear Backlash	0.10-0.16 mm (0.004-0.006 in.)
Side Bearing Preload	6-8000 N
Axle Housing Retained Spread	0.11 mm to 0.17 mm (0.004 in. to 0.007 in.)
Select Snap Ring Size	3.60-4.50mm (0.14-0.17 in.) In 0.02mm (0.0007 in.) increments
Select Pinion Shim Size	1.40-2.50mm (0.05-0.10 in.) In 0.01mm (0.0004 in.) increments
Pinion Torque To Rotate	2.25N·m (20 in. lbs.)
Total Torque To Rotate (Approx.)	3.38N·m (30 in. lbs.)

## AXLE SHAFT SEALS

### REMOVAL

1. Remove halfshaft(s). (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - REMOVAL)
2. Using suitable screwdriver (1), remove axle shaft seal (2).
3. Visually inspect halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc. Replace halfshaft if necessary.

### INSTALLATION

1. Using Tool 9223 (2), install **NEW** axle shaft seal (1). Lubricate the inside diameter with Mopar® Gear and Axle Lubricant 75W-140 to protect seal during halfshaft installation.
2. Install halfshaft(s). (Refer to 3 - DIFFERENTIAL & DRIVELINE/HALF SHAFT - INSTALLATION)

3. Remove fill plug (1) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-140. Reinstall fill plug and torque to 50 N·m (37 ft. lbs.) torque.

## PINION SEAL/FLANGE

### REMOVAL

1. Remove rear axle assembly from vehicle. Refer to Rear Axle Removal.
2. Measure axle assembly rotating torque and record measurement for reuse on assembly.

3. Using flange holder C-3281(1) and 41mm socket, remove pinion flange nut and discard.

**Note:** Due to axle imbalance concerns, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion flange.

4. Using puller 1026 (1), remove pinion flange (2) from pinion shaft.

5. Using suitable tool (1), remove pinion seal (2) and discard.

## INSTALLATION

1. Apply light coating of gear lubricant to the lip of the pinion seal.
2. Using Tool 9231A (1), install pinion seal until tool bottoms on carrier.

3. Install pinion flange into position. Align index marks to maintain assembly balance.
4. Using Installer 6448A (1), lightly tap on pinion flange (2) until adequate pinion shaft threads are exposed.

5. Install **new** pinion flange nut. Using flange holder tool C-3281(1) and 41mm socket, torque nut to 136 N·m (100 ft. lbs.).

6. Measure assembly turning torque. Axle assembly rotating torque must be should be equal to the reading recorded upon seal/flange removal.

7. If rotating torque is low, increase pinion flange nut torque in 7 N·m (5 ft. lbs.) increments. Repeat until proper rotating torque is received.

8. Stake pinion flange nut (1) as shown.  
9. Install rear axle assembly. Refer to Rear Axle Installation.

## DIFFERENTIAL

### REMOVAL

1. Remove drain plug (1) and drain fluid into container suitable for reuse.
2. Install drain plug and torque to 50 N·m (37 ft. lbs.).

3. Remove twelve axle cover-to-housing bolts (1) and remove cover (2) with a suitable screwdriver.

4. Install spreader adapters (1), Tool 9226, as shown. Adapters contain two hole patterns and are labeled accordingly.

5. Mount spreader Tool W-129-B (1) into bench vise. Install axle assembly to spreader and

6. Using suitable torque wrench (1), measure and record rear axle assembly total turning torque.

7. Using suitable screwdriver (1), remove both axle seals (2).

8. Set up dial indicator C-3339-A to measure housing spread as shown.

9. Spread axle housing no more than 0.30 mm (0.012 in.).

**Note:** The differential side bearing snap rings are select-fit, and control ring gear backlash and differential side bearing preload. It is important to return original snap rings to their original position.

10. Using suitable snap ring pliers (2), compress and remove differential side bearing snap rings (1). Identify and tag for proper reuse.

11. Back off W-129-B spreader (1) to relax tension on housing.

12. Measure snap ring thickness and record for future use.

13. Install Tool 9522 (1) into one side of housing and push inward to release differential side bearing cup (2) from opposite side. Repeat for other bearing.

14. Remove differential assembly from axle housing.

**Note:** Note: If difficulty removing differential is encountered due to interference with W-129-B spreader and adapter plates, remove axle from spreader and adapter plates from axle to facilitate removal.

## DISASSEMBLY

1. Remove differential ring gear-to-case bolts (1).

2. Using brass drift (1), remove ring gear (2).

3. Remove bearings (2) from the differential case (3) with Puller/Press C-293-PA (5), Adapters C-293-37 (1) and Plug SP-3289 (4).

4. Drive out pinion shaft-to-case roll pin using hammer and suitable punch.

5. Using brass drift (2), drive out pinion shaft (1).

6. Install Tool 9631 (1) into differential side gear.

7. Rotate Tool 9631 (1) to gain access to and remove pinion gears and thrust washers.

8. Remove differential side gears (4) and thrust washers (5).

## ASSEMBLY

1. Lubricate all differential components with hypoid gear lubricant.
2. Install differential side gears (2) and thrust washers to Tools 9631 (1) as shown in illustration.

3. Install differential pinion gears (1) and thrust washers into position across from each other.

4. Rotate pinion gears into place using Tool 9631 and line up gear centers with pinion shaft bore.

5. Using a brass hammer, drive pinion shaft (3) into differential case (1), making sure to line up roll pin bores.
6. Using suitable punch (2), drive new roll pin into position.

7. Measure differential gear rotating torque as shown. Differential gear rotating torque should be 5-30 N·m (44-266 in. lbs.) Rotating torque is adjusted using select side gear thrust washers. Refer to the following chart.

**Available Side Gear Thrust Washer Thicknesses**

1.25 mm (0.049 in.)
1.30 mm (0.051 in.)
1.35 mm (0.053 in.)
1.40 mm (0.055 in.)
1.45 mm (0.057 in.)
1.50 mm (0.059 in.)
1.55 mm (0.061 in.)
1.60 mm (0.063 in.)
1.65 mm (0.065 in.)

8. Remove differential case from Tool 9630 (2).

- '9. Install ring gear to case. Lightly tap ring gear into position to facilitate starting of bolts.
10. Install **new** ring gear-to-case bolts and torque to 85 N·m (63 ft. lbs.).

11. Using Tool 9523 (2) and Handle C-4171 (1), press **new** differential side bearings (3) onto differential case.

## INSTALLATION

**Note:** If replacement differential side bearings or differential case are being installed, it is necessary to measure and adjust Differential Side Bearing Preload and Gear Backlash. Refer to Adjustments — Differential Side Bearing Preload and Gear Backlash to determine proper snap ring selection.

1. Install differential assembly (1) into axle housing.

**Note:** If difficulty installing differential is encountered due to interference with spreader and plates, remove axle housing from spreader, plates from housing, and install differential. Return assembly to the spreader.

2. Install differential side bearing cups (2). Use tool 9522 (1) to aid in differential alignment.

3. Use Tool 9522 (1) to aid in seating side bearing cups (2).

4. Set up Dial Indicator Set C-3339-A to measure housing spread as shown:

- a. Clamp SP-5426 (1)
- b. Post SP-5425-B (2)
- c. Metric Dial Indicator 9524 (3)

5. Expand spreader W-129-B (1) to spread axle housing no more than 0.30 mm (0.012 in.).

**Note:** The differential side bearing snap rings are select-fit, and control ring gear backlash and differential side bearing preload. It is necessary to return snap rings to their original position. If replacement differential side bearings, differential case, or axle housing are being installed, refer to Adjustments — Differential Side Bearing Preload and Gear Backlash to determine proper snap ring selection.

6. Using suitable snap ring pliers (2), install differential side bearing snap rings (1).

7. Back off W-129-B spreader (1) to relax tension on housing.

8. Remove axle assembly from spreader. Remove plates (1).

9. Apply 4mm (0.157 in.) bead (2) of Mopar® Axle RTV to axle housing cover (1) as shown.

10. Install cover (2) to axle housing. Install and torque cover-to-housing bolts (1) to 30 N·m (22 ft. lbs.) + 90°.

11. Install axle seals (1) using Tool 9223 (2).

## DIFFERENTIAL CASE BEARINGS

### REMOVAL

1. Remove differential assembly from axle. Refer to Differential Removal.

2. Remove bearings (2) from the differential case (3) with Puller/Press C-293-PA (5), Adapters C-293-37 (1) and Plug SP-3289 (4).

## INSTALLATION

1. Using Tool 9523 and Handle C-4171, press differential side bearings onto differential case.

2. Install differential and reassemble axle assembly.

## DIFFERENTIAL COVER

### REMOVAL

1. Remove axle assembly from vehicle.(Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 210MM - REMOVAL)
2. Remove axle housing cover bolts (1). Using suitable screwdriver, pry cover (2) from housing.

### INSTALLATION

1. Thoroughly clean cover and install a 4 mm (0.157 in.) bead of Mopar® AXLE RTV (2) as shown.

2. Immediately install cover. Install and torque bolts (1) to 50 N·m (37 ft. lbs.).
3. Install axle assembly to vehicle. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 210MM - INSTALLATION)

## PINION GEAR/RING GEAR

### REMOVAL

1. Remove differential assembly. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 210MM/DIFFERENTIAL - REMOVAL)

2. Place differential case in a soft-jawvied vise and remove ring gear-to-case bolts (1).

3. Remove ring gear from differential case with a brass drift (1) and hammer.

4. Using 41mm socket and flange wrench Tool C-3281 (1), remove pinion nut and discard.

5. Using puller Tool 1026 (1), remove pinion flange (2).

6. Using a suitable screwdriver, remove and discard the pinion seal.
7. Remove pinion tail bearing cone.

8. Move axle housing to press and press out pinion shaft (1) as shown.

9. Remove collapsible spacer (1) and washers (2). Discard collapsible spacer.

10. Remove pinion head bearing (2) with Puller C-293-PA (1) and Adapters C-293-37 (3,4).

11. Using driver handle C-4171(2) and remover Tool 9084 (1), drive out pinion head bearing cup.

12. Remove pinion head shim. Measure and record shim thickness.

13. Using driver handle C-4171 (2) and remover Tool D-149 (1), drive out pinion tail bearing cup.

## INSTALLATION

1. Install selected pinion depth shim into housing.

2. Press pinion head bearing cup into housing using Tools C-4171 (1) and C-4310 (2).

3. Press pinion tail bearing cup into housing using Tools C-4171 (1) and D-146 (2).

4. Press **new** pinion head bearing (2) onto pinion shaft using Tool C-3095-A (1).

5. Install washers (2) and **new** collapsible spacer (1) to pinion shaft.

6. Install pinion shaft (1) into housing and support on press table atop Tool 8255 (2). **Ensure pinion gear face is centered atop Tool 8255.**

7. Using Tool C-3095-A (1), press on **new** pinion tail bearing (2).

8. Install new pinion seal (1) into position.

9. Press pinion seal into housing using Tool 9231A (1).

10. Lightly lubricate pinion flange seal with axle lubricant for flange installation.
11. Align index marks and press pinion flange (2) on using Tool C-3095-A (1).

12. Install new pinion flange nut by hand.
13. Hold pinion flange with Tool C-3281 (1). Using a deep 41 mm socket, tighten pinion flange nut to an initial torque of 203 N·m (150 ft. lbs.).

14. Rotate pinion flange to ensure bearing is properly seated.
15. Measure pinion rotating torque using suitable torque wrench (1). **Pinion rotating torque should be 215-245 N. cm (19-22 in. lbs.).**
16. If pinion rotating torque exceeds the specified range, the pinion shaft must be removed and the crush sleeve replaced.

17. If pinion rotating torque is below the specified range, increase nut torque by 7 N·m (5 ft. lbs.) increments and recheck turning torque until rotating torque is within range.

18. Stake pinion flange nut (1) using hammer and suitable punch.

19. Install ring gear to differential case. Loosely install **new** ring-gear-to-differential case bolts.
20. Torque all ring gear-to-case bolts to 85 N·m (64 ft. lbs.)

21. Install differential and reassemble axle assembly. (Refer to 3 - DIFFERENTIAL & DRIVELINE/REAR AXLE - 210MM/DIFFERENTIAL - INSTALLATION)

## BRAKES - BASE

### DESCRIPTION - BASE BRAKES

The base brake system consists of the following components:

- Brake pedal
- Master cylinder
- Power brake booster
- Brake tubes and hoses
- Proportioning valves (2) (non-ABS only)
- Disc brakes (front and rear)
- Brake lamp switch
- Brake fluid level sensor
- Parking brake

All brakes are power assist type through the use of a vacuum operated power brake booster.

The hydraulic brake system is front/rear split on both the non-antilock and antilock braking systems. This means the front brakes are on one hydraulic circuit from the master cylinder and the rear brakes are on the other.

Front disc brakes control the braking of the front wheels; rear braking is controlled by rear disc brakes.

Vehicles equipped with the optional antilock brake system (ABS) (with and without traction control) use a system designated Mk 25. This system shares most base brake hardware used on vehicles without ABS. An Electronic Stability Program (ESP) is also available. All components differing from the base brake hardware are described in detail in the Antilock Brake System section.

The parking brake on this vehicle is pedal-operated.

For more information on the description of any individual base brake component, refer to that component elsewhere in this section. For information on the brake lamp switch, (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - DESCRIPTION)

## WARNING

**WARNING:** Dust and dirt accumulating on brake parts during normal use may contain asbestos fibers from production or aftermarket brake linings. Breathing excessive concentrations of asbestos fibers can cause serious bodily harm. Exercise care when servicing brake parts. Do not sand or grind brake lining unless equipment used is designed to contain the dust residue. Do not clean brake parts with compressed air or by dry brushing. Cleaning should be done by dampening the brake components with a fine mist of water, then wiping the brake components clean with a dampened cloth. Dispose of cloth and all residue containing asbestos fibers in an impermeable container with the appropriate label. Follow practices prescribed by the Occupational Safety And Health Administration (OSHA) and the Environmental Protection Agency (EPA) for the handling, processing, and disposing of dust or debris that may contain asbestos fibers.

## CAUTION

**CAUTION:** Use only Mopar® brake fluid or an equivalent from a tightly sealed container. Brake fluid must conform to DOT 3 specifications. Do not use petroleum-based fluid because seal damage in the brake system will result.

**CAUTION:** Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

**CAUTION:** Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.

**CAUTION:** During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.

**CAUTION:** Disc brake calipers are made of aluminum. They are anodized and appear black in color. When handling the calipers or brake rotors, be careful to avoid damaging them, and avoid scratching or nicking the brake pad lining.

**CAUTION:** Anytime the battery has been disconnected and is reconnected it is important that this be performed properly. The vehicle may be equipped with systems that require special calibration processes. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

## STANDARD PROCEDURE

### BASE BRAKE BLEEDING

**CAUTION:** Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.

**CAUTION:** Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

**Note:** For bleeding the antilock brake hydraulic system, (Refer to 5 - BRAKES - STANDARD PROCEDURE)

**Note:** Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

**Note:** Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the brake hydraulic system.

- Right rear wheel
- Left rear wheel
- Right front wheel
- Left front wheel

**Note: Pressure bleeding is recommended to bleed this brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.**

The base brake system can be bled using the pressure method or the manual method. Both methods are presented in this text.

## PRESSURE BLEEDING METHOD

**Note: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.**

1. Remove filler cap from the top of fluid reservoir (2) on master cylinder.
2. Install Adapter (1), Special Tool 6921, in the caps place on the reservoir (2).
3. Attach Bleeder Tank, Special Tool C-3496-B, or equivalent, to Adapter 6921 (1). Pressurize the system following the pressure bleeder manufacturer's instructions.

4. If installed, remove rubber dust caps from all four bleeder screws on calipers.
5. Starting at the first wheel circuit as listed earlier, attach a clear hose (1) to the bleeder screw at that wheel's brake caliper and feed the other end of the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.

**CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.**

6. Open bleeder screw at least one full turn or more to obtain an adequate flow of brake fluid.
7. After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose (1) and jar (2), close the bleeder screw.

8. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.
9. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Rebleed the brake system as necessary.
10. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
11. Reinstall all 4 bleeder screw dust caps.
12. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

## MANUAL BLEEDING METHOD

**Note:** To bleed the base brake system manually, an assistants help is required.

1. Remove rubber duct caps from all 4 bleeder screws.
2. Attach a clear hose (1) to the bleeder screw at one wheel and feed the other end of the hose into a clear jar (2) containing fresh brake fluid.
3. Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

**CAUTION:** Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

4. While the pedal is being held down, open the bleeder screw at least 1 full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.
5. Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.
6. Repeat steps One through Five until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

**Note:** Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

7. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.
8. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Rebleed the brake system as necessary.
9. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then rebleed base brakes. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
10. Reinstall all 4 bleeder screw dust caps.
11. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

*Handle, Universal C-4171*

## SWITCH-ADJUSTABLE PEDALS

### DESCRIPTION

The adjustable pedals switch is located on the left side trim of the driver's seat cushion. Fore and Aft movement of the paddle-type switch allows front-to-rear travel of the adjustable pedals, up to approximately 76 mm (3 inches) total movement. Pushing the paddle forward moves the peddles away from the driver and vice-versa. Movement stops when the switch is released.

The switch actuates the electric motor-driven adjustable pedals mechanism through the memory seat module (MSM). MSM logic prevents pedal adjustment while the speed control is set and when the transmission is in Reverse.

### REMOVAL

1. Move driver's seat to full-forward, full-upward position.
2. Disconnect battery negative cable from battery post and isolate.
3. Remove seat belt shield from driver's seat cushion left side trim.
4. Remove three screws fastening seat cushion side trim in place.
5. Lift side trim from seat and utilizing slack in seat belt, turn trim over.
6. Disconnect wiring connector (2) from adjustable pedals switch (3).
7. Remove two mounting screws (1) and remove switch (3).

## INSTALLATION

1. Position switch (3) connector-side-down on the inside of the driver's seat cushion side trim.
2. Install two screws (1) fastening switch in place.
3. Connect wiring connector (2) to adjustable pedals switch (3).
4. Position side trim on driver's seat cushion left side and install three screws fastening side trim in place.
5. Install seat belt shield on driver's seat cushion left side trim.
6. Connect negative battery cable to battery post. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
7. Check operation of adjustable pedals.
8. If vehicle is equipped with memory seats, the system will need to be initialized. Refer to appropriate diagnostic information.

## SENSOR - BRAKE FLUID LEVEL

### REMOVAL

The brake fluid level sensor (2) is an integral part of the master cylinder fluid reservoir (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID RESERVOIR - REMOVAL)

## INSTALLATION

The brake fluid level sensor (2) is an integral part of the master cylinder fluid reservoir (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID RESERVOIR - INSTALLATION)

## HYDRAULIC/MECHANICAL

### DESCRIPTION - DISC BRAKES

Four-wheel disc brakes are standard on this vehicle. There are two four-wheel disc brake systems available, a standard and a premium. The standard disc brake system is referred to as "Seventeen-Inch." The premium disc brake system is referred to as "Eighteen-Inch."

"Seventeen-inch" four-wheel disc brakes (so called because they are designed to fit inside 17-inch wheels) are standard on rear-wheel drive models with V6 engines. They feature single-piston aluminum calipers (2) and vented rotors (1) in the front and single-piston aluminum calipers (4) with solid rotors (3) in the rear.

“Eighteen-inch” four-wheel disc brakes (so called because they are designed to fit inside 18-inch wheels) are standard on Chrysler 300 Hemi C and all international models, and optional on other models. They feature twin-piston aluminum calipers (1) and vented rotors (2) in the front and single-piston aluminum calipers (4) with vented rotors (3) in the rear. Although the rear calipers appear the same as the 17-inch system, the rear calipers used with this system feature a wider jaw to compensate for the wider, vented brake rotors used.

The calipers with the “18-inch” system, which are readily visible through the aluminum wheels, have a gray anodized coating for corrosion protection and long-term neat appearance.

Although the caliper used is the same, rear-wheel drive models mount the front caliper to the front of the knuckle while all-wheel drive models mount the front caliper to the rear of the knuckle.

All calipers are aluminum construction and are the low-drag type. All calipers are anodized, giving them an off-black appearance. New-technology caliper construction allows minimal drag of the pads on the discs with low clearance to the rotors to maintain maximum pedal feel and responsiveness.

Phenolic pistons are used in all calipers. The pistons have stainless steel caps for protection against damage due to contact with the brake pads.

All brake rotors are fully coated with Geomet™, a water-soluble, environmental friendly corrosion preventive. Both the friction surfaces and the vents are coated. During initial brake applications of a new rotor, the brake pads scrub the coating off the friction surfaces, ensuring that the remainder will be rust free. Coating the vents also ensures that there will not be a loss of heat capacity over time.

## PADS - FRONT BRAKE

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

**Note:** Perform steps 2 through 6 on each side of the vehicle.

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

**Note:** In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

3. Remove Lower caliper guide pin bolt. To do so, hold the guide pin (3) stationary while turning bolt (1).

4. Rotate caliper upward (1), exposing brake pads (2 and 5). **Use care not to overextend brake hose when doing this or damage may occur.**
5. Remove inboard (2) and outboard (5) brake pads from caliper adapter (4).
6. If necessary, remove anti-rattle clips (3) from upper and lower abutments of adapter (4).

## CLEANING

**WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.**

## INSTALLATION

**Note: Perform steps 1 through 7 on each side of the vehicle.**

1. Completely retract caliper piston(s) back into bore(s) of caliper. To do so:
  - a. Remove fluid reservoir cap.
  - b. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston(s) before installing C-clamp to avoid damaging piston(s).
  - c. Install fluid reservoir cap.

2. If removed, attach anti-rattle clips (3) to upper and lower abutments of adapter (4).
3. Install NEW inboard (2) and outboard (5) brake pads on caliper adapter (4). NEW Inboard and outboard pads are interchangeable.
4. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
5. Rotate caliper downward, aligning upper mounting boss with lower guide pin.

6. Install Upper caliper guide pin bolt (1). While holding guide pin (3) stationary tighten bolt to 60 N·m (44 ft. lbs.) torque.

7. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
8. Lower vehicle.
9. Pump brake pedal several times to set pads to caliper and brake rotor.

10. Check and adjust brake fluid level in reservoir (1).  
(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID - STANDARD PROCEDURE)
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

## PADS - REAR BRAKE

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

**Note:** Perform steps 2 through 6 on each side of the vehicle.

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

**Note:** In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

3. Remove Upper caliper guide pin bolt (1). To do so, hold the guide pin (3) stationary while turning bolt.

4. Rotate caliper downward (5), exposing brake pads (2 and 3). **Use care not to overextend brake hose when doing this or damage may occur.**
5. Remove inboard (2) and outboard (3) brake pads from caliper adapter (4).
6. If necessary, remove anti-rattle clips (1) from upper and lower abutments of adapter (4).

## CLEANING

**WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.**

## INSTALLATION

**Note:** Perform steps 1 through 7 on each side of the vehicle.

1. Completely retract caliper piston back into bore of caliper. To do so:
  - a. Remove fluid reservoir cap.
  - b. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
  - c. Install fluid reservoir cap.
2. If removed, attach anti-rattle clips (1) to upper and lower abutments of adapter (4).
3. Install NEW inboard (2) and outboard (3) brake pads on caliper adapter (4). NEW Inboard and outboard pads are interchangeable.
4. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
5. Rotate caliper upward, aligning upper mounting boss with upper guide pin.

6. Install Upper caliper guide pin bolt (1). While holding guide pin (3) stationary tighten bolt to 60 N-m (44 ft. lbs.) torque.

7. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
8. Lower vehicle.
9. Pump brake pedal several times to set pads to caliper and brake rotor.

10. Check and adjust brake fluid level in reservoir (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/FLUID - STANDARD PROCEDURE)
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

## CALIPER - FRONT SINGLE PISTON DISC BRAKE

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

5. Remove banjo bolt (6) connecting flexible brake hose (1) to caliper (5). There are two sealing washers (7) (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

6. While holding guide pins from turning, remove caliper guide pin bolts (2).
7. Remove brake caliper (1) from brake adapter (3) and pads.

## DISASSEMBLY

**Note:** Before disassembling brake caliper, clean and inspect it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - CLEANING)(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSPECTION)

**WARNING:** Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

**CAUTION:** Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Drain brake fluid from caliper.

2. Mount caliper in a vise equipped with protective jaws.
3. Place a wooden block (2) (padded with approximately one-inch thickness of shop towels) in front of caliper (1) piston as shown. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out. This will cushion and protect caliper piston during removal.

**WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.**

4. Apply low pressure compressed air to caliper fluid inlet in **short spurts** to ease piston out of bore.
5. Remove piston from caliper (1).

**CAUTION: When working on disc brake caliper, always use care and suitable tools to avoid damaging the aluminum housing.**

6. Using a suitable tool (1), carefully remove dust boot (2) and discard it.

**CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch bore or leave burrs on seal groove edges.**

7. Using a soft tool such as a plastic trim stick (2), work piston seal (1) out of its groove in caliper piston bore. Discard used seal.

8. Remove caliper bleeder screw (1) from caliper housing (2).
9. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
10. Inspect both piston and bore for scoring or pitting.

**Note:** It is not recommended to hone caliper bore. The anodized coating would be compromised.

## CLEANING

**WARNING:** DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

## INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

## ASSEMBLY

**CAUTION:** Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

**Note:** Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid or equivalent when assembling brake caliper.

**Note:** Never use used or old piston seals or boots for reassembly.

1. Lubricate caliper piston, piston seal (1) and piston bore (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) in groove of caliper bore (2). Seal should be started at one area of groove and gently worked around and into the groove using only your clean fingers to seat it.

3. Install NEW dust boot (1) on piston (2) and work boot lip into groove at top of piston. Stretch boot downward, straightening boot folds, then move boot back upward as necessary until folds snap uniformly into place.

4. Install piston (1) into caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage can be avoided. **The dust boot will not seat at this time. Refer to following step.**

5. Seat dust boot (3) in caliper counterbore using Installer (2), Special Tool 9315, with Handle (1), Special Tool C-4171. Install dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

6. Install bleeder screw in correct threaded hole. Caliper housing is not side-specific, so it is important to install bleeder screw in threaded hole that will be uppermost once caliper is installed on vehicle. Tighten bleeder screw to 15 N·m (125 in. lbs.) torque.
7. Install caliper on vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSTALLATION)

## INSTALLATION

**CAUTION:** Always inspect brake pads before installing disc brake caliper and replace as necessary. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSPECTION)

1. Completely retract caliper piston back into bore of caliper. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.

**CAUTION:** Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

3. Slide caliper over brake pads and onto caliper adapter (3).

**CAUTION:** Extreme caution should be taken not to crossthread caliper guide pin bolts (2) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N·m (44 ft. lbs.) torque.

5. Install banjo bolt (6) attaching brake hose (1) to caliper (5). Install NEW washers (7) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 43 N·m (32 ft. lbs.) torque.

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
7. Lower vehicle.
8. Remove brake pedal holding tool.

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

10. Bleed (1) base brake hydraulic system as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

## CALIPER - FRONT TWIN PISTON DISC BRAKE

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

5. Remove banjo bolt (6) connecting flexible brake hose (1) to caliper (5). There are two sealing washers (7) (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

6. While holding guide pins from turning, remove caliper guide pin bolts (2).
7. Remove brake caliper (1) from brake adapter (3) and pads.

## DISASSEMBLY

**Note:** Before disassembling the brake caliper, clean and inspect it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - CLEANING)(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSPECTION)

**WARNING:** Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such practice.

1. Drain brake fluid from caliper.

**CAUTION:** Do not use excessive force when clamping caliper (2) in vise. Caliper housing is made of aluminum. Excessive vise pressure will cause bore distortion.

2. Mount caliper (2) in vise equipped with protective jaws.
3. C-clamp (1) a block of wood (3) over one piston.

4. Take another block of wood and pad it with one-inch thickness of shop towels. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out.
5. Place the padded block of wood (1) in outboard shoe side of caliper (2) in front of exposed piston (3). This will cushion and protect caliper piston during removal.

**WARNING:** Do not place face or hands near caliper and piston if using compressed air to remove piston. Do not use high pressure.

**WARNING:** Never attempt to catch piston as it leaves bore. This could result in personal injury.

**CAUTION:** Do not blow piston out of bore with sustained air pressure. This could result in a cracked piston. Use only short spurts of air.

6. Apply **short spurts of low pressure air** with a rubber tipped blow gun through caliper brake hose port. Use only enough air pressure to ease piston out of bore.
7. Remove piston from caliper (2).
8. Remove C-clamp and block of wood.
9. C-clamp (1) the block of wood (3) over dust boot of first piston removed. This will seal empty piston bore.

10. Move padded piece of wood (1) in front of piston (2) yet to be removed.
11. Remove second piston using same procedure with **short spurts of low pressure air**.
12. Remove C-clamp and block of wood from caliper.

13. Remove piston dust boots (1) (over each bore) with an appropriate pry tool (2). **Use care not to damage aluminum housing.**

**CAUTION:** Use an appropriate tool (1) to remove piston seals (2) to avoid scratching piston bore. Do not use a screwdriver or other metal tool to remove seals.

14. Using a soft tool such as a plastic trim stick (1), remove piston seals (2) from caliper bores.

15. Remove caliper bleeder screw (2) from caliper housing (1).
16. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
17. Inspect both piston and bore for scoring or pitting.

**Note: It is not recommended to hone caliper bore. The anodized coating would be compromised.**

## CLEANING

**WARNING: DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.**

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

## INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

## ASSEMBLY

**CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.**

**Note: Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid when assembling brake caliper.**

**Note: Never use old or used piston seals or boots for assembly.**

1. Lubricate caliper pistons, piston seals (1) and piston bores (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) into groove of each caliper piston bore (2).

**Note: Make sure seal is fully seated and not twisted in groove.**

3. Install NEW boot (1) on each piston (2) and work boot lip into groove at top of piston. Stretch boot rearward straightening boot folds, then move boot forward as necessary until folds snap uniformly into place.

4. Install each piston (1), one at a time, into its caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage is avoided.

**CAUTION:** When seating dust boots in following step, use care not to over-install boots or damage will occur. Each boot (2) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (3) of boot still showing above caliper housing.

5. Seat dust boots (3) in caliper counterbores using Installer (2), Special Tool 9315, with Handle (1), Special Tool C-4171. Install each dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

6. Install caliper bleeder screw (2) in caliper housing (1). Tighten bleeder screw to 15 N·m (125 in. lbs.) torque.
7. Install caliper on vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSTALLATION)

## INSTALLATION

**CAUTION:** Always inspect brake pads before installing disc brake caliper and replace as necessary. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSPECTION)

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block over piston before installing C-clamp to avoid damaging piston.

**CAUTION:** Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
3. Slide caliper over brake pads and onto caliper adapter (3).

**CAUTION:** Extreme caution should be taken not to crosstread caliper guide pin bolts (2) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N·m (44 ft. lbs.) torque.

5. Install banjo bolt (6) attaching brake hose (1) to caliper (5). Install NEW washers (7) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 43 N·m (32 ft. lbs.) torque.

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
7. Lower vehicle.
8. Remove brake pedal holding tool.

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

10. Bleed (1) base brake hydraulic system as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

## CALIPER - REAR DISC BRAKE

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

5. Remove banjo bolt (4) connecting flexible brake hose (3) to caliper (1). There are two sealing washers (2) (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

6. While holding guide pins from turning, remove caliper guide pin bolts (2).
7. Remove brake caliper (1) from brake adapter (3) and pads.

## DISASSEMBLY

**Note:** Before disassembling brake caliper, clean and inspect it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - CLEANING)(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSPECTION)

**WARNING:** Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

**CAUTION:** Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Drain brake fluid from caliper.

2. Mount caliper in a vise equipped with protective jaws.
3. Place a wooden block (2) (padded with approximately one-inch thickness of shop towels) in front of caliper (1) piston as shown. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out. This will cushion and protect caliper piston during removal.

**WARNING:** Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

4. Apply low pressure compressed air to caliper fluid inlet in **short spurts** to ease piston out of bore.
5. Remove piston from caliper (1).

**CAUTION:** When working on disc brake caliper, always use care and suitable tools to avoid damaging the aluminum housing.

6. Using a suitable tool (1), carefully remove dust boot (2) and discard it.

**CAUTION:** Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch bore or leave burrs on seal groove edges.

7. Using a soft tool such as a plastic trim stick (2), work piston seal (1) out of its groove in caliper piston bore. Discard used seal.

8. Remove caliper bleeder screw (1) from caliper housing (2).
9. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
10. Inspect both piston and bore for scoring or pitting.

**Note:** It is not recommended to hone caliper bore. The anodized coating would be compromised.

## CLEANING

**WARNING:** DUST AND DIRT ACCUMULATING ON BRAKE PARTS DURING NORMAL USE MAY CONTAIN ASBESTOS FIBERS FROM PRODUCTION OR AFTERMARKET BRAKE LININGS. BREATHING EXCESSIVE CONCENTRATIONS OF ASBESTOS FIBERS CAN CAUSE SERIOUS BODILY HARM. EXERCISE CARE WHEN SERVICING BRAKE PARTS. DO NOT SAND OR GRIND BRAKE LINING UNLESS EQUIPMENT USED IS DESIGNED TO CONTAIN THE DUST RESIDUE. DO NOT CLEAN BRAKE PARTS WITH COMPRESSED AIR OR BY DRY BRUSHING. CLEANING SHOULD BE DONE BY DAMPENING THE BRAKE COMPONENTS WITH A FINE MIST OF WATER, THEN WIPING THE BRAKE COMPONENTS CLEAN WITH A DAMPENED CLOTH. DISPOSE OF CLOTH AND ALL RESIDUE CONTAINING ASBESTOS FIBERS IN AN IMPERMEABLE CONTAINER WITH THE APPROPRIATE LABEL. FOLLOW PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL PROTECTION AGENCY (EPA) FOR THE HANDLING, PROCESSING, AND DISPOSING OF DUST OR DEBRIS THAT MAY CONTAIN ASBESTOS FIBERS.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

## INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

## ASSEMBLY

**CAUTION:** Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

**Note:** Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid or equivalent when assembling brake caliper.

**Note:** Never use used or old piston seals or boots for reassembly.

1. Lubricate caliper piston, piston seal (1) and piston bore (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) in groove of caliper bore (2). Seal should be started at one area of groove and gently worked around and into the groove using only your clean fingers to seat it.

3. Install NEW dust boot (1) on piston (2) and work boot lip into groove at top of piston. Stretch boot downward, straightening boot folds, then move boot back upward as necessary until folds snap uniformly into place.

4. Install piston (1) into caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage can be avoided.

**CAUTION:** When installing dust boot in following step, use care not to over-install boot or damage will occur. The boot (3) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (2) of boot still showing above caliper housing.

5. Seat dust boot (3) in caliper counterbore using Installer, Special Tool 9314, with Handle, Special Tool C-4171. Install dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

6. Install bleeder screw in correct threaded hole. Caliper housing is not side-specific, so it is important to install bleeder screw in threaded hole that will be uppermost once caliper is installed on vehicle. Tighten bleeder screw to 15 N·m (125 in. lbs.) torque.
7. Install caliper on vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/DISC BRAKE CALIPER - INSTALLATION)

## INSTALLATION

**CAUTION:** Always inspect brake pads before installing disc brake caliper and replace as necessary. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSPECTION)

1. Completely retract caliper piston back into bore of caliper. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.

**CAUTION:** Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
3. Slide caliper over brake pads and onto caliper adapter (3).

**CAUTION:** Extreme caution should be taken not to crosstread caliper guide pin bolts (2) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N·m (44 ft. lbs.) torque.

5. Install banjo bolt (4) attaching brake hose (3) to caliper (1). Install NEW washers (2) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 43 N·m (32 ft. lbs.) torque.

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque. (Refer to 22 - TIRES/WHEELS - INSTALLATION)
7. Lower vehicle.
8. Remove brake pedal holding tool.

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

10. Bleed (1) base brake hydraulic system as necessary. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

## FLUID

### DIAGNOSIS AND TESTING

#### BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brake hydraulic unit and all hydraulic fluid hoses.

### STANDARD PROCEDURE

#### BRAKE FLUID LEVEL CHECKING

Check master cylinder reservoir fluid level a minimum of twice annually.

Fluid reservoirs (1) are marked with the words MAX and MIN to indicate proper brake fluid fill level of the master cylinder.

If necessary, add brake fluid to bring the level to the bottom of the MAX mark on the side of the master cylinder fluid reservoir (1).

Use only Mopar® brake fluid or equivalent from a sealed container. Brake fluid must conform to DOT 3 specifications (DOT 4 or DOT 4+ are acceptable, but do not last as long.).

**DO NOT** use brake fluid with a lower boiling point, as brake failure could result during prolonged hard braking.

Use only brake fluid that was stored in a tightly-sealed container.

**DO NOT** use petroleum-based fluid because seal damage will result. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid etc.

### SPECIFICATIONS

#### BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. DOT 4 and DOT 4+ are acceptable brake fluids, but do not last as long. They must be changed approximately every two years. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

**CAUTION:** Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

**CAUTION:** Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

## RESERVOIR - MASTER CYLINDER FLUID

### REMOVAL

1. Remove access panel (1) in cowl area to expose master cylinder (2).
2. Thoroughly clean all surfaces of brake fluid reservoir and master cylinder. Use only Mopar® Brake Parts Cleaner or equivalent.

3. Remove brake fluid reservoir cap (1). Using a clean syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.

**CAUTION:** When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

4. Remove screw (3) fastening fluid reservoir to master cylinder housing.
5. Rock the brake fluid reservoir side-to-side while pulling up to remove it from seal grommets in master cylinder housing.

6. Remove two brake fluid reservoir seal grommets (2) from master cylinder housing (1).

## INSTALLATION

1. Install NEW brake fluid reservoir sealing grommets (2) in master cylinder housing (1).

2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets (2) or reservoir is not properly installed.
3. Install fluid reservoir mounting screw (3). Tighten screw to 28 N-m (250 in. lbs.) torque.

4. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.
5. Install access panel in cowl area.

**WARNING:** Be certain a firm brake pedal is achieved prior to attempting vehicle operation. If a firm brake pedal cannot be achieved, bleed entire brake hydraulic system and check for leaks. (refer to 5 - brakes - standard procedure)

6. Road test vehicle to ensure proper operation of brakes.

## JUNCTION BLOCK

### DESCRIPTION

A junction block is used on vehicles that are not equipped with antilock brakes (ABS) allowing use of the same brake tubes on all applications. The junction block is located in the engine compartment, in front of the right wheel well. The junction block mounts in the same location as the ABS integrated control unit (ICU) does on vehicles with ABS.

It has six threaded ports to which the brake tubes connect. Two are for the brake tubes coming from the master cylinder. The remaining four ports are for the brake tubes going to each wheel brake assembly.

The junction block contains two proportioning valves. The proportioning valves are not serviced separately from the junction block. For more information on proportioning valves, (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PROPORTIONING VALVE - DESCRIPTION)

### OPERATION

The junction block distributes the brake fluid coming from the master cylinder primary and secondary ports to the four brake tubes leading to the wheel brakes. Since the junction block mounts in the same location as the ABS integrated control unit (ICU), it allows for the common use of brake tubes on the vehicle whether it is equipped with or without ABS.

The junction block includes rear brake proportioning valves. Placed in the fluid flow passages leading to the rear brake tube ports, they balance front-to-rear braking. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/PROPORTIONING VALVE - OPERATION)

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

3. Remove brake tubes (1, 2, 3 and 10) at junction block (5).

4. Remove remaining brake tubes (1 and 3) at junction block (5).

5. Pull up on junction block (5) and remove from mounting grommets (8).

## INSTALLATION

1. Install junction block (5), pushing mounting bracket down into mounting grommets (8) located in body of vehicle.

2. Install brake tubes to rear (1 and 3) at hydraulic control unit. Tighten tube nuts to 14 N·m (124 in. lbs.) torque.

3. Install brake tubes (1, 2, 3 and 10) at junction block (5). Tighten tube nuts to 14 N·m (124 in. lbs.) torque.
4. Remove brake pedal holding tool.

5. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

6. Fill and bleed (1) base brake hydraulic system. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
7. Road test vehicle to verify proper operation of brakes.

## MASTER CYLINDER

### STANDARD PROCEDURE

### MASTER CYLINDER BLEEDING

**CAUTION:** When clamping master cylinder in vise, only clamp master cylinder by its mounting flange. Do not clamp master cylinder piston rod, reservoir, seal or body.

1. Clamp master cylinder in a vise.
2. Attach special tools for bleeding master cylinder in the following fashion:
  - a. Thread one Adapter (3), Special Tool 8822-2, in each outlet port. Tighten Adapters to 14 N·m (124 in. lbs.) torque.
  - b. Thread a Bleeder Tube (1), Special Tool 8358-1, into each Adapter. Tighten each tube to 14 N·m (124 in. lbs.) torque. Flex each bleeder tube and place open end into mouth of fluid reservoir as far down as possible.

**Note:** Make sure open ends of bleeder tubes stay below surface of brake fluid once reservoir is filled to proper level.

3. Fill brake fluid reservoir (1) to the MAX level with Mopar® brake fluid or equivalent conforming to DOT 3 (DOT 4 and DOT 4+ are acceptable) specifications. Make sure fluid level is above tips of bleeder tubes in reservoir to ensure no air is ingested during bleeding.

4. Using a wooden dowel as a pushrod (2), slowly depress master cylinder pistons, then release pressure, allowing pistons to return to released position. Repeat several times until all air bubbles are expelled. Make sure fluid level stays above tips of bleeder tubes in reservoir while bleeding.
5. Remove bleeder tubes (1) and adapters (3) from master cylinder outlet ports, then plug outlet ports and install fill cap on reservoir.
6. Remove master cylinder from vise.
7. Install master cylinder on vehicle. (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ MASTER CYLINDER - INSTALLATION)

## REMOVAL

**CAUTION:** Vacuum in power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent power brake booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping brake pedal, with vehicle's engine not running, until a firm feeling brake pedal is achieved.

1. With engine not running, pump brake pedal until a firm pedal is achieved (4-5 strokes).
2. Disconnect and isolate battery negative cable (2) from battery post.

3. Remove access panel (1) in cowl area to expose master cylinder (2).
4. Thoroughly clean all surfaces of brake fluid reservoir and master cylinder. Use only Mopar® Brake Parts Cleaner or equivalent.

5. Disconnect wiring harness (6) connector from brake fluid level sensor (2) in master cylinder brake fluid reservoir (1).
6. If equipped with Electronic Stability Program, disconnect wiring harness (6) connector from pressure switch (5).

7. Disconnect primary (3) and secondary (2) brake tubes from master cylinder (4). Install sealing plugs in open brake tube outlet ports.

**CAUTION:** Before removing master cylinder from power brake vacuum booster, master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into power brake vacuum booster. Use only Mopar® Brake Parts Cleaner or equivalent.

8. Remove two nuts (1) attaching master cylinder to power brake booster.
9. Slide master cylinder straight out of power brake booster.

**CAUTION:** Seal on rear of master cylinder (2) is used to allow vacuum ability in power brake vacuum booster. Vacuum seal on master cylinder **MUST** be replaced whenever master cylinder is removed from power brake vacuum booster.

10. Remove vacuum seal located on mounting flange of master cylinder (2). Vacuum seal is removed by **carefully** pulling it off rear of master cylinder. **Do not attempt to pry seal off master cylinder by inserting a sharp tool between seal and master cylinder casting. Damage can occur.**

## DISASSEMBLY

1. Clean master cylinder housing and brake fluid reservoir. Use only Mopar® Brake Parts Cleaner or equivalent.
2. If equipped with Electronic Stability Program, remove pressure switch on bottom of master cylinder (1).

3. Remove brake fluid reservoir cap (1). Using a syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.

**CAUTION:** When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

4. Remove screw (3) fastening fluid reservoir to master cylinder housing.
5. Rock the brake fluid reservoir side-to-side while pulling up to remove it from seal grommets in master cylinder housing.

6. Remove two brake fluid reservoir seal grommets (2) from master cylinder housing (1).

## ASSEMBLY

1. Install NEW brake fluid reservoir sealing grommets (2) in master cylinder housing (1).

2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets (2) or reservoir is not properly installed.
3. Install fluid reservoir mounting screw (3). Tighten screw to 28 N-m (250 in. lbs.) torque.

4. If equipped with Electronic Stability Program, install pressure switch (1) on bottom of master cylinder. Tighten switch to 28 N·m (250 in. lbs.) torque.
5. Thoroughly bleed master cylinder before installing it on vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - STANDARD PROCEDURE)
6. Install master cylinder on power brake booster. Upon installation, vacuum seal (2) on rear of master cylinder must be replaced. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)

## INSTALLATION

1. Thoroughly bleed master cylinder before installing it on vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - STANDARD PROCEDURE)

**CAUTION:** When replacing master cylinder on vehicle, a **NEW** vacuum seal (2) **MUST** be installed on master cylinder.

2. Install **NEW** vacuum seal (2) on rear of master cylinder making sure seal fits squarely in mounting groove.

3. Position master cylinder (4) on studs of power brake booster, aligning booster push rod with master cylinder piston.
4. Install two master cylinder mounting nuts (1). Tighten both mounting nuts to 25 N·m (225 in. lbs.) torque.

**CAUTION:** When tightening primary and secondary brake tube nuts at master cylinder, be sure brake tubes do not contact any other components within vehicle and that there is slack in flexible sections of tubes. This is required due to movement between ABS ICU and master cylinder while vehicle is in motion.

5. Thread primary (3) and secondary (2) brake tubes into master cylinder primary and secondary ports. Tighten tube nuts to 14 N·m (124 in. lbs.) torque.

6. If equipped with Electronic Stability Program, connect wiring harness (6) connector to pressure switch (5).
7. Connect wiring harness (6) connector to brake fluid level switch (2) mounted in brake fluid reservoir (1).

8. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

9. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.
10. Install access panel in cowl area.

**WARNING: BE CERTAIN A FIRM BRAKE PEDAL IS ACHIEVED PRIOR TO ATTEMPTING VEHICLE OPERATION. IF A FIRM BRAKE PEDAL CANNOT BE ACHIEVED, BLEED ENTIRE BRAKE HYDRAULIC SYSTEM AND CHECK FOR LEAKS. (Refer to 5 - BRAKES - STANDARD PROCEDURE)**

11. Road test vehicle to ensure proper operation of brakes.

## PEDAL

### REMOVAL

1. Disconnect and isolate battery negative cable (2) from battery post.

2. Remove brake lamp switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL)
3. Remove booster push rod from pin on brake pedal. To do so:
  - a. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip (3).
  - b. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
  - c. **Discard retaining clip (3). It is not to be reused. Install NEW retaining clip when assembling.**
4. Slide booster push rod (5) off brake pedal pin (4).
5. Remove four power brake booster (3) mounting nuts (1).
6. Remove two nuts (1) fastening pedal bracket to upper dash panel (2).
7. Push power brake booster (3) forward into engine compartment as far as possible by hand. Do not force it.
8. Remove brake pedal (4).

## INSTALLATION

1. Install adjustable brake pedal assembly (4) under instrument panel and slide over booster push rod.
2. From engine compartment side, push power brake booster (3) mounting studs back through dash panel (2) and brake pedal bracket.
3. Install two upper mounting nuts (1) fastening pedal bracket to upper dash panel (2). **Do not tighten at this time.**
4. Install four power brake booster mounting nuts (1). Tighten nuts to 25 N·m (19 ft. lbs.) torque.
5. Tighten two upper mounting nuts (1) to 25 N·m (19 ft. lbs.) torque.

6. Slide booster push rod (5) onto brake pedal pin (4). Install NEW retaining clip (3) securing push rod to brake pedal.
7. Install and adjust NEW brake lamp switch (2). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

8. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
9. Road test vehicle testing operation of brakes.

## PEDAL - ADJUSTABLE BRAKE

### STANDARD PROCEDURE

### ADJUSTABLE PEDALS SYCHRONIZATION

**Note:** Although the pedals can be synchronized at either the full-forward or full-rearward positions (both pedals must be in the same position), it is recommended to do so with the pedals positioned in the full-forward position due to service part positioning from the factory.

1. Disconnect the adjuster cable (1) running between the accelerator pedal module and the brake pedal assembly at the adjuster motor (2).

2. Using the switch, position the accelerator pedal (2) in the full-forward position. The pin on the pedal (1) will line up with the adjustment line (2) at this point.

3. Using a drill motor, or other suitable device, rotate the adjuster cable strand (2) from the accelerator pedal end to position the brake pedal (1) toward the full-forward position.

4. Rotate the adjuster cable strand until the brake pedal (4) gear drive block (1) lines up with the full-forward adjustment line (3) as shown. If fine adjustments are necessary, turn the adjustment knob (2) by hand to line up the components.
5. Reconnect the adjuster cable to the adjuster motor. If the cable resists connection, turn the adjustment knob (2) by hand until the cable drops into place.
6. Verify proper operation of the adjustable pedals.

## REMOVAL

1. Move driver's seat to full rearward position.

2. Disconnect and isolate battery negative cable (2) from battery post.

3. Disconnect adjuster cable (1) at accelerator adjuster motor (2).

4. Remove brake lamp switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL)

5. Remove booster push rod from pin on brake pedal. To do so:

- a. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip (3).
- b. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
- c. **Discard retaining clip (3). It is not to be reused. Install NEW retaining clip when assembling.**

6. Slide booster push rod (5) off brake pedal pin (4).

7. Disconnect wiring connector (2) at brake pedal position sensor (3).

8. Remove four power brake booster mounting nuts (4).
9. Remove two nuts (5) fastening pedal bracket to upper dash panel (2).
10. Push power brake booster (1) forward into engine compartment as far as possible by hand. Do not force it.
11. Remove adjustable brake pedal assembly (3).
12. Remove adjuster cable at brake pedal gear drive.

## INSTALLATION

1. Attach cable to brake pedal gear drive.

2. Install adjustable brake pedal assembly (3) under instrument panel and slide over booster push rod.
3. From engine compartment side, push power brake booster (1) mounting studs back through dash panel (2) and brake pedal bracket.
4. Install two nuts (5) fastening pedal bracket to upper dash panel (2). **Do not tighten at this time.**
5. Install four power brake booster mounting nuts (4). Tighten nuts to 25 N·m (19 ft. lbs.) torque.
6. Tighten two upper mounting nuts (5) to 25 N·m (19 ft. lbs.) torque.

7. Connect wiring connector (2) at brake pedal position sensor (3).

8. Slide booster push rod (5) onto brake pedal pin (4). Install NEW retaining clip (3) securing push rod to brake pedal.
9. Install and adjust NEW brake lamp switch (2). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

10. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

11. Synchronize brake pedal to accelerator pedal, then connect adjuster cable (1) to adjuster motor (2). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/PEDAL - STANDARD PROCEDURE)
12. If vehicle is equipped with memory seats, the system will need to be initialized. Refer to appropriate diagnostic information.
13. Test operation of adjustable pedals.
14. Road test vehicle testing operation of brakes and accelerator.

## BOOSTER - POWER BRAKE

### REMOVAL

1. Move driver's seat to full rearward position.

2. Disconnect and isolate battery negative cable (2) from battery post.
3. Remove master cylinder. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - REMOVAL)

4. If equipped with Electronic Stability Program (ESP), disconnect wiring harness (6) connector at pedal travel sensor (7) on power brake booster (3).
5. If equipped with ESP, disconnect wiring harness (6) connector at active brake booster solenoid (4).

6. Disconnect vacuum hose (3) from check valve (2) on face of booster (1). **Do not remove check valve from booster.**

7. Remove brake lamp switch. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - REMOVAL)

8. Remove booster push rod from pin on brake pedal. To do so:

- Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip (3).
- Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
- Discard retaining clip (3). It is not to be reused. Install NEW retaining clip when assembling.**

9. Slide booster push rod (5) off brake pedal pin (4).

10. Remove four power brake booster mounting nuts (4).

11. Remove windshield wiper module. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL)

12. Slide power brake booster forward out of dash panel and remove through opening between cross-brace and windshield.

## INSTALLATION

**Note:** Before installing booster, make sure there is a **NEW** booster seal (2) placed over push rod and mounting studs on rear of booster (1).

1. Install power brake booster through opening between cross-brace and windshield. Guide booster (1) push rod and mounting studs through dash panel (2).
2. Install four power brake booster mounting nuts (4). Tighten nuts to 25 N·m (19 ft. lbs.) torque.

3. Slide booster push rod (5) onto brake pedal pin (4). Install NEW retaining clip (3) securing push rod to brake pedal.
4. Install and adjust NEW brake lamp switch (2). (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/BRAKE LAMP SWITCH - INSTALLATION)

5. Connect vacuum hose (3) to check valve (2) on face of booster (1). **Do not remove check valve from booster.**

6. If equipped with Electronic Stability Program (ESP), connect wiring harness (6) connector at pedal travel sensor (7) on power brake booster (3).
7. If equipped with ESP, connect wiring harness (6) connector at active brake booster solenoid (4).
8. Install master cylinder (1). (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/MASTER CYLINDER - INSTALLATION)
9. Install windshield wiper module and components removed to access. (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION)

10. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
11. Road test vehicle to ensure proper operation of brakes.

## VALVE - PROPORTIONING

### DESCRIPTION

Two proportioning valves are used on each vehicle without antilock brakes. One valve is used for each rear brake hydraulic circuit. The proportioning valves that are located in the junction block (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/JUNCTION BLOCK - DESCRIPTION). The valves are not serviceable and must be replaced as part of the junction block.

### OPERATION

Proportioning valves balance front to rear braking by controlling (at a given ratio) brake hydraulic pressure to the rear brakes above a preset level (split point). On light pedal applications equal brake pressure is transmitted to both the front and rear brakes. On heavier pedal applications, through the use of proportioning valves, the pressure transmitted to the rear will be lower than the front brakes. This prevents premature rear wheel skid.

## ROTOR

### DIAGNOSIS AND TESTING

#### BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

#### BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE).

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

## ROTOR MINIMUM THICKNESS

Measure rotor thickness (1) at the center of the brake shoe contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

**CAUTION:** Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Minimum thickness specifications (1) are cast on the rotor's unmachined surface (2). Limits can also be found in this component's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

## ROTOR THICKNESS VARIATION

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor. If thickness measurements vary beyond the specification listed in the specification table (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS), the rotor should be refaced or replaced. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - STANDARD PROCEDURE).

## ROTOR RUNOUT

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove tire and wheel assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)
3. Install standard wheel mounting nuts, flat side to rotor, on all studs (2). Progressively tighten nuts to 150 N·m (110 ft. lbs.) torque.
4. Mount Dial Indicator (1), Special Tool C-3339A, with Wheel, Special Tool 25w, or equivalent, to knuckle. Position Dial Indicator Wheel to contact rotor braking surface approximately ten millimeters from outer edge of rotor (3).
5. Slowly rotate brake rotor checking lateral runout, marking the low and high spots. Record these measurements.
6. Check and record runout of opposite side of rotor in same fashion, marking the low and high spots.
7. Compare runout measurement to specifications. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor (1) and the one wheel stud (2) closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.

8. Remove the rotor from the hub. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - REMOVAL)

**Note:** Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.

9. Mount Dial Indicator (2), Special Tool C-3339A, to the knuckle. Position Dial Indicator stem so it contacts hub face (1) near outer diameter. Care must be taken to position stem outside of stud circle, but inside of chamfer on the hub rim.
10. Slowly rotate hub measuring runout. Hub runout should not exceed 0.01 mm (0.0004 inch). If runout exceeds this specification, the hub must be replaced. (Refer to 2 - SUSPENSION/Front/HUB / BEARING - REMOVAL)(Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)
11. If hub runout does not exceed this specification, install original rotor back on hub, aligning chalk mark on rotor (2) with a wheel mounting stud, two studs apart from original stud (1).

12. Install standard wheel mounting nuts, flat side to rotor, on all studs (2). Progressively tighten nuts to 150 N·m (110 ft. lbs.) torque.
13. Mount Dial Indicator (1) and remeasure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)
14. If runout is still not within specifications, reface or replace brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTORS - STANDARD PROCEDURE)

## STANDARD PROCEDURE

### BRAKE ROTOR MACHINING

**Note:** Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

**Note:** All brake rotors (2) have markings for minimum allowable thickness cast on an unmachined surface of the rotor (1) or stamped into the hat section. Minimum thickness specifications can also be found in this component's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

Minimum allowable thickness is the minimum thickness which the brake rotor machined surface may be cut to.

**CAUTION:** Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits **MUST BE MAINTAINED**. Extreme care in the operation of rotor turning equipment is required. Specifications for brake rotor machining can be found in this section's specification table. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - SPECIFICATIONS)

## REMOVAL

### FRONT

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove wheel mounting nuts(3), then tire and wheel assembly (1).

**Note:** In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before mounting bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

3. Remove two bolts (2) securing disc brake caliper adapter (3) to knuckle (1).
4. Remove disc brake caliper and adapter (3) from knuckle as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

5. Remove any clips (3) retaining brake rotor (2) to wheel studs.
6. Slide brake rotor (2) off hub and bearing (1).

## REAR

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

**Note:** In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

3. Remove two bolts (1) securing disc brake caliper adapter (3) to knuckle (2).
4. Remove disc brake caliper and adapter (3) from knuckle as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

5. Remove any clips (2) retaining brake rotor (3) to wheel mounting studs.
6. Slide brake rotor (3) off hub and bearing (1).

## INSTALLATION

### FRONT

**Note:** Inspect brake shoes (pads) before installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ BRAKE PADS/SHOES - INSPECTION)

1. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.
2. Install brake rotor (2) over studs on hub and bearing.

3. Install disc brake caliper and adapter assembly (3) over brake rotor.
4. Install mounting bolts (2) securing caliper adapter (3) to knuckle (1). Tighten bolts to 169 N·m (125 ft. lbs.) torque.

5. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
6. Lower vehicle.
7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

8. Check and adjust brake fluid level in reservoir (1) as necessary.

9. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake shoes.

## REAR

**Note: Inspect disc brake shoes and parking brake shoes before installation. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/BRAKE PADS/SHOES - INSPECTION)**

1. Clean hub face to remove any dirt or corrosion where brake rotor mounts (1).
2. Install brake rotor (3) over wheel mounting studs and onto hub (1).

3. Install disc brake caliper and adapter assembly (3) over brake rotor.
4. Install mounting bolts (1) securing caliper adapter (3) to knuckle (2). Tighten bolts to 169 N·m (125 ft. lbs.) torque.

5. Install tire and wheel assembly (1) (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting nuts (3) to 150 N·m (110 ft. lbs.) torque.
6. Lower vehicle.
7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

8. Check and adjust brake fluid level in reservoir (1) as necessary.
9. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake shoes.

## SPECIFICATIONS

### BRAKE ROTOR

**Note:** When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits **MUST BE MAINTAINED**. Extreme care in the operation of rotor turning (machining) equipment is required.

#### LIMITS/SPECIFICATIONS - 17 INCH BRAKES (BASE)

Brake Rotor	Rotor Thickness	Minimum Rotor Thickness	Rotor Thickness Variation	Rotor Runout *
Front	27.87-28.13 mm 1.097-1.107 in.	26.5 mm 1.040 in.	0.010 mm 0.0004 in.	0.035 mm 0.0014 in.
Rear	9.87-10.13 mm 0.389-0.399 in.	8.5 mm 0.335 in.	0.010 mm 0.0004 in.	0.035 mm 0.0014 in.
* TIR Total Indicator Reading (Measured On Vehicle)				

#### LIMITS/SPECIFICATIONS - 18 INCH BRAKES (PREMIUM)

## TUBES/HOSES

### DESCRIPTION

The brake tubes are steel with a corrosion-resistant nylon coating applied to the external surfaces.

The flex hoses used at each wheel brake are made of reinforced rubber with fittings at each end. The fitting at each brake caliper is the banjo-type and requires a special banjo bolt and copper washers.

### INSPECTION

Brake tubing should be inspected periodically for evidence of physical damage or contact with moving or hot components.

Flexible rubber hose is used at both the front and rear wheel brakes. Inspection of the flexible brake hoses should be performed whenever the brake system is serviced and every 7,500 miles or 12 months, whichever comes first. Inspect hydraulic brake hoses for surface cracking, scuffing, or worn spots. If the fabric casing of the hose becomes exposed due to cracks or abrasions in the hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

## CABLE - PARKING BRAKE FRONT REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect front parking brake cable (2) at connector (1) to right rear parking brake cable.
3. Remove front cable from equalizer (4).

4. Remove screw (2) fastening cable routing bracket (1) to rear crossmember.

5. Remove screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).
6. Lower vehicle.
7. Remove driver door opening sill scuff plate and cowl side trim.
8. Remove clip and roll back carpet away from front cable.
9. Disconnect front parking brake cable strand (3) at lever connector (2).

10. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown to collapse retainer fingers. Pull cable from bracket.

11. Remove parking brake cable grommet (2) from floor pan (3).  
12. Remove parking brake cable (7) through hole in floor pan.

## INSTALLATION

1. Guide parking brake cable (7) down through hole in floor pan.
2. Install parking brake cable grommet (2) in hole of floor pan (3).
3. Guide cable end (3) up through lever bracket and press cable housing retainer (7) into bracket allowing retainer fingers to lock cable in place.
4. Connect front parking brake cable strand (3) at lever connector (2).
5. Lay carpet back into place and install retaining clip.
6. Install driver door opening sill scuff plate and cowl side trim.
7. Raise and support vehicle.

8137a472

8. Install screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).

9. Route cable above rear crossmember, then slide cable (2) through equalizer (4) above rear differential.

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

10. Connect front parking brake cable (2) at connector (1) to right rear parking brake cable (6).

813b14a7

11. Install screw (2) fastening cable routing bracket (1) to rear crossmember.

12. Lower vehicle until rear wheels are just above floor level.

13. Apply parking brake lever. Release lever, then reapply.

14. Check to make sure rear wheels will not rotate with lever applied.

15. Lower vehicle.

8135bfd4

## CABLE - PARKING BRAKE REAR

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. If removing left rear parking brake cable, disconnect cable (3) at equalizer (4) above rear cross-member (5).
3. If removing right rear parking brake cable, disconnect cable (6) at connector (1) above rear cross-member (5).
4. Remove parking brake shoes on side of cable service. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - REMOVAL)

5. Remove shoe actuator lever (1) from end of cable (2) and support.

6. Remove screw (3) fastening cable (1) to knuckle (2). Remove cable from knuckle.

7. Place 14 mm 12-point deep well socket (3) over cable strand (1) onto cable retainer at crossmember bracket as shown to collapse retainer fingers. It may be necessary to wiggle the socket around somewhat to collapse fingers. With socket in place, pull cable (2) from bracket.
8. Remove cable.

## INSTALLATION

1. Route Rear parking brake cable through rear suspension.
2. Guide cable end through crossmember bracket and press cable housing retainer into bracket allowing retainer fingers to lock cable in place.

3. Insert opposite end of cable (1) through rear knuckle (2) and install mounting screw (3). Tighten screw to 8 N·m (71 in. lbs.) torque.

4. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
5. Install parking brake shoes as well as all components necessary to access them. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - INSTALLATION)

**Note:** Due to short travel and low spring tension, it is not necessary to lock out parking brake lever to service parking brake components.

6. If installing left rear parking brake cable, connect cable (3) at equalizer (4) above rear crossmember (5).
7. If installing right rear parking brake cable, connect cable (6) at connector (1) above rear crossmember (5).

8. Lower vehicle until rear wheels are just above floor level.
9. Apply parking brake lever. Release lever, then reapply.
10. Check to make sure rear wheels will not rotate with lever applied.

11. Lower vehicle.
12. Adjust parking brake shoes as necessary. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENT)

## LEVER - PARKING BRAKE

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect front parking brake cable (2) at connector (1) to right rear parking brake cable.
3. Lower vehicle.

4. Remove fasteners (6) securing steering column opening cover (1) in place.
5. Disconnect wiring connector (3) at decklid release switch.
6. Disconnect parking brake release cable (4) at lever (5) and remove steering column opening cover (1).
7. Disconnect wiring connector (7) at parking brake switch (1).
8. Disconnect front parking brake cable strand (3) at lever connector (2).

9. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown to collapse retainer fingers. Pull cable from bracket.

10. Remove bolt (4) and two nuts (2) mounting parking brake lever (3) to body (5).  
11. Remove parking brake lever (3).

## INSTALLATION

1. Install parking brake lever (3) over mounting studs (1).  
2. Install bolt (4) and two nuts (2) mounting parking brake lever to body (5). Tighten bolt and nuts to 26 N·m (19 ft. lbs.) torque.

3. Connect wiring connector (7) at parking brake switch (1).
4. Guide cable end (3) up through lever bracket and press cable housing retainer (7) into bracket allowing retainer fingers to lock cable in place.
5. Connect front parking brake cable strand (3) at lever connector (2).
6. If installing new lever, remove pin locking out automatic tensioning spring.

7. Connect parking brake release cable (4) at handle (5) in steering column opening cover (1).
8. Connect wiring connector (3) at decklid release switch.
9. Position steering column opening cover (1) and install fasteners (6) securing it in place.
10. Raise and support vehicle.

**Note:** Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

11. Connect front parking brake cable (2) at connector (1) to right rear parking brake cable (6).
12. Lower vehicle until rear wheels are just above floor level.
13. Apply parking brake lever. Release lever to test release cable and handle. Reapply lever. While doing this, check to make sure the red indicator lamp in the cluster turns on and off properly.
14. Check to make sure rear wheels will not rotate with lever applied.
15. Lower vehicle.

## SHOE AND LINING - PARKING BRAKE

### REMOVAL

**Note:** The following procedure may be used to remove shoes on either side of the vehicle.

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Access and remove rear hub and bearing. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - REMOVAL)
3. Completely back off parking brake shoe adjustment (8).
4. Remove parking brake shoe adjuster spring (3).
5. Remove shoe adjuster (8).
6. Remove upper brake shoe hold-down clip and pin (7).
7. Remove upper shoe (6) from return spring (4) and shoe actuator lever (1).
8. Remove return spring (4) from lower shoe (6).

9. Remove shoe actuator lever (1) from end of cable (2).

10. Remove lower brake shoe hold-down clip and pin (7).
11. Remove lower shoe (6).
12. Inspect springs, adjuster, lever and aluminum shoe anchor pin for wear or damage. Replace as necessary.

## INSTALLATION

**Note:** The following procedure may be used to install shoes on either side of the vehicle.

**Note:** Inspect springs, adjuster, lever and aluminum shoe anchor pin for wear or damage prior to installation. Replace as necessary.

1. Install lower brake shoe hold-down pin (7) through rear of support (2).
2. Install lower shoe (6) against support plate (2).
3. Install lower brake shoe hold-down clip (7).

4. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.

5. Install return spring (4) to lower shoe (6).
6. Install upper shoe (6) against support plate and onto shoe actuator lever.
7. Install upper brake shoe hold-down pin (7) through rear of support and upper shoe.
8. Install upper brake shoe hold-down clip (7).
9. Attach return spring (4) to upper shoe (6).
10. Install shoe adjuster (8). Place end of adjuster with star wheel upward.
11. Install parking brake shoe adjuster spring (3).

12. Using Brake Shoe Gauge, Special Tool C-3919, or equivalent, measure inside diameter of parking brake drum portion of rotor. Set gauge.

13. Place Gauge (1) over parking brake shoes at widest point.
14. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge. This will give a good preliminary adjustment of parking brake shoes, before a final adjustment is made at end of this procedure.
15. Install hub and bearing with wheel speed sensor as well as all components necessary to access it. (Refer to 2 - SUSPENSION/REAR/HUB / BEARING - INSTALLATION)
16. Lower vehicle.
17. Perform final adjustment of parking brake shoes. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENT)

## ADJUSTMENTS

### PARKING BRAKE SHOE ADJUSTMENT

1. Place parking brake lever in "full released" position.
2. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
3. Remove plug in parking brake shoe support to access adjuster star-wheel (1).

**Note:** Through the access hole (2), rotate the adjuster star wheel (1) in the following direction to expand the shoes outward against the drum.

- Left brake – Rotate star-wheel toward rear of vehicle.
  - Right brake – Rotate star-wheel toward front of vehicle.
4. Using an appropriate tool, turn adjuster star wheel (1) until wheel will not rotate (dead lock).
  5. Back off adjuster six detents (teeth).
  6. Rotate wheel, checking for light drag. If drag is too heavy, continue to back off adjuster one detent at a time until light drag is present. **Do not back off star-wheel more than 17 detents from wheel lock.**

7. Install access plug.
8. Adjust opposite wheel parking brake shoes using same method.
9. Lower vehicle.
10. Apply and release parking brake lever once to ensure proper operation of parking brakes.

## BRAKES - ABS ELECTRICAL DIAGNOSTICS

## BRAKES - ABS ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

## APS-INTERMITTENT CONDITION

For the Adjustable Pedals System circuit diagrams.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

1.

**Note:** The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

**WARNING:** When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

1. Refer to any Technical Service Bulletins (TSBs) that may apply.
2. Review the scan tool information. If possible, try to duplicate the conditions under which the DTC set.
3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Perform a voltage drop test on the related circuits between the suspected faulty component and the Memory Seat Module.
6. Inspect and clean all grounds that are related to the most current DTC.
7. If numerous trouble codes were set, use a wiring schematic and look for any common ground or supply circuits.
8. Monitor with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
9. Use the scan tool to perform a System Test if one applies to failing component.
10. A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

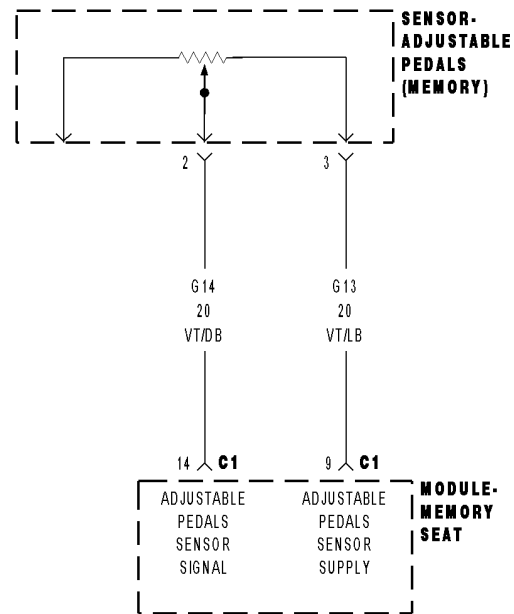

#### Were any problems found during the above inspections?

**Yes** >> Perform the necessary repairs.  
Perform APS VERIFICATION TEST VER - 1.

**No** >> Test Complete.

---

## B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW

**B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)**

For the Adjustable Pedal System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Adjustable Pedal Motor is in active operation.
- **Set Condition:**  
The Memory Seat Module detects a low signal circuit voltage that is not within voltage specification from the Adjustable Pedal Sensor.

Possible Causes
CONNECTOR/TERMINAL DAMAGE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND, OR OPEN (G14) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT SHORTED TO GROUND, OR OPEN ADJUSTABLE PEDALS SENSOR - INTERNAL FAULT MEMORY SEAT MODULE - INTERNAL FAULT

**Diagnostic Test****1. CHECK FOR DTC B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

**Does the scan tool display: B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform APS VERIFICATION TEST - VER 1.

**B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)****2. CHECK CONNECTOR/TERMINAL FOR DAMAGE**

**Note:** Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector, Adjustable Pedals Sensor, and Adjustable Pedals Sensor harness connector.

**Is the Adjustable Pedals Sensor or any of the connectors/terminals damaged?**

- Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Using a 12-volt test light connected to 12-volts, probe the (G13) Adjustable Pedals Sensor Supply circuit.

**Does the test light illuminate brightly?**

- Yes** >> Repair the (G13) Adjustable Pedals Sensor Supply circuit for a short to ground.  
Perform APS VERIFICATION TEST - VER 1.
- No** >> Go To 4

**B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)****4. CHECK (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Connect a jumper wire between the (G13) Adjustable Pedals Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (G13) Adjustable Pedals Sensor Supply circuit.

**Does the test light illuminate brightly**

**Yes** >> Go To 5

**No** >> Repair the (G13) Adjustable Pedals Sensor Supply circuit for an open.

Perform APS VERIFICATION TEST - VER 1.

**5. CHECK (G14) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Using a 12-volt test light connected to 12-volts, probe the (G14) Adjustable Pedals Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G14) Adjustable Pedals Sensor Signal circuit for a short to ground.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)****6. CHECK (G14) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Connect a jumper wire between the (G14) Adjustable Pedals Sensor Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (G14) Adjustable Pedals Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 7

**No** >> Repair the (G14) Adjustable Pedals Sensor Signal circuit for an open.  
Perform APS VERIFICATION TEST - VER 1.

**7. CHECK (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT VOLTAGE**

Turn the ignition off.

Disconnect the Adjustable Pedals Sensor harness connector.

Measure the voltage between the (G13) Adjustable Pedals Sensor Supply circuit and ground.

**Is the voltage between 4.0 and 5.0 volts?**

**Yes** >> Go To 8

**No** >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

**B1D56-ADJUSTABLE PEDAL SENSOR CIRCUIT LOW (CONTINUED)****8. CHECK (G14) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT VOLTAGE**

Turn the ignition off.

Reconnect all connectors.

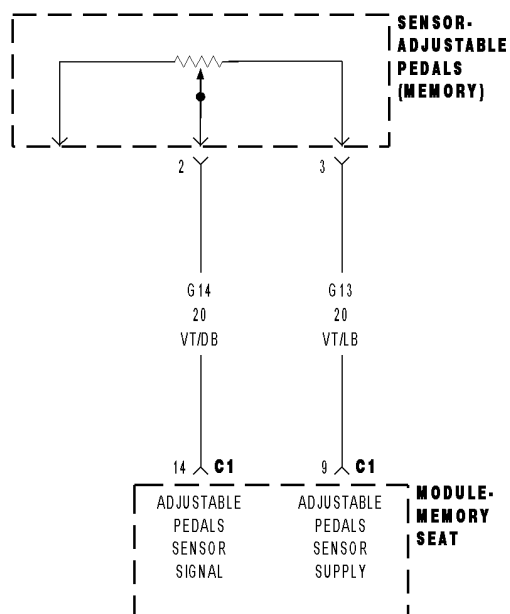

Measure the voltage of the (G14) Adjustable Pedals Sensor Signal circuit in the Memory Seat Module harness connector.

**Is the voltage above 0.5 volts?**

- Yes** >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.
- No** >> Replace the Adjustable Pedals Sensor in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

**B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH**

**B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)**

For the Adjustable Pedal System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Adjustable Pedal Motor is in active operation.
- **Set Condition:**  
The Memory Seat Module detects a high signal circuit voltage that is not within voltage specification from the Adjustable Pedal Sensor.

Possible Causes
CONNECTOR/TERMINAL DAMAGE (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE (G14) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE ADJUSTABLE PEDALS SENSOR - INTERNAL FAULT MEMORY SEAT MODULE - INTERNAL FAULT

**Diagnostic Test****1. CHECK FOR DTC B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

**Does the scan tool display: B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform APS VERIFICATION TEST - VER 1.

**B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)****2. CHECK CONNECTOR/TERMINAL FOR DAMAGE**

**Note:** Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector, Adjustable Pedals Sensor, and Adjustable Pedals Sensor harness connector.

**Is the Adjustable Pedals Sensor or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK (G13) ADJUSTABLE PEDALS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Turn the ignition on.

Measure the voltage between the (G13) Adjustable Pedals Sensor Supply circuit and ground.

**Is the voltage above 5.0 volts?**

**Yes** >> Repair the (G13) Adjustable Pedals Sensor Supply circuit for a short to voltage.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1D57-ADJUSTABLE PEDAL SENSOR CIRCUIT HIGH (CONTINUED)****4. CHECK (G14) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Turn the ignition on.

Measure the voltage between the (G14) Adjustable Pedals Sensor Signal circuit and ground.

**Is the voltage above 5.0 volts?**

**Yes** >> Repair the (G14) Adjustable Pedals Sensor Signal circuit for a short to voltage.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK (G14) ADJUSTABLE PEDALS SENSOR SIGNAL CIRCUIT VOLTAGE**

Turn the ignition off.

Reconnect all connectors.

Measure the voltage of the (G14) Adjustable Pedals Sensor Signal circuit in the Memory Seat Module harness connector.

**Is the voltage below 4.0 volts?**

**Yes** >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Replace the Adjustable Pedals Sensor in accordance with the Service Information.

Perform APS VERIFICATION TEST - VER 1.

B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE

**B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)**

For the Adjustable Pedal System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

The Adjustable Pedals Switch is in active operation.

- **Set Condition:**

The Memory Seat Module detects an activation of both pedal switches at the same time.

Possible Causes
CONNECTOR/TERMINAL DAMAGE
(Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT SHORTED TO GROUND
(Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND
(Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT AND (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TOGETHER
ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT
MEMORY SEAT MODULE - INTERNAL FAULT

## Diagnostic Test

### 1. CHECK FOR DTC B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle the Adjustable Pedals Switch forward and rearward.

With the scan tool, read DTC's

**Does the scan tool display: B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform APS VERIFICATION TEST - VER 1.

**B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)****2. CHECK CONNECTOR/TERMINAL FOR DAMAGE**

**Note:** Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector, Adjustable Pedals Switch, and Adjustable Pedals Switch harness connector.

**Is the Adjustable Pedals Switch or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK (Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q103) Adjustable Pedals Switch Rearward circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (Q103) Adjustable Pedals Switch Rearward circuit for a short to ground.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)****4. CHECK (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q102) Adjustable Pedals Switch Forward circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (Q102) Adjustable Pedals Switch Forward circuit for a short to ground.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK (Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT AND (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Switch harness connector.

Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward circuit and (Q102) Adjustable Pedals Switch Forward circuit.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (Q103) Adjustable Pedals Switch Rearward circuit and (Q102) Adjustable Pedals Switch Forward circuit for a short together.

Perform APS VERIFICATION TEST - VER 1.

**B1D5B-ADJUSTABLE PEDAL SWITCH CIRCUIT PERFORMANCE (CONTINUED)****6. CHECK ADJUSTABLE PEDALS SWITCH SHORTED**

Turn the ignition off.

Disconnect the Adjustable Pedals Switch harness connector.

Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward and (Q102) Adjustable Pedals Switch Forward terminals at the Adjustable Pedals Switch.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.
- No** >> Replace the Adjustable Pedals Switch in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

## B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD

**B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)**

For the Adjustable Pedal System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Adjustable Pedals Switch is in active operation.
- **Set Condition:**  
The Memory Seat Module detects that the Adjustable Pedals Switch has been activated for a time period of more than 50 seconds.

Possible Causes
CONNECTOR/TERMINAL DAMAGE (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT MEMORY SEAT MODULE - INTERNAL FAULT

**Diagnostic Test**

**1. CHECK FOR DTC B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.  
With the scan tool, record and erase DTC's.  
Cycle the ignition switch from off to on.  
Cycle the Adjustable Pedals Switch forward and rearward.  
With the scan tool, read DTC's

**Does the scan tool display: B1D5C–ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform APS VERIFICATION TEST - VER 1.

**B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)****2. CHECK CONNECTOR/TERMINAL FOR DAMAGE**

**Note:** Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector, Adjustable Pedals Switch, and Adjustable Pedals Switch harness connector.

**Is the Adjustable Pedals Switch or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK (Q102) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q102) Adjustable Pedals Switch Forward circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (Q102) Adjustable Pedals Switch Forward circuit for a short to ground.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1D5C-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK FORWARD (CONTINUED)****4. CHECK ADJUSTABLE PEDALS SWITCH SHORTED**

Turn the ignition off.

Disconnect the Adjustable Pedals Switch harness connector.

Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward and (Q102) Adjustable Pedals Switch Forward terminals at the Adjustable Pedals Switch.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.
- No** >> Replace the Adjustable Pedals Switch in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

## B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD

**B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)**

For the Adjustable Pedal System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Adjustable Pedals Switch is in active operation.
- **Set Condition:**  
The Memory Seat Module detects that the Adjustable Pedals Switch has been activated for a time period of more than 50 seconds.

Possible Causes
CONNECTOR/TERMINAL DAMAGE (Q103) ADJUSTABLE PEDALS SWITCH FORWARD CIRCUIT SHORTED TO GROUND ADJUSTABLE PEDALS SWITCH - INTERNAL FAULT MEMORY SEAT MODULE - INTERNAL FAULT

**Diagnostic Test**

**1. CHECK FOR DTC B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.  
With the scan tool, record and erase DTC's.  
Cycle the ignition switch from off to on.  
Cycle the Adjustable Pedals Switch forward and rearward.  
With the scan tool, read DTC's

**Does the scan tool display: B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform APS VERIFICATION TEST - VER 1.

**B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)****2. CHECK CONNECTOR/TERMINAL FOR DAMAGE**

**Note:** Check all terminals for broken, bent, pushed out, or corroded terminals.

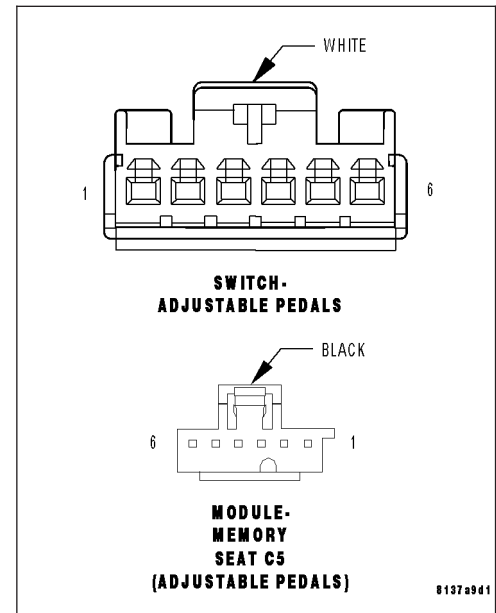

Turn the ignition off.

Inspect the Memory Seat Module harness connector, Adjustable Pedals Switch, and Adjustable Pedals Switch harness connector.

**Is the Adjustable Pedals Switch or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK (Q103) ADJUSTABLE PEDALS SWITCH REARWARD CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Switch harness connector.

Using a 12-volt test light connected to 12-volts, probe the (Q103) Adjustable Pedals Switch Rearward circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (Q103) Adjustable Pedals Switch Rearward circuit for a short to ground.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1D5D-ADJUSTABLE PEDAL SWITCH CIRCUIT STUCK REARWARD (CONTINUED)****4. CHECK ADJUSTABLE PEDALS SWITCH SHORTED**

Turn the ignition off.

Disconnect the Adjustable Pedals Switch harness connector.

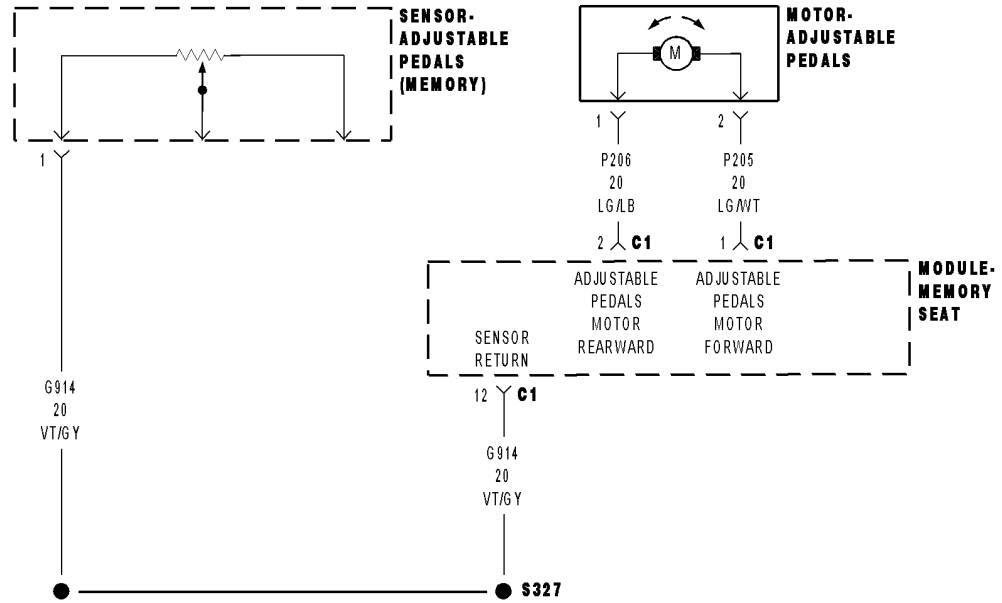

Measure the resistance between the (Q103) Adjustable Pedals Switch Rearward and (Q102) Adjustable Pedals Switch Forward terminals at the Adjustable Pedals Switch.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.
- No** >> Replace the Adjustable Pedals Switch in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

## B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE

**B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)**

For the Adjustable Pedal System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
The Adjustable Pedals Motor is in active operation.
- **Set Condition:**  
The Memory Seat Module detects that the Adjustable Pedals Motor has been activated for a time period and has not spun with three motor direction commands.

Possible Causes
CONNECTOR/TERMINAL DAMAGE MECHANICAL FAILURE IN THE ADJUSTABLE PEDALS (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT OPEN (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT OPEN (G914) RETURN CIRCUIT OPEN ADJUSTABLE PEDALS MOTOR - INTERNAL FAULT MEMORY SEAT MODULE - INTERNAL FAULT

**Diagnostic Test**

**1. CHECK FOR DTC B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, record and erase DTC's.

Cycle the ignition switch from off to on.

Cycle and hold the Adjustable Pedals Switch forward, rearward, and forward at two second intervals.

With the scan tool, read DTC's

**Does the scan tool display: B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE?**

- Yes

>> Go To 2
- No

>> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform APS VERIFICATION TEST - VER 1.

**B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)****2. CHECK CONNECTOR/TERMINAL FOR DAMAGE**

**Note:** Check all terminals for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Inspect the Memory Seat Module harness connector, Adjustable Pedals Motor, and Adjustable Pedals Motor harness connector.

**Is the Adjustable Pedals Motor or any of the connectors/terminals damaged?**

**Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK ADJUSTABLE PEDALS ASSEMBLY FOR MECHANICAL DAMAGE**

Turn the ignition off.

Inspect the Adjustable Pedals Assembly for any physical damage.

**Note:** Check for any conditions that would cause the motor to stall or be stuck.

**Is the Adjustable Pedals Assembly damaged or broken?**

**Yes** >> Replace the Adjustable Pedals Assembly in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)****4. CHECK (P205) ADJUSTABLE PEDALS MOTOR FORWARD CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Motor harness connector.

Connect a jumper wire between the (P205) Adjustable Pedals Motor Forward circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (P205) Adjustable Pedals Motor Forward circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (P205) Adjustable Pedals Motor Forward circuit for an open.

Perform APS VERIFICATION TEST - VER 1.

**5. CHECK (P206) ADJUSTABLE PEDALS MOTOR REARWARD CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Motor harness connector.

Connect a jumper wire between the (P206) Adjustable Pedals Motor Rearward circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (P206) Adjustable Pedals Motor Rearward circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (P206) Adjustable Pedals Motor Rearward circuit for an open.

Perform APS VERIFICATION TEST - VER 1.

**B1D67-ADJUSTABLE PEDAL CONTROL CIRCUIT PERFORMANCE (CONTINUED)****6. CHECK (G914) SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Memory Seat Module harness connector.

Disconnect the Adjustable Pedals Sensor harness connector.

Connect a jumper wire between the (G914) Sensor Return circuit and ground.

Using a 12-volt test light connected to 12-volts, probe the (G914) Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To

**No** >> Repair the (G914) Sensor Return circuit for an open.  
Perform APS VERIFICATION TEST - VER 1.

**7. CHECK ADJUSTABLE PEDALS MOTOR**

Turn the ignition off.

Disconnect the Adjustable Pedals Motor harness connector.

Measure the resistance between the (P205) Adjustable Pedals Motor Forward and (P206) Adjustable Pedals Motor Rearward terminals at the Adjustable Pedals Motor.

**Is the resistance below 100.0 ohms?**

**Yes** >> Replace and reprogram the Memory Seat Module in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Replace the Adjustable Pedals Motor in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

## APS VERIFICATION TEST – VER 1

### Diagnostic Test

1.

1. Ensure all accessories are turned off and the battery is fully charged.
2. Connect all previously disconnected components and connectors.
3. If the Memory Seat Module was replaced, reprogram the the Adjustable Pedals hard stop.
4. Start with the Adjustable Pedals going forward.
5. When the Adjustable Pedals reach full travel, continue to apply the Adjustable Pedals Switch for 10 seconds to learn the hard stop.
6. Repeat this step in both travel directions.
7. Verify that the Adjustable Pedals System is disabled with the vehicle in reverse.
8. Verify that the Adjustable Pedals System is disabled when the speed control is activated.
9. Ensure that the ignition is on, and with the scan tool, erase all Diagnostic Trouble Codes from All modules.
10. Fully operate the Adjustable Pedals System.
11. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTC's from all modules.
12. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.
13. Again, with the scan tool read DTC's. If any DTC's are present, return to Symptom list.
14. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete.

**Are any DTC's present or is the original concern still present?**

**Yes**    >> Repair is not complete, refer to appropriate symptom.

**No**     >> Repair is complete.

---

## ABS-INTERMITTENT CONDITION

For the Anti-Lock Brake TCS/ESP circuit diagrams.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

1.

**Note:** The conditions that set the DTC are not present at this time. The following list may help in identifying the intermittent condition.

**WARNING:** When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

1. Refer to any Technical Service Bulletins (TSBs) that may apply.
2. Review the scan tool Freeze Frame information. If possible, try to duplicate the conditions under which the DTC set.
3. Turn the ignition off.
4. Visually inspect the related wire harness. Disconnect all the related harness connectors. Look for any chafed, pierced, pinched, partially broken wires and broken, bent, pushed out, or corroded terminals.
5. Perform a voltage drop test on the related circuits between the suspected faulty component and the Anti-Lock Brake Module.
6. Inspect and clean all PCM, ABS, engine, and chassis grounds that are related to the most current DTC.
7. If numerous trouble codes were set, use a wire schematic and look for any common ground or supply circuits
8. For any Relay DTCs, actuate the Relay with the scan tool and wiggle the related wire harness to try to interrupt the actuation.
9. Use the scan tool to perform a System Test if one applies to failing component.
10. A co-pilot, data recorder, and/or lab scope should be used to help diagnose intermittent conditions.

#### Were any problems found during the above inspections?

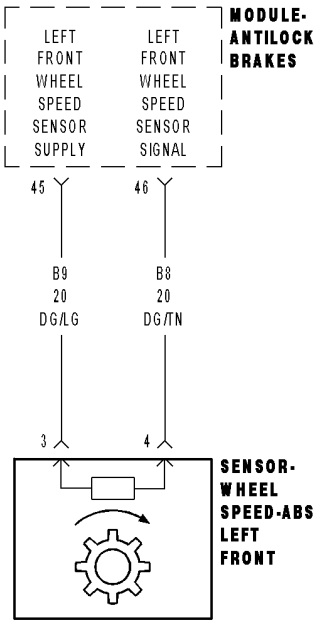

**Yes** >> Perform the necessary repairs.  
Perform ABS VERIFICATION TEST VER - 1.

**No** >> Test Complete.

---

C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT

**C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT FRONT WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C100A–LEFT FRONT WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B8) LEFT FRONT WSS SIGNAL AND THE (B9) LEFT FRONT WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Measure the resistance between the (B8) Left Front WSS Signal and the (B9) Left Front WSS Supply circuits at the Left Front WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B8) Left Front WSS Signal and the (B9) Left Front WSS Supply circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS Supply circuit in the Left Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B9) Left Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B9) Left Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****6. CHECK THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B9) Left Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B9) Left Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Connect a jumper wire between the (B9) Left Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B9) Left Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B9) Left Front WSS Supply circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

**C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****8. CHECK THE (B9) LEFT FRONT WSS SUPPLY AND THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****10. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Connect a jumper wire between the (B8) Left Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B8) Left Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****12. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Left Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Left Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C100A-LEFT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****14. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

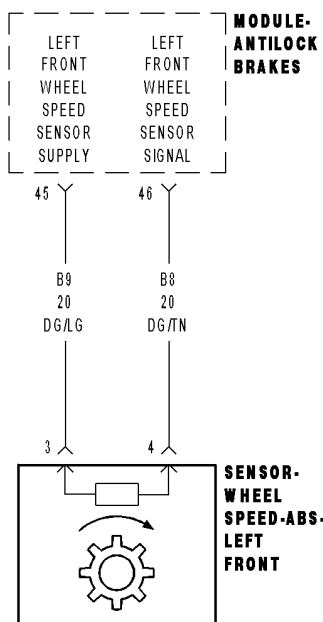

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B8) Left Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Left Front Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT AND (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER (B9) LEFT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B8) LEFT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT FRONT WSS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.

**CAUTION:** Ensure braking capability is available before road testing.

- Drive the vehicle over 25 km/h (15 mph).
- Park the vehicle and cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B8) LEFT FRONT WSS SIGNAL AND THE (B9) LEFT FRONT WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Measure the resistance between the (B8) Left Front WSS Signal and the (B9) Left Front WSS Supply circuits at the Left Front WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B8) Left Front WSS Signal and the (B9) Left Front WSS Supply circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B9) Left Front WSS Supply circuit in the Left Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B9) Left Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B9) Left Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****6. CHECK THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B9) Left Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B9) Left Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B9) LEFT FRONT WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Connect a jumper wire between the (B9) Left Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B9) Left Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B9) Left Front WSS Supply circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

**C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****8. CHECK THE (B9) LEFT FRONT WSS SUPPLY AND THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****10. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Connect a jumper wire between the (B8) Left Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B8) Left Front WSS Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

**C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****12. CHECK THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B8) Left Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B8) Left Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Left Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Left Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C1011-LEFT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****14. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B8) Left Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

**C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Left Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN LEFT FRONT WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the LF WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B9) LEFT FRONT WSS SUPPLY CIRCUIT AND THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C100A LEFT FRONT WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1014-LEFT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****4. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Left Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Left Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B8) Left Front WSS Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT

**C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT FRONT WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C1015–RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B6) RIGHT FRONT WSS SIGNAL AND THE (B7) RIGHT FRONT WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Measure the resistance between the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits at the Right Front WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits for a short together. Perform ABS VERIFICATION TEST - VER 1.

**C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit in the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****6. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B7) Right Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****8. CHECK THE (B7) RIGHT FRONT WSS SUPPLY AND THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****10. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B6) Right Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****12. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Right Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Right Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C1015-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****14. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

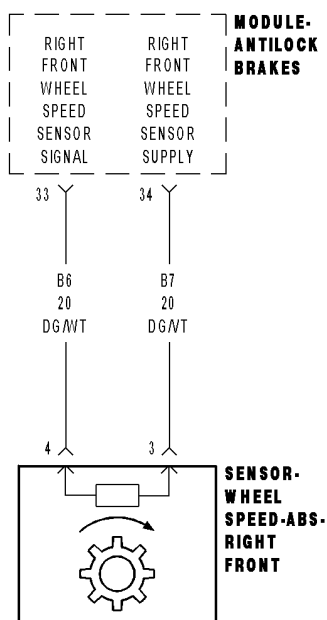

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

## C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Right Front Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT FRONT WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test**

**1. CHECK FOR A DTC C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.

**CAUTION:** Ensure braking capability is available before road testing.

- Drive the vehicle over 25 Km/h (15 mph).
- Park the vehicle and cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B6) RIGHT FRONT WSS SIGNAL AND THE (B7) RIGHT FRONT WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Measure the resistance between the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits at the Right Front WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit in the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****6. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B7) Right Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****8. CHECK THE (B7) RIGHT FRONT WSS SUPPLY AND THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****10. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B6) Right Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****12. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Right Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Right Front WSS in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**C101C-RIGHT FRONT WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****14. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

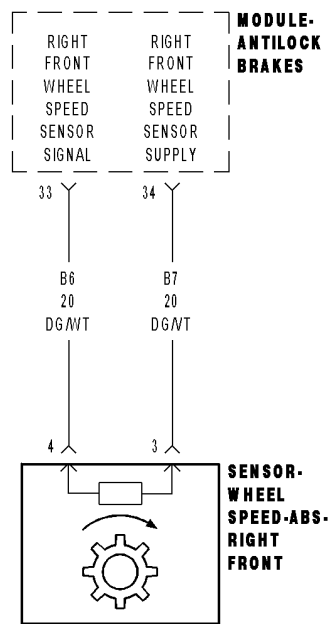

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B6) Right Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE

**C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Right Front Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN RIGHT FRONT WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the RF WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B7) RIGHT FRONT WSS SUPPLY CIRCUIT AND THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C1015 RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure. Perform ABS VERIFICATION TEST - VER 1.

**C101F-RIGHT FRONT WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****4. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Right Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Right Front WSS in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

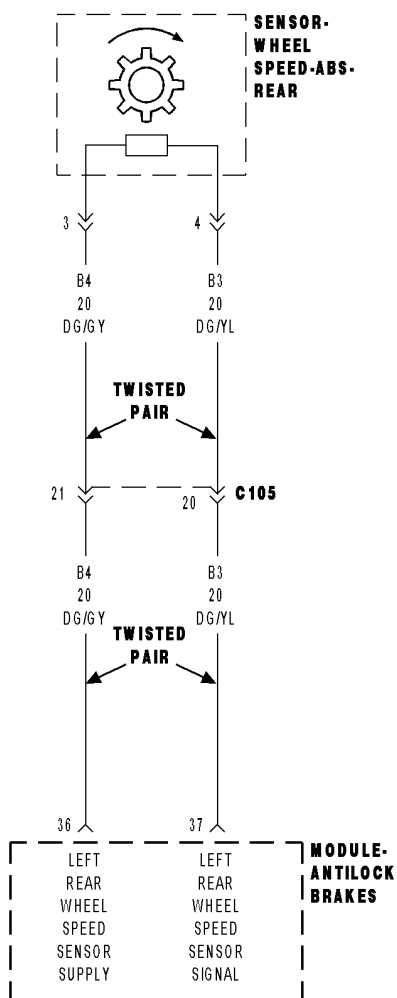

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT**

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT REAR WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B3) LEFT REAR WSS SIGNAL AND THE (B4) LEFT REAR WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Measure the resistance between the (B3) Left Rear WSS Signal and the (B4) Left Rear WSS Supply circuits at the Left Rear WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B3) Left Rear WSS Signal and the (B4) Left Rear WSS Supply circuits for a short together. Perform ABS VERIFICATION TEST - VER 1.

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B4) LEFT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS Supply circuit in the Left Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B4) LEFT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B4) Left Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B4) Left Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****6. CHECK THE (B4) LEFT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B4) Left Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B4) Left Rear WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B4) LEFT REAR WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Connect a jumper wire between the (B4) Left Rear WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B4) Left Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B4) Left Rear WSS Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****8. CHECK THE (B4) LEFT REAR WSS SUPPLY AND THE (B3) LEFT REAR WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****10. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Connect a jumper wire between the (B3) Left Rear WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B3) Left Rear WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****12. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Left Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Left Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C1020-LEFT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****14. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B3) Left Rear WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Left Rear Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT AND (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER (B4) LEFT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B3) LEFT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN LEFT REAR WSS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.

**CAUTION:** Ensure braking capability is available before road testing.

- Drive the vehicle over 25 Km/h (15 mph).
- Park the vehicle and cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B3) LEFT REAR WSS SIGNAL AND THE (B4) LEFT REAR WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Measure the resistance between the (B3) Left Rear WSS Signal and the (B4) Left Rear WSS Supply circuits at the Left Rear WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B3) Left Rear WSS Signal and the (B4) Left Rear WSS Supply circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B4) LEFT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B4) Left Rear WSS Supply circuit in the Left Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B4) LEFT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B4) Left Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B4) Left Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****6. CHECK THE (B4) LEFT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B4) Left Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B4) Left Rear WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B4) LEFT REAR WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Connect a jumper wire between the (B4) Left Rear WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B4) Left Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B4) Left Rear WSS Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****8. CHECK THE (B4) LEFT REAR WSS SUPPLY AND THE (B3) LEFT REAR WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****10. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Connect a jumper wire between the (B3) Left Rear WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B3) Left Rear WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****12. CHECK THE (B3) LEFT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Left Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B3) Left Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B3) Left Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Left Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Left Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C1027-LEFT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****14. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

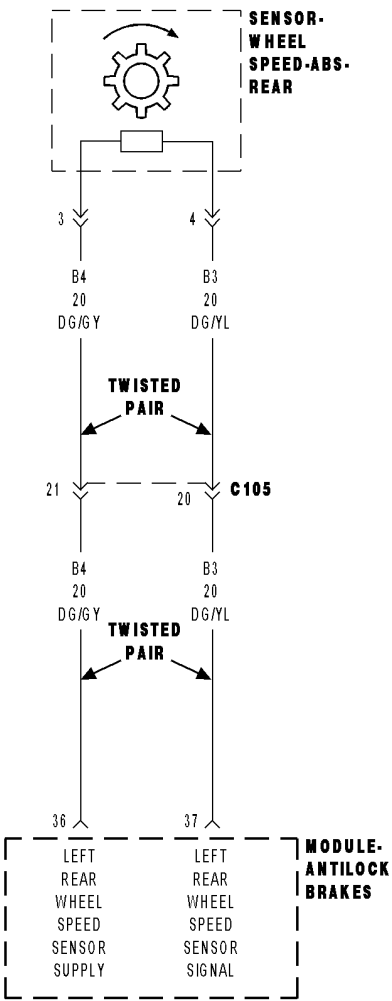

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B3) Left Rear WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

**C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Left Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT OPEN LEFT REAR WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the LR WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B4) LEFT REAR WSS SUPPLY CIRCUIT AND THE (B3) LEFT REAR WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C1020 LEFT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C102A-LEFT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****4. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Left Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Left Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

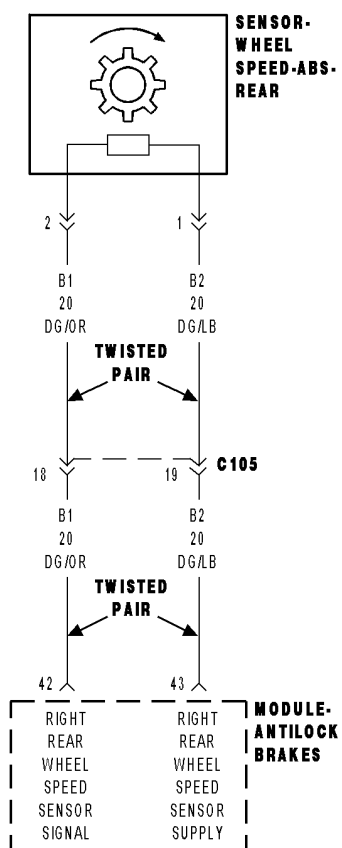

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B3) Left Rear WSS Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

**C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT**

**C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT AND (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT REAR WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C102B–RIGHT REAR WHEEL SPEED SENSOR CIRCUIT?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B1) RIGHT REAR WSS SIGNAL AND THE (B2) RIGHT REAR WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Measure the resistance between the (B1) Right Rear WSS Signal and the (B2) Right Rear WSS Supply circuits at the Right Rear WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B1) Right Rear WSS Signal and the (B2) Right Rear WSS Supply circuits for a short together. Perform ABS VERIFICATION TEST - VER 1.

## C102B—RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)

#### 4. CHECK THE VOLTAGE ON THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS Supply circuit in the Right Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

## 5. CHECK THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B2) Right Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****6. CHECK THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B2) Right Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B2) Right Rear WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Connect a jumper wire between the (B2) Right Rear WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B2) Right Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****8. CHECK THE (B2) RIGHT REAR WSS SUPPLY AND THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****10. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Connect a jumper wire between the (B1) Right Rear WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****12. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Right Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Right Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C102B-RIGHT REAR WHEEL SPEED SENSOR CIRCUIT (CONTINUED)****14. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

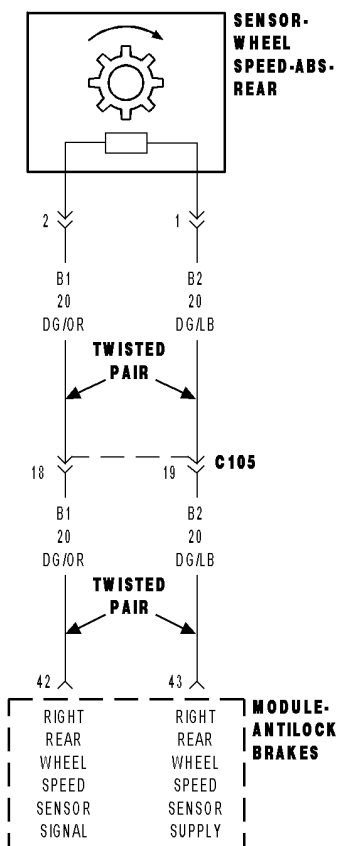

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

# C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE

**C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Right Rear Wheel Speed Signal circuit indicates continuously too high or too low wheel speed.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT AND (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TOGETHER (B2) RIGHT REAR WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B1) RIGHT REAR WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT REAR WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test**

**1. CHECK FOR A DTC C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.

**CAUTION:** Ensure braking capability is available before road testing.

- Drive the vehicle over 25 Km/h (15 mph).
- Park the vehicle and cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

## C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)

## 2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE

**Note: Check all related wiring for bruised, chafed, pierced, or partially broken wires.**

**Note: Check all related connectors for broken, bent, pushed out, or corroded terminals.**

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable) for damage.

### Were any problems found?

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

### 3. CHECK THE (B1) RIGHT REAR WSS SIGNAL AND THE (B2) RIGHT REAR WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Measure the resistance between the (B1) Right Rear WSS Signal and the (B2) Right Rear WSS Supply circuits at the Right Rear WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B1) Right Rear WSS Signal and the (B2) Right Rear WSS Supply circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B2) Right Rear WSS Supply circuit in the Right Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B2) Right Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B2) Right Rear WSS Supply circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****6. CHECK THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B2) Right Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B2) Right Rear WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B2) RIGHT REAR WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Connect a jumper wire between the (B2) Right Rear WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B2) Right Rear WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B2) Right Rear WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****8. CHECK THE (B2) RIGHT REAR WSS SUPPLY AND THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****10. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to ground, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Connect a jumper wire between the (B1) Right Rear WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****12. CHECK THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Right Rear WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B1) Right Rear WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B1) Right Rear WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Right Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Right Rear WSS in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**C1032-RIGHT REAR WHEEL SPEED SENSOR SIGNAL ERRATIC PERFORMANCE (CONTINUED)****14. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE

**C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Right Rear Wheel Speed Sensor circuit fails the diagnostic test.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN RIGHT REAR WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the RR WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B2) RIGHT REAR WSS SUPPLY CIRCUIT AND THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C102B RIGHT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C1035-RIGHT REAR WHEEL SPEED COMPARATIVE PERFORMANCE (CONTINUED)****4. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Right Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Right Rear WSS in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

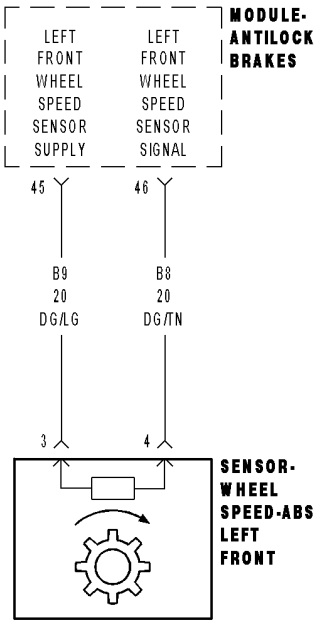

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C1041-LEFT FRONT TONE WHEEL PERFORMANCE

**C1041-LEFT FRONT TONE WHEEL PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT FRONT TONE WHEEL

**Diagnostic Test****1. CHECK FOR A DTC C1041-LEFT FRONT TONE WHEEL PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read and record DTC's.

**Does the scan tool display: C1041-LEFT FRONT TONE WHEEL PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**2. CHECK THE LEFT FRONT TONE WHEEL FOR DAMAGE**

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

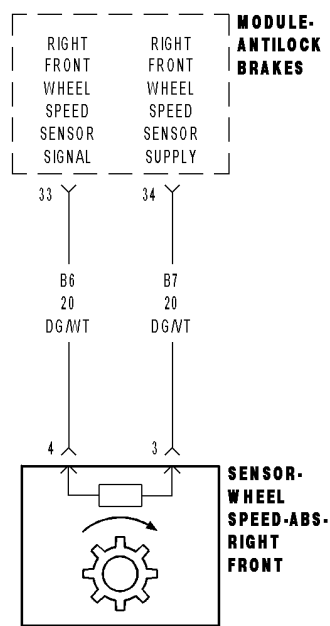

Check the Left Front Tone Wheel for damage.

**Were any problems found?**

**Yes** >> Replace the Left Front Tone Wheel in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Test Complete.

C1042-RIGHT FRONT TONE WHEEL PERFORMANCE

**C1042-RIGHT FRONT TONE WHEEL PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT FRONT TONE WHEEL

**Diagnostic Test****1. CHECK FOR A DTC C1042-RIGHT FRONT TONE WHEEL PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read and record DTC's.

**Does the scan tool display: C1042-RIGHT FRONT TONE WHEEL PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**2. CHECK THE RIGHT FRONT TONE WHEEL FOR DAMAGE**

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

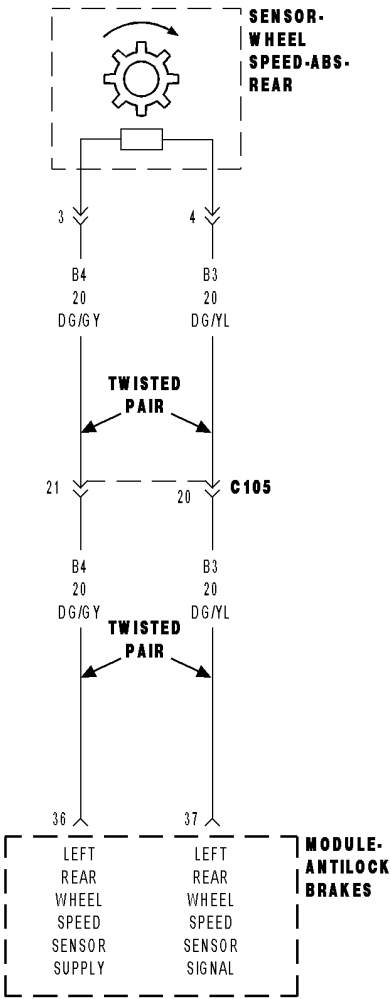

Check the Right Front Tone Wheel for damage.

**Were any problems found?**

**Yes** >> Replace the Right Front Tone Wheel in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Test Complete.

C1043-LEFT REAR TONE WHEEL PERFORMANCE

**C1043-LEFT REAR TONE WHEEL PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
LEFT REAR TONE WHEEL

**Diagnostic Test****1. CHECK FOR A DTC C1043-LEFT REAR TONE WHEEL PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read and record DTC's.

**Does the scan tool display: C1043-LEFT REAR TONE WHEEL PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**2. CHECK THE LEFT REAR TONE WHEEL FOR DAMAGE**

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Left Rear Tone Wheel for damage.

**Were any problems found?**

**Yes** >> Replace the Left Rear Tone Wheel in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Test Complete.

C1044-RIGHT REAR TONE WHEEL PERFORMANCE

**C1044-RIGHT REAR TONE WHEEL PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects periodic drops of a WSS signal.

Possible Causes
RIGHT REAR TONE WHEEL

**Diagnostic Test****1. CHECK FOR A DTC C1044-RIGHT REAR TONE WHEEL PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Test drive the vehicle in a straight line to 40 Km/h (25 mph).

With the scan tool, read and record DTC's.

**Does the scan tool display: C1044-RIGHT REAR TONE WHEEL PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**2. CHECK THE RIGHT REAR TONE WHEEL FOR DAMAGE**

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked.

Check the Right Rear Tone Wheel for damage.

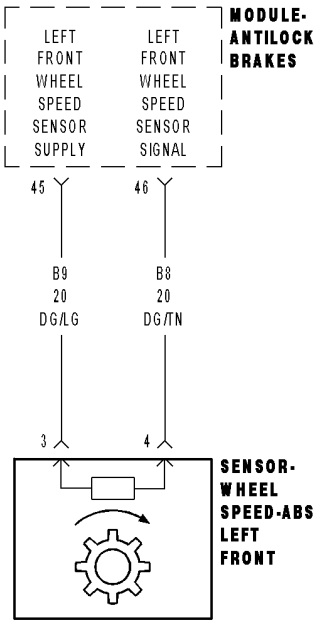

**Were any problems found?**

**Yes** >> Replace the Right Rear Tone Wheel in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Test Complete.

C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING

**C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B8) LEFT FRONT WSS SIGNAL CIRCUIT OPEN LEFT FRONT WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the LF WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Front WSS, Left Front WSS harness connector, and Left Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B9) LEFT FRONT WSS SUPPLY CIRCUIT AND THE (B8) LEFT FRONT WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Left Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B9) Left Front WSS Supply and (B8) Left Front WSS Signal circuits at the Left Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C100A LEFT FRONT WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1046-LEFT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)****4. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE LEFT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Left Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Left Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B8) LEFT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B8) Left Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B8) Left Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B8) Left Front WSS Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING

**C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT OPEN RIGHT FRONT WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the RF WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Front WSS, Right Front WSS harness connector, and Right Front WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B7) RIGHT FRONT WSS SUPPLY CIRCUIT AND THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C1015 RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure. Perform ABS VERIFICATION TEST - VER 1.

**C1047-RIGHT FRONT WHEEL PRESSURE PHASE MONITORING (CONTINUED)****4. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Right Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Right Front WSS in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING

**C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B3) LEFT REAR WSS SIGNAL CIRCUIT OPEN LEFT REAR WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the LR WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Left Rear WSS, Left Rear WSS harness connector, and Left Rear WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B4) LEFT REAR WSS SUPPLY CIRCUIT AND THE (B3) LEFT REAR WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Left Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B4) Left Rear WSS Supply and (B3) Left Rear WSS Signal circuits at the Left Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C1020 LEFT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C1048-LEFT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)****4. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE LEFT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Left Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Left Rear WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B3) LEFT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B3) Left Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B3) Left Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B3) Left Rear WSS Signal circuit for an open. Perform ABS VERIFICATION TEST - VER 1.

C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING

**C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a pressure reduction phase and the following pressure hold phase is too long.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS/TONE WHEEL DAMAGE (B1) RIGHT REAR WSS SIGNAL CIRCUIT OPEN RIGHT REAR WSS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle in a straight line to 40 Km/h (25 mph) while monitoring all the WSS speeds with the scan tool.

**Did the RR WSS speed differ by 8 Km/h (5 mph) or show NO speed?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector, Right Rear WSS, Right Rear WSS harness connector, and Right Rear WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE BETWEEN (B2) RIGHT REAR WSS SUPPLY CIRCUIT AND THE (B1) RIGHT REAR WSS SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Right Rear WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B2) Right Rear WSS Supply and (B1) Right Rear WSS Signal circuits at the Right Rear WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Refer to DTC-C102B RIGHT REAR WHEEL SPEED SENSOR CIRCUIT for the diagnostic repair procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C1049-RIGHT REAR WHEEL PRESSURE PHASE MONITORING (CONTINUED)****4. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE RIGHT REAR WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Right Rear WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 5

**No** >> Replace the Right Rear WSS in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B1) RIGHT REAR WSS SIGNAL VOLTAGE AT THE ANTI-LOCK BRAKE MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B1) Right Rear WSS Signal circuit and chassis ground at the Anti-Lock Brake Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B1) Right Rear WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B1) Right Rear WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C1073-ABS PUMP MOTOR CONTROL CIRCUIT

**C1073-ABS PUMP MOTOR CONTROL CIRCUIT (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the ABS Pump Motor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE ABS PUMP MOTOR FUSE OPEN (A107) FUSED B(+) CIRCUIT SHORTED TO GROUND OR OPEN (Z903) GROUND CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK THE ABS PUMP MOTOR FOR CONTINUOUS OPERATION**

Cycle the ignition from off to on.

Monitor the ABS Pump Motor for continuous operation.

**Is the ABS Pump Motor running continuously?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 2

**2. CHECK FOR A DTC C1073-ABS PUMP MOTOR CONTROL CIRCUIT**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

**CAUTION:** Ensure braking capability is available before road testing.

Drive the vehicle over 40 Km/h (25 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C1073-ABS PUMP MOTOR CONTROL CIRCUIT?**

**Yes** >> Go To 3

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1073-ABS PUMP MOTOR CONTROL CIRCUIT (CONTINUED)****3. CHECK ABS PUMP OPERATION WITH SCAN TOOL**

Cycle the ignition from off to on.

With the scan tool, actuate the ABS Pump Motor.

**Did the ABS Pump Motor operate?**

**Yes** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

**No** >> Go To 4

**4. CHECK THE ABS PUMP MOTOR FUSE FOR AN OPEN**

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor fuse.

**Is the ABS Pump Motor fuse open?**

**Yes** >> Go To 5

**No** >> Go To 6

**5. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND**

Turn the ignition off.

Visually inspect the (A107) Fused B(+) circuit in the wiring harness.

Look for any signs of intermittent short to ground.

**Is the wiring harness OK?**

**Yes** >> Go To 6

**No** >> Repair the (A107) Fused B(+) circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**C1073-ABS PUMP MOTOR CONTROL CIRCUIT (CONTINUED)****6. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector and (A107) Fused B(+) circuit in the wiring harness for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Repair the (A107) Fused B(+) circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1073-ABS PUMP MOTOR CONTROL CIRCUIT (CONTINUED)****8. CHECK THE (Z903) GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance of the (Z903) Ground circuit between the Anti-Lock Brake Module harness connector and ground

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (Z903) Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a comparison between the tire circumference value contained in EEPROM and the tire circumference value received on the CAN Bus.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1078-TIRE REVOLUTIONS RANGE PERFORMANCE

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C1078-TIRE REVOLUTIONS RANGE PERFORMANCE?**

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit at the Anti-Lock Brake Module harness connector..

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)****4. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)****6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Measure the resistance of the (D65) CAN C (+) Bus circuit between the Anti-lock Brake Module and the Front Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**C1078-TIRE REVOLUTIONS RANGE PERFORMANCE (CONTINUED)****8. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D64) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Measure the resistance of the (D64) CAN C (-) Bus circuit between the Anti-lock Brake Module and the Front Control Module.

**Is the resistance below 5.0 ohms?**

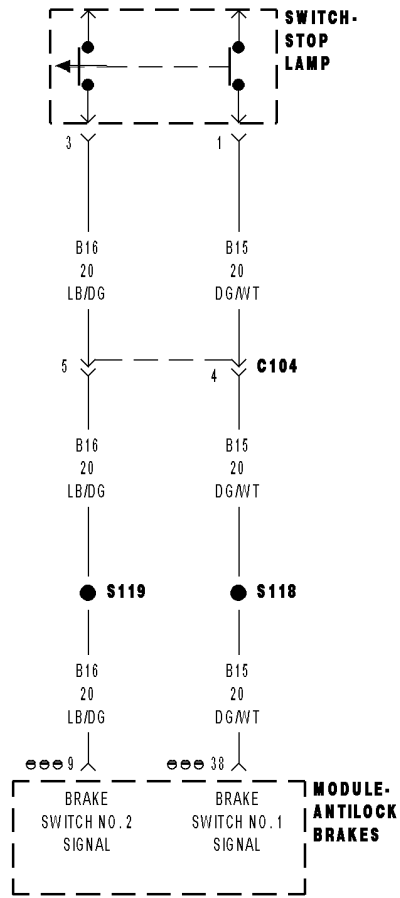

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit. Perform ABS VERIFICATION TEST - VER 1.

# C107C-BRAKE PEDAL SWITCH 1/2 STUCK

TCs

C107C-BRAKE PEDAL SWITCH 1/2 STUCK (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a mismatch between the two signals of the redundant stop lamp switch.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE STOP LAMP SWITCH (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT OPEN (B16) BRAKE SWITCH NO. 2 SIGNAL CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C107C-BRAKE PEDAL SWITCH 1/2 STUCK

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C107C-BRAKE PEDAL SWITCH 1/2 STUCK?**

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C107C-BRAKE PEDAL SWITCH 1/2 STUCK (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT WHILE DEPRESSING AND RELEASING BRAKE PEDAL**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B15) Brake Switch No. 1 Signal circuit.

Depress and release the brake pedal.

**Does the test light illumination toggle from off to on?**

**Yes** >> Go To 5

**No** >> Go To 4

**C107C-BRAKE PEDAL SWITCH 1/2 STUCK (CONTINUED)****4. CHECK THE (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Stop Lamp Switch harness connector.

Connect a jumper wire between the (B15) Brake Switch No. 1 Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B15) Brake Switch No. 1 Signal circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Stop Lamp Switch in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B15) Brake Switch No. 1 Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B16) BRAKE SWITCH NO. 2 SIGNAL CIRCUIT WHILE DEPRESSING AND RELEASING BRAKE PEDAL**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B16) Brake Switch No. 2 Signal circuit.

Depress and release the brake pedal.

**Does the test light illumination toggle from off to on?**

- Yes** >> Replace the Stop Lamp Switch in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 6

**C107C-BRAKE PEDAL SWITCH 1/2 STUCK (CONTINUED)****6. CHECK THE (B16) BRAKE SWITCH NO. 2 SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Stop Lamp Switch harness connector.

Connect a jumper wire between the (B16) Brake Switch No. 2 Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B16) Brake Switch No. 2 Signal circuit.

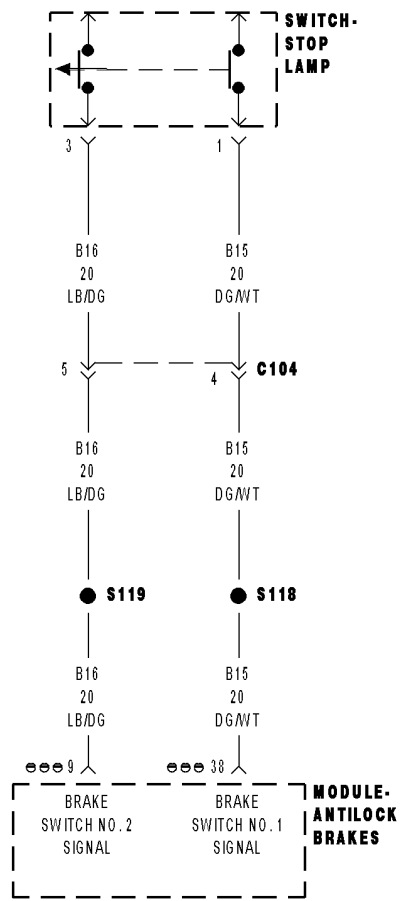

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B16) Brake Switch No. 2 Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION

TC

**C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects an implausible signal from the Stop Lamp Switch.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE STOP LAMP SWITCH (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT OPEN (B16) BRAKE SWITCH NO. 2 SIGNAL CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's.

**Does the scan tool display: C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT WHILE DEPRESSING AND RELEASING BRAKE PEDAL**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B15) Brake Switch No. 1 Signal circuit.

Depress and release the brake pedal.

**Does the test light illumination toggle from off to on?**

**Yes** >> Go To 5

**No** >> Go To 4

**C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION (CONTINUED)****4. CHECK THE (B15) BRAKE SWITCH NO. 1 SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Stop Lamp Switch harness connector.

Turn the ignition on.

Connect a jumper wire between the (B15) Brake Switch No. 1 Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B15) Brake Switch No. 1 Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Stop Lamp Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B15) Brake Switch No. 1 Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (B16) BRAKE SWITCH NO. 2 SIGNAL CIRCUIT WHILE DEPRESSING AND RELEASING BRAKE PEDAL**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B16) Brake Switch No. 2 Signal circuit.

Depress and release the brake pedal.

**Does the test light illumination toggle from off to on?**

**Yes** >> Replace the Stop Lamp Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C107D-BRAKE PEDAL SWITCH 1/2 CORRELATION (CONTINUED)****6. CHECK THE (B16) BRAKE SWITCH NO. 2 SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Stop Lamp Switch harness connector.

Turn the ignition on.

Connect a jumper wire between the (B16) Brake Switch No. 2 Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B16) Brake Switch No. 2 Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B16) Brake Switch No. 2 Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a calculated steering wheel angle offset is out of the specified range.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (A913) FUSED B(+) CIRCUIT OPEN (Z910) GROUND CIRCUIT OPEN (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN STEERING CONTROL MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's.

**Does the scan tool display: C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check the Steering Angle Sensor installation.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (A913) FUSED B(+) CIRCUIT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Measure the voltage of the (A913) Fused B(+) circuit.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Repair the (A913) Fused B(+) circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)****4. CHECK THE RESISTANCE OF THE (Z910) GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Measure the resistance between the (Z910) Ground circuit and ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (Z910) Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (D65) CAN C (+) BUS and the (D64) CAN C (-) BUS circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)****6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)****8. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Steering Control Module harness connector.

Measure the resistance of the (D65) CAN C (+) Bus circuit between the Anti-lock Brake Module and the Steering Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 9

**No** >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

**9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1219-STEERING ANGLE SENSOR ERRATIC PERFORMANCE (CONTINUED)****10. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D64) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance of the (D64) CAN C (-) Bus circuit between the Anti-lock Brake Module and the Steering Control Module.

**Is the resistance below 5.0 ohms?**

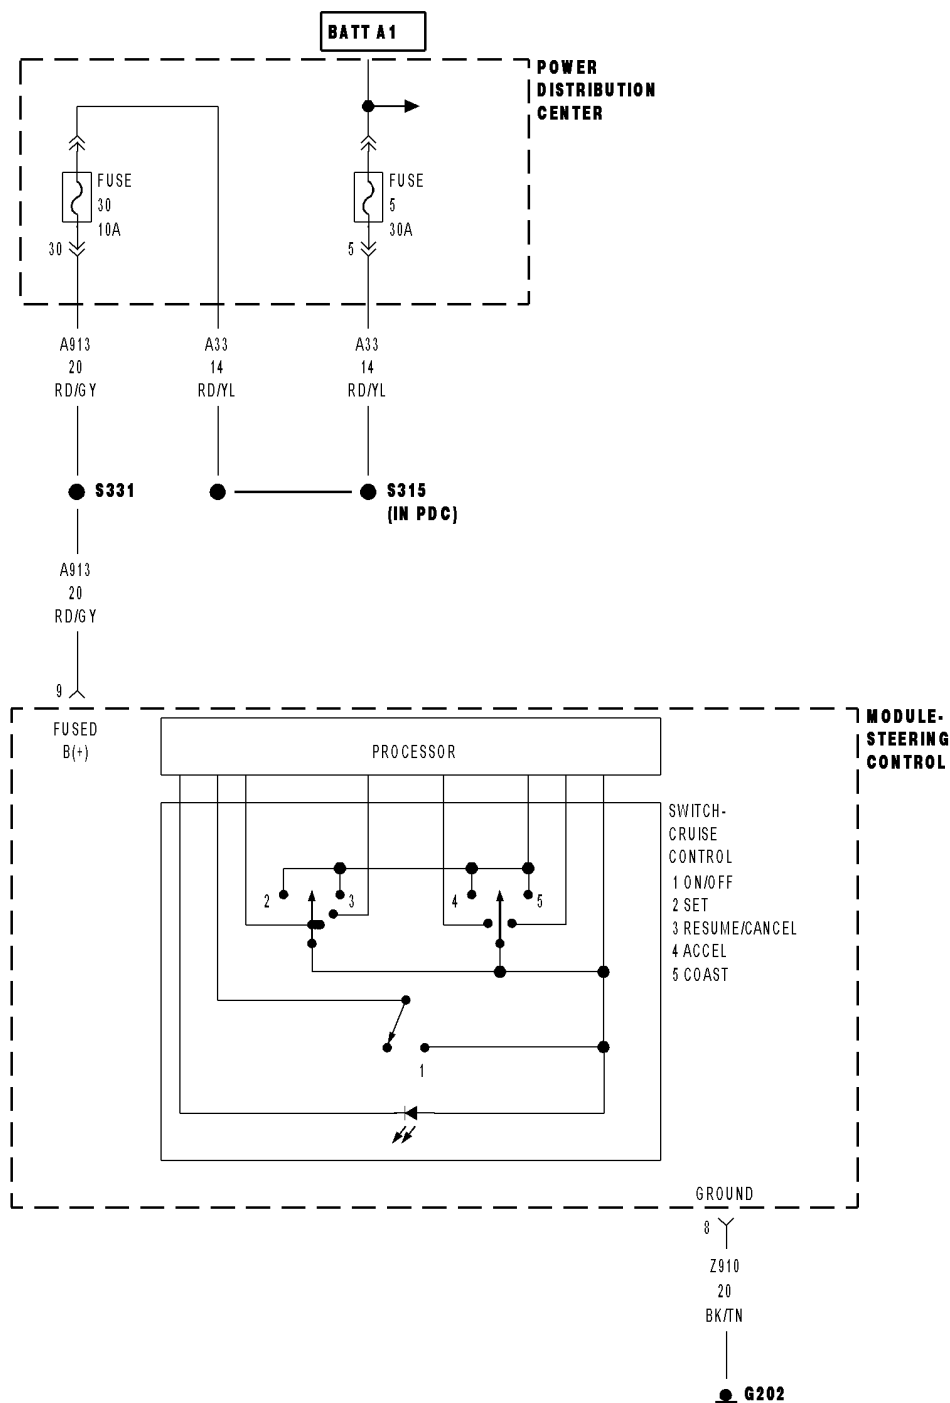

**Yes** >> Replace the Steering Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit. Perform ABS VERIFICATION TEST - VER 1.

## C121A-STEERING ANGLE SENSOR NOT INITIALIZED

**C121A-STEERING ANGLE SENSOR NOT INITIALIZED (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects a low voltage at the Steering Angle Sensor or Steering Angle Sensor failure.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (A913) FUSED B(+) CIRCUIT OPEN (Z910) GROUND CIRCUIT OPEN STEERING CONTROL MODULE

**Diagnostic Test****1. CHECK FOR A DTC C121A-STEERING ANGLE SENSOR NOT INITIALIZED**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's.

**Does the scan tool display: C121A-STEERING ANGLE SENSOR NOT INITIALIZED?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check the Steering Angle Sensor installation.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**C121A-STEERING ANGLE SENSOR NOT INITIALIZED (CONTINUED)****3. CHECK THE VOLTAGE ON THE (A913) FUSED B(+) CIRCUIT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Measure the voltage of the (A913) Fused B(+) circuit.

**Is the voltage above 10 volts?**

**Yes** >> Go To 4

**No** >> Repair the (A913) Fused B(+) circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE RESISTANCE OF THE (Z910) GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Measure the resistance between the (Z910) Ground circuit and ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Steering Control Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (Z910) Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C121C-TORQUE REQUEST SIGNAL DENIED

**C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates if engine management relevant for Automatic Yaw Control/Traction Control System control can be accomplished.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN POWERTRAIN CONTROL MODULE

**Diagnostic Test**

**1. CHECK FOR A DTC C121C-TORQUE REQUEST SIGNAL DENIED**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C121C-TORQUE REQUEST SIGNAL DENIED?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (D65) CAN C (+) BUS AND (D64) CAN C (-) BUS CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (D65) CAN C (+) BUS and the (D64) CAN C (-) BUS circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)****4. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)****6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Measure the resistance of the (D65) CAN C (+) Bus circuit between the Anti-lock Brake Module and the Powertrain Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**C121C-TORQUE REQUEST SIGNAL DENIED (CONTINUED)****8. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D64) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Measure the resistance of the (D64) CAN C (-) Bus circuit between the Anti-lock Brake Module and the Powertrain Control Module.

**Is the resistance below 5.0 ohms?**

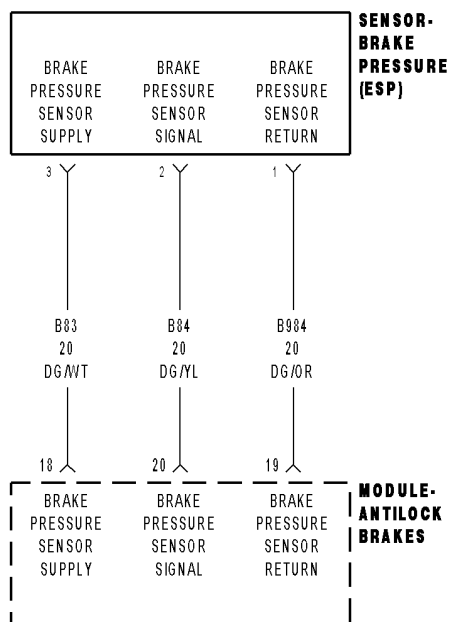

**Yes** >> Replace the Powertrain Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit. Perform ABS VERIFICATION TEST - VER 1.

## C121D-BRAKE PRESSURE SENSOR CIRCUIT

C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE PRESSURE SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C121D-BRAKE PRESSURE SENSOR CIRCUIT

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Start the engine.
- Depress and release the brake pedal.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C121D-BRAKE PRESSURE SENSOR CIRCUIT?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS**

**Note:** Before continuing the brake system must be bled to verify there is no air in the brake system.

**Note:** Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers.

**Was there any air in the brake system or base brake issues found?**

- Yes** >> Repair as needed.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 4

**4. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

**Is the voltage above 4 volts?**

- Yes** >> Go To 8
- No** >> Go To 5

**C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)****5. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)****7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition off.

Connect a jumper wire between the (B83) Brake Pressure Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**8. CHECK THE RESISTANCE TO GROUND ON THE (B984) BRAKE PRESSURE RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B984) Brake Pressure Return Circuit and ground.

**Is the resistance below 5.0 ohm?**

**Yes** >> Go To 12

**No** >> Go To 9

**C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)****9. CHECK THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B984) Brake Pressure Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B984) Brake Pressure Sensor Return circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**10. CHECK THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B984) Brake Pressure Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B984) Brake Pressure Sensor Return circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)****11. CHECK THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition off.

Connect a jumper wire between the (B984) Brake Pressure Sensor Return circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B984) Brake Pressure Sensor Return circuit

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B984) Brake Pressure Sensor Return circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**12. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OUTPUT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Reconnect the Brake Pressure Sensor harness connector.

Start the engine.

While back probing, measure the voltage of the (B84) Brake Pressure Sensor Signal circuit at the Brake Pressure Sensor harness connector while depressing and releasing the brake pedal.

**Is the voltage between 0.50 volts to 4.55 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)****13. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (B84) Brake Pressure Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B84) Brake Pressure Sensor Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 14

**14. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B84) Brake Pressure Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B84) Brake Pressure Sensor Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 15

**C121D-BRAKE PRESSURE SENSOR CIRCUIT (CONTINUED)****15. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition off.

Connect a jumper wire between the (B84) Brake Pressure Sensor Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B84) Brake Pressure Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Brake Pressure Sensor in accordance with the Service Information.

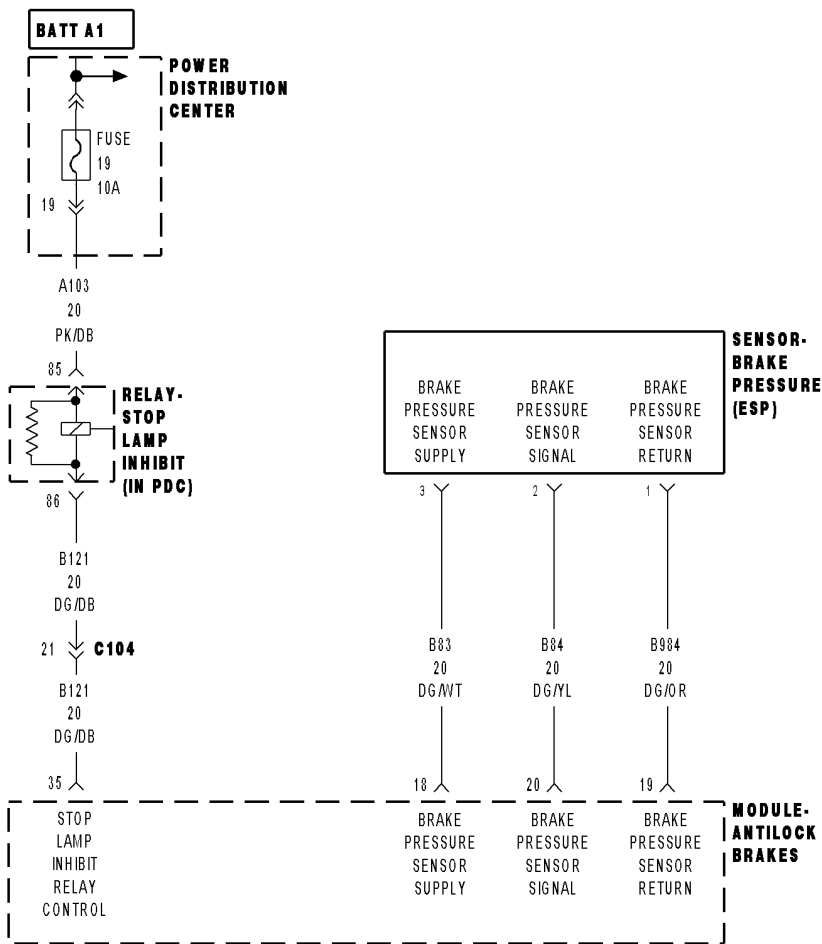

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B137) Brake Pressure Sensor Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUITS SHORTED TOGETHER (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B984) BRAKE PRESSURE SENSOR RETURN CIRCUITS SHORTED TOGETHER (B121) STOP LAMP INHIBIT RELAY CONTROL CIRCUIT BRAKE PEDAL TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE**

**Note:** If any of the following DTC's are present they must be repaired before continuing.

C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT  
 C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE  
 C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE  
 C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW  
 C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTC's.

**Does the scan tool display: C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
 Perform ABS VERIFICATION TEST - VER 1.

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS**

**Note:** Before continuing the brake system must be bled to verify there is no air in the brake system.

**Note:** Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers.

**Was there any air in the brake system or base brake issues found?**

**Yes** >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

**Is the voltage above 4 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)****6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Connect a jumper wire between the (B83) Brake Pressure Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)****8. CHECK THE RESISTANCE TO GROUND ON THE (B984) BRAKE PRESSURE RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B984) Brake Pressure Return Circuit and ground.

**Is the resistance below 5.0 ohm?**

**Yes** >> Go To 9

**No** >> Repair the (B984) Brake Pressure Return circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**9. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OUTPUT**

Turn the ignition off.

Start the engine.

While back probing, measure the voltage of the (B84) Brake Pressure Sensor Signal circuit at the Brake Pressure Sensor harness connector while depressing and releasing the brake pedal.

**Is the voltage between 0.50 volts to 4.55 volts?**

**Yes** >> Go To 13

**No** >> Go To 10

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)****10. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Connect a jumper wire between the (B84) Brake Pressure Sensor Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B84) Brake Pressure Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 11

**No** >> Repair the (B84) Brake Pressure Sensor Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**11. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B84) Brake Pressure Sensor Signal circuit and the (B83) Brake Pressure Sensor Supply circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply and (B84) Brake Pressure Sensor Signal circuits for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 12

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)****12. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B84) Brake Pressure Sensor Signal and the (B984) Brake Pressure Sensor Return circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B84) Brake Pressure Sensor Signal and (B984) Brake Pressure Sensor Return circuits for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B121) STOP LAMP INHIBIT RELAY CONTROL OPERATION**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage on the (B121) Stop Lamp Inhibit Relay Control circuit while depressing and releasing the brake pedal.

**Does the voltage toggle from approximately 0 to 12 volts?**

**Yes** >> Go To 14

**No** >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

**C121E-BRAKE PRESSURE SENSOR COMPARATIVE PERFORMANCE (CONTINUED)****14. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT VOLTAGE OUTPUT**

Turn the ignition off.

Turn the ignition on.

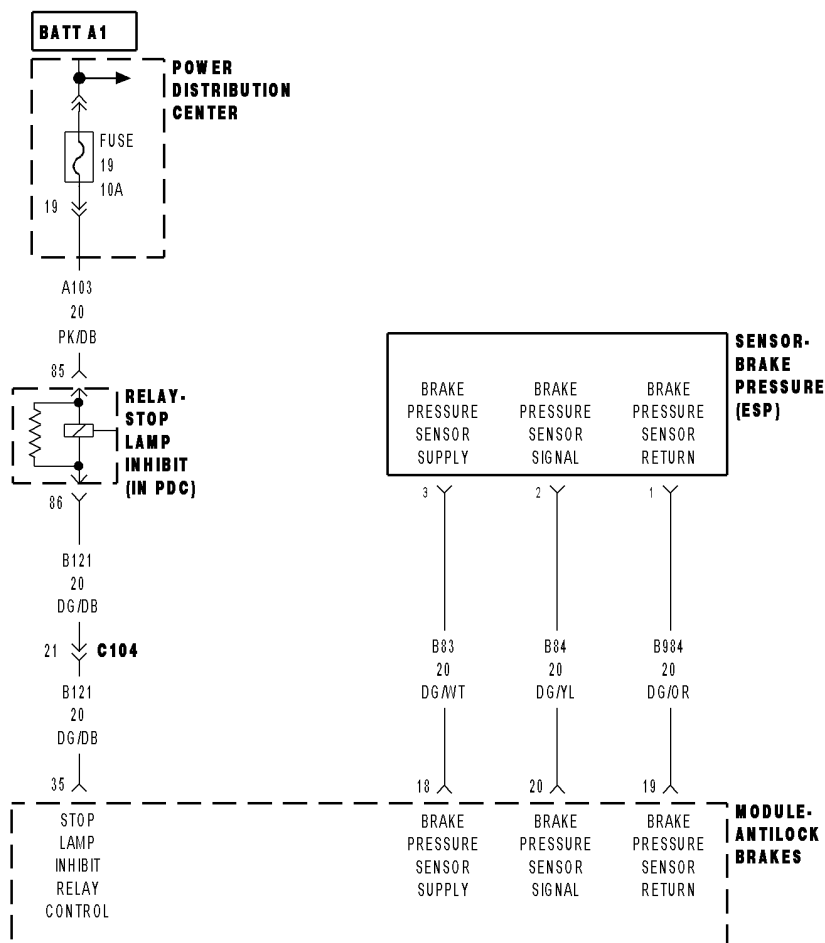

While back probing, measure the voltage of the (B137) Brake Pedal Travel Sensor Signal circuit at the Brake Pedal Travel Sensor harness connector while depressing and releasing the brake pedal.

**Is the voltage between 0.15 volts to 4.85 volts?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Brake Pedal Travel Sensor in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

# C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is out of range.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUITS SHORTED TOGETHER (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B984) BRAKE PRESSURE SENSOR RETURN CIRCUITS SHORTED TOGETHER STOP LAMP INHIBIT RELAY CONTROL CIRCUIT BRAKE PEDAL TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION**

**Note:** If any of the following DTC's are present they must be repaired before continuing.

C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT  
 C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE  
 C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE  
 C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW  
 C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTC's.

**Does the scan tool display: C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
 Perform ABS VERIFICATION TEST - VER 1.

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS**

**Note:** Before continuing the brake system must be bled to verify there is no air in the brake system.

**Note:** Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers.

**Was there any air in the brake system or base brake issues found?**

**Yes** >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

**Is the voltage above 4 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)****6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Connect a jumper wire between the (B83) Brake Pressure Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)****8. CHECK THE RESISTANCE TO GROUND ON THE (B984) BRAKE PRESSURE RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B984) Brake Pressure Return Circuit and ground.

**Is the resistance below 5.0 ohm?**

**Yes** >> Go To 9

**No** >> Repair the (B984) Brake Pressure Return circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**9. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OUTPUT**

Turn the ignition off.

Start the engine.

While back probing, measure the voltage of the (B84) Brake Pressure Sensor Signal circuit at the Brake Pressure Sensor harness connector while depressing and releasing the brake pedal.

**Is the voltage between 0.50 volts to 4.55 volts?**

**Yes** >> Go To 13

**No** >> Go To 10

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)****10. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Connect a jumper wire between the (B84) Brake Pressure Sensor Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B84) Brake Pressure Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 11

**No** >> Repair the (B84) Brake Pressure Sensor Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**11. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B84) Brake Pressure Sensor Signal circuit and the (B83) Brake Pressure Sensor Supply circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply and (B84) Brake Pressure Sensor Signal circuits for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 12

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)****12. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B84) Brake Pressure Sensor Signal and the (B984) Brake Pressure Sensor Return circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B84) Brake Pressure Sensor Signal and (B984) Brake Pressure Sensor Return circuits for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B121) STOP LAMP INHIBIT RELAY CONTROL OPERATION**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage on the (B121) Stop Lamp Inhibit Relay Control circuit while depressing and releasing the brake pedal.

**Does the voltage toggle from approximately 0 to 12 volts?**

**Yes** >> Go To 14

**No** >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

**C1221-BRAKE PRESSURE SENSOR/ACCELERATOR PEDAL POSITION SENSOR CORRELATION (CONTINUED)****14. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT VOLTAGE OUTPUT**

Turn the ignition off.

Turn the ignition on.

While back probing, measure the voltage of the (B137) Brake Pedal Travel Sensor Signal circuit at the Brake Pedal Travel Sensor harness connector while depressing and releasing the brake pedal.

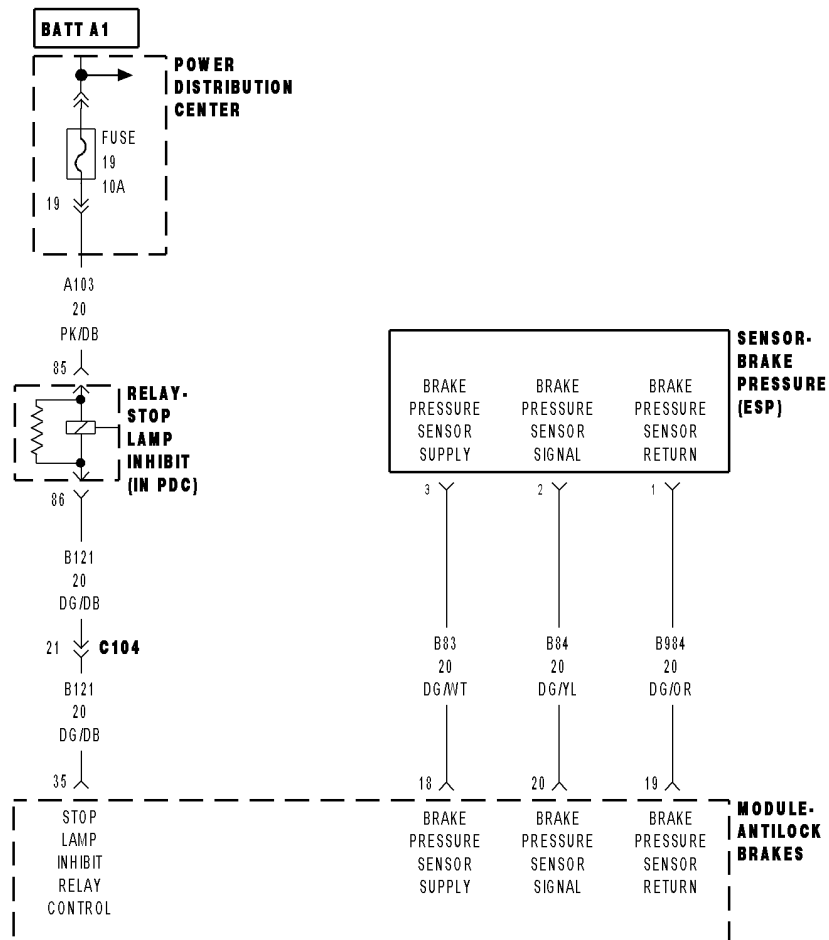

**Is the voltage between 0.15 volts to 4.85 volts?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Brake Pressure Sensor in accordance with the Service Information  
Perform ABS VERIFICATION TEST - VER 1.

## C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION

**C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is not plausible.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE AIR IN BRAKE SYSTEM/WORN MECHANICAL COMPONENTS (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OPEN (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUITS SHORTED TOGETHER (B84) BRAKE PRESSURE SENSOR SIGNAL AND (B984) BRAKE PRESSURE SENSOR RETURN CIRCUITS SHORTED TOGETHER STOP LAMP INHIBIT RELAY CONTROL CIRCUIT BRAKE PEDAL TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION**

**Note:** If any of the following DTC's are present they must be repaired before continuing.

C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE

C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW

C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Start the engine.

Depress and release the brake pedal.

With the scan tool, read and record DTC's.

**Does the scan tool display: C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK FOR AIR IN BRAKE SYSTEM AND WORN MECHANICAL COMPONENTS**

**Note:** Before continuing the brake system must be bled to verify there is no air in the brake system.

**Note:** Visually inspect for worn brake linings, undersized rotors, binding or frozen calipers.

**Was there any air in the brake system or base brake issues found?**

**Yes** >> Repair as needed.

**No** >> Go To 4

**C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

**Is the voltage above 4 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)****6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Connect a jumper wire between the (B83) Brake Pressure Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)****8. CHECK THE RESISTANCE TO GROUND ON THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B984) Brake Pressure Sensor Return Circuit and ground.

**Is the resistance below 5.0 ohm?**

**Yes** >> Go To 9

**No** >> Repair the (B984) Brake Pressure Sensor Return circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**9. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT OUTPUT**

Turn the ignition off.

Start the engine.

While back probing, measure the voltage of the (B84) Brake Pressure Sensor Signal circuit at the Brake Pressure Sensor harness connector while depressing and releasing the brake pedal.

**Is the voltage between 0.50 volts to 4.55 volts?**

**Yes** >> Go To 13

**No** >> Go To 10

**C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)****10. CHECK THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Connect a jumper wire between the (B84) Brake Pressure Sensor Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B84) Brake Pressure Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 11

**No** >> Repair the (B84) Brake Pressure Sensor Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**11. CHECK FOR A SHORT BETWEEN THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT AND THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B84) Brake Pressure Sensor Signal circuit and the (B83) Brake Pressure Sensor Supply circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply and (B84) Brake Pressure Sensor Signal circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 12

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B84) Brake Pressure Sensor Signal and the (B984) Brake Pressure Sensor Return circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B84) Brake Pressure Sensor Signal and (B984) Brake Pressure Sensor Return circuits for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B121) STOP LAMP INHIBIT RELAY CONTROL OPERATION**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Measure the voltage on the (B121) Stop Lamp Inhibit Relay Control circuit while depressing and releasing the brake pedal.

**Does the voltage toggle from approximately 0 to 12 volts?**

**Yes** >> Go To 14

**No** >> Repair as needed.

Perform ABS VERIFICATION TEST - VER 1.

**C1222-BRAKE PEDAL TRAVEL SENSOR/BRAKE PRESSURE SENSOR CORRELATION (CONTINUED)****14. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT VOLTAGE OUTPUT**

Turn the ignition off.

Turn the ignition on.

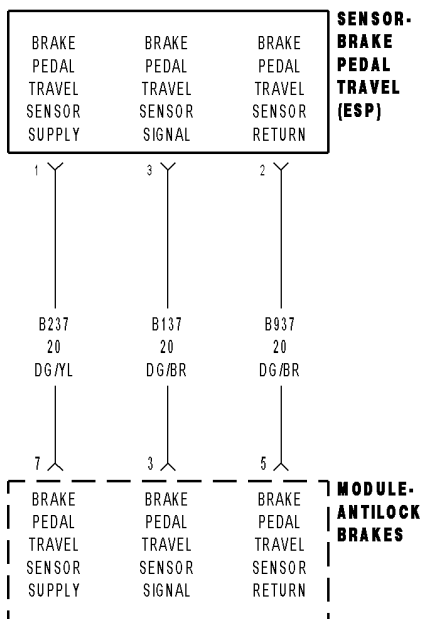

While back probing, measure the voltage of the (B137) Brake Pedal Travel Sensor Signal circuit at the Brake Pedal Travel Sensor harness connector while depressing and releasing the brake pedal.

**Is the voltage between 0.15 volts to 4.85 volts?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Brake Pedal Travel Sensor in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

## C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE

**C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pedal Travel Sensor Signal is not plausible.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE PEDAL TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

**Diagnostic Test**

**1. CHECK FOR A DTC C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check the installation of the Brake Pedal Travel Sensor.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B237) Brake Pedal Travel Sensor Supply circuit.

**Is the voltage above 4 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE (CONTINUED)****4. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B237) Brake Pedal Travel Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B237) Brake Pedal Travel Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE (CONTINUED)****6. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B237) Brake Pedal Travel Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B237) Brake Pedal Travel Sensor Supply circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly**

- Yes** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 8

**C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE (CONTINUED)****8. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B937) Brake Pedal Travel Sensor Return circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 10

**No** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE (CONTINUED)****10. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B137) Brake Booster Travel Position Sensor Signal circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B137) Brake Pedal Travel Sensor Signal circuit for a short to voltage.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 12

**C1227-BRAKE PEDAL TRAVEL SENSOR CIRCUIT PERFORMANCE (CONTINUED)****12. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B137) Brake Pedal Travel Sensor Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 13

**No** >> Repair the (B137) Brake Pedal Travel Sensor Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**13. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT VOLTAGE OUTPUT**

Turn the ignition off.

Reconnect the Anti-Lock Brake Module harness connector.

Reconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

While back probing, measure the voltage of the (B137) Brake Pedal Travel Sensor Signal circuit at the Brake Pedal Travel Sensor harness connector while depressing and releasing the brake pedal.

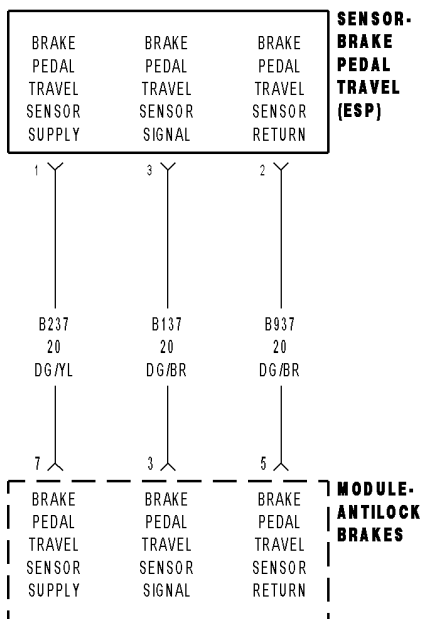

**Is the voltage between 0.15 volts to 4.85 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Replace the Brake Pedal Travel Sensor in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

## C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW

C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pedal Travel Sensor Signal is within the low fault area.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE PEDAL TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW?**

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check the installation of the Brake Pedal Travel Sensor.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B237) Brake Pedal Travel Sensor Supply circuit.

**Is the voltage above 4 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW (CONTINUED)****4. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B237) Brake Pedal Travel Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B237) Brake Pedal Travel Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW (CONTINUED)****6. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B237) Brake Pedal Travel Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B237) Brake Pedal Travel Sensor Supply circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly**

- Yes** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 8

**C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW (CONTINUED)****8. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B937) Brake Pedal Travel Sensor Return circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 10

**No** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW (CONTINUED)****10. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B137) Brake Pedal Travel Sensor Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B137) Brake Pedal Travel Sensor Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 12

**C1228-BRAKE PEDAL TRAVEL SENSOR CIRCUIT LOW (CONTINUED)****12. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B137) Brake Pedal Travel Sensor Signal circuit and ground.

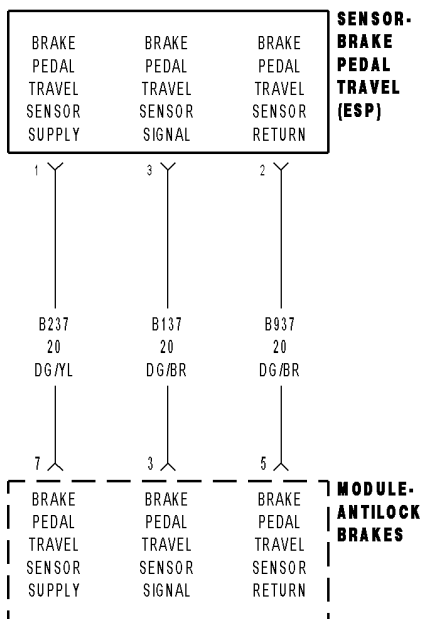

Using a 12-volt test light connected to 12-volts, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Brake Pedal Travel Sensor in accordance with the Service Information  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B137) Brake Pedal Travel Sensor Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH

C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pedal Travel Sensor Signal is within the high fault area.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE PEDAL TRAVEL SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check the installation of the Brake Pedal Travel Sensor.

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B237) Brake Pedal Travel Sensor Supply circuit.

**Is the voltage above 4 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH (CONTINUED)****4. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B237) Brake Pedal Travel Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B237) Brake Pedal Travel Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH (CONTINUED)****6. CHECK THE (B237) BRAKE PEDAL TRAVEL SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B237) Brake Pedal Travel Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B237) Brake Pedal Travel Sensor Supply circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B237) Brake Pedal Travel Sensor Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly**

- Yes** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 8

**C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH (CONTINUED)****8. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (B937) BRAKE PEDAL TRAVEL SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B937) Brake Pedal Travel Sensor Return circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B937) Brake Pedal Travel Sensor Return circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 10

**No** >> Repair the (B937) Brake Pedal Travel Sensor Return circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH (CONTINUED)****10. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B137) Brake Booster Travel Position Sensor Signal circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B137) Brake Pedal Travel Sensor Signal circuit for a short to voltage.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 12

**C1229-BRAKE PEDAL TRAVEL SENSOR CIRCUIT HIGH (CONTINUED)****12. CHECK THE (B137) BRAKE PEDAL TRAVEL SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pedal Travel Sensor harness connector.

Connect a jumper wire between the (B137) Brake Pedal Travel Sensor Signal circuit and ground.

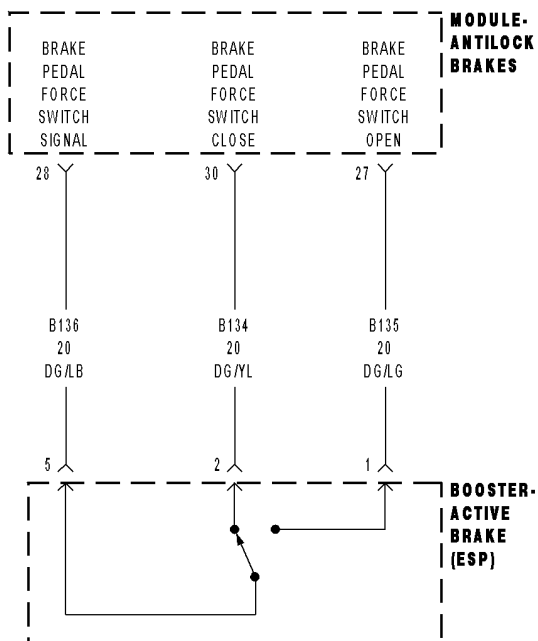

Using a 12-volt test light connected to 12-volts, check the (B137) Brake Pedal Travel Sensor Signal circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Brake Pedal Travel Sensor in accordance with the Service Information  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B137) Brake Pedal Travel Sensor Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT

C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pedal Force Switch signals are invalid or not available.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE PEDAL FORCE SWITCH ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.

**CAUTION:** Ensure brake capability is available before road testing.

- Test drive vehicle above 24 k/mh (15 mph).
- With the scan tool, read and record DTC's.

Does the scan tool display: C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT?

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT**

Turn the ignition on.

Back probe the (B134) Brake Pedal Force Switch Close circuit at the Active Brake Booster harness connector.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit.

**Is the voltage approximately 6 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****4. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B134) Brake Pedal Force Switch Close circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to 12 volts, check the (B134) Brake Pedal Force Switch Close circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****6. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Connect a jumper wire between the (B134) Brake Pedal Force Switch Close circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B134) Brake Pedal Force Switch Close circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B134) Brake Pedal Force Switch Close circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT**

Turn the ignition on.

Back probe the (B135) Brake Pedal Force Switch Open circuit at the Active Brake Booster harness connector.

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit.

**Is the voltage approximately 12 volts?**

- Yes** >> Go To 11
- No** >> Go To 8

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****8. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to ground, check the (B135) Brake Pedal Force Switch Open circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to 12 volts, check the (B135) Brake Pedal Force Switch Open circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****10. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Connect a jumper wire between the (B135) Brake Pedal Force Switch Open circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B135) Brake Pedal Force Switch Open circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B135) Brake Pedal Force Switch Open circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**11. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT**

Turn the ignition on.

Back probe the (B136) Brake Pedal Force Switch Signal circuit at the Active Brake Booster harness connector.

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit.

**Is the voltage approximately 6 volts?**

**Yes** >> Go To 15

**No** >> Go To 12

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****12. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to ground, check the (B136) Brake Pedal Force Switch Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to 12 volts, check the (B136) Brake Pedal Force Switch Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 14

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****14. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Connect a jumper wire between the (B136) Brake Pedal Force Switch Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B136) Brake Pedal Force Switch Signal circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1

**15. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT**

Turn the ignition on.

Back probe the (B134) Brake Pedal Force Switch Close circuit at the Active Brake Booster harness connector.

Depress and hold the brake pedal.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit.

**Is the voltage approximately 12 volts?**

- Yes** >> Go To 16
- No** >> Replace the Brake Pedal Force Switch in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**C122A-BRAKE PEDAL FORCE SWITCH CIRCUIT (CONTINUED)****16. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT**

Turn the ignition on.

Back probe the (B135) Brake Pedal Force Switch Open circuit at the Active Brake Booster harness connector.

Depress and hold the brake pedal.

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit.

**Is the voltage approximately 6 volts?**

**Yes** >> Go To 17

**No** >> Replace the Brake Pedal Force Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**17. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT**

Turn the ignition on.

Back probe the (B136) Brake Pedal Force Switch Signal circuit at the Active Brake Booster harness connector.

Depress and hold the brake pedal.

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit.

**Is the voltage approximately 6 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Replace the Brake Pedal Force Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

## C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE

C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pedal Force Switch signals are implausible.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN BRAKE PEDAL FORCE SWITCH ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Fame information.

With the scan tool, erase DTC's.

**CAUTION:** Ensure brake capability is available before road testing.

Test drive vehicle above 24 k/mh (15 mph).

With the scan tool, read and record DTC's.

**Does the scan tool display: C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE?**

- Yes**
- >> Go To 2
- No**
- >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT**

Turn the ignition on.

Back probe the (B134) Brake Pedal Force Switch Close circuit at the Active Brake Booster harness connector.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit.

**Is the voltage approximately 6 volts?**

- Yes** >> Go To 7
- No** >> Go To 4

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****4. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B134) Brake Pedal Force Switch Close circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to 12 volts, check the (B134) Brake Pedal Force Switch Close circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B134) Brake Pedal Force Switch Close circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****6. CHECK THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Connect a jumper wire between the (B134) Brake Pedal Force Switch Close circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B134) Brake Pedal Force Switch Close circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B134) Brake Pedal Force Switch Close circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT**

Turn the ignition on.

Back probe the (B135) Brake Pedal Force Switch Open circuit at the Active Brake Booster harness connector.

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit.

**Is the voltage approximately 12 volts?**

**Yes** >> Go To 11

**No** >> Go To 8

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****8. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to ground, check the (B135) Brake Pedal Force Switch Open circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to 12 volts, check the (B135) Brake Pedal Force Switch Open circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B135) Brake Pedal Force Switch Open circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****10. CHECK THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Connect a jumper wire between the (B135) Brake Pedal Force Switch Open circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B135) Brake Pedal Force Switch Open circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B135) Brake Pedal Force Switch Open circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**11. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT**

Turn the ignition on.

Back probe the (B136) Brake Pedal Force Switch Signal circuit at the Active Brake Booster harness connector.

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit.

**Is the voltage approximately 6 volts?**

**Yes** >> Go To 15

**No** >> Go To 12

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****12. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to ground, check the (B136) Brake Pedal Force Switch Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Using a 12-volt test light connected to 12 volts, check the (B136) Brake Pedal Force Switch Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 14

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****14. CHECK THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Active Brake Booster harness connector.

Connect a jumper wire between the (B136) Brake Pedal Force Switch Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B136) Brake Pedal Force Switch Signal circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B136) Brake Pedal Force Switch Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1

**15. CHECK THE VOLTAGE ON THE (B134) BRAKE PEDAL FORCE SWITCH CLOSE CIRCUIT**

Turn the ignition on.

Back probe the (B134) Brake Pedal Force Switch Close circuit at the Active Brake Booster harness connector.

Depress and hold the brake pedal.

Measure the voltage of the (B134) Brake Pedal Force Switch Close circuit.

**Is the voltage approximately 12 volts?**

- Yes** >> Go To 16
- No** >> Replace the Brake Pedal Force Switch in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**C122B-BRAKE PEDAL FORCE SWITCH CIRCUIT PERFORMANCE (CONTINUED)****16. CHECK THE VOLTAGE ON THE (B135) BRAKE PEDAL FORCE SWITCH OPEN CIRCUIT**

Turn the ignition on.

Back probe the (B135) Brake Pedal Force Switch Open circuit at the Active Brake Booster harness connector.

Depress and hold the brake pedal.

Measure the voltage of the (B135) Brake Pedal Force Switch Open circuit.

**Is the voltage approximately 6 volts?**

**Yes** >> Go To 17

**No** >> Replace the Brake Pedal Force Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**17. CHECK THE VOLTAGE ON THE (B136) BRAKE PEDAL FORCE SWITCH SIGNAL CIRCUIT**

Turn the ignition on.

Back probe the (B136) Brake Pedal Force Switch Signal circuit at the Active Brake Booster harness connector.

Depress and hold the brake pedal.

Measure the voltage of the (B136) Brake Pedal Force Switch Signal circuit.

**Is the voltage approximately 6 volts?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

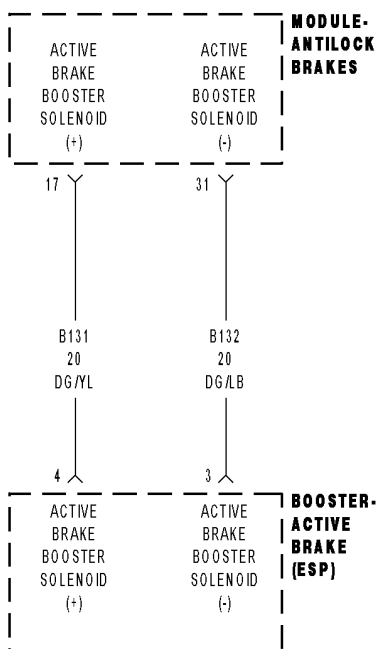

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Replace the Brake Pedal Force Switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

## C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE

**C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the Active Brake Booster circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT AND (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT SHORTED TO TOGETHER (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN ACTIVE BRAKE BOOSTER SOLENOID ANTI-LOCK BRAKE MODULE

**Diagnostic Test**

**1. CHECK FOR A DTC C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE RESISTANCE OF THE ACTIVE BRAKE BOOSTER SOLENOID**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Measure the internal resistance of the Active Brake Booster Solenoid.

**Is the resistance between 1 to 2 ohms?**

- Yes** >> Go To 4
- No** >> Replace the Active Brake Booster Solenoid in accordance with the Service information.  
Perform ABS VERIFICATION TEST - VER 1.

**4. CHECK THE VOLTAGE ON THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Turn the ignition on.

Measure the voltage of the (B131) Active Brake Booster Solenoid (+) circuit in the Active Brake Booster harness connector.

**Is the voltage above 10 volts?**

- Yes** >> Go To 9
- No** >> Go To 5

**C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)****5. CHECK FOR A SHORT BETWEEN THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) AND (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUITS**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (B131) Active Brake Booster Solenoid (+) circuit and the (B132) Active Brake Booster Solenoid (-) circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B131) Active Brake Booster Solenoid (+) circuit and the (B132) Active Brake Booster Solenoid (-) circuit for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**6. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, check the (B131) Active Brake Booster Solenoid (+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)****7. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to ground, check the (B131) Active Brake Booster Solenoid (+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. CHECK THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Connect a jumper wire between the (B131) Active Brake Booster Solenoid (+) circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B131) Active Brake Booster Solenoid (+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B131) Active Brake Booster Solenoid (+) circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C122C-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT SUPPLY VOLTAGE (CONTINUED)**

**9. CHECK THE ACTIVE BRAKE BOOSTER SOLENOID ACTUATION**

Turn the ignition off.

Reconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Connect a jumper wire between the (B132) Active Brake Booster Solenoid (-) and ground at the Anti-Lock Brake Module harness connector.

Connect a jumper wire for several seconds between the (B131) Active Brake Booster Solenoid (+) circuit and a 12 volt supply at the Anti-Lock Brake Module harness connector.

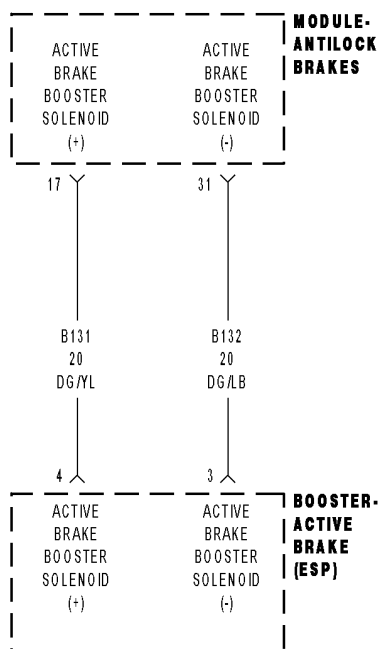

**Is there brake application when the (B131) Active Brake Booster Solenoid (+) circuit is jumped to a 12 volt supply and the (B132) Active Brake Booster Solenoid (-) jumped to ground?**

**Yes**     >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
            Perform ABS VERIFICATION TEST - VER 1.

**No**       >> Replace the Active Brake Booster Solenoid in accordance with the Service Information.  
            Perform ABS VERIFICATION TEST - VER 1.

---

## C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT

C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the Active Brake Booster circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) CIRCUIT AND (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT SHORTED TO TOGETHER (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN ACTIVE BRAKE BOOSTER SOLENOID ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE RESISTANCE OF THE ACTIVE BRAKE BOOSTER SOLENOID**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Measure the internal resistance of the Active Brake Booster Solenoid.

**Is the resistance between 1 to 2 ohms?**

**Yes** >> Go To 4

**No** >> Replace the Active Brake Booster Solenoid in accordance with the Service information.

Perform ABS VERIFICATION TEST - VER 1.

**C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)****4. CHECK FOR A SHORT BETWEEN THE (B131) ACTIVE BRAKE BOOSTER SOLENOID (+) AND (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUITS**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (B131) Active Brake Booster Solenoid (+) circuit and the (B132) Active Brake Booster Solenoid (-) circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B131) Active Brake Booster Solenoid (+) circuit and the (B132) Active Brake Booster Solenoid (-) circuit for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, check the (B132) Active Brake Booster Solenoid (-) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B132) Active Brake Booster Solenoid (-) circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)****6. CHECK THE (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to ground, check the (B132) Active Brake Booster Solenoid (-) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B132) Active Brake Booster Solenoid (-) circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B132) ACTIVE BRAKE BOOSTER SOLENOID (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Connect a jumper wire between the (B132) Active Brake Booster Solenoid (-) circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B132) Active Brake Booster Solenoid (-) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 8

**No** >> Repair the (B132) Active Brake Booster Solenoid (-) circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

## **C122D-ACTIVE BRAKE BOOSTER CONTROL CIRCUIT (CONTINUED)**

### **8. CHECK THE ACTIVE BRAKE BOOSTER SOLENOID ACTUATION**

Turn the ignition off.

Reconnect the Active Brake Booster harness connector.

Disconnect the Anti-Lock Brake Module harness connector.

Turn the ignition on.

Connect a jumper wire between the (B132) Active Brake Booster Solenoid (-) and ground at the Anti-Lock Brake Module harness connector.

Connect a jumper wire for several seconds between the (B131) Active Brake Booster Solenoid (+) circuit and a 12 volt supply at the Anti-Lock Brake Module harness connector.

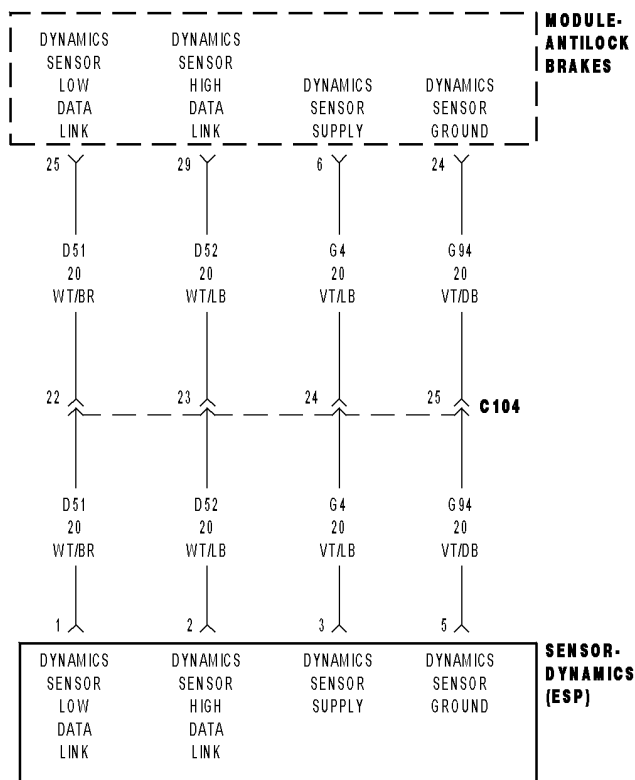

**Is there brake application when the (B131) Active Brake Booster Solenoid (+) circuit is jumped to a 12 volt supply and the (B132) Active Brake Booster Solenoid (-) jumped to ground?**

**Yes**     >> Replace the Active Brake Booster Solenoid in accordance with the Service Information  
            Perform ABS VERIFICATION TEST - VER 1.

**No**       >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
            Perform ABS VERIFICATION TEST - VER 1.

---

## C123A-ESP SYSTEM SENSORS CALIBRATION

C123A-ESP SYSTEM SENSORS CALIBRATION (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the Dynamics Sensor stored calibration values are invalid.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DYNAMICS SENSOR
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C123A-ESP SYSTEM SENSORS CALIBRATION

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C123A-ESP SYSTEM SENSORS CALIBRATION?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C123A-ESP SYSTEM SENSORS CALIBRATION (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE DYNAMICS SENSOR OUTPUT**

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle while monitoring the Dynamics Sensor operation.

**Was the Lateral Sensor output between 0.02 G to 0.16 G and the Yaw Sensor between 1.30° to 5.70°?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Replace the Dynamics Sensor in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**C123B-ESP SYSTEM CONTROL TOO LONG (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates Dynamics Sensor failure.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
DYNAMICS SENSOR

**Diagnostic Test****1. CHECK FOR A DTC C123B-ESP SYSTEM CONTROL TOO LONG**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C123B-ESP SYSTEM CONTROL TOO LONG?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST - VER 1.

**C123B-ESP SYSTEM CONTROL TOO LONG (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE

**C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the Dynamics Sensor values are invalid.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE IMPROPERLY INSTALLED DYNAMICS SENSOR (G94) DYNAMICS SENSOR GROUND CIRCUIT OPEN DYNAMICS SENSOR

**Diagnostic Test**

**1. CHECK FOR A DTC C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE DYNAMICS SENSOR INSTALLATION**

**Note: Dynamics Sensor installation and mounting bolt torque is crucial for proper operation.**

Check the Dynamics Sensor for damaged, modified or bent mounting bracket.

Check the Dynamics Sensor mounting bolts for loose or over tightened mounting bolts.

**Were any problems found?**

- Yes** >> Repair as needed.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 4

**C123C-DYNAMICS SENSOR MOUNTING/INSTALLATION PERFORMANCE (CONTINUED)****4. CHECK THE RESISTANCE BETWEEN THE (G94) DYNAMICS SENSOR GROUND CIRCUIT AND GROUND**

Turn the ignition off.

Disconnect the Dynamics Sensor harness connector.

Measure the resistance between the (G94) Dynamics Sensor Ground circuit and ground.

**Is the resistance below 5.0 ohm?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (G94) Dynamics Sensor Ground circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

## C2100-BATTERY VOLTAGE LOW

C2100-BATTERY VOLTAGE LOW (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that voltage is below 7.5 volts.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE
STARTING AND CHARGING CONDITION
(A111) FUSED B(+) CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN
(Z903) GROUND CIRCUIT OPEN
INTEGRATED POWER MODULE
ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A C2100-BATTERY VOLTAGE LOW

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C2100-BATTERY VOLTAGE LOW?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2100-BATTERY VOLTAGE LOW (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE BATTERY AND CHARGING SYSTEM**

Turn the ignition off.

Perform a battery and charging system test.

**Note:** Refer to the Service Information for related test(s)/symptom(s).

**Does the battery and charging system pass?**

- Yes** >> Go To 4
- No** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**C2100-BATTERY VOLTAGE LOW (CONTINUED)****4. CHECK THE VOLTAGE ON THE (A111) FUSED B(+) CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A111) Fused B(+) circuit.

**Is the voltage below 10 volts?**

**Yes** >> Go To 5

**No** >> Go To 8

**5. CHECK THE (A111) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, check the (A111) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (A111) Fused B(+) circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2100-BATTERY VOLTAGE LOW (CONTINUED)****6. CHECK THE (A111) FUSED B(+) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to ground, check the (A111) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (A111) Fused B(+) circuit for a short to voltage.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (A111) FUSED B(+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Remove the Anti-Lock Brake Module Fused B(+) fuse.

Disconnect the Anti-Lock Brake Module harness connector.

Connect a jumper wire between the (A111) Fused B(+) circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (A111) Fused B(+) circuit.

**Does the test light illuminate brightly**

**Yes** >> Replace the Integrated Power Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (A111) Fused B(+) circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C2100-BATTERY VOLTAGE LOW (CONTINUED)****8. CHECK THE (Z903) GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (Z903) Ground circuit and ground.

**Is the resistance below 5.0 ohm?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (Z903) Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

# C2101-BATTERY VOLTAGE HIGH

**C2101-BATTERY VOLTAGE HIGH (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that voltage is above 17 volts.

Possible Causes
BATTERY CHARGER ON VEHICLE TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE STARTING AND CHARGING CONDITION (Z903) GROUND CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A C2101-BATTERY VOLTAGE HIGH**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition from off to on.

With the scan tool, read and record DTC's.

**Does the scan tool display: C2101-BATTERY VOLTAGE HIGH?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**2. CHECK FOR BATTERY CHARGER CONNECTED TO VEHICLE**

**Is a battery charger connected to the vehicle?**

**Yes** >> Ensure battery is fully charged.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**C2101-BATTERY VOLTAGE HIGH (CONTINUED)****3. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 4

**4. CHECK THE BATTERY AND CHARGING SYSTEM**

Turn the ignition off.

Perform a battery and charging system test.

**Note:** Refer to the Service Information for related test(s)/symptom(s).

**Does the battery and charging system pass?**

- Yes** >> Go To 5
- No** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**C2101-BATTERY VOLTAGE HIGH (CONTINUED)****5. CHECK THE VOLTAGE ON THE (A111) FUSED B(+) CIRCUIT**

**WARNING:** When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Start the engine.

Raise engine speed above 1,800 RPM's.

Measure the voltage of the (A111) Fused B(+) circuit.

**Is the voltage above 17 volts?**

**Yes** >> Refer to the appropriate Service Information for Charging System testing and repair.

**No** >> Go To 6

**6. CHECK THE (Z903) GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (Z903) Ground circuit and ground.

**Is the resistance below 5.0 ohm?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

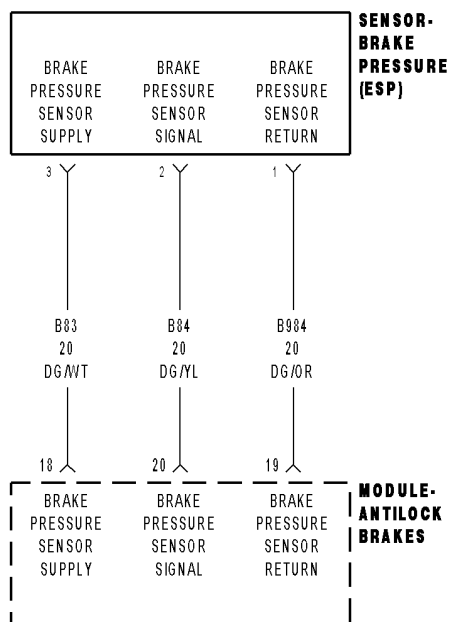

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (Z903) Anti-Lock Brake Module Ground circuit for an open.

Perform ABS VERIFICATION TEST - VER 1

## C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW

C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is within the low fault area.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TOGETHER (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT SHORTED TOGETHER (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW?**

- Yes** >> Go To 2
- No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

**Is the voltage above 4 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)****4. CHECK FOR A SHORT BETWEEN THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B83) Brake Pressure Sensor Supply and the (B84) Brake Pressure Sensor Signal circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply and (B84) Brake Pressure Sensor Signal circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK FOR A SHORT BETWEEN THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B83) Brake Pressure Sensor Supply and the (B984) Brake Pressure Sensor Return circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply and (B984) Brake Pressure Sensor Return circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)****6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**C2111-SENSOR SUPPLY VOLTAGE CIRCUIT LOW (CONTINUED)****8. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Connect a jumper wire between the (B83) Brake Pressure Sensor Supply circuit and ground.

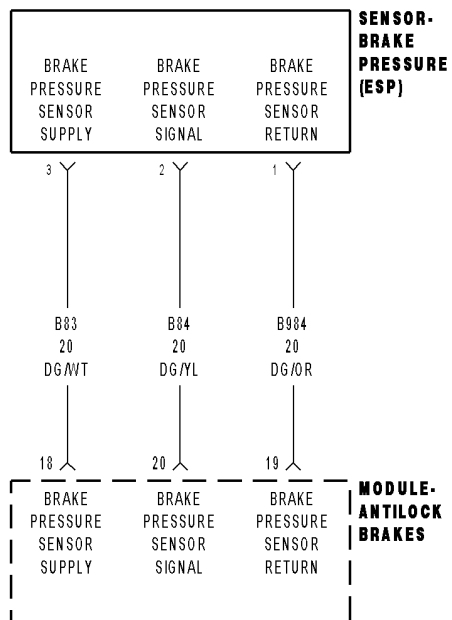

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B83) Brake Pressure Sensor Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH

**C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates that the Brake Pressure Sensor Signal is within the high fault area.

Possible Causes
TERMINAL/CONNECTOR/WIRING HARNESS DAMAGE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT SHORTED TOGETHER (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT SHORTED TOGETHER (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE OR GROUND ANTI-LOCK BRAKE MODULE

**Diagnostic Test**

**1. CHECK FOR A DTC C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition from off to on.
- With the scan tool, read and record DTC's.

**Does the scan tool display: C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/WIRING HARNESS FOR DAMAGE**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (B83) Brake Pressure Sensor Supply circuit.

**Is the voltage above 6 volts?**

- Yes** >> Go To 4
- No** >> Replace the Brake Pressure Sensor in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH (CONTINUED)****4. CHECK FOR A SHORT BETWEEN THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B84) BRAKE PRESSURE SENSOR SIGNAL CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B83) Brake Pressure Sensor Supply and the (B84) Brake Pressure Sensor Signal circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply and (B84) Brake Pressure Sensor Signal circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK FOR A SHORT BETWEEN THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT AND THE (B984) BRAKE PRESSURE SENSOR RETURN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Measure the resistance between the (B83) Brake Pressure Sensor Supply and the (B984) Brake Pressure Sensor Return circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply and (B984) Brake Pressure Sensor Return circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2112-SENSOR SUPPLY VOLTAGE CIRCUIT HIGH (CONTINUED)****6. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B83) BRAKE PRESSURE SENSOR SUPPLY CIRCUIT FOR SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Brake Pressure Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (B83) Brake Pressure Sensor Supply circuit.

**Does the test light illuminate brightly**

**Yes** >> Repair the (B83) Brake Pressure Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

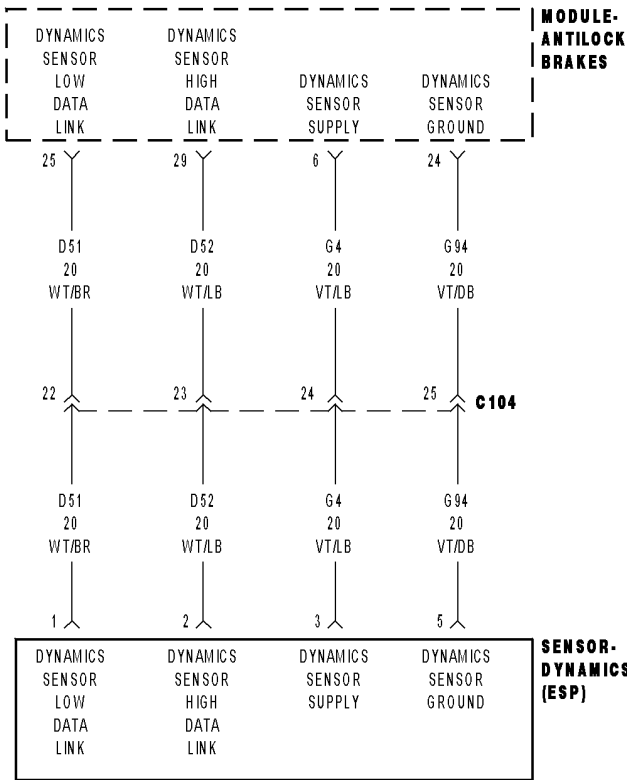

**No** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW

**C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the operating voltage is out of specified range.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (G94) DYNAMICS SENSOR GROUND CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN DYNAMICS SENSOR ANTI-LOCK BRAKE MODULE

**1. CHECK FOR A DTC C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (G4) Dynamics Sensor Supply Circuit.

**Is the voltage above 10 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****4. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (G4) Dynamics Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G4) Dynamics Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (G4) Dynamics Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G4) Dynamics Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****6. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (G4) Dynamics Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (G4) Dynamics Sensor Supply circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G4) Dynamics Sensor Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE RESISTANCE BETWEEN THE (G94) DYNAMICS SENSOR GROUND CIRCUIT AND GROUND**

Turn the ignition off.

Disconnect the Dynamics Sensor harness connector.

Measure the resistance between the (G94) Dynamics Sensor Ground Circuit and Ground.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 8

**C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****8. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (G94) Dynamics Sensor Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G94) Dynamics Sensor Ground circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (G94) Dynamics Sensor Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G94) Dynamics Sensor Ground circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C2114-DYNAMICS SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****10. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (G94) Dynamics Sensor Ground circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (G94) Dynamics Sensor Ground circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G94) Dynamics Sensor Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH

C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the operating voltage is out of specified range.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE
CHARGING SYSTEM
(G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO GROUND OR VOLTAGE
(G94) DYNAMICS SENSOR GROUND CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN
DYNAMICS SENSOR
ANTI-LOCK BRAKE MODULE

1. CHECK FOR A DTC C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Check all related wiring for bruised, chafed, pierced, or partially broken wires.

Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (G4) Dynamics Sensor Supply Circuit.

**Is the voltage above 17 volts?**

**Yes** >> Go To 4

**No** >> Go To 7

**C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)****4. CHECK THE VOLTAGE ON THE (A111) FUSED B(+) CIRCUIT**

**WARNING:** When the engine is operating, do not stand in direct line with the fan. Do not put your hands near the pulleys, belts, or fan. Do not wear loose clothing. Failure to follow these instructions can result in personal injury or death.

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Start the engine.

Raise engine speed above 1,800 RPM's.

Measure the voltage of the (A111) Fused B(+) circuit.

**Is the voltage above 17 volts?**

**Yes** >> Refer to appropriate Service Information for Charging System testing and repair.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (G4) Dynamic Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G4) Dynamic Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)****6. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (G4) Dynamics Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G4) Dynamics Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE RESISTANCE BETWEEN THE (G94) DYNAMICS SENSOR GROUND CIRCUIT AND GROUND**

Turn the ignition off.

Disconnect the Dynamics Sensor harness connector.

Measure the resistance between the (G94) Dynamics Sensor Ground Circuit and Ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)****8. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (G94) Dynamics Sensor Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G94) Dynamics Sensor Ground circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (G94) Dynamics Sensor Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G94) Dynamics Sensor Ground circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C2115-DYNAMICS SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)****10. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (G94) Dynamics Sensor Ground circuit and ground.

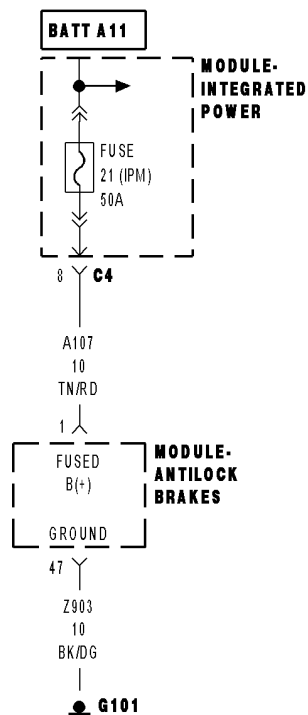

Using a 12-volt test light connected to 12-volts, check the (G94) Dynamics Sensor Ground circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G94) Dynamics Sensor Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE

**C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module indicates the ABS Pump Motor circuit fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE ABS PUMP MOTOR FUSE OPEN (A107) FUSED B(+) CIRCUIT SHORTED TO GROUND OR OPEN (Z907) GROUND CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

**CAUTION:** Ensure braking capability is available before road testing.

Drive the vehicle over 40 Km/h (25 mph).

Park the vehicle and cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE (CONTINUED)****2. CHECK ABS PUMP OPERATION WITH SCAN TOOL**

Cycle the ignition from off to on.

With the scan tool, actuate the ABS Pump Motor.

**Did the ABS Pump Motor operate?**

**Yes** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

**No** >> Go To 3

**3. CHECK THE ABS PUMP MOTOR FUSE FOR AN OPEN**

Turn the ignition off.

Remove and visually inspect the ABS Pump Motor fuse.

**Is the ABS Pump Motor fuse open?**

**Yes** >> Go To 4

**No** >> Go To 5

**4. CHECK THE (A107) FUSED B(+) FOR A SHORT TO GROUND**

Turn the ignition off.

Visually inspect the (A107) Fused B(+) circuit in the wiring harness.

Look for any signs of intermittent short to ground.

**Is the wiring harness OK?**

**Yes** >> Go To 5

**No** >> Repair the (A107) Fused B(+) circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE (CONTINUED)****5. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Visually inspect the Anti-Lock Brake Module harness connector and (A107) Fused B(+) circuit in the wiring harness for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**6. CHECK THE VOLTAGE ON THE (A107) FUSED B(+) CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A107) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 7

**No** >> Repair the (A107) Fused B(+) circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C2116-ABS PUMP MOTOR SUPPLY LOW VOLTAGE (CONTINUED)****7. CHECK THE (Z903) GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

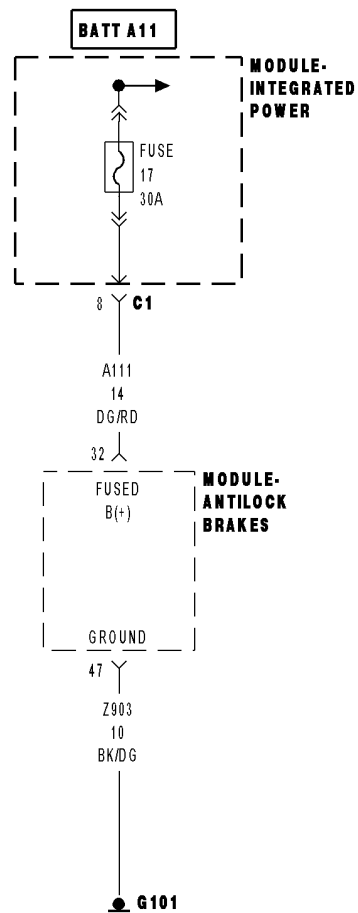

Measure the resistance of the (Z903) Ground circuit between the Anti-Lock Brake Module harness connector and ground

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (Z903) Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C2200-ANTI-LOCK BRAKE MODULE INTERNAL

C2200-ANTI-LOCK BRAKE MODULE INTERNAL (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (A111) FUSED B(+) CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (Z903) GROUND CIRCUIT OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2200-ANTI-LOCK BRAKE MODULE INTERNAL

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C2200-ANTI-LOCK BRAKE MODULE INTERNAL?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2200-ANTI-LOCK BRAKE MODULE INTERNAL (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (A111) FUSED B(+) CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the voltage of the (A111) Fused B(+) circuit in the Anti-Lock Brake Module harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C2200-ANTI-LOCK BRAKE MODULE INTERNAL (CONTINUED)****4. CHECK THE (A111) FUSED B(+) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to 12-volts, check the (A111) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (A111) Fused B(+) circuit for a short to ground.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (A111) FUSED B(+) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Using a 12-volt test light connected to ground, check the (A111) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (A111) Fused B(+) circuit for a short to voltage.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2200-ANTI-LOCK BRAKE MODULE INTERNAL (CONTINUED)****6. CHECK THE (A111) FUSED B(+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Remove the Anti-Lock Brake Module Fused B(+) fuse.

Disconnect the Anti-Lock Brake Module harness connector.

Connect a jumper wire between the (A111) Fused B(+) circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (A111) Fused B(+) circuit.

**Does the test light illuminate brightly?**

- Yes** >> Replace the Integrated Power Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (A111) Fused B(+) circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (Z903) GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (Z903) Ground circuit and ground.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (Z903) Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

C2202-ORIGINAL VIN MISMATCH/MISSING

**C2202-ORIGINAL VIN MISMATCH/MISSING (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C2202-ORIGINAL VIN MISMATCH/MISSING**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C2202-ORIGINAL VIN MISMATCH/MISSING?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2202-ORIGINAL VIN MISMATCH/MISSING (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit for a short together.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**C2202-ORIGINAL VIN MISMATCH/MISSING (CONTINUED)****4. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2202-ORIGINAL VIN MISMATCH/MISSING (CONTINUED)****6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Measure the resistance of the (D65) CAN C (+) Bus circuit between the Anti-lock Brake Module and the Front Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

Perform ABS VERIFICATION TEST - VER 1.

**C2202-ORIGINAL VIN MISMATCH/MISSING (CONTINUED)****8. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Front Control Module harness connector.

Measure the resistance of the (D64) CAN C (-) Bus circuit between the Anti-lock Brake Module and the Front Control Module.

**Is the resistance below 5.0 ohms?**

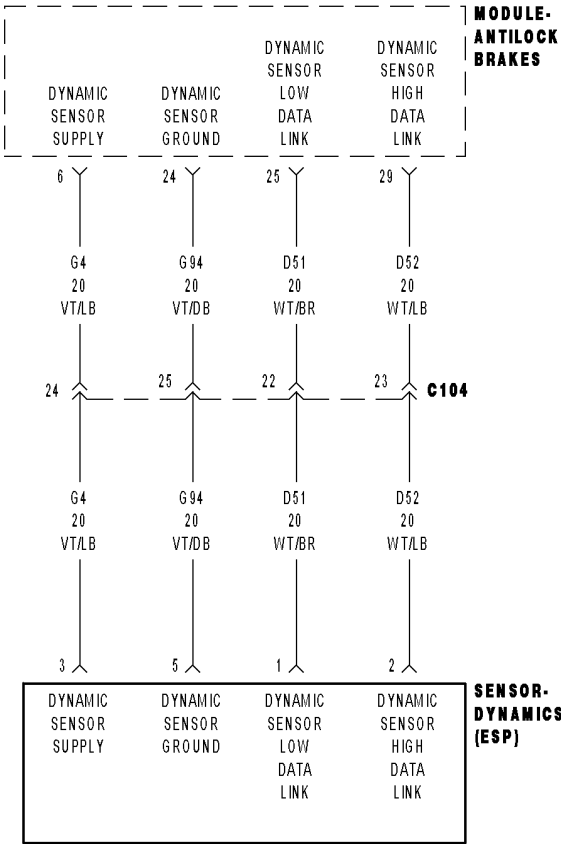

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit. Perform ABS VERIFICATION TEST - VER 1.

C2204-DYNAMICS SENSOR INTERNAL

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module fails the diagnostic test.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (G94) DYNAMICS SENSOR GROUND CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN DYNAMICS SENSOR ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK FOR A DTC C2204-DYNAMICS SENSOR INTERNAL**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Test drive the vehicle.

With the scan tool, read and record DTC's

**Does the scan tool display: C2204-DYNAMICS SENSOR INTERNAL?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Check the Dynamics Sensor installation and torque of the mounting bolts.

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE VOLTAGE ON THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT**

Turn the ignition off.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (G4) Dynamics Sensor Supply Circuit.

**Is the voltage above 10 volts?**

**Yes** >> Go To 7

**No** >> Go To 4

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****4. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (G4) Dynamics Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G4) Dynamics Sensor Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (G4) Dynamics Sensor Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G4) Dynamics Sensor Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****6. CHECK THE (G4) DYNAMICS SENSOR SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (G4) Dynamics Sensor Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (G4) Dynamics Sensor Supply circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G4) Dynamics Sensor Supply circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE RESISTANCE BETWEEN THE (G94) DYNAMICS SENSOR GROUND CIRCUIT AND GROUND**

Turn the ignition off.

Disconnect the Dynamics Sensor harness connector.

Measure the resistance between the (G94) Dynamics Sensor Ground Circuit and Ground.

**Is the resistance below 5.0 ohm?**

- Yes** >> Go To 11
- No** >> Go To 8

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****8. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (G94) Dynamics Sensor Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G94) Dynamics Sensor Ground circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (G94) Dynamics Sensor Ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (G94) Dynamics Sensor Ground circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****10. CHECK THE (G94) DYNAMICS SENSOR GROUND CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (G94) Dynamic Sensor Ground circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (G94) Dynamics Sensor Return circuit

**Does the test light illuminate brightly?**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (G94) Dynamics Sensor Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**11. CHECK THE DYNAMICS SENSOR OUTPUT**

**CAUTION:** Ensure brake capability is available before road testing.

Have an assistant test drive the vehicle while monitoring the Dynamics Sensor operation.

**Was the Lateral Sensor output between 0.02 G to 0.16 G and the Yaw Sensor between 1.30° to 5.70°**

- Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 12

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****12. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D52) Dynamics Sensor High Datalink circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D52) Dynamics Sensor High Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 14

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****14. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (D52) Dynamics Sensor High Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 15

**No** >> Repair the (D52) Dynamics Sensor High Datalink circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**15. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 16

**C2204-DYNAMICS SENSOR INTERNAL (CONTINUED)****16. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 17

**17. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Connect a jumper wire between the (D51) Dynamics Sensor Low Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

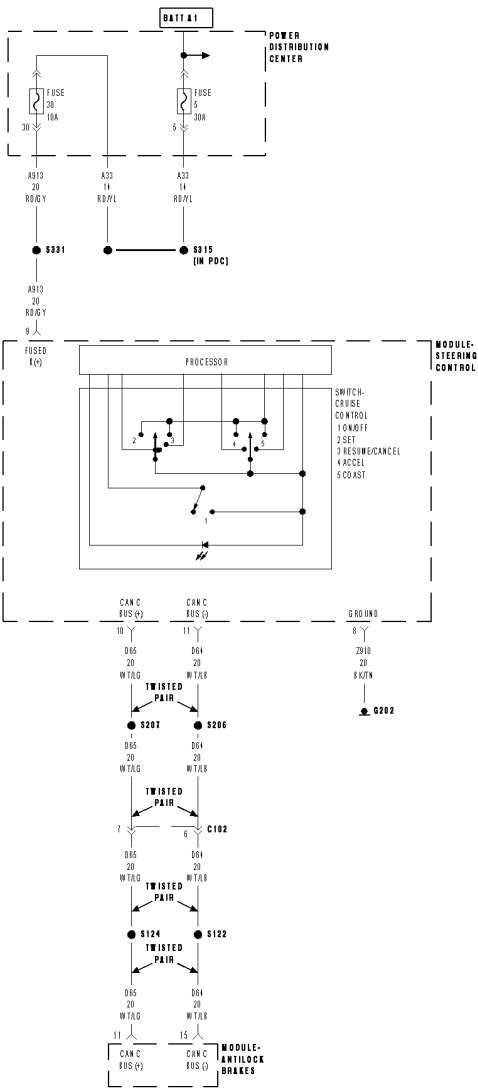

**No** >> Repair the (D51) Dynamics Sensor High Datalink circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

C2205-STEERING ANGLE SENSOR INTERNAL

**C2205-STEERING ANGLE SENSOR INTERNAL (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects the Steering Angle Sensor has sent the internal failure status.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (A913) FUSED B(+) CIRCUIT OPEN (Z910) GROUND CIRCUIT OPEN (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN STEERING CONTROL MODULE

**Diagnostic Test****1. CHECK FOR A DTC C2205-STEERING ANGLE SENSOR INTERNAL**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C2205-STEERING ANGLE SENSOR INTERNAL?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2205-STEERING ANGLE SENSOR INTERNAL (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Check the Steering Angle Sensor installation.

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE VOLTAGE OF THE STEERING CONTROL MODULE (A913) FUSED B(+) CIRCUIT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

Measure the voltage of the (A913) Fused B(+) circuit.

**Is the voltage above 10 volts?**

- Yes** >> Go To 4
- No** >> Repair the (A913) Fused B(+) circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**C2205-STEERING ANGLE SENSOR INTERNAL (CONTINUED)****4. CHECK THE RESISTANCE OF THE STEERING CONTROL MODULE (Z910) GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Measure resistance between the (Z910) Ground circuit and ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (Z910) Ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**5. CHECK THE (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

**Is the resistance below 150 ohms?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2205-STEERING ANGLE SENSOR INTERNAL (CONTINUED)****6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Transmission Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Transmission Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**C2205-STEERING ANGLE SENSOR INTERNAL (CONTINUED)****8. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Transmission Control Module harness connector.

Measure the resistance of the (D65) CAN C (+) Bus circuit between the Anti-lock Brake Module and the Transmission Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 9

**No** >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

**9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Transmission Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

Perform ABS VERIFICATION TEST - VER 1.

**C2205-STEERING ANGLE SENSOR INTERNAL (CONTINUED)****10. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Transmission Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Transmission Control Module harness connector.

Measure the resistance of the (D64) CAN C (-) Bus circuit between the Anti-lock Brake Module and the Transmission Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Steering Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

## C2206-VEHICLE CONFIGURATION MISMATCH

C2206-VEHICLE CONFIGURATION MISMATCH (CONTINUED)

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects the signal from the gateway module relevant for vehicle character-  
istic is missing for a period greater than the specified fault duration.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT SHORTED TOGETHER (D65) CAN C (+) BUS CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (D64) CAN C (-) BUS CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK FOR A DTC C2206-VEHICLE CONFIGURATION MISMATCH

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C2206-VEHICLE CONFIGURATION MISMATCH?**

- Yes**    >> Go To 2
- No**    >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**C2206-VEHICLE CONFIGURATION MISMATCH (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

- Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 3

**3. CHECK THE (D65) CAN C (+) BUS CIRCUIT AND (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Measure the resistance between the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit.

**Is the resistance below 150 ohms?**

- Yes** >> Repair the (D65) CAN C (+) BUS circuit and the (D64) CAN C (-) BUS circuit for a short together.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Go To 4

**C2206-VEHICLE CONFIGURATION MISMATCH (CONTINUED)****4. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D65) CAN C (+) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D65) CAN C (+) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C2206-VEHICLE CONFIGURATION MISMATCH (CONTINUED)****6. CHECK THE (D65) CAN C (+) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Measure the resistance of the (D65) CAN C (+) Bus circuit between the Anti-lock Brake Module and the Powertrain Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (D65) CAN C (+) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

**7. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to 12-volts, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**C2206-VEHICLE CONFIGURATION MISMATCH (CONTINUED)****8. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D64) CAN C (-) BUS circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D64) CAN C (-) BUS circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. CHECK THE (D64) CAN C (-) BUS CIRCUIT FOR AN OPEN CIRCUIT**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Powertrain Control Module harness connector.

Measure the resistance of the (D64) CAN C (-) Bus circuit between the Anti-Lock Brake Module and the Powertrain Control Module.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Anti-Lock Brake Module in accordance with the Service Information.

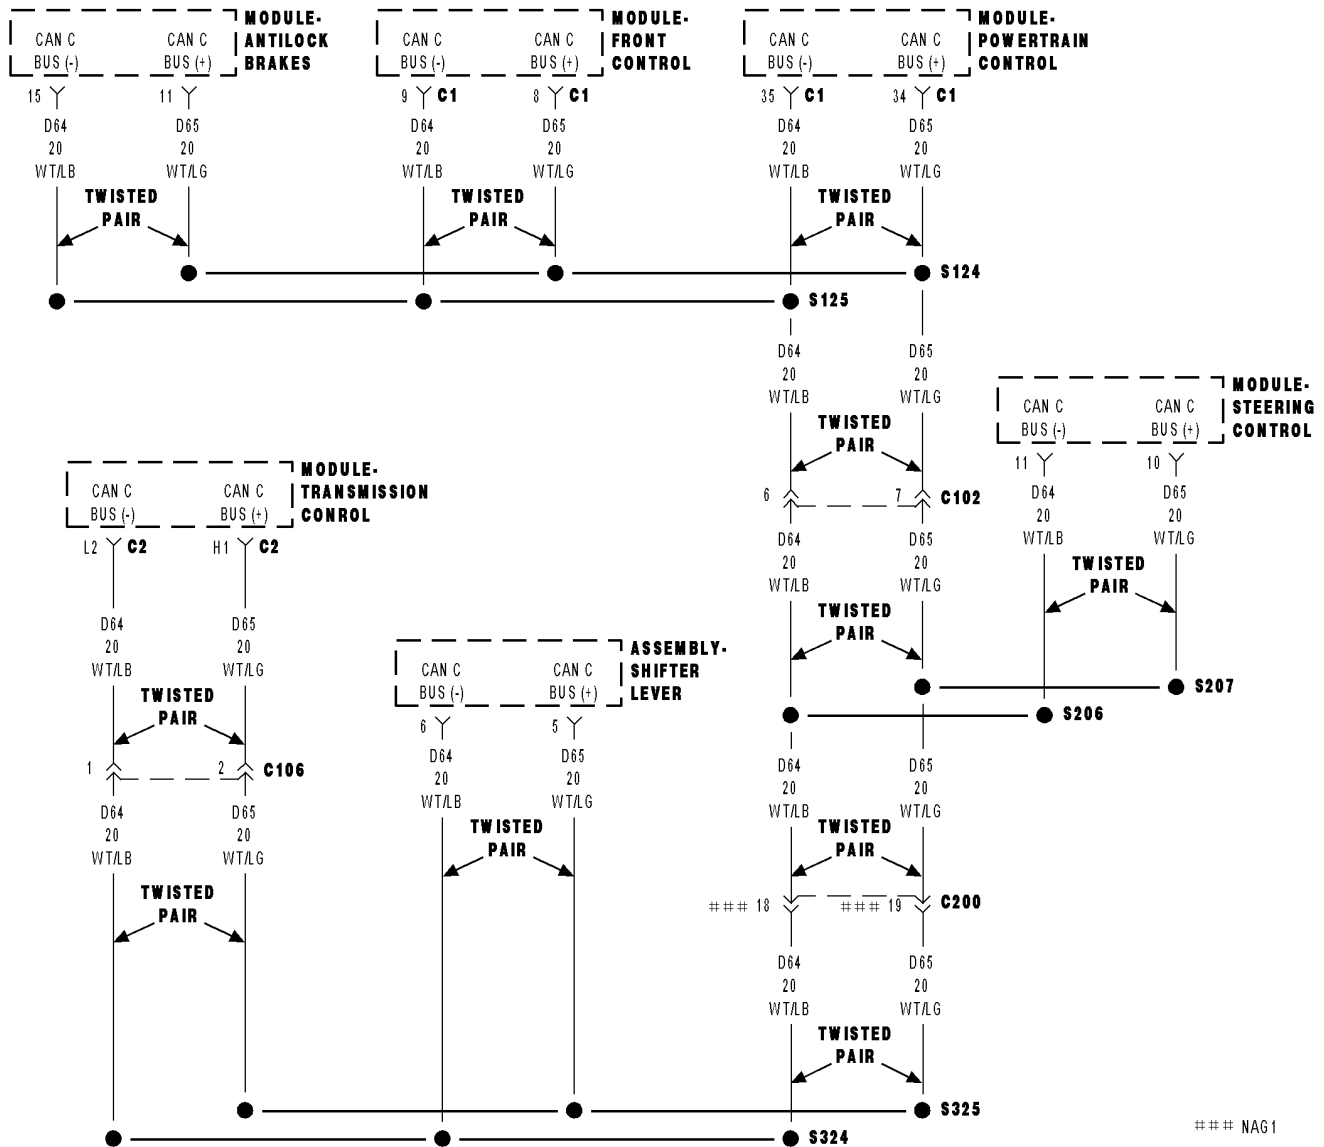

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C (-) BUS circuit for an open circuit.

Perform ABS VERIFICATION TEST - VER 1.

# U0002-CAN C BUS OFF PERFORMANCE

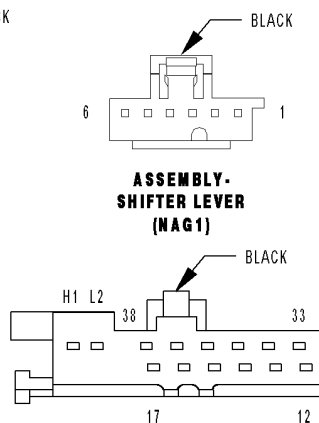

MODULE-FRONT CONTROL C1

MODULE-STEERING CONTROL

MODULE-ANTILOCK BRAKES

ASSEMBLY-SHIFTER LEVER (NAG1)

MODULE-POWERTRAIN CONTROL C1

**U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The FCM detects a short in either CAN C Bus circuit.

**Possible Causes**

(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND  
(D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND  
(D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE  
(D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE  
(D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT  
ANTILOCK BRAKE MODULE  
POWERTRAIN CONTROL MODULE  
SHIFTER LEVER ASSEMBLY (NAG1 ONLY)  
TRANSMISSION CONTROL MODULE (NAG1 ONLY)  
STEERING CONTROL MODULE  
FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)****2. ANTILOCK BRAKE MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?**

**Yes** >> Go To 3

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.  
Perform ABS VERIFICATION TEST — VER 1.

**3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?**

**Yes** >> Go To 4

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

**U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)****4. SHIFTER LEVER ASSEMBLY (NAG1 ONLY)— INTERNAL SHORT**

Turn the ignition off.

**Note:** If the vehicle is not equipped with a NAG1 controller then skip this step.

Disconnect the Shifter Lever Assembly harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?**

**Yes** >> Go To 5

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Shifter Lever Assembly in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**5. TRANSMISSION CONTROL MODULE (NAG1 ONLY)— INTERNAL SHORT**

Turn the ignition off.

**Note:** If the vehicle is not equipped with a NAG1 controller then skip this step.

Disconnect the Transmission Control Module C2 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?**

**Yes** >> Go To 6

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)****6. STEERING CONTROL MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0002-CAN C BUS OFF PERFORMANCE as active?**

**Yes** >> Go To 7

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Steering Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**7. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

**Is there any voltage present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 8

**U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)****8. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

**Is there any voltage present?**

**Yes** >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 10

**U0002-CAN C BUS OFF PERFORMANCE (CONTINUED)****10. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT**

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

## U0100-LOST COMMUNICATION WITH ECM/PCM

**U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the ECM/PCM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
ECM/PCM
ECM/PCM POWER AND GROUND
MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure.  
Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

**U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)****2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

**3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ECM/PCM is active on the bus.

**Is the ECM/PCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

**U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)****4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

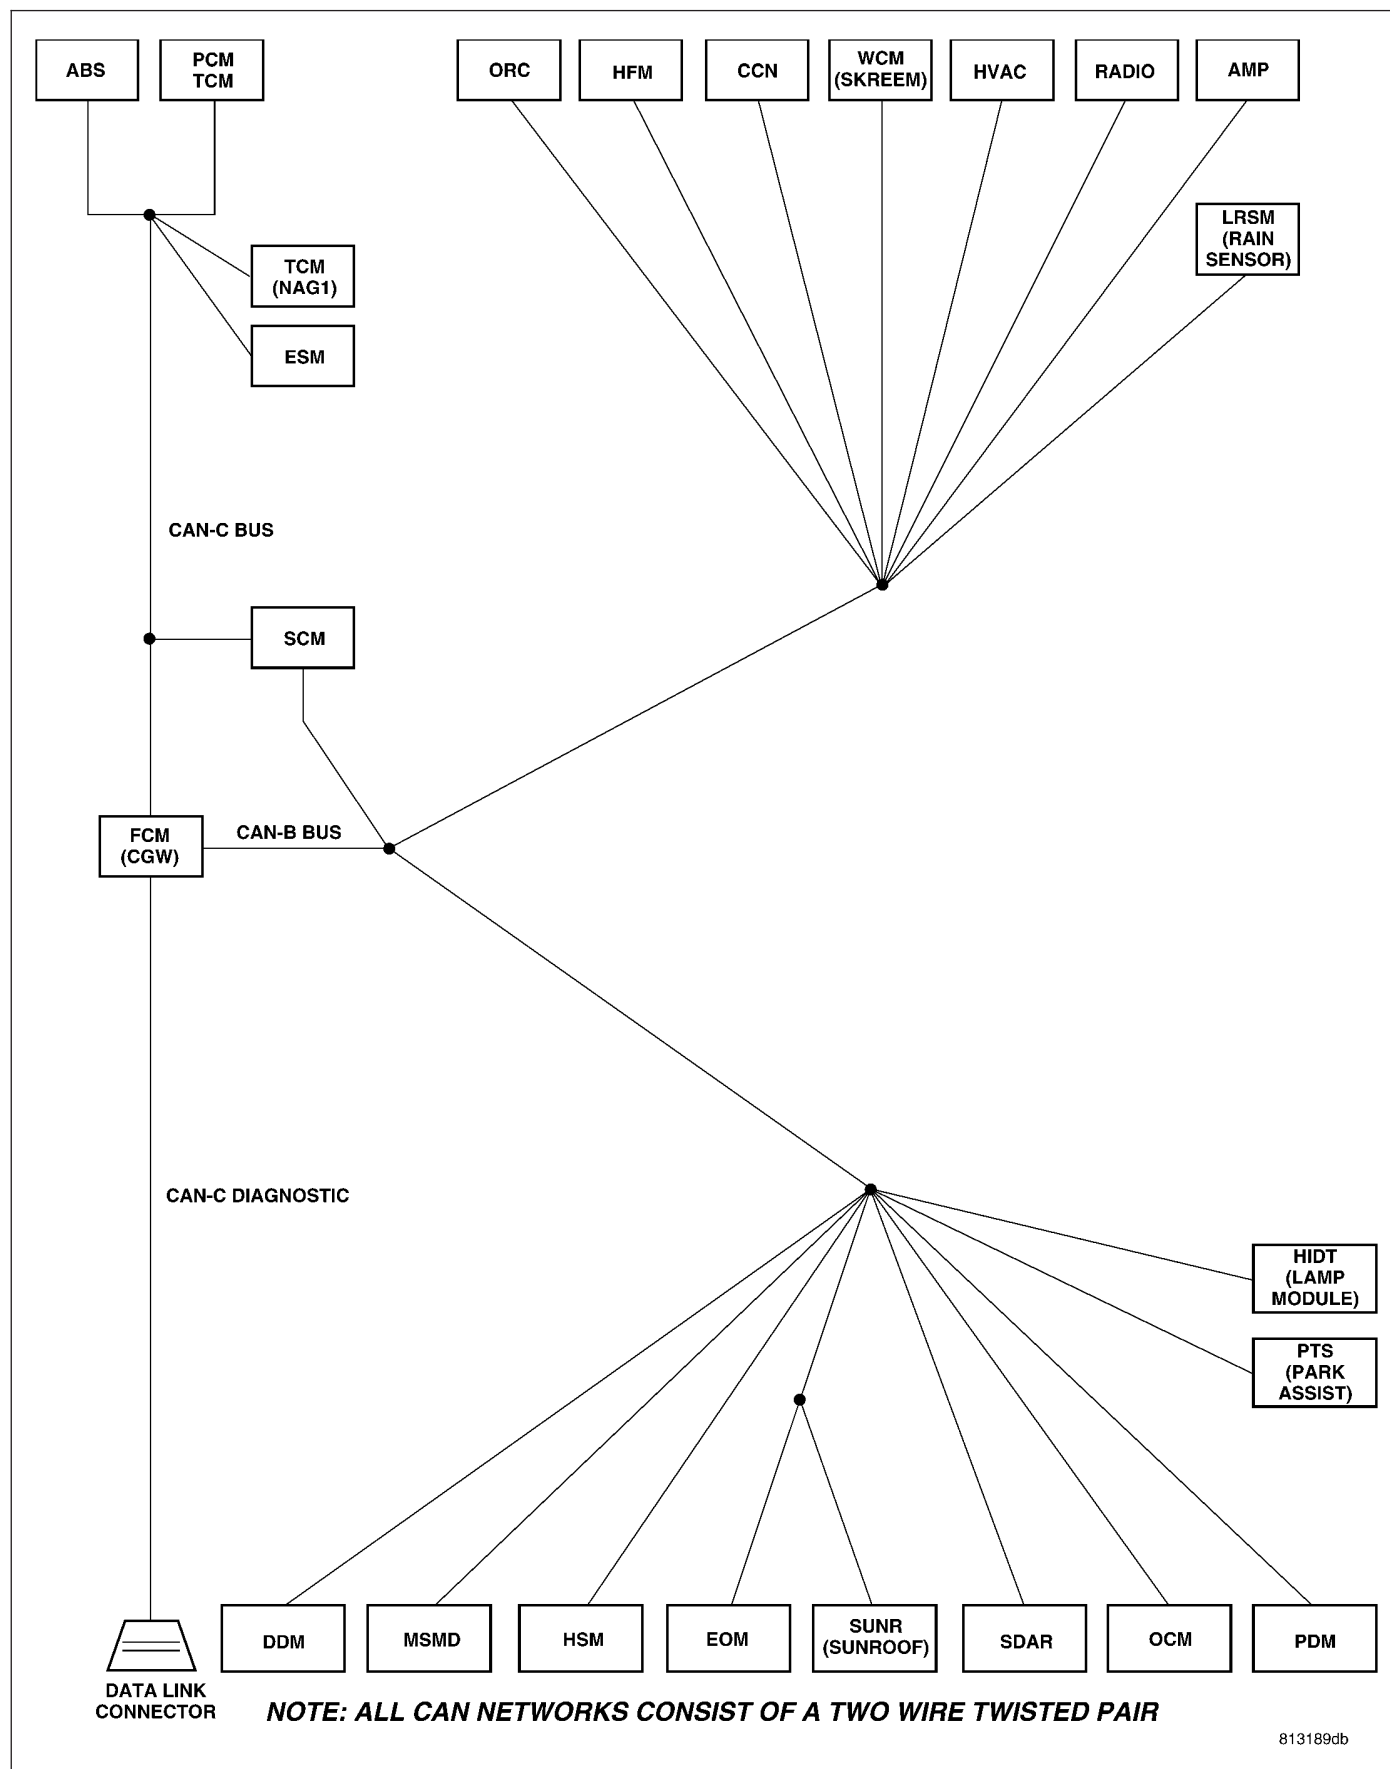

**Is there more than one module with active DTCs “Logged Against” the ECM/PCM?**

- Yes** >> Replace/update the ECM/PCM in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

## U0101-LOST COMMUNICATION WITH TCM

**U0101-LOST COMMUNICATION WITH TCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the TCM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
TCM
TCM POWER AND GROUND
MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure.  
Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

**U0101-LOST COMMUNICATION WITH TCM (CONTINUED)****2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCS from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

**Does the scan tool display any active DTCS to the conditions listed above?**

- Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 3

**3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

**Is the TCM active on the bus?**

- Yes** >> Go To 4
- No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

**U0101-LOST COMMUNICATION WITH TCM (CONTINUED)****4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

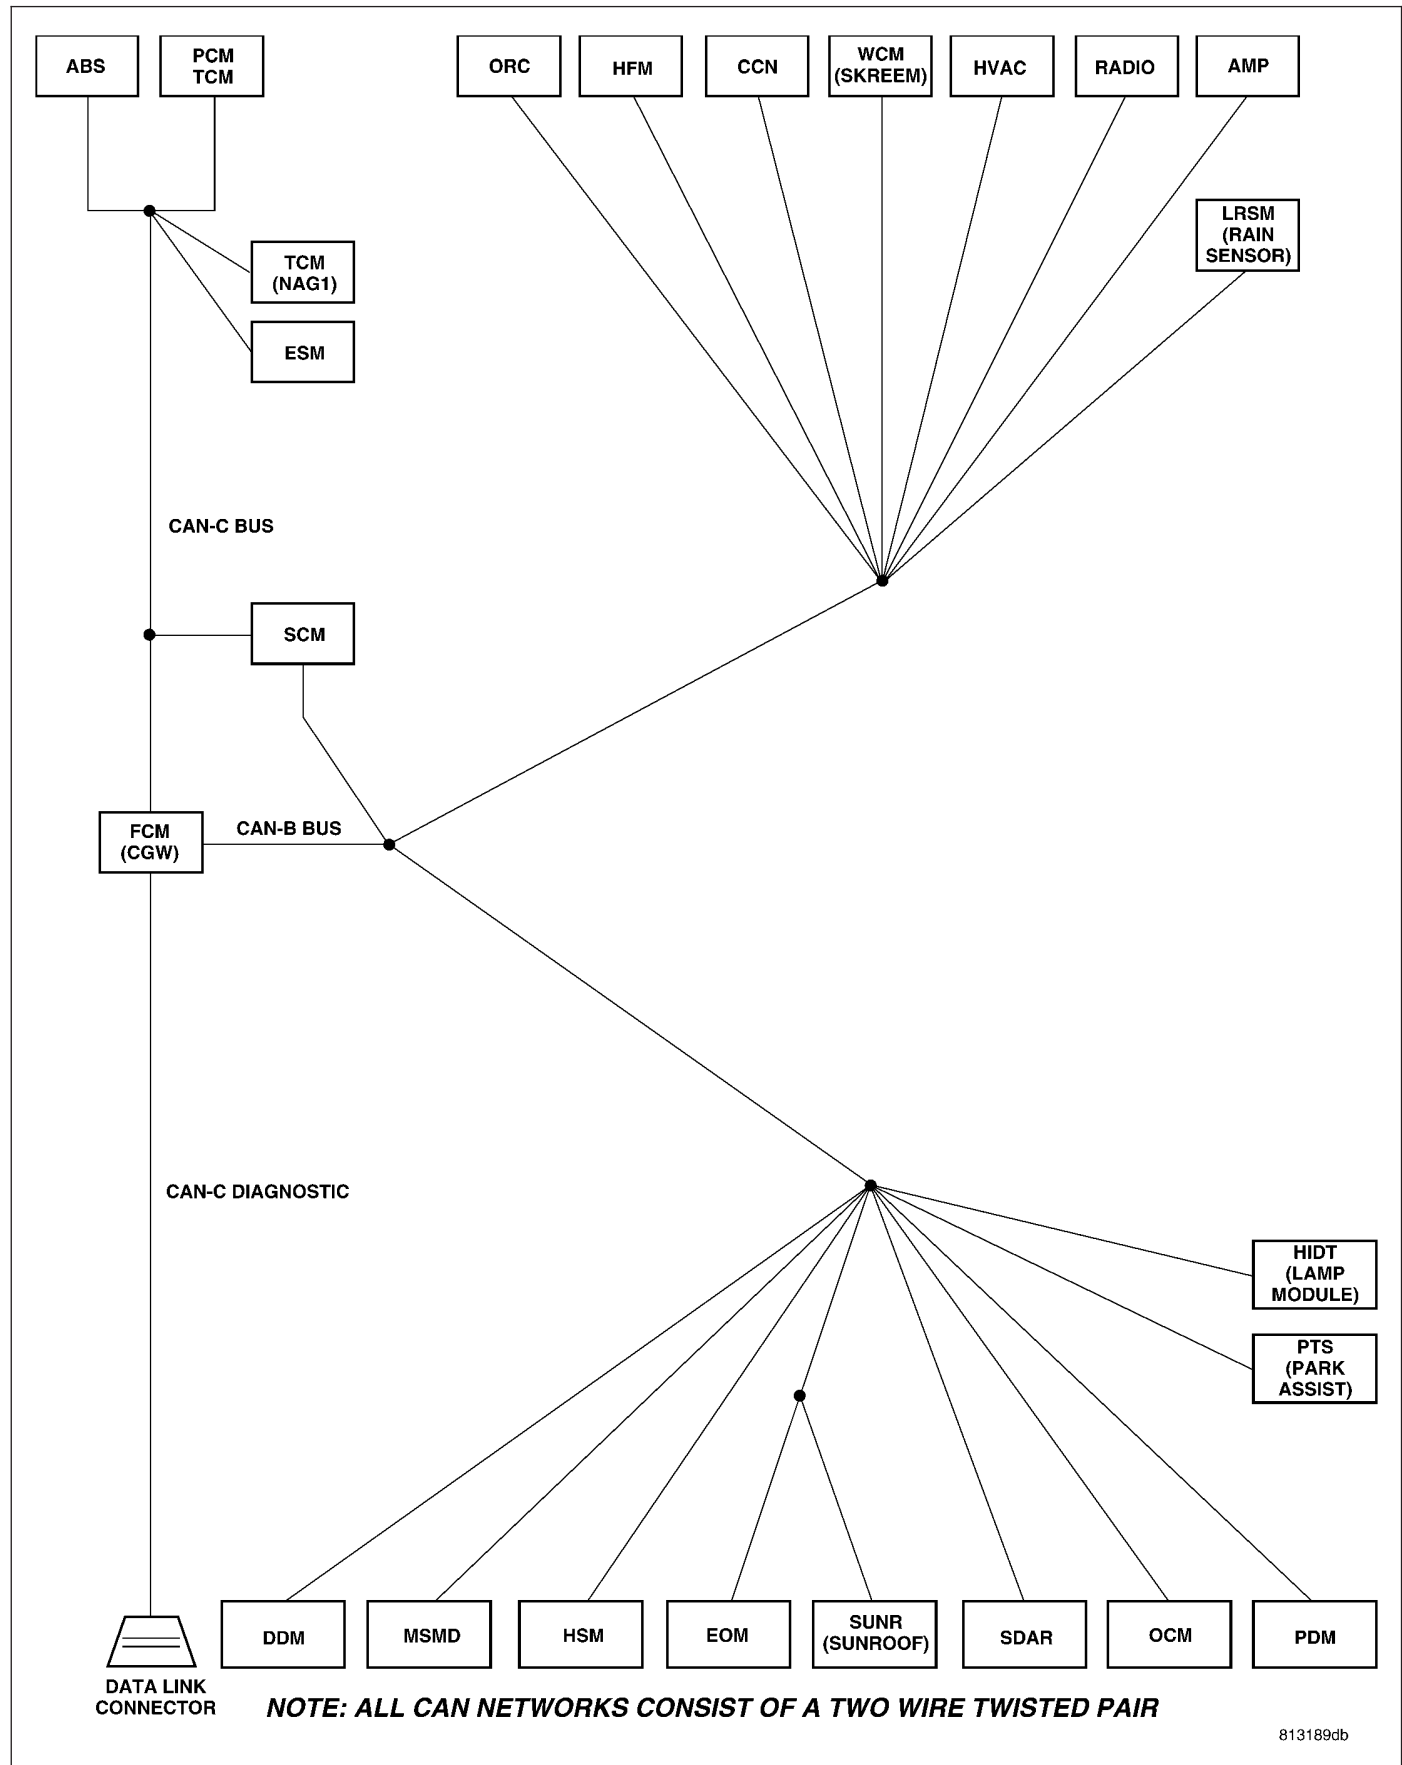

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the TCM?**

- Yes** >> Replace/update the TCM in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

## U0125-LOST COMMUNICATION WITH DYNAMICS SENSOR

**U0125-LOST COMMUNICATION WITH DYNAMICS SENSOR (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Dynamics Sensor for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY DYNAMICS SENSOR DYNAMICS SENSOR POWER AND GROUND MODULE THAT SET THIS DTC

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure.  
Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

**U0125-LOST COMMUNICATION WITH DYNAMICS SENSOR (CONTINUED)****2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

- Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 3

**3. VERIFY THAT THE DYANMICS SENSOR IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Dynamics Sensor is active on the bus.

**Is the Dynamics Sensor active on the bus?**

- Yes** >> Go To 4
- No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

**U0125-LOST COMMUNICATION WITH DYNAMICS SENSOR (CONTINUED)****4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

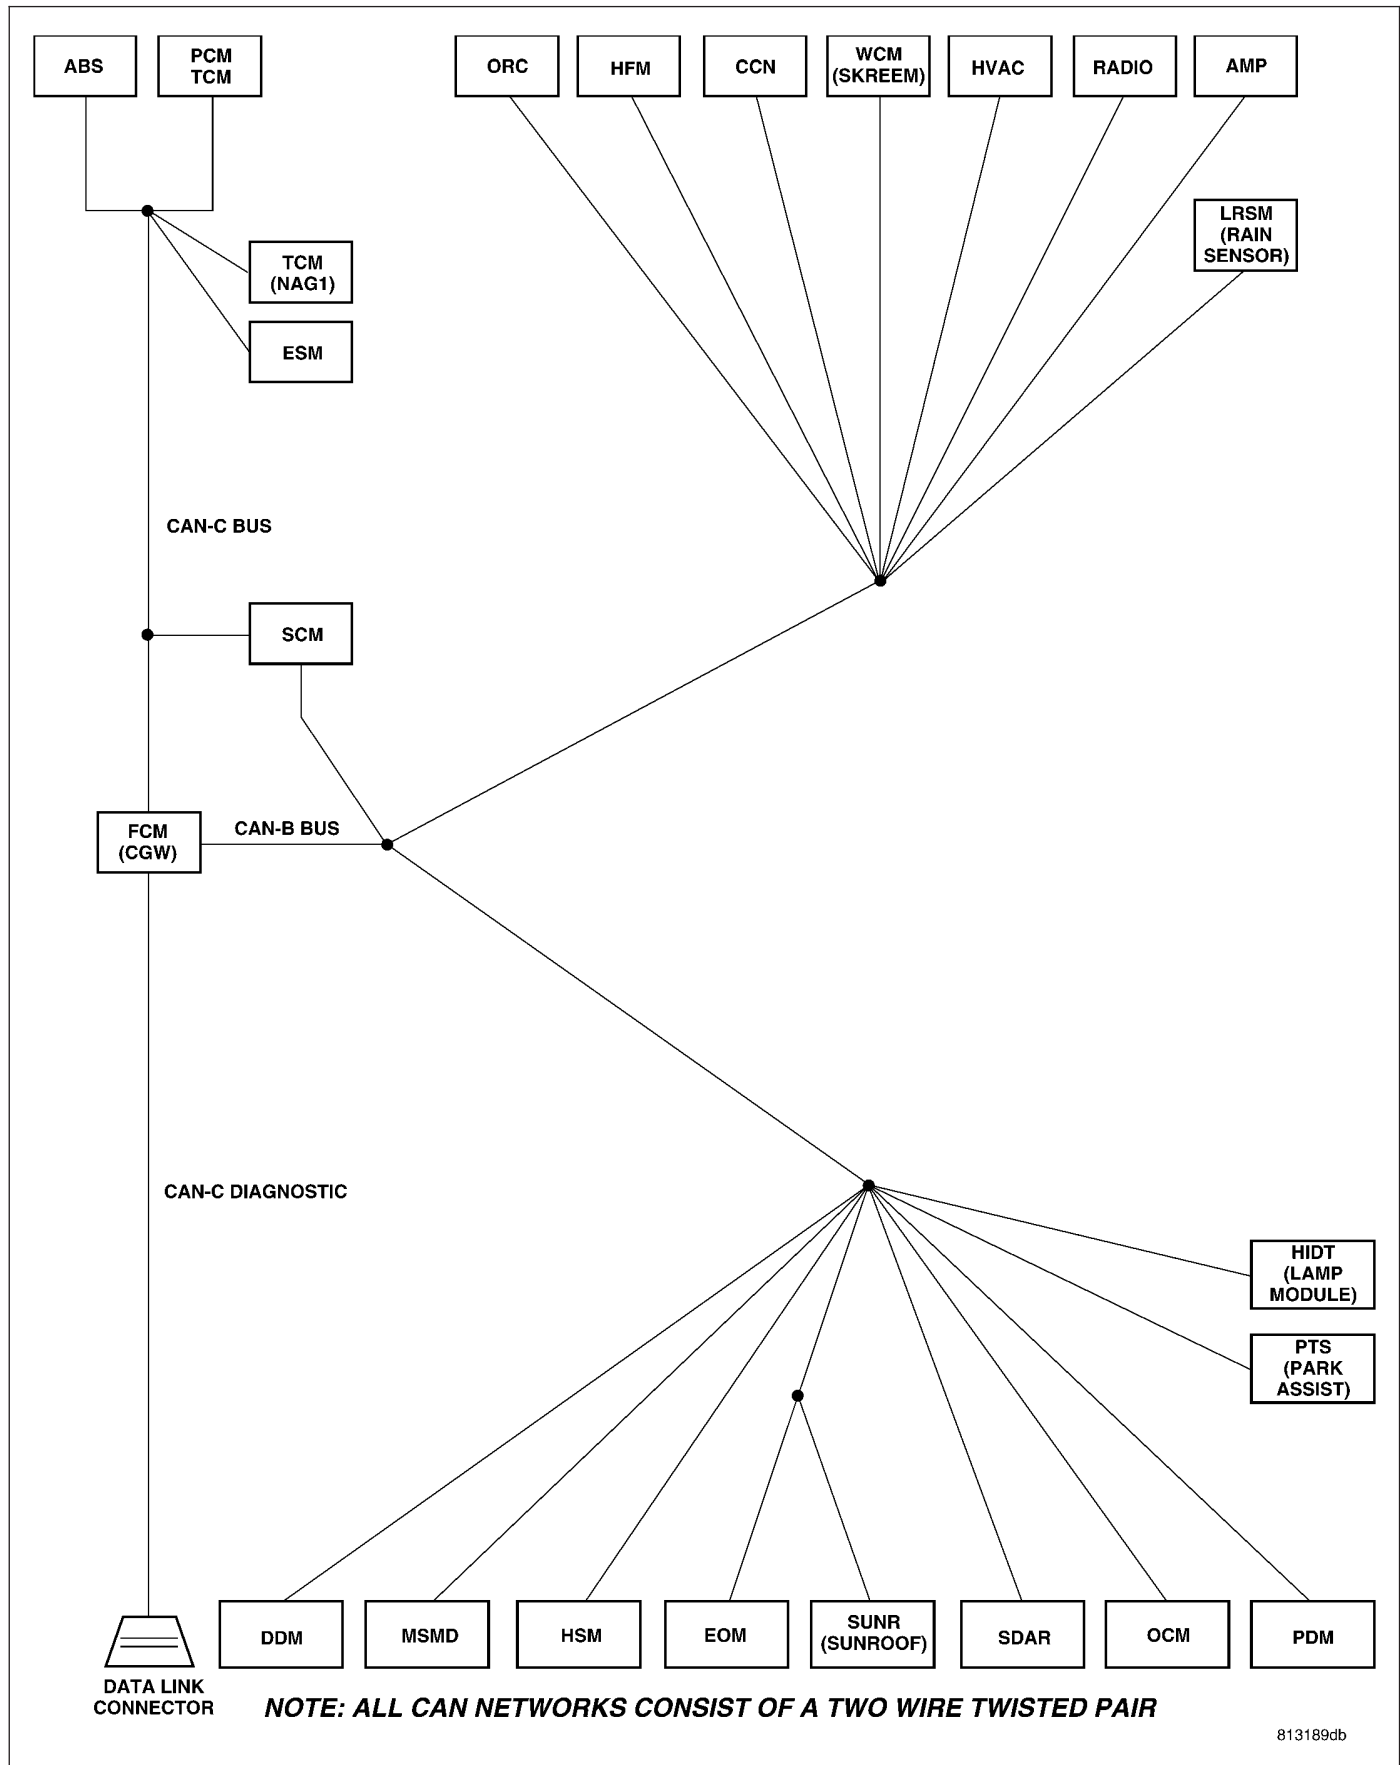

**Is there more than one module with active DTCs “Logged Against” the DYNAMICS SENSOR?**

- Yes** >> Replace/update the Dynamics Sensor in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

## U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR

**U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Steering Angle Sensor for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
STEERING ANGLE SENSOR
STEERING ANGLE SENSOR POWER AND GROUND
MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure.  
Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

**U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (CONTINUED)****2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCs**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

**3. VERIFY THAT THE STEERING ANGLE SENSOR IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Steering Angle Sensor is active on the bus.

**Is the Steering Angle Sensor active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

**U0126-LOST COMMUNICATION WITH STEERING ANGLE SENSOR (CONTINUED)****4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the STEERING ANGLE SENSOR?**

- Yes** >> Replace/update the Steering Angle Sensor in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE**

**U0141—LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Front Control Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
FRONT CONTROL MODULE
FRONT CONTROL MODULES POWER AND GROUND
MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure.  
Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

**U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)****2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCS from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCS.

**Does the scan tool display any active DTCS to the conditions listed above?**

- Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Go To 3

**3. VERIFY THAT THE FCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FCM is active on the bus.

**Is the FCM active on the bus?**

- Yes** >> Go To 4
- No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

**U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)****4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

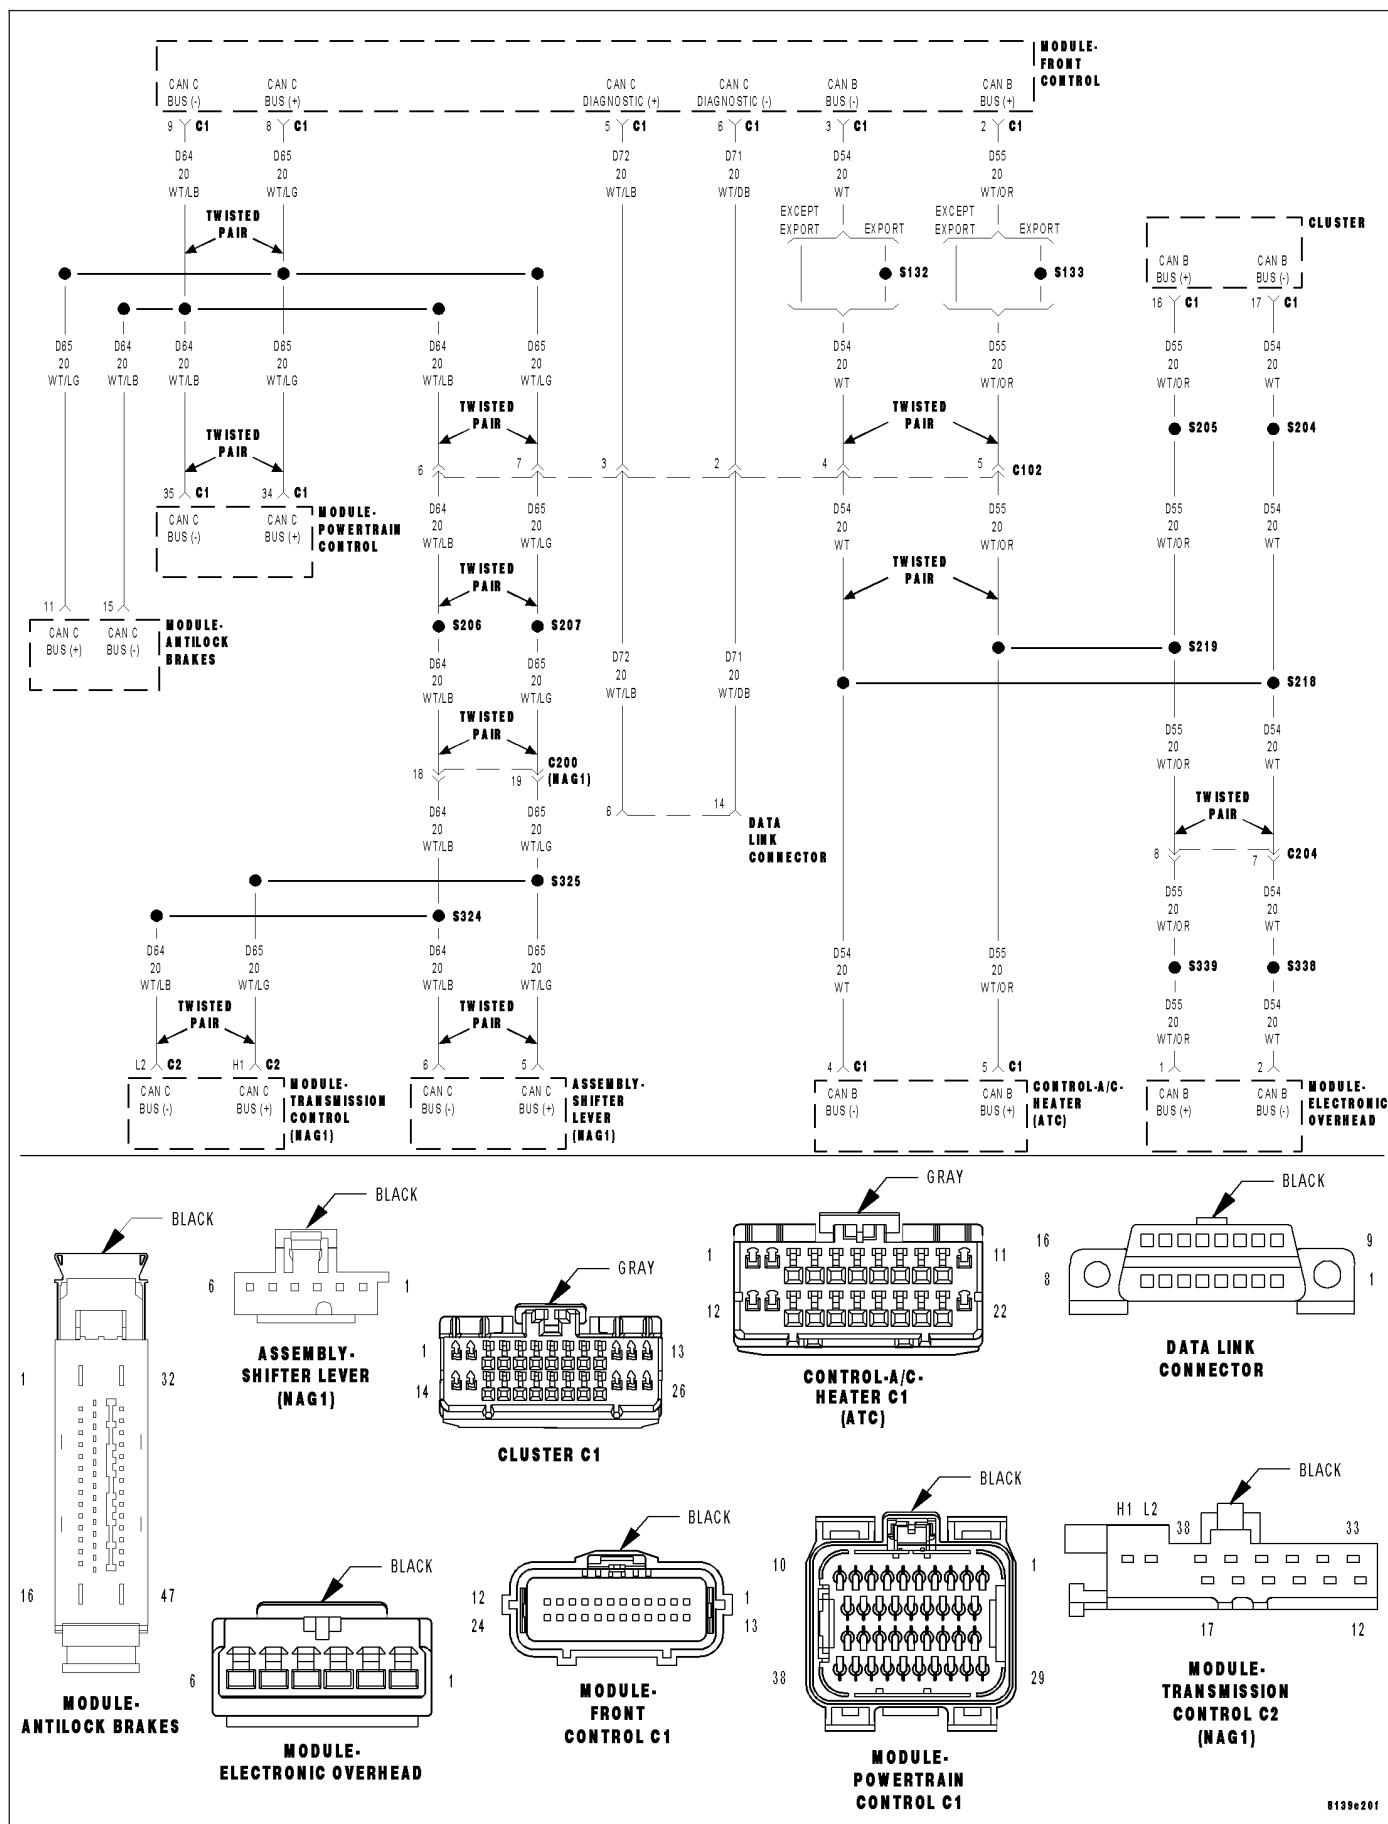

**Is there more than one module with active DTCs “Logged Against” the FCM?**

- Yes** >> Replace/update the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

## U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM

**U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM (CONTINUED)**

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**

Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.

- **Set Condition:**

When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Control Module (ECM).

Possible Causes
FCM CAN BUS DTCS
ENGINE DTCS
ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

**Are there any FCM CAN BUS DTC's present?**

**Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 2

**U0401-IMPLAUSIBLE DATA RECEIVED FROM ECM/PCM (CONTINUED)****2. CHECK IF ENGINE DTC'S ARE PRESENT**

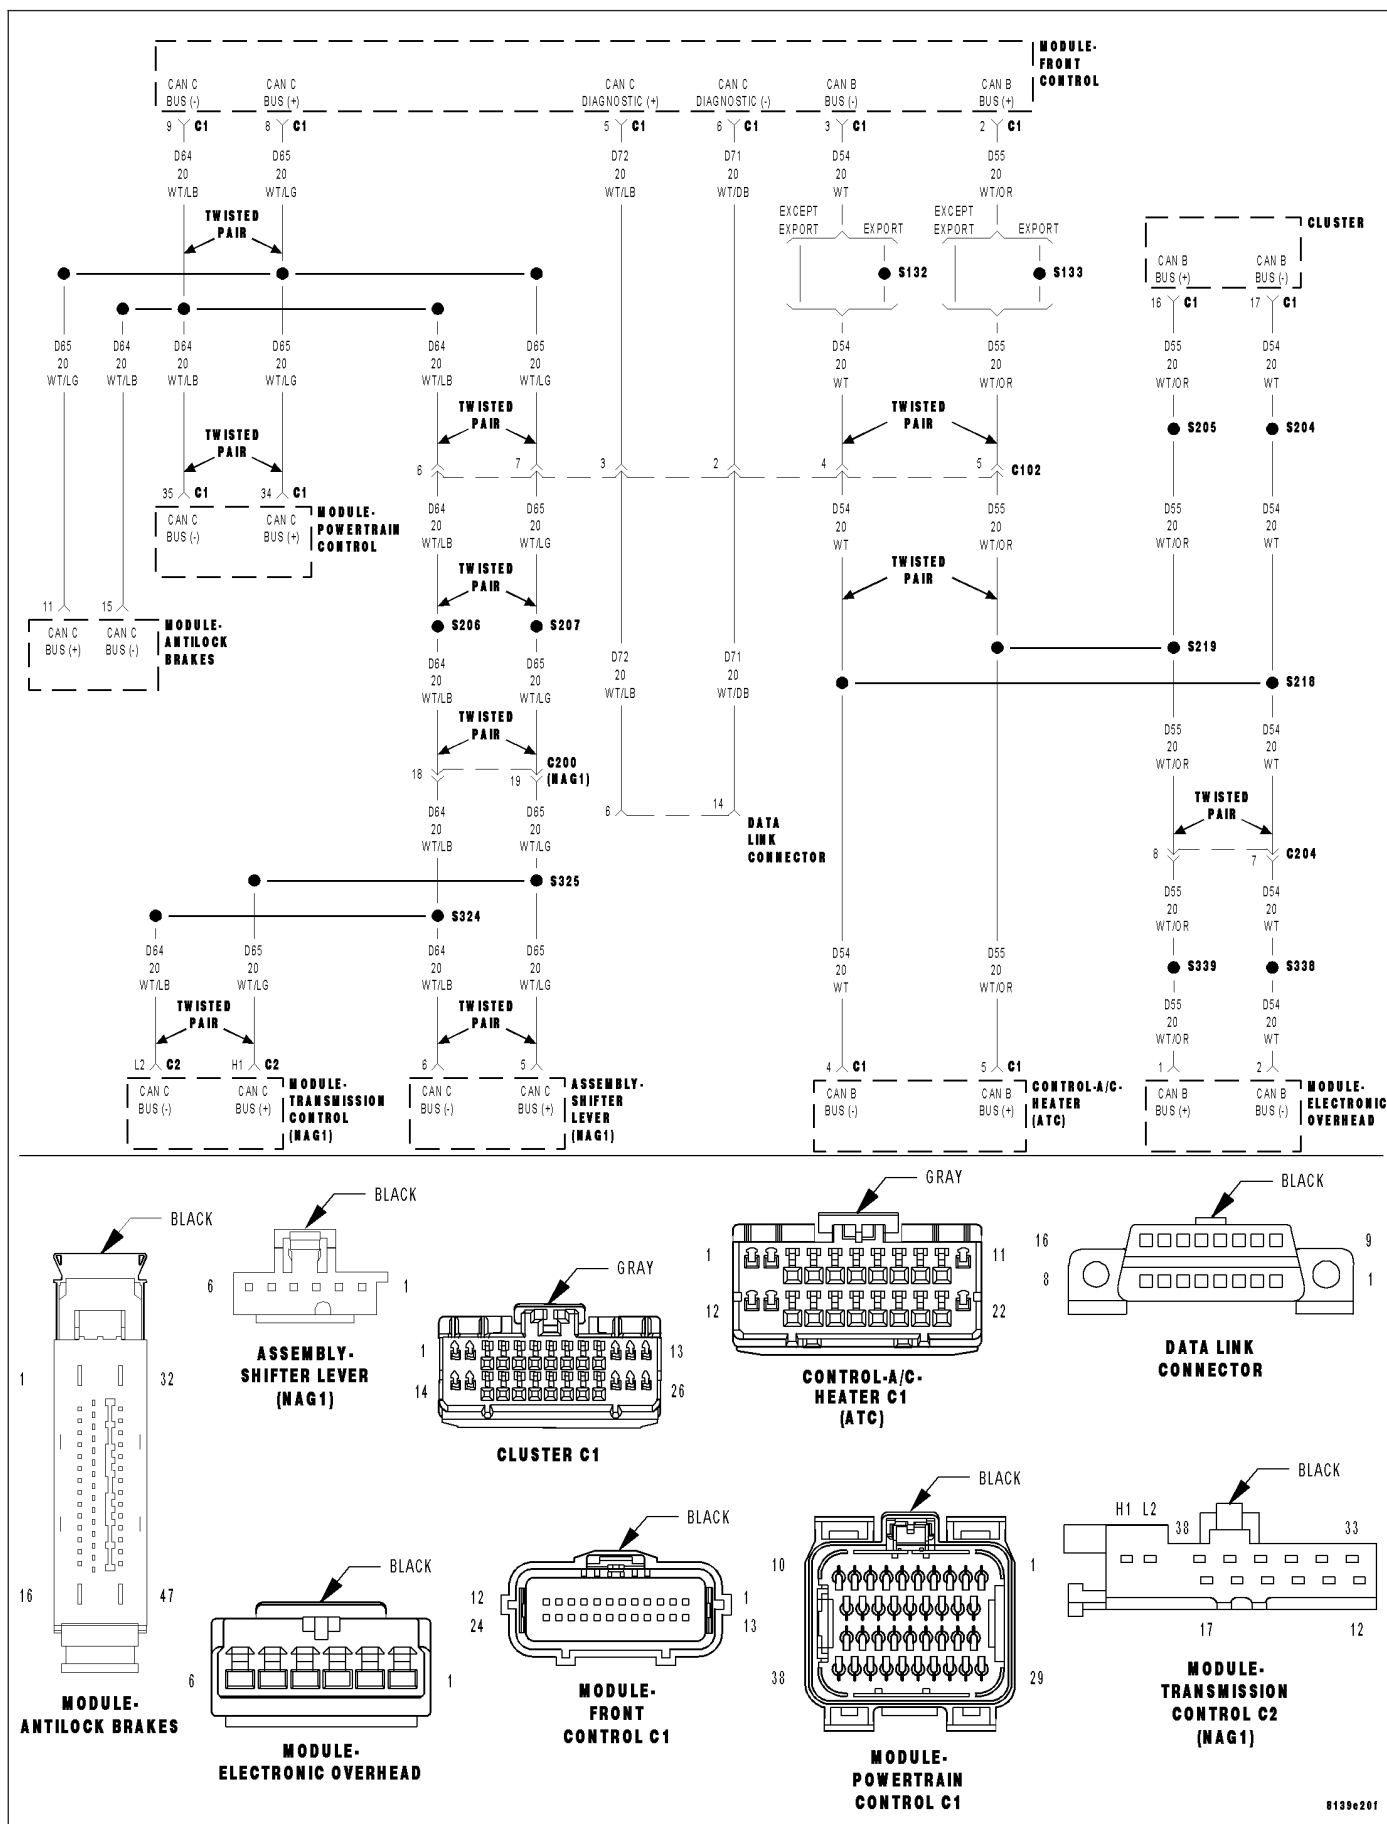

With the scan tool, read Engine DTCs.

**Are there any Engine DTC's present?**

- Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

# U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM

U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously with the ignition on, one valid CAN message received at least once, and no U0002-CAN C Bus Off Performance DTC present.
- **Set Condition:**  
When the Anti-Lock Brake Module detects an incorrect CAN message from the Transmission Control Module (TCM).

Possible Causes
FCM CAN BUS DTCS TRANSMISSION DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT

With the scan tool, read FCM DTCs.

- Are there any FCM CAN BUS DTC's present?**
- Yes**    >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.  
            Perform ABS VERIFICATION TEST - VER 1.
- No**      >> Go To 2

**U0402-IMPLAUSIBLE DATA RECEIVED FROM TCM (CONTINUED)****2. CHECK IF TRANSMISSION DTC'S ARE PRESENT**

With the scan tool, read Transmission DTCs.

**Are there any Transmission DTC's present?**

- Yes** >> Refer to the 21 - TRANSMISSION ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

The diagram illustrates the electrical connection between the **SENSOR-DYNAMICS (ESP)** and the **MODULE-ANTILOCK BRAKES**. The wiring is organized into two main sections, each enclosed in a dashed box.

**Top Section (Module-Antilock Brakes):**

- Left Side:** Labeled "DYNAMICS SENSOR LOW DATA LINK". It features a terminal labeled "25" connected to a wire labeled "D51 20 WT/BR".
- Right Side:** Labeled "DYNAMICS SENSOR HIGH DATA LINK". It features a terminal labeled "29" connected to a wire labeled "D52 20 WT/LB".

**Bottom Section (Sensor-Dynamics (ESP)):**

- Left Side:** Labeled "DYNAMICS SENSOR LOW DATA LINK". It features a terminal labeled "1" connected to a wire labeled "D51 20 WT/BR".
- Right Side:** Labeled "DYNAMICS SENSOR HIGH DATA LINK". It features a terminal labeled "2" connected to a wire labeled "D52 20 WT/LB".

**Central Connection:**

- A horizontal line connects the two sections, labeled "C104".
- On the left side of this line, there is a terminal labeled "22".
- On the right side of this line, there is a terminal labeled "23".

**Physical Views:**

- SENSOR-DYNAMICS (ESP):** A top-down view of the sensor module, showing a rectangular connector with multiple pins. A label "BLACK" points to the top edge of the connector. Pin numbers 1, 3, 4, and 6 are indicated.
- MODULE-ANTILOCK BRAKES:** A side view of the module, showing a vertical connector with multiple pins. A label "BLACK" points to the top edge of the connector. Pin numbers 1, 16, 32, and 47 are indicated.

**U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects too many CAN Bus off events.

Possible Causes
WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN DYNAMICS SENSOR

**Diagnostic Test****1. CHECK FOR A DTC U1003-ESP CAN C BUS PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: U1003-ESP CAN C BUS PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.  
Perform ABS VERIFICATION TEST - VER 1.

**U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Check the Dynamic Sensor installation and torque of the mounting bolts.

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D52) Dynamics Sensor High Datalink circuit for a short to voltage.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)****4. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D52) Dynamics Sensor High Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (D52) Dynamics Sensor High Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (D52) Dynamics Sensor High Datalink circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)****6. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**U1003-ESP CAN C BUS PERFORMANCE (CONTINUED)****8. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Connect a jumper wire between the (D51) Dynamics Sensor Low Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

U1004-CAN C BUS TRANSMIT PERFORMANCE

**U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)**

For the Anti-Lock Brake System circuit diagram.(Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects invalid CAN message from the Dynamics Sensor.

Possible Causes
<p>WIRING HARNESS, TERMINAL, CONNECTOR DAMAGE</p> <p>(D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN</p> <p>(D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT SHORTED TO GROUND, VOLTAGE, OR OPEN</p> <p>DYNAMICS SENSOR</p>

**Diagnostic Test****1. CHECK FOR A DTC U1004-CAN C BUS TRANSMIT PERFORMANCE**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: U1004-CAN C BUS TRANSMIT PERFORMANCE?**

**Yes** >> Go To 2

**No** >> Refer to the INTERMITTENT CONDITION diagnostic procedure.

Perform ABS VERIFICATION TEST - VER 1.

**U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)****2. CHECK THE WIRING HARNESS, TERMINALS, AND CONNECTORS**

Check the Dynamic Sensor installation and torque of the mounting bolts.

Visually inspect the related wiring harness. Look for any bruised, chafed, pierced, or partially broken wires.

Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D52) Dynamics Sensor High Datalink circuit for a short to voltage.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 4

**U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)****4. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D52) Dynamics Sensor High Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 5

**5. CHECK THE (D52) DYNAMICS SENSOR HIGH DATALINK CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Connect a jumper wire between the (D52) Dynamics Sensor High Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D52) Dynamics Sensor High Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 6

**No** >> Repair the (D52) Dynamics Sensor High Datalink circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)****6. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Using a 12-volt test light connected to 12-volts, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 8

**U1004-CAN C BUS TRANSMIT PERFORMANCE (CONTINUED)****8. CHECK THE (D51) DYNAMICS SENSOR LOW DATALINK CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Anti-Lock Brake Module harness connector.

Disconnect the Dynamics Sensor harness connector.

Turn the ignition on.

Connect a jumper wire between the (D51) Dynamics Sensor Low Datalink circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (D51) Dynamics Sensor Low Datalink circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Dynamics Sensor in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D51) Dynamics Sensor Low Datalink circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

## U140E-IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED

**U140E-IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED (CONTINUED)**

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects an incorrect CAN messages from the Engine Control Module (ECM).

Possible Causes
FCM CAN BUS DTCS ENGINE DTCS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

**Are there any FCM CAN BUS DTC's present?**

**Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 2

**U140E-IMPLAUSIBLE VEHICLE CONFIGURATION DATA RECEIVED (CONTINUED)****2. CHECK IF ENGINE DTC'S ARE PRESENT**

With the scan tool, read Engine DTCs.

**Are there any Engine DTC's present?**

- Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

# U1501-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM PCM

U1501-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM PCM (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects an incorrect CAN message from the Engine Control Module (ECM).

Possible Causes
FCM CAN BUS DTCS ENGINE DTCS ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT

With the scan tool, read FCM DTCs.

- Are there any FCM CAN BUS DTC's present?**
- Yes**    >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.  
            Perform ABS VERIFICATION TEST - VER 1.
- No**      >> Go To 2

**U1501-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM PCM (CONTINUED)****2. CHECK IF ENGINE DTC'S ARE PRESENT**

With the scan tool, read Engine DTCs.

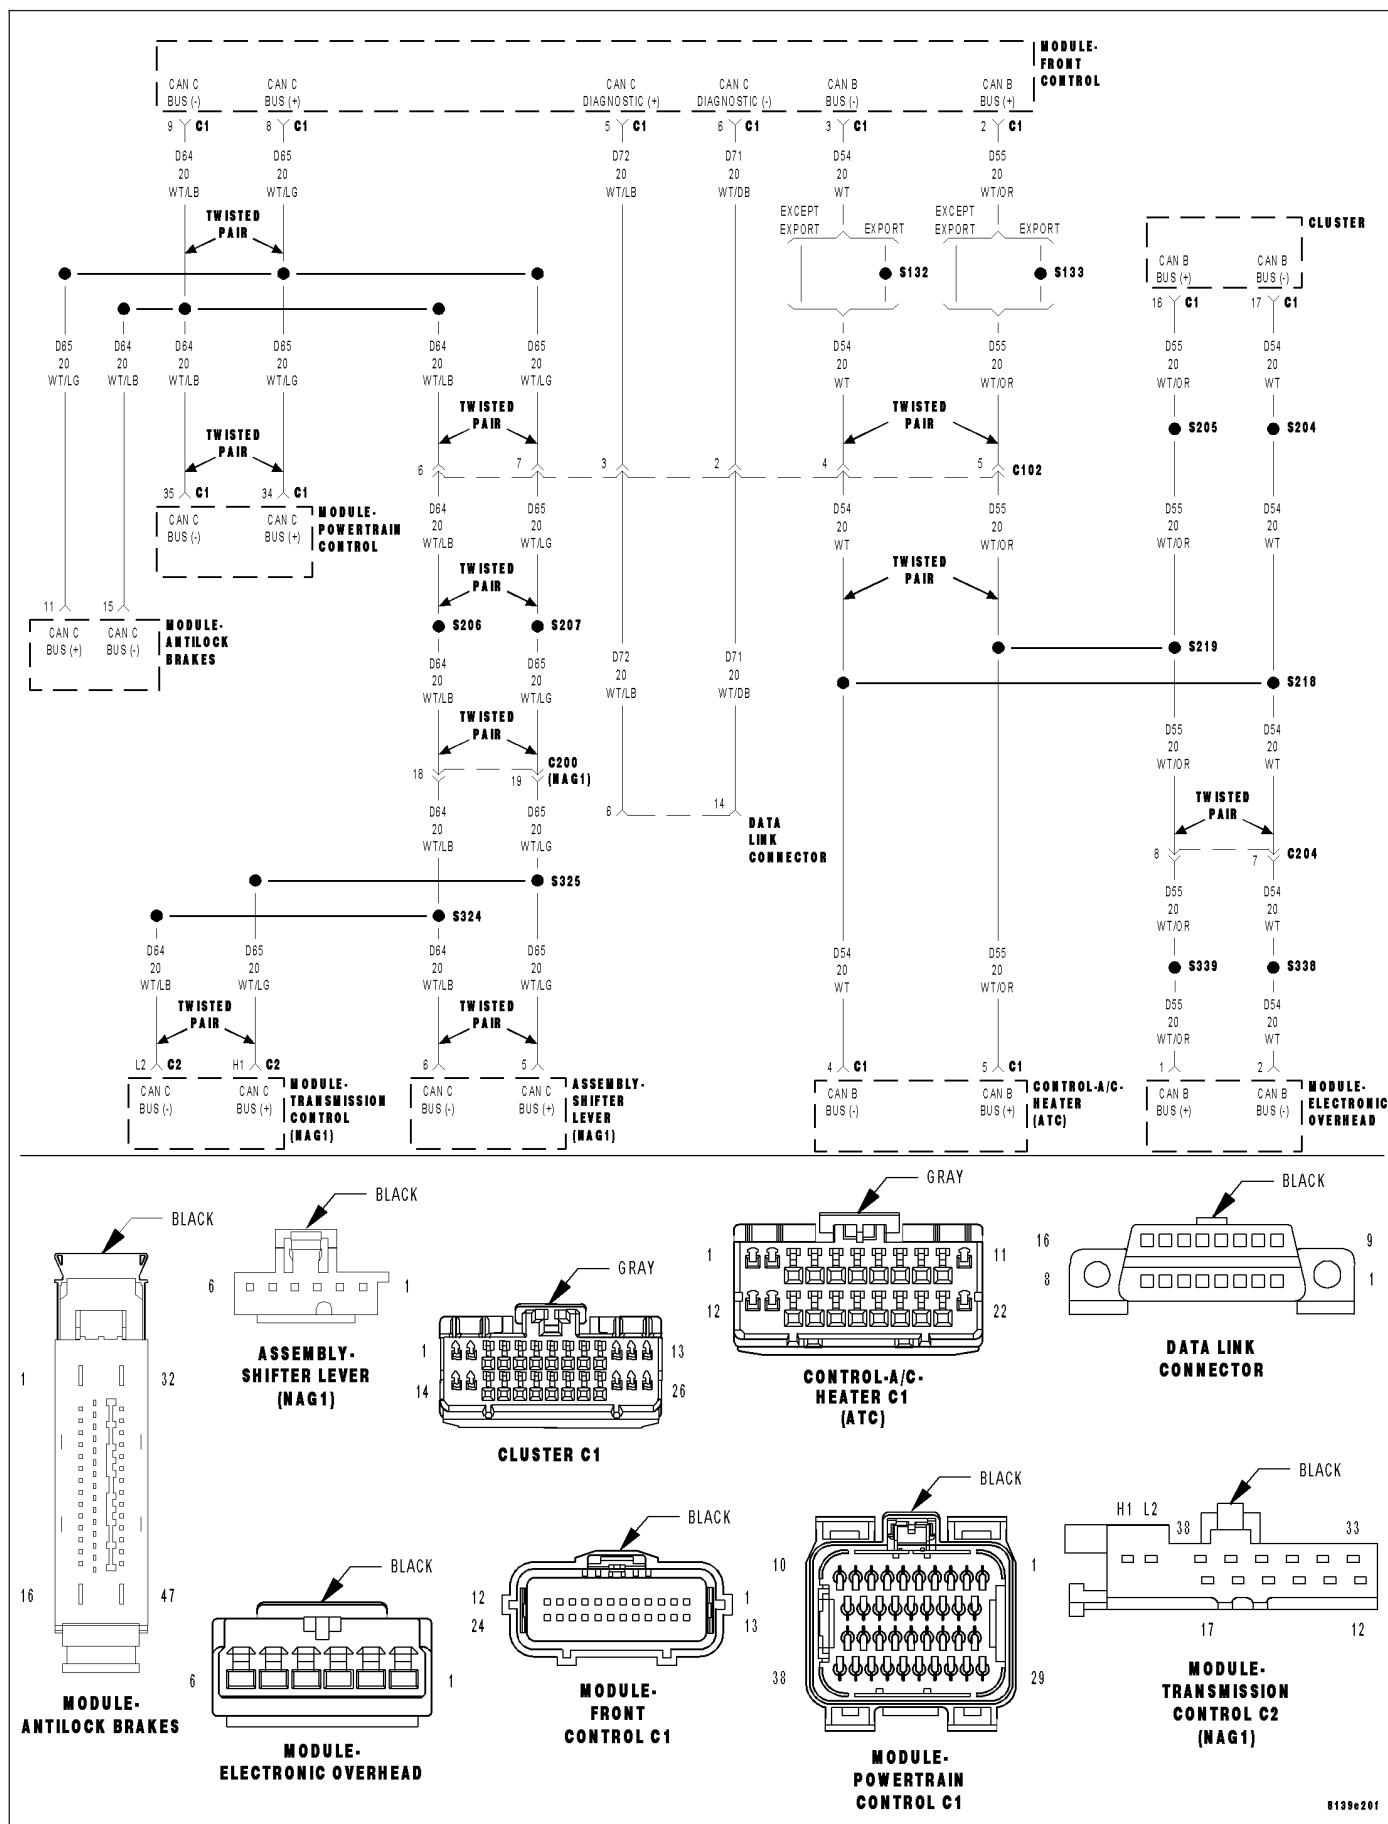

**Are there any Engine DTC's present?**

- Yes** >> Refer to the 9 - ENGINE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

## U1502-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM

**U1502-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM (CONTINUED)**

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects an incorrect CAN message from the Transmission Control Module (TCM).

Possible Causes
FCM CAN BUS DTCS TRANSMISSION DTCS ANTI-LOCK BRAKE MODULE

**Diagnostic Test****1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT**

With the scan tool, read FCM DTCs.

**Are there any FCM CAN BUS DTC's present?**

**Yes** >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 2

**U1502-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM TCM (CONTINUED)****2. CHECK IF TRANSMISSION DTC'S ARE PRESENT**

With the scan tool, read Transmission DTCs.

**Are there any Transmission DTC's present?**

- Yes** >> Refer to the 21 - TRANSMISSION ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

# U1503-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM

U1503-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM FCM (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects an incorrect CAN message from the Front Control Module (FCM).

Possible Causes
FCM CAN BUS DTCS
ANTI-LOCK BRAKE MODULE

Diagnostic Test

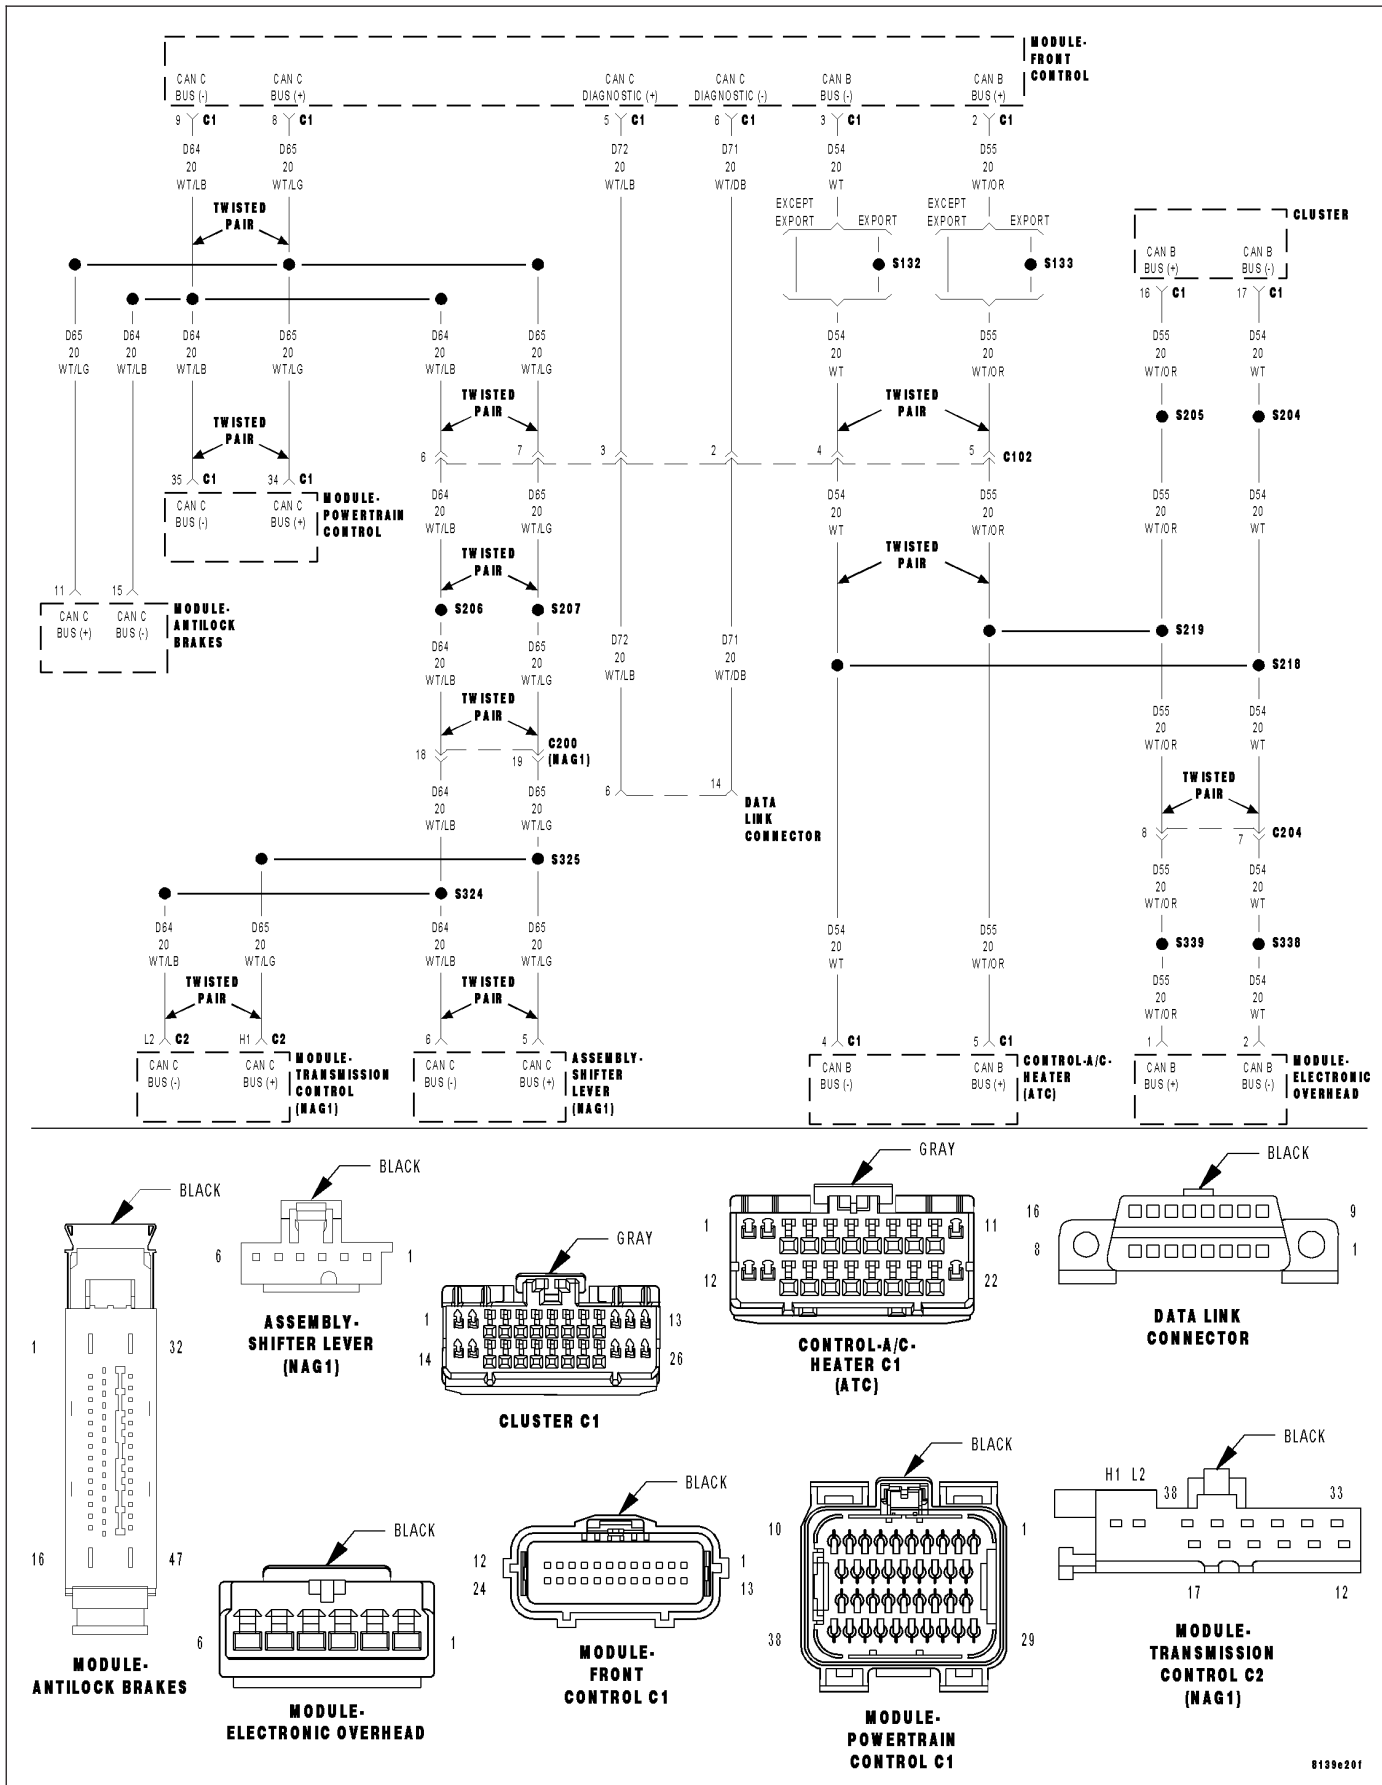

1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT

With the scan tool, read FCM DTCs.

- Are there any FCM CAN BUS DTC's present?**
- Yes**    >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.  
Perform ABS VERIFICATION TEST - VER 1.
- No**    >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

## U1504-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM STEERING ANGLE SENSOR

U1504-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM STEERING ANGLE SENSOR (CONTINUED)

For the Anti-Lock Brake System circuit diagram. (Refer to 5 - BRAKES - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
Continuously with the ignition on.
- **Set Condition:**  
When the Anti-Lock Brake Module detects an incorrect CAN message from the Steering Angle Sensor.

Possible Causes
FCM CAN BUS DTCS STEERING ANGLE SENSOR ANTI-LOCK BRAKE MODULE

Diagnostic Test

1. CHECK IF FCM CAN BUS DTC'S ARE PRESENT

With the scan tool, read FCM DTCs.

- Are there any FCM CAN BUS DTC's present?**
- Yes**    >> Refer to 8-ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING and diagnose the appropriate symptom.  
            Perform ABS VERIFICATION TEST - VER 1.
- No**      >> Go To 2

**U1504-IMPLAUSIBLE MESSAGE DATA LENGTH RECEIVED FROM STEERING ANGLE SENSOR (CONTINUED)****2. CHECK IF STEERING ANGLE SENSOR DTC'S ARE PRESENT**

With the scan tool, read Steering Angle Sensor DTCs.

**Are there any STEERING ANGLE SENSOR DTC's present?**

- Yes** >> Refer to the 5 - BRAKE ELECTRICAL DIAGNOSTICS and diagnose the appropriate symptom.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Using the schematics as a guide, check the Anti-Lock Brake Module pins, terminals, and connectors for corrosion, damage, or terminal push out. Pay particular attention to all power and ground circuits. If no problems are found, replace the Anti-Lock Brake Module per the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

## ABS VERIFICATION TEST — VER 1

### Diagnostic Test

1.

1. Turn the ignition off.
2. Connect all previously disconnected components and connectors.
3. Ensure all accessories are turned off and the battery is fully charged.

**Note:** If the vehicle is equipped with ESP (Electronic Stability Program) the Steering Angle Sensor must be calibrated anytime an ABS component or the battery is disconnected. To calibrate the Steering Angle Sensor, start the engine and center the steering wheel. Turn the steering wheel all the way to the left until it stops, turn the steering wheel all the way to the right until it stops and bring the steering wheel back to center.

4. Ensure that the ignition is on, and with the scan tool, erase all Diagnostic Trouble Codes from All modules. Start the engine and allow it to run for 2 minutes and fully operate the system that was malfunctioning.

**CAUTION:** Ensure braking capability is available before road testing.

5. Turn the ignition off and wait 5 seconds. Turn the ignition on and using the scan tool, read DTC's from all modules.
6. If any Diagnostic Trouble Codes are present, return to symptom list and trouble shoot new or recurring symptom.

**Note:** For Sensor Signal and Pump Motor faults, the CAB must sense all 4 wheels at 25 km/h (15 mph) before it will extinguish the ABS Indicator.

**CAUTION:** Ensure braking capability is available before road testing.

7. If there are no DTC's present after turning ignition on, road test the vehicle for at least 5 minutes. Perform several antilock braking stops.
8. Again, with the scan tool read DTC's. If any DTC's are present, return to Symptom list.
9. If there are no Diagnostic Trouble Codes (DTC's) present, and the customer's concern can no longer be duplicated, the repair is complete.

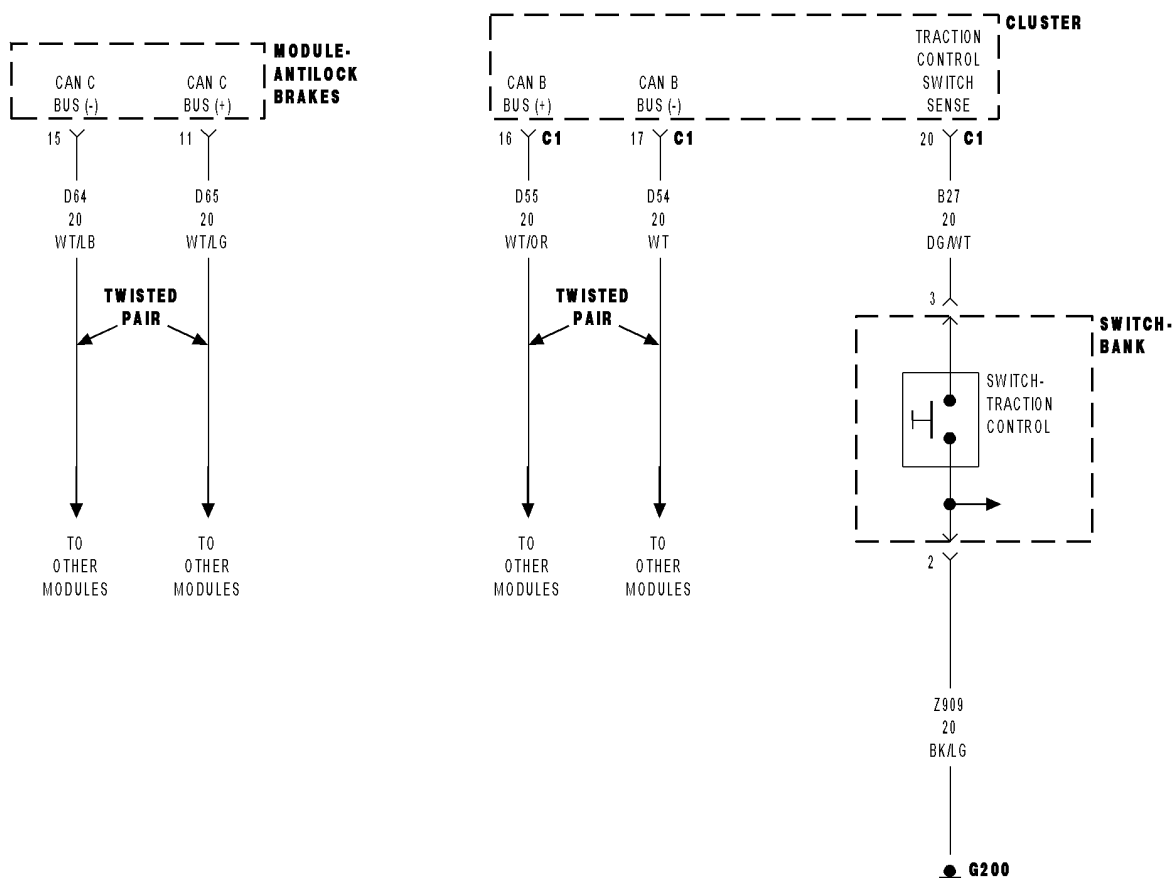

**Are any DTC's present or is the original concern still present?**

**Yes** >> Repair is not complete, refer to appropriate symptom.

**No** >> Repair is complete.

---

# C230D-TRAC/ESP OFF SWITCH INPUT CIRCUIT LOW

**C230D-TRAC/ESP OFF SWITCH INPUT CIRCUIT LOW (CONTINUED)**

For the Cluster/CCN circuit diagram. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - SCHEMATICS AND DIAGRAMS)

For a complete wiring diagram **Refer to Section 8W**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the CCN indicates that the Trac/ESP Switch is low for 30 seconds.

Possible Causes
STUCK CLOSED TRAC/ESP SWITCH (B27) TRACTION CONTROL SWITCH SENSE CIRCUIT SHORTED TO GROUND INSTRUMENT CLUSTER/CCN

**Diagnostic Test****1. CHECK FOR A DTC C230D-TRAC/ESP OFF SWITCH INPUT CIRCUIT LOW**

**Note:** If any of the following DTC's are present they must be repaired before continuing.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Turn the Trac/ESP Switch ON then OFF.

Wait for 30 seconds.

With the scan tool, read and record DTC's.

**Does the scan tool display: C230D-TRAC/ESP OFF SWITCH INPUT CIRCUIT LOW?**

**Yes**    >> Go To 2

**No**    >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform ABS VERIFICATION TEST - VER 1.

**C230D-TRAC/ESP OFF SWITCH INPUT CIRCUIT LOW (CONTINUED)****2. CHECK FOR A STUCK TRAC/ESP SWITCH**

Turn the ignition off.

Disconnect the Trac/ESP Switch harness connector.

Ensure the switch is in the OFF position.

Measure the internal resistance of the Trac/ESP Switch between the (B27) Traction Control Switch Sense circuit and (Z909) Ground circuit.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Trac/ESP switch in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. INSTRUMENT CLUSTER/CCN**

Turn the ignition off.

Disconnect the Trac/ESP Switch harness connector.

Disconnect the Instrument Cluster C1 harness connector.

Measure the resistance of the (B27) Traction Control Switch Sense circuit to ground.

**Is the resistance below 5.0 ohms?**

**Yes** >> Repair the (B27) Traction Control Switch Sense circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Replace the Instrument Cluster/CCN in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW**

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Front Control Module fails the Right Front WSS Signal circuit.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT FRONT WSS FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR A DTC C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform ABS VERIFICATION TEST - VER 1.

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Front Control Module C1 harness connector, WSS, WSS harness connector, and WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B6) RIGHT FRONT WSS SIGNAL AND THE (B7) RIGHT FRONT WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Measure the resistance between the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits at the Right Front WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits for a short together. Perform ABS VERIFICATION TEST - VER 1.

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit in the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)****6. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B7) Right Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Front Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)****8. CHECK THE (B7) RIGHT FRONT WSS SUPPLY AND THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)****10. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B6) Right Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Front Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)****12. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Right Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Right Front WSS in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**C1017-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT LOW (CONTINUED)****14. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE FRONT CONTROL MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Front Control Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

- Yes** >> Replace the Front Control Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B6) Right Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

## C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH

C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Front Control Module fails the Right Front WSS Signal circuit.

Possible Causes
TERMINAL/CONNECTOR/TONE WHEEL DAMAGE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT AND (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TOGETHER (B7) RIGHT FRONT WSS SUPPLY CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN (B6) RIGHT FRONT WSS SIGNAL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN RIGHT FRONT WSS FRONT CONTROL MODULE

Diagnostic Test

1. CHECK FOR A DTC C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform ABS VERIFICATION TEST - VER 1.

**C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS/TONE WHEEL FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

**Note:** Check the tone wheel teeth for missing teeth, cracks, or looseness. Teeth should be perfectly square, not bent, or nicked. Turn the ignition off.

Visually inspect the Front Control Module C1 harness connector, WSS, WSS harness connector, and WSS tone wheel (if applicable) for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. CHECK THE (B6) RIGHT FRONT WSS SIGNAL AND THE (B7) RIGHT FRONT WSS SUPPLY CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Measure the resistance between the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits at the Right Front WSS harness connector.

**Is the resistance above 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (B6) Right Front WSS Signal and the (B7) Right Front WSS Supply circuits for a short together.  
Perform ABS VERIFICATION TEST - VER 1.

**C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)****4. CHECK THE VOLTAGE ON THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT**

Turn the ignition off.

Reconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage of the (B7) Right Front WSS Supply circuit in the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 8

**No** >> Go To 5

**5. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)****6. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B7) Right Front WSS Supply circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (B7) RIGHT FRONT WSS SUPPLY CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B7) Right Front WSS Supply circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B7) Right Front WSS Supply circuit.

**Does the test light illuminate brightly**

**Yes** >> Replace the Front Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B7) Right Front WSS Supply circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)****8. CHECK THE (B7) RIGHT FRONT WSS SUPPLY AND THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE**

Turn the ignition off.

Disconnect the Right Front WSS harness connector.

Turn the ignition on.

Measure the voltage between the (B7) Right Front WSS Supply and (B6) Right Front WSS Signal circuits at the Right Front WSS harness connector.

**Is the voltage above 10 volts?**

**Yes** >> Go To 12

**No** >> Go To 9

**9. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 10

**C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)****10. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to ground, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to voltage.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Connect a jumper wire between the (B6) Right Front WSS Signal circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Front Control Module in accordance with the Service Information.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (B6) Right Front WSS Signal circuit for an open.

Perform ABS VERIFICATION TEST - VER 1.

**C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)****12. CHECK THE (B6) RIGHT FRONT WSS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Disconnect the Right Front WSS harness connector.

Using a 12-volt test light connected to 12-volts, check the (B6) Right Front WSS Signal circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (B6) Right Front WSS Signal circuit for a short to ground.

Perform ABS VERIFICATION TEST - VER 1.

**No** >> Go To 13

**13. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE RIGHT FRONT WSS HARNESS CONNECTOR**

Turn the ignition off.

Reconnect all connectors.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Right Front WSS harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

**Yes** >> Go To 14

**No** >> Replace the Right Front WSS in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.

**C1018-RIGHT FRONT WHEEL SPEED SENSOR CIRCUIT HIGH (CONTINUED)****14. CHECK THE (B6) RIGHT FRONT WSS SIGNAL VOLTAGE AT THE FRONT CONTROL MODULE HARNESS CONNECTOR**

Turn the ignition off.

Turn the ignition on.

While back probing, measure between the (B6) Right Front WSS Signal circuit and chassis ground at the Front Control Module harness connector.

Slowly rotate the wheel by hand.

**Did the (B6) Right Front WSS Signal circuit voltage toggle between approximately 1.6 to .8 volts?**

- Yes** >> Replace the Front Control Module in accordance with the Service Information.  
Perform ABS VERIFICATION TEST - VER 1.
- No** >> Repair the (B6) Right Front WSS Signal circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW**

**B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Front Control Module fails the Adjustable Pedal Inhibit Relay circuit.

Possible Causes
TERMINAL/CONNECTOR DAMAGE ADJUSTABLE PEDALS RELAY (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN FRONT CONTROL MODULE INTEGRATED POWER MODULE

**Diagnostic Test****1. CHECK FOR A DTC B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform APS VERIFICATION TEST - VER 1.

**B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Visually inspect the wiring for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. SWAP OUT THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Install a substitute relay in place of the Adjustable Pedals Relay.

Turn the ignition on.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?**

**Yes** >> Go To 4

**No** >> Replace the Adjustable Pedals Relay in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

**B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW (CONTINUED)****4. CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUIT FOR THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Remove the Adjustable Pedals Relay from the IPM.

Measure the voltage of the internal Fused B(+) circuit at the IPM.

**Is the voltage above 10 volts?**

**Yes** >> Go To 5

**No** >> Replace the IPM in accordance with the Service Information.

Perform APS VERIFICATION TEST - VER 1.

**5. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Using a 12-volt test light connected to 12-volts, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (P201) Adjustable Pedals Relay Control circuit for a short to ground.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW (CONTINUED)****6. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (P201) Adjustable Pedals Relay Control circuit for a short to voltage.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Connect a jumper wire between the (P201) Adjustable Pedals Relay Control circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Front Control Module in accordance with the Service Information.

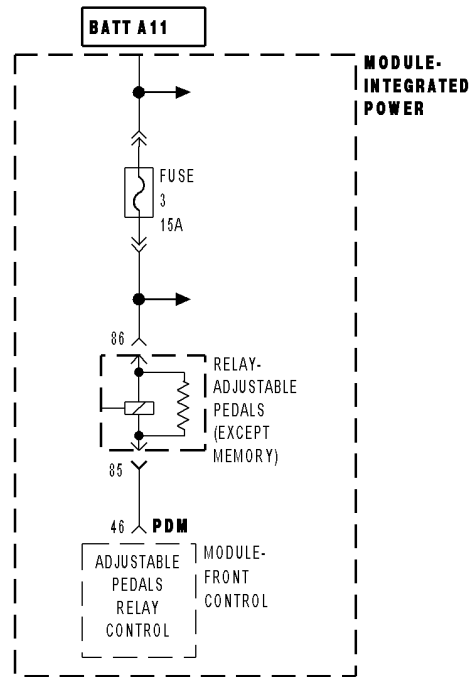

Perform APS VERIFICATION TEST - VER 1.

**No** >> Repair the (P201) Adjustable Pedals Relay Control circuit for an open.

Perform APS VERIFICATION TEST - VER 1.

## B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH

**B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Front Control Module fails the Adjustable Pedal Inhibit Relay circuit.

Possible Causes
TERMINAL/CONNECTOR DAMAGE ADJUSTABLE PEDALS RELAY (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN FRONT CONTROL MODULE INTEGRATED POWER MODULE

**Diagnostic Test**

**1. CHECK FOR A DTC B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH**

**Note:** This DTC must be active for the results of this test to be valid.

- Turn the ignition on.
- With the scan tool, read and record DTC's.
- With the scan tool, read and record Freeze Fame information.
- With the scan tool, erase DTC's.
- Cycle the ignition switch from off to on.
- With the scan tool, read and record DTC's

**Does the scan tool display: B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH?**

- Yes

>> Go To 2
- No

>> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform APS VERIFICATION TEST - VER 1.

**B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Visually inspect the wiring for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. SWAP OUT THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Install a substitute relay in place of the Adjustable Pedals Relay.

Turn the ignition on.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?**

**Yes** >> Go To 4

**No** >> Replace the Adjustable Pedals Relay in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

**B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH (CONTINUED)****4. CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUIT FOR THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Remove the Adjustable Pedals Relay from the IPM.

Measure the voltage of the internal Fused B(+) circuit at the IPM.

**Is the voltage above 10 volts?**

**Yes** >> Go To 5

**No** >> Replace the IPM in accordance with the Service Information.

Perform APS VERIFICATION TEST - VER 1.

**5. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Using a 12-volt test light connected to 12-volts, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (P201) Adjustable Pedals Relay Control circuit for a short to ground.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**B1D50-ADJUSTABLE PEDAL INHIBIT CIRCUIT HIGH (CONTINUED)****6. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (P201) Adjustable Pedals Relay Control circuit for a short to voltage.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Connect a jumper wire between the (P201) Adjustable Pedals Relay Control circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Replace the Front Control Module in accordance with the Service Information.

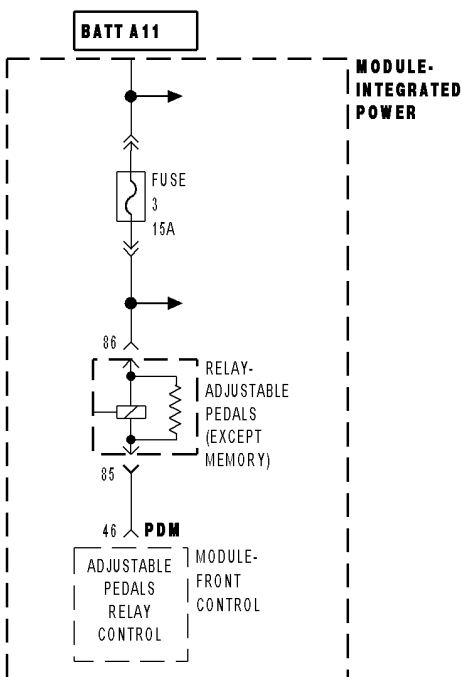

Perform APS VERIFICATION TEST - VER 1.

**No** >> Repair the (P201) Adjustable Pedals Relay Control circuit for an open.

Perform APS VERIFICATION TEST - VER 1.

**B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN**

**B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
When the Front Control Module fails the Adjustable Pedal Inhibit Relay circuit.

Possible Causes
TERMINAL/CONNECTOR DAMAGE ADJUSTABLE PEDALS RELAY (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE, GROUND, OR OPEN FRONT CONTROL MODULE INTEGRATED POWER MODULE

**Diagnostic Test****1. CHECK FOR A DTC B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN**

**Note:** This DTC must be active for the results of this test to be valid.

Turn the ignition on.

With the scan tool, read and record DTC's.

With the scan tool, read and record Freeze Frame information.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform APS VERIFICATION TEST - VER 1.

**B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN (CONTINUED)****2. CHECK THE TERMINALS/CONNECTORS FOR DAMAGE**

**Note:** Check all related wiring for bruised, chafed, pierced, or partially broken wires.

**Note:** Check all related connectors for broken, bent, pushed out, or corroded terminals.

Turn the ignition off.

Visually inspect the wiring for damage.

**Were any problems found?**

**Yes** >> Repair as necessary.  
Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 3

**3. SWAP OUT THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Install a substitute relay in place of the Adjustable Pedals Relay.

Turn the ignition on.

With the scan tool, erase DTC's.

Cycle the ignition switch from off to on.

With the scan tool, read and record DTC's

**Does the scan tool display: B1D4F-ADJUSTABLE PEDAL INHIBIT CIRCUIT LOW?**

**Yes** >> Go To 4

**No** >> Replace the Adjustable Pedals Relay in accordance with the Service Information.  
Perform APS VERIFICATION TEST - VER 1.

**B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN (CONTINUED)****4. CHECK THE VOLTAGE ON THE FUSED B(+) CIRCUIT FOR THE ADJUSTABLE PEDALS RELAY**

Turn the ignition off.

Remove the Adjustable Pedals Relay from the IPM.

Measure the voltage of the internal Fused B(+) circuit at the IPM.

**Is the voltage above 10 volts?**

**Yes** >> Go To 5

**No** >> Replace the IPM in accordance with the Service Information.

Perform APS VERIFICATION TEST - VER 1.

**5. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Using a 12-volt test light connected to 12-volts, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (P201) Adjustable Pedals Relay Control circuit for a short to ground.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 6

**B1D51-ADJUSTABLE PEDAL INHIBIT CIRCUIT OPEN (CONTINUED)****6. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly?**

**Yes** >> Repair the (P201) Adjustable Pedals Relay Control circuit for a short to voltage.

Perform APS VERIFICATION TEST - VER 1.

**No** >> Go To 7

**7. CHECK THE (P201) ADJUSTABLE PEDALS RELAY CONTROL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Front Control Module harness connector.

Remove the Adjustable Pedals Relay from the IPM.

Connect a jumper wire between the (P201) Adjustable Pedals Relay Control circuit and ground.

Using a 12-volt test light connected to 12-volts, check the (P201) Adjustable Pedals Relay Control circuit.

**Does the test light illuminate brightly**

**Yes** >> Replace the Front Control Module in accordance with the Service Information.

Perform APS VERIFICATION TEST - VER 1.

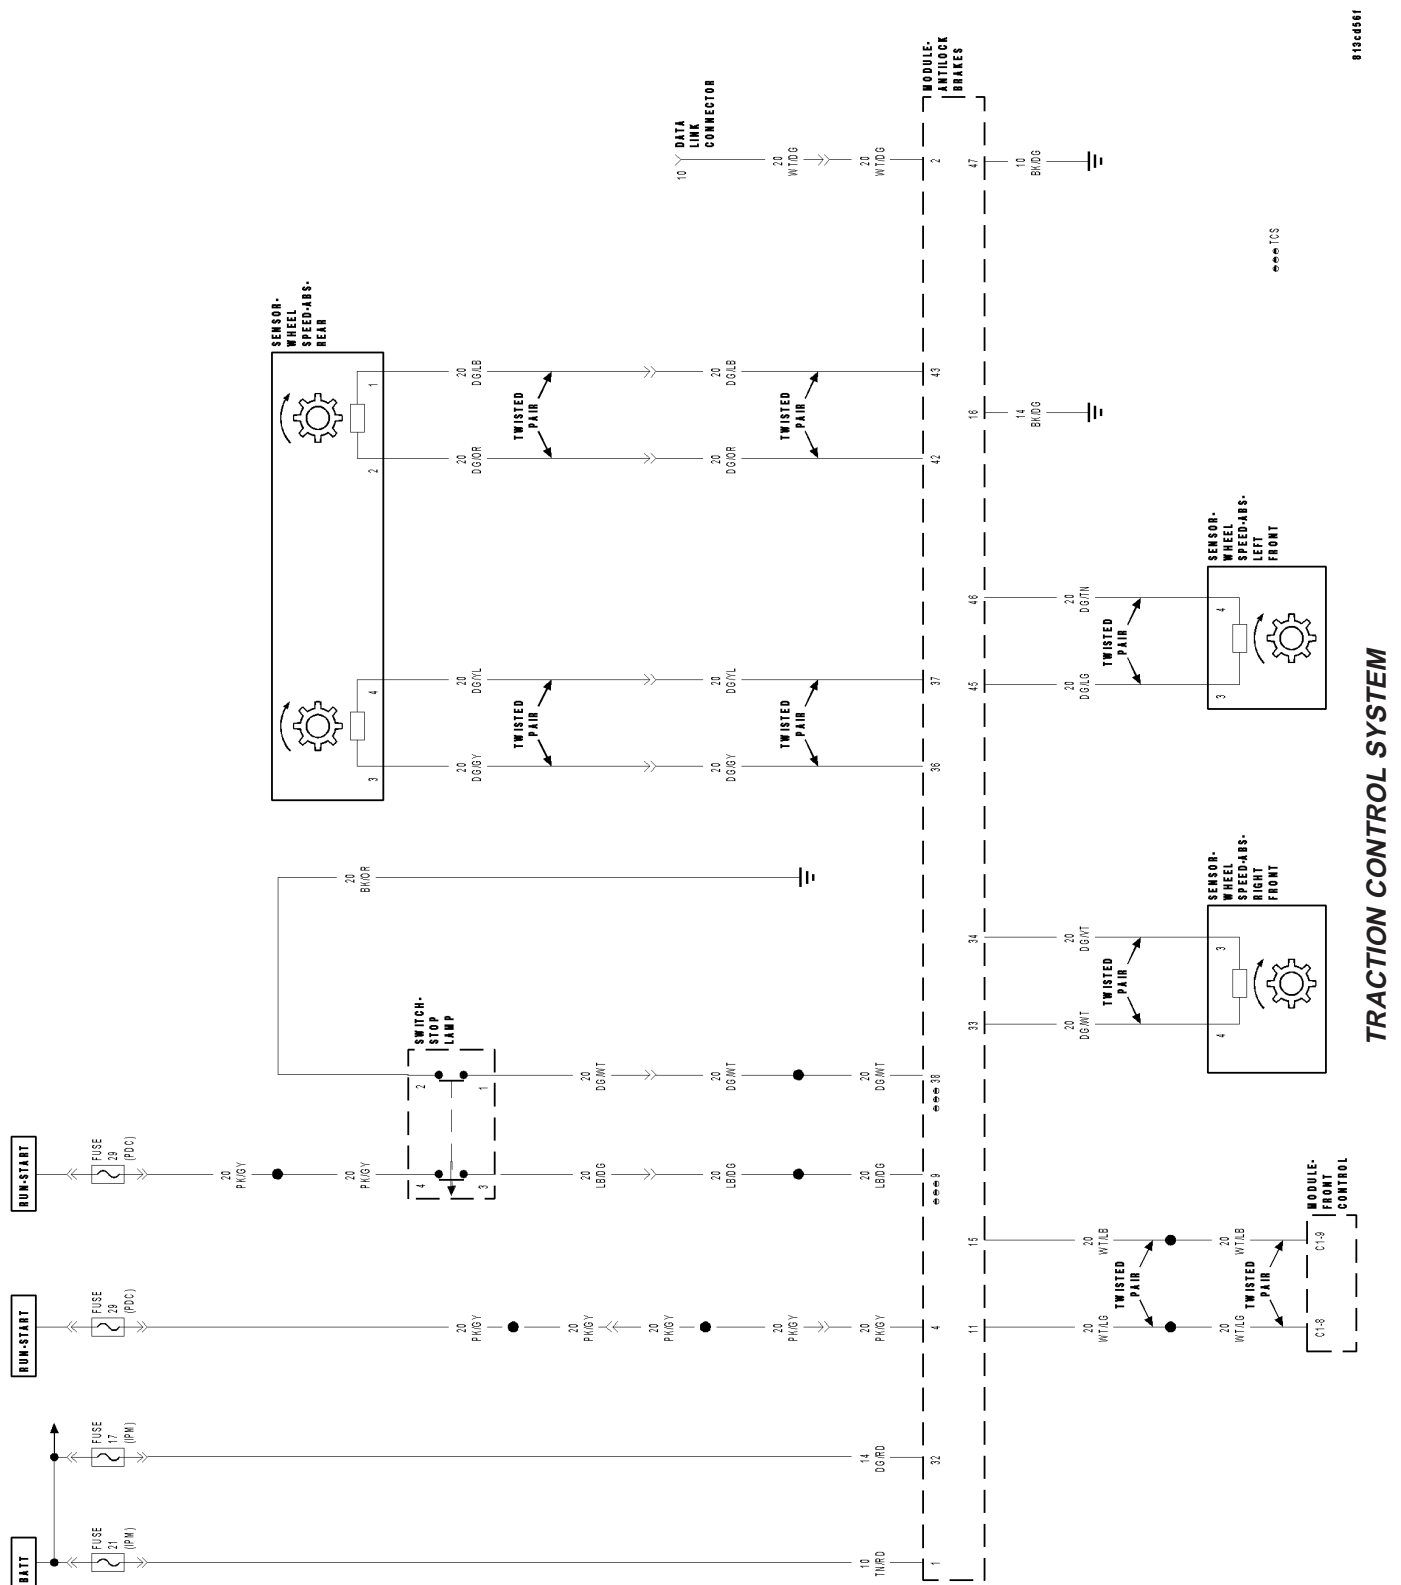

**No** >> Repair the (P201) Adjustable Pedals Relay Control circuit for an open.

Perform APS VERIFICATION TEST - VER 1.

## BRAKES - ABS - SERVICE INFORMATION

### DESCRIPTION

#### ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL

This vehicle uses the MK25 Antilock braking system (ABS). This system, a combined ABS and Traction Control system is standard on some vehicles and optional on others.

This antilock brake system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Includes Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (3)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)

81118725

### ABS

The purpose of the antilock brake system (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

#### ALL-SPEED TRACTION CONTROL

The traction control system is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. Depending on how slippery, an automatically activated Winter Mode feature will select lower transmission up-shift speeds. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

With rear-wheel drive, All-Speed Traction Control is effective up to 85 mph (137 km/h); with AWD, All-Speed Traction Control is effective up to 45 mph (72 km/h), which is common among competitive AWD vehicles with traction control.

### ELECTRONIC STABILITY PROGRAM

ESP® (Electronic Stability Program), which includes a Brake Assist feature, is standard on some models and optional on others. ESP aids the driver in maintaining vehicle directional stability. ESP will do whatever can be done, within the limits of available traction, to keep the car on course.

ESP uses the ABS with Traction Control along with the following components to operate:

- Active Brake Booster
- Brake Pressure Switch
- Dynamics Sensor
- Travel Sensor
- Steering Angle Sensor (SAS)

The Active Brake Booster is part of the Power Brake Booster. The Brake Pressure Switch is mounted to the bottom of the Master Cylinder. The Dynamics Sensor that is mounted under the center console, which is near the center of

gravity of the car for effective sensing. The Travel Sensor is mounted in the Power Brake Booster. The Steering Angle Sensor is located in the steering column.

## **ELECTRONIC VARIABLE BRAKE PROPORTIONING**

Vehicles equipped with ABS use electronic variable brake proportioning (EVBP) to balance front-to-rear braking. The EVBP is used in place of a rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

## **OPERATION**

### **ANTILOCK BRAKE SYSTEM WITH TRACTION CONTROL**

#### **ABS**

There are a few performance characteristics of the MK25 Antilock Brake System that may at first seem abnormal, but in fact are normal. These characteristics are described below.

#### **NORMAL BRAKING**

Under normal braking conditions, the ABS functions the same as a standard base brake system with a diagonally split master cylinder and conventional vacuum assist.

#### **ABS BRAKING**

ABS operation is available at all vehicle speeds above 3–5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation, although for vehicle stability, both rear wheel solenoids receive the same electrical signal. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the integrated control unit (ICU) regulates hydraulic pressure at all 4 of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

#### **NOISE AND BRAKE PEDAL FEEL**

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3–4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

#### **TIRE NOISE AND MARKS**

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25–30 percent. This means that the wheel rolling velocity is 25–30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

### **START-UP AND DRIVE-OFF CYCLES**

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12–25 mph (20–40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

### **PREMATURE ABS CYCLING**

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no fault codes are stored in the CAB.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

### **ALL-SPEED TRACTION CONTROL**

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing “all-speed” traction control.

With AWD, where front-wheel slip can occur, the degree of throttle intervention is relatively less than with rear-wheel drive. The difference in speed capability and the degree of throttle intervention between rear-wheel drive and all-wheel drive is due to the fact that non-driven front wheels on a rear-wheel drive vehicle give the system an accurate vehicle speed reference on which to base responses. With AWD, the possibility that the front wheels may also be slipping makes appropriate corrective action more difficult to determine, thus limiting the effective speed range. Offsetting this is the fact that loss of traction is less likely with AWD because torque is transmitted through all four wheels to begin with. In actual driving situations on snow or ice, the rear-wheel drive and AWD systems respond in essentially the same way up to the 45 mph (72 km/h) limit of the AWD system.

When severe wheel slippage is detected (as on snow-covered roads), the Winter Mode feature of All-Speed Traction Control causes the transmission to up-shift to higher gears at lower speeds than normal. Once a slippery launch condition is detected, the transmission will remain in Winter Mode for a minimum of three minutes. After that, if the road is providing normal traction, the system returns to providing normal up-shifts.

## ELECTRONIC STABILITY PROGRAM

To determine whether the car is responding properly to cornering commands, ESP uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESP operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESP system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is turning too rapidly (oversteering) or not rapidly enough (understeering).

ESP notifies the active brake booster electronically of the need for maximum output. A solenoid opens a valve in the booster that immediately applies maximum boost to the master cylinder. A travel sensor in the booster detects the rate and travel of the brake pedal. Above the threshold of an "extreme" brake application, ESP activates the solenoid, thus applying maximum available hydraulic pressure to the brakes. In this type of situation, stopping distance is determined by the ABS system based on available traction, rather than the amount of force that the driver can exert on the brake pedal. This becomes the deciding factor in how quickly the vehicle will stop.

## ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the outlet valve and draining through the inlet valve check valve. At the same time the inlet valve is switched on in case of another brake application.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

## STANDARD PROCEDURE

### ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS must always be bled anytime it is suspected that the HCU has ingested air.

Brake systems with ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

**Note:** During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add Mopar® DOT 3 brake fluid as required.

### BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

1. Make sure all hydraulic fluid lines are installed and properly torqued.
2. Connect the scan tool to the diagnostics connector. The diagnostic connector is located under the lower steering column cover to the left of the steering column.
3. Using the scan tool, check to make sure the ABM does not have any fault codes stored. If it does, clear them.

**WARNING:** When bleeding the brake system wear safety glasses. A clear bleed tube (1) must be attached to the bleeder screws and submerged in a clear container filled part way with clean brake fluid (2). Direct the flow of brake fluid away from yourself and the painted surfaces of the vehicle. Brake fluid at high pressure may come out of the bleeder screws when opened.

**Note:** Pressure bleeding is recommended to bleed the base brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

4. Bleed the base brake system. (Refer to 5 - BRAKES - BASE - STANDARD PROCEDURE)
5. Using the scan tool, select ECU VIEW, followed by ABS MISCELLANEOUS FUNCTIONS to access bleeding. Follow the instructions displayed. When finished, disconnect the scan tool and proceed.
6. Bleed the base brake system a second time. Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.
7. Fill the master cylinder fluid reservoir (1) to the MAX level.
8. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

## SENSOR-DYNAMICS

### DESCRIPTION

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor. The sensor is used to measure side-to-side (Lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - Yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor must be replaced when necessary.

### REMOVAL

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Remove floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL)

3. Disconnect wiring harness (1) connector at sensor (3).
4. Remove nuts (2) mounting sensor (3) to floor pan tunnel (4).
5. Remove dynamics sensor (3) from vehicle.

## INSTALLATION

1. Install dynamics sensor (3) over studs mounted to floor pan tunnel (4).
2. Install mounting nuts (2). Tighten nuts to 12 N·m (110 in. lbs.) torque.
3. Connect wiring harness (1) connector to module (3).
4. Install floor console. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

5. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
6. Perform Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## SENSOR - BRAKE PRESSURE REMOVAL

1. Disconnect wiring harness (6) connector from pressure switch (5).

2. Remove pressure switch (1) on bottom of master cylinder.

## INSTALLATION

1. Install pressure switch (1) on bottom of master cylinder. Tighten switch to 28 N·m (250 in. lbs.) torque.

2. Connect wiring harness (6) connector to pressure switch (5).

3. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.
4. Perform Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## SENSOR - TRAVEL

### REMOVAL

**CAUTION:** Vacuum in power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent power brake booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping brake pedal, with vehicle's engine not running, until a firm feeling brake pedal is achieved.

1. With engine not running, pump brake pedal until a firm pedal is achieved (4-5 strokes).

2. Disconnect and isolate battery negative cable (2) from battery post.

3. Disconnect wiring harness (6) connector at pedal travel sensor (7) on power brake booster (3).

4. Using a small screwdriver, remove sensor retaining ring (1).
5. Pull travel sensor straight out of booster.

## INSTALLATION

**CAUTION:** Before installing new pedal travel sensor, replace O-ring (2) inside booster opening. Sparingly lubricate NEW O-ring with brake fluid. Use care not to lose O-ring inside booster.

1. Install NEW sensor retaining ring (1) in groove on booster.

2. Align sensor keyway with notch in top of sensor mount on booster housing, then install pedal travel sensor (2). The sensor will snap into place past the retaining ring (1).

3. Connect wiring harness (6) connector to pedal travel sensor (7).

4. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

5. Perform Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)
6. Start vehicle and check for vacuum leaks around sensor. Correct as necessary.

## SENSOR - STEERING ANGLE

### REMOVAL

**WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED. REFER TO ELECTRICAL RESTRAINT SYSTEM FOR SERVICE PROCEDURES. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY.**

**CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.**

1. Position the front wheels **straight ahead**.
2. Fully extend or pull out adjustable steering column.

3. Disconnect the negative (ground) cable from the battery.
4. Remove the airbag (4), (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - REMOVAL).

5. Remove the steering wheel allen bolt (2) then remove the steering wheel (3).

6. Remove the clock spring screws (1), (Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

7. Remove the steering angle sensor (3) screws.

8. Remove the steering angle sensor (1) from the column (2).

## INSTALLATION

1. Install the steering angle sensor (1) to the SCCM (2).

2. Tighten the screws securing the steering angle sensor (3) to the SCCM.

3. Install the clockspring and tighten the screws (1)(Refer to 8 - ELECTRICAL/RESTRAINTS/CLOCKSPRING - REMOVAL).

4. Align the spline on the steering wheel hub to shaft.
5. Then install the steering wheel (3) and install a **new** bolt (2). Tighten the bolt to 61 N·m (45 ft. lbs.).

6. Install the airbag (4) (Refer to 8 - ELECTRICAL/ RESTRAINTS/DRIVER AIRBAG - INSTALLATION).

7. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
8. Perform Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)
9. Test the operation of the horn, lights and any other functions that are steering column operated.

## SENSOR - FRONT WHEEL SPEED

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

**Note:** To remove sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

2. Remove sensor cable routing clip (2) from brake hose bracket (3).
3. Remove sensor connector (1) from body wiring harness connector (4).

4. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
5. Remove wheel speed sensor cable routing clip (2) from brake hose routing bracket (5).

## INSTALLATION

1. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N·m (95 in. lbs.) torque.
2. Attach wheel speed sensor cable and routing clip (2) to brake hose routing bracket (5).

3. Attach sensor cable routing clip (2) to brake hose bracket (3).
4. Connect sensor connector (1) to body wiring harness connector (4). When installing connector, make sure retaining clip on body connector is properly in place and sensor connect cannot be pulled out.
5. Lower vehicle.
6. Perform Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## SENSOR - REAR WHEEL SPEED

### REMOVAL

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

**Note:** To remove sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

2. Remove sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).
3. Separate left sensor connector (4) from right sensor connector (3).

4. If removing left sensor, unclip sensor cable (3) from routing clip near body connector (1).

5. If removing left sensor, unclip sensor cable (1) from routing clips (2) along rear of crossmember near rear differential (3).

6. If removing left sensor, unclip sensor cable (2) from routing clip (1) above toe link mount on rear cross-member.
7. Unclip sensor cable (2) from routing clips (3) along toe link.

8. Unclip sensor cable at rear brake rotor shield (1).
9. Remove screw (2) fastening sensor head (3) to rear knuckle.
10. Remove wheel speed sensor.

## INSTALLATION

1. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
2. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N·m (100 in. lbs.) torque.
3. Install sensor cable at rear brake rotor shield (1).

4. Clip sensor cable (2) to routing clips (3) along toe link.
5. If installing left sensor, clip sensor cable (2) to routing clip (1) above toe link mount on rear crossmember.

6. If installing left sensor, clip sensor cable (1) to routing clips (2) along rear of crossmember near rear differential (3).

7. If installing left sensor, clip sensor cable (3) to routing clip near body connector (1).

8. Match left sensor connector (4) to right sensor connector (3) to make one connector.
9. Insert sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

## SWITCH - ESP

### DESCRIPTION

The ESP Off Switch is located in the Instrument Panel Switch Pod in the center of the instrument panel. The ESP Off switch turns the Electronic Stability Program off whenever the switch is depressed. Depressing the switch a second time turns the ESP back on. The switch resets itself each time the ignition is cycled.

The ESP Off switch is serviced as part of the Instrument Panel Switch Pod.

### REMOVAL

The ESP Off switch is serviced as part of the Instrument Panel Switch Pod. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - REMOVAL)

### INSTALLATION

The ESP Off switch is serviced as part of the Instrument Panel Switch Pod. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - INSTALLATION)

## **SWITCH - TRACTION CONTROL**

### **DESCRIPTION**

The Traction Control Off Switch is located in the Instrument Panel Switch Pod in the center of the instrument panel. The traction control Off switch turns the traction control off whenever the switch is depressed. Depressing the switch a second time turns the traction control back on. The switch resets itself each time the ignition is cycled.

The traction control Off switch is serviced as part of the Instrument Panel Switch Pod.

### **REMOVAL**

The traction control Off switch is serviced as part of the Instrument Panel Switch Pod. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - REMOVAL)

### **INSTALLATION**

The traction control Off switch is serviced as part of the Instrument Panel Switch Pod. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/INSTRUMENT PANEL SWITCH POD - INSTALLATION)

## **BOOSTER - ACTIVE BRAKE**

### **DESCRIPTION**

The active brake booster is part of the Electronic Stability Program (ESP). It is serviced as part of the power brake booster. For more information on ESP, (Refer to 5 - BRAKES - DESCRIPTION).

## **HCU (HYDRAULIC CONTROL UNIT)**

### **REMOVAL**

To remove the HCU, the ICU must be removed and disassembled. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - REMOVAL)(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - DISASSEMBLY)

### **INSTALLATION**

To install the HCU, assemble and install the ICU. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - ASSEMBLY)(Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - INSTALLATION)

## **ICU (INTEGRATED CONTROL UNIT)**

### **REMOVAL**

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

3. Remove brake tubes (1, 2, 3 and 10) at hydraulic control unit (5).

4. Remove remaining brake tubes (1 and 3) at hydraulic control unit.
5. Disconnect 47-way wiring connector (5) at antilock brake module (ABM) (6).

6. Pull up on unit (5) and remove from mounting grommets (8).

## DISASSEMBLY

1. Remove two screws attaching mounting bracket to HCU. Remove bracket.

2. Remove three screws (2) attaching ABM (1).

3. Remove ABM (1) from HCU (3).

## ASSEMBLY

1. Align ABM solenoids and pump/motor wiring connector (4) with HCU valves (2) and connector passage. Slide ABM (1) onto HCU (3).

2. Install three screws (2) attaching ABM (1). Tighten screws to 2 N·m (17 in. lbs.) torque.
3. Attach mounting bracket to HCU. Install two mounting bracket attaching screws and tighten to 11 N·m (97 in. lbs.) torque.
4. Install ICU in vehicle. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ICU (INTEGRATED CONTROL UNIT) - INSTALLATION)

## INSTALLATION

1. Install unit (5), pushing mounting bracket down into mounting grommets (8) located in body of vehicle.

2. Connect 47-way wiring connector (5) at antilock brake module (ABM) (6).
3. Install brake tubes to rear (1 and 3) at hydraulic control unit. Tighten tube nuts to 14 N·m (124 in. lbs.) torque.

4. Install brake tubes (1, 2, 3 and 10) at hydraulic control unit (5). Tighten tube nuts to 14 N·m (124 in. lbs.) torque.
5. Remove brake pedal holding tool.

6. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)

7. Fill and bleed (1) base brake hydraulic system and ABS. (Refer to 5 - BRAKES - STANDARD PROCEDURE)
8. Perform Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## COOLING

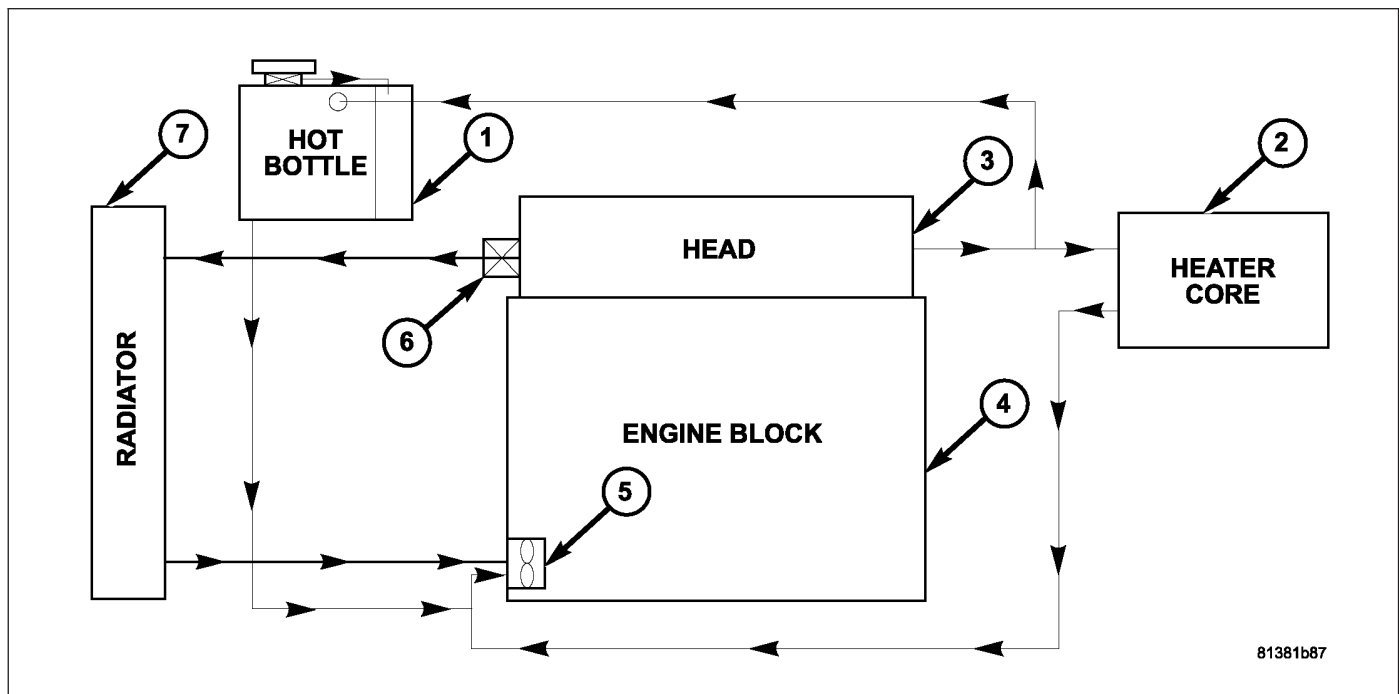

### DESCRIPTION

The cooling system consists of :

- Radiator
- Electric Cooling fan
- Fan shroud
- Radiator pressure cap
- Thermostat
- Coolant reserve/overflow system
- Transmission oil cooler (if equipped with an automatic transmission)
- Coolant
- Water pump
- Hoses and hose clamps

## OPERATION

The cooling system also provides a means of heating the passenger compartment (11) and cooling the automatic transmission fluid (if equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

## DIAGNOSIS AND TESTING

### ON-BOARD DIAGNOSTICS (OBD)

#### COOLING SYSTEM RELATED DIAGNOSTICS

The powertrain control module (PCM) has been programmed to monitor certain cooling system components:

- If the engine has remained cool for too long a period, such as with a stuck open thermostat, a Diagnostic Trouble Code (DTC) can be set.
- If an open or shorted condition has developed in the relay circuit controlling the electric radiator fan, a Diagnostic Trouble Code (DTC) can be set.

If the problem is sensed in a monitored circuit often enough to indicated an actual problem, a DTC is stored. The DTC will be stored in the PCM memory for eventual display to the service technician. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

#### ACCESSING DIAGNOSTIC TROUBLE CODES

To read DTC's and to obtain cooling system data, (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION).

#### ERASING TROUBLE CODES

After the problem has been repaired, use the scan tool to erase a DTC. Refer to the appropriate Powertrain Diagnostic Procedures service information for operation of the scan tool.

## COOLING SYSTEM - TESTING FOR LEAKS

### ULTRAVIOLET LIGHT METHOD

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light) (1). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until the radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause the additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.

### PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if the cause of coolant loss is not located during the warm engine examination.

**WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING.**

Carefully remove the radiator pressure cap from the filler neck and check coolant level. Push down on cap to disengage it from the stop tabs. Wipe the inside of filler neck and examine the lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect the radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on the outside of filler neck. If the cams are damaged, seating of the pressure cap valve and tester seal will be affected.

Attach pressure tester (7700 or an equivalent) (1) to radiator filler neck.

Operate tester pump to apply 124.1 kPa (18 psi) pressure to system. If hoses enlarge excessively or bulge while testing, replace as necessary. Observe the gauge pointer and determine the condition of the cooling system according to the following criteria:

**Holds Steady:** If the pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test. Refer to INTERNAL LEAKAGE INSPECTION .

**Drops Slowly:** Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

**Drops Quickly:** Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

## INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect the transmission dipstick for water globules and the transmission fluid cooler for leakage.

**WARNING: WITH RADIATOR PRESSURE TESTER TOOL INSTALLED ON RADIATOR, DO NOT ALLOW PRESSURE TO EXCEED 145 KPA (21 PSI). PRESSURE WILL BUILD UP QUICKLY IF A COMBUSTION LEAK IS PRESENT. TO RELEASE PRESSURE, ROCK TESTER FROM SIDE TO SIDE. WHEN REMOVING TESTER, DO NOT TURN TESTER MORE THAN 1/2 TURN IF SYSTEM IS UNDER PRESSURE.**

Operate the engine without the pressure cap on the radiator until the thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 124.1 kPa (18 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on the dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

## COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

**WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAINCOCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.**

Drain sufficient coolant to allow thermostat removal (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL) for 2.7L/3.5L engine, (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL) for 5.7L engine. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of the top of the thermostat housing.

**CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.**

Start engine and accelerate rapidly three times, to approximately 3000 rpm while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

## PRELIMINARY CHECKS

### ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature
- Slight tail wind at idle
- Slow traffic
- Traffic jams
- High speed or steep grades

Driving techniques that avoid overheating are:

- Idle with A/C off when temperature gauge is at end of normal range.
- Increasing engine speed for more air flow is recommended.

### TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

### RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed
- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

**Note: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to COOLING SYSTEM DIAGNOSIS CHART BELOW.**

These charts are to be used as a quick-reference only. Refer to COOLING SYSTEM DIAGNOSIS CHART

## COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	<ol style="list-style-type: none"><li>1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat?</li><li>2. Is the temperature sending unit connected?</li><li>3. Is the temperature gauge operating OK?</li><li>4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.</li><li>5. Improper operation of internal heater doors or heater controls.</li></ol>	<ol style="list-style-type: none"><li>1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION). Replace thermostat if necessary.</li><li>2. Check the temperature sensor connector. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING) . Repair connector if necessary.</li><li>3. Check gauge operation. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER/ENGINE TEMPERATURE GAUGE - DESCRIPTION). Repair as necessary.</li><li>4. Check coolant level in the coolant reserve/overflow tank or degas bottle and the radiator. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section of the manual text for WARNINGS and CAUTIONS associated with removing the radiator cap.</li><li>5. Inspect heater and repair as necessary. (Refer to 24 - HEATING &amp; AIR CONDITIONING - DIAGNOSIS AND TESTING) .</li></ol>

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	<p>1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.</p> <p>2. Is the temperature gauge reading correctly?</p> <p>3. Is the temperature warning illuminating unnecessarily?</p> <p>4. Coolant low in coolant reserve/overflow tank and radiator?</p> <p>5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.</p> <p>6. Poor seals at the radiator cap.</p> <p>7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools</p> <p>8. Incorrect coolant concentration</p>	<p>1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. Refer to Possible Causes (2-18).</p> <p>2. Check gauge. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING). Repair as necessary.</p> <p>3. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).</p> <p>4. Check for coolant leaks and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>5. Tighten cap</p> <p>6. (a) Check condition of cap and cap seals. Refer to Radiator Cap. Replace cap if necessary. (b) Check condition of radiator filler neck or degas bottle. If neck is bent or damaged, replace radiator or degas bottle.</p> <p>7. (a) Check condition of radiator cap and cap seals. Refer to Radiator Cap in this Group. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator. (c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary. (d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.</p> <p>8. Check coolant. (Refer to LUBRICATION &amp; MAINTENANCE/ FLUID TYPES - DESCRIPTION)</p>

CONDITION	POSSIBLE CAUSES	CORRECTION
	<p>9. Coolant not flowing through system</p> <p>10. Radiator or A/C condenser fins are dirty or clogged.</p> <p>11. Radiator core is corroded or plugged.</p> <p>13. Dragging brakes</p> <p>12. Fuel or ignition system problems.</p> <p>14. Bug screen or cardboard is being, reducing airflow.</p> <p>15. Thermostat partially or completely shut.</p> <p>16. Coolings fan not operating properly.</p> <p>17. Cylinder head gasket leaking.</p> <p>18. Heater core leaking.</p>	<p>9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.</p> <p>10. Remove insects and debris. (Refer to 7 - COOLING - STANDARD PROCEDURE).</p> <p>11. Have radiator re-cored or replaced.</p> <p>13. Check and correct as necessary. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)</p> <p>12. Refer to 14 - Fuel System or 8 - Electrical for diagnosis and testing procedures.</p> <p>14. Remove bug screen or cardboard.</p> <p>15. Check thermostat operation and replace as necessary. (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL).</p> <p>16. Check cooling fan drive operation. Refer to appropriate Diagnostic Information.</p> <p>17. Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>18. Check heater core for leaks. (Refer to 24 - HEATING &amp; AIR CONDITIONING - DIAGNOSIS AND TESTING). Repair as necessary.</p>

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READING IS INCONSISTANT (FLUCTUATES, CYCLES, OR IS ERRATIC)	<p>1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.</p> <p>2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.</p> <p>3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running)</p> <p>4. Gauge reading high after re-starting a warmed up (hot) engine.</p> <p>5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).</p> <p>6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late.</p> <p>7. Water pump impeller loose on shaft.</p> <p>8. Loose accessory drive belt. (water pump slipping)</p> <p>9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late.</p>	<p>1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.</p> <p>2. Check operation of gauge and repair if necessary. (Refer to 8 - ELECTRICAL/INSTRUMENT CLUSTER - DIAGNOSIS AND TESTING).</p> <p>3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven.</p> <p>4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.</p> <p>5. Check and correct coolant leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>6. (a) Check for cylinder head gasket leaks. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). (b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary.</p> <p>7. Check water pump and replace as necessary. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL).</p> <p>8.. Check and correct as necessary. (Refer to 7 - COOLING/ ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING)</p> <p>9. Locate leak and repair as necessary.</p>
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/ OVERFLOW TANK	<p>1. Pressure relief valve in radiator cap is defective.</p>	<p>1. Check condition of radiator cap and cap seals. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace cap as necessary.</p>

CONDITION	POSSIBLE CAUSES	CORRECTION
<p>COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT</p> <p>DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH</p>	<p>1. Coolant leaks in radiator, cooling system hoses, water pump or engine.</p> <p>1. Engine overheating.</p> <p>2. Freeze point of coolant not correct. Mixture is too rich or too lean.</p>	<p>1. Pressure test and repair as necessary. (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).</p> <p>1. Check reason for overheating and repair as necessary.</p> <p>2. Check coolant concentration. (Refer to LUBRICATION &amp; MAINTENANCE/FLUID TYPES - DESCRIPTION).</p>
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	<p>1. (a) Radiator cap relief valve stuck. (Refer to 7 - COOLING/ENGINE/RADIATOR PRESSURE CAP - DIAGNOSIS AND TESTING). Replace if necessary</p> <p>(b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary.</p> <p>(c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary.</p> <p>(d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.</p>
NOISY COOLING FAN	<p>1. Fan blades loose.</p> <p>2. Fan blades striking a surrounding object.</p> <p>3. Air obstructions at radiator or air conditioning condenser.</p>	<p>1. Replace fan blade assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).</p> <p>2. Locate point of fan blade contact and repair as necessary.</p> <p>3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser.</p>

CONDITION	POSSIBLE CAUSES	CORRECTION
INADEQUATE HEATER PERFORMANCE. THERMOSTAT FAILED IN OPEN POSITION	<ol style="list-style-type: none"> <li>1. Has a Diagnostic trouble Code (DTC) been set?</li> <li>2. Coolant level low</li> <li>3. Obstructions in heater hose/fittings</li> <li>4. Heater hose kinked</li> <li>5. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation.</li> </ol>	<ol style="list-style-type: none"> <li>1. (Refer to 25 - EMISSIONS CONTROL - DESCRIPTION) for correct procedures and replace thermostat if necessary</li> <li>2. (Refer to 7 - COOLING - STANDARD PROCEDURE).</li> <li>3. Remove heater hoses at both ends and check for obstructions</li> <li>4. Locate kinked area and repair as necessary</li> <li>5. (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL) for 2.7L engine, (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL) for 3.5L engine, (Refer to 7 - COOLING/ENGINE/WATER PUMP - REMOVAL) for 5.7L engine. If a slipping belt is detected, (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - DIAGNOSIS AND TESTING). If heater core obstruction is detected, (Refer to 24 - HEATING &amp; AIR CONDITIONING/PLUMBING/HEATER CORE - REMOVAL).</li> </ol>
STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	<ol style="list-style-type: none"> <li>1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.</li> </ol>	<ol style="list-style-type: none"> <li>1. Occasional steam emitting from this area is normal. No repair is necessary.</li> </ol>
COOLANT COLOR	<ol style="list-style-type: none"> <li>1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.</li> </ol>	<ol style="list-style-type: none"> <li>1. (Refer to LUBRICATION &amp; MAINTENANCE/FLUID TYPES - DESCRIPTION) Adjust coolant mixture as necessary.</li> </ol>
COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	<ol style="list-style-type: none"> <li>1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.</li> </ol>	<ol style="list-style-type: none"> <li>1. A normal condition. No repair is necessary.</li> </ol>

## STANDARD PROCEDURE

### DRAINING COOLING SYSTEM - ALL ENGINES

**WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAIN-COCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.**

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Remove radiator pressure cap.
2. Loosen radiator petcock.
3. Remove drain plug (1).

**WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAIN-COCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.**

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

4. Remove radiator pressure cap.
5. Loosen radiator petcock.
6. Remove cylinder block drain plugs (1).

## COOLING SYSTEM FILLING

**WARNING:** Make sure engine cooling system is cool before removing pressure cap or any hose. severe personal injury may result from escaping hot coolant. The cooling system is pressurized when hot.

**Note:** Cooling system fill procedure is critical to overall cooling system performance.

1. Close radiator draincock. **Hand tighten only.**
2. Install engine block drain plugs, if removed. Coat the threads with Mopar® Thread Sealant with Teflon.

**WARNING:** When installing drain hose to air bleed valve, route hose away from accessory drive belts, accessory drive pulleys, and electric cooling fan motors.

**Note:** It may be necessary to install a bleed fitting on the 5.7L engine.

3. Attach a 1.5 - 2 m (4 - 6 ft.) long 6.35 mm (1/4 inch.) ID clear hose to bleeder fitting
  - **Bleed Valve Location (2.7L):** Located on the water outlet connector at the front of engine.
  - **Bleed Valve Location (3.5L):** Located on the lower intake manifold, left of center and below the upper intake plenum.
  - **Plug Location (5.7L):** Located on the front of the water outlet housing at the front of engine.
4. Route hose away from the accessory drive belt, drive pulleys and electric cooling fan. Place the other end of hose into a clean container. The hose will prevent coolant from contacting the accessory drive belt when bleeding the system during the refilling operation.

**Note:** It is imperative that the cooling system air bleed valve be opened before any coolant is added to the cooling system. Failure to open the bleed valve first will result in an incomplete fill of the system.

5. 5.7L ENGINE - Install a threaded and barbed fitting into water pump housing.
6. Attach Tool 8195 (1), Filling Aid Funnel to pressure bottle filler neck.
7. Using hose pinch-off pliers, pinch overflow hose (3) that connects between the two chambers of the coolant bottle (2).
8. Open bleed fitting.

**CAUTION:** Do not mix coolants. If coolant is used other than specified, a reduction in corrosion protection will occur.

9. Pour a 50/50 mix of Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula and distilled water into the larger section of Filling Aid Funnel (the smaller section of funnel is to allow air to escape). For system capacity, (Refer to 7 - COOLING - SPECIFICATIONS).
10. Slowly fill the cooling system until a steady stream of coolant flows from the hose attached to the bleed valve.
11. Close the bleed valve and continue filling system to the top of the Tool 8195 (1).
12. Remove pinch-off pliers from overflow hose.
13. Allow the coolant in Filling Funnel to drain into overflow chamber of the pressure bottle.
14. Remove Tool 8195 (1). Install cap on coolant pressure bottle.
15. Remove hose from bleed valve.
16. 5.7L ENGINE - Install fitting into thermostat housing. Coat the threads with Mopar® Thread Sealant with Teflon.
17. Start engine and run at 1500 - 2000 RPM for 30 minutes.

**Note: The engine cooling system will push any remaining air into the coolant bottle within about an hour of normal driving. As a result, a drop in coolant level in the pressure bottle may occur. If the engine cooling system overheats and pushes coolant into the overflow side of the coolant bottle, this coolant will be sucked back into the cooling system ONLY IF THE PRESSURE CAP IS LEFT ON THE BOTTLE. Removing the pressure cap breaks the vacuum path between the two bottle sections and the coolant will not return to cooling system.**

18. Shut off engine allow it to cool down for 30 minutes. This permits coolant to be drawn into the pressure chamber.
19. With engine COLD, observe coolant level in pressure chamber. Coolant level should be within MIN and MAX marks. Adjust coolant level as necessary.

**Note: The coolant bottle has two chambers. Coolant will normally only be in the inboard of the two. The outboard chamber is only to recover coolant in the event of an overheat or after a recent service fill.**

## ADDING ADDITIONAL COOLANT

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Do not use coolant additives that are claimed to improve engine cooling.**

## COOLANT LEVEL CHECK

**Note:** Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant recovery bottle (2).

The coolant reserve/overflow system provides a quick method for determining coolant level. With engine not running, the coolant level should be between ADD and FULL marks (3). If the coolant level is at or below the ADD mark, fill the recovery bottle with a 50/50 mixture of antifreeze and water ONE QUART AT A TIME. Repeat this procedure until the coolant level is at the FULL mark.

## COOLING SYSTEM CLEANING/REVERSE FLUSHING

### CLEANING

Drain cooling system and refill with water. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty, fill system with water, run engine and drain system. Repeat until water drains clean.

### REVERSE FLUSHING

Reverse flushing of cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

### REVERSE FLUSHING RADIATOR

Disconnect radiator hoses from radiator inlet and outlet. Attach a section of radiator hose to radiator bottom outlet fitting and insert flushing gun. Connect a water supply hose and air supply hose to flushing gun.

**CAUTION:** Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow radiator to fill with water. When radiator is filled, apply air in short blasts. Allow radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. Have radiator cleaned more extensively by a radiator repair shop.

### REVERSE FLUSHING ENGINE

Drain cooling system. Remove thermostat housing and thermostat. Install thermostat housing. Disconnect radiator upper hose from radiator and attach flushing gun to hose. Disconnect radiator lower hose from water pump and attach a lead-away hose to water pump inlet fitting.

**CAUTION:** On vehicles equipped with a heater water control valve, be sure heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering heater core.

Connect water supply hose and air supply hose to flushing gun. Allow engine to fill with water. When engine is filled, apply air in short blasts, allowing system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove lead away hose, flushing gun, water supply hose and air supply hose. Remove thermostat housing and install thermostat. Install thermostat housing with a replacement gasket. Refer to Thermostat Replacement. Connect radiator hoses. Refill cooling system with correct antifreeze/water mixture. Refer to Refilling the Cooling System.

## CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

**CAUTION: Follow manufacturers instructions when using these products.**

## TENSIONERS-BELT

### DESCRIPTION

Correct drive belt tension is required to ensure optimum performance of the belt (1) driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

It is not necessary to adjust belt tension on the 2.7L/ 3.5L or 5.7L engines. These engines are equipped with an automatic belt tensioner (2). The tensioner maintains correct belt tension at all times. Due to use of this belt tensioner (2), do not attempt to use a belt tension gauge on these engines.

### OPERATION

The automatic belt tensioner maintains belt tension by using internal spring pressure, a pivoting arm and pulley to apply force against the drive belt.

## REMOVAL

### 2.7L ENGINE

On all engines, the tensioner (1) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.

If the above specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- Belt is not installed in pulley grooves
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

**Note:** A used belt should be replaced if tensioner indexing arrow has moved to the minimum tension indicator. Tensioner travel stops at this point.

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

**WARNING:** BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY EXCEPT FOR PULLEY ON TENSIONER.

2. Remove tensioner assembly bolt (2).
3. Remove tensioner assembly (1) from mounting bracket.

### 3.5L ENGINE

On all engines, the tensioner (1) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.

If the above specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- Belt is not installed in pulley grooves
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

**Note:** A used belt should be replaced if tensioner indexing arrow has moved to the minimum tension indicator. Tensioner travel stops at this point.

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

**WARNING: BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY EXCEPT FOR PULLEY ON TENSIONER.**

2. Remove tensioner assembly bolt (1).
3. Remove tensioner assembly (2) from mounting bracket.

## 5.7L ENGINE

On all engines, the tensioner (1) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.

If the above specification cannot be met, check for:

- The wrong belt being installed (incorrect length/width)
- Worn bearings on an engine accessory (A/C compressor, power steering pump, water pump, idler pulley or generator)
- Belt is not installed in pulley grooves
- A pulley on an engine accessory being loose
- Misalignment of an engine accessory
- Belt incorrectly routed.

**Note: A used belt should be replaced if tensioner indexing arrow has moved to the minimum tension indicator. Tensioner travel stops at this point.**

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

**WARNING: BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY EXCEPT FOR PULLEY ON TENSIONER.**

2. Remove tensioner assembly bolt (2).
3. Remove tensioner assembly (1) from mounting bracket.

## INSTALLATION

### 2.7L ENGINE

1. Install tensioner bolt (2) to tensioner (1). Tighten bolt to 34 N·m (40 ft. lbs.) torque.
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

On all engines, the tensioner (1) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.

3. Check belt indexing marks.

### 3.5L ENGINE

1. Install tensioner bolt (2) to tensioner (1). Tighten bolt to 34 N·m (40 ft. lbs.) torque.
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

On all engines, the tensioner (1) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.

3. Check belt indexing marks.

## 5.7L ENGINE

1. Install tensioner bolt (2) to tensioner (1). Tighten bolt to 34 N·m (40 ft. lbs.) torque.
2. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

On all engines, the tensioner (1) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.

3. Check belt indexing marks.

## BELTS-DRIVE

### DIAGNOSIS AND TESTING

#### ACCESSORY DRIVE BELT

##### VISUAL DIAGNOSIS

When diagnosing serpentine accessory drive belts, small cracks (1) that run across the ribbed surface of the belt from rib to rib, are considered normal. These are not a reason to replace the belt. However, cracks (2) running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords, severe glazing or chunking.

Any belt with bumb, surface coming apart, or any other uneven indications along the flat surface of the belt must be remove and inspected and replaced if necessary.

Refer to ACCESSORY DRIVE BELT DIAGNOSIS CHART for further belt diagnosis.

##### NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

## ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	<ol style="list-style-type: none"> <li>1. Foreign objects imbedded in pulley grooves.</li> <li>2. Installation damage</li> </ol>	<ol style="list-style-type: none"> <li>1. Remove foreign objects from pulley grooves. Replace belt.</li> <li>2. Replace belt</li> </ol>
RIB OR BELT WEAR	<ol style="list-style-type: none"> <li>1. Pulley misaligned</li> <li>2. Abrasive environment</li> <li>3. Rusted pulley(s)</li> <li>4. Sharp or jagged pulley groove tips</li> <li>5. Belt rubber deteriorated</li> </ol>	<ol style="list-style-type: none"> <li>1. Align pulley(s)</li> <li>2. Clean pulley(s). Replace belt if necessary</li> <li>3. Clean rust from pulley(s)</li> <li>4. Replace pulley. Inspect belt.</li> <li>5. Replace belt</li> </ol>
BELT SLIPS	<ol style="list-style-type: none"> <li>1. Belt slipping because of insufficient tension</li> <li>2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol)</li> <li>3. Driven component bearing failure (seizure)</li> <li>4. Belt glazed or hardened from heat and excessive slippage</li> </ol>	<ol style="list-style-type: none"> <li>1. Inspect/Replace tensioner if necessary</li> <li>2. Replace belt and clean pulleys</li> <li>3. Replace faulty component or bearing</li> <li>4. Replace belt.</li> </ol>
LONGITUDINAL BELT CRACKING	<ol style="list-style-type: none"> <li>1. Belt has mistracked from pulley groove</li> <li>2. Pulley groove tip has worn away rubber to tensile member</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace belt</li> <li>2. Replace belt</li> </ol>
"GROOVE JUMPING" (Belt does not maintain correct position on pulley)	<ol style="list-style-type: none"> <li>1. Incorrect belt tension</li> <li>2. Pulley(s) not within design tolerance</li> <li>3. Foreign object(s) in grooves</li> <li>4. Pulley misalignment</li> <li>5. Belt cordline is broken</li> </ol>	<ol style="list-style-type: none"> <li>1. Inspect/Replace tensioner if necessary</li> <li>2. Replace pulley(s)</li> <li>3. Remove foreign objects from grooves</li> <li>4. Align component</li> <li>5. Replace belt</li> </ol>
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	<ol style="list-style-type: none"> <li>1. Incorrect belt tension</li> <li>2. Tensile member damaged during belt installation</li> <li>3. Severe misalignment</li> <li>4. Bracket, pulley, or bearing failure</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace Inspect/Replace tensioner if necessary</li> <li>2. Replace belt</li> <li>3. Align pulley(s)</li> <li>4. Replace defective component and belt</li> </ol>

CONDITION	POSSIBLE CAUSES	CORRECTION
<b>NOISE</b> (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension 2. Bearing noise 3. Belt misalignment 4. Belt to pulley mismatch 5. Driven component induced vibration 6. Belt flat surface coming apart	1. Inspect/Replace tensioner if necessary 2. Locate and repair 3. Align belt/pulley(s) 4. Install correct belt 5. Locate defective driven component and repair 6. Replace belt
<b>TENSION SHEETING FABRIC FAILURE</b> (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object 2. Excessive heat causing woven fabric to age 3. Tension sheeting splice has fractured	1. Correct rubbing condition 2. Replace belt 3. Replace belt
<b>CORD EDGE FAILURE</b> (Tensile member exposed at edges of belt or separated from belt body)	1. Incorrect belt tension 2. Belt contacting stationary object 3. Pulley(s) out of tolerance 4. Insufficient adhesion between tensile member and rubber matrix	1. Inspect/Replace tensioner if necessary 2. Replace belt 3. Replace pulley 4. Replace belt

## REMOVAL

### 2.7L ENGINE

**CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVER DAMAGE MAY OCCUR TO THE TENSIONER.**

Belt tension is not adjustable. Belt adjustment is maintained by an automatic ( spring load ) belt tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner (5) counterclockwise until it contacts it's stop. Remove belt, then slowly rotate the tensioner into the freearm position.

### 3.5L ENGINE

**CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVER DAM-AGE MAY OCCUR TO THE TENSIONER.**

Belt tension is not adjustable. Belt adjustment is main-  
tained by an automatic ( spring load ) belt tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner (5) counterclockwise until it  
contacts it's stop. Remove belt, then slowly rotate  
the tensioner into the freearm position.

### 5.7L ENGINE

**CAUTION: DO NOT LET TENSIONER ARM SNAP BACK TO THE FREEARM POSITION, SEVER DAM-AGE MAY OCCUR TO THE TENSIONER.**

Belt tension is not adjustable. Belt adjustment is main-  
tained by an automatic ( spring load ) belt tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate belt tensioner (6) counterclockwise until it  
contacts it's stop. Remove belt, then slowly rotate  
the tensioner into the freearm position.

## INSTALLATION

### 2.7L ENGINE

Belt tension is not adjustable. Belt adjustment is maintained by an automatic ( spring load ) belt tensioner.

1. Check condition of all pulleys.

**CAUTION:** When installing the serpentine accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install new belt. Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.

**ON all engines, the tensioner (5) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.**

3. With the drive belt installed, inspect the belt wear indicator.

### 3.5L ENGINE

Belt tension is not adjustable. Belt adjustment is maintained by an automatic ( spring load ) belt tensioner.

1. Check condition of all pulleys.

**CAUTION:** When installing the serpentine accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install new belt. Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.

**ON all engines, the tensioner (5) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.**

3. With the drive belt installed, inspect the belt wear indicator.

## 5.7L ENGINE

Belt tension is not adjustable. Belt adjustment is maintained by an automatic ( spring load ) belt tensioner.

1. Check condition of all pulleys.

**CAUTION:** When installing the serpentine accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Install new belt. Route the belt around all pulleys except the idler pulley. Rotate the tensioner arm until it contacts its stop position. Route the belt around the idler and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.

**ON all engines, the tensioner (6) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.**

3. With the drive belt installed, inspect the belt wear indicator.

## IDLER PULLEY

### REMOVAL

#### 2.7L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove cover (3).
3. Remove bolt (2) and idler pulley (1).

### 3.5L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
2. Remove cover (3).
3. Remove bolt (2) and idler pulley (1).

### 5.7L ENGINE

1. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELT TENSIONERS - REMOVAL).
2. Remove cover (3).
3. Remove bolt (2) and idler pulley (1).

## INSTALLATION

### 2.7L ENGINE

1. Position idler pulley (1).
2. Tighten bolt (2) to 28 N·m (250 in. lbs.).
3. Install cover (3).
4. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION)

### 3.5L ENGINE

1. Position idler pulley (1).
2. Tighten bolt to (2) 28 N·m (250 in. lbs.).
3. Install cover (3).
4. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

## 5.7L ENGINE

1. Position idler pulley (1).
2. Tighten bolt (2) to 54 N·m (40 ft. lbs.).
3. Install cover (3).
4. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).

## COOLANT

### DESCRIPTION

#### ENGINE COOLANT

##### ETHYLENE-GLYCOL MIXTURES

**CAUTION:** Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 year/100,000 Mile Formula (ethylene-glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain a freeze point of -37°C (-35°F).

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68% antifreeze concentration, which prevents freezing down to -67.7° C (-90° F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149° C (300° F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22° C (-8° F ).

##### PROPYLENE-GLYCOL MIXTURES

It's overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32° C (-26° F). 5° C higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125° C (257° F ) at 96.5 kPa (14 psi), compared to 128° C (263° F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up on a cooling system designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

#### HOAT COOLANT

**WARNING: ANTIFREEZE IS AN ETHYLENE-GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE-GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASE COOLANT PROPERLY, CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE, PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED, PERSONAL INJURY CAN RESULT.**

**CAUTION:** Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT), may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.**

## COOLANT PERFORMANCE

The required ethylene-glycol (antifreeze) and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

**Pure Water**-Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

**100 percent Ethylene-Glycol**-The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

**50/50 Ethylene-Glycol and Water**-Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

**CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.**

## COOLANT SELECTION AND ADDITIVES

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

**CAUTION: Do not use coolant additives that are claimed to improve engine cooling.**

## OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the cooling fins in the radiator transfers the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol or propylene-glycol coolant prevents water present in the cooling system from freezing within temperatures indicated by mixture ratio of coolant to water.

## DIAGNOSIS AND TESTING

### COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of  $-37^{\circ}\text{C}$  ( $-34^{\circ}\text{F}$ ) to  $-46^{\circ}\text{C}$  ( $-50^{\circ}\text{F}$ ). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer Tool 8286 (Refer to 7 - COOLING - SPECIAL TOOLS) will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

**CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.**

### STANDARD PROCEDURE - COOLANT SERVICE

For engine coolant recommended service schedule, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION).

## HOUSING-COOLANT OUTLET - 2.7L

### REMOVAL

**WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Disconnect engine coolant temperature sensor electrical connector (3).
3. Remove screws (5) attaching heater tube (4) to outlet connector (1).
4. Disengage tube (4) from outlet connector (1) only enough for connector removal.
5. Remove bolts (2) attaching water outlet connector (1).
6. Remove outlet connector (1).

## INSTALLATION

1. Clean sealing surfaces. Inspect gaskets for tears and cuts. Inspect O-ring on heater tube. Replace as necessary.
2. Install outlet connector (1) and mounting bolts (2). Tighten bolts to 12 N·m (105 in. lbs.).
3. Install heater tube (4) to outlet connector (1). Tighten bolts to 3.3 N·m (30 in. lbs.).
4. Connect engine coolant temperature sensor electrical connector (3).
5. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

## COOLANT RECOVERY CONTAINER

### REMOVAL

1. Remove coolant recovery container pressure cap (3).
2. Remove and plug coolant recovery tube (1).
3. Remove mounting nuts (2).
4. Remove coolant recovery container (3) from vehicle.

## INSTALLATION

1. Position coolant recovery container (3).
2. Install mounting nuts (2). Tighten to 10 N·m (89 in. lbs.).
3. Install coolant recovery tube (1).
4. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
5. Install coolant recovery container pressure cap (4).

## ENGINE BLOCK HEATER

### DESCRIPTION

The engine block heater(1) is mounted in the cylinder block (2), near the right rear corner. The block heater is a dry cylinder type design and is powered by 110 volt AC. **The power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds and become damaged.**

### OPERATION

When power is applied (110 volt AC) to the block heater, the heating element transfers heat through the aluminum engine block and into the coolant without directly penetrating the cooling system.

### DIAGNOSIS AND TESTING

#### ENGINE BLOCK HEATER

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with an ohmmeter or 12-volt test light.

## REMOVAL

1. Raise vehicle on hoist.
2. Detach power cord plug from block heater (1).
3. Remove block heater attaching screw located below heater terminals.
4. Remove block heater from cylinder block (2).

## INSTALLATION

1. Thoroughly clean cylinder block heater cavity.
2. Insert heater assembly (1) into block (2) with mounting hole is located below heater terminals.
3. Install mounting screw and tighten to 12 N·m (105 in. lbs.).
4. Attach power cord to heater.

**CAUTION:** To prevent damage, the power cord must be secured in its retainer clips, and not positioned so it could contact linkages or exhaust manifolds.

5. Lower vehicle.

## ENGINE COOLANT TEMP SENSOR

### REMOVAL

#### 5.7L V-8

The Engine Coolant Temperature (ECT) sensor (3) on the 5.7L engine is located under the air conditioning compressor. It is installed into a water jacket at the front of the cylinder block.

**WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR.**

1. Partially drain the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).
3. Carefully unbolt air conditioning compressor from front of engine. Do not disconnect any A/C hoses from compressor. Temporarily support compressor to gain access to ECT sensor (3).
4. Disconnect electrical connector (2) from sensor (3).
5. Remove sensor (3) from cylinder block.

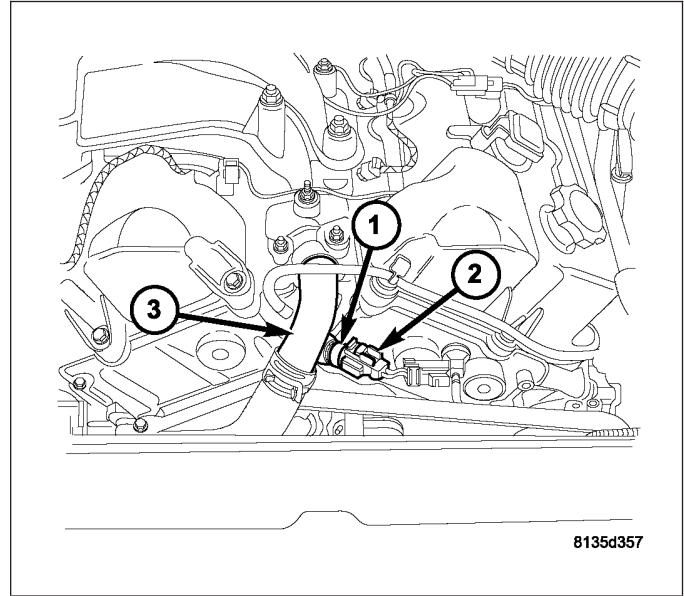

#### 3.5L V6

1. Disconnect negative battery cable.
2. Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. With the engine cold, disconnect coolant sensor electrical connector.
4. Remove sensor (2).

## 2.7L V6

1. Disconnect negative batter cable.
2. Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Disconnect the electrical connector (2).
4. Remove engine coolant sensor (1) from coolant outlet tube (3).

## INSTALLATION

### 5.7L V-8

1. Apply thread sealant to sensor threads.
2. Install ECT sensor (3) to engine.
3. Tighten sensor to 11 N·m (97.3 in. lbs.) torque.
4. Connect electrical connector (2) to ECT sensor (3).
5. Fill the cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

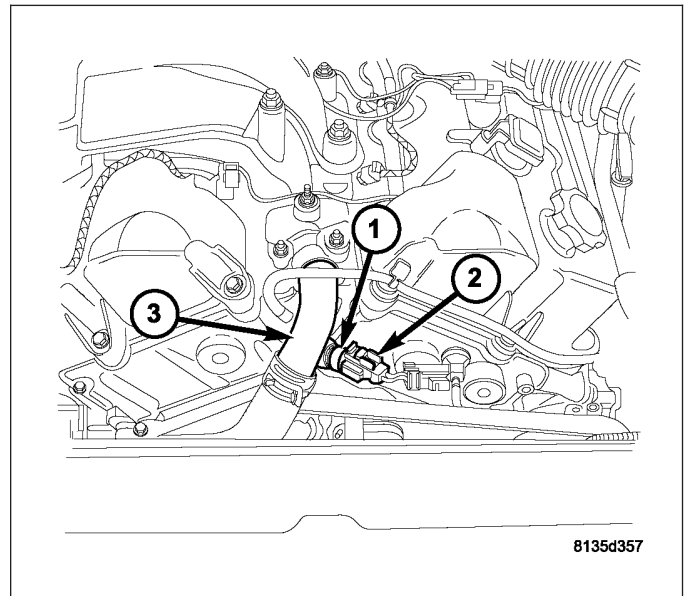

### 3.5L V6

1. Install engine coolant temperature sensor (2).  
Tighten sensor to 28 N·m (20 ft. lbs.) torque.
2. Attach electrical connector to sensor.
3. Connect negative battery cable.

### 2.7L V6

1. Apply thread sealant to sensor threads.
2. Install engine coolant temperature sensor (1) into coolant outlet tube (3).
3. Tighten sensor to 28 N·m (20 ft. lbs.) torque.
4. Connect electrical connector (2) to engine coolant temperature sensor (1).

## ENGINE COOLANT THERMOSTAT

### DESCRIPTION

The engine cooling thermostats are a wax pellet driven, reverse poppet choke type. The thermostats have an air bleed located in the thermostat flange. The air bleed allows internal trapped air during cooling system filling to be released. The thermostat on the 2.7L and 3.5L engines are located on the lower left side of engine, near the front. The thermostat on both engines are on the inlet side of the water pump.

The thermostat on the 5.7L gas powered engine is located beneath the thermostat housing (1) at the front of the intake manifold.

### OPERATION

The engine cooling thermostat is a wax pellet driven, reverse poppet choke type. The thermostat is designed to provide the fastest warm up possible by preventing leakage through it and to guarantee a minimum engine oper-

ating temperature of 88 to 93°C (192 to 199°F). The thermostat also will automatically reach wide open so it will not restrict flow to the radiator as temperature of the coolant rises in hot weather to around 104°C (220°F). Above this temperature the coolant temperature is controlled by the radiator, fan, and ambient temperature, not the thermostat.

The thermostat is operated by a wax filled container (pellet) which is sealed. When heated coolant reaches a pre-determined temperature, the wax expands enough to overcome the closing spring and water pump pressure, which forces the valve to open.

## DIAGNOSIS AND TESTING

### ENGINE COOLANT THERMOSTAT

The thermostat is operated by a wax filled chamber (pellet) which is sealed. When heated coolant reaches a pre-determined temperature the wax pellet expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

Thermostat diagnostics is included in powertrain control module's (PCM) programing for on-board diagnosis. The malfunction indicator light (MIL) will illuminate and a diagnostic trouble code (DTC) will be set when an "open too soon" condition occurs. Do not change a thermostat for lack of heater performance or temperature gauge position, unless a DTC is present. For other probable causes, (Refer to 7 - COOLING - DIAGNOSIS AND TESTING). Thermostat failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).

## REMOVAL

### 2.7L ENGINE

1. Disconnect negative cable.

**WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove radiator lower hose from thermostat housing (1).
4. Remove nuts
5. Loosen starter bolt at heater tube bracket.
6. Pull heater tube out of thermostat housing and position out of the way.
7. Remove bolt and two studs.

8. Remove thermostat housing (1), O-ring (2) and thermostat (5).
9. Remove thermostat housing bolts (4) and spacer (3).

## REMOVAL

1. Disconnect negative cable.

**WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove radiator lower hose from thermostat housing (1).
4. Remove bypass hose.
5. Remove bolts.
6. Remove thermostat housing and thermostat..

## 5.7L ENGINE

1. Disconnect negative battery cable at battery.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove radiator hose at thermostat housing (1).

**Note: THERMOSTAT O-RING IS PART OF THERMOSTAT (2) AND IS NOT SERVICED SEPERATLY.**

4. Remove thermostat housing mounting bolts (3), thermostat housing (1) and thermostat (2).

## INSTALLATION

### 2.7L ENGINE

1. Clean gasket sealing surfaces.

**Note: Install thermostat with the bleed valve located at the 12 o'clock position.**

2. Install thermostat and gasket into thermostat housing.
3. If removed, install two studs.
4. Install thermostat, thermostat housing (5) and gasket and bolt. Tighten attaching bolts to 12 N·m (105 in. lbs.).
5. Lubricate heater return tube O-ring with coolant.
6. Position heater return tube over two studs. Install nuts. Tighten attaching bolts to 12 N·m (105 in. lbs.).
7. Tighten starter bolt to 54.3 N·m (40 ft. lbs.).

8. Connect the lower radiator hoses to the thermostat housing. Install hose clamps.
9. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
10. Connect negative cable.

## INSTALLATION

1. Position thermostat and gasket on block.
2. Install thermostat housing and mounting bolts. Tighten attaching bolts to 12 N·m (105 in. lbs.).
3. Install radiator hose.
4. Install bypass hose.
5. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

### 5.7L ENGINE

1. Clean mating areas of timing chain cover and thermostat housing (1).

**Note: Install thermostat with the bleed valve located at the 12 o'clock position.**

2. Install thermostat (2) (spring side down) into recessed machined groove on timing chain cover with bleed valve located at the 12 o'clock position.
3. Position thermostat housing (1) on timing chain cover.
4. Install two housing-to-timing chain cover bolts (3). Tighten bolts to 13 N·m (112 in. lbs.) torque.

**CAUTION: Thermostat housing must be tightened evenly and thermostat (2) must be centered into recessed groove in timing chain cover. If not, it may result in a cracked thermostat housing (1), damaged timing chain cover threads or coolant leaks.**

5. Install lower radiator hose on thermostat housing.
6. Lower vehicle.
7. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
8. Connect negative battery cable to battery.
9. Start and warm the engine. Check for leaks.

## HEATER SUPPLY TUBE

### REMOVAL

#### 2.7L ENGINE

**WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove radiator (Refer to 7 - COOLING/ENGINE/ RADIATOR - REMOVAL).
3. Disconnect engine coolant temperature sensor connector.
4. Remove radiator upper hose at tube (3).
5. Remove heater hose from heater tube at rear of engine.
6. Disconnect heater tube from retaining clip at rear of engine.
7. Disconnect electrical connector from coolant temperature sensor.
8. Remove screws (2) attaching heater tube (3) to outlet connector (1).
9. Disengage heater tube (3) from outlet connector (1). To remove heater tube, move forward until the tube (3) clears cylinder heads.

### 3.5L ENGINE

**WARNING: DO NOT REMOVE PRESSURE CAP WITH SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove upper and lower intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - UPPER - REMOVAL) and (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - LOWER - REMOVAL).
3. Position lower intake manifold upside down on bench and remove the tube retaining bolt (5).
4. Remove heater supply tube (4) from manifold and discard O-ring (2).

### 5.7L ENGINE

1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).
4. Remove heater hoses from heater tubes.
5. Remove heater tube mounting bolts.
6. Remove heater tubes from water pump housing and remove from vehicle.

## INSTALLATION

### 2.7L ENGINE

1. Inspect heater tube O-ring (4). Replace as necessary.
2. Lubricate O-ring (4) with a silicone type grease such as Mopar® Dielectric Grease.
3. Install the heater tube (3) by inserting tube in-between cylinder heads. Insert tube into outlet connector (1).
4. Attach heater tube (3) to the retaining clip at rear of engine.
5. Install attaching screws and tighten to 3 N·m (30 in. lbs.).
6. Install radiator (Refer to 7 - COOLING/ENGINE/RADIATOR - INSTALLATION).
7. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
8. Operate engine until it reaches normal operating temperature. Check cooling system for correct fluid levels.

### 3.5L ENGINE

1. Clean heater tube sealing surfaces.
2. Inspect heater tube O-ring (2). Replace as necessary.
3. Lubricate O-ring (2) with a silicone type grease such as Mopar® Dielectric Grease.
4. Install O-ring (2) on heater supply tube (4).
5. Install heater tube (4) on manifold.
6. Install retaining bolts. Tighten bolts to 12 N·m (105 in. lbs.).
7. Install lower and upper intake manifolds (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION - Lower) and (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION - Upper).
8. Refill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
9. Operate engine until it reaches normal operating temperature. Check cooling system for correct fluid levels.

## 5.7L ENGINE

1. Position heater tubes into water pump housing.
2. Install mounting bolts. Tighten bolts to 10 N·m (88 in. lbs.).
3. Install heater hose onto heater tubes.
4. Install intake manifold (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
5. Connect negative battery cable.
6. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
7. Start vehicle and check for cooling system leaks.

## RADIATOR

### REMOVAL

1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove upper radiator hose (2).
4. Remove upper radiator closure panels (1).
5. Remove radiator fan assembly (4) (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
6. Raise vehicle.
7. Remove lower splash shield.
8. Remove lower radiator hose (1).
9. Remove lower condensor mount bolts.

10. Lower vehicle.
11. Remove upper radiator hose.
12. Remove upper radiator mounting brackets (1) and bolts (2).
13. Remove upper condensor mounting bolts.
14. Separate condensor assembly from radiator.
15. Tilt radiator toward engine and remove radiator from vehicle.

## CLEANING

Clean radiator fins are necessary for good heat transfer. The radiator and air conditioning fins should be cleaned when an accumulation of debris has occurred. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

## INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

## INSTALLATION

1. Position radiator into engine compartment. Seat the radiator assembly lower rubber isolators into the mounting holes in radiator lower support.
2. Install radiator mounting bracket (1) and bolts (2). Tighten to 5 N·m (45 in. lbs.).
3. Position condensor on radiator and install upper mounting bolts. Tighten bolts to 10 N·m (88 in. lbs.).
4. Raise vehicle.

5. Install lower condensor mounting bolts. Tighten bolts to 10 N·m (88 in. lbs.)
6. Install lower radiator hose (1) and clamp.
7. Lower vehicle.

8. Install the radiator fan (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
9. Install upper radiator upper hose. Align hose so it does not interfere with the accessory drive belt or engine. Position hose clamp so it will not interfere with the hood.
10. Connect negative cable.
11. Fill cooling system with coolant (Refer to 7 - COOLING - STANDARD PROCEDURE).
12. Operate engine until it reaches normal operating temperature. Check cooling system and automatic transmission for correct fluid levels.

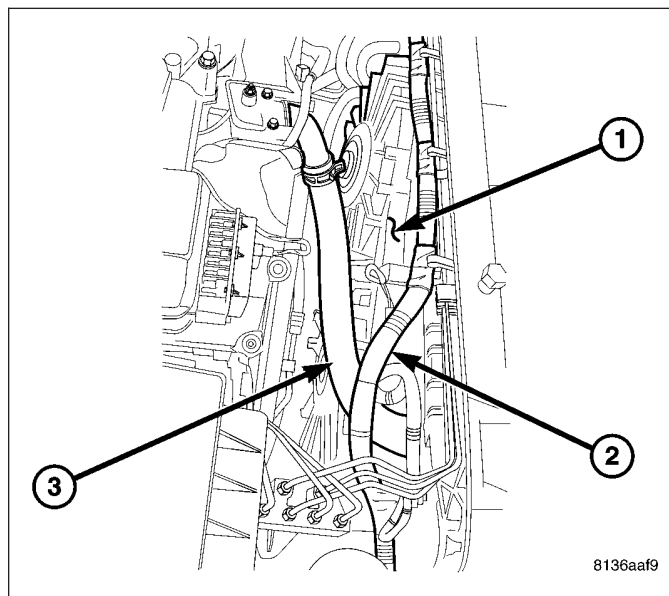

## RADIATOR FAN

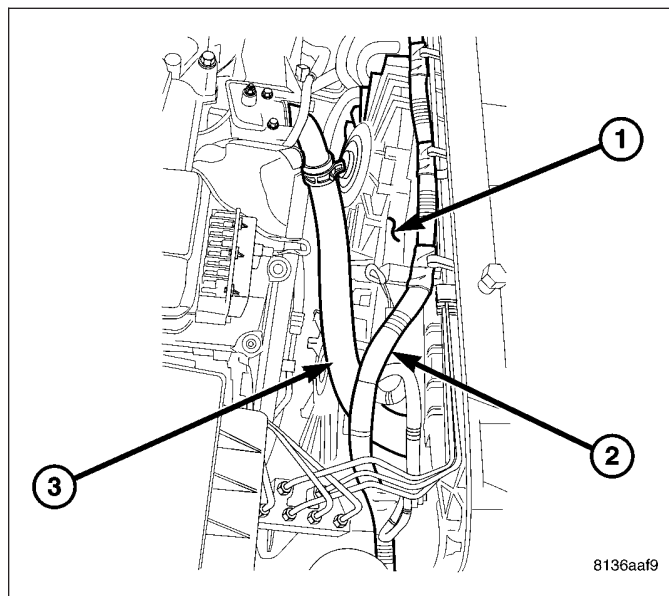

### REMOVAL

1. Disconnect negative battery cable.
2. Partially drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove upper radiator hose (3).
4. Disconnect cooling fan electrical connector (2).
5. Remove cooling fan mounting bolts.
6. Remove radiator cooling fan assembly (1) from vehicle.

### INSTALLATION

1. Position radiator cooling fan assembly (1) in vehicle.
2. Install cooling fan mounting bolts. Tighten to 10 N·m (88 in. lbs.).
3. Connect cooling fan electrical connector (2).
4. Install upper radiator hose (3).
5. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
6. Operate engine until it reaches normal operating temperature. Check cooling system and automatic transmission for correct fluid levels.

## CAP-RADIATOR PRESSURE

### DESCRIPTION

All cooling systems are equipped with a pressure cap on the radiator. This cap releases pressure at some point within a range of 131-158 kPa (19-23 psi). The pressure relief point (in pounds) is engraved on top of the cap (3).

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve (4). This valve opens when system pressure reaches the release range of 131-158 kPa (19-23 psi).

A rubber gasket (2) seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

### OPERATION

A vent valve in the center of the cap will remain shut as long as the cooling system is pressurized. As the coolant cools, it contracts and creates a vacuum in cooling system. This causes the vacuum valve to open and coolant in reserve/overflow tank to be drawn through connecting hose into radiator. If the vacuum valve is stuck shut, or overflow hose is kinked, radiator hoses will collapse on cool-down.

### DIAGNOSIS AND TESTING

#### RADIATOR CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool 7700 (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 131 kPa (21 psi) and hold pressure at a minimum of 130 kPa (18.8 psi).

**WARNING: THE WARNING WORDS "DO NOT OPEN HOT" ON RADIATOR PRESSURE CAP, ARE A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, RADIATOR CAP SHOULD NOT BE REMOVED WHILE SYSTEM IS HOT AND/OR UNDER PRESSURE.**

Do not remove radiator cap at any time **except** for the following purposes:

1. Check and adjust antifreeze freeze point.
2. Refill system with new antifreeze.
3. Conducting service procedures.
4. Checking for vacuum leaks.

**WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT AT LEAST 15 MINUTES BEFORE REMOVING RADIATOR CAP. WITH A RAG, SQUEEZE RADIATOR UPPER HOSE TO CHECK IF SYSTEM IS UNDER PRESSURE. PLACE A RAG OVER CAP AND WITHOUT PUSHING CAP DOWN, ROTATE IT COUNTER-CLOCKWISE TO FIRST STOP. ALLOW FLUID TO ESCAPE THROUGH THE COOLANT RESERVE/OVERFLOW HOSE INTO RESERVE/OVERFLOW TANK. SQUEEZE RADIATOR UPPER HOSE TO DETERMINE WHEN PRESSURE HAS BEEN RELEASED. WHEN COOLANT AND STEAM STOP BEING PUSHED INTO TANK AND SYSTEM PRESSURE DROPS, REMOVE RADIATOR CAP COMPLETELY.**

## RADIATOR CAP

Remove cap (1) from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap (1) on pressure tester 7700 (2) or an equivalent.

Operate tester pump to bring pressure to 138 kPa (20 psi) on gauge. If pressure cap (1) fails to hold pressure of at least 131 kPa (19 psi) replace cap. Refer to the following **CAUTION**.

The pressure cap may test properly while positioned on tool 7700 (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

**CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.**

## CLEANING

Use only a mild soap and water to clean the radiator cap. Using any type solvent may cause damage to the seal in the radiator cap.

## INSPECTION

Hold cap at eye level, right side up. The vent valve at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

## WATER PUMP

### DESCRIPTION

The 2.7L and 3.5L pump has a die cast aluminum housing and a plastic swept vane impeller. The 2.7L water pump bolts directly to the cylinder block, behind the timing chain cover and is driven by the engine primary timing chain.

The 3.5L water pump bolts directly to the rear timing belt cover using a press-in-place gasket for sealing. The water pump is driven by the engine timing belt.

## REMOVAL

### 2.7L ENGINE

**WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM COOLANT CAN RESULT.**

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove radiator fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
3. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

**Note: The water pump is driven by the primary timing chain.**

4. Remove the timing chain and all chain guides (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
5. Remove bolts (2 and 3) attaching water pump (1) to block.
6. Remove water pump (1) and gasket.

### 3.5L ENGINE

The water pump on all models can be replaced without discharging the air conditioning system.

**WARNING: DO NOT REMOVE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.**

1. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
2. Remove accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL).

**Note: The water pump is driven by the timing belt.**

3. Remove engine timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - REMOVAL).
4. Remove water pump mounting bolts (1). Note position of longer bolt for proper re-installation.
5. Remove water pump body (1) from engine.

## 5.7L ENGINE

1. Disconnect negative battery cable.
2. Drain cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
3. Remove radiator fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - REMOVAL).
4. Remove accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - REMOVAL)
5. Remove thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - REMOVAL)

**Note:** The water pump mounting bolts (2) are different lengths. Note the location of the water pump mounting bolts (2).

6. Remove water pump mounting bolts (2) and remove water pump (1).

## INSPECTION - 2.7L

Inspect and replace the water pump if it has any of the following defects:

1. Damage or cracks on the pump body.

2. Coolant leaks: If the shaft seal is leaking, this will be evident by traces of thick deposits of dried glycol running down from the pump primary weep passage. A thin black stain below the pump primary weep hole/passagage is considered normal operation.

3. Coolant leaks: If the pump primary weep passage is plugged, coolant may come from the secondary weep passage and collect in the valley of the engine. The coolant will eventually run out the back side of the engine. Leakage from the secondary weep passage may give false indications that core plug(s) may be leaking on the back side of the engine block. If this condition is found, clean the primary weep passage of debris.
4. Impeller rubs inside of cylinder block.
5. Excessively loose or rough turning bearing.

**Note:** It is normal for the water pump to weep a small amount of coolant from the primary weep hole (black stain at weep passage). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident from the primary weep passage. This indicates a shaft seal failure and pump must be replaced. Coolant may leak from the secondary weep passage and fill the valley of the engine. If this condition is found, clean the primary weep passage of debris. Be sure to perform a thorough analysis before replacing water pump.

## INSTALLATION

### 2.7L ENGINE

1. Clean all sealing surfaces.
2. Install water pump (1) and gasket. Tighten mounting bolts to 12 N·m (105 in. lbs.).
3. Install timing chain guides and timing chain (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
4. Install the accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
5. Install the radiator fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
6. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

### 3.5L ENGINE

1. Clean all O-ring surfaces on pump and cover.
2. Apply Mopar® Dielectric Grease or the equivalent silicone grease to the O-ring (1) to facilitate assembly. Install new O-ring (1) on water pump body (3).
3. Position water pump (3) to engine.
4. Install mounting bolts. Tighten to 12 N·m (105 in. lbs.).
5. Install timing belt (Refer to 9 - ENGINE/VALVE TIMING/TIMING BELT/CHAIN AND SPROCKETS - INSTALLATION).
6. Install accessory drive belts (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
7. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).

## 5.7L ENGINE

1. Install water pump and mounting bolts (2). Tighten mounting bolts to 28 N·m (20 ft. lbs.).
2. Make sure double ended bolt (3) is in the proper location. Tighten double ended bolt to 28 N·m (20 ft. lbs.).
3. Install thermostat (Refer to 7 - COOLING/ENGINE/ENGINE COOLANT THERMOSTAT - INSTALLATION).
4. Install accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/DRIVE BELTS - INSTALLATION).
5. Install the radiator fan assembly (Refer to 7 - COOLING/ENGINE/RADIATOR FAN - INSTALLATION).
6. Connect negative battery cable.
7. Fill cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE).
8. Pressure test cooling system (Refer to 7 - COOLING - DIAGNOSIS AND TESTING).

TRANSMISSION

## TRANSMISSION

### STANDARD PROCEDURE

#### TRANSMISSION COOLER LINE QUICK CONNECT FITTING DISASSEMBLY/ ASSEMBLY

##### DISCONNECT

1. Remove dust cap by pulling it straight back off of quick connect fitting.
2. Place disconnect tool Special Tool 8875A onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect fitting.
4. Rotate the disconnect tool 60° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler line to remove.

81019138

## CONNECT

1. Align transmission cooler line with quick connect fitting while pushing straight into the fitting.
2. Push in on transmission cooler line until a "click" is heard or felt.
3. Slide dust cap down the transmission cooler line and snap it over the quick connect fitting until it is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

**Note:** If dust cap will not snap into place, repeat assembly step #2.

## TRANS COOLER

### DESCRIPTION

The automatic transmission cooler (2) is located in the front of the radiator and behind the front fascia and is combined with the A/C condenser. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The Transmission oil cooler/A/C condenser assembly is equipped with quick connect fitting for the transmission oil cooler lines, a tapping block (3) for the receiver/drier (4) and mounting provisions for the power steering cooler (5).

The transmission oil cooler/AC condenser is service as an assembly. For removal (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - REMOVAL) and installation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/A/C CONDENSER - INSTALLATION).

## TRANS COOLER LINES

### REMOVAL

1. Remove upper radiator closure panels
2. Using Tool 8875A, remove transmission cooler lines from transmission cooler (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).
3. Raise vehicle on hoist.
4. Remove front transmission cooler lines from the thermal bypass valve block.
5. Remove rear transmission cooler lines from the thermal bypass valve block
6. Remove the transmission cooler lines from the transmission.

### INSTALLATION

1. Install rear transmission cooler lines at transmission. Tighten fittings to 20 N·m (18 ft. lbs.).
2. Install rear transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N·m (18 ft. lbs.).
3. Install front transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N·m (18 ft. lbs.).
4. Install front transmission cooler lines into transmission cooler (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE).
5. Lower vehicle.
6. Check transmission fluid level (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC - 42RLE/FLUID - STANDARD PROCEDURE).

## AUDIO - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

## B210D-BATTERY VOLTAGE LOW

For the Occupant Classification System circuit diagram (Refer to 8 - ELECTRICAL/RESTRAINTS - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the module detects that the battery voltage is less than 9.0 volts for 1 second.

Possible Causes
VEHICLE CHARGING SYSTEM
AMPLIFIER

## Diagnostic Test

### 1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B210D-BATTERY VOLTAGE LOW?**

- Yes** >> Go To
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

### 2. CHECK THE BATTERY VOLTAGE TO THE AMPLIFIER

With the scan tool in Data Display, read Amplifier battery voltage.

**Is the battery voltage less than 9.0 volts?**

- Yes** >> Go To 3
- No** >> Replace the Amplifier in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.

### 3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

**Does the scan tool display any Charging System related DTCs?**

- Yes** >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- No** >> Replace the Amplifier in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.

B210E-BATTERY VOLTAGE HIGH

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the module detects that the battery voltage is greater 16.5 volts for 1 second.

Possible Causes
VEHICLE CHARGING SYSTEM
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.  
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B210E-BATTERY VOLTAGE HIGH?

- Yes    >> Go To 2
- No    >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

2. CHECK THE BATTERY VOLTAGE TO THE AMPLIFIER

With the scan tool in Data Display, read Amplifier battery voltage.

Is the battery voltage greater than 16.5 volts?

- Yes    >> Go To 3
- No    >> Replace the Amplifier in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.

**B210E-BATTERY VOLTAGE HIGH (CONTINUED)****3. CHECK FOR CHARGING SYSTEM RELATED DTCs IN THE POWERTRAIN CONTROL MODULE (PCM)**

With the scan tool in ECU View, select PCM and check for any Charging System related DTCs.

**Does the scan tool display any Charging System related DTCs?**

- Yes** >> Diagnose and repair the DTCs. Refer to (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING).
- No** >> Replace the Amplifier in accordance with the Service Information.  
Perform OCS VERIFICATION TEST - VER 1.

**B221F-AMPLIFIER INTERNAL**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a software checksum test failure.

Possible Causes
AMPLIFIER

**Diagnostic Test**

**1. REPLACE THE AMPLIFIER**

When this code is set, the Amplifier must be replaced.

**Repair**

Replace the Amplifier in accordance with the Service Information.  
Perform the BODY VERIFICATION TEST-VER 1.

---

**B1488–CABIN EQ MISMATCH PERFORMANCE**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the cabin EQ message is incompatible with the EQ's stored in the amplifier for 10 consecutive cycles, then the amplifier will set this DTC.

POSSIBLE CAUSES
NO COMMUNICATION WITH FRONT CONTROL MODULE
ACTIVE FCM DTCs
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1488–CABIN EQ MISMATCH PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK AMPLIFIER BUSSED INPUTS/OUTPUTS**

With the scan tool in Amplifier Data Display, read the Cabin EQ# settings in the Bussed Inputs and Bussed Outputs Sections.

**Note:** The Cabin EQ# settings in the Inputs/Outputs section should match one another. The Cabin EQ# in the Inputs section is the information that is received from the FCM. The Cabin EQ# in the Outputs section is the information that is stored in the Amplifier's memory.

The Cabin EQ# settings are as follows:

- •\$51: HB Premium 1 (w/o Subwoofer)
- •\$52: HB Premium 2 (with Subwoofer)

**Do the Cabin EQ# settings match one another?**

**Yes** >> Replace the Amplifier in accordance to the service information.  
Perform the BODY VERIFICATION TEST-VER 1.

**No** >> Go To 3

**B1488-CABIN EQ MISMATCH PERFORMANCE (CONTINUED)****3. VERIFY COMMUNICATION WITH FRONT CONTROL MODULE**

With the scan tool in ECU VIEW, read active modules on the bus.

**Does the scan tool show the Front Control Module active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Communication category for the related symptoms.  
Perform the BODY VERIFICATION TEST VER 1.

---

**4. CHECK FRONT CONTROL MODULE FOR ACTIVE DTCs**

With the scan tool, erase FCM DTCs.

Turn the ignition off. Wait approximately 10 seconds.

Turn the ignition on.

With the scan tool, read FCM DTCs.

**Are any active DTCs present?**

**Yes** >> Refer to symptom list for problems related to the Front Control Module.  
Perform the BODY VERIFICATION TEST VER 1.

**No** >> Replace the Front Control Module in accordance with the Service Information.  
Perform the BODY VERIFICATION TEST-VER.1

---

**B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of  $5 \pm 1$  sec.

Possible Causes
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1460-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?**

- Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND (X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND LEFT FRONT I/P SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****2. CHECK THE (X209) AMPLIFIED LEFT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C2 harness connector.

Measure the resistance between ground and the (X209) Amplified Left Front I/P Speaker (+) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X209) Amplified Left Front I/P Speaker (+) circuit for a short to ground.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**3. CHECK THE (X299) AMPLIFIED LEFT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X299) Amplified Left Front I/P Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X299) Amplified Left Front I/P Speaker (-) for a short to ground.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 4

**B1461-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT I/P SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Left Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground.

**Is the resistance below 10K ohms?**

- Yes** >> Replace the Left Front I/P Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1462-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****2. CHECK FOR VOLTAGE ON THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Left I/P Speaker harness connector.

Turn the ignition on.

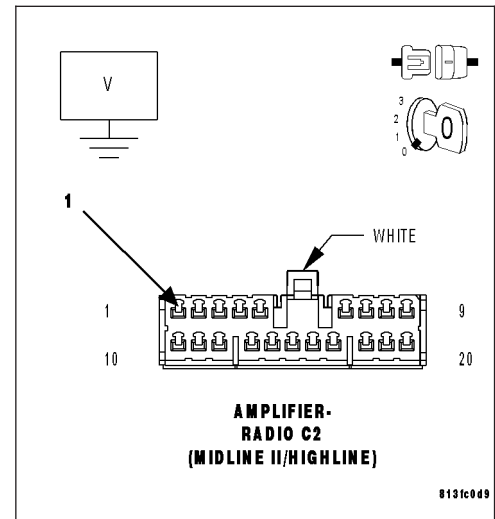

Measure for voltage on the (X209) Amplified Left I/P Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**3. CHECK FOR VOLTAGE ON THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT**

Measure for voltage on the (X299) Amplified Left I/P Speaker (-) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

# B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**  
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT OPEN
(X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT OPEN
LEFT FRONT I/P SPEAKER
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****2. CHECK THE OPERATION OF THE LEFT FRONT I/P SPEAKER**

Disconnect the Left I/P Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left I/P Speaker circuits in the Amplified Left I/P Speaker harness connector.

**Is the voltage present greater than 1 volt?**

**Yes** >> Replace the Amplified Left I/P Speaker in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X209) Amplified Left I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X209) Amplified Left I/P Speaker (+) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

**B1463-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****4. CHECK THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X299) Amplified Left I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Left I/P Speaker harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Repair the (X299) Amplified Left I/P Speaker (-) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

## B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

**B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**  
The amplifier detects that the output circuits are shorted together.

**Possible Causes**

(X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUIT  
AMPLIFIED LEFT I/P SPEAKER  
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED LEFT I/P SPEAKER**

Disconnect the Amplified Left I/P Speaker.

Measure the resistance of the speaker between the two terminals.

**Is the resistance of the speaker less than 1 ohm?**

**Yes** >> Replace the Amplified Left I/P Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1464-CHANNEL 1 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)****3. CHECK THE (X209) AMPLIFIED LEFT I/P SPEAKER (+) CIRCUIT, AND THE (X299) AMPLIFIED LEFT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X209) Amplified Left I/P Speaker (+) circuit, and the (X299) Amplified Left I/P Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.  
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1465-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

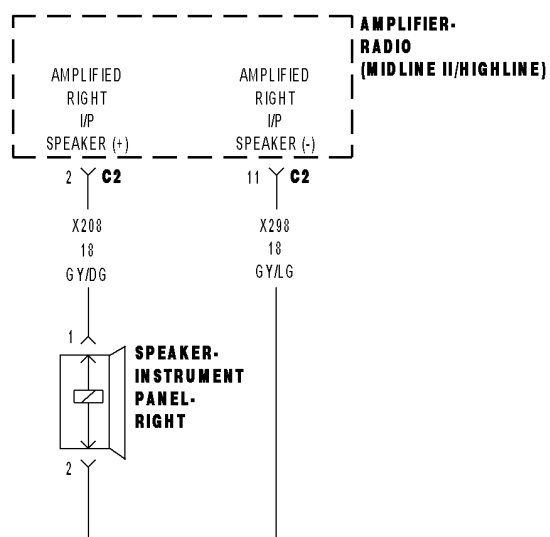

- Yes

>> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No

>> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

## B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT SHORTED TO GROUND
(X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT SHORTED TO GROUND
RIGHT FRONT I/P SPEAKER
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****2. CHECK THE (X208) AMPLIFIED RIGHT FRONT I/P SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C2 harness connector.

Measure the resistance between ground and the (X208) Amplified Right Front I/P Speaker (+) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X208) Amplified Right Front I/P Speaker (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**3. CHECK THE (X298) AMPLIFIED RIGHT FRONT I/P SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X298) Amplified Right Front I/P Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X298) Amplified Right Front I/P Speaker (-) for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 4

**B1466-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT I/P SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Right Front I/P Speaker.

Measure the resistance of the speaker circuit between the Amplifier C2 harness connector and ground..

**Is the resistance below 10K ohms?**

- Yes** >> Replace the Right Front I/P Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

## B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1467-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****2. CHECK FOR VOLTAGE ON THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Disconnect the Amplified Right I/P Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X208) Amplified Right I/P Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X208) Amplified Right I/P Speaker (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**3. CHECK FOR VOLTAGE ON THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT**

Measure for voltage on the (X298) Amplified Right I/P Speaker (-) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X298) Amplified Right I/P Speaker (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**  
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT OPEN (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT OPEN RIGHT I/P SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****2. CHECK THE OPERATION OF THE RIGHT FRONT I/P SPEAKER**

Disconnect the Right I/P Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right I/P Speaker circuits in the Amplified Right I/P Speaker harness connector.

**Is the voltage present greater than 1 volt?**

**Yes** >> Replace the Amplified Right I/P Speaker in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**3. CHECK THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X208) Amplified Right I/P Speaker (+) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X208) Amplified Right I/P Speaker (+) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

**B1468-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****4. CHECK THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance of the (X298) Amplified Right I/P Speaker (-) circuit between the Amplifier C2 harness connector and the Amplified Right I/P Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Repair the (X298) Amplified Right I/P Speaker (-) circuit for an open.

Perform BODY VERIFICATION TEST VER-1.

B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

**B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**  
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT SHORTED TO THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUIT AMPLIFIED RIGHT I/P SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT I/P SPEAKER**

Disconnect the Amplified Right I/P Speaker.

Measure the resistance of the speaker between the two terminals.

**Is the resistance of the speaker less than 1 ohm?**

**Yes** >> Replace the Amplified Right I/P Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1469-CHANNEL 2 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)****3. CHECK THE (X208) AMPLIFIED RIGHT I/P SPEAKER (+) CIRCUIT, AND THE (X298) AMPLIFIED RIGHT I/P SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C2 harness connector.

Measure the resistance between the (X208) Amplified Right I/P Speaker (+) circuit, and the (X298) Amplified Right I/P Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X208) Amplified Right I/P Speaker (+) circuit, and the (X298) Amplified Right I/P Speaker (-) circuit for a short together.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.

Perform BODY VERIFICATION TEST VER-1.

**B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of  $5 \pm 1$  sec.

Possible Causes
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B146A-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?**

- Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW**

**B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND LEFT FRONT DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE (X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X201) Amplified Left Front Door Speaker (+) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X201) Amplified Left Front Door Speaker (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B146B-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

**3. CHECK THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X291) Amplified Left Front Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X291) Amplified Left Front Door Speaker (-) for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 4

---

**4. CHECK OPERATION OF THE AMPLIFIED LEFT FRONT DOOR SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Left Front Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

**Is the resistance below 10K ohms?**

**Yes** >> Replace the Left Front Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

# B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Left Front Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X201) Amplified Left Front Door Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

- Yes** >> Repair the (X201) Amplified Left Front Door Speaker (+) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

**B146C-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

**3. CHECK FOR VOLTAGE ON THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT**

Measure for voltage on the (X291) Amplified Left Front Door Speaker (-) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X291) Amplified Left Front Door Speaker (-) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

The diagram illustrates the electrical connection for the left front door speaker. At the bottom, a dashed box represents the 'AMPLIFIER-RADIO (MIDLINE II/HIGHLINE)', containing two columns of terminals. The left column has terminals 1, 14, and 11, all labeled 'X201 18 GY/VT' and 'C1'. The right column has terminals 7, 15, and 12, all labeled 'X291 18 GY/YL' and 'C1'. A solid line connects terminal 1 to terminal 12. Another solid line connects terminal 11 to terminal 14. A dashed line connects terminal 14 to terminal 12. A solid line connects terminal 12 to terminal 15. A solid line connects terminal 15 to terminal 7. A solid line connects terminal 7 to the speaker. The speaker is labeled 'SPEAKER-LEFT FRONT DOOR' and is shown with a switch and a terminal block. The terminal block has terminals 1 and 3, both labeled 'X291 18 GY/YL' and 'C300'. The speaker is connected to terminal 1.

**B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**  
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X201) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT OPEN
(X291) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT OPEN
LEFT REAR DOOR SPEAKER
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE LEFT REAR DOOR SPEAKER**

Disconnect the Left Rear Door Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Door Speaker circuits in the Amplified Left Rear Door Speaker harness connector.

**Is the voltage present greater than 1 volt?**

**Yes** >> Replace the Amplified Left Rear Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B146D-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. CHECK THE (X201) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X201) Amplified Left Rear Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X201) Amplified Left Rear Door Speaker (+) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

**4. CHECK THE (X291) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X291) Amplified Left Rear Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Repair the (X291) Amplified Left Rear Door Speaker (-) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

# B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

**B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**  
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUIT AMPLIFIED LEFT FRONT DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED LEFT FRONT DOOR SPEAKER**

Disconnect the Amplified Left Front Door Speaker.

Measure the resistance of the speaker between the two terminals.

**Is the resistance of the speaker less than 1 ohm?**

**Yes** >> Replace the Amplified Left Front Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B146E-CHANNEL 3 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)****3. CHECK THE (X201) AMPLIFIED LEFT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X291) AMPLIFIED LEFT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X201) Amplified Left Front Door Speaker (+) circuit, and the (X291) Amplified Left Front Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

- Yes**    >> Repair the (X201) Amplified Left Front Door Speaker (+) circuit, and the (X291) Amplified Left Front Door Speaker (-) circuit for a short together.  
            Perform BODY VERIFICATION TEST VER-1.
- No**      >> Replace the Amplifier in accordance with the service information.  
            Perform BODY VERIFICATION TEST VER-1.
-

B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.  
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B146F-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes

>> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No

>> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

# B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND RIGHT FRONT DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X202) Amplified Right Front Door Speaker (+) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X202) Amplified Left Front Door Speaker (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1470-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****3. CHECK THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X292) Amplified Right Front Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X292) Amplified Right Front Door Speaker (-) for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 4

---

**4. CHECK OPERATION OF THE AMPLIFIED RIGHT FRONT DOOR SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Right Front Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

**Is the resistance below 10K ohms?**

**Yes** >> Replace the Right Front Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

**B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH**

**B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Right Front Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X202) Amplified Right Front Door Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

- Yes** >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

**B1471-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

**3. CHECK FOR VOLTAGE ON THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT**

Measure for voltage on the (X292) Amplified Right Front Door Speaker (-) circuit.

**Is the voltage above 10.0 volts?**

- Yes**    >> Repair the (X292) Amplified Right Front Door Speaker (-) circuit for a short to voltage.  
            Perform BODY VERIFICATION TEST VER-1.
- No**      >> Replace the Amplifier in accordance with the service information.  
            Perform BODY VERIFICATION TEST VER-1.
-

# B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**  
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT OPEN (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT OPEN RIGHT FRONT DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE RIGHT FRONT DOOR SPEAKER**

Disconnect the Right Front Door Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Front Door Speaker circuits in the Amplified Right Front Door Speaker harness connector.

**Is the voltage present greater than 1 volt?**

**Yes** >> Replace the Amplified Right Front Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1472-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. CHECK THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X202) Amplified Right Front Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Front Door Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

**4. CHECK THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

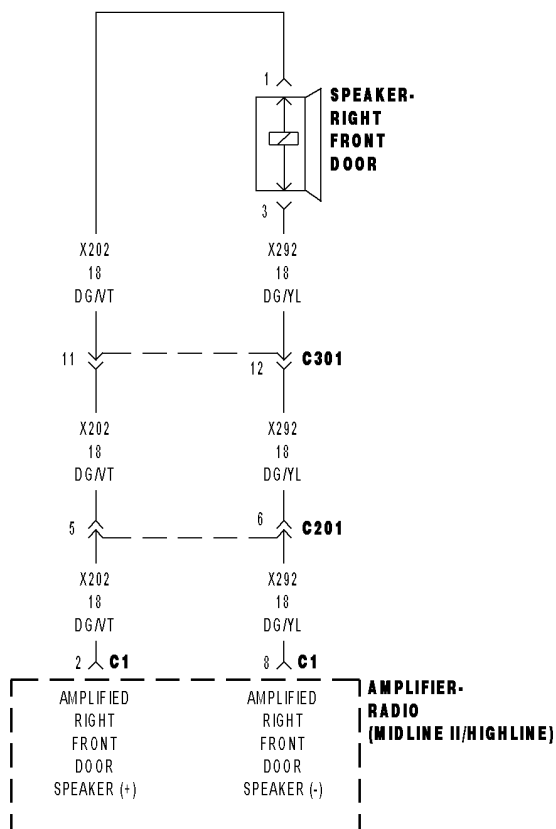

Measure the resistance of the (X292) Amplified Right Front Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Front Door Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Repair the (X292) Amplified Right Front Door Speaker (-) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

**B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER**

**B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**  
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUIT AMPLIFIED RIGHT FRONT DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT FRONT DOOR SPEAKER**

Disconnect the Amplified Right Front Door Speaker.

Measure the resistance of the speaker between the two terminals.

**Is the resistance of the speaker less than 1 ohm?**

**Yes** >> Replace the Amplified Right Front Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1473-CHANNEL 4 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)****3. CHECK THE (X202) AMPLIFIED RIGHT FRONT DOOR SPEAKER (+) CIRCUIT, AND THE (X292) AMPLIFIED RIGHT FRONT DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X202) Amplified Right Front Door Speaker (+) circuit, and the (X292) Amplified Right Front Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

- Yes**    >> Repair the (X202) Amplified Right Front Door Speaker (+) circuit, and the (X292) Amplified Right Front Door Speaker (-) circuit for a short together.  
            Perform BODY VERIFICATION TEST VER-1.
- No**      >> Replace the Amplifier in accordance with the service information.  
            Perform BODY VERIFICATION TEST VER-1.
-

**B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of  $5 \pm 1$  sec.

Possible Causes
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1474-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?**

- Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND LEFT REAR DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE (X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X393) Amplified Left Rear Door Speaker (+) circuit.

**Is the resistance below 10K ohms?**

- Yes** >> Repair the (X393) Amplified Left Rear Door Speaker (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

**B1475-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****3. CHECK THE (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X303) Amplified Left Rear Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X303) Amplified Left Rear Door Speaker (-) for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 4

---

**4. CHECK OPERATION OF THE AMPLIFIED LEFT REAR DOOR SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Left Rear Door Speaker.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

**Is the resistance below 10K ohms?**

**Yes** >> Replace the Left Rear Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

## B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Left Rear Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X393) Amplified Left Rear Door Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

- Yes** >> Repair the (X393) Amplified Left Rear Door Speaker (+) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

**B1476-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

**3. CHECK FOR VOLTAGE ON THE (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT**

Measure for voltage on the (X303) Amplified Left Rear Door Speaker (-) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X303) Amplified Left Rear Door Speaker (-) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**  
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT OPEN (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT OPEN LEFT REAR DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE LEFT REAR DOOR SPEAKER**

Disconnect the Left Rear Door Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Left Rear Door Speaker circuits in the Amplified Left Rear Door Speaker harness connector.

**Is the voltage present greater than 1 volt?**

**Yes** >> Replace the Amplified Left I/P Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1477-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. CHECK THE (X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X393) Amplified Left Rear Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X393) Amplified Left Rear Door Speaker (+) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

**4. CHECK THE (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X303) Amplified Left Rear Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Left Rear Door Speaker harness connector.

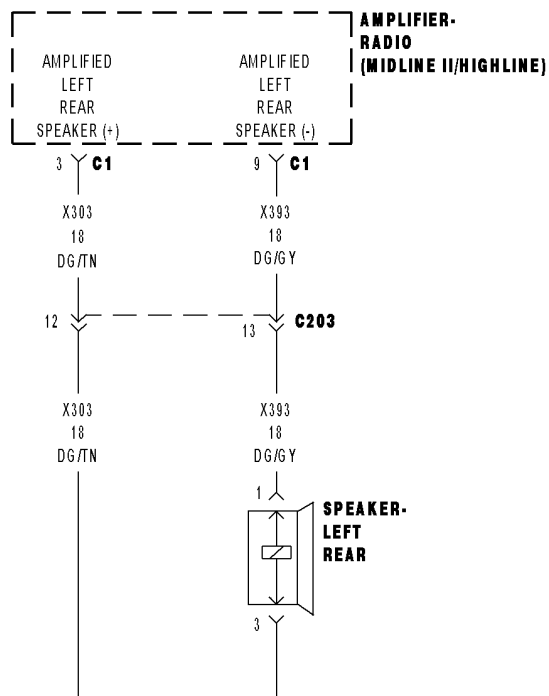

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Repair the (X303) Amplified Left Rear Door Speaker (-) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

## B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

**B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**  
The amplifier detects that the output circuits are shorted together.

**Possible Causes**

(X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUIT  
AMPLIFIED LEFT REAR DOOR SPEAKER  
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED LEFT REAR DOOR SPEAKER**

Disconnect the Amplified Left Rear Door Speaker.

Measure the resistance of the speaker between the two terminals.

**Is the resistance of the speaker less than 1 ohm?**

**Yes** >> Replace the Amplified Left Rear Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1478-CHANNEL 5 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)****3. CHECK THE (X393) AMPLIFIED LEFT REAR DOOR SPEAKER (+) CIRCUIT, AND THE (X303) AMPLIFIED LEFT REAR DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X393) Amplified Left Rear Door Speaker (+) circuit, and the (X303) Amplified Left Rear Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

- Yes**    >> Repair the (X393) Amplified Left Rear Door Speaker (+) circuit, and the (X303) Amplified Left Rear Door Speaker (-) circuit for a short together.  
            Perform BODY VERIFICATION TEST VER-1.
- No**      >> Replace the Amplifier in accordance with the service information.  
            Perform BODY VERIFICATION TEST VER-1.
-

B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.  
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1479-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

- Yes

>> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No

>> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

# B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO GROUND (X394) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT SHORTED TO GROUND RIGHT REAR DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE (X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X304) Amplified Right Rear Door Speaker (+) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X304) Amplified Right Rear Door Speaker (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B147A-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****3. CHECK THE (X394) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X394) Amplified Right Rear Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X394) Amplified Right Rear Door Speaker (-) for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 4

---

**4. CHECK OPERATION OF THE AMPLIFIED RIGHT REAR DOOR SPEAKER**

Turn the ignition off.

Reconnect and reinstall the Right Rear Door Speaker.

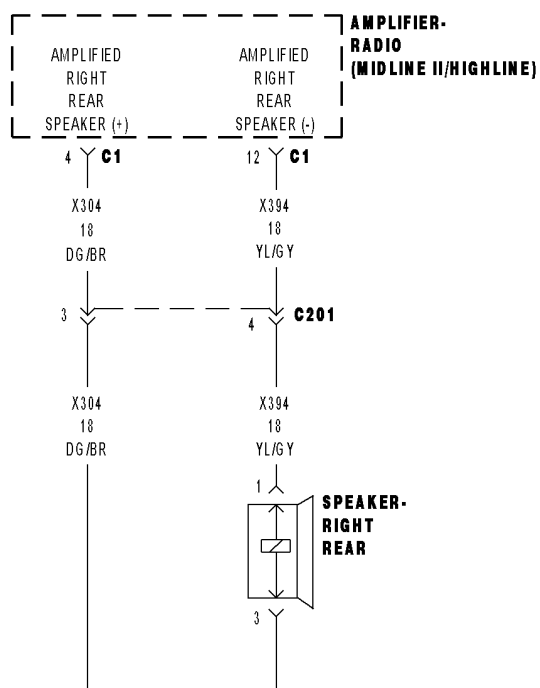

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

**Is the resistance below 10K ohms?**

**Yes** >> Replace the Right Rear Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

**B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH**

**B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT SHORT TO VOLTAGE (X394) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Right Rear Door Speaker harness connector.

Turn the ignition on.

Measure for voltage on the (X304) Amplified Right Rear Door Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

- Yes** >> Repair the (X304) Amplified Right Rear Door Speaker (+) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

**B147B-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

**3. CHECK FOR VOLTAGE ON THE (X394) AMPLIFIED RIGHT REAR SPEAKER SPEAKER (-) CIRCUIT**

Measure for voltage on the (X394) Amplified Right Rear Door Speaker (-) circuit.

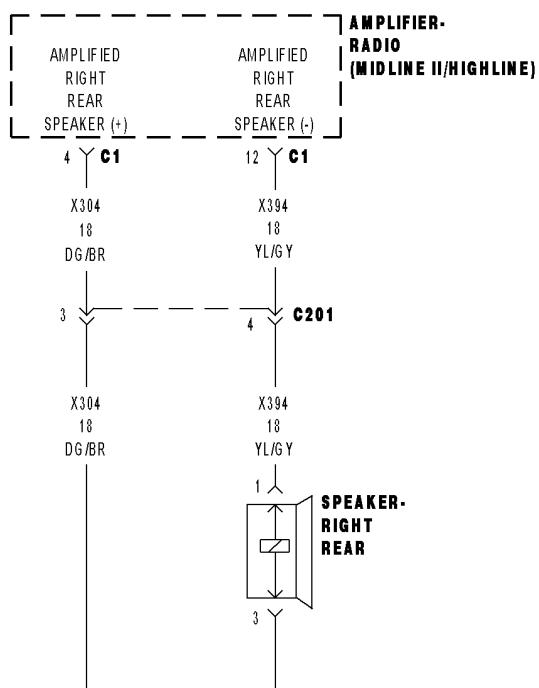

**Is the voltage above 10.0 volts?**

**Yes**    >> Repair the (X394) Amplified Right Rear Door Speaker (-) circuit for a short to voltage.  
             Perform BODY VERIFICATION TEST VER-1.

**No**      >> Replace the Amplifier in accordance with the service information.  
             Perform BODY VERIFICATION TEST VER-1.

---

# B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**  
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT OPEN (X394) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT OPEN RIGHT REAR DOOR SPEAKER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE RIGHT REAR DOOR SPEAKER**

Disconnect the Right Rear Door Speaker harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Right Rear Door Speaker circuits in the Amplified Right Rear Door Speaker harness connector.

**Is the voltage present greater than 1 volt?**

**Yes** >> Replace the Amplified Right Rear Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B147C-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. CHECK THE (X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X304) Amplified Right Rear Door Speaker (+) circuit between the Amplifier C1 harness connector and the Amplified Right Rear Door Speaker harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X304) Amplified Right Rear Door Speaker (+) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

**4. CHECK THE (X394) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X394) Amplified Right Rear Door Speaker (-) circuit between the Amplifier C1 harness connector and the Amplified Right Rear Door Speaker harness connector.

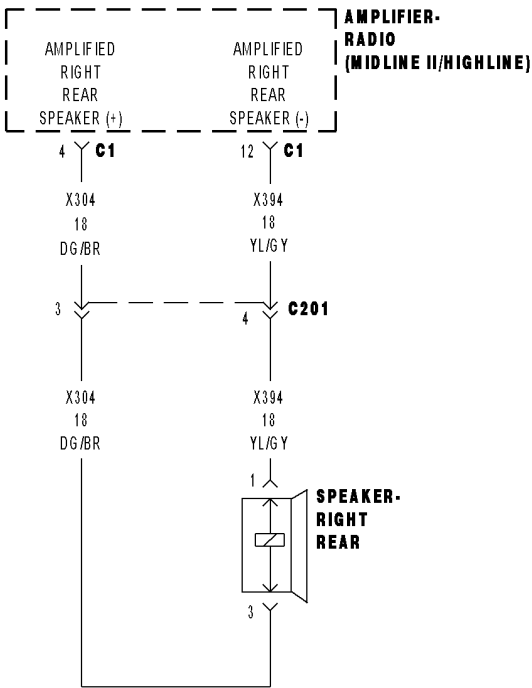

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Repair the (X394) Amplified Right Rear Door Speaker (-) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

**B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**  
The amplifier detects that the output circuits are shorted together.

Possible Causes
(X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT SHORTED TO THE (X394) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUIT
AMPLIFIED RIGHT REAR DOOR SPEAKER
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED RIGHT REAR DOOR SPEAKER**

Disconnect the Amplified Right Rear Door Speaker.

Measure the resistance of the speaker between the two terminals.

**Is the resistance of the speaker less than 1 ohm?**

**Yes** >> Replace the Amplified Right Rear Door Speaker in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B147D-CHANNEL 6 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

**3. CHECK THE (X304) AMPLIFIED RIGHT REAR DOOR SPEAKER (+) CIRCUIT, AND THE (X394) AMPLIFIED RIGHT REAR DOOR SPEAKER (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X304) Amplified Right Rear Door Speaker (+) circuit, and the (X394) Amplified Right Rear Door Speaker (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X304) Amplified Right Rear Door Speaker (+) circuit, and the (X394) Amplified Right Rear Door Speaker (-) circuit for a short together.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

**B147E-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of  $5 \pm 1$  sec.

Possible Causes
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

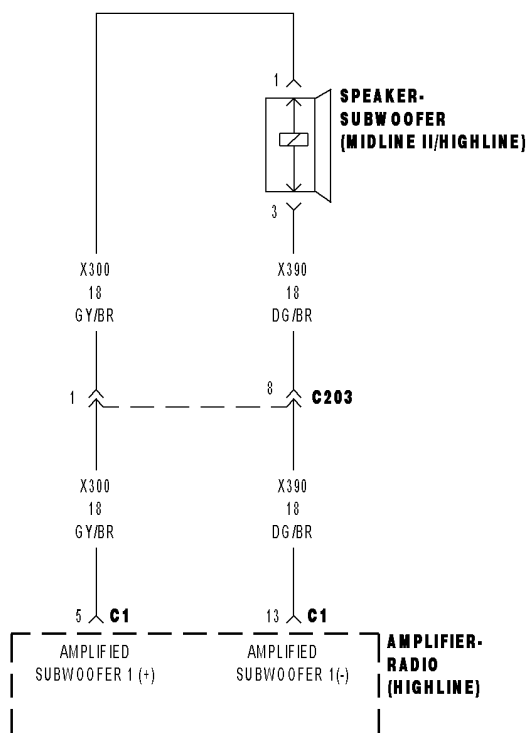

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B147E-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?**

- Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B147F-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT LOW**

**B147F-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a shorted to ground condition on the speaker output circuit.

Possible Causes
(X300) AMPLIFIED SUBWOOFER 1(+) CIRCUIT SHORTED TO GROUND (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT SHORTED TO GROUND SUBWOOFER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B147F-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE (X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Amplifier C1 harness connector.

Measure the resistance between ground and the (X300) Amplified Subwoofer 1 (+) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X300) Amplified Subwoofer 1 (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B147F-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****3. CHECK THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X390) Amplified Subwoofer 1 (-) circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X390) Amplified Subwoofer 1 (-) for a short to ground.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 4

---

**4. CHECK OPERATION OF THE AMPLIFIED SUBWOOFER**

Turn the ignition off.

Reconnect the Subwoofer harness connector.

Measure the resistance of the speaker circuit between the Amplifier C1 harness connector and ground..

**Is the resistance below 10K ohms?**

**Yes** >> Replace the Subwoofer 1 in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

## B1480-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B1480-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Amplifier detects a short to battery condition on the output circuit.

Possible Causes
(X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT SHORT TO VOLTAGE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT SHORT TO VOLTAGE AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1480-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK FOR VOLTAGE ON THE (X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Disconnect the Amplified Subwoofer 1 harness connector.

Turn the ignition on.

Measure for voltage on the (X300) Amplified Subwoofer 1 (+) circuit.

**Is the voltage above 10.0 volts?**

- Yes** >> Repair the (X300) Amplified Subwoofer 1 (+) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.
- No** >> Go To 3

**B1480-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

**3. CHECK FOR VOLTAGE ON THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT**

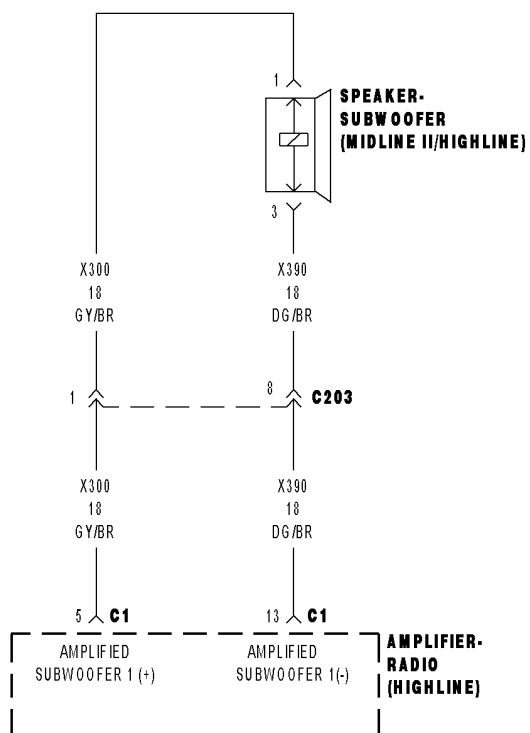

Measure for voltage on the (X390) Amplified Subwoofer 1 (-) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X390) Amplified Subwoofer 1 (-) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

---

**B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN**

**B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Amplifier Bus wake-up. Amplifier reset with scan tool.
- **Set Condition:**  
The Amplifier detects an open condition on the speaker output circuit.

Possible Causes
(X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT OPEN (X299) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT OPEN SUBWOOFER AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on.

Turn the radio on.

With the scan tool, erase Amplifier DTCs.

With the scan tool, reset the amplifier.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE SUBWOOFER**

Disconnect the Subwoofer harness connector.

Turn the radio on and turn the volume to mid level.

With a voltmeter set to read in A/C voltage, measure the voltage of the Amplified Subwoofer 1 circuits in the Amplified Subwoofer harness connector.

**Is the voltage present greater than 1 volt?**

**Yes** >> Replace the Amplified Subwoofer in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1481-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. CHECK THE (X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X300) Amplified Subwoofer 1 (+) circuit between the Amplifier C1 harness connector and the Amplified Subwoofer harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X300) Amplified Subwoofer 1 (+) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

**4. CHECK THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance of the (X390) Amplified Subwoofer 1 (-) circuit between the Amplifier C1 harness connector and the Amplified Subwoofer harness connector.

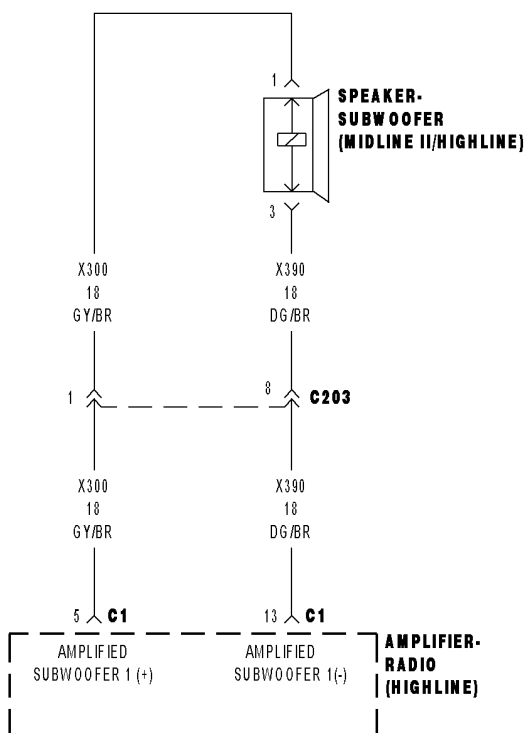

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Repair the (X390) Amplified Subwoofer 1 (-) circuit for an open.  
Perform BODY VERIFICATION TEST VER-1.

---

## B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER

**B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on. Radio volume at 25 or higher.
- **Set Condition:**  
The amplifier detects that the output circuits are shorted together.

**Possible Causes**

(X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT SHORTED TO THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUIT  
AMPLIFIED SUBWOOFER 1  
AMPLIFIER

**Diagnostic Test****1. CHECK FOR AN INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, erase Amplifier DTCs.

Turn the radio on.

Turn the volume level to 25.

With the scan tool, read Amplifier DTCs.

**Does the scan tool display active: B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**2. CHECK THE OPERATION OF THE AMPLIFIED SUBWOOFER 1**

Disconnect the Amplified Subwoofer 1.

Measure the resistance of the speaker between the two terminals.

**Is the resistance of the speaker less than 1 ohm?**

**Yes** >> Replace the Amplified Subwoofer 1 in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1482-CHANNEL 7 AUDIO SPEAKER OUTPUT CIRCUIT SHORTED TOGETHER (CONTINUED)****3. CHECK THE (X300) AMPLIFIED SUBWOOFER 1 (+) CIRCUIT, AND THE (X390) AMPLIFIED SUBWOOFER 1 (-) CIRCUITS FOR A SHORT TOGETHER**

Turn the ignition off.

Disconnect the Amplifier C1 harness connector.

Measure the resistance between the (X300) Amplified Subwoofer 1 (+) circuit, and the (X390) Amplified Subwoofer 1 (-) circuit.

**Is the resistance below 10K ohms?**

- Yes**    >> Repair the (X300) Amplified Subwoofer 1 (+) circuit, and the (X390) Amplified Subwoofer 1 (-) circuit for a short together.  
             Perform BODY VERIFICATION TEST VER-1.
- No**      >> Replace the Amplifier in accordance with the service information.  
             Perform BODY VERIFICATION TEST VER-1.
-

B1483-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
This DTC will set if a DC offset occurs on the output channel, the amplifier shall set a DTC after a maturity rate of 5 ±1 sec.

Possible Causes
AMPLIFIER

Diagnostic Test

1. CHECK FOR AN INTERMITTENT CONDITION

Turn the ignition on, then off, and then on again.  
With the scan tool, read Amplifier DTCs.

Does the scan tool display active: B1483-CHANNEL 8 AUDIO SPEAKER OUTPUT CIRCUIT PERFORMANCE?

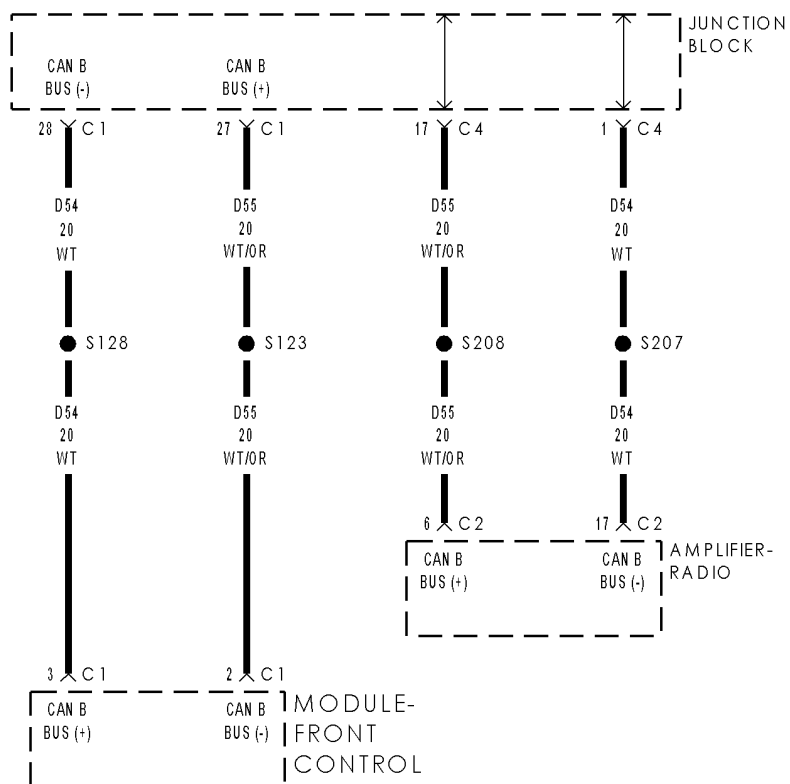

- Yes

>> Replace the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.
- No

>> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

## U0019-CAN B BUS

**U0019–CAN B BUS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously.
- **Set Condition:**  
Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN FRONT CONTROL MODULE (D54) CAN B BUS (–) CIRCUIT OPEN (D55) CAN B BUS (+) CIRCUIT OPEN AMPLIFIER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTCs

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

**Does the scan tool display U0019–CAN B BUS CIRCUIT?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**2. CHECK FRONT CONTROL MODULE DTCs**

With the scan tool, read Front Control Module DTCs

**Does the scan tool display any CAN B BUS DTCs – ACTIVE?**

**Yes** >> Refer to the symptom list for problems related to Communication in the ELECTRICAL.– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

**No** >> Go to 3

**U0019-CAN B BUS (CONTINUED)****3. CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Amplifier harness connector.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

**Is the resistance below 2.0 ohms?**

- Yes**    >> Go To 4  
            Perform BODY VERIFICATION TEST - VER 1.
- No**      >> Repair the Can B Bus (+) circuit for an open.  
            Perform BODY VERIFICATION TEST - VER 1.
- 

**4. CAN B BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D54) Can B Bus (-) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

**Is the resistance below 2.0 ohms?**

- Yes**    >> Replace the Amplifier in accordance with the service information..  
            Perform BODY VERIFICATION TEST - VER 1.
- No**      >> Repair the Can B Bus (-) circuit for an open.  
            Perform BODY VERIFICATION TEST - VER 1.
-

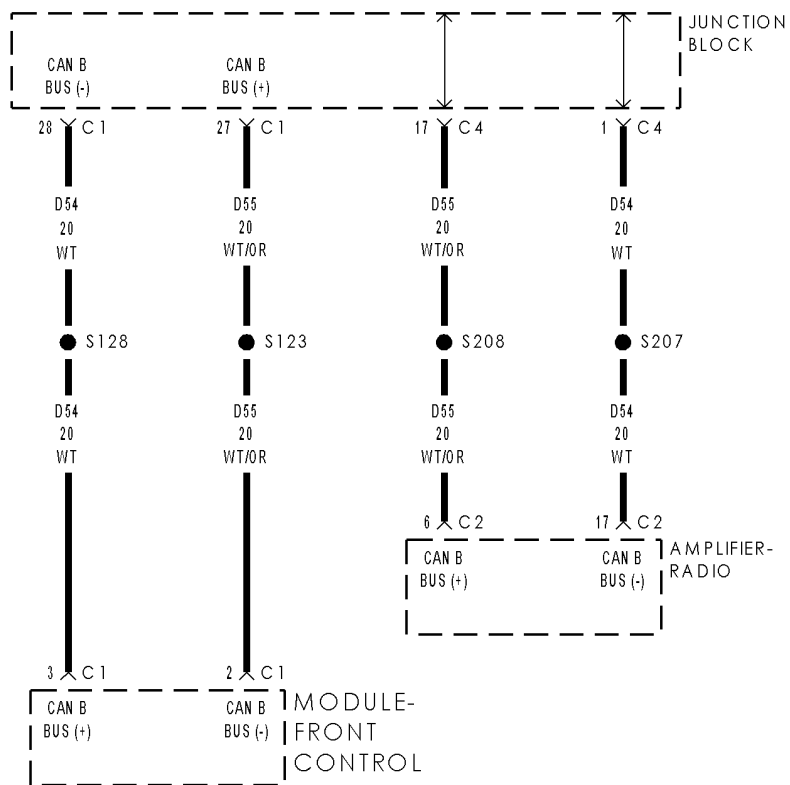

## **U0020-CAN B BUS OFF PERFORMANCE**

For the Amplifier circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)

**U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)**

- **When Monitored:**  
Continuously.
- **Set Condition:**  
Whenever the Can B Bus (+) or B Bus (–) circuit is open, shorted to voltage or shorted to ground, this code will set.

Possible Causes
CAN B BUS DTCs IN FRONT CONTROL MODULE (D54) CAN B BUS (–) CIRCUIT OPEN (D55) CAN B BUS (+) CIRCUIT OPEN AMPLIFIER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase DTCs

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read DTCs.

**Does the scan tool display U0020-CAN B BUS OFF PERFORMANCE?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST - VER 1.

**2. CHECK FRONT CONTROL MODULE DTCs**

With the scan tool, read Front Control Module DTCs

**Does the scan tool display any CAN B BUS DTCs – ACTIVE?**

**Yes** >> Refer to the symptom list for problems related to Communication in the ELECTRICAL– ELECTRONIC CONTROL MODULES – ELECTRICAL DIAGNOSES section.

**No** >> Go to 3

**U0020-CAN B BUS OFF PERFORMANCE (CONTINUED)****3. CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Amplifier harness connector.

Disconnect the Front Control Module C1 harness connector.

Measure the resistance of the (D55) Can B Bus (+) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

**Is the resistance below 2.0 ohms?**

- Yes**    >> Go To 4  
            Perform BODY VERIFICATION TEST - VER 1.
- No**      >> Repair the Can B Bus (+) circuit for an open.  
            Perform BODY VERIFICATION TEST - VER 1.
- 

**4. CAN B BUS (–) CIRCUIT OPEN**

Measure the resistance of the (D54) Can B Bus (–) circuit between the Front Control Module C1 harness connector and the Amplifier harness connector.

**Is the resistance below 2.0 ohms?**

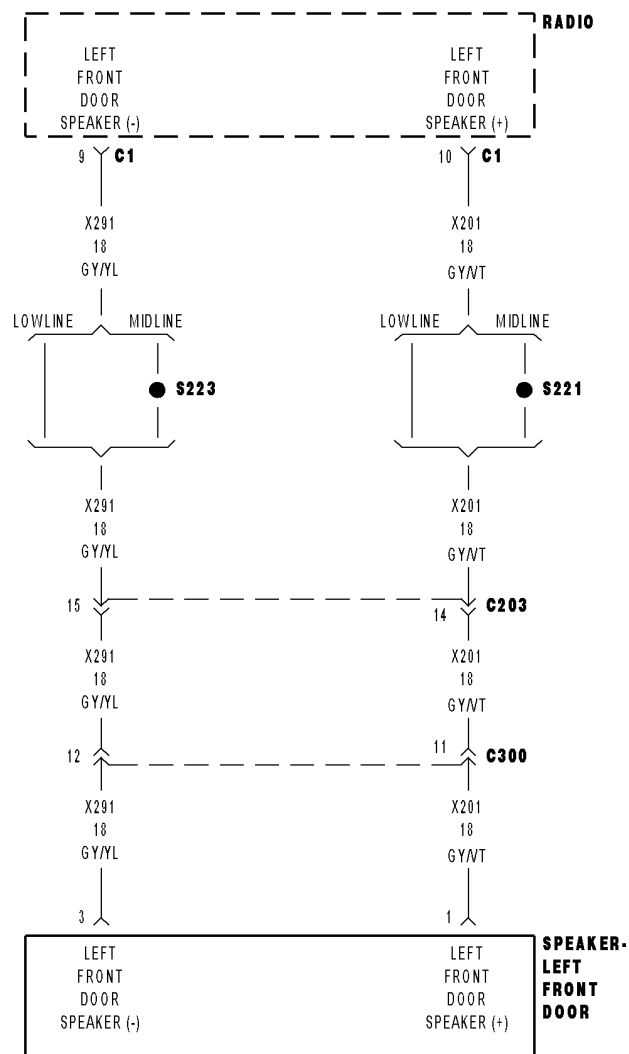

- Yes**    >> Replace the Amplifier in accordance with the service information..  
            Perform BODY VERIFICATION TEST - VER 1.
- No**      >> Repair the Can B Bus (–) circuit for an open.  
            Perform BODY VERIFICATION TEST - VER 1.
-

## **U0141—LOST COMMUNICATION WITH FRONT CONTROL MODULE**

For a complete wiring diagram **Refer to Section 8W.**

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes
SPEAKER (X201) (X291) LEFT FRONT SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST VER 1.

**2. (X201) (X291) SPEAKER OUTPUT CIRCUITS.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Left Audio Speaker connector.

Measure the resistance between ground and each speaker (X201)(+) and (X291)(-) circuit.

**Is the resistance below 1000.0 ohms for each circuit?**

**Yes** >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

**No** >> Go To 3

**B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

**3. SPEAKER**

Turn the ignition off.

Disconnect the Front Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1401-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

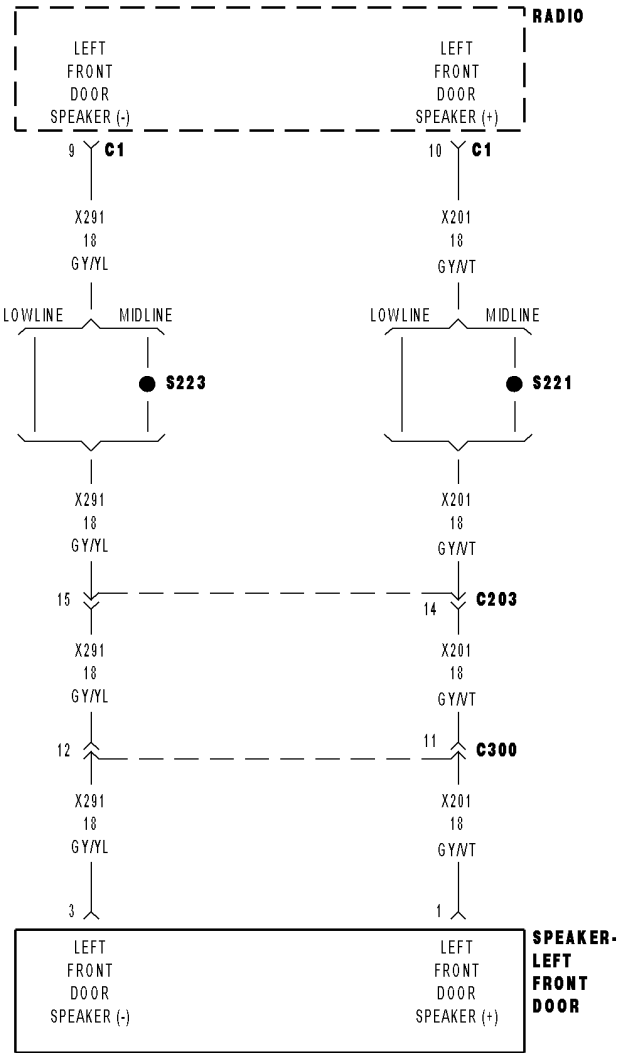

**Yes**     >> Replace the Speaker in accordance with the service information.  
            Perform the BODY VERIFICATION TEST VER 1.

**No**       >> Test Complete.

---

B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X201) SPEAKER OUTPUT CIRCUIT (+) (X291) SPEAKER OUTPUT CIRCUIT (-)

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

**Does the scan tool display active: B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****2. CHECK FOR VOLTAGE ON THE (X201) SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Left Front Speaker harness connector.

Measure for voltage on the (X201) Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X201) Speaker (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1402-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****3. CHECK FOR VOLTAGE ON THE (X291) SPEAKER (-) CIRCUIT**

Measure for voltage on the (X291) Speaker (-) circuit.

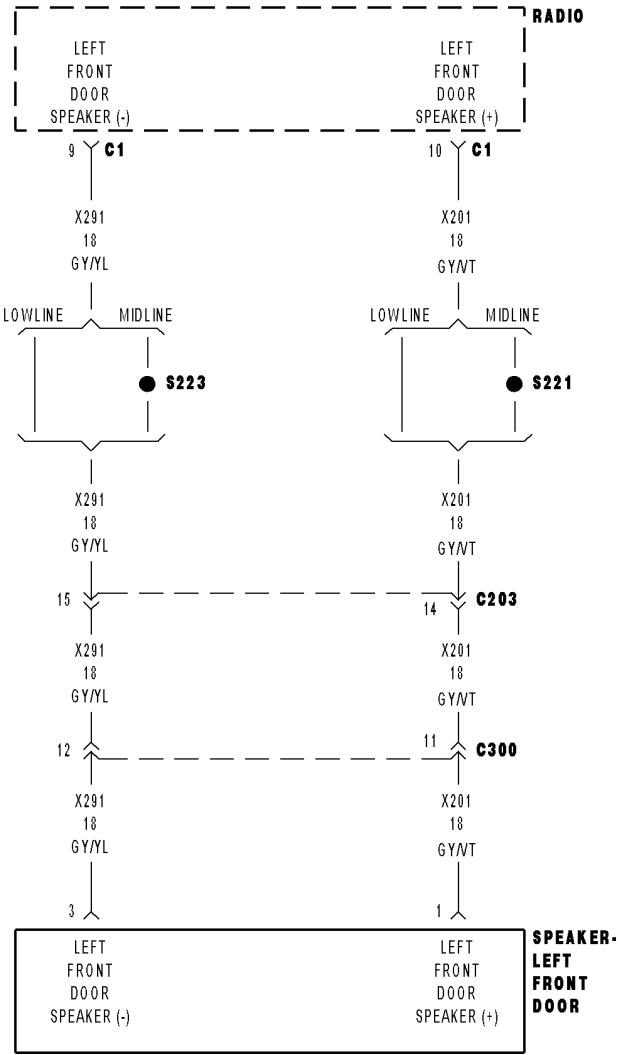

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X291) Speaker (-) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Radio in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X201) (X291) LEFT FRONT SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

**2. (X201) (X291) SPEAKER OUTPUT CIRCUITS.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Left Audio Speaker connector.

Measure the resistance of each speaker (X201)(+) and (X291)(-) circuit between the Radio and the Speaker.

**Is the resistance below 5.0 ohms for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the applicable Output Speaker circuit for an open condition.  
Perform the BODY VERIFICATION TEST VER 1.

**B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. SPEAKER**

Turn the ignition off.

Disconnect the Front Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

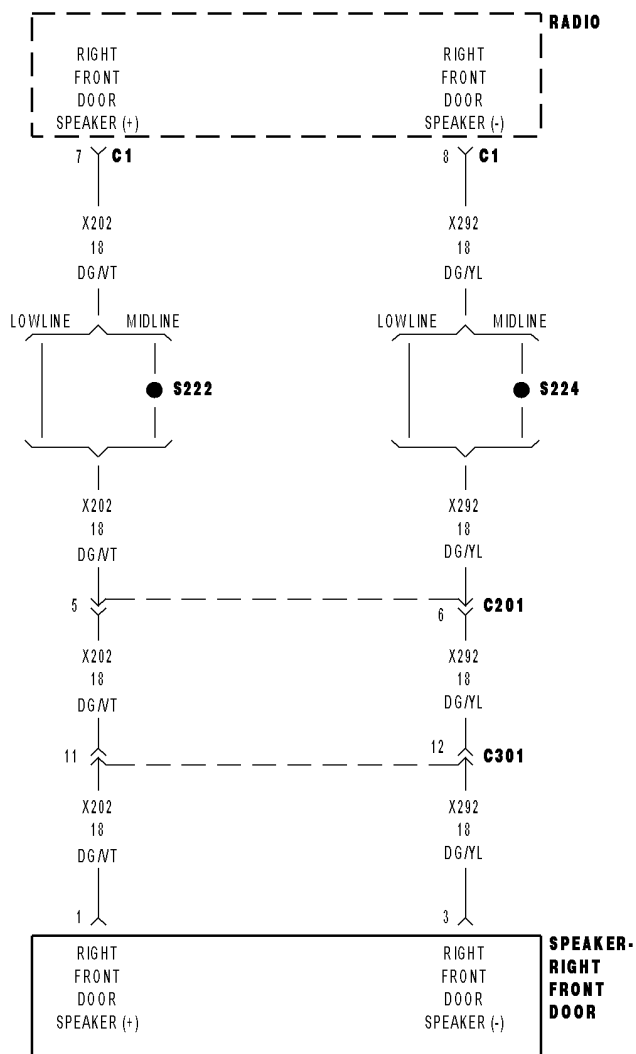

**Does the Scan Tool read: B1403-FRONT LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Replace the Speaker in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER 1.

**No** >> Test Complete.

---

## B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes
SPEAKER (X202) (X292) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST VER 1.

**2. (X202) (X292) SPEAKER OUTPUT CIRCUITS.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Right Audio Speaker connector.

Measure the resistance between ground and each speaker (X202)(+) and (X292)(-) circuit.

**Is the resistance below 1000.0 ohms for each circuit?**

**Yes** >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

**No** >> Go To 3

**B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****3. SPEAKER**

Turn the ignition off.

Disconnect the Front Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1405-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes**    >> Replace the Speaker in accordance with the service information.  
            Perform the BODY VERIFICATION TEST VER 1.

**No**      >> Test Complete.

---

B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X202) SPEAKER OUTPUT CIRCUIT (+) (X292) SPEAKER OUTPUT CIRCUIT (-)

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

**Does the scan tool display active: B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****2. CHECK FOR VOLTAGE ON THE (X202) SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Right Rear Speaker harness connector.

Measure for voltage on the (X202) Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X202) Speaker (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B1406-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****3. CHECK FOR VOLTAGE ON THE (X292) SPEAKER (-) CIRCUIT**

Measure for voltage on the (X292) Speaker (-) circuit.

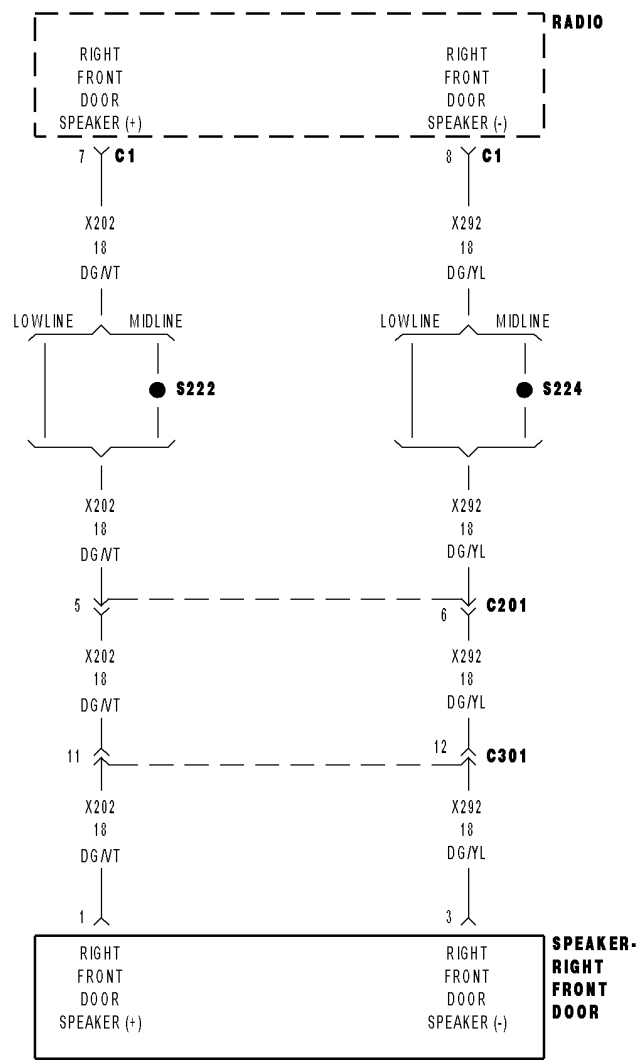

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X292) Speaker (-) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Radio in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X202) (X292) RIGHT FRONT SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

**2. (X202) (X292) Speaker Output circuits.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Front Right Audio Speaker connector.

Measure the resistance of each speaker (X202)(+) and (X292)(-) circuit between the Radio and the Speaker.

**Is the resistance below 5.0 ohms for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

**B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. Speaker**

Turn the ignition off.

Disconnect the Front Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1407-FRONT RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Replace the Speaker in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER 1.

**No** >> Test Complete.

---

## B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes
SPEAKER (X303) (X393) LEFT REAR SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

**2. (X303) (X393) SPEAKER OUTPUT CIRCUITS.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Left Audio Speaker connector.

Measure the resistance between ground and each speaker (X303)(+) and (X393)(-) circuit.

**Is the resistance below 1000.0 ohms for each circuit?**

**Yes** >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

**No** >> Go To 3

**B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****3. SPEAKER**

Turn the ignition off.

Disconnect the Rear Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

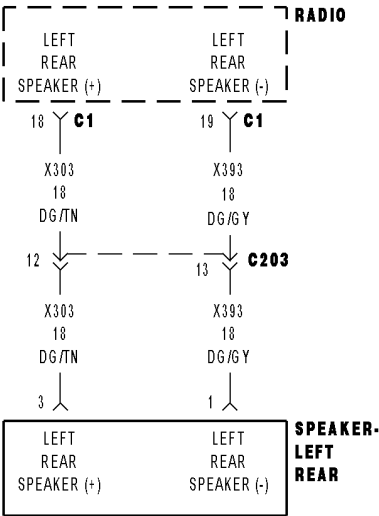

**Does the Scan Tool read: B1409-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Replace the Speaker in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER 1.

**No** >> Test Complete.

---

B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X303) SPEAKER OUTPUT CIRCUIT (+) (X393) SPEAKER OUTPUT CIRCUIT (-)

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

**Does the scan tool display active: B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B140A-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****2. CHECK FOR VOLTAGE ON THE (X303) SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Left Rear Speaker harness connector.

Measure for voltage on the (X303) Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X303) Speaker (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**3. CHECK FOR VOLTAGE ON THE (X393) SPEAKER (-) CIRCUIT**

Measure for voltage on the (X393) Speaker (-) circuit.

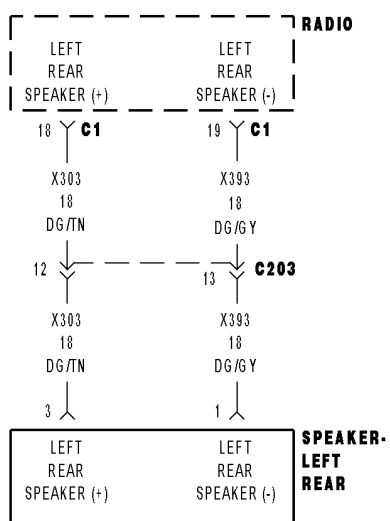

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X393) Speaker (-) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Radio in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

## B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X303) (X393) LEFT REAR SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. Intermittent Condition**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

**2. (X303) (X393) Speaker Output circuits.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Left Audio Speaker connector.

Measure the resistance of each speaker (X303)(+) and (X393)(-) circuit between the Radio and the Speaker.

**Is the resistance below 5.0 ohms for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the applicable Output Speaker circuit for an open condition.

Perform the BODY VERIFICATION TEST VER 1.

**B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

**3. Speaker**

Turn the ignition off.

Disconnect the Rear Left Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

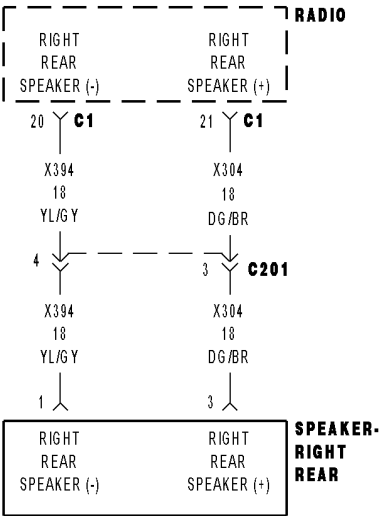

**Does the Scan Tool read: B140B-REAR LEFT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Replace the Speaker in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER 1.

**No** >> Test Complete.

---

B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW

**B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is LOW for more than 3 seconds.

Possible Causes
SPEAKER (X304) (X394) RIGHT REAR SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. Intermittent Condition**

Turn the ignition on.

With the Scan Tool, clear all Audio DTC's.

Turn the Radio on.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.

Perform the BODY VERIFICATION TEST VER 1.

**2. (X304) (X394) Speaker Output circuits.**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Rear Right Audio Speaker connector.

Measure the resistance between ground and each speaker (X304)(+) and (X394)(-) circuit.

**Is the resistance below 1000.0 ohms for each circuit?**

**Yes** >> Repair the applicable Speaker (+) or (-) Output circuit for a short to ground condition.

**No** >> Go To 3

**B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW (CONTINUED)****3. Speaker**

Turn the ignition off.

Disconnect the Rear Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B140D-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT LOW?**

**Yes** >> Replace the Speaker in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER 1.

**No** >> Test Complete.

---

## B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH

**B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- **Set Condition:**

Possible Causes
SPEAKER (X304) SPEAKER OUTPUT CIRCUIT (+) (X394) SPEAKER OUTPUT CIRCUIT (-)

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. INTERMITTENT CONDITION**

Turn the ignition on, then off, and then on again.

With the scan tool, read Radio DTCs.

**Does the scan tool display active: B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.  
Perform BODY VERIFICATION TEST VER-1.

**B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****2. CHECK FOR VOLTAGE ON THE (X304) SPEAKER (+) CIRCUIT**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Disconnect the Right Rear Speaker harness connector.

Measure for voltage on the (X304) Speaker (+) circuit.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X304) Speaker (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST VER-1.

**No** >> Go To 3

**B140E-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT HIGH (CONTINUED)****3. CHECK FOR VOLTAGE ON THE (X394) SPEAKER (-) CIRCUIT**

Measure for voltage on the (X394) Speaker (-) circuit.

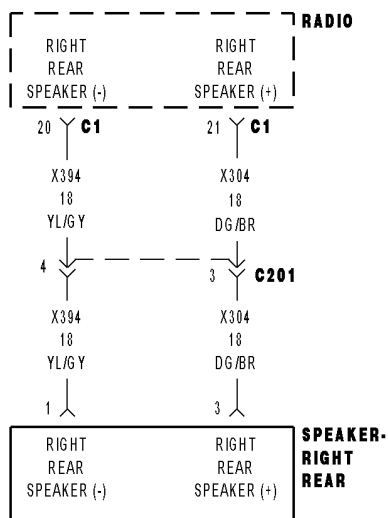

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (X394) Speaker (-) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST VER-1.

**No** >> Replace the Radio in accordance with the service information.  
Perform BODY VERIFICATION TEST VER-1.

## B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN

**B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)**

For the Audio system circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the Radio on.
- **Set Condition:**
- When the Output circuit is open for more than 3 seconds. The Radio will not set the fault if the radio confirms an amplifier is on the BUS.

Possible Causes
SPEAKER (X304) (X394) RIGHT REAR SPEAKER OUTPUT CIRCUIT

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test**

**1. Intermittent Condition**

- Turn the ignition on.
- With the Scan Tool, clear all Audio DTC's.
- Turn the Radio on.
- With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

- Yes** >> Go To 2
- No** >> The condition that caused the symptom is currently not present. Inspect the related wiring for a possible intermittent condition. Look for any chafed, pierced, pinched, or partially broken wires.  
Perform the BODY VERIFICATION TEST VER 1.

**2. (X394) (X304) Speaker Output circuits.**

- Turn the ignition off.
- Disconnect the Radio C1 harness connector.
- Disconnect the Rear Right Audio Speaker connector.
- Measure the resistance of each speaker (X304)(+) and (X394)(-) circuit between the Radio and the Speaker.

**Is the resistance below 5.0 ohms for each circuit?**

- Yes** >> Go To 3
- No** >> Repair the applicable Output Speaker circuit for an open condition.  
Perform the BODY VERIFICATION TEST VER 1.

**B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN (CONTINUED)****3. Speaker**

Turn the ignition off.

Disconnect the Rear Right Audio Speaker.

Turn the ignition on.

Turn the Radio on.

With the Scan Tool, clear all Audio DTC's.

With the Scan Tool, read the DTC information.

**Does the Scan Tool read: B140F-REAR RIGHT AUDIO SPEAKER OUTPUT CIRCUIT OPEN?**

**Yes** >> Replace the Speaker in accordance with the service information.  
Perform the BODY VERIFICATION TEST VER 1.

**No** >> Test Complete.

---

B1421-AUDIO CD READ ERROR/INOPERABLE DISC

For the Audio System circuit diagram(Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Continuously with the ignition on and the radio CD player turned on.
- **Set Condition:**
- The code will set if a CD that is not formatted as a music CD is installed in the radio CD player.

Possible Causes
CD READ FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. RADIO

Replace the problem CD with a good, clean,unscratched, music CD.  
Turn the radio CD player on.  
With the Scan Tool, read DTC's.

**Does the Scan Tool display: B1421 Audio CD Read Error/Inoperable Disc?**

- Yes

>> Eject the inoperative CD and replace the CD in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.
- No

>> Test Complete.

**B1422-AUDIO DVD READ ERROR/INOPERABLE DISC**

For the Audio System circuit diagram(Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- Continuously with the ignition on and the DVD player turned on.
- **Set Condition:**
- The code will set if a DVD that is not formatted as a DVD is installed in the DVD player.

Possible Causes
DVD READ FAILURE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. DVD PLAYER**

Replace the problem DVD with a good, clean, unscratched DVD.

Turn the DVD player on.

With the Scan Tool, read DTC's.

**Does the Scan Tool display: B1422 Audio DVD Read Error/Inoperable Disc?**

- Yes**    >> Eject the inoperative DVD and replace the DVD in accordance with the service information.  
              Perform the BODY VERIFICATION TEST — VER 1.
- No**     >> Test Complete.

B1429-RADIO DISPLAY HIGH TEMPERATURE

For the Audio System circuit diagram(Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition and Navigation Radio on.
- Set Condition:
- The code will set if the temperature inside the display exceeds 158°F

Possible Causes
HIGH TEMPERATURE FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. VERIFY THAT DTC B1429—RADIO DISPLAY HIGH TEMPERATURE IS ACTIVE.

With the Scan Tool, erase the Audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The radio display should operate to 158°F.

With the Scan Tool, read the DTC's.

Does the Scan Tool display, B1429— Radio Display High Temperature?

- Yes

>> Replace the Radio in accordance with the service information.  
Perform the BODY VERIFICATION TEST — VER 1.
- No

>> Test Complete.

**B142A-RADIO UNIT HIGH TEMPERATURE**

For the Audio System circuit diagram(Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition and Radio on.
- Set Condition:
- The code will set if the temperature inside the radio is above +65°C ( +145°F )

Possible Causes
HIGH TEMPERATURE FAILURE

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

**Diagnostic Test****1. VERIFY THAT DTC B142A—RADIO UNIT HIGH TEMPERATURE IS ACTIVE.**

With the Scan Tool, erase the Audio DTC's.

Start the engine and allow the engine to reach normal operating temperature.

If the vehicle has been in the hot sunlight or extreme cold, move the vehicle indoors and open the doors to allow the inside temperature to stabilize.

The Radio should operate between —23°C and 65°C ( —10°F and +145°F ).

With the Scan Tool, read the DTC's.

**Does the Scan Tool display, B142A— Radio Unit High Temperature?**

**Yes** >> Replace the Radio in accordance with the service information.

Perform the BODY VERIFICATION TEST — VER 1.

**No** >> Test Complete.

B142D-AUDIO ANTENNA NOT CONNECTED

For the Audio System circuit diagram(Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on and the radio in seek mode.
- **Set Condition:**
- With the radio in seek mode for two loops around the band. The radio does not detect an antenna connection or does not receive a radio station signal.

Possible Causes
BAD ANTENNA CONNECTION
RADIO

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Test Antenna

Turn the ignition off.  
Disconnect the Radio Antenna connector.  
Inspect the Radio Antenna connection.

- Was the Antenna connection clean and secure?**
- Yes**    >> Go To 2
- No**     >> Repair the Antenna connection as needed.  
          Perform the BODY VERIFICATION TEST — VER1.

2. ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

- Is the Antenna ok?**
- Yes**    >> Go To 3
- No**     >> Repair or replace the Antenna assembly as necessary.  
          Perform the BODY VERIFICATION TEST — VER1.

**B142D-AUDIO ANTENNA NOT CONNECTED (CONTINUED)****3. RADIO**

**Note:** Reconnect all previously disconnected components.

**Note:** Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's, put the radio in seek up and down mode for 2 loops around the band cycle before proceeding.

With the Scan Tool, read the audio DTC's.

**Did this DTC reset?**

**Yes**    >> Replace the radio in accordance with the service information.  
            Perform the BODY VERIFICATION TEST-VER1.

**No**      >> Test Complete.

---

## B142E-GPS ANTENNA NOT CONNECTED

For the Audio System circuit diagram(Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
- With the ignition on and the radio in navigation mode.
- **Set Condition:**
- With the radio does not detect GPS antenna connection.

Possible Causes
BAD ANTENNA CONNECTION RADIO

**Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.**

## Diagnostic Test

### 1. TEST ANTENNA

Turn the ignition off.

Disconnect the GPS Antenna connector.

Inspect the GPS Antenna connection.

**Was the Antenna connection clean and secure?**

**Yes** >> Go To 2

**No** >> Repair the Antenna connection as needed.  
Perform the BODY VERIFICATION TEST — VER1.

### 2. ANTENNA

Refer to the Audio System in the service information and test the antenna in accordance with the service procedure.

**Is the Antenna ok?**

**Yes** >> Go To 3

**No** >> Repair or replace the Antenna assembly as necessary.  
Perform the BODY VERIFICATION TEST — VER1.

**B142E-GPS ANTENNA NOT CONNECTED (CONTINUED)****3. RADIO**

**Note:** Reconnect all previously disconnected components.

**Note:** Move vehicle outside approximately 30ft from any structure.

Turn the ignition and radio on.

With the Scan Tool, erase the audio DTC's and operate the navigation system.

With the Scan Tool, read the audio DTC's.

**Did this DTC reset?**

**Yes**    >> Replace the radio in accordance with the service information.  
            Perform the BODY VERIFICATION TEST-VER1.

**No**      >> Test Complete.

---

B221E-RADIO INTERNAL

For the Audio System circuit diagram (Refer to 8 - ELECTRICAL/AUDIO - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- When Monitored:
- Continuously with the ignition on and radio turned on.
- Set Condition:
- The code will set if the radio detects a radio internal failure.

Possible Causes
RADIO INTERNAL FAILURE

Always perform the Pre-Diagnostic Troubleshooting procedure before proceeding.

Diagnostic Test

1. Verify DTC B221E-RADIO INTERNAL IS ACTIVE

**Note:** If a DTC is set, erase the DTC and attempt to reset the DTC.  
**If the DTC resets, follow test.**

This is an internal radio failure

[View repair](#)

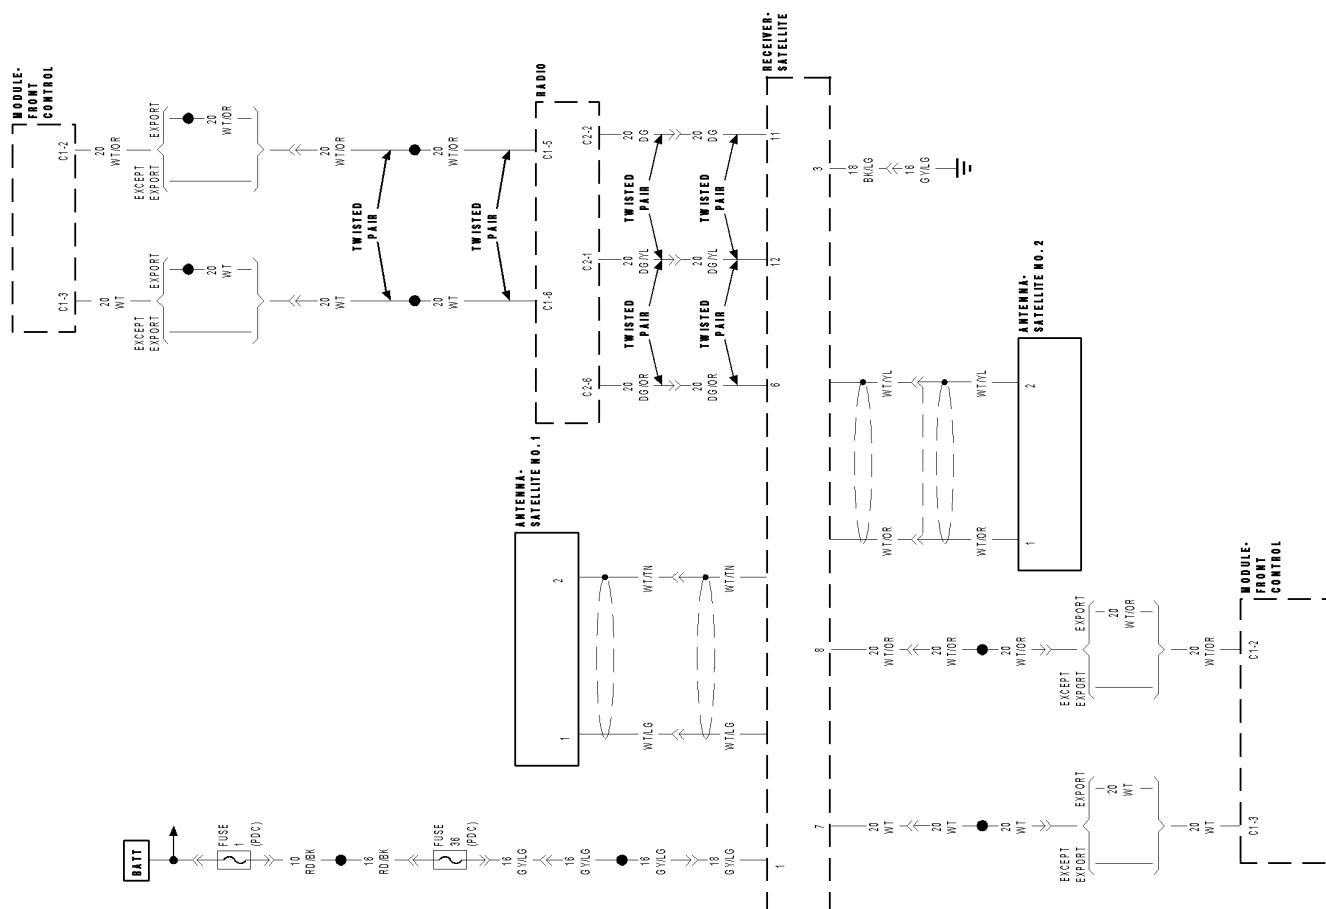

Does the DTC reset and read B221E-Radio Internal?

Repair

- Replace the Radio in accordance with the service information.
- Perform the BODY VERIFICATION TEST — VER 1.

## AUDIO/VIDEO - SERVICE INFORMATION

### DESCRIPTION

Several radios are offered. The audio system uses a CAN B bus Ignition ON message so that the system will only operate when the ignition switch is in the RUN or ACCESSORY/ACCESSORY DELAY positions.

The audio system includes the following components:

- Amplifier
- Antenna integral to the rear glass
- Radio noise suppression components
- Radio
- Speakers

Certain functions and features of the audio/video system rely upon resources shared with other electronic modules in the vehicle over the CAN bus network. For diagnosis of the CAN bus network, the use of a scan tool and the proper Diagnostic Procedures information is recommended.

For complete circuit diagrams, refer to the appropriate wiring information.

### DIAGNOSIS AND TESTING - AUDIO/VIDEO

**Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.**

For complete circuit diagrams, refer to the appropriate wiring information.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO ELECTRICAL, RESTRAINTS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

### AUDIO SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
NO AUDIO.	1. FUSE INOPERATIVE.	1. CHECK RADIO FUSES IN INTEGRATED POWER MODULE (IPM). REPLACE FUSES, IF REQUIRED.
	2. RADIO CONNECTOR DAMAGED.	2. CHECK FOR LOOSE OR CORRODED RADIO CONNECTOR. REPAIR, IF REQUIRED.
	3. WIRING DAMAGED.	3. CHECK FOR BATTERY VOLTAGE AT RADIO CONNECTOR. REPAIR WIRING, IF REQUIRED.
	4. GROUND DAMAGED.	4. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.
	5. RADIO INOPERATIVE.	5. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
	6. AMPLIFIER INOPERATIVE.	6. PERFORM DIAGNOSIS ON AMPLIFIER. REPLACE AS NECESSARY.
NO DISPLAY.	1. FUSE INOPERATIVE.	1. CHECK RADIO FUSES. REPLACE FUSES, IF REQUIRED.
	2. RADIO CONNECTOR DAMAGED.	2. CHECK FOR LOOSE OR CORRODED RADIO CONNECTOR. REPAIR, IF REQUIRED.
	3. WIRING DAMAGED.	3. CHECK FOR BATTERY VOLTAGE AT RADIO CONNECTOR. REPAIR WIRING, IF REQUIRED.
	4. GROUND DAMAGED.	4. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.
	5. RADIO INOPERATIVE.	5. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
NO MEMORY.	1. FUSE INOPERATIVE.	1. CHECK IGNITION-OFF DRAW FUSE. REPLACE FUSE, IF REQUIRED.
	2. RADIO CONNECTOR DAMAGED.	2. CHECK FOR LOOSE OR CORRODED RADIO CONNECTOR. REPAIR, IF REQUIRED.
	3. WIRING DAMAGED.	3. CHECK FOR BATTERY VOLTAGE AT RADIO CONNECTOR. REPAIR WIRING, IF REQUIRED.
	4. GROUND DAMAGED.	4. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.
	5. RADIO INOPERATIVE.	5. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
POOR RADIO RECEPTION.	1. ANTENNA OR CABLE DAMAGED OR INOPERATIVE.	1. REFER TO ANTENNA DIAGNOSIS. REPAIR OR REPLACE ANTENNA, IF REQUIRED.
	2. GROUND DAMAGED.	2. CHECK FOR CONTINUITY BETWEEN RADIO CHASSIS AND A KNOWN GOOD GROUND. THERE SHOULD BE CONTINUITY. REPAIR GROUND, IF REQUIRED.

CONDITION	POSSIBLE CAUSE	CORRECTION
	3. RADIO INOPERATIVE.	3. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
	4. POOR ANTENNA CONNECTION AT RADIO OR IN LINE.	4. VERIFY PROPER CONNECTION.
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING	1. DOOR TRIM PANEL LOOSE OR MISSING FASTENERS.	1. INSPECT DOOR TRIM PANEL AND CORRECT AS NECESSARY. REPLACE ANY MISSING FASTENERS.
	2. WATER SHIELD LOOSE OR MISALIGNED.	2. INSPECT WATER SHIELD AND ADJUST AS REQUIRED.
	3. ITEMS PLACED IN DOOR TRIM PANEL MAP POCKETS VIBRATING OR MOVING FROM SIDE TO SIDE.	3. REMOVE ITEMS FROM DOOR TRIM PANEL. ENSURE THAT VIBRATION IS NO LONGER PRESENT.
NO/POOR TAPE OPERATION.	1. TAPE DAMAGED.	1. INSERT KNOWN GOOD TAPE AND TEST OPERATION.
	2. FOREIGN OBJECTS BEHIND TAPE DOOR.	2. REMOVE FOREIGN OBJECTS AND TEST OPERATION.
	3. DIRTY CASSETTE TAPE HEAD.	3. CLEAN HEAD WITH MOPAR CASSETTE HEAD CLEANER.
	4. RADIO INOPERATIVE.	4. EXCHANGE OR REPLACE RADIO, IF REQUIRED.
NO COMPACT DISC OPERATION	1. CD DAMAGED.	1. INSERT KNOWN GOOD CD AND TEST OPERATION.
	2. FOREIGN MATERIAL ON CD.	2. CLEAN CD AND TEST OPERATION.
	3. CONDENSATION ON CD OR OPTICS.	3. ALLOW TEMPERATURE OF VEHICLE INTERIOR TO STABILIZE AND TEST OPERATION.
	4. RADIO INOPERATIVE.	4. EXCHANGE OR REPLACE RADIO, IF REQUIRED.

## AMPLIFIER

### DESCRIPTION

The amplifier (2) is available in two ratings: 288 watt (RD7), and 380 watt (RDF). The amplifier is mounted to the left of the steering column under the instrument panel.

### OPERATION

The amplifier receives fused battery current from a fuse in the rear Power Distribution Center (PDC) at all times. The internal circuitry of the amplifier switches the amplifier ON based upon a CAN bus message that is received from the radio receiver whenever the radio is turned on. The amplifier receives the sound signal inputs from the left and right rear outputs of the radio, then sends the amplified speaker outputs for each of those channels to the speakers.

### DIAGNOSIS AND TESTING

#### AMPLIFIER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

The amplifier unit should be checked if there is no sound output noted from the speakers. For diagnosis of the power amplifier, (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - DIAGNOSIS AND TESTING).

### REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate battery negative cable.
2. Remove the instrument panel silencer.

3. Disconnect electrical harness connectors.
4. Remove the mounting fasteners (1).
5. Remove the amplifier (2).

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Position amplifier (2) into place.
2. Install mounting fasteners (1).

3. Connect electrical harness connectors.
4. Install instrument panel silencer.
5. Connect battery negative cable.

## ANTENNA CABLE

### REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate battery negative cable.
2. Remove right side cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
3. Disconnect antenna cable from instrument panel antenna cable.
4. Remove right side front and rear door scuff plates (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
5. Remove right side C-pillar trim panel (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
6. Disconnect antenna cable from antenna module.
7. Move floor carpet aside.
8. Remove antenna cable.

### INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Position antenna cable and secure to wire harness.
2. Connect antenna cable to antenna module.
3. Connect antenna cable to instrument panel antenna cable.
4. Install right side C-pillar trim panel (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
5. Install right side front and rear door scuff plates (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).
6. Install right side cowl trim panel (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).
7. Connect battery negative cable.

## ANTENNA - SATELLITE RADIO

### REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Lower the rear portion of the headliner as necessary to access underside of antenna
3. Disconnect the wire harness connectors from the antenna.

4. From inside the vehicle, and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Insert wire harness through hole in roof panel. Press antenna into position until both retainers engage into position.

2. Connect wire harness connectors to antenna.
3. Install headliner.
4. Connect battery negative cable.

## ANTENNA MODULE

### DESCRIPTION

The antenna module is an electronic circuit component designed to capture and enhance RF (Radio Frequency) signals in both the AM and FM broadcast bands. The antenna module is mounted to the right C-pillar (sedan) or rear liftgate (wagon). The module is grounded through the mounting bracket and fastener. The module has a two wire electrical connector that connects to the integral radio antenna and EBL grid, located on the rear window. There is also an electrical connector for battery voltage and a coax cable connector.

### OPERATION

The antenna module receives both AM and FM radio signals supplied by the rear window integral radio antenna and selectively amplifies them. The amplified signal is then sent through the body length coax cable to the radio input.

### DIAGNOSIS AND TESTING

#### ANTENNA MODULE

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AM RECEPTION, WEAK FM RECEPTION	<ol style="list-style-type: none"> <li>1. Antenna module to antenna connector open or disconnected.</li> <li>2. Cable open or disconnected.</li> <li>3. No battery power at antenna module.</li> <li>4. Antenna module disconnected from glass.</li> </ol>	<ol style="list-style-type: none"> <li>1. Repair open, reconnect antenna module connector to glass mounted antenna.</li> <li>2. Replace antenna cable or, reconnect cable.</li> <li>3. Check fuse. if okay, repair open in battery voltage circuit.</li> <li>4. Connect module connector to glass.</li> </ol>
NO AM OR FM RECEPTION	<ol style="list-style-type: none"> <li>1. Coax disconnected at radio.</li> <li>2. Coax shorted to ground.</li> </ol>	<ol style="list-style-type: none"> <li>1. Reconnect coax.</li> <li>2. Repair or Replace coax</li> </ol>
WEAK OR NO AM/FM RECEPTION	<ol style="list-style-type: none"> <li>1. Antenna Module inoperative.</li> </ol>	<ol style="list-style-type: none"> <li>1. Replace antenna module.</li> </ol>

### REMOVAL

#### SEDAN

1. Disconnect and isolate the battery negative cable.
2. Remove C-pillar upper trim.
3. Disconnect wire harness connectors and antenna cable.
4. Remove mounting fasteners and antenna module.

## WAGON

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove the liftgate trim.
3. Disconnect wire harness connectors and antenna cable.
4. Remove mounting fasteners and antenna module.

## INSTALLATION

### SEDAN

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Position module into place.
2. Install and tighten mounting fasteners.
3. Connect wire harness connectors and antenna cable to antenna module.
4. Install C-pillar upper trim.
5. Connect battery negative cable.

## WAGON

1. Position module into place.
2. Install and tighten mounting fasteners.
3. Connect wire harness connectors and antenna cable to antenna module.
4. Install the liftgate trim.
5. Connect the battery negative cable.

## REAR GLASS INTEGRAL ANTENNA

### DESCRIPTION

The integral antenna element is bonded to the rear glass and is replaced with the glass assembly only.

### OPERATION

The integral antenna receives radio frequencies and sends them to the antenna module for amplification.

### DIAGNOSIS AND TESTING

#### REAR GLASS INTEGRAL ANTENNA

The antenna grid pattern is located above the EBL grid.

For circuit descriptions and diagrams, refer to the appropriate wiring information. To detect breaks in the integral antenna elements, the following procedure is required:

1. Disconnect the antenna module connector from the antenna terminals on the glass.
2. Using an ohmmeter, place a lead on one of the terminals and check each end of the grid pattern connected to this terminal for continuity. If continuity is present, move one lead through the grid in progression starting at the terminal with the other lead on the terminal until continuity is lost. Repeat procedure for the other terminal. A break in the antenna grid can be repaired using a Mopar Rear Window Defogger Repair Kit or equivalent.

## IP ANTENNA CABLE

### REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove the radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - REMOVAL).
3. Remove the glove box (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
4. Remove the right side cowl trim (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - REMOVAL).
5. Disconnect antenna cable at right side cowl area.
6. Remove cable from instrument panel.

### INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Install cable to instrument panel.
2. Connect antenna cable at right side cowl area.
3. Install the right side cowl trim (Refer to 23 - BODY/INTERIOR/COWL TRIM COVER - INSTALLATION).
4. Install the glove box (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
5. Install the radio (Refer to 8 - ELECTRICAL/AUDIO/RADIO - INSTALLATION).
6. Connect the battery negative cable.

## RADIO

### DESCRIPTION

Available radios include:

- AM/FM/MP3/6 disc CD with full screen navigation (REC sales code)
- AM/FM/MP3/6 disc CD (RAQ sales code)
- AM/FM/cassette/6 disc CD/MP3 (RAK sales code)
- AM/FM/CD with changer control (REF sales code)
- AM/FM/6 disc CD/RDS (RAR sales code) - export only
- AM/FM/CD/RDS (REG sales code) - export only
- AM/FM with integrated display (REJ sales code) - export only

### REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).
3. Remove mounting fasteners.

**CAUTION:** Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

4. Disconnect the antenna cable (3) by pulling the locking antenna connector (2) away from the radio (1).
5. Disconnect the electrical harness connector and remove radio.

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Connect the electrical harness and antenna cable (3) to radio (1).

2. Position radio and install mounting fasteners.
3. Install instrument panel center bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Connect battery negative cable.

## RADIO NOISE SUPPRESSION COMPONENTS

### DESCRIPTION

Radio noise suppression devices are installed on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of "buzzing," "hissing," "popping," "clicking," "crackling," and/or "whirring" sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder heads. The other is secured to the frame.
- **Resistor-type spark plugs** - This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.
- **Exhaust-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the exhaust pipe. The other is secured to the frame.

### OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of

these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

## SWITCH-REMOTE RADIO

### DESCRIPTION

Two rocker-type switches are mounted on the front of the steering wheel spokes.

The left switch controls the following functions:

- AUDIO SYSTEM HOT KEY - Controls mode selection: AM, FM, Tape, CD, Satellite Radio
- FUNCTION SELECT - Controls the radio preset advance or disc change (in audio mode), reset or trip functions and scroll through warning messages, and personal feature selection (only when vehicle is in Park).
- SCROLL - Controls the radio station seek up/down, CD change track, tape change side, satellite radio change channel, trip functions, navigation, system status messages, and personal settings

The right switch controls the following:

- AUDIO SYSTEM VOLUME - Controls the system volume level
- C/T - Compass/Temperature hot key
- MENU - Controls trip functions, navigation, system status, personal settings, and telephone

### REMOVAL

**Note: A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).**

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag (Refer to 8 - ELECTRICAL/RESTRAINTS/DRIVER AIRBAG - REMOVAL).
3. Disconnect electrical connector (s).
4. Remove mounting fastener and switch.

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Position switch into place.
2. Install and tighten mounting fastener.
3. Connect electrical harness connector.
4. Install the driver airbag.
5. Connect the battery negative cable.

## SATELLITE RECEIVER MODULE

### REMOVAL

#### SEDAN

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove left side trunk trim.
3. Disconnect electrical harness connector (3).
4. Disconnect antenna harness connectors.
5. Remove mounting bracket fasteners (1).
6. Remove module to mounting bracket fasteners (2).

**WAGON**

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove the left rear quarter trim panel.
3. Disconnect electrical harness connector.
4. Disconnect antenna harness connectors.

5. Remove mounting bracket fasteners

6. Remove module to mounting bracket fasteners (2).

## INSTALLATION

### SEDAN

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Install and tighten module to mounting bracket fasteners (2).
2. Position module into place.
3. Install and tighten mounting bracket fasteners (1).
4. Connect antenna harness connectors.
5. Connect electrical harness connectors (3).
6. Install left side trunk trim.
7. Connect battery negative cable.

### WAGON

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Install and tighten module to mounting bracket fasteners (2).
2. Position module into place.

3. Install and tighten mounting bracket fasteners.

4. Connect antenna harness connectors.
5. Connect electrical harness connectors.
6. Install left rear quarter trim panel.
7. Connect battery negative cable.

## SPEAKER

### DESCRIPTION

#### FOUR SPEAKER

The four speaker system includes four speakers in four locations. One 15.2 X 23 centimeter (6 X 9 inch) diameter speaker is located in each front door. There is also one 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf.

#### SIX SPEAKER

The six speaker system features six speakers in six locations. One 15.2 X 23 centimeter (6 X 9 inch) diameter speaker is located in each front door. One 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf. Two 8.9 centimeter (3.5 inch) speakers are located on the top portion of the instrument panel.

#### SIX SPEAKER - BOSTON ACOUSTICS

The six speaker system features six speakers in six locations. One 15.2 X 23 centimeter (6 X 9 inch) diameter speaker is located in each front door. One 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf. Two 8.9 centimeter (3.5 inch) speakers are located on the top portion of the instrument panel. This speaker system also includes an amplifier. The total available power of the speaker system is 288 watts.

## EIGHT SPEAKER - BOSTON ACOUSTICS

The eight speaker system features eight speakers in eight locations. One 16.5 centimeter (6 X 9 inch) diameter speaker is located in each front door. One 15.2 X 23 centimeter (6 X 9 inch) diameter speaker located on each side of the rear shelf. A subwoofer is located on the rear shelf (sedan only) Two 8.9 centimeter (3.5 inch) speakers are located on the top portion of the instrument panel. This speaker system also includes an amplifier. The total available power of the speaker system is 380 watts.

## DIAGNOSIS AND TESTING

### SPEAKER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

**WARNING: DISABLE THE AIRBAG SYSTEM BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, SEAT BELT TENSIONER, SIDE AIRBAG, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE, THEN WAIT TWO MINUTES FOR THE AIRBAG SYSTEM CAPACITOR TO DISCHARGE BEFORE PERFORMING FURTHER DIAGNOSIS OR SERVICE. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

**CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.**

1. If all speakers are inoperative, check the radio fuses in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check the amplifier fuse (if equipped) in the junction block. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Turn the radio OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with a amplifier, remove the radio receiver. If the vehicle is equipped with an amplifier, disconnect the wire harness connectors. There are two connectors. The one on the body harness has body speakers only. The other on the instrument panel harness has the instrument panel speakers, battery, ground, and CAN. Go to Step 5.
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.
6. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

## REMOVAL

### FRONT DOOR SPEAKER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Remove mounting fasteners.
4. Disconnect electrical harness connector and remove speaker.

### INSTRUMENT PANEL SIDE SPEAKER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove speaker cover from instrument panel.
3. Remove mounting fasteners.
4. Disconnect electrical harness connector and remove speaker.

## INSTRUMENT PANEL CENTER SPEAKER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove speaker cover from instrument panel.
3. Remove mounting fasteners.
4. Disconnect electrical harness connector and remove speaker.

## REAR SPEAKER - SEDAN

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove upper C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
3. Remove the lower C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
4. Remove the rear shelf trim (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - REMOVAL).
5. Remove the mounting fasteners.
6. Disconnect the electrical harness connector and remove speaker.

## REAR SPEAKER - WAGON

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove the quarter trim speaker cover (Refer to 23 - BODY/INTERIOR/SPEAKER BOX TRIM COVER - REMOVAL).
3. Remove the mounting fasteners.
4. Disconnect the electrical harness connector and remove speaker.

## SUBWOOFER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove upper C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
3. Remove the lower C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
4. Remove the rear shelf trim (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - REMOVAL).
5. Remove the mounting fasteners.
6. Disconnect the electrical harness connector and remove subwoofer.

## INSTALLATION

### FRONT DOOR SPEAKER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Connect electrical harness connector and position speaker.
2. Install and tighten mounting fasteners.
3. Install front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
4. Connect battery negative cable.

### INSTRUMENT PANEL SIDE SPEAKER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Connect electrical harness connector and position speaker.
2. Install and tighten mounting fasteners.
3. Install speaker cover to instrument panel.
4. Connect battery negative cable.

## INSTRUMENT PANEL CENTER SPEAKER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Connect electrical harness connector and position speaker.
2. Install and tighten mounting fasteners.
3. Install speaker cover to instrument panel.
4. Connect battery negative cable.

## REAR SPEAKER - SEDAN

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Connect electrical harness connector and position speaker.
2. Install and tighten mounting fasteners.
3. Install the rear shelf trim (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - INSTALLATION).
4. Install the lower C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
5. Install the upper C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
6. Connect the battery negative cable.

## REAR SPEAKER - WAGON

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Connect electrical harness connector and position speaker.
2. Install and tighten mounting fasteners.
3. Install the speaker grille trim (Refer to 23 - BODY/INTERIOR/SPEAKER BOX TRIM COVER - INSTALLATION).
4. Connect the battery negative cable.

## SUBWOOFER

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Connect electrical harness connector and position subwoofer.
2. Install and tighten mounting fasteners.
3. Install the rear shelf trim (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - INSTALLATION).
4. Install the lower C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
5. Install the upper C-pillar trim (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
6. Connect the battery negative cable.

CHIME/BUZZER - ELECTRICAL DIAGNOSTICS

DIAGNOSIS AND TESTING

## B122C-PTS SENSOR 7 CIRCUIT LOW

**B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition in Run/Start, and the PRNDL in R, N, or D. (Late build vehicles will disable the Park Assist System in Neutral)
- **Set Condition:**  
Sensor ring down time is too short (700 µsecs).

Possible Causes
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 7
PARK ASSIST MODULE

**Diagnostic Test**

**1. CHECK FOR ACTIVE DTC: B122C-PTS SENSOR 7 CIRCUIT LOW**

- Turn the ignition on.
- Apply the vehicle park brake.
- Shift the transmission into reverse.
- With the scan tool, record and erase Park Assist Module DTCs.
- Wait 30 seconds.
- With the scan tool, read Park Assist Module DTCs.

**Is DTC: B122C-PTS SENSOR 7 CIRCUIT LOW active?**

- Yes** >> Go To 2
- No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)****2. CHECK PARK ASSIST SENSOR NO. 7 FOR A SHORT TO GROUND**

Shift the transmission into park.

With the scan tool, erase DTCs.

Turn the ignition off.

Disconnect Park Assist Sensor No. 7.

Turn the ignition on.

Shift the transmission into reverse.

With the scan tool, read Park Assist Module DTCs.

**Does the scan tool display: B122C-PTS SENSOR 7 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace Park Assist Sensor No. 7 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D700) Park Assist Sensor No. 7 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)****4. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

Measure the resistance between the (D700) Park Assist Sensor No. 7 Signal circuit and the (Z171) Park Assist Display Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT**

Measure the resistance between the (D700) Park Assist Sensor No. 7 Signal circuit and the (Z914) Park Assist Module Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**B122C-PTS SENSOR 7 CIRCUIT LOW (CONTINUED)****6. CHECK THE (D700) PARK ASSIST SENSOR NO. 7 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D700) Park Assist Sensor No. 7 Signal circuit.

**Is the resistance below 10K ohms?**

- Yes** >> Repair the (D700) Park Assist Sensor No. 7 Signal circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Park Assist Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B122E-PTS SENSOR 7 RING TIME TOO SHORT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in Neutral).
- **Set Condition:**  
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 7

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B122E-PTS SENSOR 7 RING TIME TOO SHORT

Turn the ignition on.  
Apply the vehicle park brake.  
Shift the transmission into reverse.  
With the scan tool, record and erase Park Assist Module DTCs.  
Wait 30 seconds.  
With the scan tool, read Park Assist Module DTCs.

- Is DTC: B122E-PTS SENSOR 7 RING TIME TOO SHORT active?
- Yes**    >> Go To 2
- No**    >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

2. REPLACE PARK ASSIST SENSOR NO. 7

View Repair

Repair

Replace Park Assist Sensor No. 7 in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B122F-PTS SENSOR 7 RING TIME TOO LONG**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in Neutral).
- **Set Condition:**  
Data line stuck at 0.

Possible Causes
PARK ASSIST SENSOR NO. 7

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B122F-PTS SENSOR 7 RING TIME TOO LONG**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B122F-PTS SENSOR 7 RING TIME TOO LONG active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. REPLACE PARK ASSIST SENSOR NO 7.**

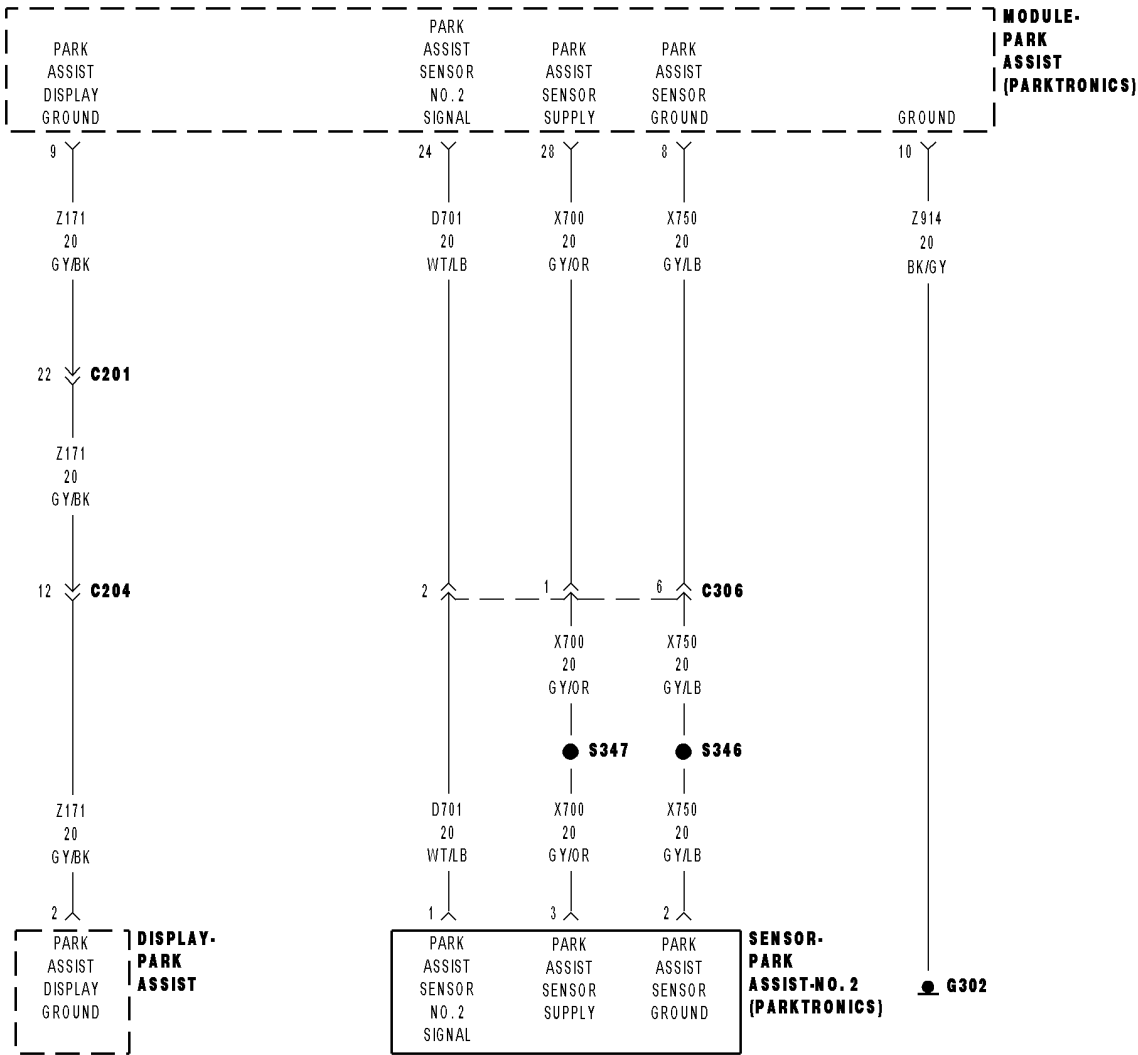

**View Repair**

**Repair**

Replace Park Assist Sensor No. 7 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1231-PTS SENSOR 8 CIRCUIT LOW

**B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition in Run/Start, and the PRNDL in R, N, or D (Late build vehicles will disable the Park Assist System in Neutral).

- **Set Condition:**

Sensor ring down time is too short (700 µsecs).

Possible Causes
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 8
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B1231-PTS SENSOR 8 CIRCUIT LOW**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B1231-PTS SENSOR 8 CIRCUIT LOW active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)****2. CHECK PARK ASSIST SENSOR NO. 8 FOR A SHORT TO GROUND**

Shift the transmission into park.

With the scan tool, erase DTCs.

Turn the ignition off.

Disconnect Park Assist Sensor No. 8.

Turn the ignition on.

Shift the transmission into reverse.

With the scan tool, read Park Assist Module DTCs.

**Does the scan tool display: B1231-PTS SENSOR 8 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace Park Assist Sensor No. 8 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)****4. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (Z171) Park Assist Display Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT**

Measure the resistance between the (D701) Park Assist Sensor No. 8 Signal circuit and the (Z914) Park Assist Module Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**B1231-PTS SENSOR 8 CIRCUIT LOW (CONTINUED)****6. CHECK THE (D701) PARK ASSIST SENSOR NO. 8 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D701) Park Assist Sensor No. 8 Signal circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D701) Park Assist Sensor No. 8 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1233-PTS SENSOR 8 RING TIME TOO SHORT**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in Neutral).
- **Set Condition:**  
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 8

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B1233-PTS SENSOR 8 RING TIME TOO SHORT**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B1233-PTS SENSOR 8 RING TIME TOO SHORT active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. REPLACE PARK ASSIST SENSOR NO. 8**

**View Repair**

**Repair**

Replace Park Assist Sensor No. 8 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1234-PTS SENSOR 8 RING TIME TOO LONG

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Data line stuck at 0.

Possible Causes
PARK ASSIST SENSOR NO. 8

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B1234-PTS SENSOR 8 RING TIME TOO LONG

Turn the ignition on.  
Apply the vehicle park brake.  
Shift the transmission into Reverse.  
With the scan tool, record and erase Park Assist Module DTCs.  
Wait 30 seconds.  
With the scan tool, read Park Assist Module DTCs.

Is DTC: B1234-PTS SENSOR 8 RING TIME TOO LONG active?

- Yes>> Go To 2
- No>> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

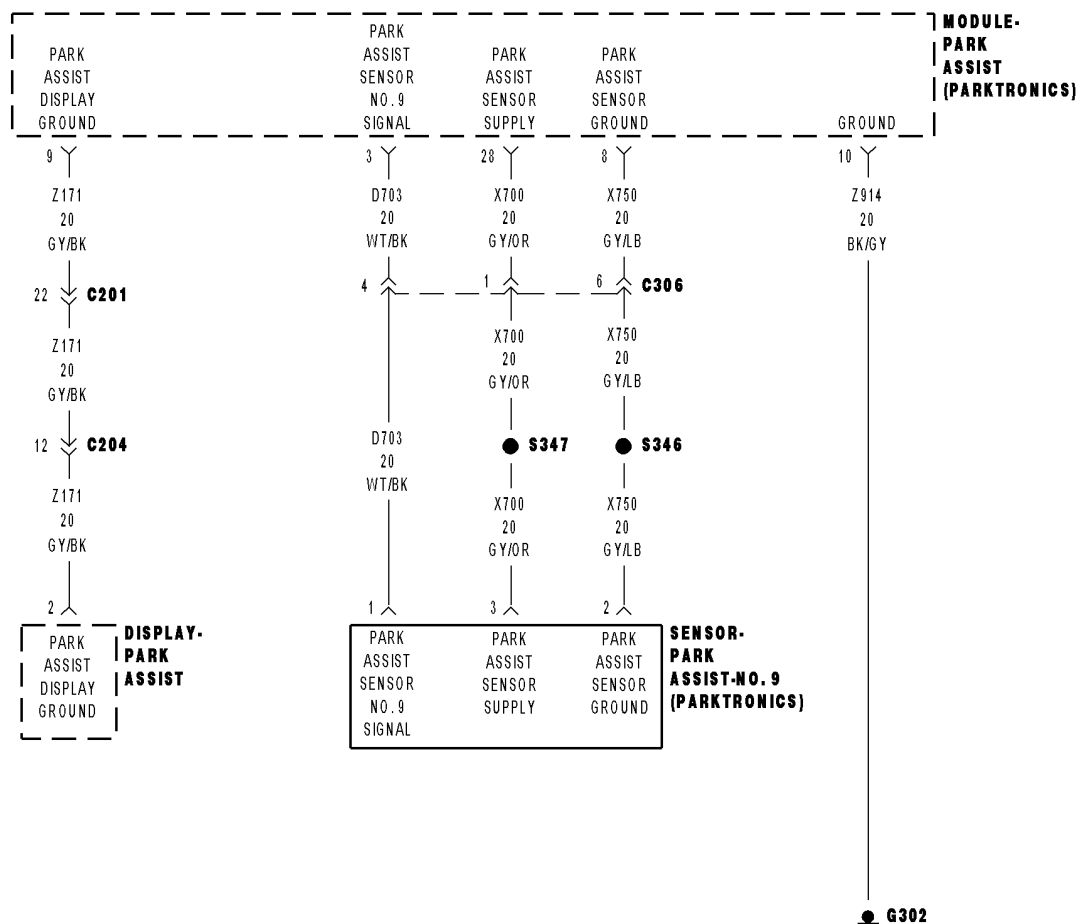

2. REPLACE PARK ASSIST SENSOR NO. 8

View Repair

Repair

Replace Park Assist Sensor No. 8 in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## B1236-PTS SENSOR 9 CIRCUIT LOW

**B1236-PTS SENSOR 9 CIRCUIT LOW (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition in Run/Start, and the PRNDL in R, N, or D (Late build vehicles will disable the Park Assist System in neutral).

- **Set Condition:**

Sensor ring down time is too short (700 µsecs).

Possible Causes
(D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT SHORTED TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 9
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B1236-PTS SENSOR 9 CIRCUIT LOW**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B1236-PTS SENSOR 9 CIRCUIT LOW active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1236-PTS SENSOR 9 CIRCUIT LOW (CONTINUED)****2. CHECK PARK ASSIST SENSOR NO. 9 FOR A SHORT TO GROUND**

Shift the transmission into park.

With the scan tool, erase DTCs.

Turn the ignition off.

Disconnect Park Assist Sensor No. 9.

Turn the ignition on.

Shift the transmission into reverse.

With the scan tool, read Park Assist Module DTCs.

**Does the scan tool display: B1236-PTS SENSOR 9 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace Park Assist Sensor No. 9 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D703) Park Assist Sensor No. 9 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B1236-PTS SENSOR 9 CIRCUIT LOW (CONTINUED)****4. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

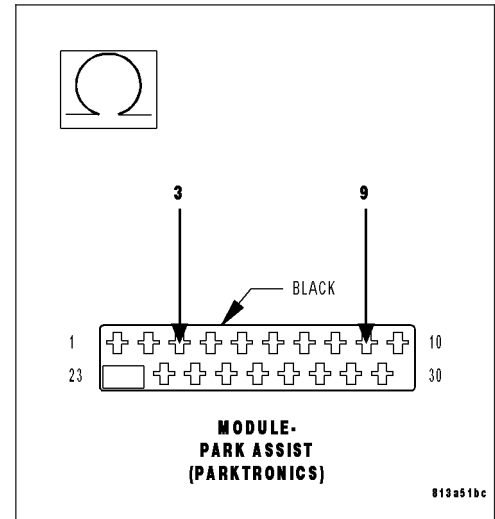

Measure the resistance between the (D703) Park Assist Sensor No. 9 Signal circuit and the (Z171) Park Assist Display Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT**

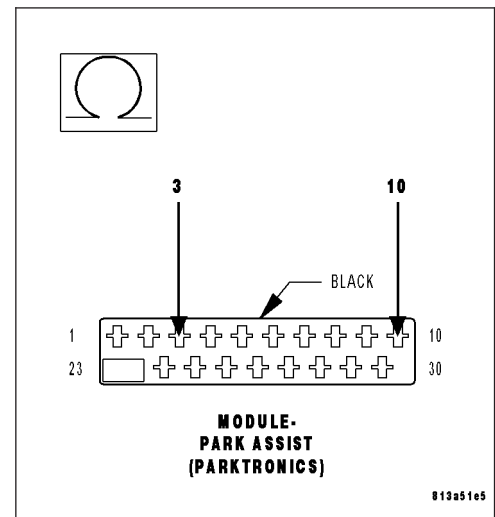

Measure the resistance between the (D703) Park Assist Sensor No. 9 Signal circuit and the (Z914) Park Assist Module Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**B1236-PTS SENSOR 9 CIRCUIT LOW (CONTINUED)****6. CHECK THE (D703) PARK ASSIST SENSOR NO. 9 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D703) Park Assist Sensor No. 9 Signal circuit.

**Is the resistance below 10K ohms?**

- Yes** >> Repair the (D703) Park Assist Sensor No. 9 Signal circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Park Assist Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1238-PTS SENSOR 9 RING TIME TOO SHORT

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 9

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B1238-PTS SENSOR 9 RING TIME TOO SHORT

Turn the ignition on.  
Apply the vehicle park brake.  
Shift the transmission into Reverse.  
With the scan tool, record and erase Park Assist Module DTCs.  
Wait 30 seconds.  
With the scan tool, read Park Assist Module DTCs.

- Is DTC: B1238-PTS SENSOR 9 RING TIME TOO SHORT active?
- Yes** >> Go To 2
- No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

2. REPLACE PARK ASSIST SENSOR NO. 9

View Repair

Repair

Replace Park Assist Sensor No. 9 in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1239-PTS SENSOR 9 RING TIME TOO LONG**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Data line stuck at 0.

Possible Causes
PARK ASSIST SENSOR NO. 9

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B1239-PTS SENSOR 9 RING TIME TOO LONG**

Turn the ignition on.  
Apply the vehicle park brake.  
Shift the transmission into Reverse.  
With the scan tool, record and erase Park Assist Module DTCs.  
Wait 30 seconds.  
With the scan tool, read Park Assist Module DTCs.

**Is DTC: B1239-PTS SENSOR 9 RING TIME TOO LONG active?**

- Yes** >> Go To 2
- No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

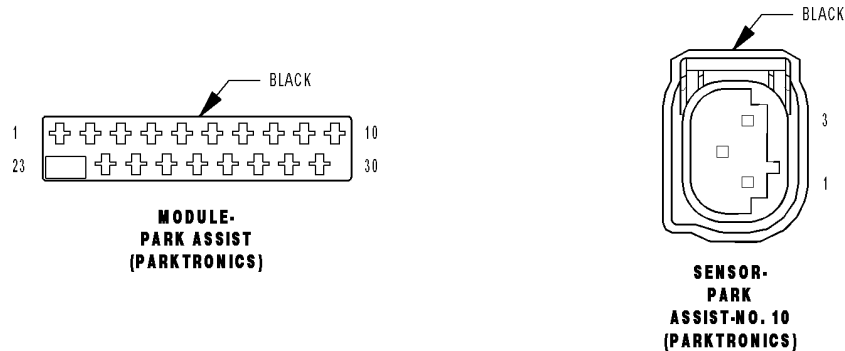

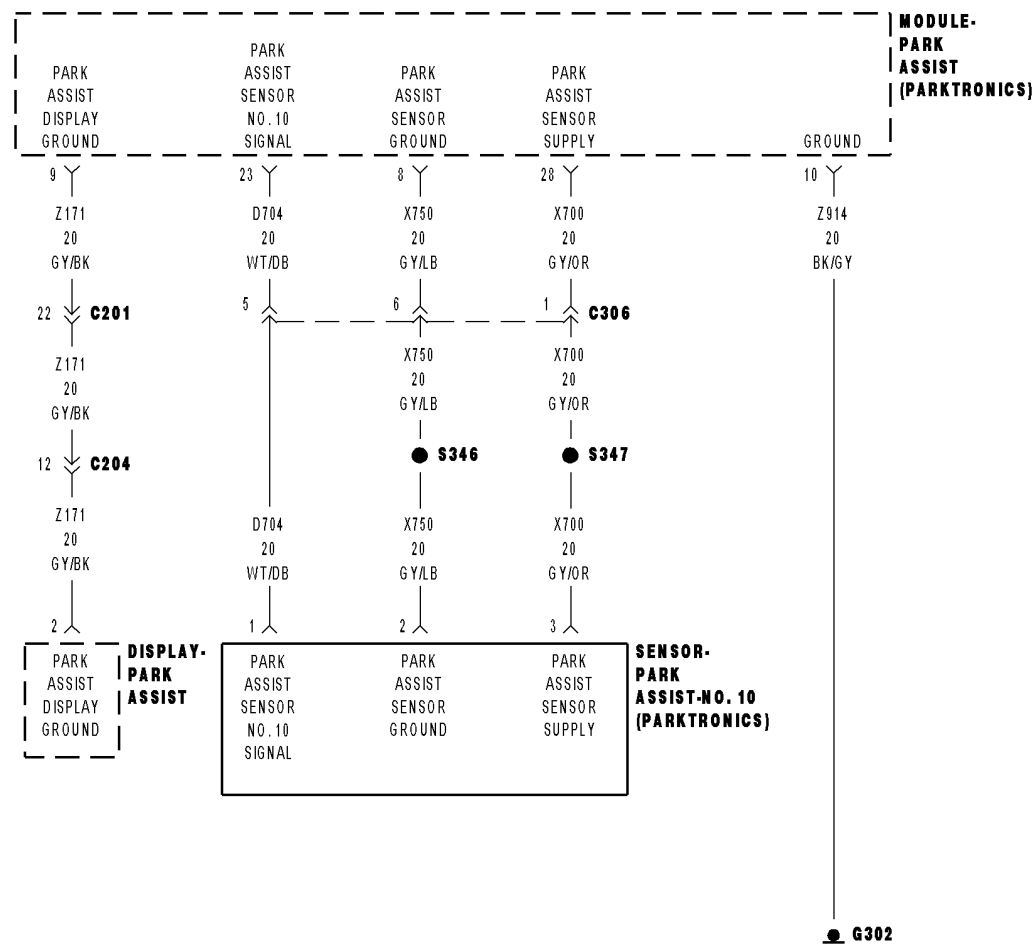

**2. REPLACE PARK ASSIST SENSOR NO. 9**

**View Repair**

**Repair**

Replace Park Assist Sensor No. 9 in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B123B-PTS SENSOR 10 CIRCUIT LOW

**B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition in Run/Start, and PRNDL in R, N, or D (Late build vehicles will disable the Park Assist System in neutral).

- **Set Condition:**

Sensor ring down time is too short (700 µsecs).

Possible Causes
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR NO. 10
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B123B-PTS SENSOR 10 CIRCUIT LOW**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B123B-PTS SENSOR 10 CIRCUIT LOW active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)****2. CHECK PARK ASSIST SENSOR NO. 10 FOR A SHORT TO GROUND**

Shift the transmission into park.

With the scan tool, erase DTCs.

Turn the ignition off.

Disconnect Park Assist Sensor No. 10.

Turn the ignition on.

Shift the transmission into reverse.

With the scan tool, read Park Assist Module DTCs.

**Does the scan tool display: B123B-PTS SENSOR 10 CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace Park Assist Sensor No. 10 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (D704) Park Assist Sensor No. 10 Signal circuit and the (X750) Park Assist Sensor Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)****4. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

Measure the resistance between the (D704) Park Assist Sensor No. 10 Signal circuit and the (Z171) Park Assist Display Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT**

Measure the resistance between the (D704) Park Assist Sensor No. 10 Signal circuit and the (Z914) Park Assist Module Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**B123B-PTS SENSOR 10 CIRCUIT LOW (CONTINUED)****6. CHECK THE (D704) PARK ASSIST SENSOR NO. 10 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D704) Park Assist Sensor No. 10 Signal circuit and ground.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D704) Park Assist Sensor No. 10 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B123D-PTS SENSOR 10 RING TIME TOO SHORT**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Sensor ring down time exceeds limit (greater than 1450 µsecs).

Possible Causes
PARK ASSIST SENSOR NO. 10

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B123D-PTS SENSOR 10 RING TIME TOO SHORT**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B123D-PTS SENSOR 10 RING TIME TOO SHORT active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. REPLACE THE PARK ASSIST SENSOR NO. 10**

**View Repair**

**Repair**

Replace Park Assist Sensor No. 10 in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B123E-PTS SENSOR 10 RING TIME TOO LONG

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Data line stuck at 0.

Possible Causes
PARK ASSIST SENSORNO. 10

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B123E-PTS SENSOR 10 RING TIME TOO LONG

Turn the ignition on.  
Apply the vehicle park brake.  
Shift the transmission into reverse.  
With the scan tool, record and erase Park Assist Module DTCs.  
Wait 30 seconds.  
With the scan tool, read Park Assist Module DTCs.

Is DTC B123E-PTS SENSOR 10 RING TIME TOO LONG active?

- Yes

>> Go To 2
- No

>> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

2. REPLACE PARK ASSIST SENSOR NO. 10

View Repair

Repair

Replace Park Assist Sensor No. 10 in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on, transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Park Assist Module supply voltage less than 9.0 volts.

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

## Diagnostic Test

### 1. CHECK FOR ACTIVE DTC: B210D-BATTERY VOLTAGE LOW

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B210D-BATTERY VOLTAGE LOW active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

### 2. VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM

**Note:** Troubleshoot any PCM charging/cranking DTCs before proceeding.

**Note:** Ensure the battery is fully charged.

**Are any charging system DTCs present?**

**Yes** >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedures.

**No** >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B210E-BATTERY VOLTAGE HIGH

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on, and the transmission in reverse or neutral (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Park Assist Module supply voltage greater than 16.0 volts.

Possible Causes
VEHICLE CHARGING SYSTEM
PARK ASSIST MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTC: B210E-BATTERY VOLTAGE HIGH

Turn the ignition on.  
Apply the vehicle park brake.  
Shift the transmission into reverse.  
With the scan tool, record and erase Park Assist Module DTCs.  
Wait 30 seconds.  
With the scan tool, read Park Assist Module DTCs.

- Is DTC: B210E-BATTERY VOLTAGE HIGH active?**
- Yes**    >> Go To 2
- No**    >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

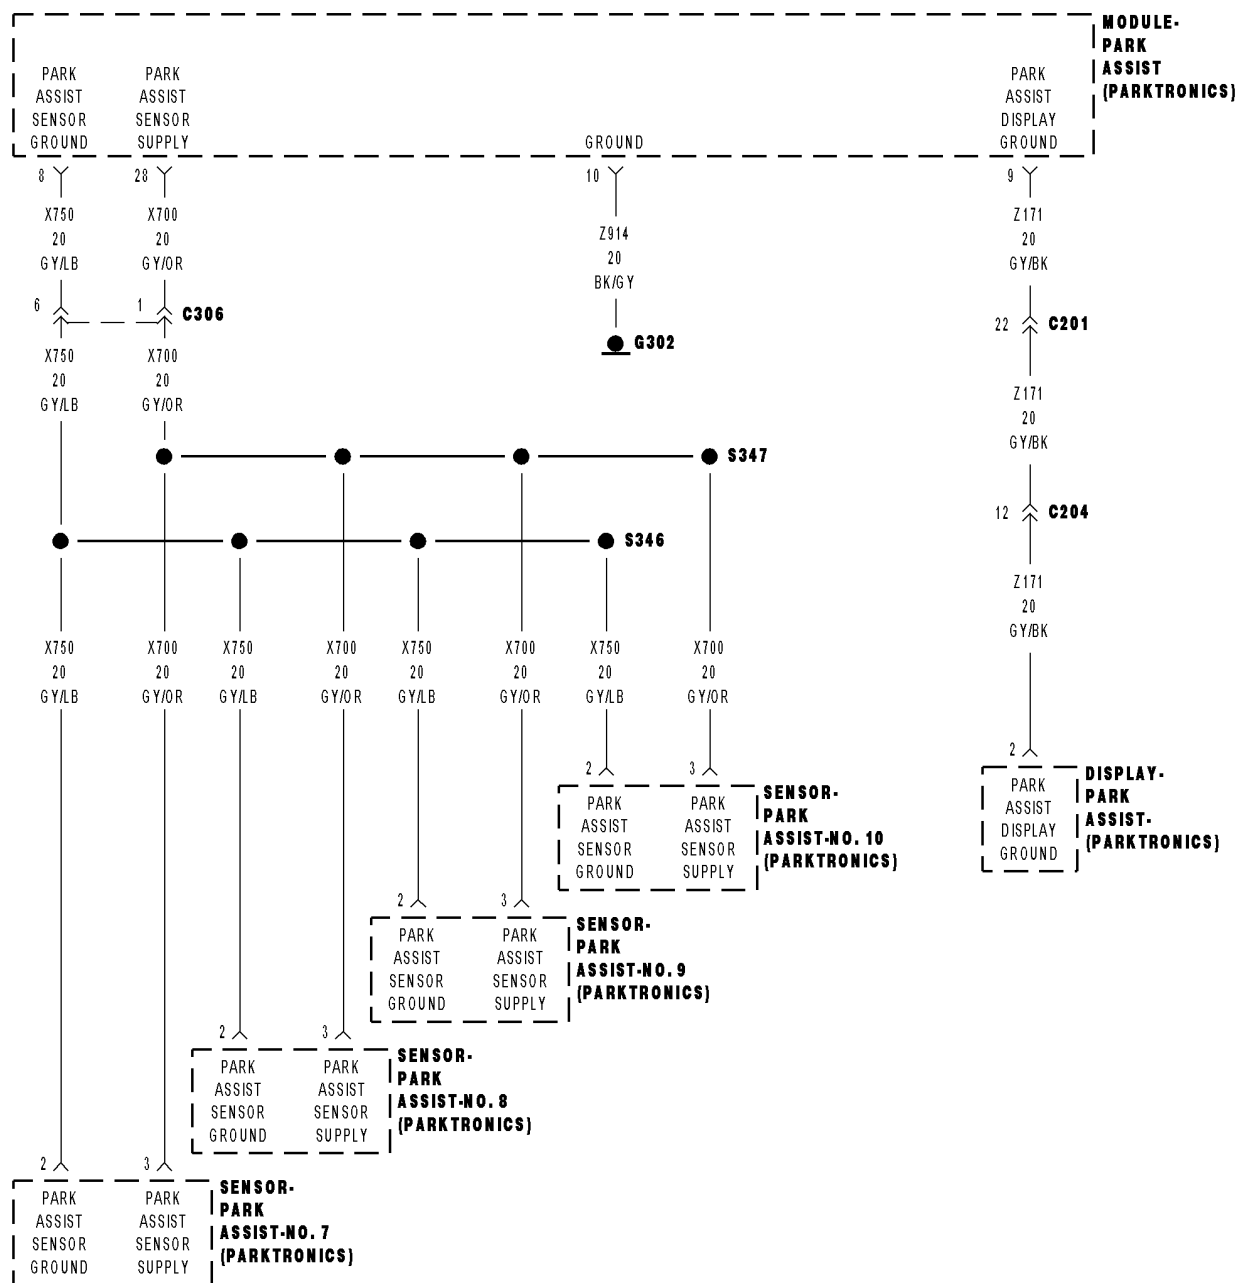

2. VERIFY OPERATION OF THE VEHICLE CHARGING SYSTEM

**Note:** Troubleshoot any PCM charging/cranking DTCs before proceeding.

**Note:** Ensure the battery is fully charged.

- Are any charging system DTCs present?**
- Yes**    >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedures.
- No**    >> Replace the Park Assist Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

# B2126-SENSOR SUPPLY VOLTAGE LOW

**B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition in Run/Start, and the PRNDL in R, N, or D (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
Park assist Sensor supply voltage less than 7.2 volts.

Possible Causes
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORTED TO GROUND
PARK ASSIST SENSOR
PARK ASSIST MODULE

**Diagnostic Test**

**1. CHECK FOR AN ACTIVE DTC**

- Turn the ignition on.
- Apply the park brake.
- Shift the transmission into Reverse.
- With the scan tool, record and erase DTCs.
- Wait 30 seconds.
- With the scan tool, read DTCs.

- Is the DTC active?**
- Yes**    >> Go To 2
- No**     >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.
- Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****2. CHECK EACH PARK ASSIST SENSOR FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect one Park Assist Sensor.

Turn the ignition on.

With the scan tool, read Park Assist Module DTCs. If DTC B2126 is still active, repeat this procedure by disconnecting another park assist sensor. However, if DTC B2126 changes from active to stored, or if all four sensors have been disconnected, proceed as follows:

**Is B2126-SENSOR SUPPLY VOLTAGE LOW still active?**

**Yes** >> Go To 3

**No** >> Replace the Park Assist Sensor that caused DTC B2126 to change from active to stored after disconnecting it in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

**Note: Perform this test with all Park Assist Sensors disconnected.**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (X750) Park Assist Sensor Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X700) Park Assist Sensor Supply circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****4. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

**Note:** Perform this test with all Park Assist Sensors disconnected.

Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (Z171) Park Assist Display Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X700) Park Assist Sensor Supply circuit for a short to the (Z171) Park Assist Display Ground circuit.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**5. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT**

**Note:** Perform this test with all Park Assist Sensors disconnected.

Measure the resistance between the (X700) Park Assist Sensor Supply circuit and the (Z914) Park Assist Module Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X700) Park Assist Sensor Supply circuit for a short to the (Z914) Park Assist Module Ground circuit.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**B2126-SENSOR SUPPLY VOLTAGE LOW (CONTINUED)****6. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO GROUND**

**Note:** Perform this test with all Park Assist Sensors disconnected.

Measure the resistance between ground and the (X700) Park Assist Sensor Supply circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X700) Park Assist Sensor Supply circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**Wiring Diagram for PARK ASSIST (PARKTRONICS)**

The diagram shows the electrical connections for the PARK ASSIST system. The main power source is the **MODULE-PARK ASSIST (PARKTRONICS)**, which provides **PARK ASSIST SENSOR GROUND** and **PARK ASSIST SENSOR SUPPLY** to the four sensors. The sensors are connected to the ground line via terminals 8, 28, 10, and 9. The ground line is connected to the **GROUND** terminal. The sensors are connected to the ground line via terminals 2 and 3. The sensors are connected to the ground line via terminals 2 and 3. The sensors are connected to the ground line via terminals 2 and 3. The sensors are connected to the ground line via terminals 2 and 3.

**B2127-SENSOR SUPPLY VOLTAGE HIGH (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition in Run/Start, PRNDL in R, N, or D; vehicle speed less than 40 mph (Late build vehicles will disable the Park Assist System in neutral).

- **Set Condition:**

Park Assist Sensor supply voltage greater than 9.2 volts.

Possible Causes
(X700) PARK ASSIST SENSOR SUPPLY CIRCUIT SHORT TO VOLTAGE
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B2127-SENSOR SUPPLY VOLTAGE HIGH**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B2127-SENSOR SUPPLY VOLTAGE HIGH active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK THE (X700) PARK ASSIST SENSOR SUPPLY CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Turn the ignition on.

Measure the voltage on the (X700) Park Assist Sensor Supply circuit.

**Is the voltage above 9.2 volts?**

**Yes** >> Repair the (X700) Park Assist Sensor Supply circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**MODULE-PARK ASSIST (PARKTRONICS)**

**DISP. PARK ASSIST (PARKTRONICS)**

**SENSOR-PARK ASSIST-NO. 9 (PARKTRONICS)**

**SENSOR-PARK ASSIST-NO. 8 (PARKTRONICS)**

**SENSOR-PARK ASSIST-NO. 7 (PARKTRONICS)**

**Wiring Details:**

- Module-Park Assist (PARKTRONICS) Connections:**
  - PARK ASSIST DISPLAY SUPPLY: 29 (X777, 20, DG/GY) to 21 (X777, 20, DG/GY) to 10 (X777, 20, DG/GY) to 1 (PARK ASSIST DISPLAY SUPPLY)
  - PARK ASSIST DISPLAY GROUND: 9 (Z171, 20, GY/BK) to 22 (Z171, 20, GY/BK) to 12 (Z171, 20, GY/BK) to 2 (PARK ASSIST DISPLAY GROUND)
  - PARK ASSIST DISPLAY SIGNAL: 25 (D777, 20, WT/DG) to 20 (D777, 20, WT/DG) to 9 (D777, 20, WT/DG) to 3 (PARK ASSIST DISPLAY SIGNAL)
- Display-Park Assist (PARKTRONICS) Connections:**
  - PARK ASSIST SENSOR GROUND: 2 (C306) to 6 (X750, 20, GY/LB) to 2 (PARK ASSIST SENSOR GROUND)
  - PARK ASSIST SENSOR GROUND: 2 (G302) to 10 (Z914, 20, BK/GY) to 2 (PARK ASSIST SENSOR GROUND)
  - PARK ASSIST SENSOR GROUND: 2 (S346) to 2 (X750, 20, GY/LB) to 2 (PARK ASSIST SENSOR GROUND)
- Sensor-Park Assist Modules (PARKTRONICS) Connections:**
  - SENSOR-PARK ASSIST-NO. 10: 2 (PARK ASSIST SENSOR GROUND) to 2 (X750, 20, GY/LB) to 2 (PARK ASSIST SENSOR GROUND)
  - SENSOR-PARK ASSIST-NO. 9: 2 (PARK ASSIST SENSOR GROUND) to 2 (X750, 20, GY/LB) to 2 (PARK ASSIST SENSOR GROUND)
  - SENSOR-PARK ASSIST-NO. 8: 2 (PARK ASSIST SENSOR GROUND) to 2 (X750, 20, GY/LB) to 2 (PARK ASSIST SENSOR GROUND)
  - SENSOR-PARK ASSIST-NO. 7: 2 (PARK ASSIST SENSOR GROUND) to 2 (X750, 20, GY/LB) to 2 (PARK ASSIST SENSOR GROUND)

**Physical Layout:**

**DISPLAY-PARK ASSIST (PARKTRONICS)**

**MODULE-PARK ASSIST (PARKTRONICS)**

**Pin Connections:**

- Display-Park Assist (PARKTRONICS):** 1 (PARK ASSIST DISPLAY SUPPLY), 2 (PARK ASSIST DISPLAY GROUND), 3 (PARK ASSIST DISPLAY SIGNAL)
- Module-Park Assist (PARKTRONICS):** 1 (PARK ASSIST DISPLAY SUPPLY), 2 (PARK ASSIST DISPLAY GROUND), 3 (PARK ASSIST DISPLAY SIGNAL), 10 (PARK ASSIST DISPLAY SUPPLY), 20 (PARK ASSIST DISPLAY GROUND), 30 (PARK ASSIST DISPLAY SIGNAL)

**B212A-PTS DISPLAY SUPPLY VOLTAGE LOW (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition in Run/Start, PRNDL in R, N, or D; vehicle speed less than 40 mph (Late build vehicles will disable the Park Assist System in neutral).

- **Set Condition:**

Park Assist Sensor Display voltage less than 8.0 volts.

Possible Causes
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO GROUND
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT SHORT TO (X750) PARK ASSIST SENSOR GROUND CIRCUIT
PARK ASSIST DISPLAY
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: B212A-PTS DISPLAY SUPPLY VOLTAGE LOW**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: B212A-PTS DISPLAY SUPPLY VOLTAGE LOW active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B212A-PTS DISPLAY SUPPLY VOLTAGE LOW (CONTINUED)****2. CHECK PARK ASSIST MODULE FOR AN INTERNAL SHORT TO GROUND**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between ground and the (X777) Park Assist Display Supply circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Go To 3

**No** >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO THE (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

Disconnect the Park Assist Display harness connector.

Measure the resistance between the (X777) Park Assist Display Supply circuit and the (Z171) Park Assist Display Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X777) Park Assist Display Supply circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**4. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO THE (Z914) PARK ASSIST MODULE GROUND CIRCUIT**

Measure the resistance between the (X777) Park Assist Display Supply circuit and the (Z914) Park Assist Module Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X777) Park Assist Display Supply circuit for a short to the (Z914) Park Assist Module Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**B212A-PTS DISPLAY SUPPLY VOLTAGE LOW (CONTINUED)****5. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Measure the resistance between the (X777) Park Assist Display Supply circuit and the (X750) Park Assist Sensor Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X777) Park Assist Display Supply circuit for a short to the (X750) Park Assist Sensor Ground circuit.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**6. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (X777) Park Assist Display Supply circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (X777) Park Assist Display Supply circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Park Assist Display in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B222A-VEHICLE LINE MISMATCH

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the Vehicle Line data transmitted on the CAN B bus doesn't correspond with the data stored in the Park Assist Module.

Possible Causes
PARK ASSIST MODULE

Diagnostic Test

1. CHECK VEHICLE LINE IN THE PCM

With the scan tool, compare the vehicle line that is programmed in to the PCM to the vehicle line of the vehicle.

Does the vehicle line programmed into the PCM match the vehicle?

**Yes** >> Replace the Park Assist Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER 5. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

**B2232-(PTS) PARKTRONICS INTERNAL**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Park Assist Module detects an internal failure.

Possible Causes
PARK ASSIST MODULE

**Diagnostic Test****1. REPLACE THE PARK ASSIST MODULE**

**View Repair**

**Repair**

Replace the Park Assist Module in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

---

B2234-(PTS) PARKTRONICS REAR DISPLAY INTERNAL

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition in Run/Start, PRNDL in R, N, or D; vehicle speed less than 40 mph (Late build vehicles will disable the Park Assist System in neutral).
- **Set Condition:**  
The Park Assist Module detects an internal Park Assist Display failure.

Possible Causes
PARK ASSIST DISPLAY

Diagnostic Test

1. REPLACE THE PARK ASSIST DISPLAY

View Repair

Repair

Replace the Park Assist Display in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Park Assist Module supply voltage between 9–16 volts. Ignition in Run/Start.
- **Set Condition:**  
Ignition status = 7h

Possible Causes
NO COMMUNICATION WITH INSTRUMENT CLUSTER
DTCS STORED OR ACTIVE IN THE INSTRUMENT CLUSTER
ACTIVE DTCS IN THE FCM
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN**

Turn the ignition on.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. INSTRUMENT CLUSTER IS ACTIVE ON THE CAN B BUS**

With the scan tool, select ECU View.

Verify that the Instrument Cluster is active on the bus.

**Is the Instrument Cluster active on the bus?**

**Yes** >> Go To 3

**No** >> (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING) for No Response diagnostic procedures.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN (CONTINUED)

### 3. DTCS STORED OR ACTIVE IN THE INSTRUMENT CLUSTER

Check for Ignition Switch DTCs in the Instrument Cluster.

**Are any DTCs active or stored in the Instrument Cluster?**

**Yes** >> Refer to the appropriate section and perform the diagnostics for the DTCs.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go to 4

---

### 4. ACTIVE DTCS IN THE FCM

With the scan tool, select ECU View and select FCM.

With the scan tool, read active DTCs.

**Are any Communication DTCs active in the FCM Park Assist System?**

**Yes** >> Refer to the appropriate section and perform the diagnostics for the DTCs.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace and program the Park Assist Module in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

---

**U0431-IMPLAUSIBLE DATA RECEIVED FROM FCM**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Park Assist Module supply voltage between 9–16 volts. Ignition in Run/Start.
- **Set Condition:**  
PRNDL = 7h, or vehicle speed greater than 511 km/hr.

Possible Causes
CAN B OPEN OR SHORTED FRONT CONTROL MODULE PARK ASSIST MODULE

**Diagnostic Test****1. U0431-IMPLAUSIBLE DATA RECEIVED FROM FCM**

Turn the ignition on.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: U0423-IMPLAUSIBLE DATA RECEIVED FROM CLUSTER/CCN active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. U0019-NO COMMUNICATION ON THE CAN B BUS CIRCUIT ALSO ACTIVE**

With a scan tool check for DTCs in the FCM.

**Is the U0019-NO COMMUNICATION ON THE CAN B BUS CIRCUIT active at this time?**

**Yes** >> Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING for the U0019-NO COMMUNICATION ON THE CAN B BUS CIRCUIT diagnostic procedures.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace and program the Park Assist Module according to the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

The diagram illustrates the electrical connections for a Park Assist system. At the top, four sensor modules are shown, each with a 'PARK ASSIST SENSOR GROUND' terminal and a 'SENSOR-PARK ASSIST-NO. 1' through '4' terminal. These are connected to a common ground line labeled 'S346'. Below this, a 'MODULE-PARK ASSIST (PARKTRONICS)' is shown with a 'PARK ASSIST SENSOR SIGNAL' terminal connected to the common ground line. The main control module, 'MODULE-PARK ASSIST (PARKTRONICS)', is shown with a 'PARK ASSIST SENSOR SIGNAL' terminal connected to the common ground line. The diagram also shows the wiring for the 'DISPLAY-PARK ASSIST (PARKTRONICS)' module, including its 'PARK ASSIST DISPLAY SUPPLY', 'PARK ASSIST DISPLAY GROUND', and 'PARK ASSIST DISPLAY SIGNAL' terminals. The wiring is color-coded: X750 (20) GY/LB, X777 (20) DG/GY, Z171 (20) GY/BK, D777 (20) WT/DG, Z914 (20) BK/GY, and Z914 (20) BK/GY. The diagram includes a legend for the 'DISPLAY-PARK ASSIST (PARKTRONICS)' module, showing its terminals and their corresponding colors: 1 (BLACK), 2 (GY/BK), 3 (WT/DG), 4 (DG/GY), 5 (GY/BK), 6 (WT/DG), 7 (DG/GY), 8 (GY/BK), 9 (WT/DG), 10 (DG/GY), 11 (GY/BK), 12 (WT/DG), 13 (DG/GY), 14 (GY/BK), 15 (WT/DG), 16 (DG/GY), 17 (GY/BK), 18 (WT/DG), 19 (DG/GY), 20 (GY/BK), 21 (WT/DG), 22 (DG/GY), 23 (GY/BK), 24 (WT/DG), 25 (DG/GY), 26 (GY/BK), 27 (WT/DG), 28 (DG/GY), 29 (GY/BK), 30 (WT/DG).

**U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition in Run/Start, PRNDL in R, N, or D; vehicle speed less than 40 mph (Late build vehicles will disable the Park Assist System in neutral).

- **Set Condition:**

Display data line low.

Possible Causes
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO THE (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO THE (Z914) PARK ASSIST MODULE GROUND CIRCUIT
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT SHORT TO GROUND
PARK ASSIST DISPLAY
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW (CONTINUED)****2. CHECK PARK ASSIST MODULE FOR AN INTERNAL SHORT TO GROUND**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Measure the resistance between ground and the (D777) Park Assist Display Signal circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Go To 3

**No** >> Replace the Park Assist Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO THE (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT**

Disconnect the Park Assist Display harness connector.

Measure the resistance between the (D777) Park Assist Display Signal circuit and the (Z171) Park Assist Display Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D777) Park Assist Display Signal circuit for a short to the (Z171) Park Assist Display Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**4. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO THE (X750) PARK ASSIST SENSOR GROUND CIRCUIT**

Measure the resistance between the (D777) Park Assist Display Signal circuit and the (X750) Park Assist Sensor Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D777) Park Assist Display Signal circuit for a short to the (X750) Park Assist Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 5

**U1002-PTS DISPLAY COMMUNICATION CIRCUIT LOW (CONTINUED)****5. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO THE (Z914) PARK ASSIST MODULE GROUND CIRCUIT**

Measure the resistance between the (D777) Park Assist Display Signal circuit and the (Z914) Park Assist Module Ground circuit.

**Is the resistance below 10K ohms?**

**Yes** >> Repair the (D777) Park Assist Display Signal circuit for a short to the (Z914) Park Assist Module Ground circuit.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 6

**6. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance between ground and the (D777) Park Assist Display Signal circuit.

**Is the resistance below 10K ohms?**

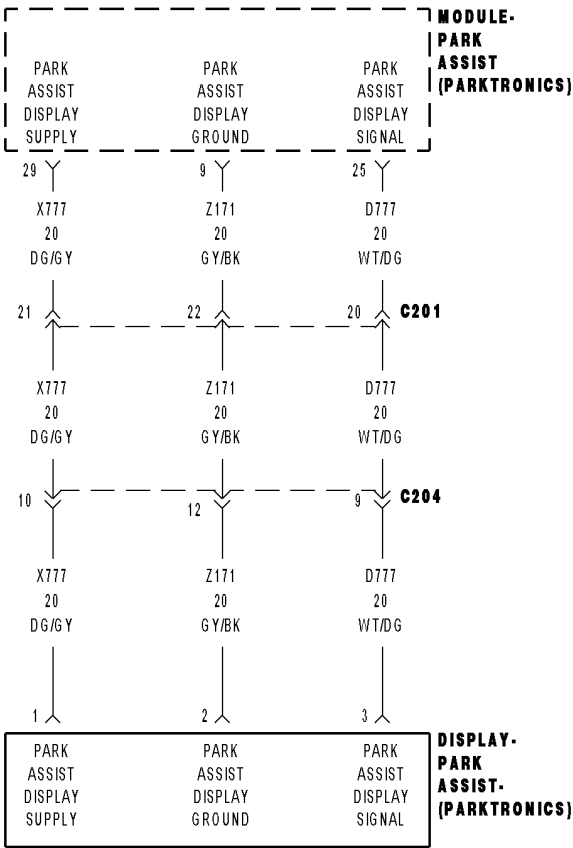

**Yes** >> Repair the (D777) Park Assist Display Signal circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Park Assist Display in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

U1101-LOST COMMUNICATION WITH PTS DISPLAY

**U1101-LOST COMMUNICATION WITH PTS DISPLAY (CONTINUED)**

For the Park Assist circuit diagram (Refer to 8 - ELECTRICAL/CHIME/BUZZER - SCHEMATIC - ELECTRICAL).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition in Run/Start, PRNDL in R, N, or D; vehicle speed less than 40 mph (Late build vehicles will disable the Park Assist System in neutral).

- **Set Condition:**

Data display line open.

Possible Causes
(D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT OPEN
(X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT OPEN
(Z171) PARK ASSIST DISPLAY GROUND CIRCUIT OPEN
PARK ASSIST DISPLAY
PARK ASSIST MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC: U1101-LOST COMMUNICATION WITH PTS DISPLAY**

Turn the ignition on.

Apply the vehicle park brake.

Shift the transmission into Reverse.

With the scan tool, record and erase Park Assist Module DTCs.

Wait 30 seconds.

With the scan tool, read Park Assist Module DTCs.

**Is DTC: U1101-LOST COMMUNICATION WITH PTS DISPLAY active?**

**Yes** >> Go To 2

**No** >> The condition that caused this code to set is not present at this time. Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**U1101-LOST COMMUNICATION WITH PTS DISPLAY (CONTINUED)****2. CHECK THE (D777) PARK ASSIST DISPLAY SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Disconnect the Park Assist Display Module harness connector.

Measure the resistance of the (D777) Park Assist Display Signal circuit between the Park Assist Module harness connector and the Park Assist Display harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (D777) Park Assist Display Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK THE (X777) PARK ASSIST DISPLAY SUPPLY CIRCUIT FOR AN OPEN**

Measure the resistance of the (X777) Park Assist Display Supply circuit between the Park Assist Module harness connector and the Park Assist Display harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (X777) Park Assist Display Supply circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## U1101-LOST COMMUNICATION WITH PTS DISPLAY (CONTINUED)

### 4. CHECK THE (Z171) PARK ASSIST DISPLAY GROUND CIRCUIT FOR AN OPEN

Measure the resistance of the (Z171) Park Assist Display Ground circuit between the Park Assist Module harness connector and the Park Assist Display harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (Z171) Park Assist Display Ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

### 5. CHECK THE OPERATION OF THE PARK ASSIST DISPLAY

Replace the Park Assist Display in accordance with the service information.

Reconnect the Park Assist Module harness connector.

Turn the ignition on.

With the scan tool, read DTCs.

**Does the scan tool display U1101-LOST COMMUNICATION WITH PTS DISPLAY?**

**Yes** >> Replace the Park Assist Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Test Complete.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

CHIME/BUZZER - SERVICE INFORMATION

DESCRIPTION

CHIME WARNING SYSTEM

The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the ElectroMechanical Instrument Cluster (EMIC) to provide audible indications of various vehicle conditions that may require the attention of the vehicle operator or occupants. The EMIC also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based EMIC utilizes electronic chime request messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hard wired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the EMIC allow it to control the audible outputs that are produced through its on-board transducer and relay.

PARK ASSIST SYSTEM

The Park Assist System is an electronic parking aid that alerts the driver to obstacles which are located immediately behind the vehicle. Objects are sensed using ultrasonic sound waves. When an object is detected, the system will give the driver visual and audible warnings. The system is customer programmable through the Electronic Vehicle Information Center (EVIC) but will be enabled from the factory as a default.

The major components of the park assist system are:

- **Park Assist Module** - supplies voltage to the object detection sensors and park assist display. It triggers the sensors, analyzes the echo delay times and calculates obstacle distances. It sends display information to the park assist display, performs system diagnostics, and communicates via the Programmable Communication Interface (PCI) data bus network.
- **Park Assist Sensors** - there are four sensors located in the rear bumper that generate ultrasonic pulses when triggered by the park assist module. The sensors signal the park assist module when reflected ultrasonic pulses are received.
- **Park Assist Display** - there are sixteen Light Emitting Diode (LED) indicators which provide indication of relative distance to obstacles. When the system is engaged and no obstacles are detected, the two outermost yellow LED's are lit at reduced brightness to show the system is working. As the distance to a detected obstacle decreases, more yellow LED's towards the center of the display illuminate.

For diagnosis and testing of the park assist system, use a scan tool and the appropriate body diagnostic information.

## OPERATION

### CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received through a fuse in the Junction Block (JB) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the On position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **Airbag Indicator Warning** - The ElectroMechanical Instrument Cluster (EMIC) transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the Controller Area Network (CAN) data bus from the Occupant Restraint Controller (ORC) requesting "Airbag" indicator illumination. This warning will only occur following completion of the "Airbag" indicator bulb test, and will only occur once during any ignition cycle.
- **Compass Mini-Trip Computer Global Reset** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the CAN data bus from the optional Compass Mini-Trip Computer (CMTC) requesting that the CMTC average fuel economy, trip odometer and distance to empty data be reset. The CMTC monitors hard wired inputs from the U.S./Metric and Reset button switches to determine the proper reset messages to send to the EMIC.
- **Door Ajar Indicator Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of any door ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Fasten Seat Belt Indicator Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to announce that a hard wired input from the seat belt switch indicates that the driver side front seat belt is not fastened with the ignition switch in the On position. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled.
- **Gate Ajar Indicator Warning** - The EMIC transducer will generate one short chime when the ignition switch is in the On position, a hard wired input is received indicating that the status of the liftgate ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Head/Park Lamps-On Warning** - The EMIC transducer will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the headlamp switch, and the ignition switch indicate that the exterior lamps are turned On with the driver side front door opened and the ignition switch in the Off position. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Key-In-Ignition Warning** - The EMIC transducer will generate repetitive chimes at a fast rate to indicate that hard wired inputs from the driver door ajar switch, the ignition switch, and the key-in ignition switch circuitry of the ignition switch indicate that the key is in the ignition lock cylinder with the driver side front door open and the ignition switch in the Off position. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Low Fuel Indicator Warning** - The EMIC transducer will generate one short chime when the low fuel indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Low Wash Indicator Warning** - The EMIC transducer will generate one short chime when the low washer fluid indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Overspeed Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to indicate that the vehicle speed is over a pre-programmed speed value. The EMIC monitors electronic vehicle speed messages received over the CAN data bus. This feature is only enabled on an EMIC that has been programmed with a Middle East Gulf Coast Country (GCC) country code.
- **Park Brake Reminder** - The EMIC transducer will generate one short chime to announce that the hard wired input from the park brake switch and a vehicle speed message input received over the CAN data bus indicate that the park brake is applied and the vehicle is moving. This chime will repeat each time the input conditions are met.
- **Sentry Key "Customer Learn" Mode Announcement** - The EMIC transducer will generate one short chime to confirm that an electronic "Customer Learn" mode message has been received over the CAN data bus to indicate that the Sentry Key Remote Entry Module (SKREEM) is prepared for programming additional sentry

key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where "Customer Learn" programming is an allowed feature.

- **Trans Overtemp Indicator Warning** - The EMIC transducer will generate repetitive chimes at a slow rate when the transmission overtemp indicator is illuminated by the instrument cluster for a high or critical transmission fluid temperature condition. This chime will repeat each time the trans overtemp indicator is cycled from Off to On.
- **Turn Signal/Hazard Warning Flasher Emulation** - The EMIC relay will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The EMIC relay will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs inoperative. In either case, the clicks will continue until the turn signal and hazard warning systems are turned off.
- **Turn Signal On Warning** - The EMIC transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.
- **Warning Indicator Announcement** - The EMIC transducer will generate one short chime each time the check gauges indicator is illuminated by the instrument cluster circuitry. The check gauges indicator may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors electronic messages received over the CAN data bus to determine when to illuminate the check gauges indicator.

The EMIC provides chime service for all available features in the chime warning system. The EMIC relies upon its internal programming, numerous hard wired inputs, and electronic message inputs received from other modules over the CAN data bus network to provide the chime warning system features. The internal programming of the EMIC determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hard wired chime warning system inputs to the EMIC may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the EMIC, the CAN data bus, or the electronic messages received by the EMIC from other modules. The most reliable, efficient and accurate means to diagnose the EMIC, the CAN data bus, or the electronic message inputs used for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

## PARK ASSIST SYSTEM

The Park Assist System display activates an audible tone that changes from intermittent to continuous as the final two Light Emitting Diodes (LED's) are illuminated on one side or both sides of the display.

The system detection length from the rear of the vehicle is 0.3 meters to 1.5 meters. This area extends around the rear side of the vehicle. The system detection height from the ground is 0.2 meters to about 1.5 meters. The radio mutes when the system activates its audible tone.

When the driver selects Reverse or Neutral the system scans for objects behind the vehicle using four sensors located in the rear bumper. A warning display above the rear window provides both visible and audible warnings indicating the range of the object.

The system is active only when the transmission gear selector is in reverse or neutral for vehicle speeds less than 16 Km/h (10 mph). If the vehicle's Parking/Emergency Brake is applied, the system is deactivated.

The display contains two sets of yellow and red Light Emitting Diode's (LED's) that the driver can see as they look over their shoulder while backing up. Each side of the vehicle has its own warning LED's. The system provides a visual warning by illuminating one or more yellow LED's as the vehicle gets closer to the object. As the vehicle continues to approach the object, one red LED is illuminated and the system emits a series of short beeps. The tone will remain constant and both red LED's are illuminated once the vehicle is within 12 inches (30.5 cm) of the object.

The system can be turned ON or OFF through the Electronic Vehicle Information Center (EVIC) when the vehicle is in PARK. If the park assist system is turned OFF, a single chime will sound and the EVIC will display the following message "REAR PARK ASSIST OFF", when the vehicle is in reverse.

- Ensure that the rear bumper is free of dirt and debris to keep the system operating properly.
- Jackhammers, large trucks, and other vibrations could affect the performance of the system.
- Ensure that the parking brake is not applied.

If "Service Park Assist System" appears in the EVIC after making sure the rear bumper is clean, proceed to diagnose the system using a scan tool and the appropriate diagnostic information.

## PARK ASSIST DISPLAY

### DESCRIPTION

The Park Assist Display is located in the rear of vehicle, over the rear window in the headliner. It is a molded plastic unit housing Light Emitting Diodes (LED's) and a chime module. Located in the rear of the vehicle for easy visual reference when the driver is backing up.

The display is used to alert the driver of any obstacles detected in the rear of the vehicle. The chime or audible signal also comes from the display unit.

### OPERATION

When the ignition is put in the RUN position, all the Light Emitting Diodes (LED's) will illuminate for approximately one second. This will be interrupted if the system senses an obstacle.

The ready status will be sensed by the outermost two yellow LED's (1) being illuminated. As the obstacle is sensed, the yellow LED's will start illuminating inward (6) until the object is approximately one foot away and then the inner red LED will light (3).

The display is sensitive to which side of the rear of the vehicle that the object is detected. If on the left rear, the left segments will light and the same for the right side of the vehicle.

### CORRELATION OF LED SEGMENTS TO DISTANCE

DISPLAY LED	DISTANCE		LED COLOR	AUDIBLE SIGNAL
	REAR CORNERS	REAR CENTER		
1st LED		300 cm (9.8 ft.)	Yellow	None
2nd LED		150 cm (4.9 ft.)	Yellow	None
3rd LED		70 cm (2.2 ft.)	Yellow	None
4th LED	60 cm (1.9 ft.)	60 cm (1.9 ft.)	Yellow	None
5th LED	50 cm (1.6 ft.)	50 cm (1.6 ft.)	Yellow	None
6th LED	40 cm (1.3 ft.)	40 cm (1.3 ft.)	Yellow	None
7th LED	30 cm (12 in.)	30 cm (12 in.)	Red	30 cm (12 in.) Intermittant
8th LED	15 cm (6 in.)	20 cm (8 in.)	Red	20 cm (8 in.) Continuous

There will be an audible tone when the object gets within 30 cm (1 ft.) from the rear of the vehicle.

To diagnose and test the Park Assist System, use a scan tool and the appropriate diagnostic information.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Lower the headliner (3) in the rear of the vehicle in the liftgate opening. Follow the headliner removal procedure for the rear of the headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
3. Bend the retaining tabs (2) upwards to allow the park assist display (1) to drop out of the headliner (3) opening.
4. Disconnect the display electrical connector (4) and remove display (1) from vehicle.

## INSTALLATION

1. Position the Park Assist Display (1) in headliner (3) opening and connect the display electrical connector (4).
2. Bend the retaining tabs (2) down behind the headliner (3).
3. Raise the headliner in the rear of the vehicle in the liftgate opening (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
4. Connect the battery negative cable.

## PARK ASSIST MODULE

### DESCRIPTION

The Park Assist Module (2) is located on the right side of the vehicle, in the trunk compartment, behind the trunk carpet. It has a molded plastic housing which houses internal circuitry and one electrical connector. There are two mounting tabs that affix the module to the right inner quarter trim panel with two screws (1).

The module (2) has a number of functions:

- Supply voltage to the sensors and display.
- Disconnection of the display with bus idle and over voltage Vmax.
- Triggering the sensors.
- Analyze echo delay times and calculate obstacle distances.
- Bi-directional data communication to the display for diagnosis.
- System diagnostics - diagnosis and error handling (sensors, display, module).
- Data exchange over the Controller Area Network (CAN) data bus.

## OPERATION

The system detection length from the rear of the vehicle is 0.3 meters to 1.5 meters. This area extends around the rear side of the vehicle. The system detection height from the ground is 0.2 meters to about 1.5 meters. The radio mutes when the system activates its audible tone.

When the driver selects Reverse or Neutral the system scans for objects behind the vehicle using four sensors located in the rear bumper. Objects can be detected from up to 1.5 meters. A warning display above the rear window provides both visible and audible warnings indicating the range of the object.

The system is active only when the vehicle is in reverse or neutral for vehicle speeds less than 16 Km/h (10 mph). If the vehicle's Parking/Emergency Brake is applied, the system is deactivated.

The display contains two sets of yellow and red Light Emitting Diode's (LED's) that the driver can see as they look over their shoulder while backing up. Each side of the vehicle has its own warning LED's. The system provides a visual warning by illuminating one or more yellow LED's as the vehicle gets closer to the object. As the vehicle continues to approach the object, one red LED is illuminated and the system emits a series of short beeps. The tone will remain constant and both red LED's are illuminated once the vehicle is within 12 inches (30.5 cm) of the object.

The system can be turned ON or OFF through the Electronic Vehicle Information Center (EVIC) when the vehicle is in PARK. If the park assist system is turned OFF, a single chime will sound and the EVIC will display the following message "REAR PARK ASSIST OFF", when the vehicle is in reverse.

- Ensure that the rear bumper is free of dirt and debris to keep the system operating properly.
- Jackhammers, large trucks, and other vibrations could affect the performance of the system.
- Ensure that the parking brake is not applied.

If "Service Park Assist System" appears in the EVIC after making sure the rear bumper is clean, proceed to diagnose the system using a scan tool and the appropriate diagnostic information.

To diagnose the Park Assist Module, use a scan tool and the appropriate body diagnostic information.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Peel back the right inner trunk carpet to expose the Park Assist Module (2).
3. Remove the two attaching screws (1) and separate the module (2) from the vehicle.

4. Disconnect the Park Assist Module (2) electrical connector (1).

## INSTALLATION

1. Connect the Park Assist Module electrical connector.

2. Position the Park Assist Module (2) and install the two attaching screws (1). Torque screws to 3.5 N·m (30 in. lbs.).
3. Reposition the trunk carpet.
4. Connect the battery negative cable.

## PARK ASSIST SENSOR

### DESCRIPTION

The Park Assist Sensors are located in the rear bumper fascia mounted equally apart. The sensors generate ultrasonic pulses when triggered by the park assist module when an obstacle is detected. The sensors then signal the module when reflected ultrasonic pulses are received.

The sensors detect objects with an ultrasonic pulse that reflects off the object and then is sent to the module to determine the distance of the object.

### OPERATION

The Park Assist Sensors:

- Generate ultrasonic pulses when triggered by the Park Assist Module.
- Reception/filtering of ultrasonic energy received.
- Signalling the module of received ultrasonic pulses that meet threshold criteria.

The sensors are supplied power by the module. The sensor supply is enabled when the sensor function is necessary.

The sensors detection length from the rear of the vehicle is 0.3 meters to 1.5 meters. This area extends around the rear side of the vehicle. The sensor detection height from the ground is 0.2 meters to about 1.5 meters.

- Ensure that the rear bumper (sensors) is free of dirt and debris to keep the system operating properly.
- Jackhammers, large trucks, and other vibrations could affect the performance of the system.
- Ensure that the parking brake is not applied.

If "Service Park Assist System" appears in the EVIC after making sure the rear bumper is clean, proceed to diagnose the system using a scan tool and the appropriate diagnostic information.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove rear fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - REMOVAL).
3. Unsnap Park Assist Sensor from the retaining housing and remove from fascia.

## INSTALLATION

1. Position the Park Assist Sensor over the retaining housing and firmly snap into housing in rear fascia.
2. Install the rear fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/REAR FASCIA - INSTALLATION).
3. Connect the battery negative cable.

# CLOCK

## TABLE OF CONTENTS

<b>CLOCK - SERVICE INFORMATION</b>		<b>REMOVAL</b> .....	2
DESCRIPTION .....	1	<b>INSTALLATION</b> .....	3
OPERATION .....	1		

### CLOCK - SERVICE INFORMATION

#### DESCRIPTION

The analog clock is located in the instrument panel center bezel, between the air distribution outlets. It has one adjustment button for setting and no second hand.

#### OPERATION

The analog clock is fed power through the M1 fuse. when installed, the clock, along with other noncritical options will be functional.

To set the analog clock, press and hold the adjustment button until desired time is reached.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the Instrument Panel Center Bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

3. Remove the two retaining screws (1) holding the clock to the rear of the I/P Center Bezel.

4. To replace the clock illumination lamps (1), turn sockets (1) counterclockwise to remove lamp and socket (1).

## INSTALLATION

1. Place lamp and sockets (1) into opening and turn clockwise till detent is felt.

2. Place the clock into bezel opening and then install the two retaining screws (1).

3. Install the Instrument Panel Center Bezel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Connect the battery negative cable.
5. Adjust clock to proper time.

## ELECTRONIC CONTROL MODULES - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

## B210D-BATTERY VOLTAGE LOW

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
Battery voltage less than 9 volts for approximately 5 to 6 seconds.

Possible Causes
RESISTANCE IN THE BATTERY POSITIVE CIRCUIT RESISTANCE IN THE GENERATOR CASE GROUND GENERATOR OPERATION (K20) GENERATOR FIELD CONTROL CIRCUIT OPEN (K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO GROUND GROUND CIRCUIT OPEN PCM

## Diagnostic Test

### 1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS

**Note:** Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

**Note:** Inspect the vehicle for after market accessories that may exceed the Generator System output.

**Note:** Make sure the generator drive belt is in good operating condition.

**Note:** Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

**Does the scan tool display any active PCM DTC's?**

**Yes** >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

**No** >> Check the above conditions that can cause a low voltage condition. Repair as necessary.  
Perform BODY VERIFICATION TEST – VER 1.

---

**B210E-BATTERY VOLTAGE HIGH**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
Battery voltage greater than 16 volts for approximately 5 to 6 seconds.

Possible Causes
(K20) GENERATOR FIELD CONTROL CIRCUIT SHORTED TO BATTERY VOLTAGE GENERATOR PCM

**Diagnostic Test****1. CHECK FOR ANY POWERTRAIN CONTROL MODULES DTCS**

**Note:** Make sure the Battery is in good condition. Using the Midtronics Battery Tester, test the Battery before continuing.

**Note:** Inspect the vehicle for after market accessories that may exceed the Generator System output.

**Note:** Make sure the generator drive belt is in good operating condition.

**Note:** Inspect the fuses in the IPM. If an open fuse is found, use the wire diagram/schematic as a guide, inspect the wiring and connectors for damage.

Turn the ignition on.

With the scan tool, read active PCM DTC's.

**Does the scan tool display any active PCM DTC's?**

**Yes** >> (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the diagnostic test procedure.

**No** >> Check the above conditions that can cause a high voltage condition. Repair as necessary.  
Perform BODY VERIFICATION TEST – VER 1.

---

## B2112-5 VOLT SUPPLY CIRCUIT LOW

**B2112-5 VOLT SUPPLY CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module detects the (F891) 5 volt supply circuit voltage below 4 volts.

Possible Causes
(F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND A/C PRESSURE TRANSDUCER FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. A/C PRESSURE TRANSDUCER**

Turn the ignition off.

Disconnect the A/C Pressure Transducer harness connector.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the A/C Pressure Transducer in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B2112-5 VOLT SUPPLY CIRCUIT LOW (CONTINUED)****3. (F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance between ground and the (F891) 5 Volt Supply circuit.

**Is the resistance below 1000.0 ohms?**

**Yes** >> Repair the (F891) 5 Volt Supply circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B2113-5 VOLT SUPPLY CIRCUIT HIGH

**B2113-5 VOLT SUPPLY CIRCUIT HIGH (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module detects the (F891) 5 volt supply circuit voltage above 5.0 volts.

Possible Causes
(F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE A/C PRESSURE TRANSDUCER FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. A/C PRESSURE TRANSDUCER**

Turn the ignition off.

Disconnect the A/C Pressure Transducer harness connector.

Cycle the ignition switch from off to on, leaving the ignition on for a minimum of 90 seconds.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the A/C Pressure Transducer in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B2113-5 VOLT SUPPLY CIRCUIT HIGH (CONTINUED)****3. (F891) 5 VOLT SUPPLY CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Turn the ignition on.

Measure the voltage of the (F891) 5 Volt Supply circuit.

**Is the voltage above 5.5 volts?**

**Yes** >> Repair the (F891) 5 Volt Supply circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B2206-CURRENT VIN MISSING/MISMATCH**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module will receive and monitor the VIN message from the PCM and record the VIN if different from the last VIN.

Possible Causes
INCORRECT VIN PROGRAMMED IN PCM
FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. CHECK VIN IN PCM**

With the scan tool compare the VIN that is programmed into the PCM to the VIN on the vehicle.

**Does the VIN programmed into the PCM match the vehicles VIN?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Program the correct VIN in the PCM and retest.

---

**B2215-FRONT CONTROL MODULE INTERNAL**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously.
- **Set Condition:**  
The Front Control Module detects an internal fault.

Possible Causes
FRONT CONTROL MODULE

**Diagnostic Test**

**1. REPLACE THE FRONT CONTROL MODULE IF DTC IS ACTIVE**

With the scan tool, read the active FCM DTC's.

- Does the scan tool display this DTC as active?**
- Yes**    >> Replace and program the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.
- No**    >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.
-

**B222C-VEHICLE CONFIGURATION NOT PROGRAMMED**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The Front Control Module is not configured correctly to the vehicle.

Possible Causes
FRONT CONTROL MODULE NOT CONFIGURED CORRECTLY
FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK FOR ACTIVE DTC**

With the scan tool, read the active DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

---

**2. CONFIGURE THE FCM TO THE VEHICLE**

With the scan tool enter program network configuration and program the FCM to the vehicle configuration.

With the scan tool, erase FCM DTC's.

Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.

With the scan tool, read the active DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair is complete.

---

# U0001-CAN C BUS

### NAG1

**MODULE-FRONT CONTROL C1**

**MODULE-STEERING CONTROL**

**MODULE-ANTILOCK BRAKES**

**ASSEMBLY-SHIFTER LEVER (NAG1)**

**MODULE-POWERTRAIN CONTROL C1**

**U0001-CAN C BUS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The FCM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT ANTILOCK BRAKE MODULE POWERTRAIN CONTROL MODULE SHIFTER LEVER ASSEMBLY (NAG1 ONLY) TRANSMISSION CONTROL MODULE (NAG1 ONLY) STEERING CONTROL MODULE FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0001–CAN C BUS as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

**U0001-CAN C BUS (CONTINUED)****2. ANTILOCK BRAKE MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0001–CAN C BUS as active?**

**Yes** >> Go To 3

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.  
Perform ABS VERIFICATION TEST — VER 1.

---

**3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0001–CAN C BUS as active?**

**Yes** >> Go To 4

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

---

**4. SHIFTER LEVER ASSEMBLY (NAG1 ONLY)— INTERNAL SHORT**

Turn the ignition off.

**Note: If the vehicle is not equipped with a NAG1 controller then skip this step.**

Disconnect the Shifter Lever Assembly harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0001–CAN C BUS as active?**

**Yes** >> Go To 5

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Shifter Lever Assembly in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

---

**U0001-CAN C BUS (CONTINUED)****5. TRANSMISSION CONTROL MODULE (NAG1 ONLY)— INTERNAL SHORT**

Turn the ignition off.

**Note: If the vehicle is not equipped with a NAG1 controller then skip this step.**

Disconnect the Transmission Control Module C2 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0001—CAN C BUS as active?**

**Yes** >> Go To 6

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

---

**6. STEERING CONTROL MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U0001—CAN C BUS as active?**

**Yes** >> Go To 7

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Steering Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

---

**U0001-CAN C BUS (CONTINUED)****7. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

**Is there any voltage present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 8

**8. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

**Is there any voltage present?**

**Yes** >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

**U0001-CAN C BUS (CONTINUED)****9. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 10

**10. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 11

**U0001-CAN C BUS (CONTINUED)****11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT**

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

**Is any resistance present?**

- Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.  
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**U0019-CAN B BUS**

**U0019-CAN B BUS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The FCM detects an open, a short high, a short low or a short together in either of the CAN B Bus circuits.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D55) CAN B BUS (+) CIRCUIT SHORTED TO (D54) CAN B BUS (-) CIRCUIT
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
ANY CAN B BUS MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

**2. ANY CAN B BUS MODULE— INTERNAL FAULT**

Turn the ignition off.

With the scan tool, monitor the active FCM DTCs.

While monitoring the scan tool, disconnect each CAN B Bus module one at a time.

**Note: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.**

**Note: This is to determine if the fault is internal within a module.**

Check for this DTC to become active after disconnecting each CAN B Bus module the vehicle is equipped with.

**Note: If the DTC becomes stored when a particular CAN B Bus module is disconnected, that module is causing the DTC to set.**

**With all the CAN B Bus modules disconnected did the FCM still set this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the module that when disconnected the DTC became stored.  
Perform BODY VERIFICATION TEST - VER 1.

---

**U0019-CAN B BUS (CONTINUED)****3. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

**Note: Ensure each CAN B Bus module is disconnected at this time.**

Turn the ignition on.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (D55) CAN B Bus (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

**4. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE**

**Note: Ensure each CAN B Bus module is disconnected at this time.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (D54) CAN B Bus (-) circuit for a short to voltage.

**No** >> Go To 5

**U0019-CAN B BUS (CONTINUED)****5. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

**Note:** Ensure each CAN B Bus module is disconnected at this time.

Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

**Is the resistance above 1000.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (D55) CAN B Bus (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.

**6. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO GROUND**

**Note:** Ensure each CAN B Bus module is disconnected at this time.

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

**Is the resistance above 1000.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (D54) CAN B Bus (-) circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.

**U0019-CAN B BUS (CONTINUED)****7. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT**

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

**Note:** Ensure each CAN B Bus module is disconnected at this time.

**Is any resistance present?**

**Yes** >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.  
Perform BODY VERIFICATION TEST - VER 1

**No** >> Go To 8

**8. (D55) CAN B BUS (+) CIRCUIT OPEN**

Measure the resistance of the (D55) CAN B Bus (+) circuit between the FCM connector and the Cluster connector.

**Is the resistance above 10.0 ohms?**

**Yes** >> Repair the (D55) CAN B Bus (+) circuit for an open or high resistance.  
Perform BODY VERIFICATION TEST - VER 1

**No** >> Go To 9

## U0019-CAN B BUS (CONTINUED)

## 9. (D54) CAN B BUS (-) CIRCUIT OPEN

Measure the resistance of the (D54) CAN B Bus (-) circuit between the FCM connector and the Cluster connector.

**Is the resistance above 10.0 ohms?**

**Yes** >> Repair the (D54) CAN B Bus (-) circuit for an open or high resistance.

Perform BODY VERIFICATION TEST - VER 1

**No** >> Replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1

**U0100-LOST COMMUNICATION WITH ECM/PCM**

**U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the ECM/PCM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY ECM/PCM ECM/PCM POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0100-LOST COMMUNICATION WITH ECM/PCM (CONTINUED)****3. VERIFY THAT THE ECM/PCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ECM/PCM is active on the bus.

**Is the ECM/PCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the ECM/PCM?**

**Yes** >> Replace/update the ECM/PCM in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0101-LOST COMMUNICATION WITH TCM

**U0101-LOST COMMUNICATION WITH TCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the TCM for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY TCM TCM POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0101-LOST COMMUNICATION WITH TCM (CONTINUED)****3. VERIFY THAT THE TCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the TCM is active on the bus.

**Is the TCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

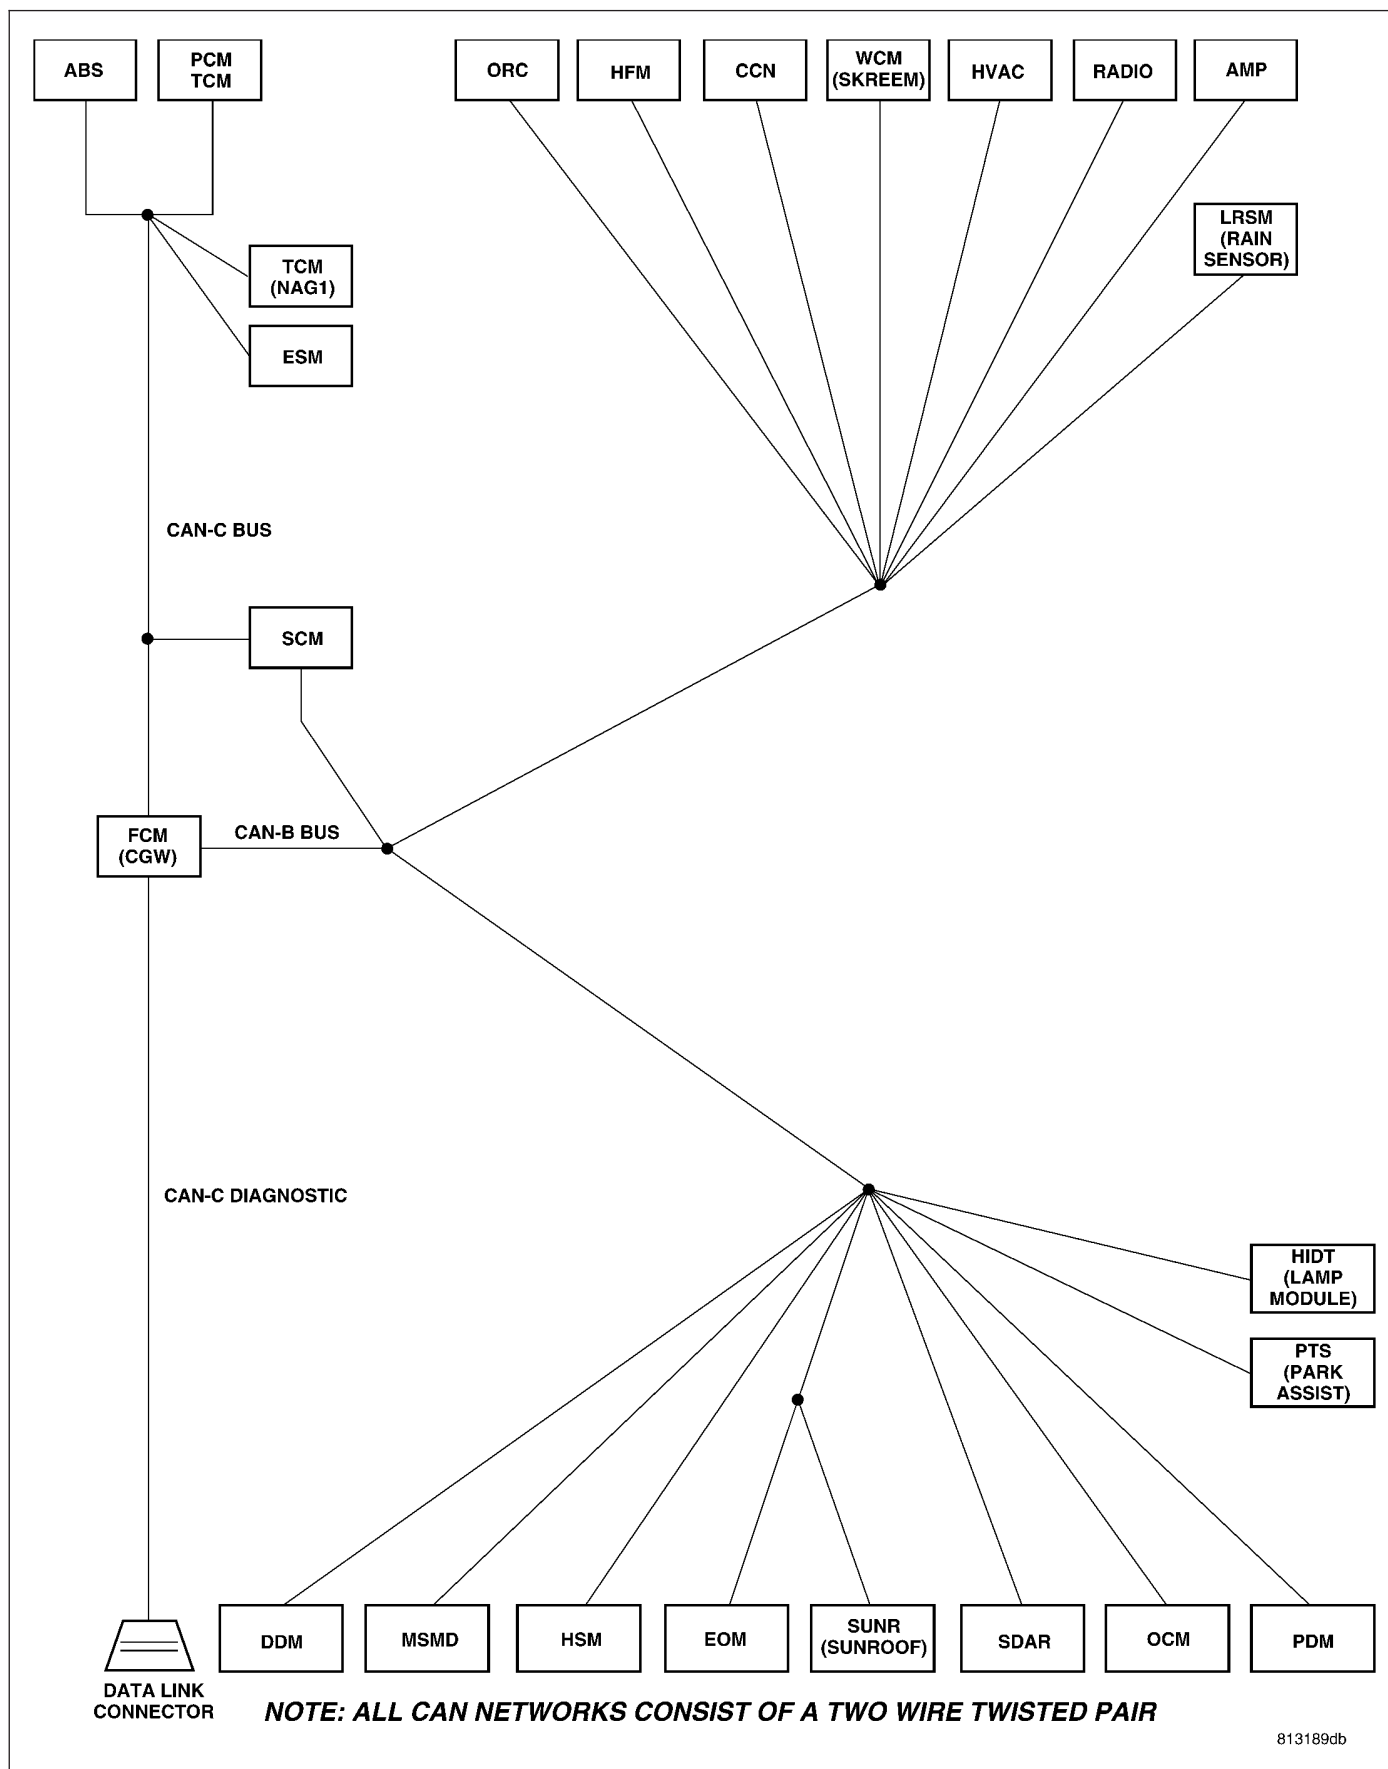

**Is there more than one module with active DTCs “Logged Against” the TCM?**

**Yes** >> Replace/update the TCM in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0103-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE

**U0103-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Electric Gear Shift Module (shifter lever assembly) for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY SHIFTER LEVER ASSEMBLY SHIFTER LEVER ASSEMBLY POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding. With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section. Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms. Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0103-LOST COMMUNICATION WITH ELECTRIC GEAR SHIFT MODULE (CONTINUED)****3. VERIFY THAT THE SHIFTER LEVER ASSEMBLY IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Shifter Lever Assembly is active on the bus.

**Is the Shifter Lever Assembly active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the Shifter Lever Assembly?**

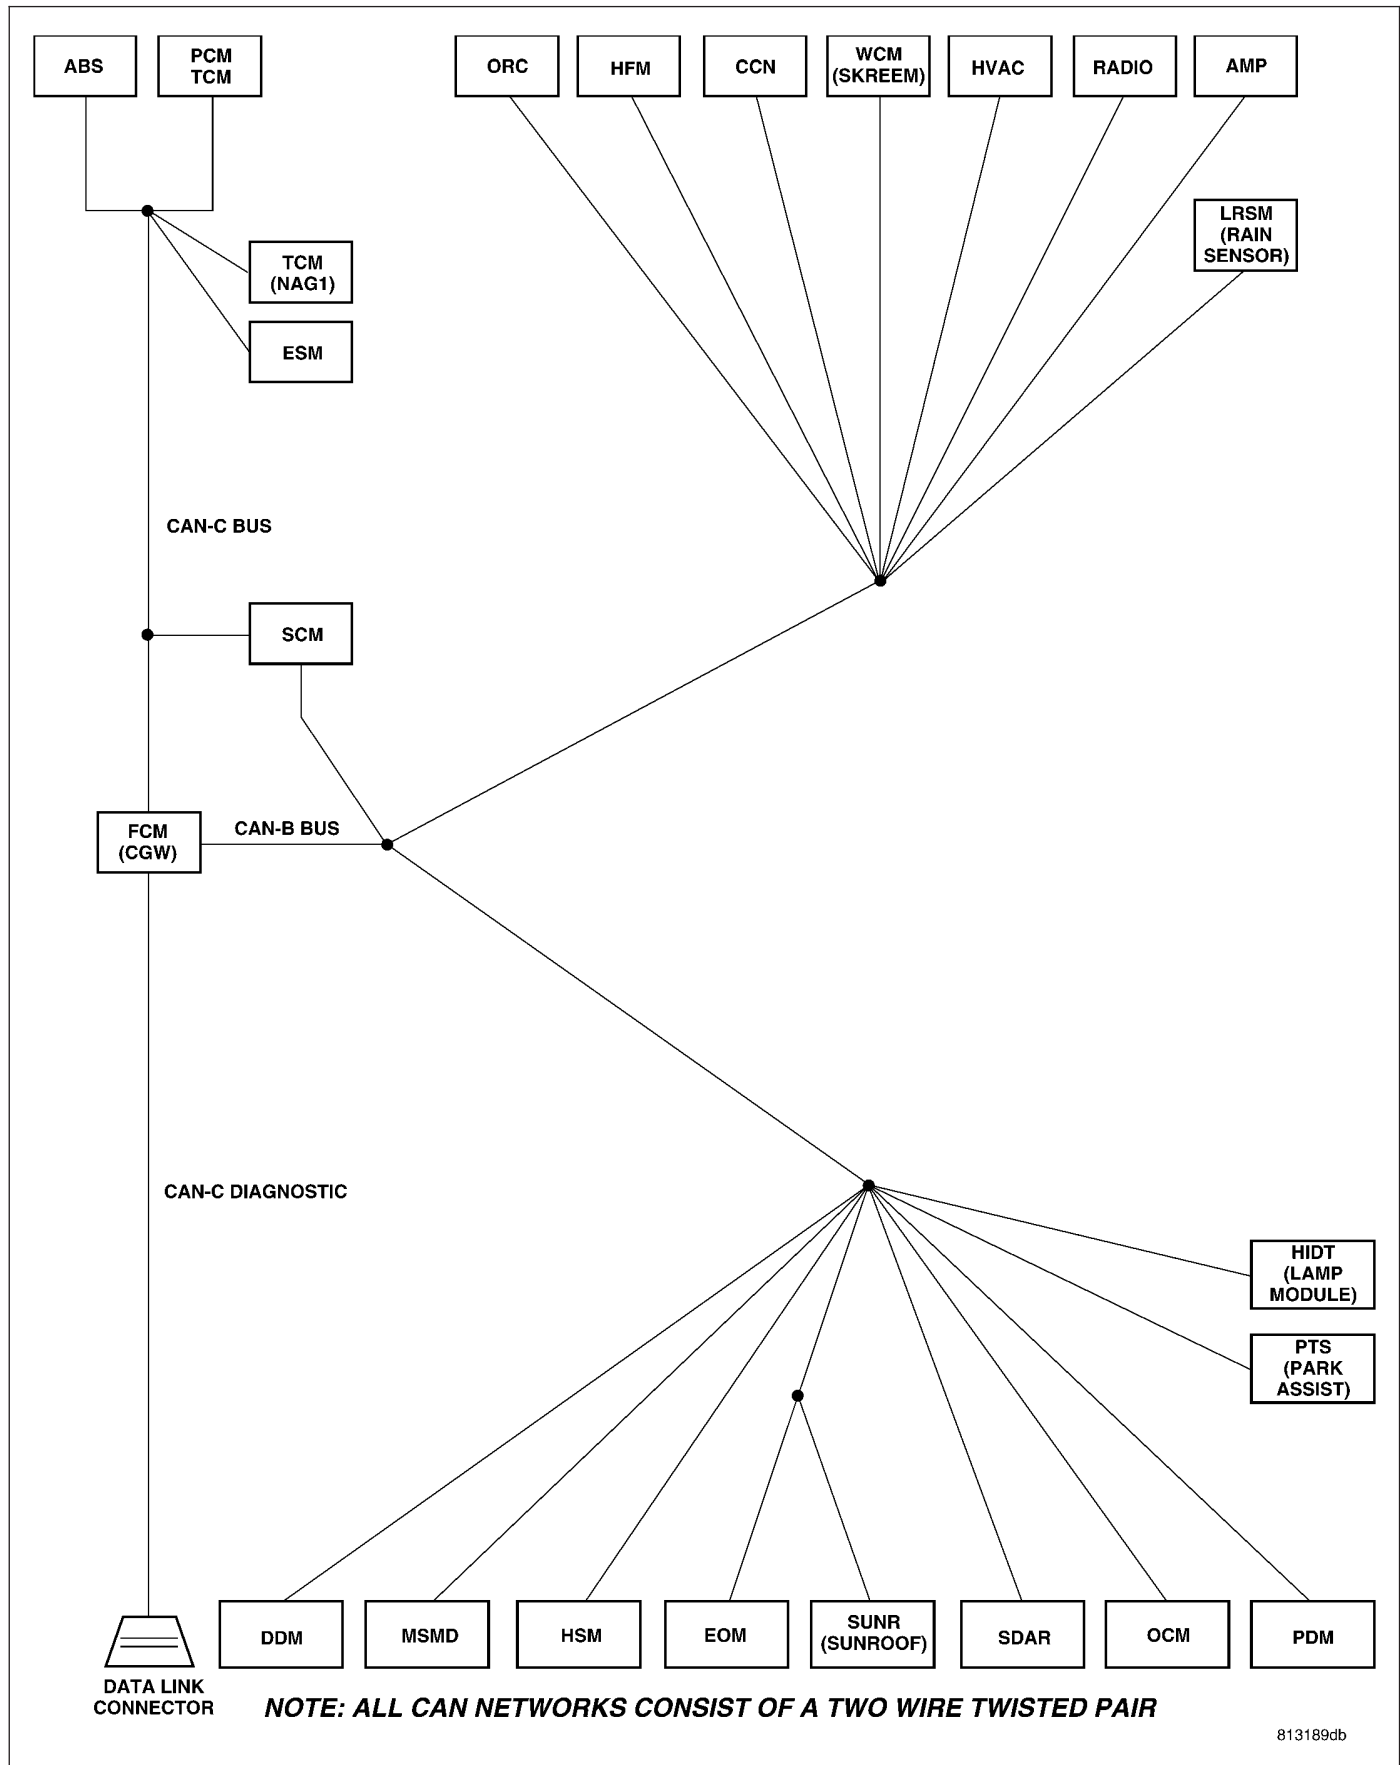

**Yes** >> Replace/update the Shifter Lever Assembly in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE

**U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Antilock Brake Module for approximately 500ms.

Possible Causes
CAN B OR CAN C BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY ANTILOCK BRAKE MODULE POWER AND GROUND ANTILOCK BRAKE MODULE MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0121-LOST COMMUNICATION WITH ANTI-LOCK BRAKE MODULE (CONTINUED)****3. VERIFY THAT THE ABS IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ABS is active on the bus.

**Is the ABS active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the ABS?**

**Yes** >> Replace/update the Antilock Brake Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE

**U0141—LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Front Control Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY FRONT CONTROL MODULE FRONT CONTROL MODULES POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0141-LOST COMMUNICATION WITH FRONT CONTROL MODULE (CONTINUED)****3. VERIFY THAT THE FCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the FCM is active on the bus.

**Is the FCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

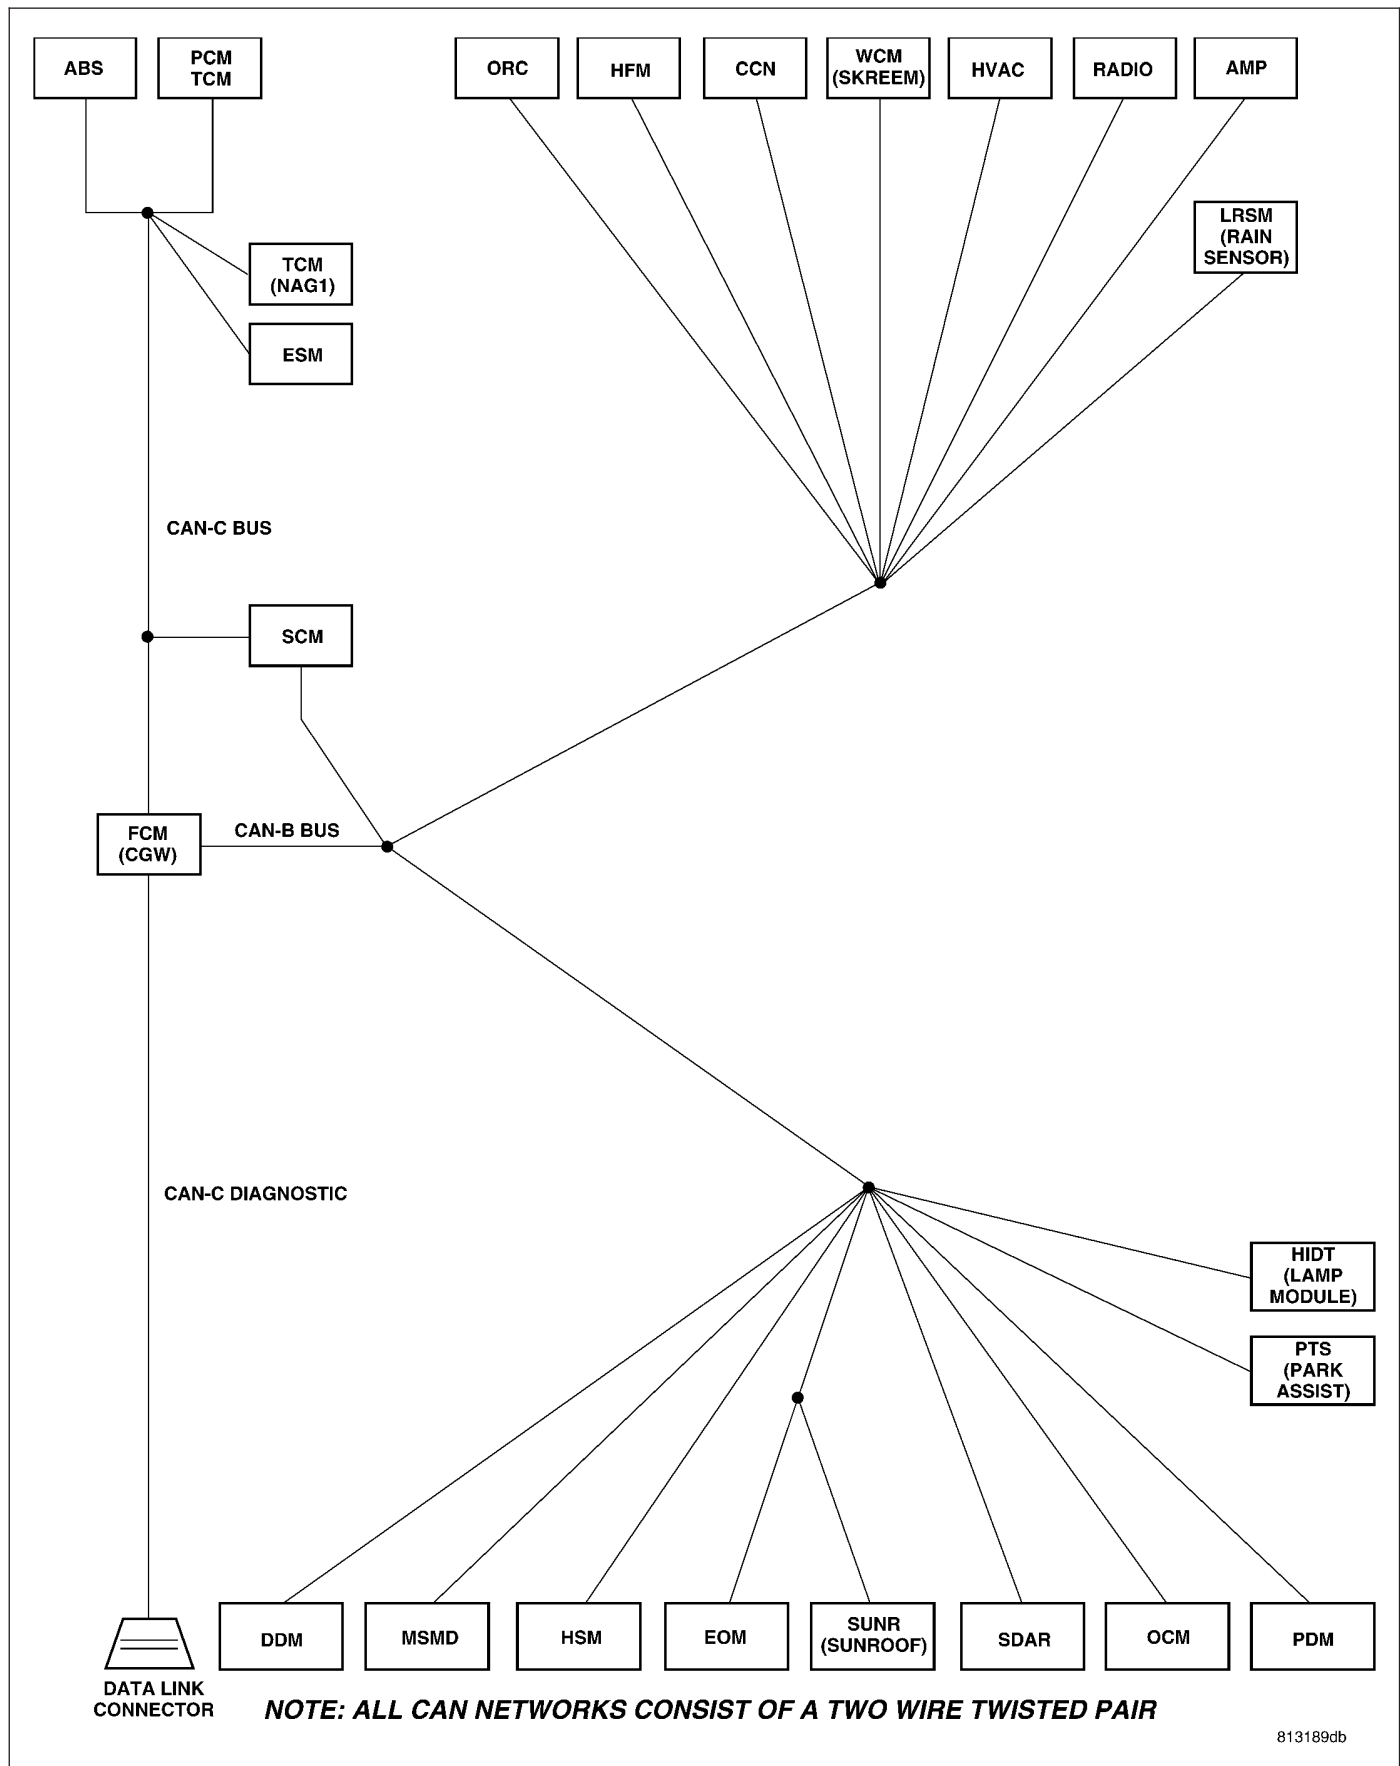

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the FCM?**

**Yes** >> Replace/update the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC)**

**U0151—LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Occupant Restraint Controller for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY OCCUPANT RESTRAINT CONTROLLER OCCUPANT RESTRAINT CONTROLLER POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0151-LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (CONTINUED)****3. VERIFY THAT THE ORC IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the ORC is active on the bus.

**Is the ORC active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the ORC?**

**Yes** >> Replace/update the Occupant Restraint Controller in accordance with the service information.  
Perform AIRBAG VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0154-LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE

**U0154—LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Occupant Classification Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY OCCUPANT CLASSIFICATION MODULE OCCUPANT CLASSIFICATION MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0154—LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (CONTINUED)****3. VERIFY THAT THE OCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the OCM is active on the bus.

**Is the OCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the OCM?**

**Yes** >> Replace/update the Occupant Classification Module in accordance with the service information.  
Perform AIRBAG VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0155-LOST COMMUNICATION WITH CLUSTER/CCN**

**U0155-LOST COMMUNICATION WITH CLUSTER/CCN (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Cluster/CCN for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY CLUSTER/CCN CLUSTER/CCN POWER AND GROUND MODULE THAT SET THE DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0155-LOST COMMUNICATION WITH CLUSTER/CCN (CONTINUED)****3. VERIFY THAT THE CCN IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the CCN is active on the bus.

**Is the CCN active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

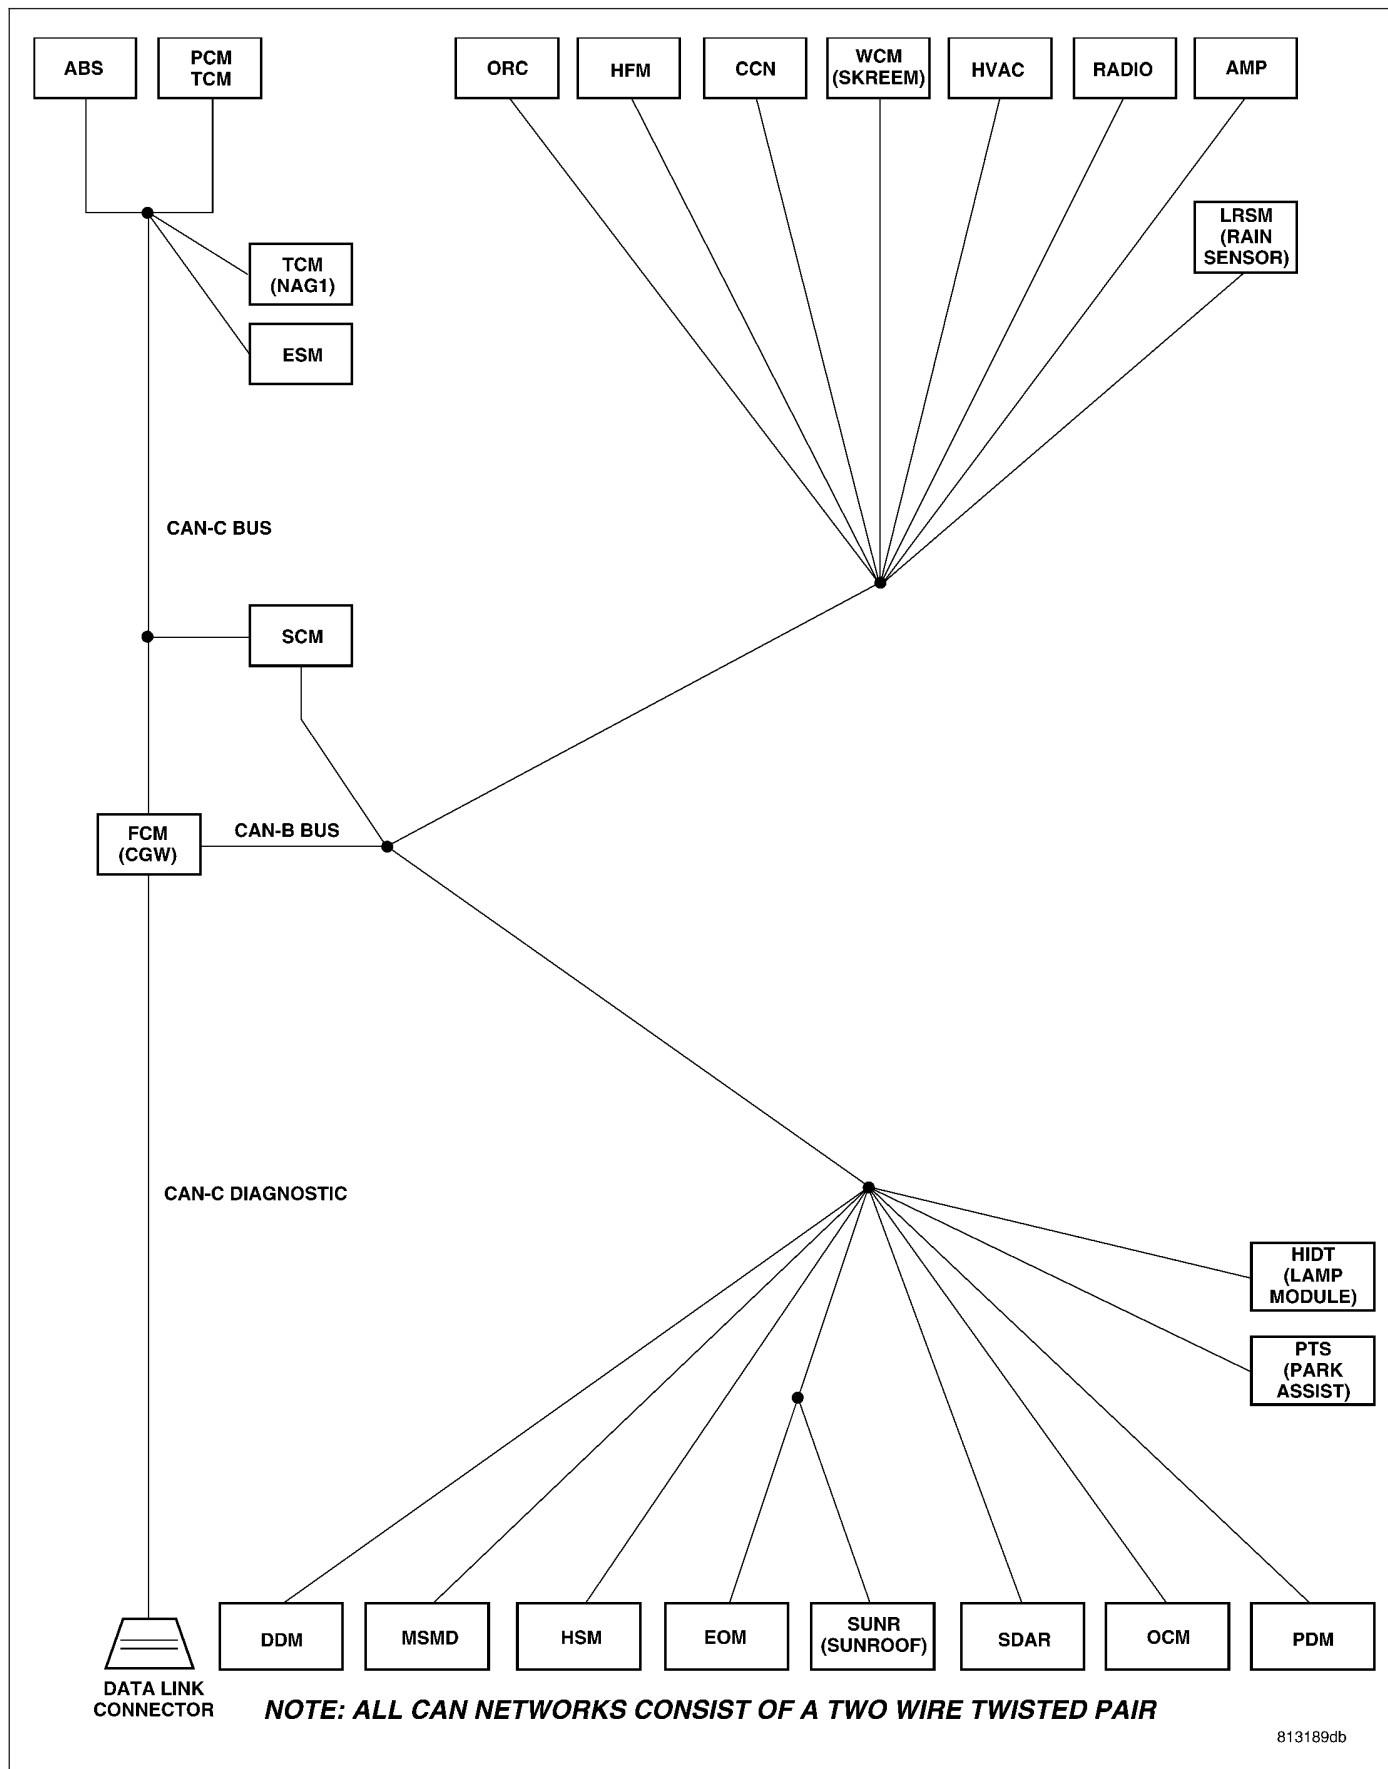

**Is there more than one module with active DTCs “Logged Against” the CCN?**

**Yes** >> Replace/update the Cluster (CCN) in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0156—LOST COMMUNICATION WITH EOM

**U0156—LOST COMMUNICATION WITH EOM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Electronic Overhead Module (EOM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
ELECTRONIC OVERHEAD MODULE POWER OR GROUND
ELECTRONIC OVERHEAD MODULE
MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0156—LOST COMMUNICATION WITH EOM (CONTINUED)****3. VERIFY THAT THE EOM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the EOM is active on the bus.

**Is the EOM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the EOM?**

**Yes** >> Replace/update the Electronic Overhead Module (EOM) in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0159-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE**

**U0159-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Park Assist Module (PTS) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY PARK ASSIST MODULE PARK ASSIST MODULE POWER OR GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read all active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0159-LOST COMMUNICATION WITH PARK ASSIST CONTROL MODULE (CONTINUED)****3. VERIFY THAT THE PTS IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the PTS is active on the bus.

**Is the PTS active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the PTS?**

**Yes** >> Replace/update the Park Assist Module (PTS) in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE**

**U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the A/C Heater Control (HVAC) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY A/C HEATER CONTROL A/C HEATER CONTROL POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0164-LOST COMMUNICATION WITH HVAC CONTROL MODULE (CONTINUED)****3. VERIFY THAT THE HVAC IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HVAC is active on the bus.

**Is the HVAC active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the HVAC?**

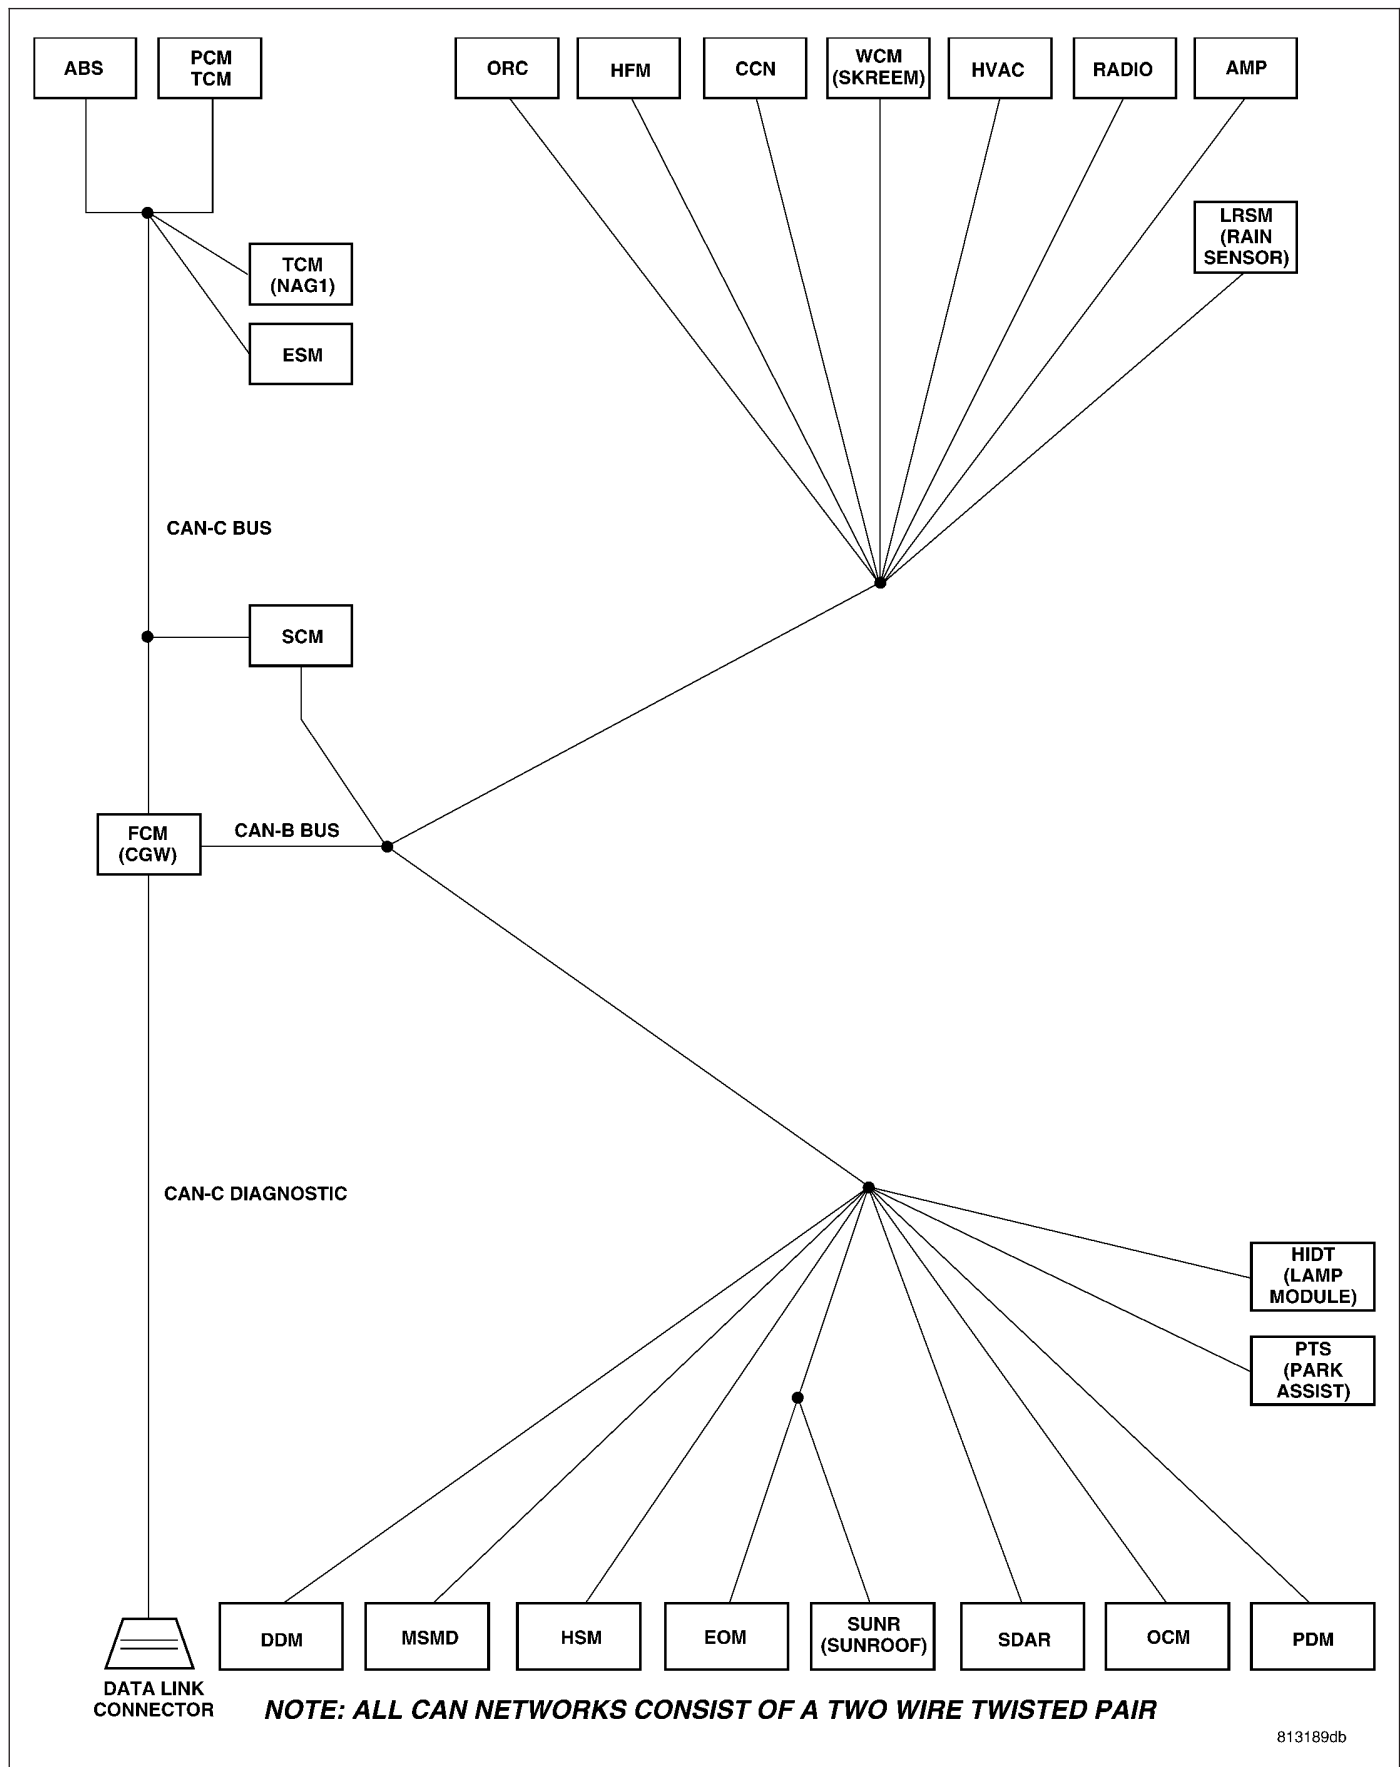

**Yes** >> Replace/update the A/C Heater Control in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set the DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM)

**U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Sentry Key Remote Entry Module (WCM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
SENTRY KEY REMOTE ENTRY MODULE
SENTRY KEY REMOTE ENTRY MODULE POWER AND GROUND
MODULE THAT SET THIS DTC

## Diagnostic Test

### 1. VERIFY DTC IS ACTIVE

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.

With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

### 2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0168-LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (CONTINUED)****3. VERIFY THAT THE WCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the WCM is active on the bus.

**Is the WCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the WCM?**

**Yes** >> Replace/update the Sentry Key Remote Entry Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE

**U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Sunroof Control Module (SUNR) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY SUNROOF CONTROL MODULE SUNROOF CONTROL MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0169-LOST COMMUNICATION WITH SUNROOF CONTROL MODULE (CONTINUED)****3. VERIFY THAT THE SUNR IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SUNR is active on the bus.

**Is the SUNR active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the SUNR?**

**Yes** >> Replace/update the Sunroof Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0181-LOST COMMUNICATION WITH HEADLAMP LEVELING TRANSLATOR**

**U0181-LOST COMMUNICATION WITH HEADLAMP LEVELING TRANSLATOR (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Headlamp Leveling Module for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY HEADLAMP LEVELING MODULE HEADLAMP LEVELING MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0181-LOST COMMUNICATION WITH HEADLAMP LEVELING TRANSLATOR (CONTINUED)****3. VERIFY THAT THE HDT IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HDT is active on the bus.

**Is the HDT active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the HDT?**

**Yes** >> Replace/update the Headlamp Leveling Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0184-LOST COMMUNICATION WITH RADIO

**U0184-LOST COMMUNICATION WITH RADIO (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**

Bus messages not received from the Radio for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY RADIO RADIO POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0184-LOST COMMUNICATION WITH RADIO (CONTINUED)****3. VERIFY THAT THE RADIO IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Radio is active on the bus.

**Is the Radio active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the Radio?**

**Yes** >> Replace/update the Radio in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER

**U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the Amplifier for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY AMPLIFIER AMPLIFIER POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0186-LOST COMMUNICATION WITH AUDIO AMPLIFIER (CONTINUED)****3. VERIFY THAT THE AMPLIFIER IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the Amplifier is active on the bus.

**Is the Amplifier active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

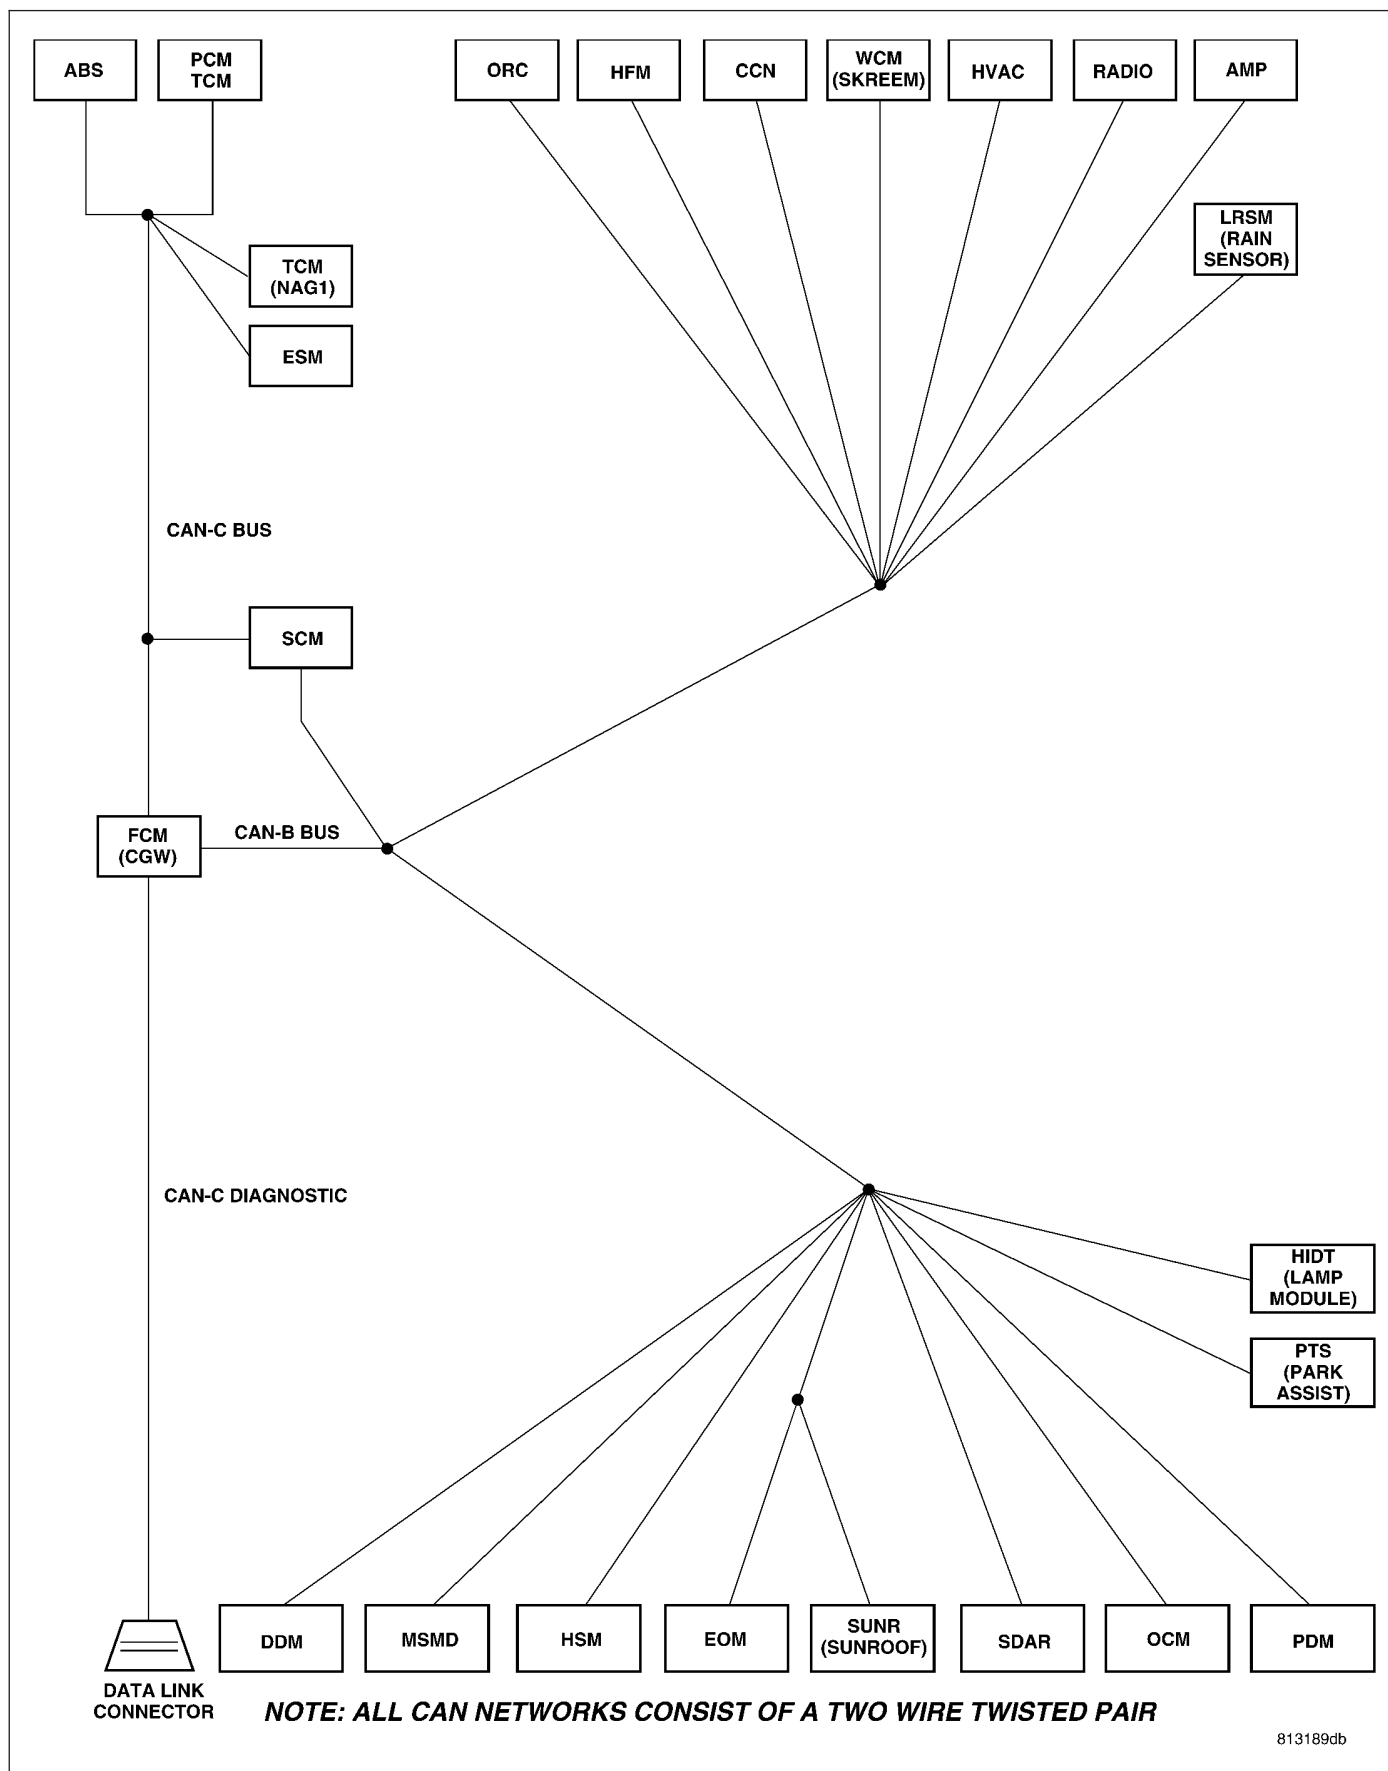

**Is there more than one module with active DTCs “Logged Against” the Amplifier?**

**Yes** >> Replace/update the Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0195-LOST COMMUNICATION WITH SDARS

**U0195-LOST COMMUNICATION WITH SDARS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**  
Bus messages not received from the Satellite Receiver (SDAR) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY SATELLITE RECEIVER SATELLITE RECEIVER POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0195-LOST COMMUNICATION WITH SDARS (CONTINUED)****3. VERIFY THAT THE SATELLITE RECEIVER IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SDARS is active on the bus.

**Is the SDARS active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the SDARS?**

**Yes** >> Replace/update the Satellite Receiver in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set the DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE**

**U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the HFM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY HANDS FREE MODULE HANDS FREE MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0197-LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (CONTINUED)****3. VERIFY THAT THE HFM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HFM is active on the bus.

**Is the HFM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the HFM?**

**Yes** >> Replace/update the Hands Free Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE**

**U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**

Bus messages not received from the DDM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY DRIVER DOOR MODULE DRIVER DOOR MODULE POWER AND GROUND MODULE THAT SET THE DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0199-LOST COMMUNICATION WITH DRIVER DOOR MODULE (CONTINUED)****3. VERIFY THAT THE DDM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the DDM is active on the bus.

**Is the DDM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

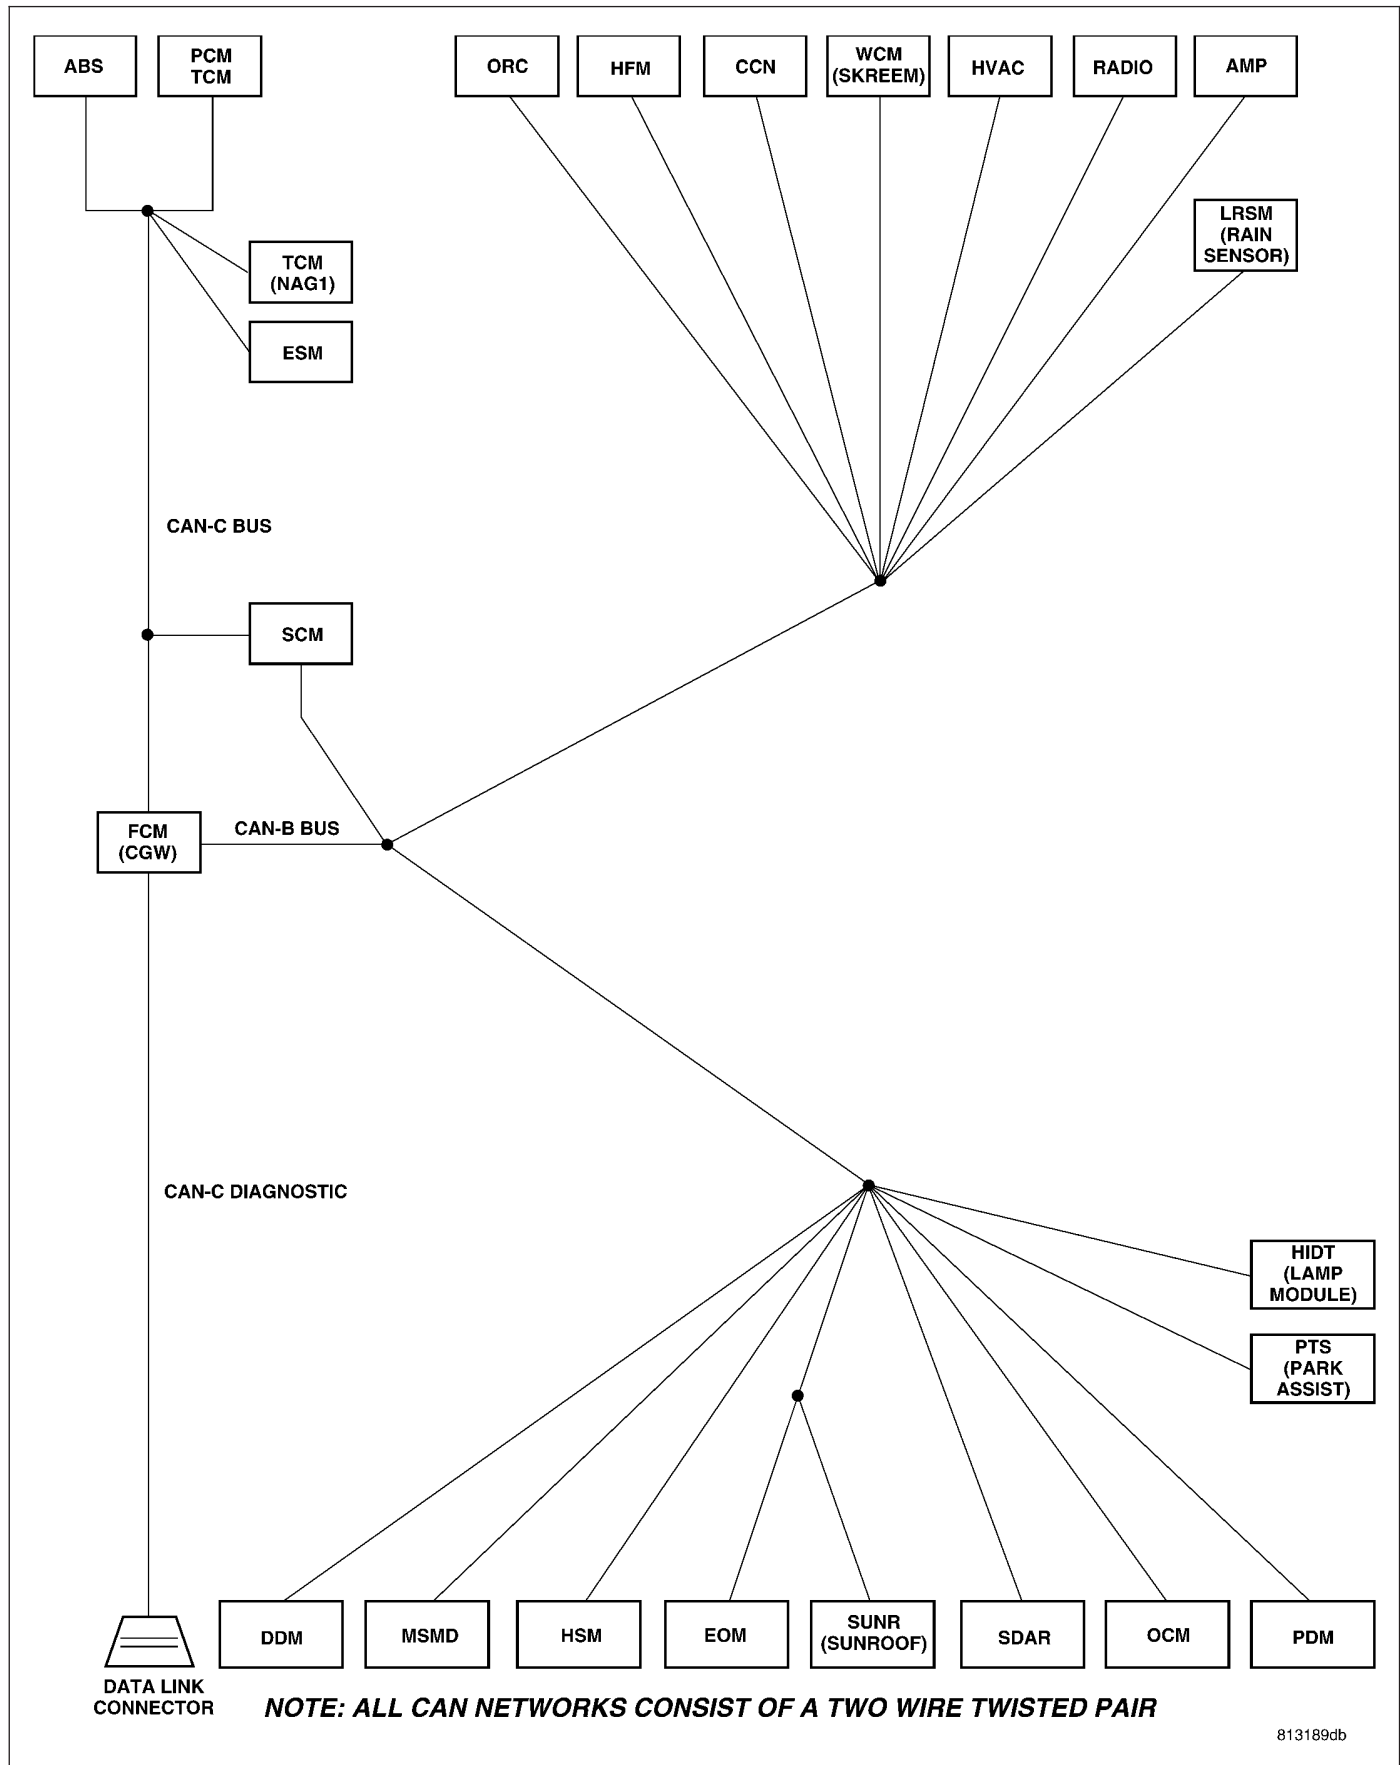

**Is there more than one module with active DTCs “Logged Against” the DDM?**

**Yes** >> Replace/update the Driver Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE**

**U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**

Bus messages not received from the PDM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY PASSENGER DOOR MODULE PASSENGER DOOR MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0200-LOST COMMUNICATION WITH PASSENGER DOOR MODULE (CONTINUED)****3. VERIFY THAT THE PDM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the PDM is active on the bus.

**Is the PDM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the PDM?**

**Yes** >> Replace/update the Passenger Door Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE

**U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**

Bus messages not received from the HSM for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY HEATED SEAT MODULE HEATED SEAT MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0208-LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (CONTINUED)****3. VERIFY THAT THE HSM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the HSM is active on the bus.

**Is the HSM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the HSM?**

**Yes** >> Replace/update the Heated Seat Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

**U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE**

**U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the MSMD for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY MEMORY SEAT MODULE MEMORY SEAT MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0209-LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (CONTINUED)****3. VERIFY THAT THE MSMD IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the MSMD is active on the bus.

**Is the MSMD active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the MSMD?**

**Yes** >> Replace/update the Memory Seat Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0212-LOST COMMUNICATION WITH SCCM - CAN B

**U0212-LOST COMMUNICATION WITH SCCM - CAN B (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the SCM (CAN B) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY STEERING CONTROL MODULE STEERING CONTROL MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0212-LOST COMMUNICATION WITH SCCM - CAN B (CONTINUED)****3. VERIFY THAT THE SCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SCM is active on the bus.

**Is the SCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the SCM?**

**Yes** >> Replace/update the Steering Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE

**U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the rain sensor (LRSM) for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED
DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES
FCM NOT CONFIGURED CORRECTLY
RAIN SENSOR
RAIN SENSOR POWER AND GROUND
MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U0231-LOST COMMUNICATION WITH RAIN SENSING MODULE (CONTINUED)****3. VERIFY THAT THE LRSM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the LRSM is active on the bus.

**Is the LRSM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

With the scan tool, select Network Diagnostics.

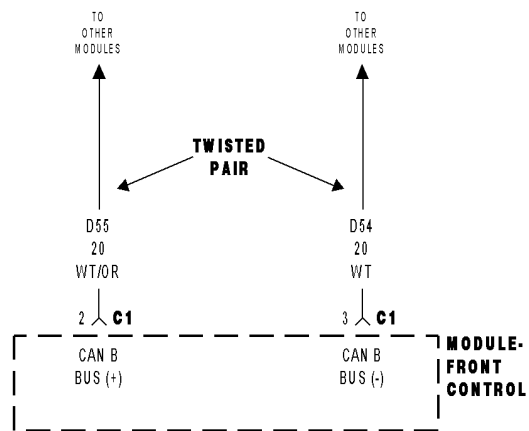

**Is there more than one module with active DTCs “Logged Against” the LRSM?**

**Yes** >> Replace/update the Rain Sensor in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

## U1105-CAN B SIGNAL MISSING

U1105-CAN B SIGNAL MISSING (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Continuously
- **Set Condition:**  
When the CAN B Bus messages are not received within 2 seconds.

Possible Causes
OTHER CAN B BUS DTC's SET IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN FRONT CONTROL MODULE

Diagnostic Test

1. CHECK FOR ACTIVE DTCS

With the scan tool, read the active DTC's.  
Cycle the ignition switch from off to on at least 5 times, leaving the ignition on for a minimum of 90 seconds per cycle.  
With the scan tool, read the active DTC's.

- Does the scan tool display this DTC as active?
- Yes

>> Go To 2
- No

>> If the DTC is stored, check for an intermittent condition. Visually inspect the related wiring harness connectors. Look for broken, bent, pushed out, or corroded terminals.

2. CHECK FRONT CONTROL MODULE FOR U0019 DTC

With the scan tool, read Front Control Module active DTC's

- Does the scan tool display U0019 CAN B BUS – ACTIVE?
- Yes

>> Refer to the table of contents in this section and perform the U0019 diagnostic procedure.
- No

>> Go To 3

**U1105-CAN B SIGNAL MISSING (CONTINUED)****3. (D55) CAN B BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Front Control Module C1 connector.

Turn the ignition on.

Measure the voltage of the (D55) CAN B Bus (+) circuit.

**Is any voltage present on this circuit?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (D54) CAN B BUS (-) CIRCUIT OPEN**

Measure the voltage of the (D54) CAN B Bus (-) circuit.

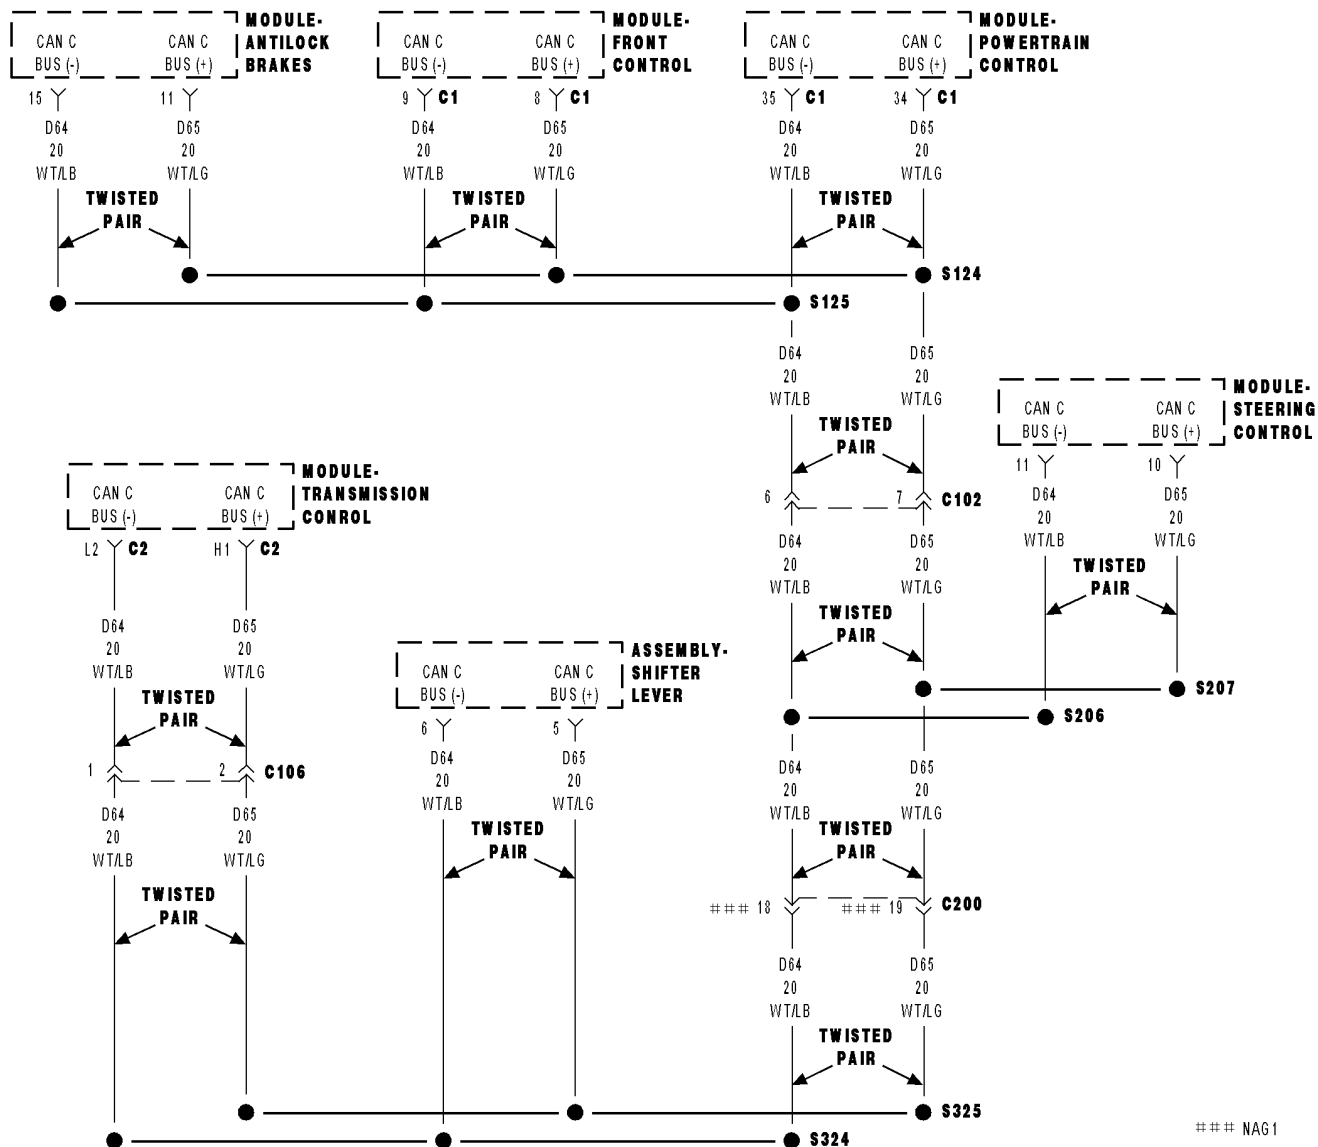

**Is any voltage present on this circuit?**

**Yes** >> Replace the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (D54) CAN B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## U1106-CAN C SIGNAL MISSING

### NAG1

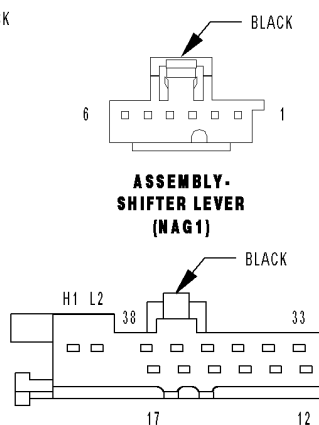

MODULE-FRONT CONTROL C1

MODULE-STEERING CONTROL

MODULE-ANTILOCK BRAKES

ASSEMBLY-SHIFTER LEVER (NAG1)  
MODULE-TRANSMISSION CONTROL C2 (NAG1)

MODULE-POWERTRAIN CONTROL C1

**U1106-CAN C SIGNAL MISSING (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The FCM detects a short in either CAN C Bus circuit.

Possible Causes
(D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT ANTILOCK BRAKE MODULE POWERTRAIN CONTROL MODULE SHIFTER LEVER ASSEMBLY (NAG1 ONLY) TRANSMISSION CONTROL MODULE (NAG1 ONLY) STEERING CONTROL MODULE FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U1106–CAN C SIGNAL MISSING as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

**U1106-CAN C SIGNAL MISSING (CONTINUED)****2. ANTILOCK BRAKE MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U1106–CAN C SIGNAL MISSING as active?**

**Yes** >> Go To 3

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Antilock Brake Module in accordance with the service information.  
Perform ABS VERIFICATION TEST — VER 1.

---

**3. POWERTRAIN CONTROL MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Powertrain Control Module C1 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U1106–CAN C SIGNAL MISSING as active?**

**Yes** >> Go To 4

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Powertrain Control Module in accordance with the service information.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

---

**4. SHIFTER LEVER ASSEMBLY (NAG1 ONLY)— INTERNAL SHORT**

Turn the ignition off.

**Note: If the vehicle is not equipped with a NAG1 controller then skip this step.**

Disconnect the Shifter Lever Assembly harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U1106–CAN C SIGNAL MISSING as active?**

**Yes** >> Go To 5

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Shifter Lever Assembly in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

---

**U1106-CAN C SIGNAL MISSING (CONTINUED)****5. TRANSMISSION CONTROL MODULE (NAG1 ONLY)— INTERNAL SHORT**

Turn the ignition off.

**Note:** If the vehicle is not equipped with a NAG1 controller then skip this step.

Disconnect the Transmission Control Module C2 harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U1106–CAN C SIGNAL MISSING as active?**

**Yes** >> Go To 6

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Transmission Control Module in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**6. STEERING CONTROL MODULE — INTERNAL SHORT**

Turn the ignition off.

Disconnect the Steering Control Module harness connector.

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display U1106–CAN C SIGNAL MISSING as active?**

**Yes** >> Go To 7

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Steering Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**7. (D65) CAN C BUS (+) CIRCUIT SHORTED TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Turn the ignition on.

Measure the voltage between the (D65) CAN C Bus (+) circuit and ground.

**Is there any voltage present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to voltage.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 8

**U1106-CAN C SIGNAL MISSING (CONTINUED)****8. (D64) CAN C BUS (-) CIRCUIT SHORTED TO VOLTAGE**

Measure the voltage between the (D64) CAN C Bus (-) circuit and ground.

**Is there any voltage present?**

**Yes** >> Repair the (D64) CAN C Bus (-) circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 9

**9. (D65) CAN C BUS (+) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (D65) CAN C Bus (+) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 10

**U1106-CAN C SIGNAL MISSING (CONTINUED)****10. (D64) CAN C BUS (-) CIRCUIT SHORTED TO GROUND**

Measure the resistance between ground and the (D64) CAN C Bus (-) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D64) CAN C Bus (-) circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 11

**11. (D65) CAN C BUS (+) CIRCUIT SHORTED TO (D64) CAN C BUS (-) CIRCUIT**

Measure the resistance between the (D65) CAN C Bus (+) circuit and the (D64) CAN C Bus (-) circuit.

**Is any resistance present?**

**Yes** >> Repair the (D65) CAN C Bus (+) circuit for a short to the (D64) CAN C Bus (-) circuit.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

## U1107-ECU IN SINGLE-WIRE MODE

**U1107-ECU IN SINGLE-WIRE MODE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
The FCM detects an open, a short high, a short low or a short together in either of the CAN B Bus circuits.

Possible Causes
(D55) CAN B BUS (+) CIRCUIT SHORTED TO GROUND
(D54) CAN B BUS (-) CIRCUIT SHORTED TO GROUND
(D55) CAN B BUS (+) CIRCUIT SHORTED TO VOLTAGE
(D54) CAN B BUS (-) CIRCUIT SHORTED TO VOLTAGE
(D55) CAN B BUS (+) CIRCUIT SHORTED TO (D54) CAN B BUS (-) CIRCUIT
(D55) CAN B BUS (+) CIRCUIT OPEN
(D54) CAN B BUS (-) CIRCUIT OPEN
ANY CAN B BUS MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

With the scan tool, record and erase FCM DTC's.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

With the scan tool, read active FCM DTC's.

**Does the scan tool display this DTC as active?**

**Yes** >> Go To 2

**No** >> The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. ANY CAN B BUS MODULE— INTERNAL FAULT**

Turn the ignition off.

With the scan tool, monitor the active FCM DTCs.

While monitoring the scan tool, disconnect each CAN B Bus module one at a time.

**Note: When performing the above step, turn the ignition off (wait one minute) before disconnecting any module. When the module is disconnected turn the ignition on.**

**Note: This is to determine if the fault is internal within a module.**

Check for this DTC to become active after disconnecting each CAN B Bus module the vehicle is equipped with.

**Note: If the DTC becomes stored when a particular CAN B Bus module is disconnected, that module is causing the DTC to set.**

**With all the CAN B Bus modules disconnected did the FCM still set this DTC as active?**

**Yes** >> Go To 3

**No** >> Replace the module that when disconnected the DTC became stored.  
Perform BODY VERIFICATION TEST - VER 1.

**U1107-ECU IN SINGLE-WIRE MODE (CONTINUED)****3. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

**Note: Ensure each CAN B Bus module is disconnected at this time.**

Turn the ignition on.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (D55) CAN B Bus (+) circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Go To 4

**4. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO VOLTAGE**

**Note: Ensure each CAN B Bus module is disconnected at this time.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

**Is the voltage above 10.0 volts?**

**Yes** >> Repair the (D54) CAN B Bus (-) circuit for a short to voltage.

**No** >> Go To 5

**U1107-ECU IN SINGLE-WIRE MODE (CONTINUED)****5. (D55) CAN B BUS (+) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

**Note:** Ensure each CAN B Bus module is disconnected at this time.

Measure the resistance between ground and the (D55) CAN B Bus (+) circuit.

**Is the resistance above 1000.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (D55) CAN B Bus (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.

**6. (D54) CAN B BUS (-) CIRCUIT FOR A SHORT TO GROUND**

**Note:** Ensure each CAN B Bus module is disconnected at this time.

Measure the resistance between ground and the (D54) CAN B Bus (-) circuit.

**Is the resistance above 1000.0 ohms?**

**Yes** >> Go To 7

**No** >> Repair the (D54) CAN B Bus (-) circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.

**U1107-ECU IN SINGLE-WIRE MODE (CONTINUED)****7. (D55) CAN B BUS (+) CIRCUIT SHORTED TO THE (D54) CAN B BUS (-) CIRCUIT**

Measure the resistance between the (D55) CAN B Bus (+) circuit and (D54) CAN B Bus (-) circuit.

**Note:** Ensure each CAN B Bus module is disconnected at this time.

**Is any resistance present?**

**Yes** >> Repair the (D55) CAN B Bus (+) circuit for a short to the (D54) CAN B Bus (-) circuit.  
Perform BODY VERIFICATION TEST - VER 1

**No** >> Go To 8

**8. (D55) CAN B BUS (+) CIRCUIT OPEN**

Measure the resistance of the (D55) CAN B Bus (+) circuit between the FCM connector and the Cluster connector.

**Is the resistance above 10.0 ohms?**

**Yes** >> Repair the (D55) CAN B Bus (+) circuit for an open or high resistance.  
Perform BODY VERIFICATION TEST - VER 1

**No** >> Go To 9

**U1107-ECU IN SINGLE-WIRE MODE (CONTINUED)****9. (D54) CAN B BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D54) CAN B Bus (-) circuit between the FCM connector and the Cluster connector.

**Is the resistance above 10.0 ohms?**

**Yes** >> Repair the (D54) CAN B Bus (-) circuit for an open or high resistance.

Perform BODY VERIFICATION TEST - VER 1

**No** >> Replace and program the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1

**U1108-ADDITIONAL CAN B ECU DETECTED**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously.
- **Set Condition:**  
The Front Control Module detects an additional CAN B module and requires a re-configuration.

Possible Causes
ADDITIONAL MODULE ADDED/REMOVED FROM THE CAN B BUS NETWORK

**Diagnostic Test****1. RECONFIGURE THE FRONT CONTROL MODULE**

Turn the ignition on.

With the scan tool, select network view and press the gateway button. This will list the CAN modules on the vehicle. Read and record the listed modules.

With the scan tool, select FCM, miscellaneous functions then add/remove ECUs.

With the scan tool, add or remove the module that was not configured in the FCM.

With the scan tool, erase DTC's.

Cycle the ignition from on to off 3 times and read the active FCM DTC's.

**Does the scan tool display this DTC as active?**

- Yes** >> Retest system and attempt to reconfigure the FCM.  
Perform BODY VERIFICATION TEST – VER 1.
- No** >> Repair is complete.  
Perform BODY VERIFICATION TEST – VER 1.
-

## U110A-LOST COMMUNICATION WITH SCCM - CAN C

**U110A-LOST COMMUNICATION WITH SCCM - CAN C (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

- With the ignition on
- Battery voltage between 10 and 16 volts
- IOD fuse installed
- FCM is configured correctly

- **Set Condition:**

Bus messages not received from the SCM (CAN C) for approximately 200ms.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY STEERING CONTROL MODULE STEERING CONTROL MODULE POWER AND GROUND MODULE THAT SET THIS DTC

**Diagnostic Test****1. VERIFY DTC IS ACTIVE**

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read active DTCs.

**Is this DTC active?**

**Yes** >> Go To 2

**No** >> Refer to the Stored Lost Communication test procedure. Refer to the table of contents in this section.  
Perform BODY VERIFICATION TEST – VER 1.

---

**2. CHECK FOR ANY OF THE FOLLOWING ACTIVE DTCS**

With the scan tool, read active DTCs from all modules.

**Note:** Check for FCM configuration, CAN B or C hardware electrical, VIN Missing/Mismatch, battery or ignition related DTCs.

**Does the scan tool display any active DTCs to the conditions listed above?**

**Yes** >> Diagnose and repair the DTC. Refer to the Table of Contents for a complete list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

---

**U110A-LOST COMMUNICATION WITH SCCM - CAN C (CONTINUED)****3. VERIFY THAT THE SCM IS ACTIVE ON THE BUS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

Verify that the SCM is active on the bus.

**Is the SCM active on the bus?**

**Yes** >> Go To 4

**No** >> Refer to the Table of Contents located in this section for a no response test procedure.  
Perform BODY VERIFICATION TEST – VER 1.

---

**4. CHECK FOR ADDITIONAL COMMUNICATION RELATED DTCS**

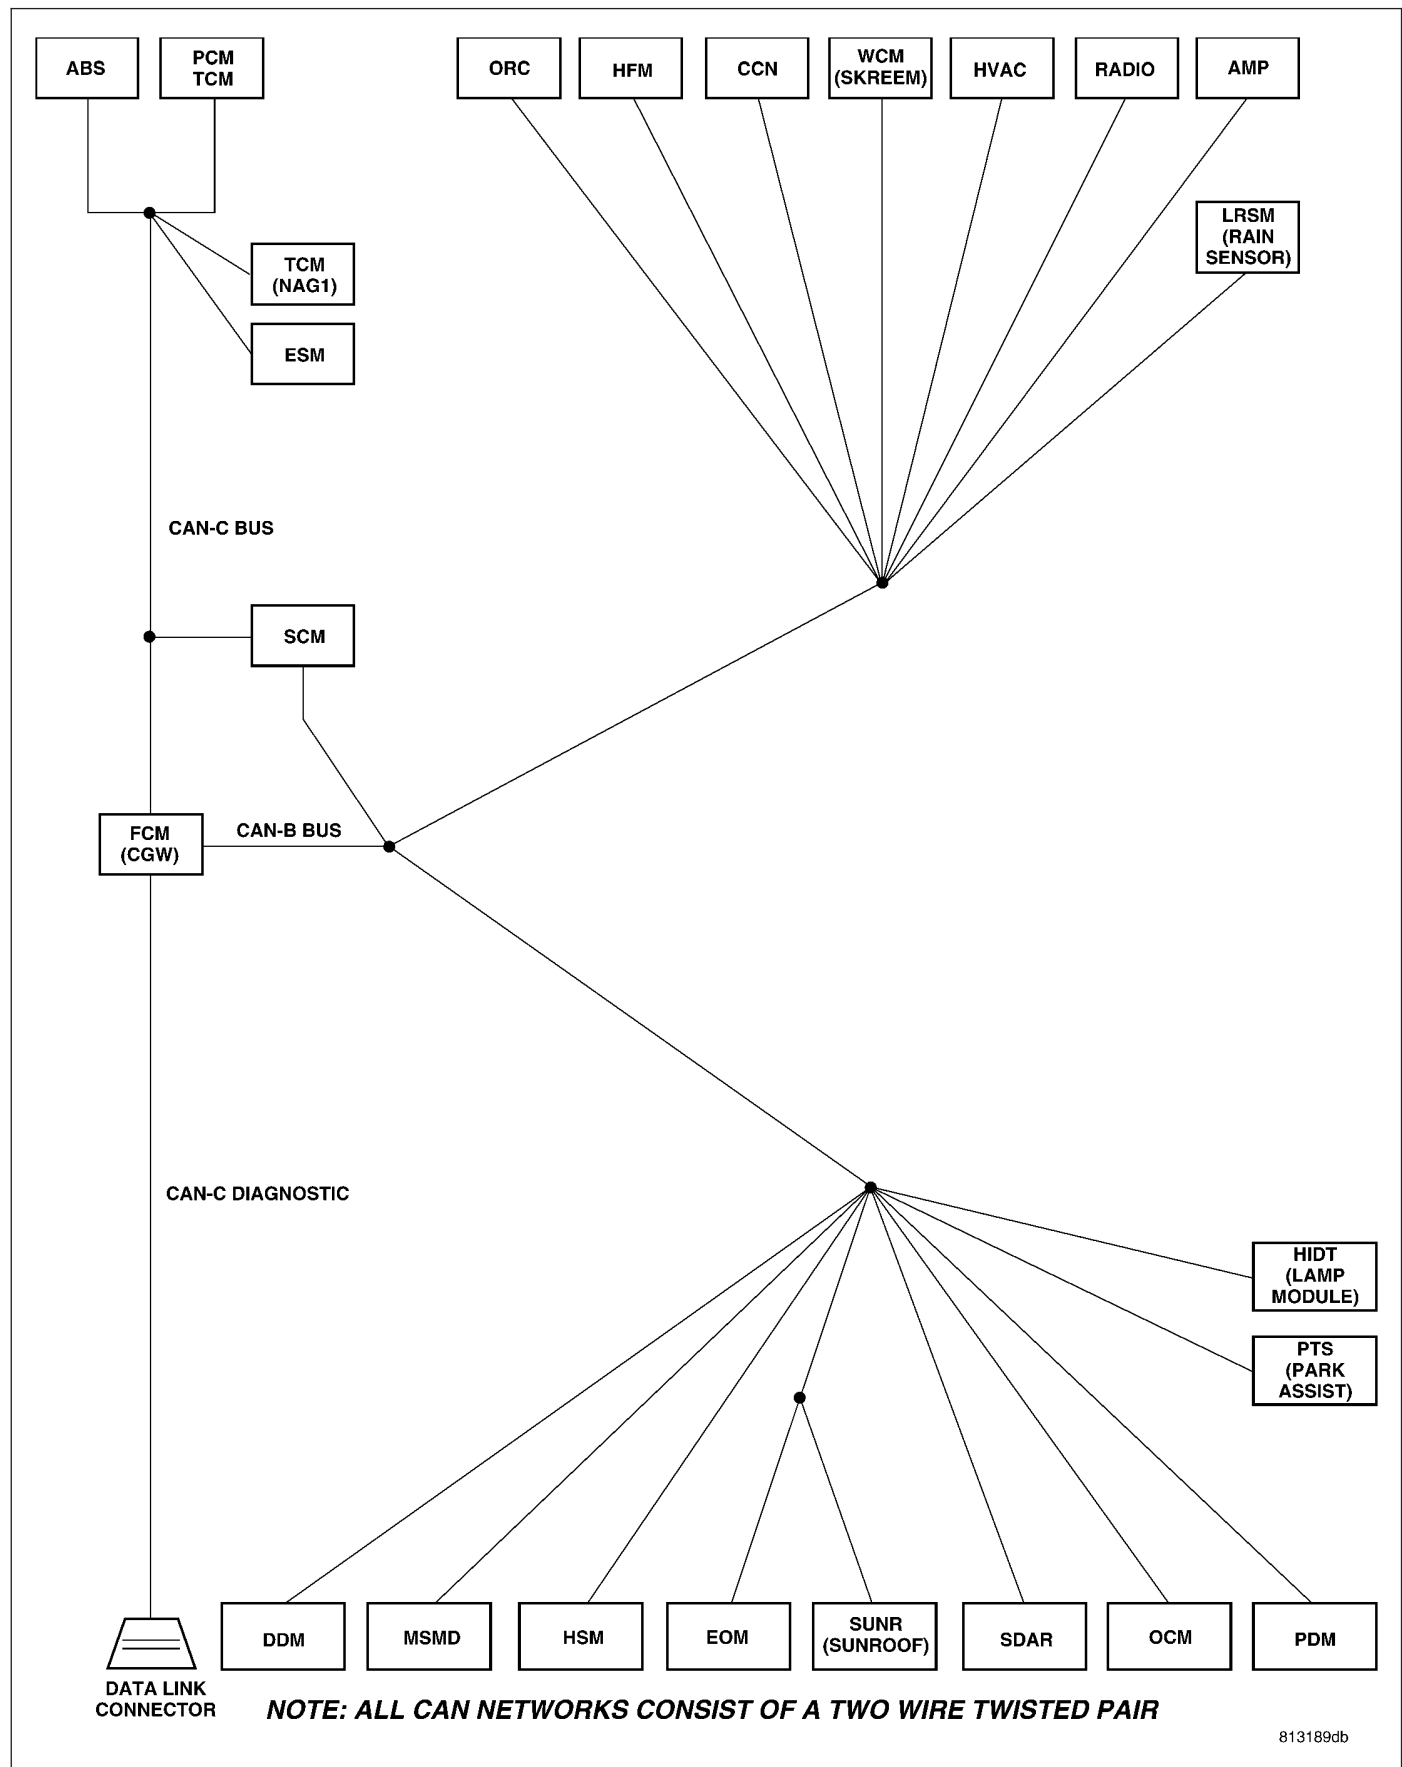

With the scan tool, select Network Diagnostics.

**Is there more than one module with active DTCs “Logged Against” the SCM?**

**Yes** >> Replace/update the Steering Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Replace/update the module that set this DTC in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1.

---

**\*STORED LOST COMMUNICATION DTCS**

**\*STORED LOST COMMUNICATION DTCS (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**
  - With the ignition on
  - Battery voltage between 10 and 16 volts
  - IOD fuse installed
  - FCM is configured correctly
- **Set Condition:**  
Bus messages not received for approximately 2 to 5 seconds.

Possible Causes
CAN B BUS CIRCUITS OPEN OR SHORTED DTCS RELATED TO BATTERY VOLTAGE, IGNITION, OR VIN MESSAGES FCM NOT CONFIGURED CORRECTLY POWER OR GROUND FROM THE REPORTING MODULE MODULE THAT SET THIS DTC PREVIOUS SERVICE PERFORMED WITHIN THE LAST 100 KEY CYCLES (FUSE/RELAYS REMOVED, WIRING SERVICE, BATTERY DISCONNECT) LOW BATTERY/JUMP START CONDITION IOD FUSE WAS REMOVED DURING SHIPPING CHECK FOR RELATED TSBS

**Diagnostic Test****1. VERIFY DTC IS STORED**

**Note:** Stored faults may indicate a customer perceived intermittent condition.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10 and 16 volts before proceeding.  
With the scan tool, read stored DTCs.

**Is this DTC stored?**

**Yes** >> Go To 2

**No** >> Diagnose the active DTC. Refer to the table of contents for a list of the symptoms.  
Perform BODY VERIFICATION TEST – VER 1.

**2. CHECK THE ENVIRONMENTAL DATA**

With the scan tool, read the loss of communication environmental data.

**Does the loss of communication environmental odometer data match up to any of the previous service procedures listed in the possible causes or are there any stored CAN B or C hardware electrical, battery, ignition voltage, VIN missing/mismatch, FCM configuration DTCs present with match environmental data?**

**Yes** >> These DTCs may have been the result of other service procedures performed. Clear DTCs.  
Perform BODY VERIFICATION TEST – VER 1.

**No** >> Go To 3

**\*STORED LOST COMMUNICATION DTCS (CONTINUED)****3. VERIFY INTERMITTENT LOST COMMUNICATION DTC-WIRING CONCERNS**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

**Is there more than one ECU with stored DTCS “Logged Against” the module and one or more lost communication DTCS stored in the offending module?**

**Yes** >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

**No** >> Go To 4

---

**4. VERIFY INTERMITTENT LOST COMMUNICATION DTC-OFFENDING MODULE**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

**Is there more than one ECU with stored DTCS “Logged Against” the module and NO lost communication DTCS stored in the offending module?**

**Yes** >> Check for TSB related to this offending module.

**No** >> Go To 5

---

**5. VERIFY INTERMITTENT LOST COMMUNICATION DTC-REPORTING MODULE**

Turn the ignition on.

With the scan tool, select Network Diagnostics.

**Is there ONLY ONE ECU with stored DTCS “Logged Against” the module?**

**Yes** >> Check for TSB related to the module that set this DTC.

**No** >> Verify if the vehicle was recently in for this type of service. Otherwise, visually inspect the related wiring harness for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals. Repair as necessary.

---

**\*CAN C DIAGNOSTIC (+) AND/OR CAN C DIAGNOSTIC (-) CIRCUITS HIGH**

**\*CAN C DIAGNOSTIC (+) AND/OR CAN C DIAGNOSTIC (-) CIRCUITS HIGH (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**  
When the scan tool queries the FCM.
- **Set Condition:**  
The scan tool has detected a shorted high condition on either or both CAN C Diagnostic circuits.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO VOLTAGE (D71) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO VOLTAGE FRONT CONTROL MODULE

**Diagnostic Test**

**1. CHECK THE STATUS OF THE ERROR MESSAGE**

**Note:** Ensure the vehicle being tested is a **CAN BUS VEHICLE**. If not, false error messages may be displayed.

**Note:** Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

**Does the scan tool display this same error message?**

**Yes**    >> Go To 2

**No**    >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. CAN C DIAGNOSTIC CIRCUITS SHORTED TO VOLTAGE**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Turn the ignition on.

Measure the voltage of the CAN C Diagnostic circuits.

**Is the voltage above 6.0 volts for either circuit?**

**Yes**    >> Repair the CAN C Diagnostic circuits for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1.

**No**    >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

**\*CAN C DIAGNOSTIC (+) CIRCUIT LOW**

**\*CAN C DIAGNOSTIC (+) CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**  
When the scan tool queries the FCM.
- **Set Condition:**  
The scan tool has detected a shorted low condition on the (D72) CAN C Diagnostic (+) circuit.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO GROUND FRONT CONTROL MODULE

**Diagnostic Test**

**1. CHECK THE STATUS OF THE ERROR MESSAGE**

**Note:** Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

**Note:** Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

**Does the scan tool display this same error message?**

- Yes**    >> Go To 2
- No**     >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D72) CAN C Diagnostic (+) circuit.

**Is the resistance below 100.0 ohms?**

- Yes**    >> Repair the (D72) CAN C Diagnostic (+) circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.
- No**     >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**\*CAN C DIAGNOSTIC (-) CIRCUIT LOW**

**\*CAN C DIAGNOSTIC (-) CIRCUIT LOW (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When the scan tool queries the FCM.
- **Set Condition:**  
The scan tool has detected a shorted low condition on the (D71) CAN C Diagnostic (-) circuit.

Possible Causes
(D71) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO GROUND FRONT CONTROL MODULE

**Diagnostic Test**

**1. CHECK THE STATUS OF THE ERROR MESSAGE**

**Note:** Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

**Note:** Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

**Does the scan tool display this same error message?**

- Yes**    >> Go To 2
- No**    >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. (D71) CAN C DIAGNOSTIC (-) CIRCUIT SHORTED TO GROUND**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between ground and the (D71) CAN C Diagnostic (-) circuit.

**Is the resistance below 100.0 ohms?**

- Yes**    >> Repair the (D71) CAN C Diagnostic (-) circuit for a short to ground.  
Perform BODY VERIFICATION TEST - VER 1.
- No**    >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

# \*CAN C DIAGNOSTIC (+) SHORTED TO CAN C DIAGNOSTIC (-)

**\*CAN C DIAGNOSTIC (+) SHORTED TO CAN C DIAGNOSTIC (-) (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**  
When the scan tool queries the FCM.
- **Set Condition:**  
The scan tool has detected a shorted together condition on the CAN C Diagnostic circuits.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO (D71) CAN C DIAGNOSTIC (-) CIRCUIT FRONT CONTROL MODULE

**Diagnostic Test**

**1. CHECK THE STATUS OF THE ERROR MESSAGE**

**Note:** Ensure the vehicle being tested is a **CAN BUS VEHICLE**. If not, false error messages may be displayed.

**Note:** Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

**Does the scan tool display this same error message?**

- Yes**    >> Go To 2
- No**    >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

**2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT SHORTED TO (D71) CAN C DIAGNOSTIC (-) CIRCUIT**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance between the (D72) CAN C Diagnostic (+) circuit and the (D71) CAN C Diagnostic (-) circuit.

**Is the resistance below 100.0 ohms?**

- Yes**    >> Repair the (D72) CAN C Diagnostic (+) circuit for a short to the (D71) CAN C Diagnostic (-) circuit.  
Perform BODY VERIFICATION TEST - VER 1.
- No**    >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

# \*CAN C DIAGNOSTIC (-) CIRCUIT OPEN

**\*CAN C DIAGNOSTIC (-) CIRCUIT OPEN (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When the scan tool queries the FCM.
- **Set Condition:**  
The scan tool has detected an open condition on the (D71) CAN C Diagnostic (-) circuit.

Possible Causes
(D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN FRONT CONTROL MODULE

**Diagnostic Test**

**1. CHECK THE STATUS OF THE ERROR MESSAGE**

**Note:** Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

**Note:** Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

**Does the scan tool display this same error message?**

**Yes**     >> Go To 2

**No**     >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

**\*CAN C DIAGNOSTIC (-) CIRCUIT OPEN (CONTINUED)****2. (D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance of the (D71) CAN C Diagnostic (-) circuit between the FCM connector and the DLC.

**Is the resistance below 5.0 ohms?**

**Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D71) CAN C Diagnostic (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

# \*CAN C DIAGNOSTIC (+) CIRCUIT OPEN

**\*CAN C DIAGNOSTIC (+) CIRCUIT OPEN (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When the scan tool queries the FCM.
- **Set Condition:**  
The scan tool has detected an open condition on the (D72) CAN C Diagnostic (+) circuit.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN FRONT CONTROL MODULE

**Diagnostic Test****1. CHECK THE STATUS OF THE ERROR MESSAGE**

**Note:** Ensure the vehicle being tested is a CAN BUS VEHICLE. If not, false error messages may be displayed.

**Note:** Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

**Does the scan tool display this same error message?**

**Yes** >> Go To 2

**No** >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

**\*CAN C DIAGNOSTIC (+) CIRCUIT OPEN (CONTINUED)****2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

Measure the resistance of the (D72) CAN C Diagnostic (+) circuit between the FCM connector and the DLC.

**Is the resistance below 5.0 ohms?**

- Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Repair the (D72) CAN C Diagnostic (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**\*BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN**

**\*BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

- **When Monitored:**  
When the scan tool queries the FCM.
- **Set Condition:**  
The scan tool has detected an open condition on both CAN C Diagnostic circuits.

Possible Causes
(D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN (D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN FRONT CONTROL MODULE

**Diagnostic Test**

**1. CHECK THE STATUS OF THE ERROR MESSAGE**

**Note:** Ensure the vehicle being tested is a **CAN BUS VEHICLE**. If not, false error messages may be displayed.

**Note:** Ensure the scan tool is updated to the latest software.

With the scan tool, record the error message.

Disconnect the scan tool from the DLC.

Cycle the ignition from on to off 3 times.

Turn the ignition on.

**Does the scan tool display this same error message?**

**Yes**    >> Go To 2

**No**    >> The conditions that caused this error message to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.

---

**\*BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN (CONTINUED)****2. (D72) CAN C DIAGNOSTIC (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Front Control Module C1 harness connector.

Disconnect the scan tool from the DLC.

**Note: Check the connectors at both the DLC and the FCM.**

Measure the resistance of the (D72) CAN C Diagnostic (+) circuit between the FCM connector and the DLC.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 3

**No** >> Repair the (D72) CAN C Diagnostic (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**\*BOTH CAN C DIAGNOSTIC (+) AND CAN C DIAGNOSTIC (-) CIRCUITS OPEN (CONTINUED)****3. (D71) CAN C DIAGNOSTIC (-) CIRCUIT OPEN**

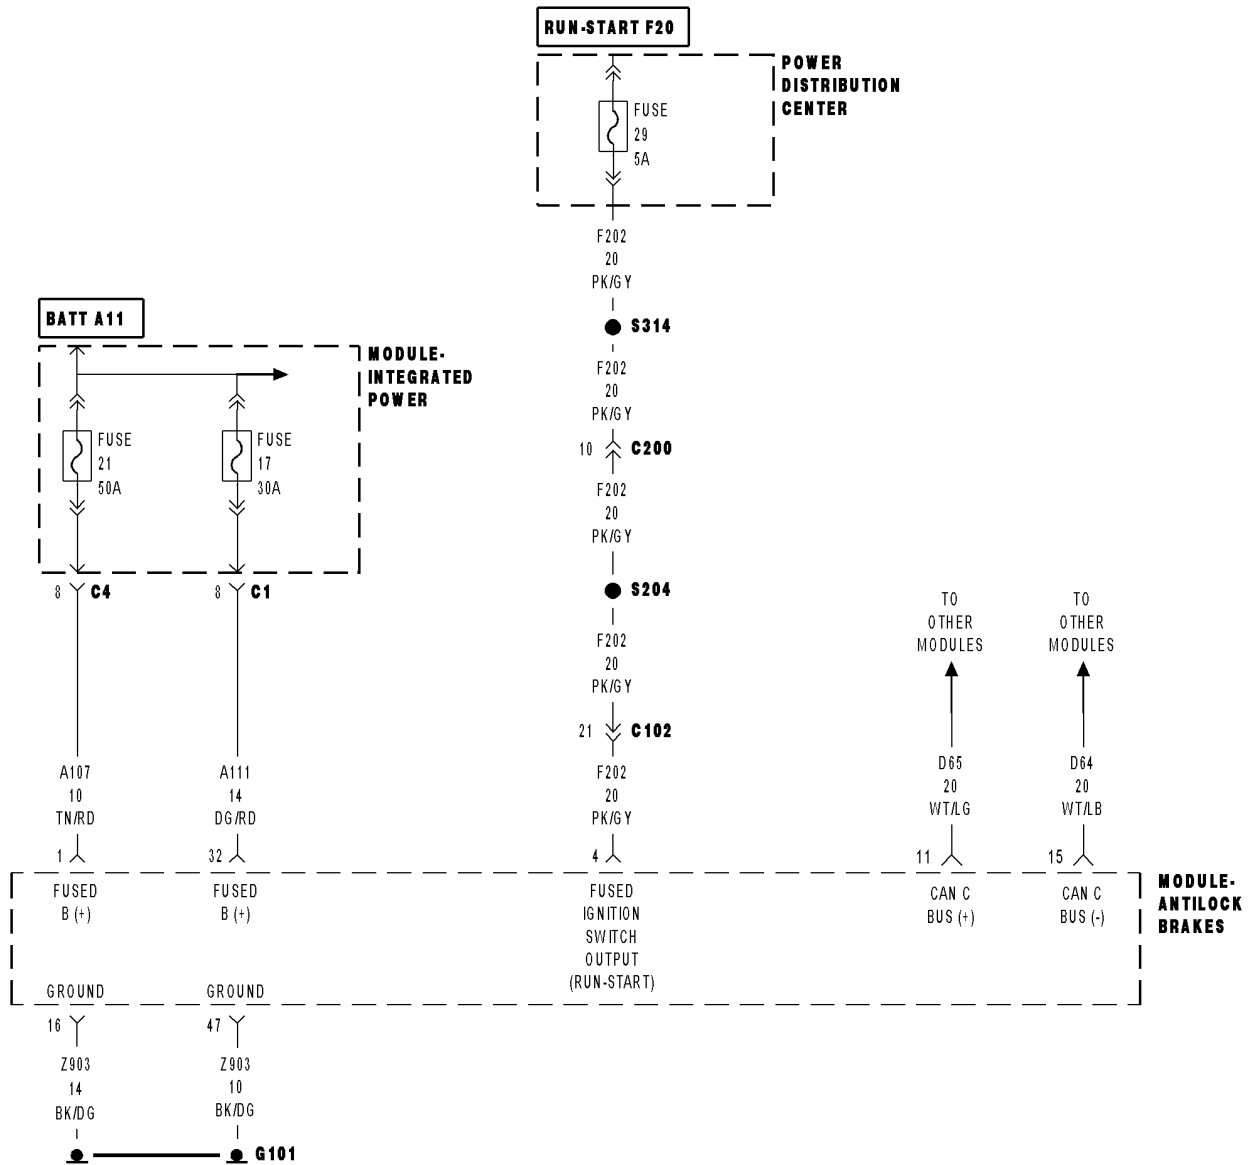

Measure the resistance of the (D71) CAN C Diagnostic (-) circuit between the FCM connector and the DLC.

**Is the resistance below 5.0 ohms?**

- Yes** >> Inspect the wiring and connectors for damage or shorted circuits. If ok, replace the Front Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.
- No** >> Repair the (D71) CAN C Diagnostic (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM ABS

**\*NO RESPONSE FROM ABS (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED (Z903) GROUND CIRCUIT OPEN (F202) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED (D65) CAN C BUS (+) CIRCUIT OPEN (D64) CAN C BUS (-) CIRCUIT OPEN ANTILOCK BRAKE MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Note:** Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM ABS (CONTINUED)****2. (A107) (A111) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Antilock Brake Module harness connector.

Using a 12-volt test light connected to ground, check each (A107) and (A111) Fused B(+) circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the Fused B(+) circuit for an open or short.  
Perform ABS VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM ABS (CONTINUED)****3. (Z903) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z903) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z903) ground circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**4. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F202) Fused Ignition Switch Output circuit for an open or short.  
Perform ABS VERIFICATION TEST - VER 1..

**\*NO RESPONSE FROM ABS (CONTINUED)****5. (D65) CAN C BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the Antilock Brake Module connector.

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (D65) CAN C Bus (+) circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**6. (D64) CAN C BUS (-) CIRCUIT OPEN**

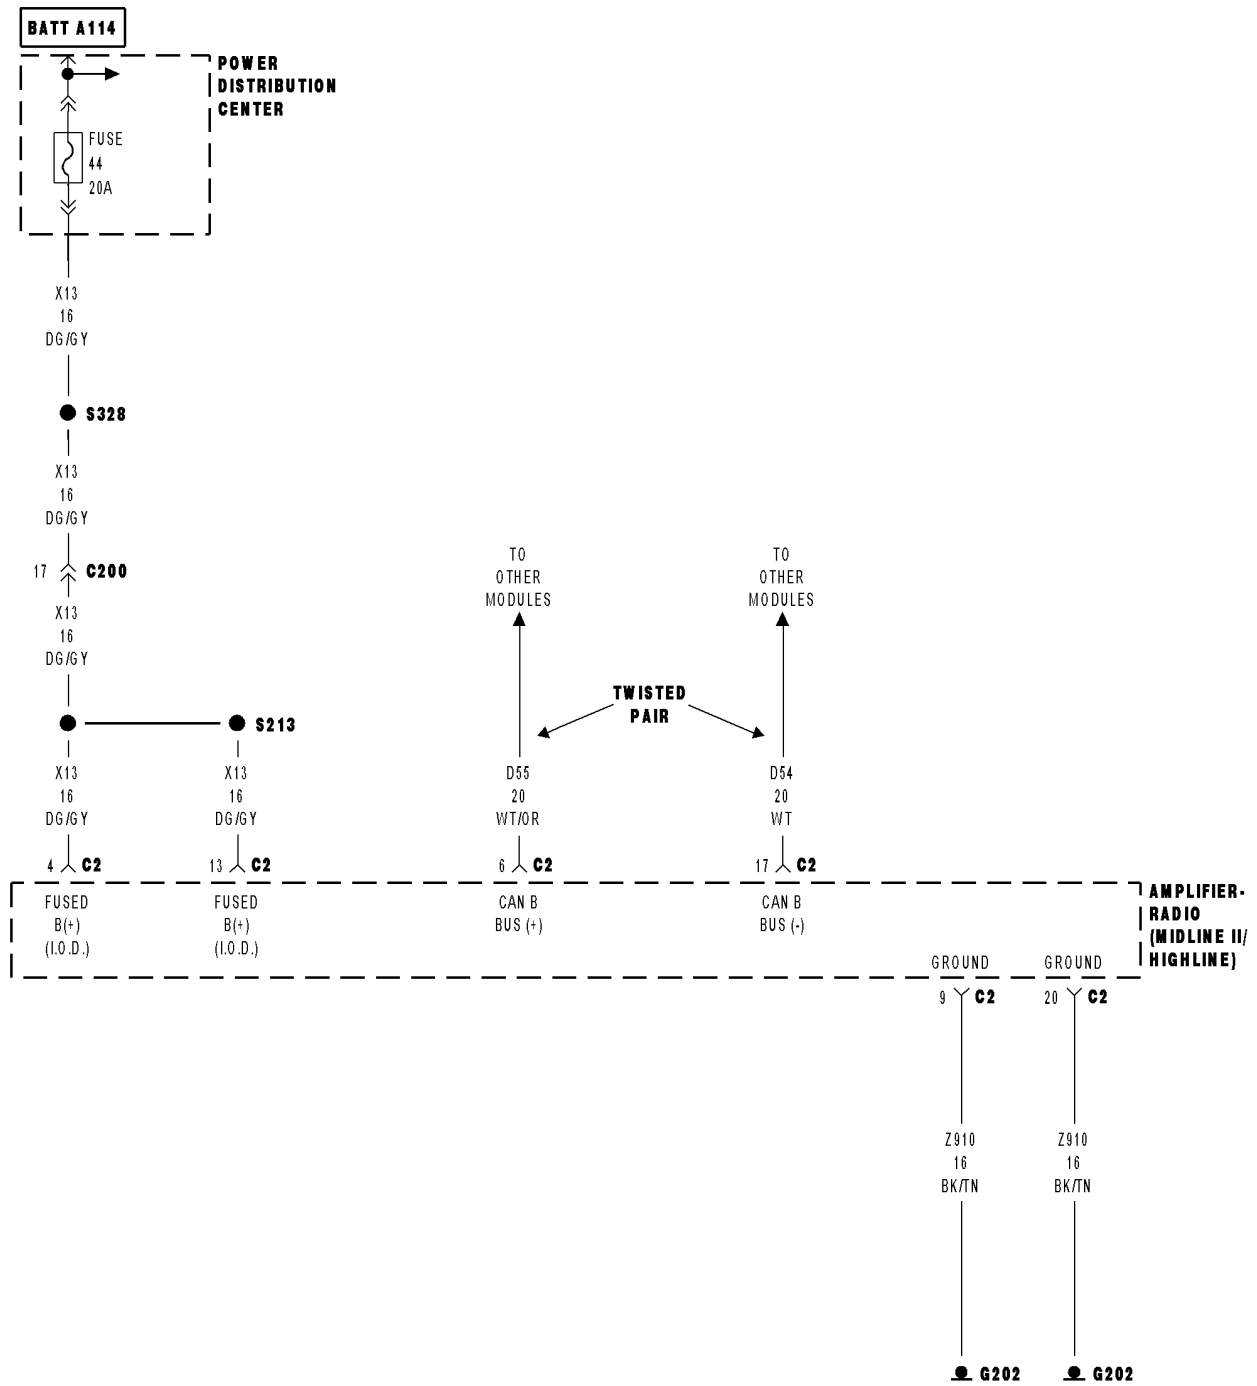

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the Antilock Brake Module connector.

**Is resistance below 5.0 ohms?**

**Yes** >> Replace the Antilock Brake Module in accordance with the service information.  
Perform ABS VERIFICATION TEST - VER 1.

**No** >> Repair the (D64) CAN C Bus (-) circuit for an open.  
Perform ABS VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM AMP**

**\*NO RESPONSE FROM AMP (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(X13) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z910) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN AMPLIFIER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (X13) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Radio Amplifier C2 harness connector.

Using a 12-volt test light connected to ground, check each (X13) Fused B(+) circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the (X13) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

81322934

**\*NO RESPONSE FROM AMP (CONTINUED)****3. (Z910) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check each (Z910) ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 4

**No** >> Repair the (Z910) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

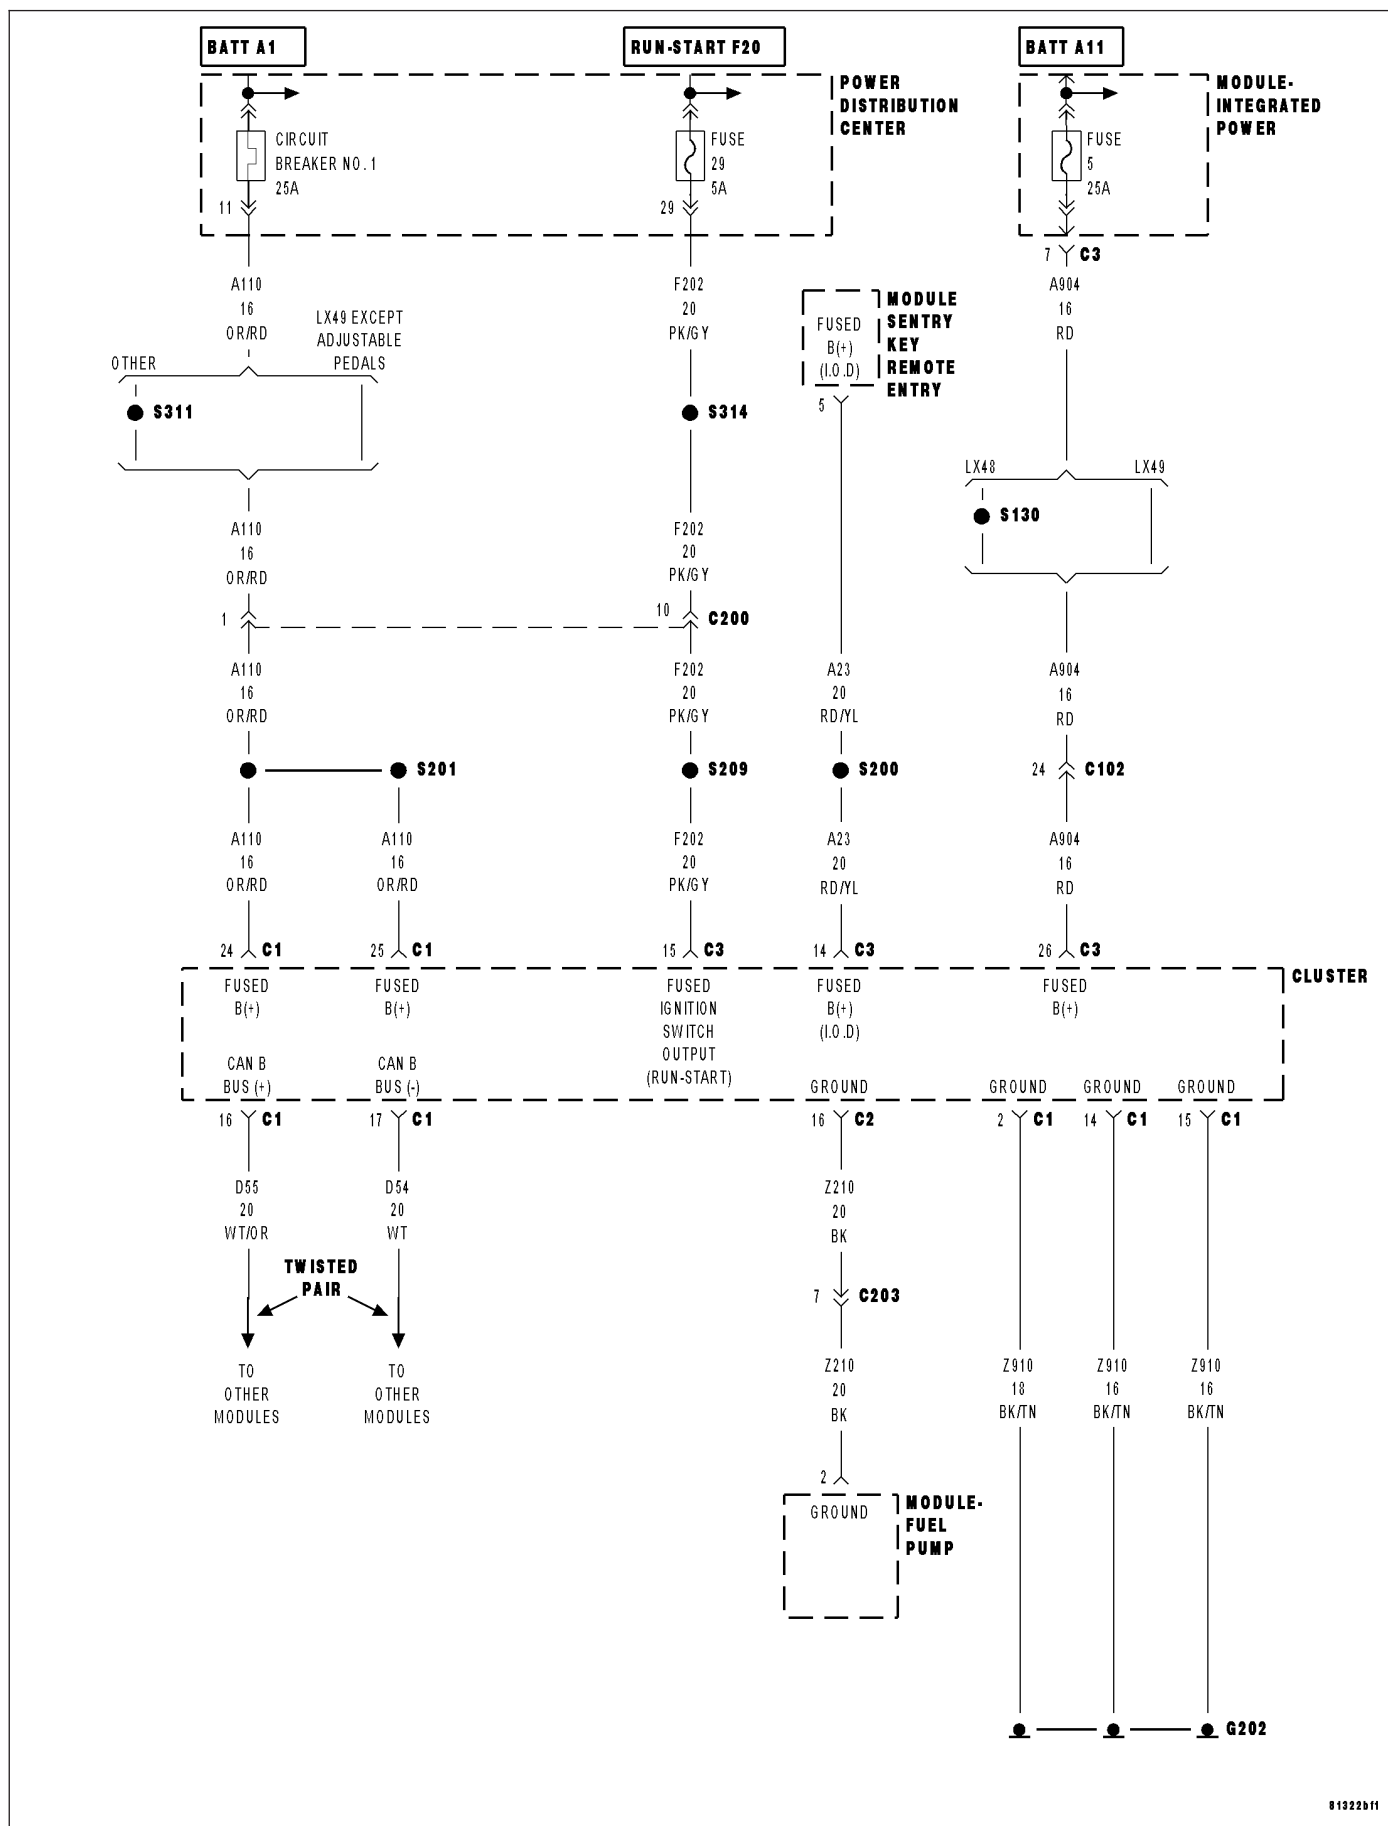

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Radio Amplifier in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM CCN**

**\*NO RESPONSE FROM CCM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(A904) (A23) (A110) FUSED B(+) CIRCUITS OPEN OR SHORTED (Z910) (Z210) GROUND CIRCUITS OPEN (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED (D55) AND (D54) CAN B BUS CIRCUITS OPEN CLUSTER (CCN)

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM CCM (CONTINUED)****2. (A904) (A23) (A110) FUSED B(+) CIRCUITS OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Cluster harness connectors.

Using a 12-volt test light connected to ground, check each (A904) (A23) (A110) Fused B(+) circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the (A904) (A23) (A110) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**3. (Z910) (Z210) GROUND CIRCUITS OPEN**

Using a 12-volt test light connected to 12-volts, check each (Z910) (Z210) ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 4

**No** >> Repair the (Z910) (Z210) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM CCM (CONTINUED)****4. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 5

**No** >> Repair the (F202) Fused Ignition Switch Output circuit for an open or short.

Perform BODY VERIFICATION TEST - VER 1.

**5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Cluster in accordance with the service information.

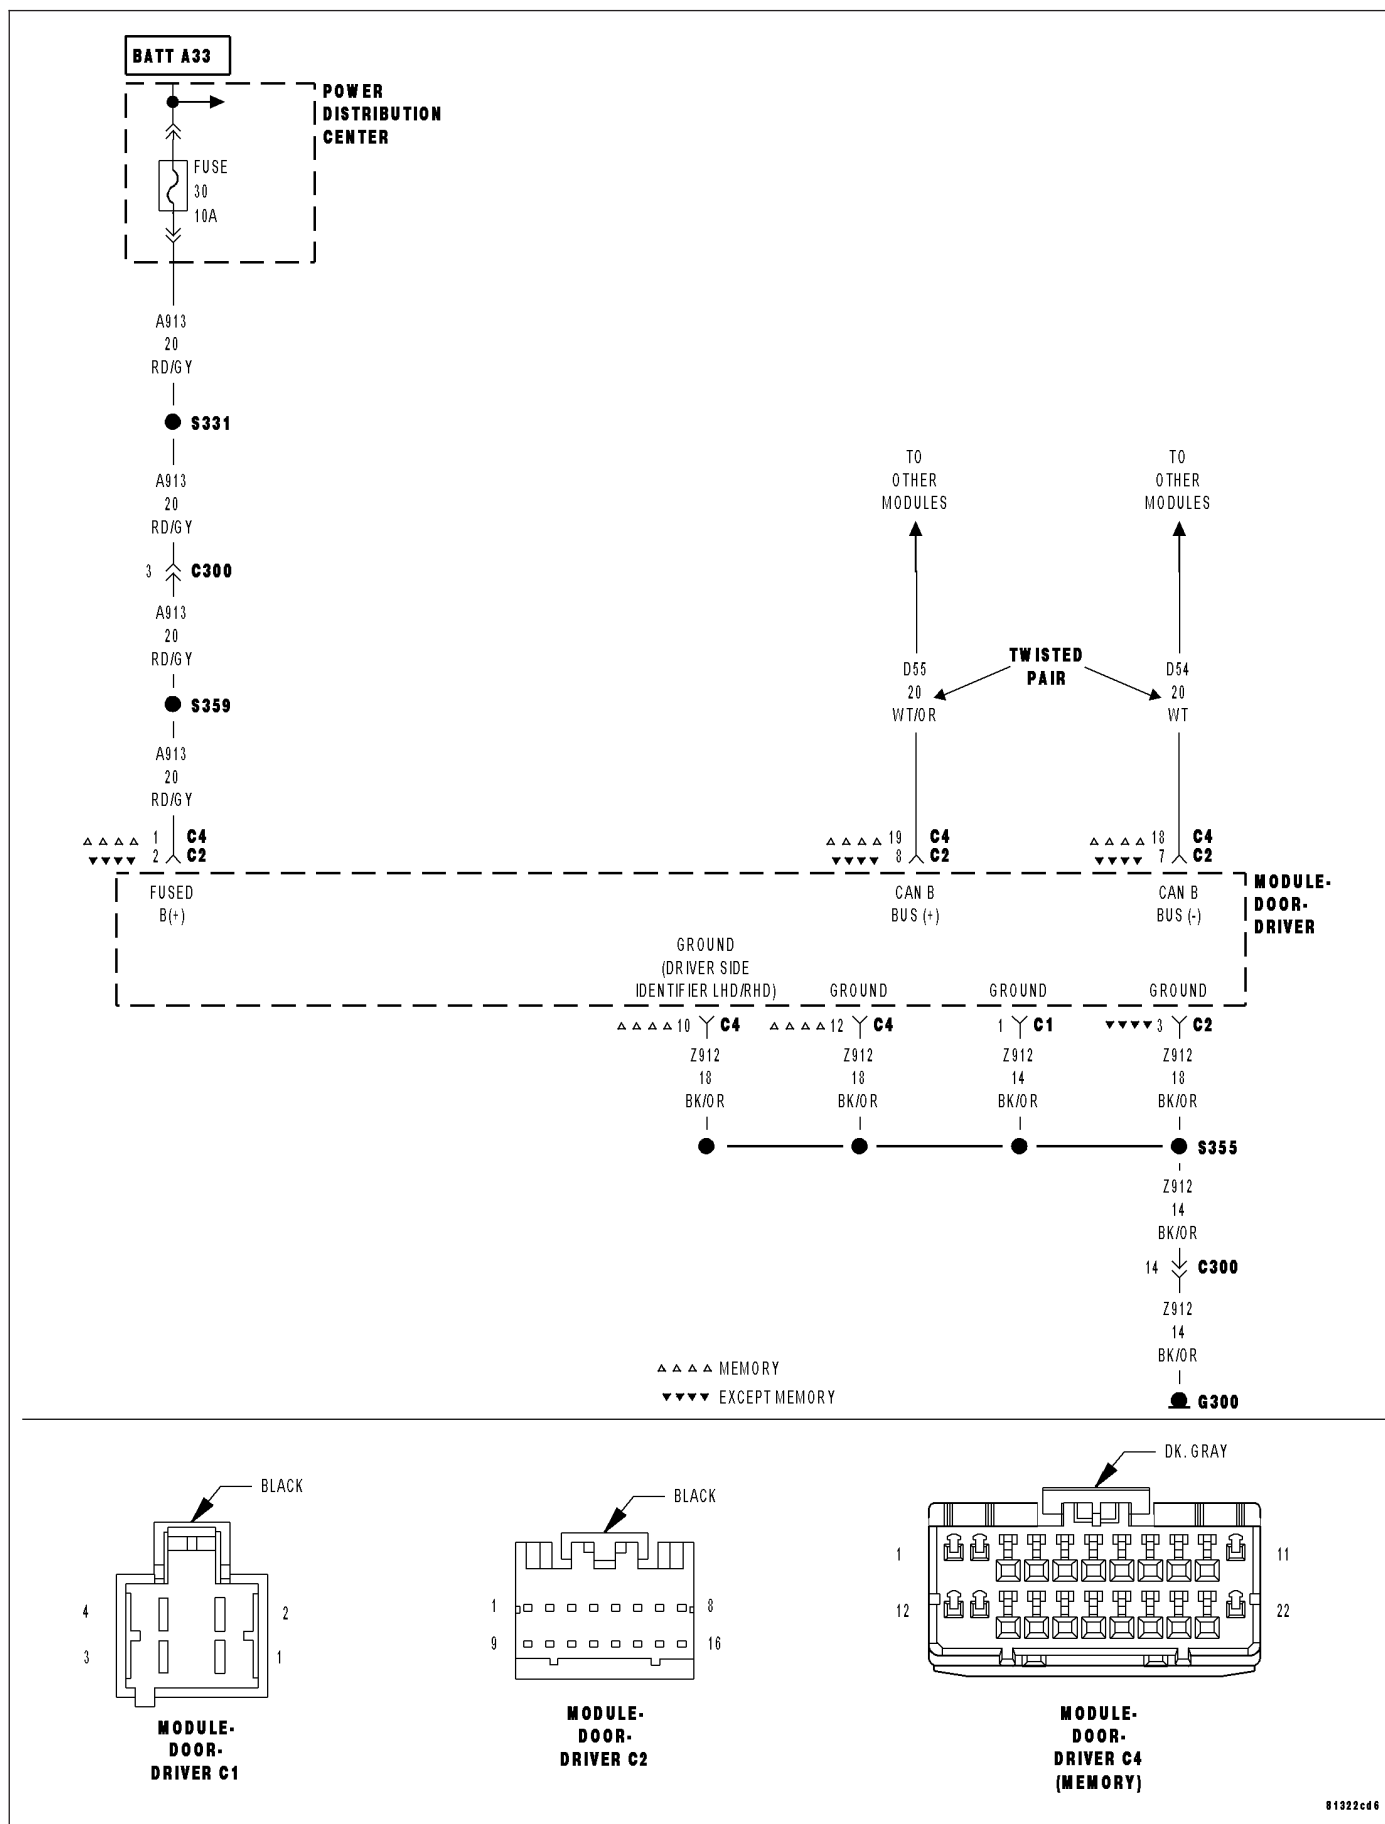

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM DDM

**\*NO RESPONSE FROM DDM (CONTINUED)**  
For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(A913) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z912) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN DRIVER MEMORY MIRROR MODULE

**Diagnostic Test**

**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.  
With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

- Yes**    >> Go To 2
- No**      >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM DDM (CONTINUED)****2. (A913) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Driver Door Module harness connectors.

Using a 12-volt test light connected to ground, check the (A913) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A913) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**3. (Z912) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check each (Z912) ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 4

**No** >> Repair the (Z912) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM DDM (CONTINUED)****4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note:** One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Driver Door Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

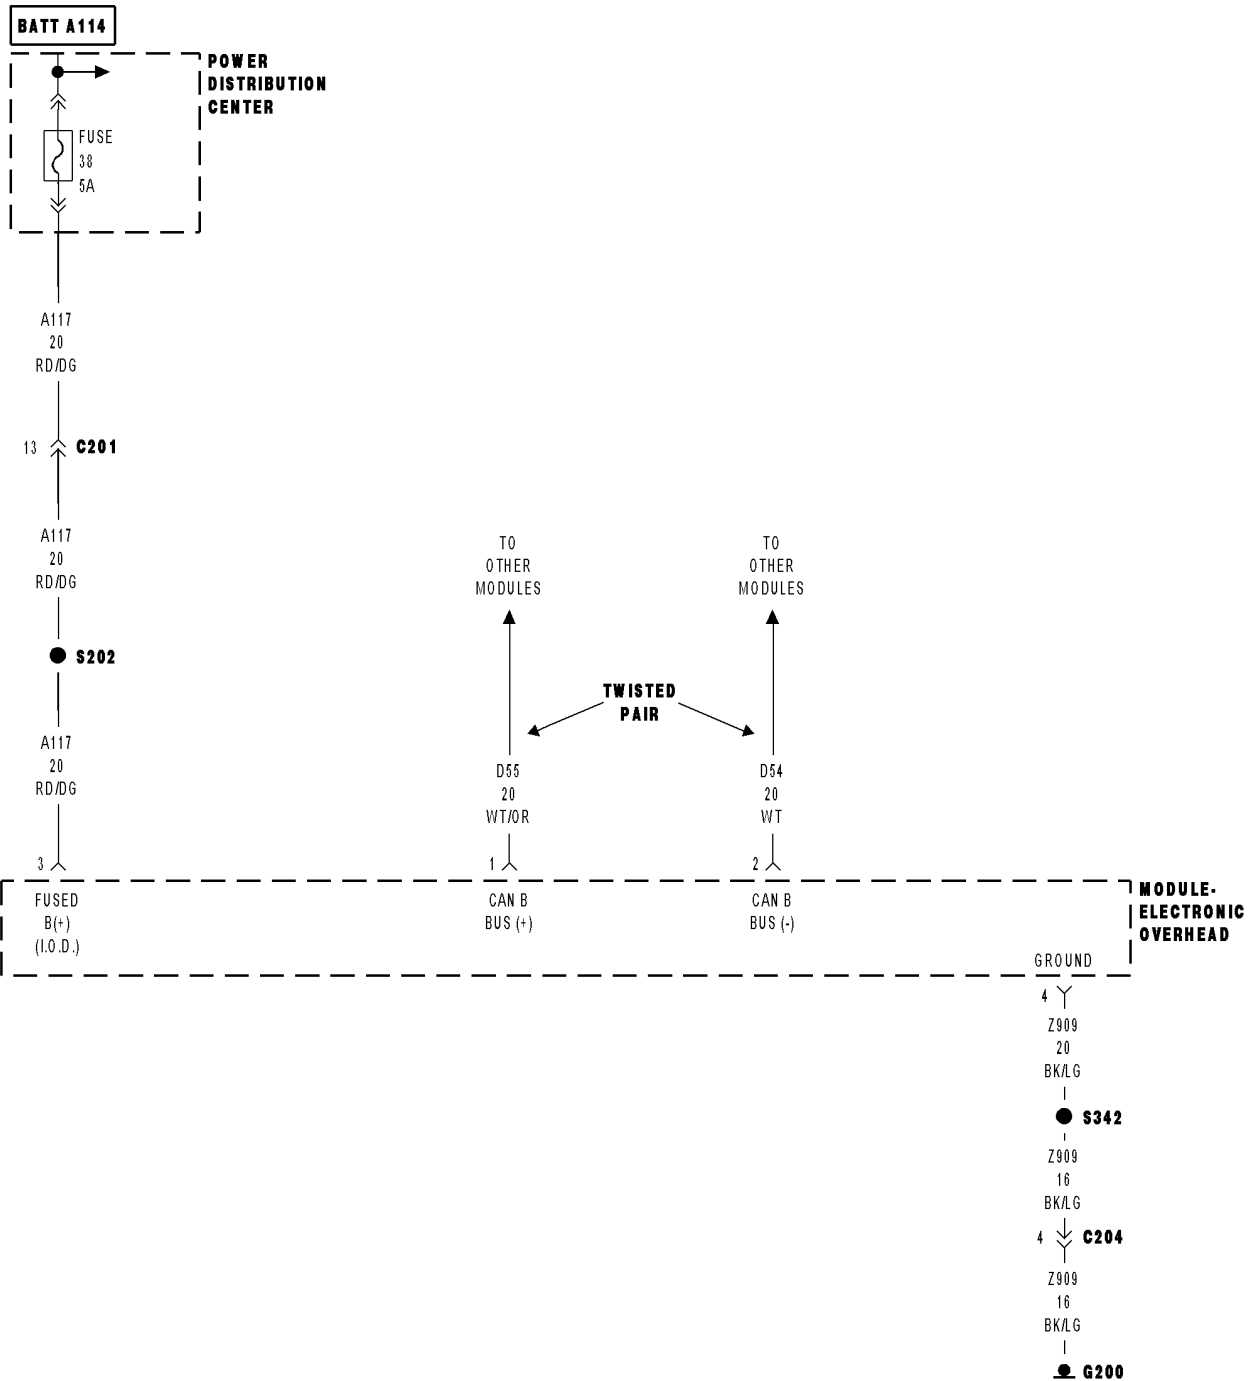

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

81322d0e

# \*NO RESPONSE FROM EOM

**\*NO RESPONSE FROM EOM (CONTINUED)**  
For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A117) FUSED B(+) CIRCUIT OPEN OR SHORTED (Z909) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN ELECTRONIC OVERHEAD MODULE

**Diagnostic Test**

**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.  
With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

- Yes** >> Go To 2
- No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

**2. (A117) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.  
Disconnect the Electronic Overhead Module harness connector.  
Using a 12-volt test light connected to ground, check the (A117) Fused B(+) circuit.

**Does the test light illuminate brightly?**

- Yes** >> Go To 3
- No** >> Repair the (A117) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM EOM (CONTINUED)****3. (Z909) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z909) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z909) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

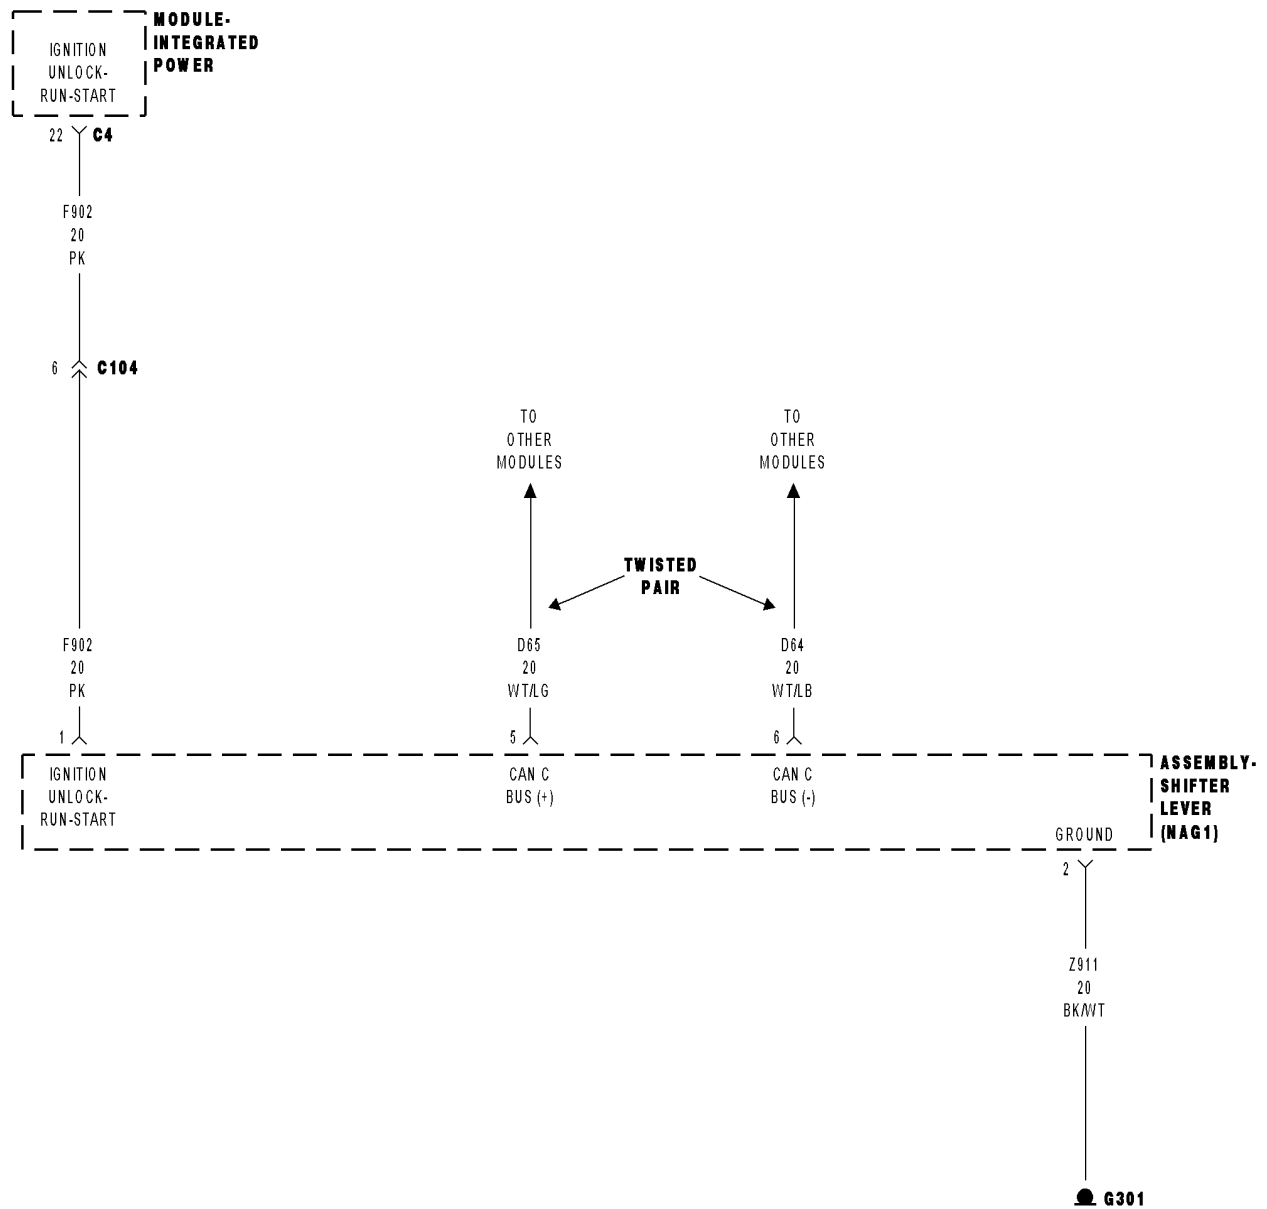

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Electronic Overhead Module (EOM) in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM ESM (SHIFTER LEVER ASSEMBLY) - NAG1**

**\*NO RESPONSE FROM ESM (SHIFTER LEVER ASSEMBLY) - NAG1 (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(Z911) GROUND CIRCUIT OPEN
(F902) IGNITION UNLOCK-RUN-START CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
SHIFTER LEVER ASSEMBLY

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Note:** Check the FCM for any active CAN C hardware and any ignition related DTCs, perform DTCs before proceeding.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (Z911) GROUND CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Shifter Lever Assembly harness connector.

Using a 12-volt test light connected to 12-volts, check the (Z911) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (Z911) ground circuit for an open.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM ESM (SHIFTER LEVER ASSEMBLY) - NAG1 (CONTINUED)****3. (F902) IGNITION UNLOCK–RUN–START CIRCUIT OPEN OR SHORTED**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F902) Ignition Unlock–Run–Start circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (F902) Ignition Unlock–Run–Start circuit for an open or short.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**4. (D65) CAN C BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the Shifter Lever Assembly connector.

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (D65) CAN C Bus (+) circuit for an open.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM ESM (SHIFTER LEVER ASSEMBLY) - NAG1 (CONTINUED)****5. (D64) CAN C BUS (-) CIRCUIT OPEN**

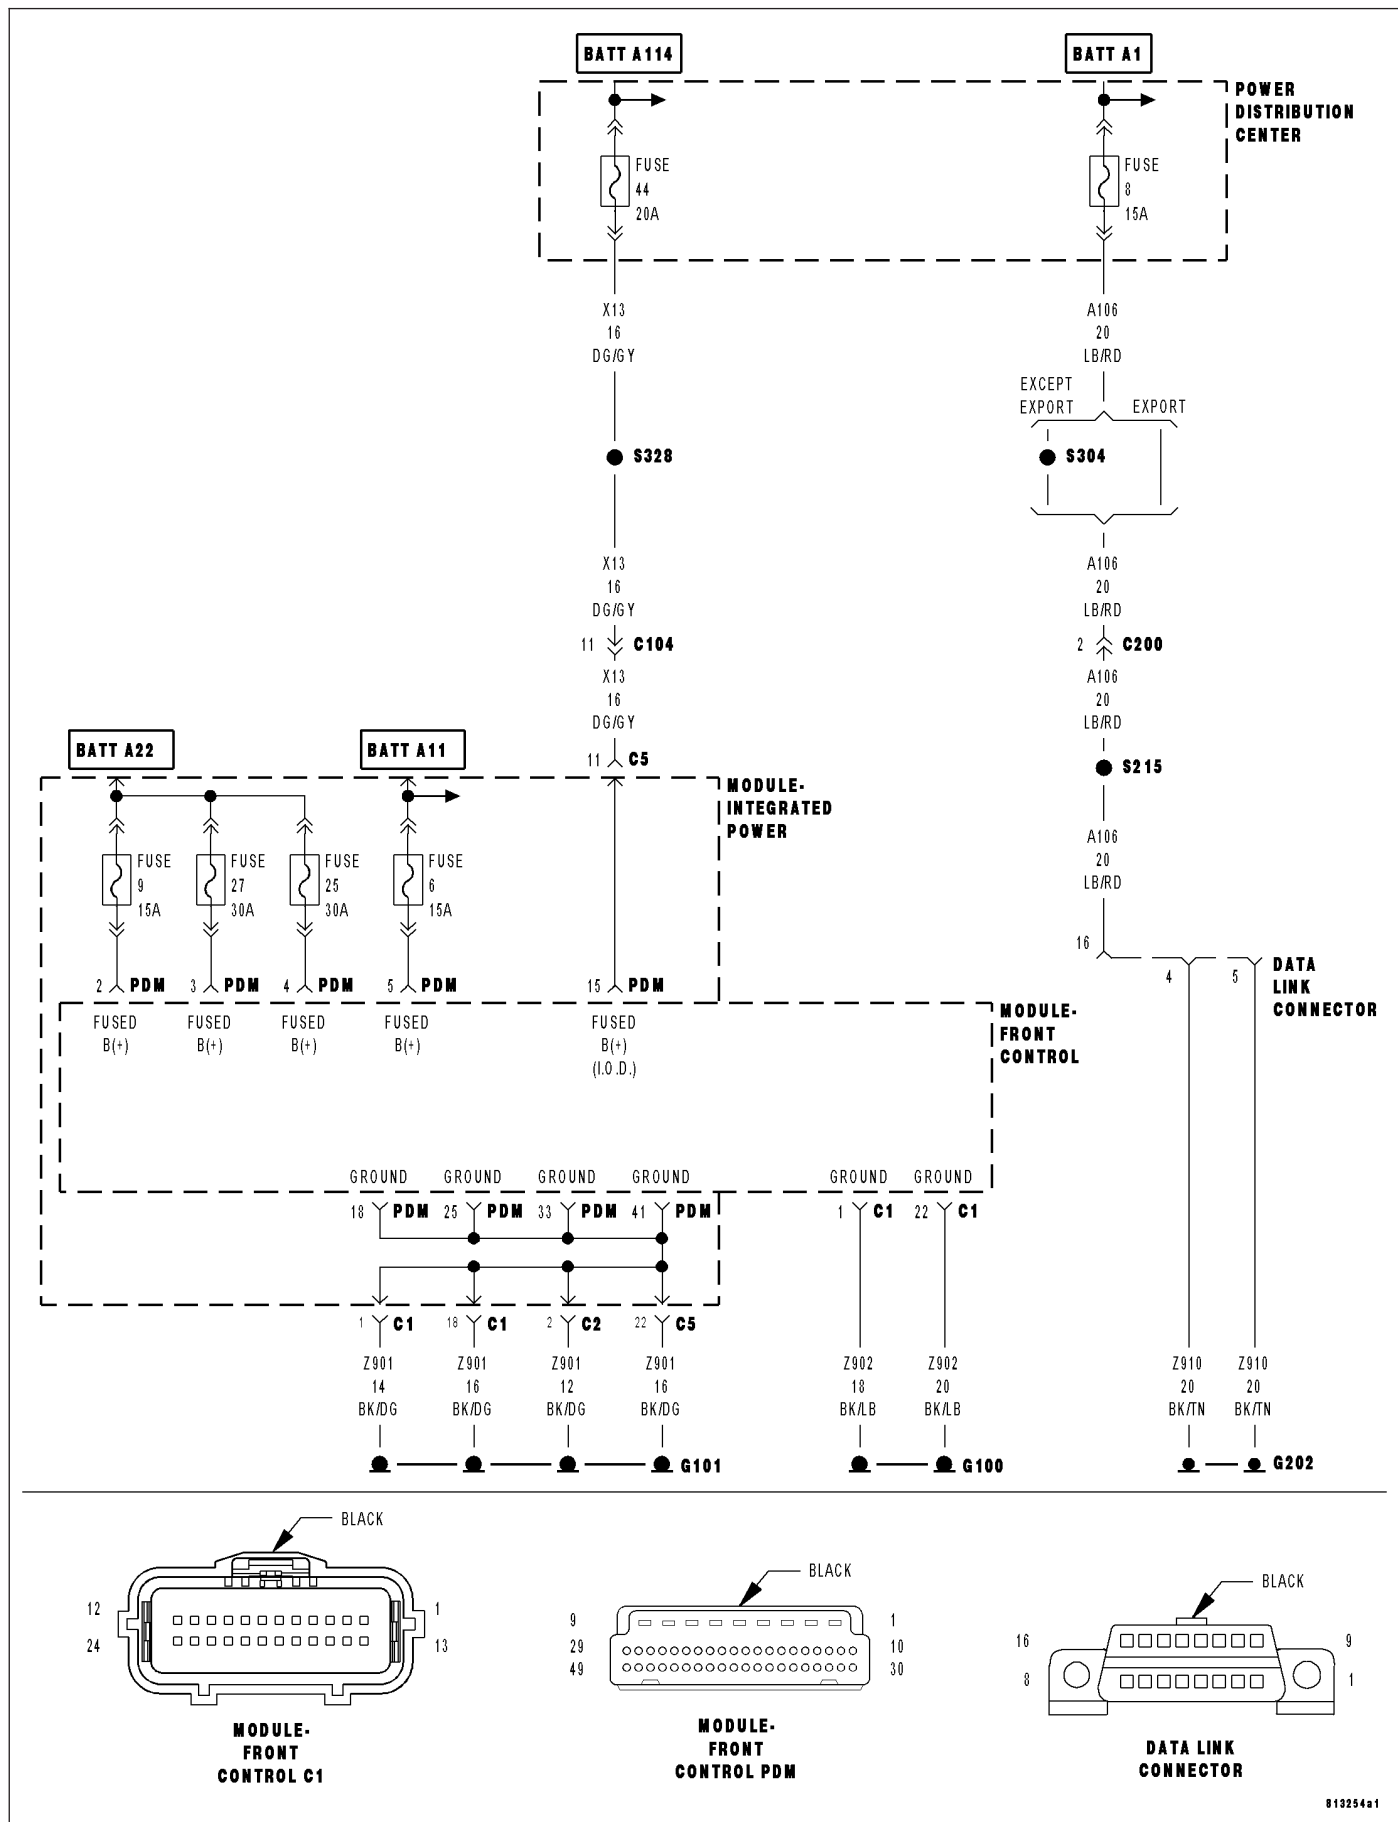

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the Shifter Lever Assembly connector.

**Is resistance below 5.0 ohms?**

- Yes** >> Replace the Shifter Lever Assembly in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.
- No** >> Repair the (D64) CAN C Bus (-) circuit for an open.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM FCM

**\*NO RESPONSE FROM FCM (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A106) FUSED B (+) CIRCUIT OPEN AT DLC (Z910) GROUND CIRCUIT OPEN AT DLC GROUND CIRCUITS OPEN AT FCM FUSED B+ CIRCUITS OPEN AT FCM FRONT CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

**Note:** Ensure the scan tool is updated to the latest software.

**Note:** If the scan tool displays any error messages involving the CAN C Diagnostic circuits, diagnose and repair the error message before proceeding. Refer to the Table of Contents.

**Note:** A loss of communication with the FCM can cause the ECU View button on the scan tool to be inoperative (not highlighted).

With the scan tool, attempt to select ECU view.

**Can the scan tool communicate with the FCM?**

**Yes** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

**No** >> Go To 2

**2. (A106) FUSED B(+) CIRCUIT OPEN AT DLC**

Disconnect the scan tool from the DLC.

Using a 12-volt test light connected to ground, check the (A106) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A106) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM FCM (CONTINUED)****3. (Z910) GROUND CIRCUIT OPEN AT DLC**

Using a 12-volt test light connected to 12-volts, check each (Z910) ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 4

**No** >> Repair the (Z910) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. GROUND CIRCUITS OPEN AT FCM C1 CONNECTOR**

Disconnect the FCM C1 harness connector.

Using a 12-volt test light connected to 12-volts, check each ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 5

**No** >> Repair the ground circuit for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM FCM (CONTINUED)****5. GROUND CIRCUITS OPEN AT FCM PDM CONNECTOR**

Remove the FCM from the PDM.

Using a 12-volt test light connected to 12-volts, check each ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 6

**No** >> Repair the ground circuit for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

**6. FUSED B(+) CIRCUITS OPEN AT FCM PDM CONNECTOR**

Using a 12-volt test light connected to ground, check each Fused B(+) circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Replace and program the Front Control Module in accordance with the service information.

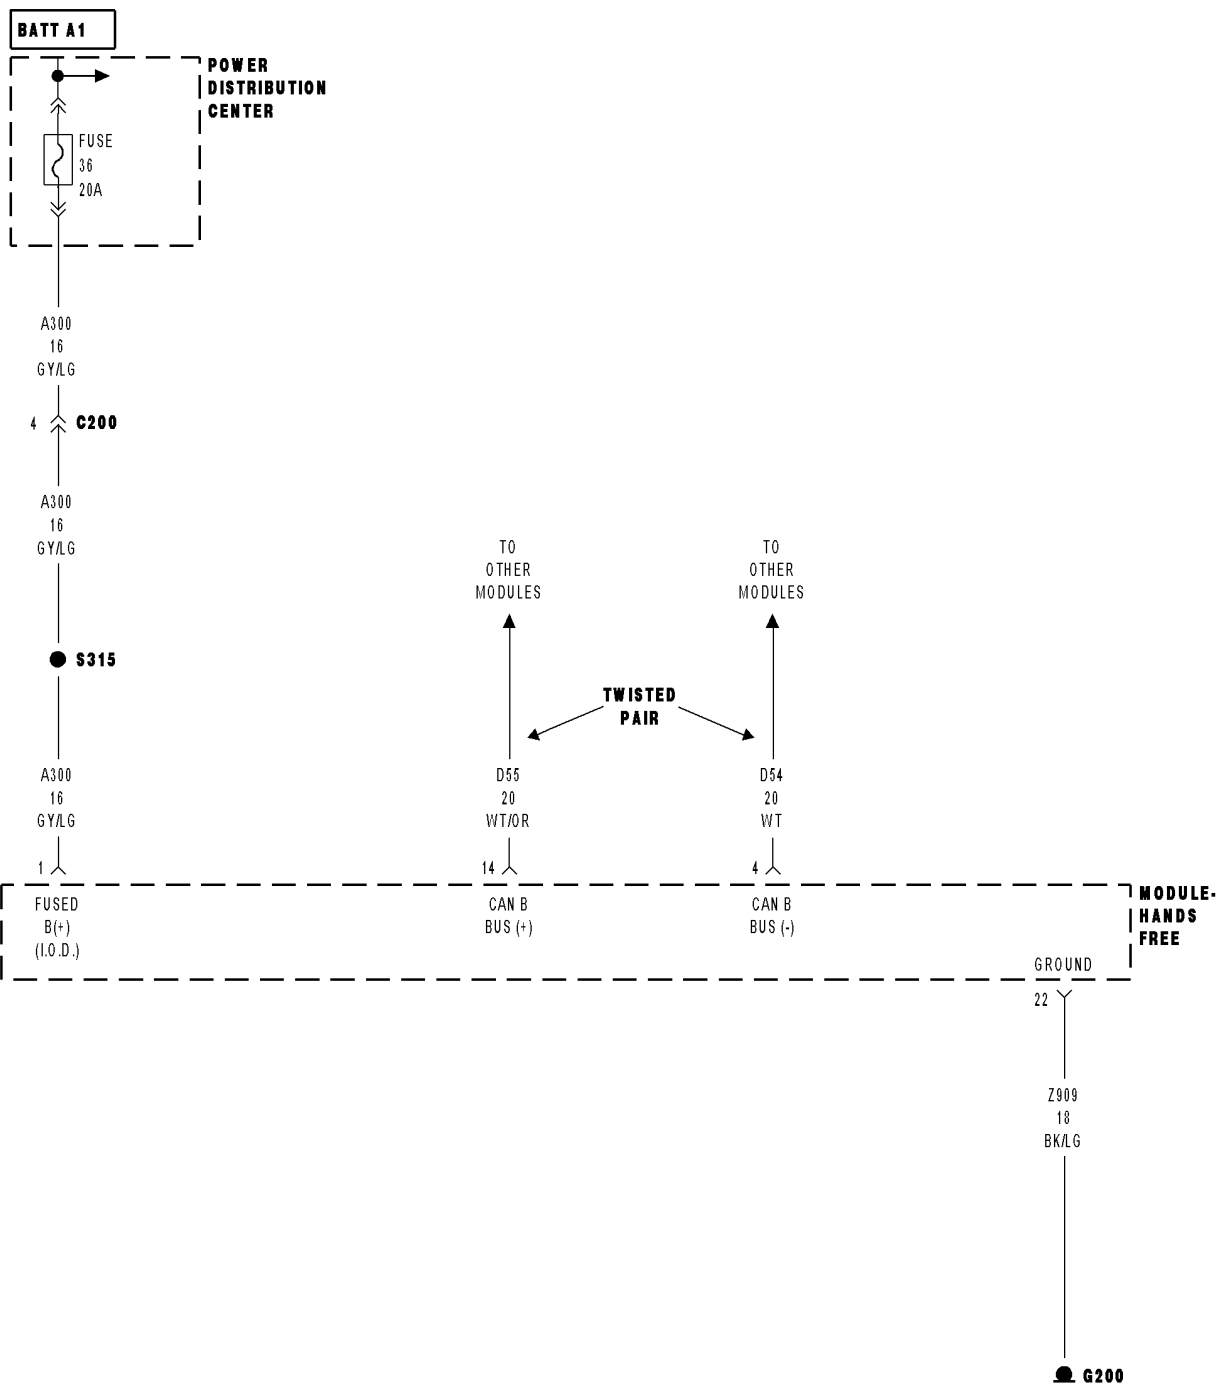

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the Fused B(+) circuit for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM HFM

**\*NO RESPONSE FROM HFM (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A300) FUSED B(+) CIRCUIT OPEN OR SHORTED (Z909) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN HANDS FREE MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (A300) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Hands Free Module harness connector.

Using a 12-volt test light connected to ground, check the (A300) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A300) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM HFM (CONTINUED)****3. (Z909) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z909) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z909) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

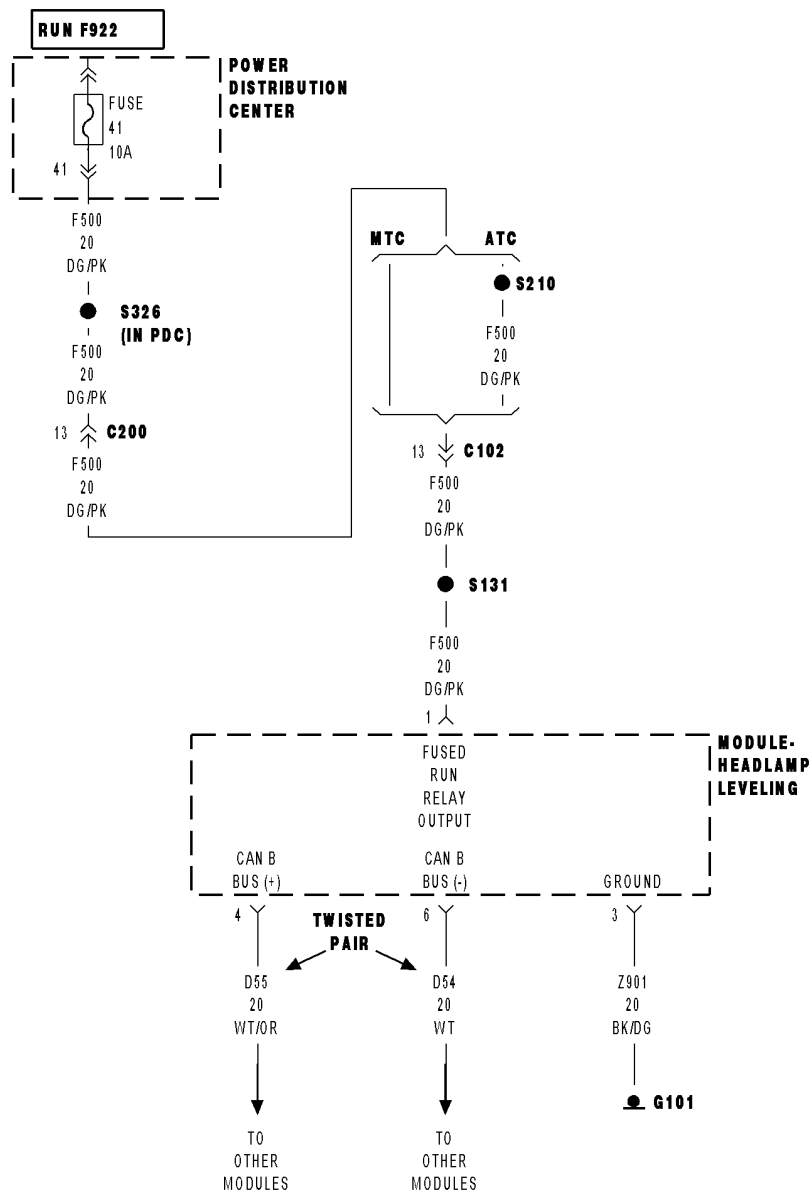

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Hands Free Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

# **\*NO RESPONSE FROM HEADLAMP LEVELING MODULE**

**MODULE-HEADLAMP LEVELING (EXPORT)**

**\*NO RESPONSE FROM HEADLAMP LEVELING MODULE (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(F500) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED (Z901) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN HEADLAMP LEVELING MODULE

**Diagnostic Test**

**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

- Yes**    >> Go To 2
- No**    >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM HEADLAMP LEVELING MODULE (CONTINUED)****2. (F500) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED**

**Note:** Check the FCM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

Turn the ignition off.

Disconnect the Headlamp Leveling Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F500) Fused Run Relay Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (F500) Fused Run Relay Output circuit for an open or short.

Perform BODY VERIFICATION TEST - VER 1.

**3. (Z901) GROUND CIRCUIT OPEN**

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z901) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z901) ground circuit for an open.

Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM HEADLAMP LEVELING MODULE (CONTINUED)****4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note:** One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Headlamp Leveling Module in accordance with the service information.

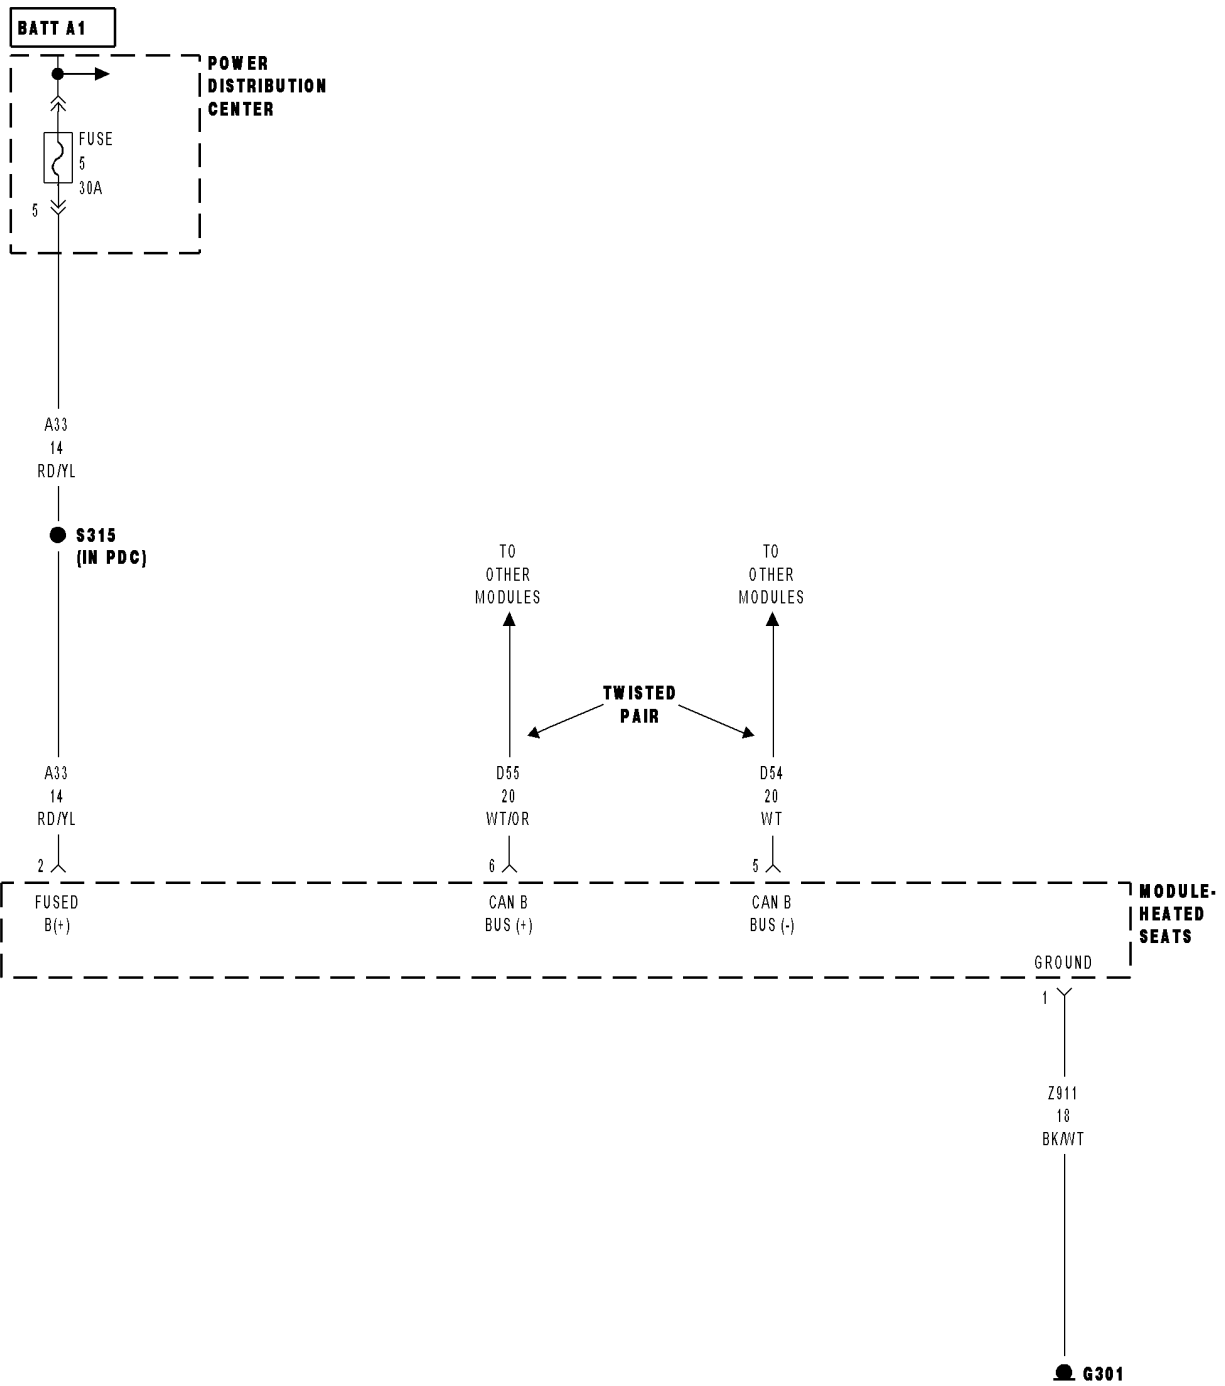

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM HSM

**\*NO RESPONSE FROM HSM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(A33) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z911) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN HEATED SEAT MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes**     >> Go To 2

**No**     >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM HSM (CONTINUED)****2. (A33) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Heated Seat Module harness connector.

Using a 12-volt test light connected to ground, check the (A33) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A33) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**3. (Z911) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z911) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z911) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM HSM (CONTINUED)****4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note:** One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Heated Seat Module in accordance with the service information.

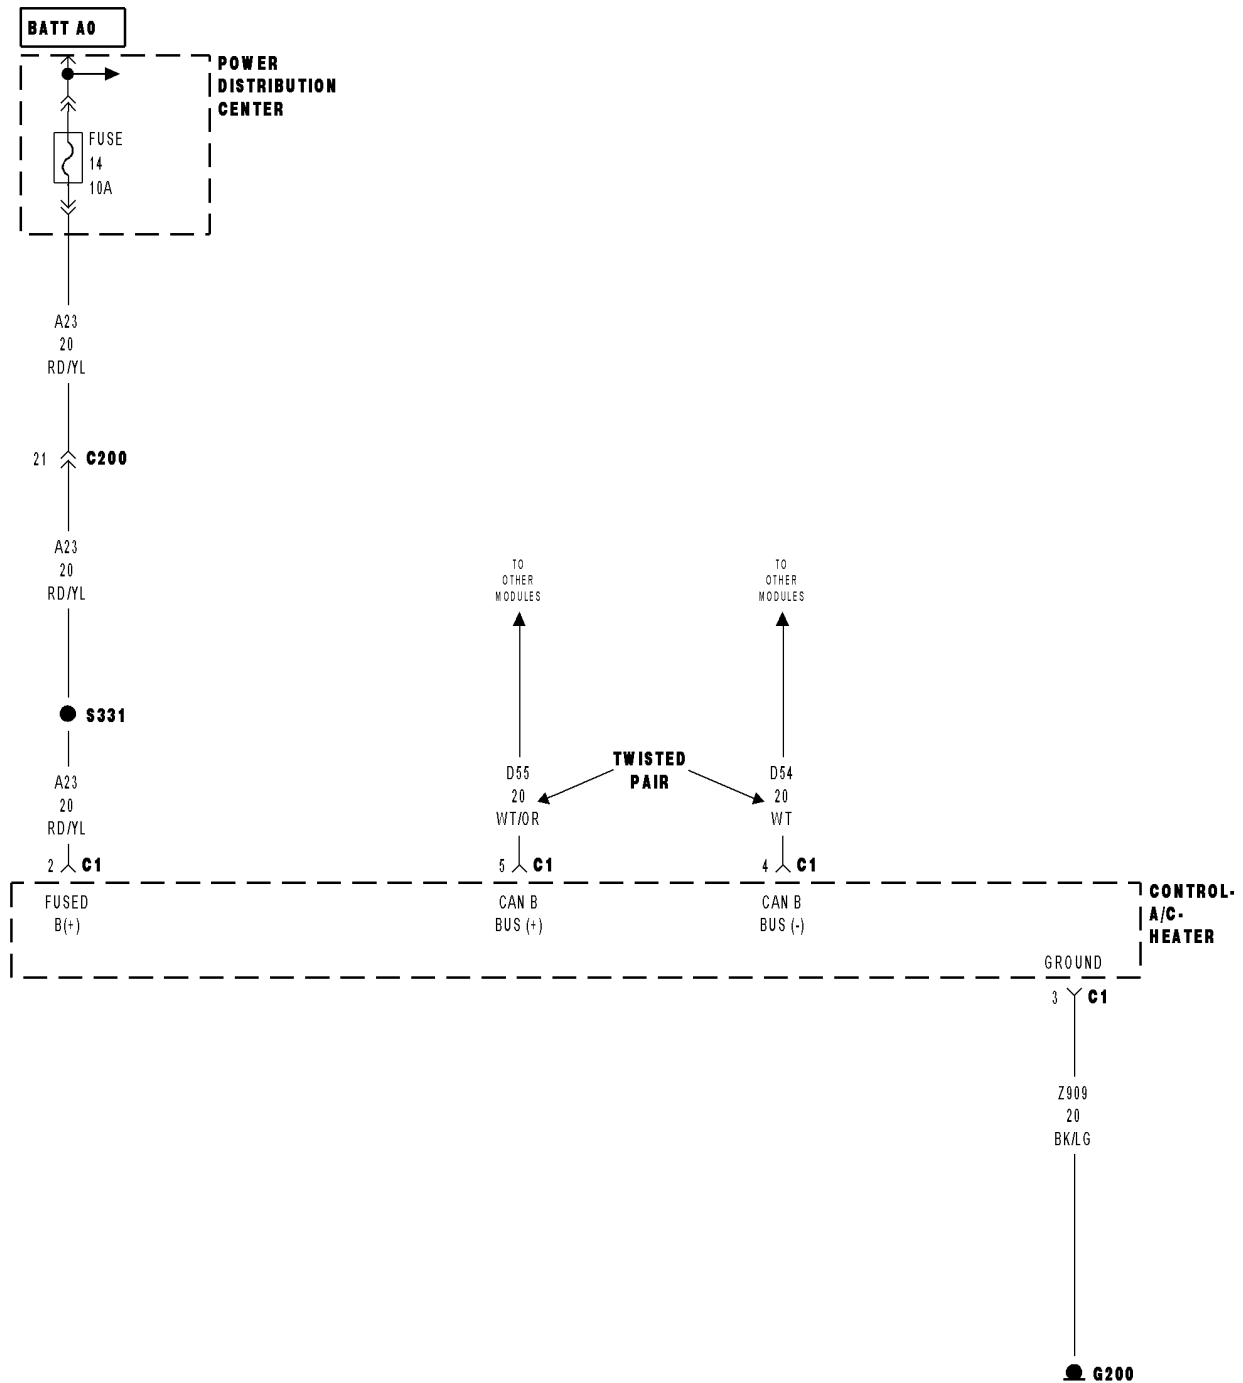

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM HVAC (ATC)

**CONTROL-A/C-  
HEATER C1  
(ATC)**

**\*NO RESPONSE FROM HVAC (ATC) (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A23) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z909) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN A/C HEATER CONTROL

**Diagnostic Test**

**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

- Yes**    >> Go To 2
- No**    >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

**2. (A23) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Using a 12-volt test light connected to ground, check the (A23) Fused B(+) circuit.

Does the test light illuminate brightly?

- Yes**    >> Go To 3
- No**    >> Repair the (A23) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM HVAC (ATC) (CONTINUED)****3. (Z909) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z909) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z909) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

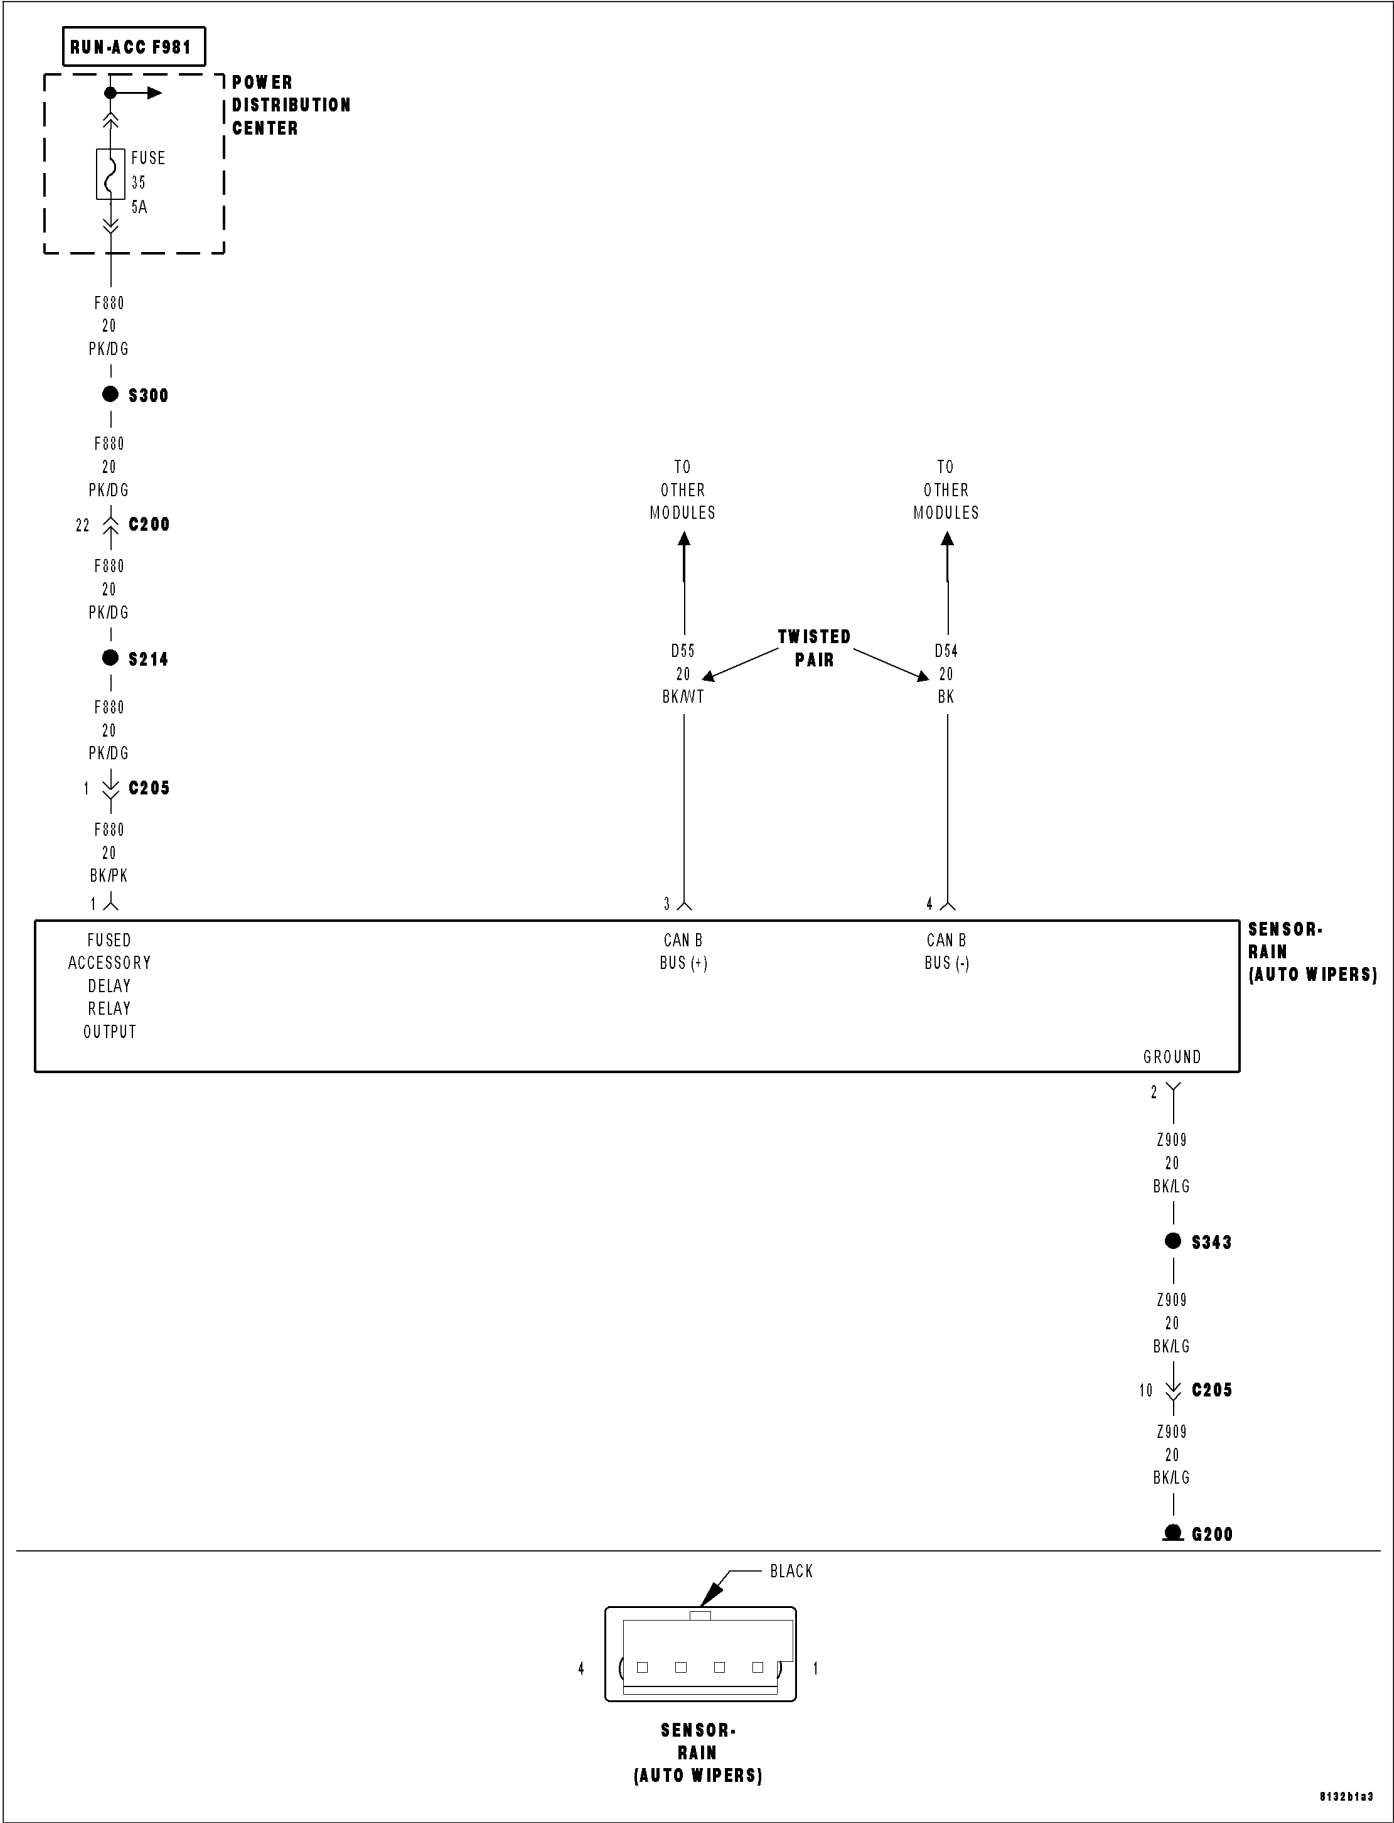

**Yes** >> Replace the A/C Heater Control in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

\*NO RESPONSE FROM LRSM (RAIN SENSOR)

**\*NO RESPONSE FROM LRSM (RAIN SENSOR) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(F880) FUSED ACCESSORY DELAY RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(Z909) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
RAIN SENSOR

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (F880) FUSED ACCESSORY DELAY RELAY OUTPUT CIRCUIT OPEN OR SHORTED**

**Note:** Check the FCM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

Turn the ignition off.

Disconnect the Rain Sensor harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F880) Fused Accessory Delay Relay Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (F880) Fused Accessory Delay Relay Output circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM LRSM (RAIN SENSOR) (CONTINUED)****3. (Z909) GROUND CIRCUIT OPEN**

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z909) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z909) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

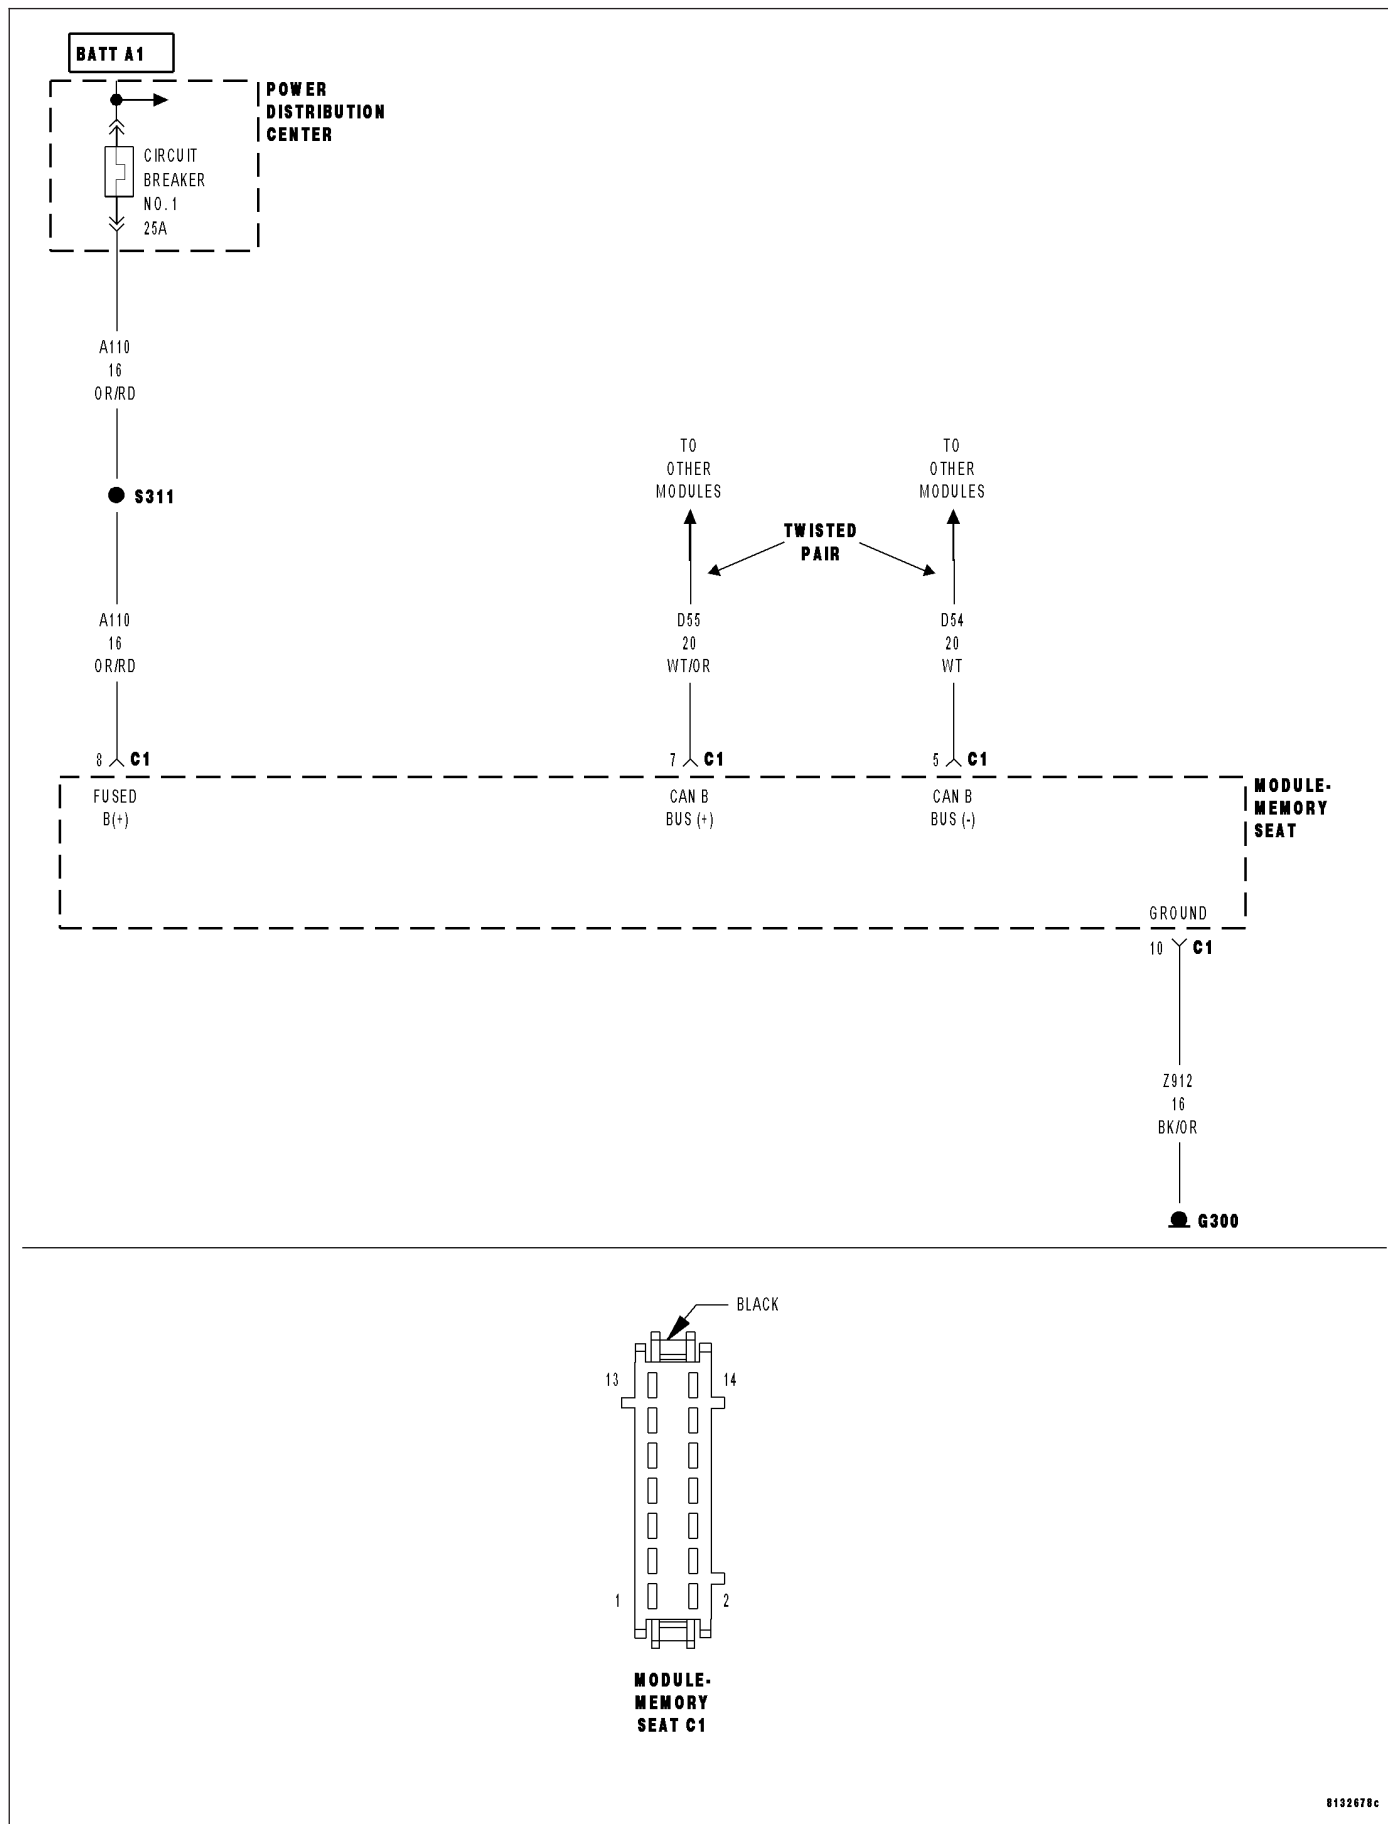

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Rain Sensor in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM MSMD**

**\*NO RESPONSE FROM MSMD (CONTINUED)**  
For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(A110) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z912) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN MEMORY SEAT MODULE

**Diagnostic Test**

**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.  
With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

- Yes**    >> Go To 2
- No**      >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM MSMD (CONTINUED)****2. (A110) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Memory Seat Module C1 harness connector.

Using a 12-volt test light connected to ground, check the (A110) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A110) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**3. (Z912) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z912) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z912) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM MSMD (CONTINUED)****4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note:** One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Memory Seat Module in accordance with the service information.

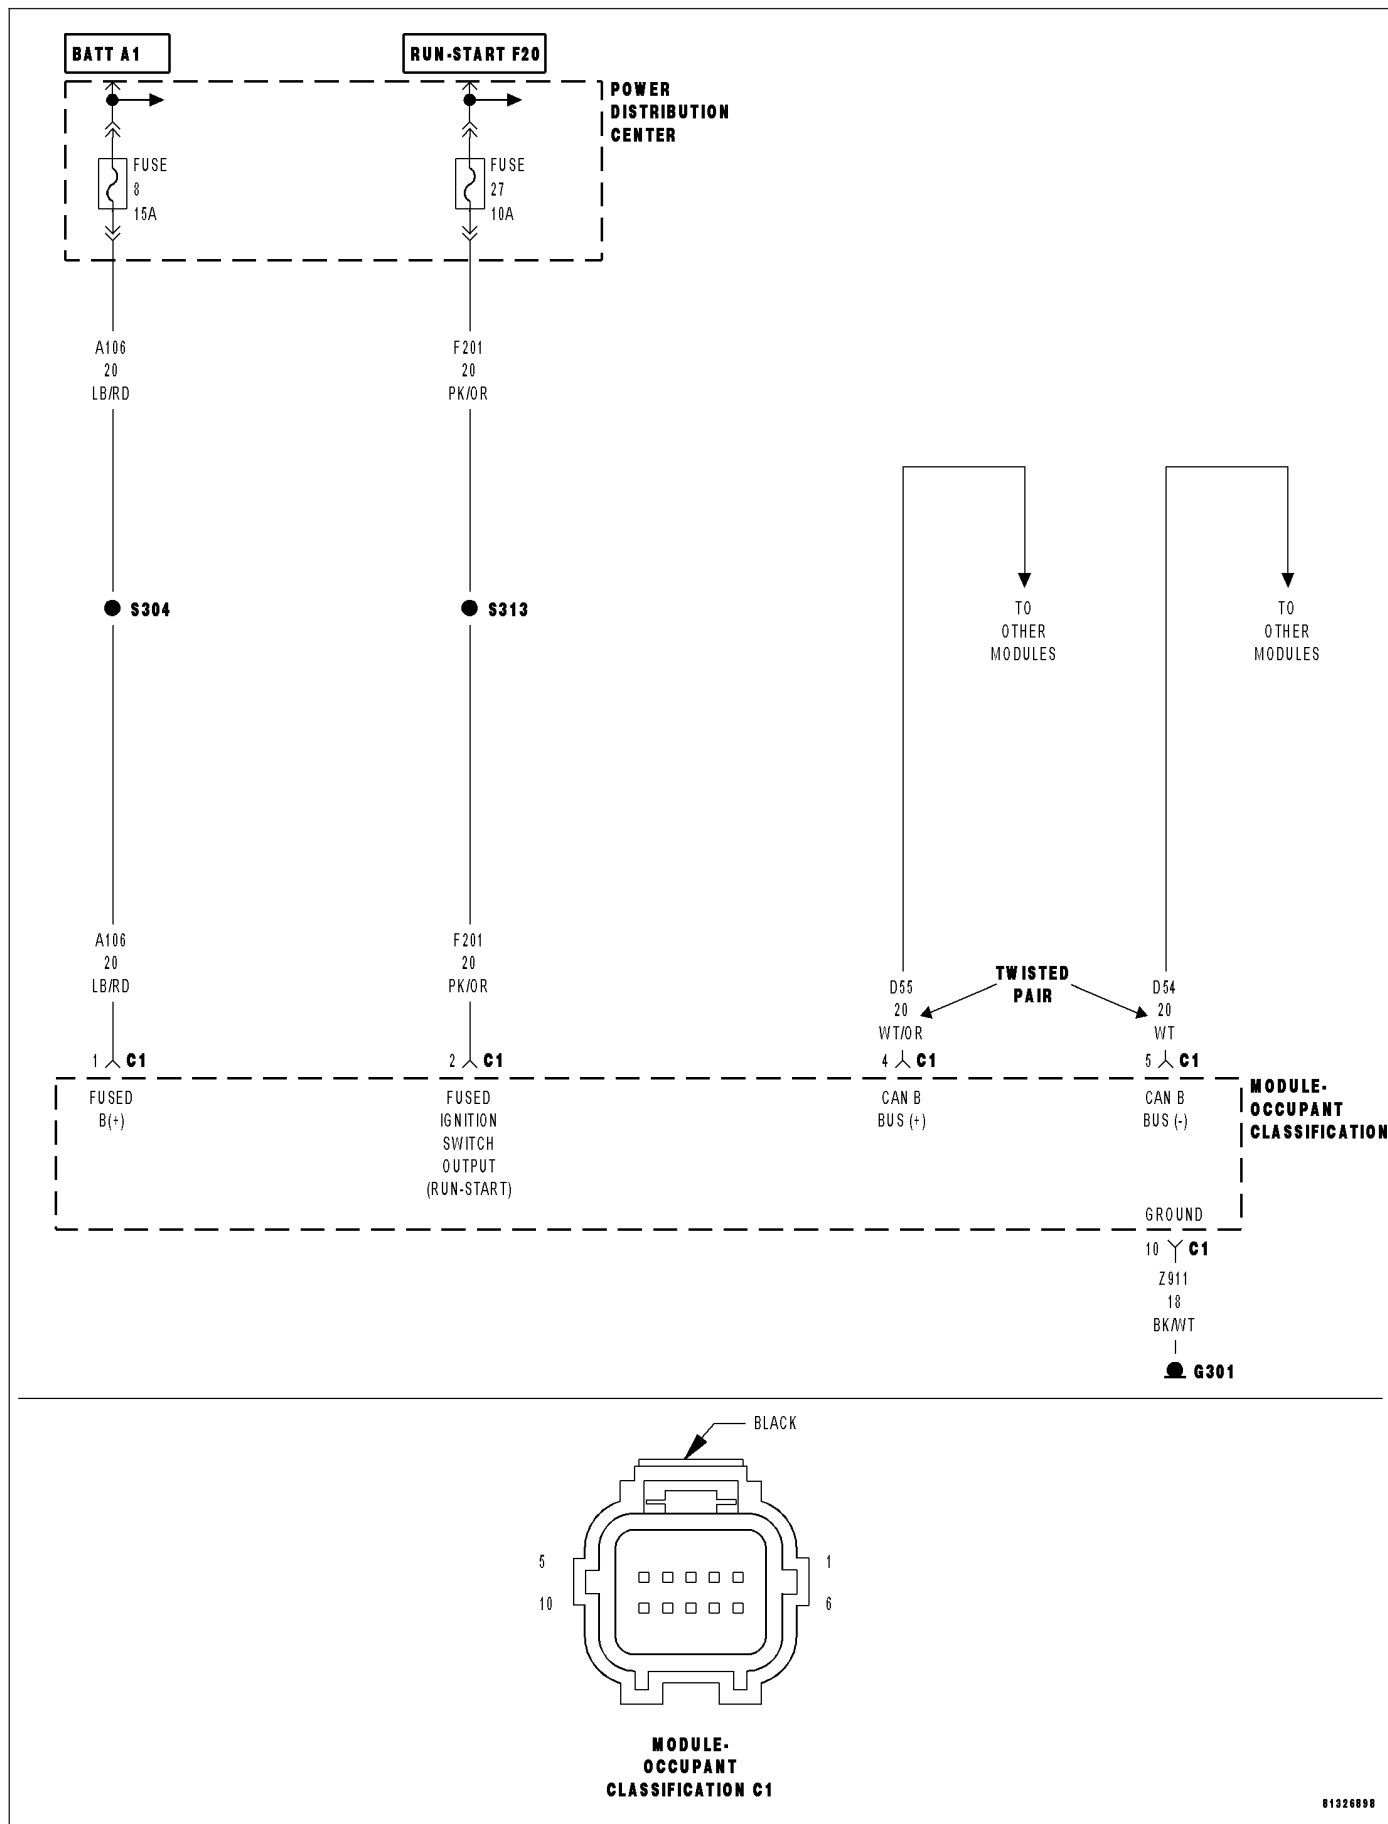

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

Possible Causes
(A106) FUSED B(+) CIRCUIT OPEN OR SHORTED (Z911) GROUND CIRCUIT OPEN (F201) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED (D55) AND (D54) CAN B BUS CIRCUITS OPEN (R263) SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND (R701) SEAT WEIGHT SENSOR 5 VOLTS CIRCUIT FOR A SHORT TO GROUND OCCUPANT CLASSIFICATION MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM OCM (CONTINUED)****2. (A106) FUSED B(+) CIRCUIT OPEN OR SHORTED**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding. Disconnect the Occupant Classification Module C1 harness connector.

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Using a 12-volt test light connected to ground, check the (A106) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A106) Fused B(+) circuit for an open or short. Perform the OCS VERIFICATION TEST-VER 1.

**3. (Z911) GROUND CIRCUIT OPEN**

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z911) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z911) ground circuit for an open. Perform the OCS VERIFICATION TEST-VER 1.

**\*NO RESPONSE FROM OCM (CONTINUED)****4. (F201) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F201) Fused Ignition Switch Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F201) Fused Ignition Switch Output circuit for an open or short.  
Perform the OCS VERIFICATION TEST-VER 1.

**5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**WARNING:** If the Occupant Classification Module is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

**Note:** One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Go To 6

Perform the OCS VERIFICATION TEST-VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform the OCS VERIFICATION TEST-VER 1.

**\*NO RESPONSE FROM OCM (CONTINUED)****6. CHECK (R263) SEAT POSITION SENSOR VOLTAGE CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance between ground and the (R263) Seat Position Sensor Voltage-Driver circuit.

**Is the resistance below 10k ohms on either circuit?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

Replace the OCM and Driver Seat Position Sensor Harness in accordance with the service information.

Perform the OCS VERIFICATION TEST-VER 1.

**No** >> Go To 7

---

**7. CHECK (R701) SEAT WEIGHT SENSOR 5 VOLTS CIRCUIT FOR A SHORT TO GROUND**

Disconnect the Occupant Classification Module C2 harness connector.

Measure the resistance between ground and the (R701) Seat Weight Sensor 5 volt circuit.

**Is the resistance below 10k ohms on either circuit?**

**Yes** >>

**Note: Do not attempt to repair the Seat Harness. Replace the Seat Harness if the condition inspecting or testing for is present in the Seat Harness.**

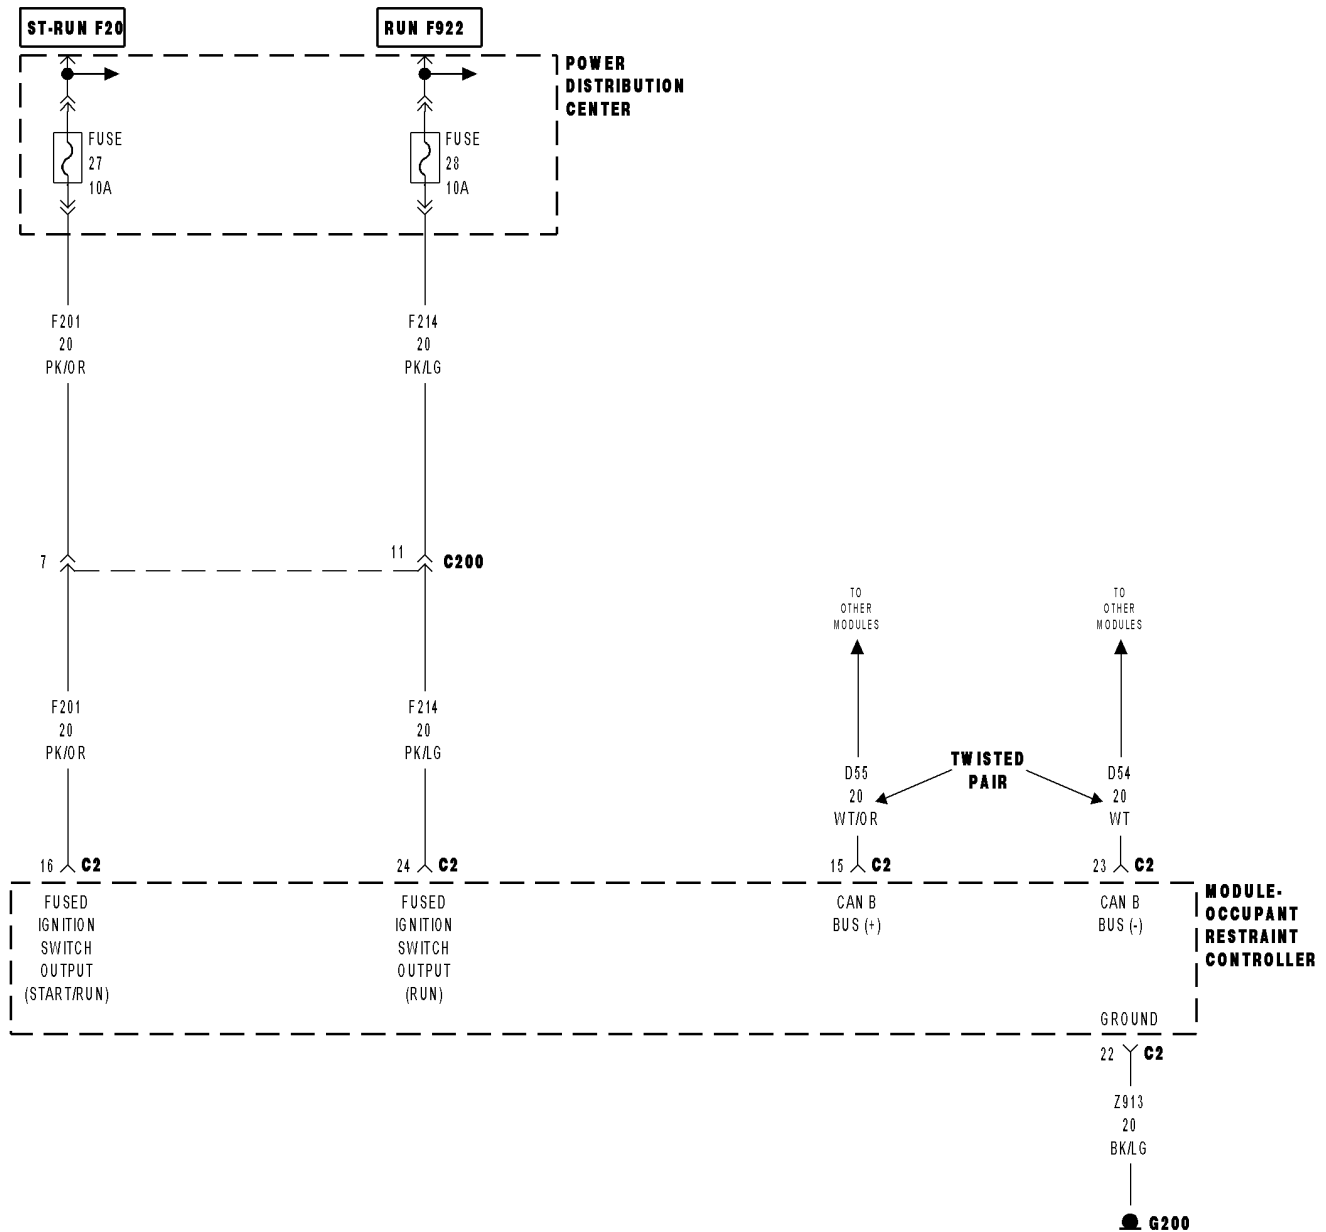

Replace the OCM and Driver Seat Position Sensor Harness in accordance with the service information.

Perform the OCS VERIFICATION TEST-VER 1.

**No** >> Replace the Occupant Classification Module in accordance with the service information.  
Perform the OCS VERIFICATION TEST-VER 1.

---

# \*NO RESPONSE FROM ORC

**MODULE-  
OCCUPANT  
RESTRAINT  
CONTROLLER C2**

**\*NO RESPONSE FROM ORC (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(Z913) GROUND CIRCUIT OPEN (F214) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED (F201) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED (D55) AND (D54) CAN B BUS CIRCUITS OPEN OCCUPANT RESTRAINT CONTROLLER MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (Z913) GROUND CIRCUIT OPEN**

**WARNING:** To avoid personal injury or death, turn the ignition off, disconnect the battery and wait two minutes before proceeding.

Disconnect the Occupant Restraint Controller Module harness connectors.

Connect the appropriate Load Tool ACM Adaptor to the ORC connector.

Using a 12-volt test light connected to 12-volts, check the (Z913) ground circuit.

Does the test light illuminate brightly?

**Yes** >> Go To 3

**No** >> Repair the (Z913) ground circuit for an open.  
Perform AIRBAG VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM ORC (CONTINUED)****3. (F214) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED**

**Note:** Check the FCM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

**WARNING:** To avoid personal injury or death, turn the ignition on, then reconnect the battery.

Using a 12-volt test light connected to ground, check the (F214) Fused Run Relay Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (F214) Fused Run Relay Output circuit for an open or short.

Perform AIRBAG VERIFICATION TEST - VER 1.

**4. (F201) FUSED IGNITION SWITCH OUTPUT (RUN/START) CIRCUIT OPEN OR SHORTED**

Using a 12-volt test light connected to ground, check the (F201) Fused Ignition Switch Output (RUN/START) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F201) Fused Ignition Switch Output (RUN/START) circuit for an open or short.

Perform AIRBAG VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM ORC (CONTINUED)****5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**WARNING:** If the Occupant Restraint Controller is dropped at any time, it must be replaced. Failure to take the proper precautions could result in accidental airbag deployment and personal injury or death.

**Note:** One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

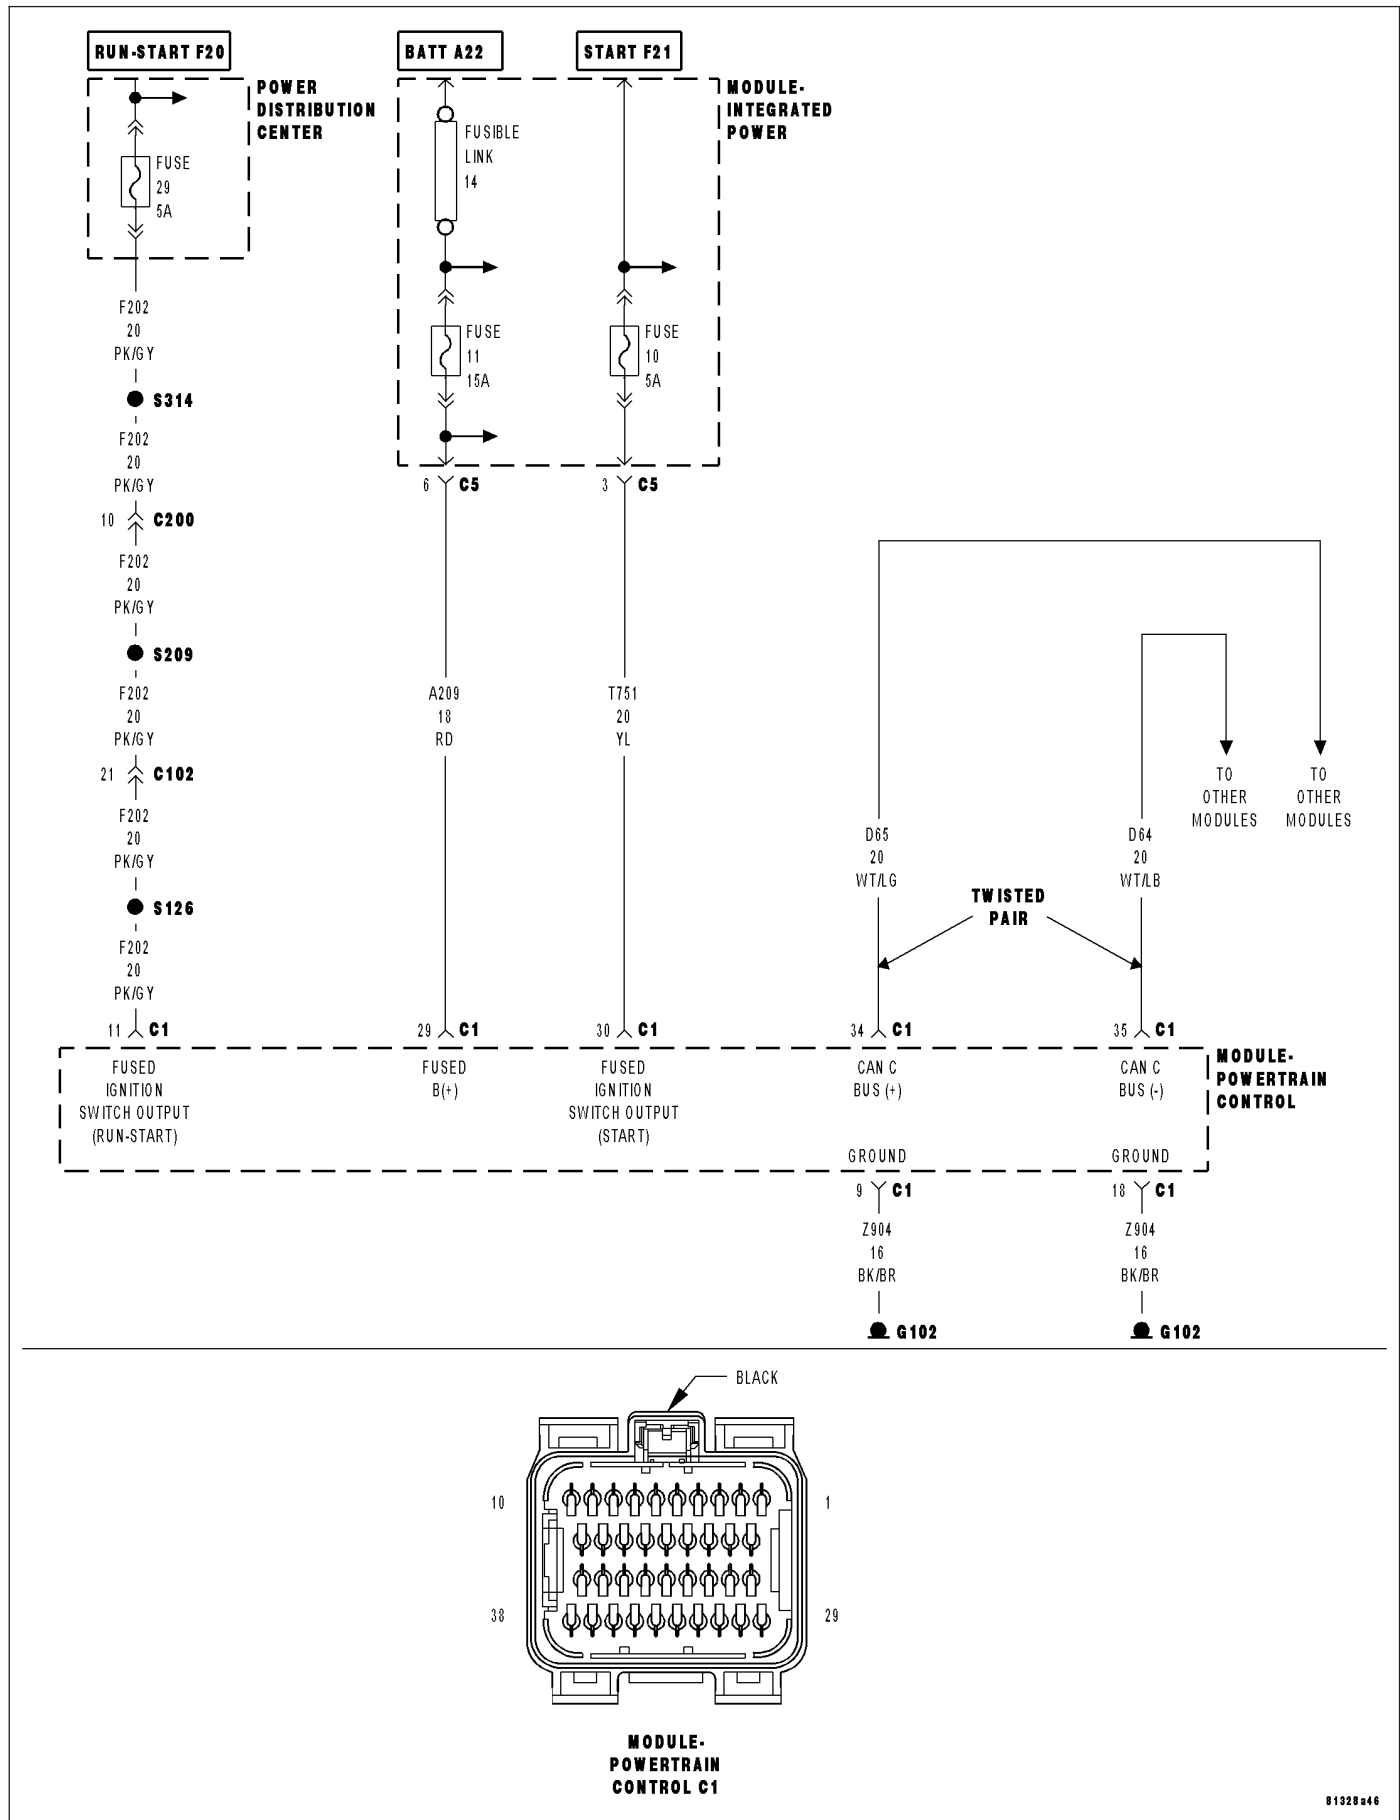

**Yes** >> Replace the Occupant Restraint Controller Module in accordance with the service information.  
Perform AIRBAG VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform AIRBAG VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM PCM

**\*NO RESPONSE FROM PCM (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(A209) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z904) GROUND CIRCUIT OPEN
(F202) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Note:** Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (A209) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the PCM C1 harness connector.

**CAUTION:** Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.

Using a 12-volt test light connected to ground, check the (A209) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A209) Fused B(+) circuit for an open or short. Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

**\*NO RESPONSE FROM PCM (CONTINUED)****3. (Z904) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check each (Z904) ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 4

**No** >> Repair the (Z904) ground circuit for an open.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

**4. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F202) Fused Ignition Switch Output circuit for an open or short.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

**\*NO RESPONSE FROM PCM (CONTINUED)****5. (D65) CAN C BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the appropriate terminal of the special tool #8815.

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 6

**No** >> Repair the (D65) CAN C Bus (+) circuit for an open.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

**6. (D64) CAN C BUS (-) CIRCUIT OPEN**

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the appropriate terminal of the special tool #8815.

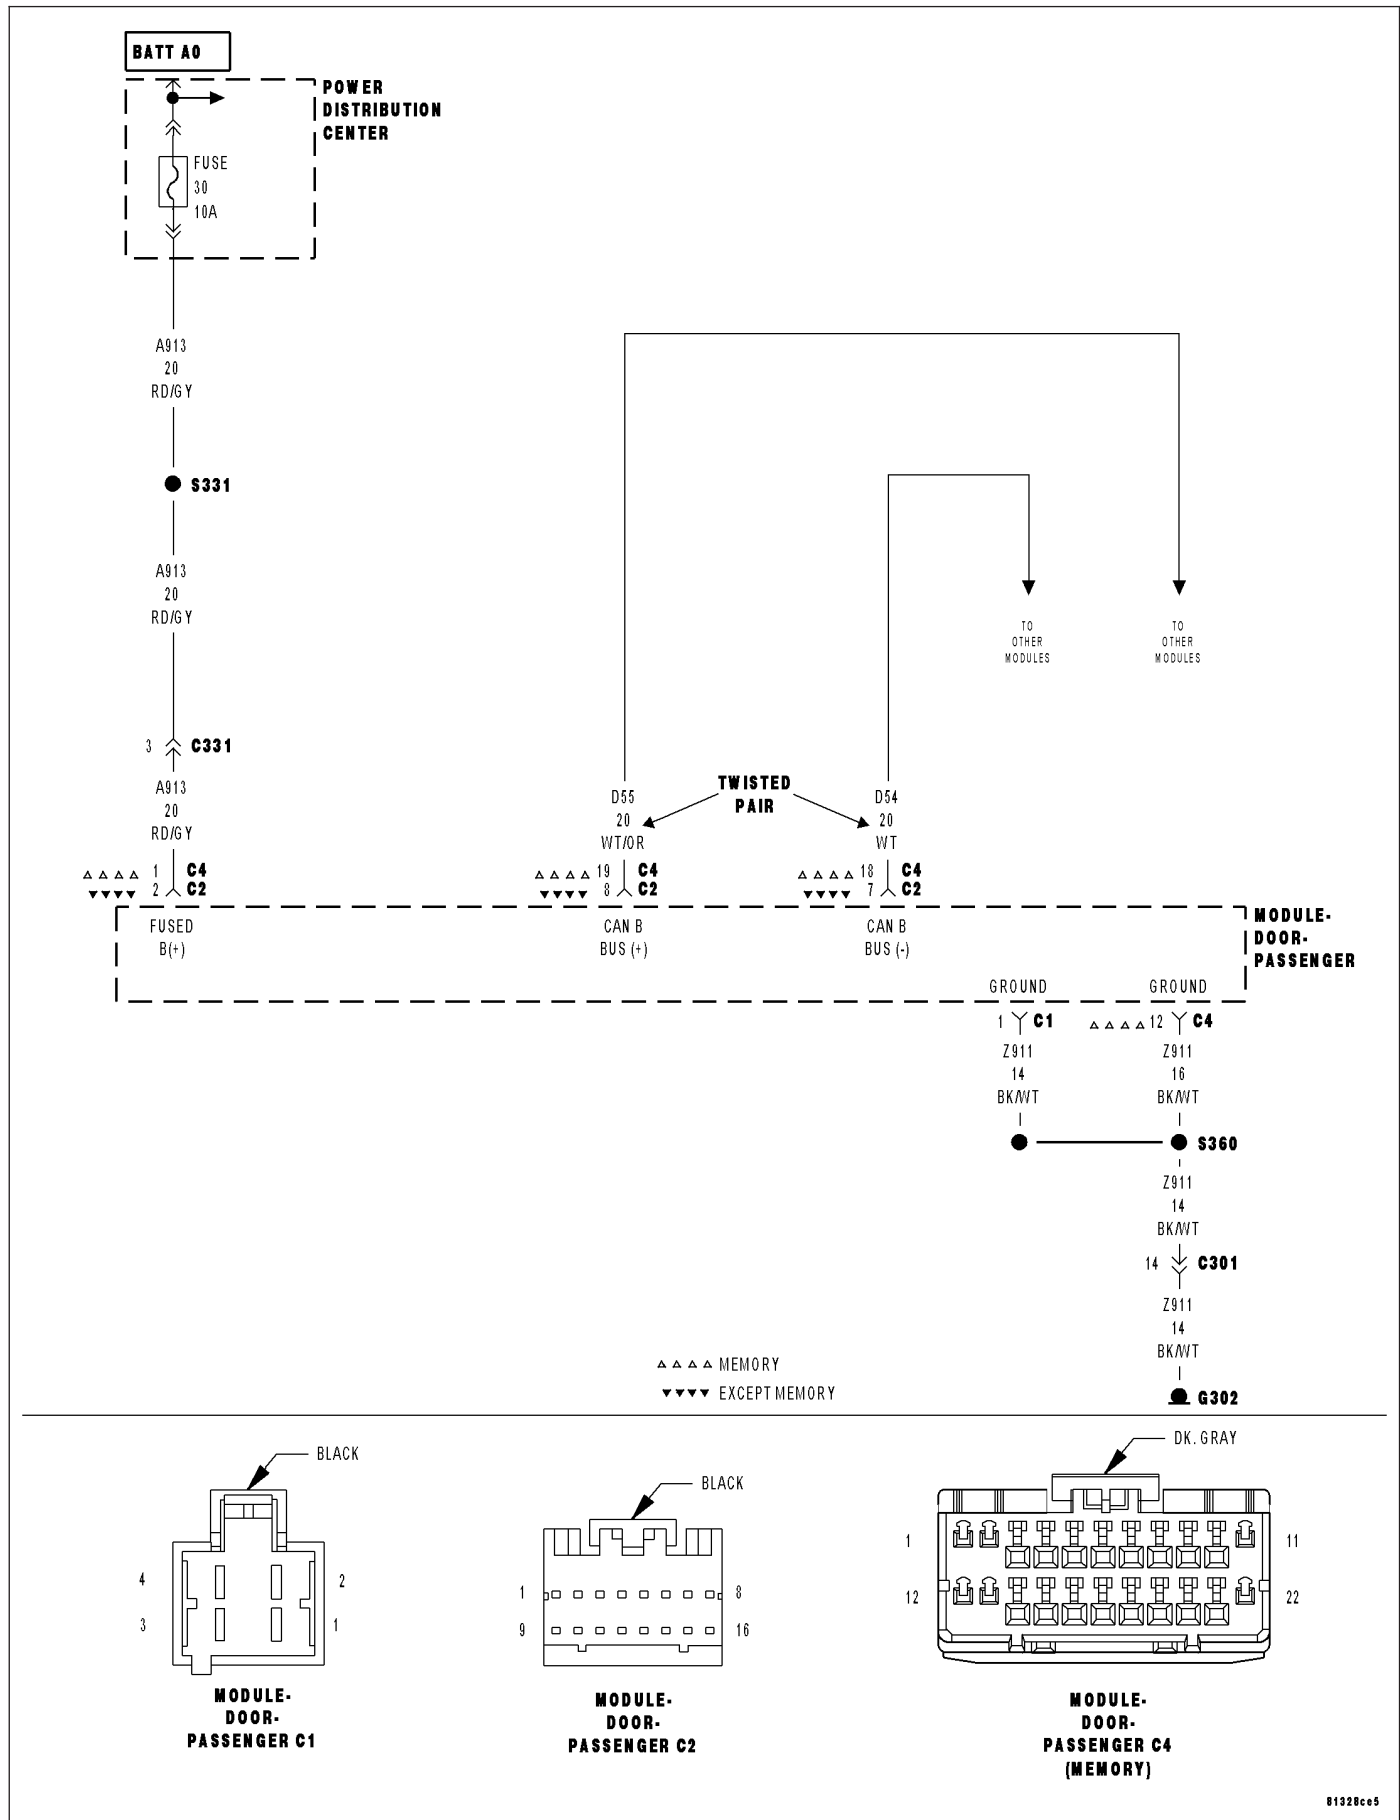

**Is resistance below 5.0 ohms?**

**Yes** >> Replace and program the Powertrain Control Module in accordance with the service information.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

**No** >> Repair the (D64) CAN C Bus (-) circuit for an open.  
Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5.

## \*NO RESPONSE FROM PDM

**\*NO RESPONSE FROM PDM (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(A913) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z911) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN PASSENGER DOOR MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**\*NO RESPONSE FROM PDM (CONTINUED)****2. (A913) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

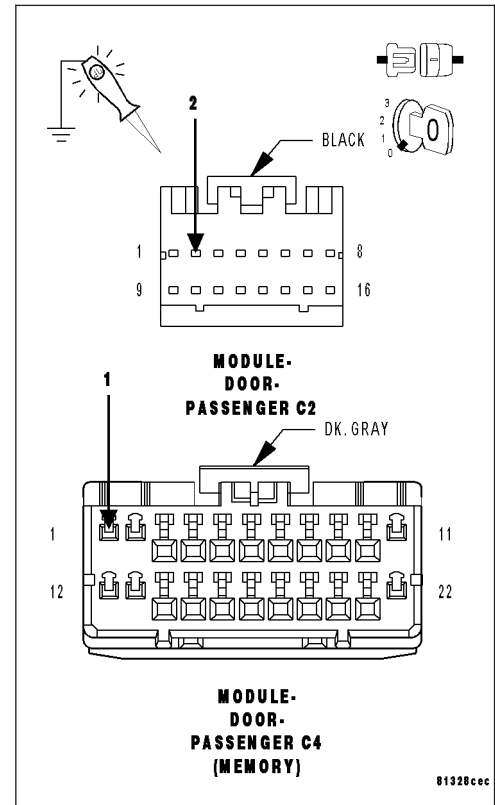

Disconnect the Passenger Door Module harness connectors.

Using a 12-volt test light connected to ground, check the (A913) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A913) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**3. (Z911) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z911) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z911) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM PDM (CONTINUED)****4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note:** One open circuit will not cause this condition.

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Passenger Door Module in accordance with the service information.

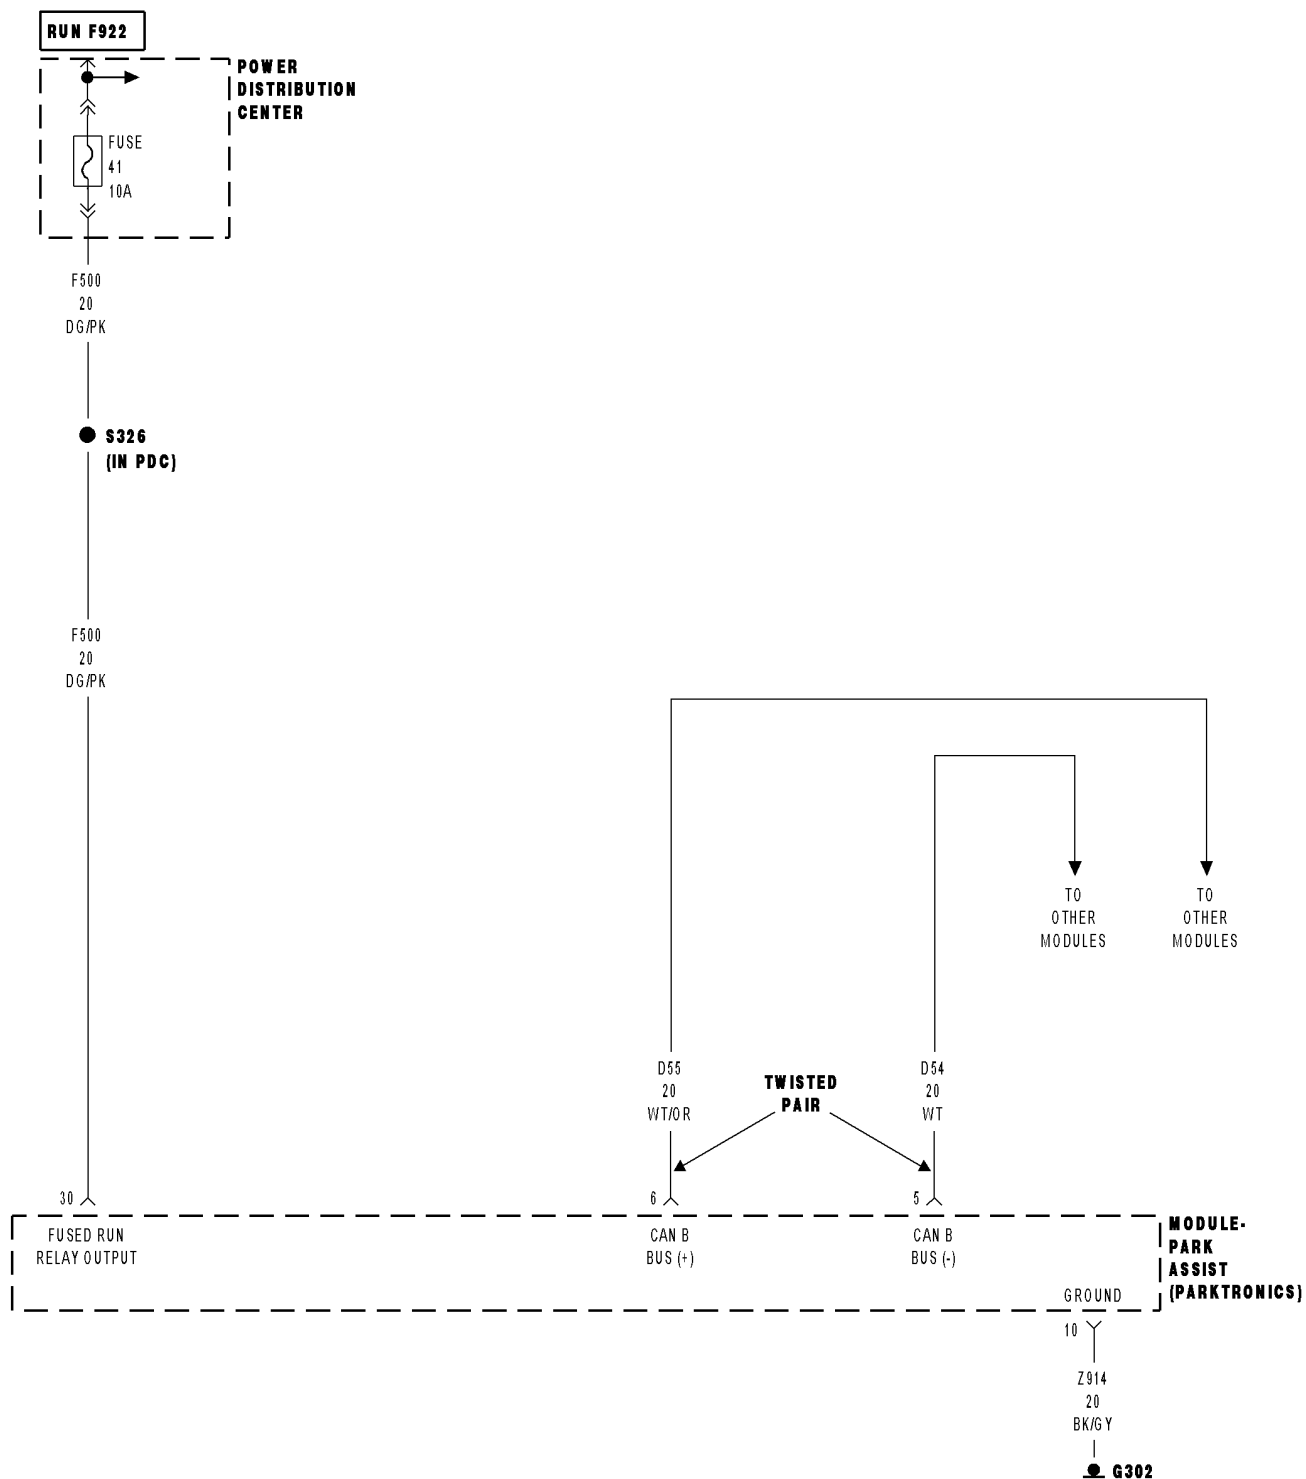

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM PTS (PARK ASSIST MODULE)**

# \*NO RESPONSE FROM PTS (PARK ASSIST MODULE) (CONTINUED)

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(F500) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED
(Z914) GROUND CIRCUIT OPEN
(D55) AND (D54) CAN B BUS CIRCUITS OPEN
PARK ASSIST MODULE

## Diagnostic Test

### 1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

### 2. (F500) FUSED RUN RELAY OUTPUT CIRCUIT OPEN OR SHORTED

**Note:** Check the FCM for any ignition related DTCs before proceeding. If set (Refer to 8 - ELECTRICAL/IGNITION CONTROL - DIAGNOSIS AND TESTING).

Turn the ignition off.

Disconnect the Park Assist Module harness connector.

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F500) Fused Run Relay Output circuit.

Does the test light illuminate brightly?

**Yes** >> Go To 3

**No** >> Repair the (F500) Fused Run Relay Output circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM PTS (PARK ASSIST MODULE) (CONTINUED)****3. (Z914) GROUND CIRCUIT OPEN**

Turn the ignition off.

Using a 12-volt test light connected to 12-volts, check the (Z914) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z914) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

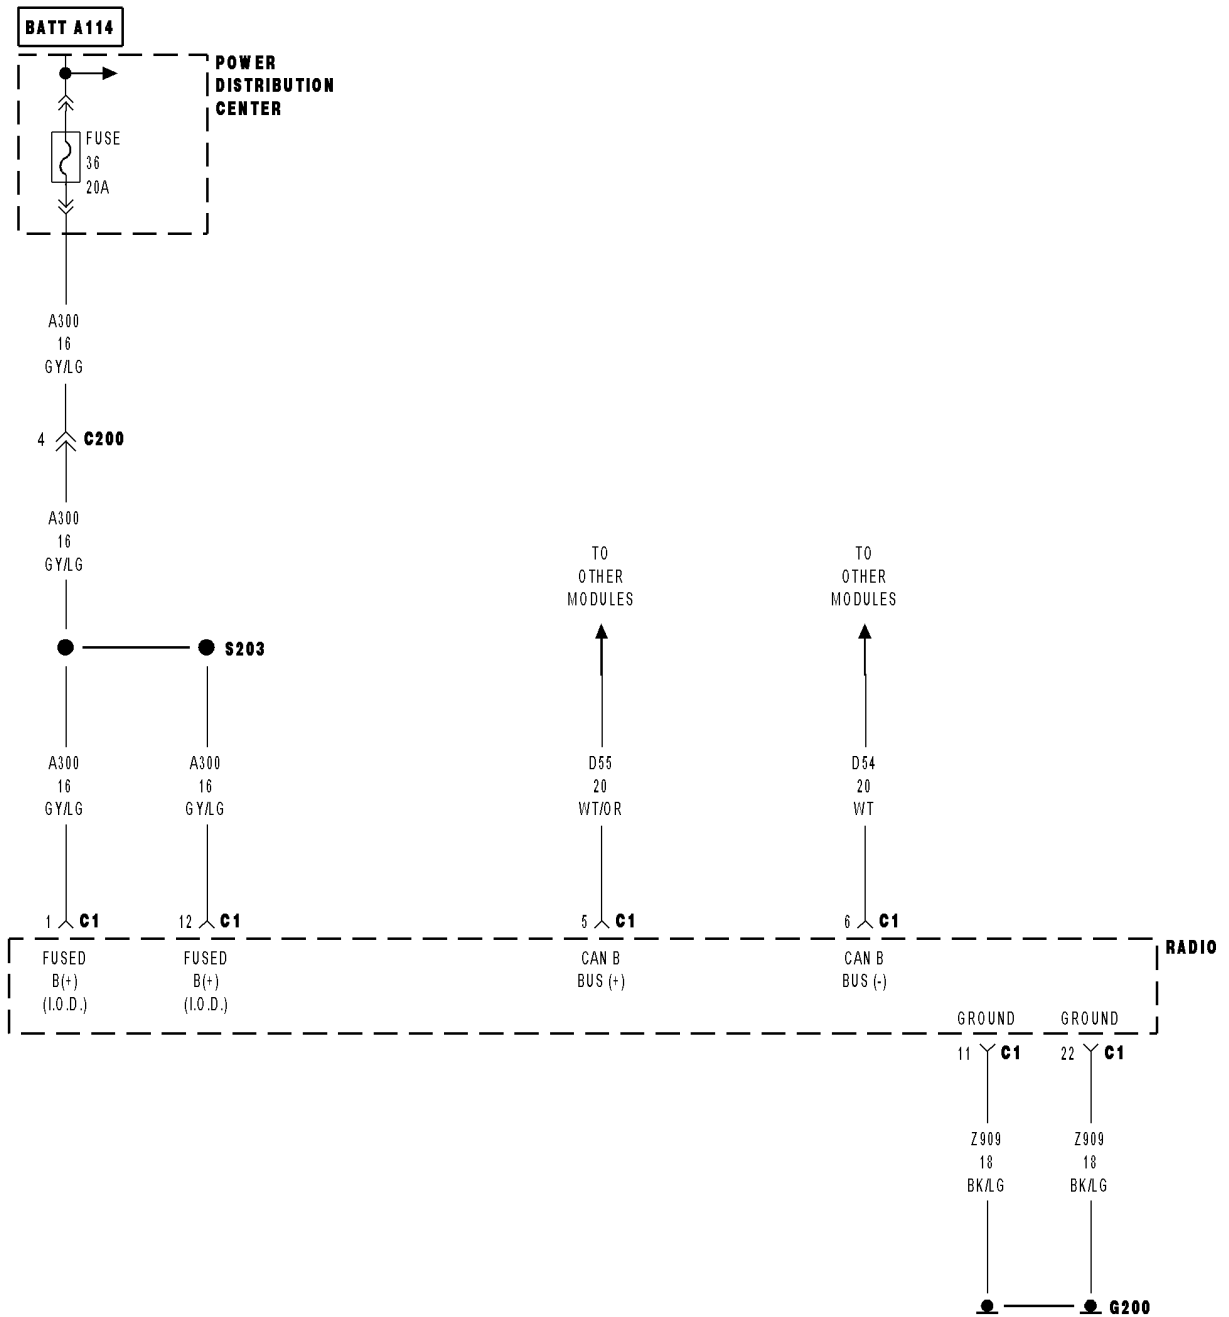

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Park Assist Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM RADIO

**\*NO RESPONSE FROM RADIO (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A300) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z909) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN RADIO

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (A300) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Radio C1 harness connector.

Using a 12-volt test light connected to ground, check each (A300) Fused B(+) circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 3

**No** >> Repair the (A300) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM RADIO (CONTINUED)****3. (Z909) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check each (Z909) ground circuit.

**Does the test light illuminate brightly for each circuit?**

**Yes** >> Go To 4

**No** >> Repair the (Z909) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

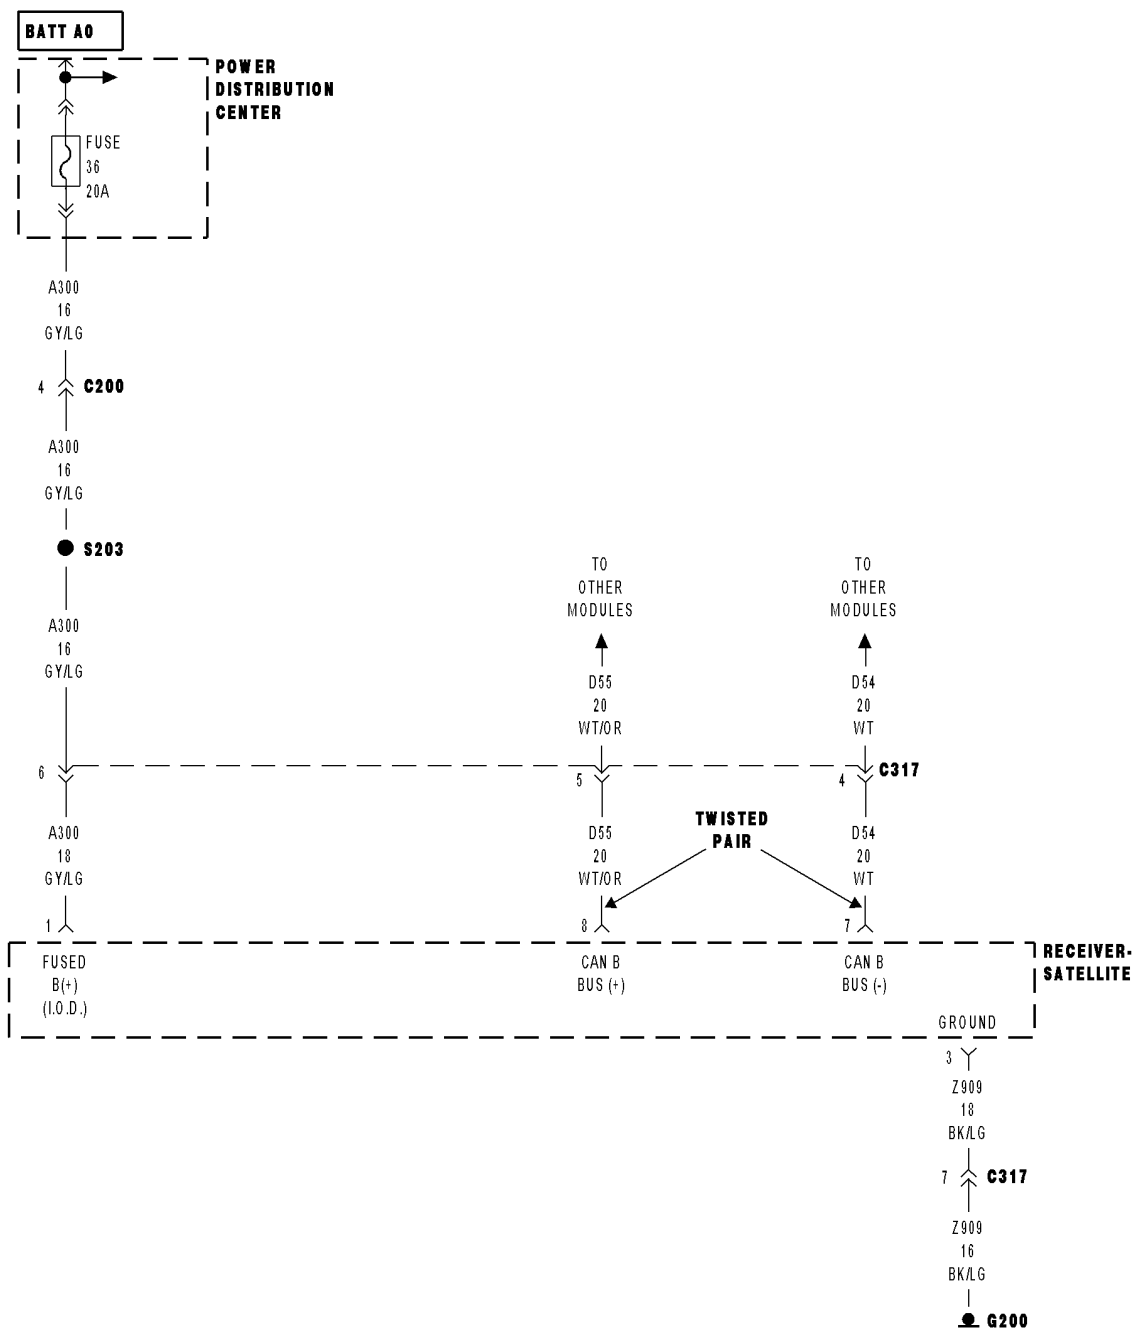

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Radio in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM SDAR****RECEIVER-SATELLITE**

**\*NO RESPONSE FROM SDAR (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A300) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z909) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN SATELLITE RECEIVER

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (A300) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Satellite Receiver harness connector.

Using a 12-volt test light connected to ground, check the (A300) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A300) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM SDAR (CONTINUED)****3. (Z909) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z909) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z909) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

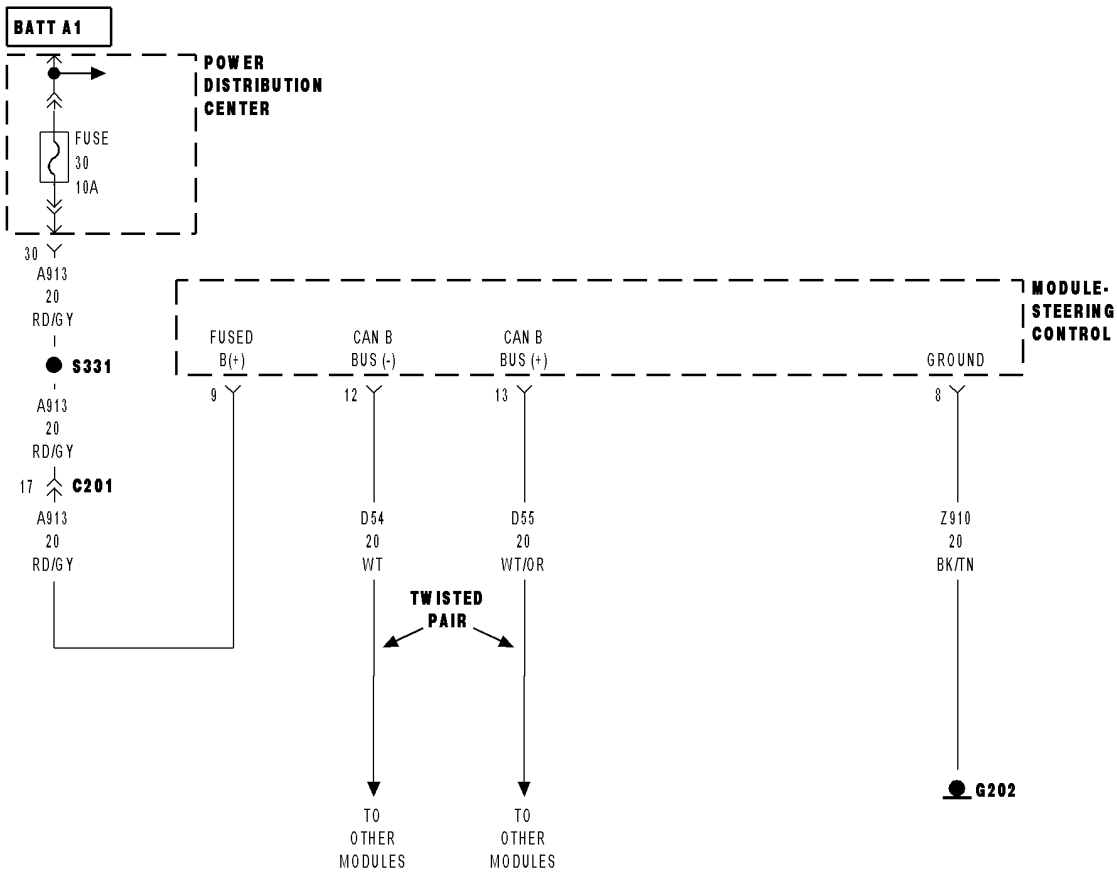

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Satellite Receiver in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM SCM**

**\*NO RESPONSE FROM SCM (CONTINUED)**  
For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A913) FUSED B(+) CIRCUIT OPEN OR SHORTED (Z910) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN STEERING CONTROL MODULE

Diagnostic Test

1. TEST FOR INTERMITTENT CONDITION

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.  
With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

Does the scan tool display a red X next to the module?

- Yes    >> Go To 2
- No    >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

2. (A913) FUSED B(+) CIRCUIT OPEN OR SHORTED

Turn the ignition off.  
Disconnect the Steering Control Module harness connector.  
Using a 12-volt test light connected to ground, check the (A913) Fused B(+) circuit.

- Does the test light illuminate brightly?
- Yes    >> Go To 3
- No    >> Repair the (A913) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**\*NO RESPONSE FROM SCM (CONTINUED)****3. (Z910) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z910) ground circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

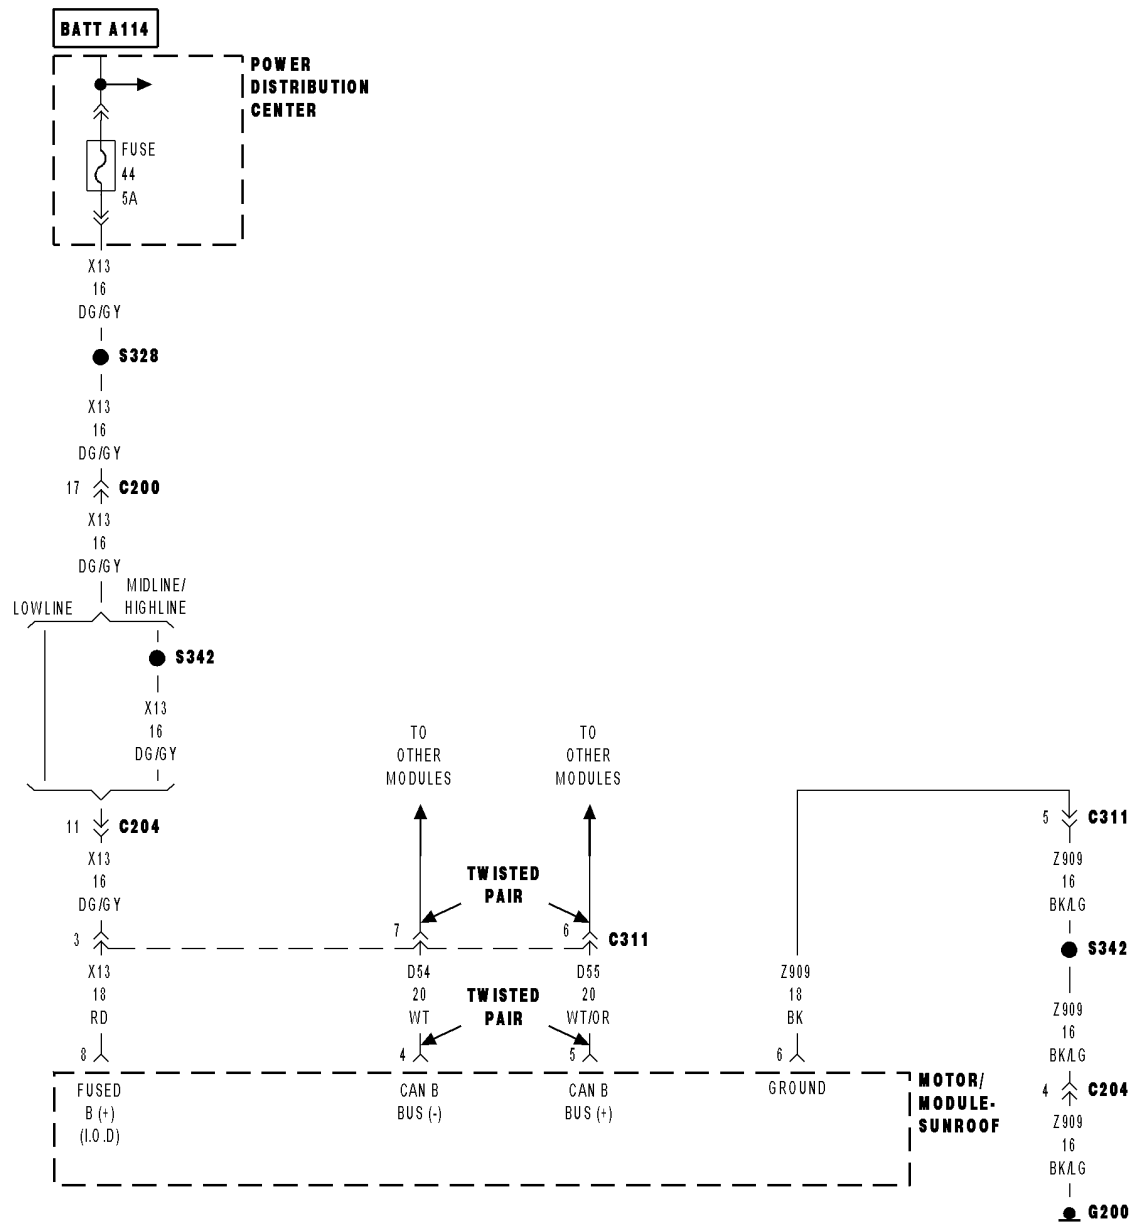

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Steering Control Module in accordance with the service information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**\*NO RESPONSE FROM SUNR (SUNROOF MODULE)**

**\*NO RESPONSE FROM SUNR (SUNROOF MODULE) (CONTINUED)**

For a complete wiring diagram Refer to Section 8W.

Possible Causes
(X13) FUSED B (+) CIRCUIT OPEN OR SHORTED (Z909) GROUND CIRCUIT OPEN (D55) AND (D54) CAN B BUS CIRCUITS OPEN SUNROOF MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (X13) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Sunroof Module harness connector.

Using a 12-volt test light connected to ground, check the (X13) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (X13) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM SUNR (SUNROOF MODULE) (CONTINUED)****3. (Z909) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z909) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z909) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (D55) AND (D54) CAN B BUS CIRCUITS OPEN**

**Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

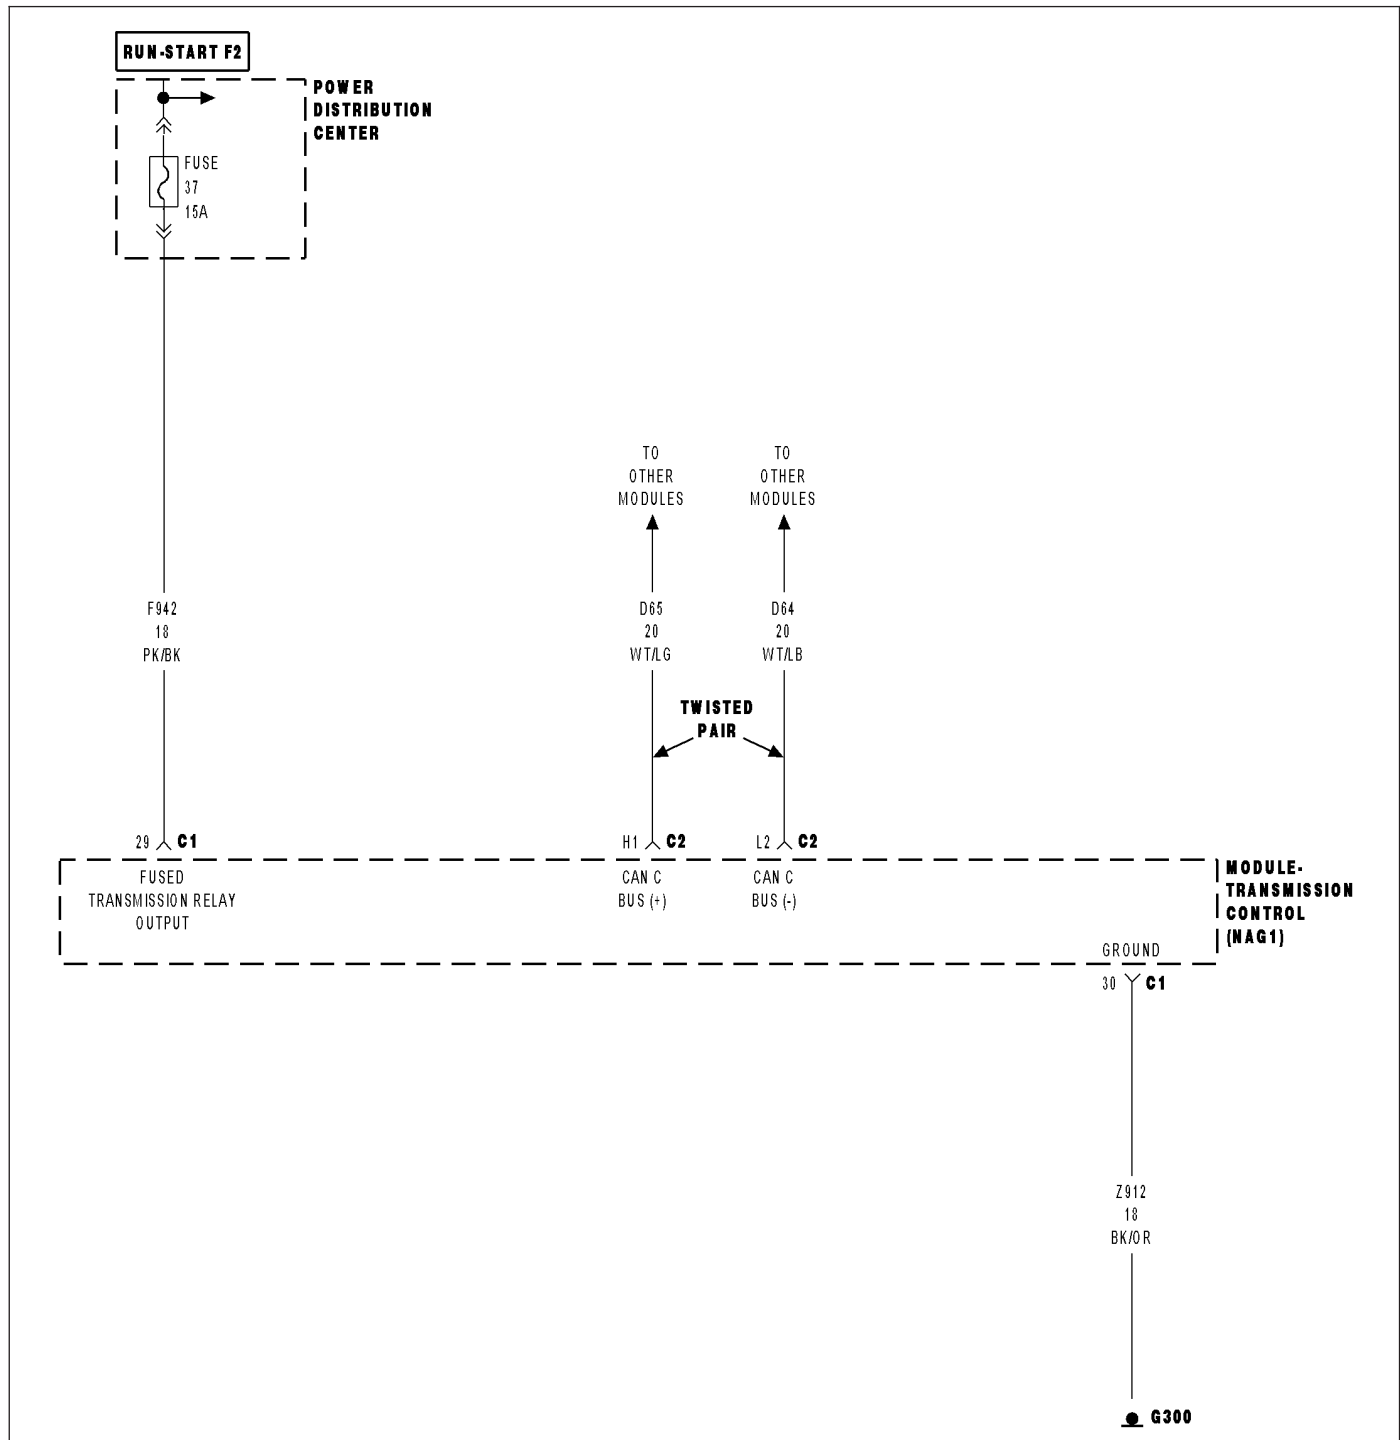

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Sunroof Module in accordance with the service information.  
Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.  
Perform BODY VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM TCM - NAG1

**\*NO RESPONSE FROM TCM - NAG1 (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(Z912) GROUND CIRCUIT OPEN (F942) FUSED TRANSMISSION RELAY OUTPUT CIRCUIT OPEN OR SHORT (D65) CAN C BUS (+) CIRCUIT OPEN (D64) CAN C BUS (-) CIRCUIT OPEN TRANSMISSION CONTROL MODULE

**Diagnostic Test**

**1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Note:** Check the FCM for any active CAN C hardware and any ignition related DTCs, perform DTCs before proceeding.

Does the scan tool display a red X next to the module?

- Yes    >> Go To 2
- No    >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

**2. (Z912) GROUND CIRCUIT OPEN**

Turn the ignition off.

Disconnect the Transmission Control Module C1 harness connector.

Using a 12-volt test light connected to 12-volts, check the (Z912) ground circuit.

Does the test light illuminate brightly?

- Yes    >> Go To 3
- No    >> Repair the (Z912) ground circuit for an open.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM TCM - NAG1 (CONTINUED)****3. (F942) FUSED TRANSMISSION RELAY OUTPUT CIRCUIT OPEN OR SHORTED**

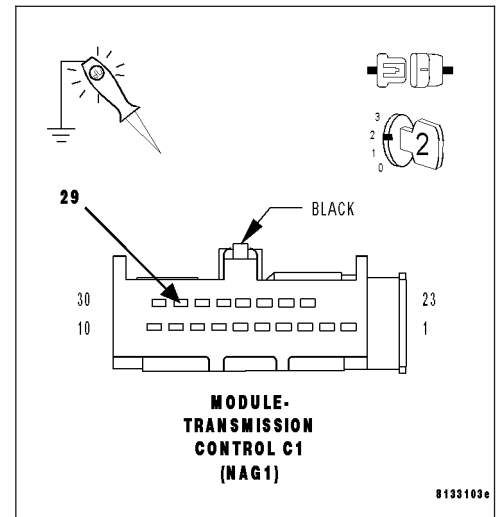

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F942) Fused Transmission Relay Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (F942) Fused Transmission Relay Output circuit for an open or short.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**4. (D65) CAN C BUS (+) CIRCUIT OPEN**

Turn the ignition off.

Disconnect the FCM C1 harness connector.

Disconnect the TCM C2 harness connector.

Measure the resistance of the (D65) CAN C Bus (+) circuit between the FCM connector and the TCM connector.

**Is resistance below 5.0 ohms?**

**Yes** >> Go To 5

**No** >> Repair the (D65) CAN C Bus (+) circuit for an open.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM TCM - NAG1 (CONTINUED)****5. (D64) CAN C BUS (-) CIRCUIT OPEN**

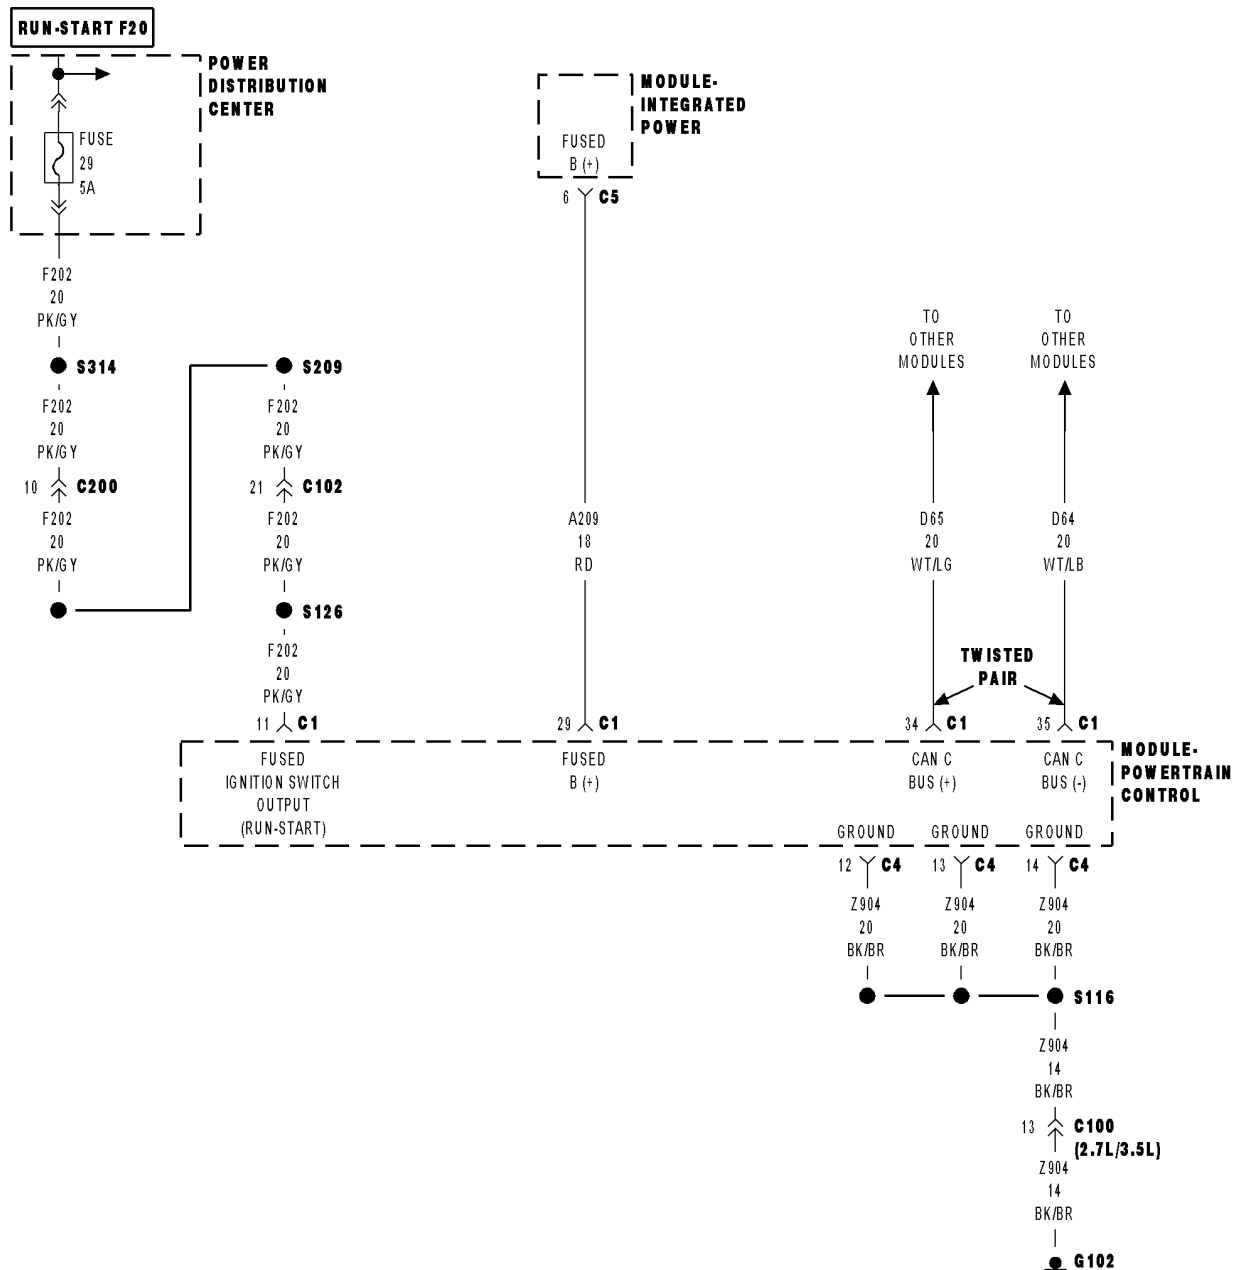

Measure the resistance of the (D64) CAN C Bus (-) circuit between the FCM connector and the TCM connector.

**Is resistance below 5.0 ohms?**

- Yes** >> Replace the Transmission Control Module in accordance with the service information.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.
- No** >> Repair the (D64) CAN C Bus (-) circuit for an open.  
Perform NAG1 TRANSMISSION VERIFICATION TEST - VER 1.

# \*NO RESPONSE FROM TCM – NGC

**\*NO RESPONSE FROM TCM – NGC (CONTINUED)**

For a complete wiring diagram **Refer to Section 8W.**

Possible Causes
(A209) FUSED B(+) CIRCUIT OPEN OR SHORTED
(Z904) GROUND CIRCUIT OPEN
(F202) FUSED IGNITION SW OUTPUT CIRCUIT OPEN OR SHORTED
(D65) CAN C BUS (+) CIRCUIT OPEN
(D64) CAN C BUS (-) CIRCUIT OPEN
POWERTRAIN CONTROL MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Note:** Check the FCM for any active CAN C hardware DTCs, perform DTC before proceeding.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent , pushed out, and corroded terminals.

---

**2. ATTEMPT TO COMMUNICATE WITH THE PCM**

With the scan tool in ECU view, observe the status of the PCM.

**Does the scan tool display a red X next to the PCM?**

**Yes** >> Refer to the No Response From PCM test procedure. Refer to the table of contents in this section.

**No** >> Go To 3

---

**\*NO RESPONSE FROM TCM – NGC (CONTINUED)****3. (Z904) GROUND CIRCUIT OPEN**

Turn the ignition off.

Disconnect the PCM C4 harness connector.

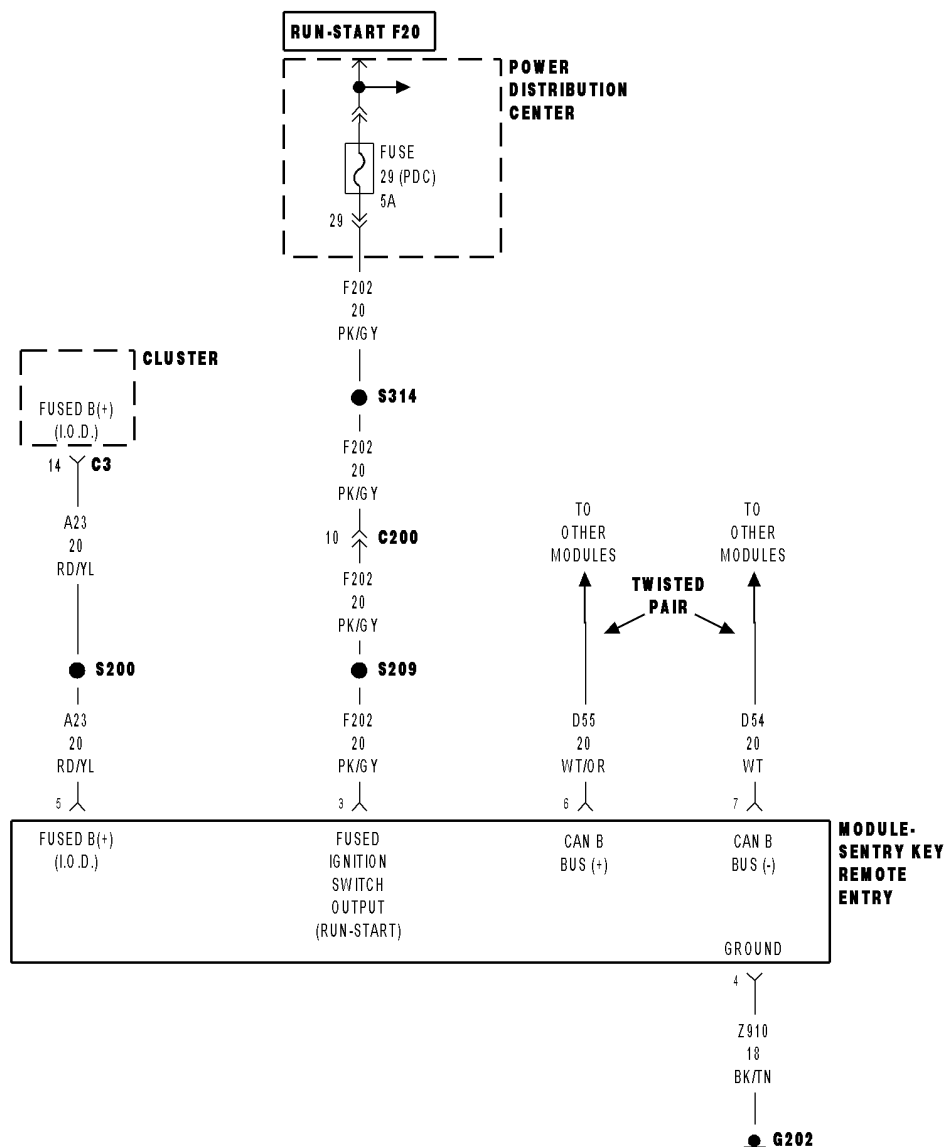

**CAUTION: Do not probe the PCM harness connectors. Probing the PCM harness connectors will damage the PCM terminals resulting in poor terminal to pin connection. Install Miller Special Tool #8815 to perform diagnosis.**

Using a 12-volt test light connected to 12-volts, check each (Z904) ground circuit.

**Does the test light illuminate brightly for each circuit?**

- Yes** >> Replace and program the Powertrain Control Module in accordance with the service information.
- No** >> Repair the (Z904) ground circuit for an open.  
Perform the appropriate TRANSMISSION VERIFICATION TEST.

**\*NO RESPONSE FROM WCM**

**\*NO RESPONSE FROM WCM (CONTINUED)**

For a complete wiring diagram Refer to **Section 8W**.

Possible Causes
(A23) FUSED B(+) CIRCUIT OPEN OR SHORTED (Z910) GROUND CIRCUIT OPEN (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED (D55) AND (D54) CAN B BUS CIRCUITS OPEN SENTRY KEY REMOTE ENTRY MODULE

**Diagnostic Test****1. TEST FOR INTERMITTENT CONDITION**

Turn the ignition on.

**Note:** Ensure the IOD fuse is installed and battery voltage is between 10.0 and 16.0 volts.

With the scan tool, select ECU view.

**Note:** A red X will be next to the module that is not communicating, indicating that the module is not active on the Bus network. A green check indicates that the module is active on the Bus network.

**Does the scan tool display a red X next to the module?**

**Yes** >> Go To 2

**No** >> The no response condition is not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring for chafed, pierced, pinched, and partially broken wires and the wiring harness connectors for broken, bent, pushed out, and corroded terminals.

**2. (A23) FUSED B(+) CIRCUIT OPEN OR SHORTED**

Turn the ignition off.

Disconnect the Sentry Key Remote Entry Module harness connector.

Using a 12-volt test light connected to ground, check the (A23) Fused B(+) circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 3

**No** >> Repair the (A23) Fused B(+) circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM WCM (CONTINUED)****3. (Z910) GROUND CIRCUIT OPEN**

Using a 12-volt test light connected to 12-volts, check the (Z910) ground circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 4

**No** >> Repair the (Z910) ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1.

**4. (F202) FUSED IGNITION SWITCH OUTPUT CIRCUIT OPEN OR SHORTED**

Turn the ignition on.

Using a 12-volt test light connected to ground, check the (F202) Fused Ignition Switch Output circuit.

**Does the test light illuminate brightly?**

**Yes** >> Go To 5

**No** >> Repair the (F202) Fused Ignition Switch Output circuit for an open or short.  
Perform BODY VERIFICATION TEST - VER 1.

**\*NO RESPONSE FROM WCM (CONTINUED)****5. (D55) AND (D54) CAN B BUS CIRCUITS OPEN****Note: One open circuit will not cause this condition.**

Measure the voltage between the (D54) CAN B Bus (-) circuit and ground.

Measure the voltage between the (D55) CAN B Bus (+) circuit and ground.

**Is there any voltage present on either circuit?**

**Yes** >> Replace the Sentry Key Remote Entry Module in accordance with the service information.

Perform BODY VERIFICATION TEST - VER 1.

**No** >> Repair the (D55) and (D54) CAN B Bus circuits for an open. Inspect the connector for damage.

Perform BODY VERIFICATION TEST - VER 1.

## MODULE - ANTILOCK BRAKE

### DESCRIPTION

The Antilock Brake Module (ABM) is a microprocessor-based device which monitors the Antilock Brake System (ABS) during normal braking and controls it when the vehicle is in an ABS stop. The ABM also monitors the Electronic Stability Program (ESP) if so equipped. The ABM (3) is mounted to the HCU (2) as part of the Integrated Control Unit (ICU). The ABM uses a 47-way connector on the vehicle wiring harness. The power source for the ABM is through the ignition switch in the RUN or ON position. The ABM is on the CAN-C bus.

The ABM (3) is mounted to the HCU (2) as part of the Integrated Control Unit (ICU). The ABM uses a 47-way connector on the vehicle wiring harness. The power source for the ABM is through the ignition switch in the RUN or ON position. The ABM is on the CAN-C bus.

### OPERATION

The primary functions of the Antilock Brake Module (ABM) are to:

- Monitor the Antilock Brake System (ABS) and Electronic Stability Program (ESP) for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in ABS or traction control mode.
- Modulates fluid pressure to the wheel brakes to control vehicle yaw rate in ESP mode.
- Store diagnostic information.
- Provide communication to the scan tool while in diagnostic mode.
- Illuminate the amber TCS/ESP indicator in the instrument cluster.

The ABM constantly monitors the ABS and ESP (if equipped) for proper operation. If the ABM detects a fault, it will turn on the amber TCS/ESP indicator and disable the ABS or ESP if so equipped. The normal base braking system will remain operational at that time.

The ABM continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the ABM commands the ABM solenoid coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The ABM continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

## REMOVAL

1. Disconnect negative (-) battery cable (2) from battery post and isolate.

2. Disconnect 47-Way wiring connector (4) at ABM (6).

3. Unclip brake tubes (1, 2 and 10) from two routing clips (6) along upper radiator support.
4. Unclip brake tube (3) from routing clip (4) below Fuse And Relay Center.
5. Lift up on entire assembly (5) from mounting grommets (8) and move inboard allowing access to ABM attaching screws. **Do not force brake tubes. Move assembly just enough to access mounting screws.**

6. Remove three screws (2) attaching ABM (1).

7. Slide ABM (1) off HCU (3).

## INSTALLATION

1. Align ABM solenoids and pump/motor wiring connector (4) with HCU valves (2) and connector passage. Slide ABM (1) onto HCU (3).

2. Install three screws attaching ABM (1) to HCU.  
Tighten screws to 2 N·m (17 in. lbs.) torque.

3. Position assembly (5) above mounting grommets (8) and press mounting bracket into place.
4. Clip brake tube (3) to routing clip (4) below Fuse And Relay Center.
5. Clip brake tubes (1, 2 and 10) to two routing clips (6) along upper radiator support.

6. Connect 47-way wiring connector (5) at ABM (6).

7. Connect battery negative cable (2) to battery post. It is important that this is performed properly. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE)
8. Perform Diagnostic Verification Test and clear any faults. (Refer to 5 - BRAKES - DIAGNOSIS AND TESTING)

## COMMUNICATION

### DESCRIPTION

All models use the Controller Area Network (CAN) protocol for their intra-vehicle communications networks (data buses).

Compared to its predecessor, J1850, CAN architecture offers the following improvements:

- Eight -times faster to ensure that messages reach their destinations in a timely manner (J1850 operates at 10.4 Kbs compared to 83.3 Kbs for the CAN system).
- Built-in error checking capabilities for increased reliability.

### OPERATION

This model uses four buses: CAN B, CAN C, diagnostic CAN C and the LIN (Local Interconnect Network) data bus. CAN B and the LIN bus operate at a lower speed than CAN C and diagnostic CAN C to provide communication among body and interior modules. CAN C is exclusively for critical powertrain, anti-lock brake and electronic stability program functions. The LIN bus is used on a limited basis for the steering wheel switches that control the EVIC. LIN is used for a local area where wires need to be kept to a minimum. The LIN used on this model is a single wire that

takes information and places it on the CAN B bus. The diagnostic CAN C bus transmits diagnostic information to an industry-standard connector for access by service personnel using a plug-in scan tool. This system allows diagnostic data to be obtained from the other two bus systems without affecting the functions of either.

The added communication speed specifically allows the All-Speed Traction Control and ESP (Electronic Stability Program) modules to notify the powertrain control module when engine torque change or a transmission shift are required to avoid wheel slip and maintain stability. Data from control modules on the CAN-C network elsewhere in the vehicle, such as vehicle speed, is transmitted to the body and interior CAN-B network via an interface in the IPM (Intelligent Power Module).

## DOOR MODULE

### DESCRIPTION

The door modules control the express up and down feature as well as normal window functions. It is used only on vehicles equipped with the express up feature. If equipped with memory system, the door module controls the memory mirror. The modules are attached to each front door trim panel.

### OPERATION

If the vehicle is equipped with the Express Up power window feature there will be a door module on each front door trim panel. The power window switches and motors are directly wired to the modules. If the vehicle is equipped with the Memory System, the exterior power mirrors and switches are also directly wired to the modules along with the rear door window switches. The modules are wired to the accessory delay relay which allows the operation of the windows and mirrors for a given period of time after the ignition is turned off and providing the doors are not opened. The modules communicate with each other and other modules on the vehicle via the CAN-B bus circuit. There are several Diagnostic Trouble Codes (DTC's) the modules will store if there are problems with the power window system or the memory power mirror system.

### ANTI-PINCH

The "Anti-Pinch" function is a safety feature that senses obstacles at the top of the glass and anywhere on the seal where it meets the glass to close during the window closing operation. When a front window switch is pressed to the "Auto-Up" position and the closing window traps an object and the sense current passes its limit, the module will stop the motor and drive the window down approximately 200 millimeters. The pinch force is speed dependent which means that if the vehicle is going over 2km per hour the pinch force will be higher than if the vehicle is stopped.

### PANIC MODE

If the window switch is held in the "Auto-Up" position and the closing window traps an object, the module will stop the motor and when the switch is released will drive the window in the opposite direction approximately 10 millimeters. If within 8 seconds after the switch was released to the neutral position, the switch is held again to the "Auto-Up" position, the module will enter the second panic mode. During the second panic mode, the module will drive the

motor with full (stall) force and stop. If within 8 seconds after the switch is released again to the neutral position, the switch is held again to the "Auto-Up" position, the module will drive the motor again with full (stall) force and stop.

## REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove front door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
3. Disconnect electrical harness connectors.
4. Remove mounting fasteners and module.

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Position module.
2. Install and tighten mounting fasteners.
3. Connect electrical harness connectors.
4. Install door trim panel (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
5. Connect battery negative cable.

## MODULE-FRONT CONTROL

### DESCRIPTION

The Front Control Module (FCM) is a micro controller based module located in the right front corner of the engine compartment. The front control module mates to the power distribution center to form the Integrated Power Module (IPM). The IPM connects directly to the battery and provides the primary means of circuit protection and power distribution for all vehicle electrical systems. The FCM controls power to some of these vehicle systems electrical and electromechanical loads based on inputs received from hard wired switch inputs and data received on the CAN bus circuit.

### OPERATION

As messages are sent over the CAN bus circuit, the Front Control Module (FCM) reads these messages and controls power to some of the vehicles electrical systems by completing the circuit to ground (low side driver) or completing the circuit to 12 volt power (high side driver). The following functions are controlled by the FCM:

- Air conditioning condenser cooling fan
- Daytime running lamps - if equipped
- Fog Lamps
- Front and rear hazard warning lamps
- Front turn signals
- Headlamps
- Horn
- Radiator fans
- Rear window defroster power and timing
- Stop, turn signal and tail lamps
- Windshield and liftgate wiper and washer systems

The FCM provides the following features for the above function:

- Acts as a link between the CAN bus network for critical powertrain, anti-lock brake systems, electronic stability program systems and the network for body and interior modules.
- Controls the wipers based on messages on the CAN B bus from the rain sensor module (if equipped).
- Controls the adjustable pedal motor on non-memory equipped vehicles.
- Controls back-up lamps.
- Flashes lamps in response to turn signal, Remote Keyless Entry (RKE) and Vehicle Theft Security System (VTSS) inputs.
- Illuminated approach feature that turns the headlamps on when the vehicle is unlocked with the Remote Keyless Entry (RKE) transmitter.
- Minimizes voltage variations to the headlamps to extend bulb life and to equalize the light output from the lamps, which might otherwise differ due to variations in wiring resistance.
- Monitors battery voltage and turns off non-essential functions such as the fog lamps, rear window defogger, and heated seats if necessary to conserve battery power.
- Operates the high-beam headlamps at reduced intensity by pulse-width modulation of the power supply to provide the daytime running lamps.

- Protects the battery from discharge if the headlamps are left on, by automatically turning them off after eight minutes.
- Provides ambient temperature sensor information.
- Provides A/C pressure transducer information.
- Provides brake fluid level information.
- Provides washer fluid level information.
- Provides the variable delay intermittent windshield and liftgate wiper time delay features, and the vehicle speed sensitive windshield wiper delay variation.
- Sounds the horn in response to RKE and VTSS inputs.
- Turns off the horn in the event of excessively long operation that could otherwise damage the horn.
- Turns off the windshield washer motor after 10 seconds of continuous operation to protect the motor.
- Controls headlamp washers (if equipped).
- Provides wheel speed information on non-ABS equipped vehicles.
- Stores vehicle configuration data.

## DIAGNOSIS AND TESTING

## BODY VERIFICATION TEST – VER 1

### Diagnostic Test

#### 1. Perform Body Verification Test

1. Disconnect all jumper wires and reconnect all previously disconnected components and connectors.
2. Ensure that all accessories are turned off.
3. Ensure that the battery is fully charged. If the battery was disconnected for any reason, refer to (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE) for accessory calibration procedures.
4. If the FCM has been replaced, the Pinion Fact MUST be programmed into the FCM. Refer to the scan tool for program procedure.
5. Turn the ignition on.
6. With the scan tool, record and erase DTCs from all modules.
7. Perform this step only if diagnosing faults related to the HVAC system.
  - The Manual Temperature Control (MTC) is not on the Bus and not addressable with a scan tool. Perform the following to clear DTCs from the MTC: 1. Turn the blower control on. 2. Press the A/C mode switch down, turn the blower control to off, wait three seconds and then release the A/C mode switch. 3. When the A/C status indicator begins flashing DTCs, press the A/C mode switch down for three seconds and then release the switch.
  - For vehicles equipped with Automatic Temperature Control (ATC), if repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, run the actuator calibration function by selecting the following from the scan tool menu: select HVAC, More Options, System Tests, Actuator Calibration Test, and Start. Follow the directions displayed by the scan tool. Allow the test to run to completion before proceeding.
  - For vehicles equipped with MTC, if repairs were made to any of the HVAC doors, linkage, door actuators, or door actuator circuits, run the actuator calibration function by performing the following: 1. Turn the ignition on. 2. Turn the blower control to off. 3. Press the EBL mode switch down for five seconds and then release it. Wait approximately 90 seconds for the calibration process to run to completion before proceeding.
8. Turn the ignition off, wait 10 seconds, and then turn the ignition on.
9. Operate all functions of the system that caused the original concern.
10. With the scan tool, select ECU View and check for DTCs in the modules.
11. Perform this step only if diagnosing faults related to the MTC HVAC system.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

- Perform the following to read DTCs from the MTC: 1. Turn the blower control on. 2. Press the A/C mode switch down, turn the blower control to off, wait three seconds and then release the A/C mode switch. 3. Read the DTCs from the flashing A/C status indicator.

**Are DTCs present in any of the modules or is the original condition still present?**

**Yes** >> The repair is not complete. Refer to the related category for the DTC or symptom that is still present.

**No** >> The repair is complete.

---

## REMOVAL

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Disconnect and isolate the battery negative cable.
2. Remove mounting fasteners.
3. Disconnect electrical connectors and remove Front Control Module (FCM).

## INSTALLATION

**Note:** A battery reconnect procedure must be performed anytime the battery has been disconnected. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE).

1. Position Front Control Module (FCM) and connect electrical connectors.
2. Install and tighten mounting fasteners.
3. Connect battery negative cable.

## MODULE-SEAT MEMORY

### DESCRIPTION

The Memory Seat Module (MSM) is located underneath the driver seat, towards the front and on the outboard side. It is used in conjunction with the other modules in the memory system to recall the driver seat to one of two preset seat positions (horizontal, vertical, and recliner). The switch for the memory seat programming and selection mounts on the driver door trim panel. The memory system is able to store and recall all driver side power seat positions, outside mirror positions, power tilt/telescopic steering column positions and power adjustable pedal position. The system can be set for two different drivers. On vehicles with a factory installed radio connected to the Controller Area Network (CAN) data bus network, the memory system is also able to store and recall up to twelve radio station presets (six AM and six FM), also for two drivers. The memory system will also store and recall the last station listened to for each driver, even if it is not one of the twelve preset stations.

The memory system will automatically recall all of these settings when a button of the memory switch is depressed, or when the doors are unlocked using the Remote Keyless Entry (RKE) transmitter (if the "RKE Linked to Memory" feature is enabled). If the vehicle has more than two drivers the RKE transmitter recall of memory features can be disabled. This is a customer programmable feature of the Electronic Vehicle Information Center (EVIC).

### OPERATION

The Memory Seat Module (MSM) receives battery current through a 25 amp circuit breaker in the Power Distribution Center (PDC) so that the memory system remains operational, regardless of the ignition switch position. When the driver memory switch button is pushed, a resistance signal is sent to the MSM via the Controller Area Network (CAN) bus circuit. The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor and other memory system components.

The MSM receives memory set/position switch input through the CAN bus circuit. The MSM also receives hard wired input from the hall effect sensors, mounted on each of the driver power seat adjuster motors and the driver side view mirror motor. The programmed software in the module allows it to know where the seat, adjustable pedals, and steering column tilt/telescope are located in its designed travel by a pulse count generated from the hall effect sensors. This way, when the memory switch is depressed the module will power these components until the correct preset location is achieved. The module will prevent the seat memory recall function from being initiated, if the transmission gear selector lever is not in the Park position, or if the vehicle is moving. These inputs are monitored over the Controller Area Network (CAN) bus circuit by the MSM.

A memory setting is saved by pressing the "set" button, then pressing either the memory "1" or "2" button within 5 seconds of pressing the "set" button.

A memory setting is recalled by pressing either the memory "1" or "2" button, or by pressing the unlock button on a "linked" Remote Keyless Entry (RKE) transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in a position other than Park or the seat belt is latched.

The MSM performs the following functions:

- Positions the driver power seat (vertical, horizontal, and recliner positions).
- Positions the power adjustable pedals.
- Positions the power tilt/telescopic steering column positions.
- Sends the memory save or recall (#1 or #2) command over the CAN data bus circuit to the other memory system components, radio station pre-sets and power mirror positions.

- Provides for “linking” the key FOBs to memory.
- Provides for the easy entry/exit feature.
- Provides the tilt mirrors in reverse feature.

When a memory button is pressed (#1 or #2) on the memory switch, the Driver Door Module (DDM) sends a recall message to the MSM. The MSM will then position the memory system components to the preprogrammed location/setting. When the Remote Keyless Entry (RKE) Transmitter button is pressed, depending on which transmitter (#1 or #2), the SKREEM (RKE Receiver) sends the recall request and FOB number (#1 or #2) data message. This RKE transmitter function depends on if the MSM is programmed to trigger the recall (linked FOBs).

A memory setting is saved by pressing the “set” button, then pressing either the memory “1” or “2” button within 5 seconds of pressing the “set” button.

A memory setting is recalled by pressing either the memory “1” or “2” button, or by pressing the unlock button on a “linked” Remote Keyless Entry (RKE) transmitter.

For driver safety, memorized settings can not be recalled if the transmission is in any position other than park or the seat belt is latched.

A key FOB is “linked” to a memory setting by pressing the “set” button and then pressing either the memory “1” or “2” button within 5 seconds of pressing the set button, then by pressing the “lock” button on the selected key FOB.

The memory system “Easy Entry and /Exit” feature provides the driver with more room to enter or exit the vehicle. When the seat is in a memorized position, it will move rearward 55 millimeters or to the end of its travel, whichever occurs first, when the key is removed from the ignition switch lock cylinder. This is a customer programmable feature of the overhead console. The seat will return to the memory position when the driver turns the vehicle’s ignition switch out of the LOCK position.

The memory system “Tilt in Reverse” feature tilts the outside mirrors down a fixed, incremental angle when the vehicle is shifted into REVERSE with the ignition switch in the RUN position. This feature provides the customer with a better view of the ground and vehicle in the area of the rear tires when backing up. The mirrors move back to their previous position when the vehicle is shifted out of REVERSE.

The memory system “learns” the seat and adjustable pedal motor maximum end positions when the motor reaches the limit of travel in any direction and stalls. Subsequently, movement will stop just short of that position to avoid extra stress on the motors and mechanisms. If the system learned a maximum position as a result of an obstruction, as for instance if a large object was placed on the floor behind the seat, the system can relearn the “true” maximum position through manually operating the power seat after the obstruction is removed.

**Note: It is normal for the power accessories contained in the memory system to stop at the maximum “learned” position and then continue to the “true” maximum position when the control switch is released and then applied in the same direction a second time.**

Certain functions and features of the memory system rely upon resources shared with other electronic modules in the vehicle over the Controller Area Network (CAN) bus. The CAN bus allows the sharing of sensor information. This helps to reduce wire harness complexity, internal controller hardware, and component sensor current loads. At the same time, this system provides increased reliability, enhanced diagnostics, and allows the addition of many new feature capabilities. For diagnosis of these electronic modules or of the CAN bus, the use of a scan tool and the proper diagnostic information are needed.

## DIAGNOSIS AND TESTING

### MEMORY SEAT MODULE

In order to obtain conclusive testing of the memory system, the Controller Area Network (CAN) data bus, and all of the electronic modules that provide inputs to, or receive outputs from the memory system components must be checked. **Any diagnosis of the memory system/module should begin with, the use of a scan tool and the appropriate diagnostic service information.**

**Refer to the appropriate wiring information for complete circuit schematic or connector pin-out information.**

**Note:** Vehicles equipped with the memory/heated seat option utilize a low voltage cut-off feature. This feature turns off the 12v power to the power seat system anytime vehicle voltage is below 11.7v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
3. Pivot the module upward and disconnect the electrical connectors (1).
4. Unsnap the memory seat module (4) from the side brackets.
5. Pull the module rearward to remove it from the front of the seat frame (3).

## INSTALLATION

**CAUTION:** The Memory Seat Module (MSM) mounting tabs can be damaged during module installation. Use care to properly align tabs to prevent binding that could result in tab breakage.

1. Place the module (4) into position making sure the mounting tabs are properly aligned with the front bracket.
2. Push down on the rear of the module (4) snapping the retaining clips into place in the side brackets.
3. Connect the MSM rear harness connectors (1).
4. Connect the MSM front harness connectors.
5. Install the driver seat cushion/cover (2) (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).
6. Connect the battery negative cable.
7. Verify system and vehicle operation.

## MODULE-POWERTRAIN CONTROL

### DESCRIPTION

#### DESCRIPTION - PCM

The Powertrain Control Module (PCM) is located in the engine compartment. The PCM is referred to as NGC.

### MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for wide open throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop.**

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O<sub>2</sub>S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O<sub>2</sub>S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O<sub>2</sub>S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

#### IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM pre-positions the idle air control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensor (TPS) is monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O2S sensor heater element is energized via the O2S relays. The O2S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

## ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Starter motor relay
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within approximately 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

## ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the idle air control (IAC) motor and adjusts ignition timing.
- The PCM operates the A/C compressor clutch through the clutch relay. This is done if A/C has been selected by the vehicle operator and requested by the A/C thermostat.
- When engine has reached operating temperature, the PCM will begin monitoring O2S sensor input. The system will then leave the warm-up mode and go into closed loop operation.

## IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Battery voltage
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O<sub>2</sub>S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

## CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen (O<sub>2</sub>S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O<sub>2</sub>S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

## ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

## DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Vehicle speed

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the idle air control (IAC) motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

## WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

## IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

## DESCRIPTION - 5 VOLT SUPPLIES

Two different Powertrain Control Module (PCM) five volt supply circuits are used; primary and secondary.

## DESCRIPTION - IGNITION CIRCUIT SENSE

This circuit ties the ignition switch to the Powertrain Control Module (PCM).

## DESCRIPTION - POWER GROUNDS

The Powertrain Control Module (PCM) has 2 main grounds. Both of these grounds are referred to as power grounds. All of the high-current, noisy, electrical devices are connected to these grounds as well as all of the sensor returns. The sensor return comes into the sensor return circuit, passes through noise suppression, and is then connected to the power ground.

The power ground is used to control ground circuits for the following PCM loads:

- Generator field winding
- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

## DESCRIPTION - SENSOR RETURN

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low-noise ground reference for all engine control system sensors. Refer to Power Grounds for more information.

## OPERATION

### OPERATION - PCM

1. Also refer to Modes of Operation.

The PCM operates the fuel system. The PCM is a pre-programmed, triple microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant temperature, throttle position, transmission gear selection (automatic transmission), vehicle speed and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

#### Note: PCM Inputs:

- A/C request
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage
- Brake switch
- J1850 bus circuits
- Camshaft position sensor signal
- Crankshaft position sensor
- Data link connections for DRB scan tool
- Engine coolant temperature sensor
- Five volts (primary)
- Five volts (secondary)
- Fuel level
- Generator (battery voltage) output
- Ignition circuit sense (ignition switch in on/off/crank/run position)
- Intake manifold air temperature sensor
- Leak detection pump (switch) sense (if equipped)

- Manifold absolute pressure (MAP) sensor
- Oil pressure
- Overdrive/override switch
- Oxygen sensors
- Park/neutral switch (auto. trans. only)
- Power ground
- Sensor return
- Signal ground
- Speed control multiplexed single wire input
- Throttle position sensor
- Transmission governor pressure sensor
- Transmission temperature sensor
- Vehicle speed (from ABS module)

**Note: PCM Outputs:**

- A/C clutch relay
- Auto shutdown (ASD) relay
- J1850 (+/-) circuits for: speedometer, voltmeter, fuel gauge, oil pressure gauge/lamp, engine temp. gauge and speed control warn. lamp
- Data link connection for DRBIII® scan tool
- EGR valve control solenoid (if equipped)
- EVAP canister purge solenoid
- Fuel injectors
- Fuel pump relay
- Generator field driver (-)
- Generator field driver (+)
- Generator lamp (if equipped)
- Idle air control (IAC) motor
- Ignition coil
- Leak detection pump
- Malfunction indicator lamp (Check engine lamp). Driven through J1850 circuits.
- Overdrive indicator lamp (if equipped). Driven through J1850 circuits.
- Oxygen sensor heater relays (if equipped).
- Radiator cooling fan relay (pulse width modulated)
- Speed control source
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped). Driven through J1850 circuits.
- Transmission convertor clutch circuit
- Transmission 3–4 shift solenoid
- Transmission relay
- Transmission temperature lamp (if equipped)
- Transmission variable force solenoid

## OPERATION - 5 VOLT SUPPLIES

Primary 5-volt supply:

- supplies the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supplies the required 5 volt power source to the Camshaft Position (CMP) sensor.
- supplies a reference voltage for the Manifold Absolute Pressure (MAP) sensor.
- supplies a reference voltage for the Throttle Position Sensor (TPS) sensor.

Secondary 5-volt supply:

- supplies the required 5 volt power source to the oil pressure sensor.
- supplies the required 5 volt power source for the Vehicle Speed Sensor (VSS) (if equipped).
- supplies the 5 volt power source to the transmission pressure sensor (if equipped with an RE automatic transmission).

## **OPERATION - IGNITION CIRCUIT SENSE**

The ignition circuit sense input tells the PCM the ignition switch has energized the ignition circuit.

Battery voltage is also supplied to the PCM through the ignition switch when the ignition is in the RUN or START position. This is referred to as the "ignition sense" circuit and is used to "wake up" the PCM.

## **DIAGNOSIS AND TESTING**

## NGC POWERTRAIN VERIFICATION TEST VER - 1

For the Engine circuit diagram (Refer to 9 - ENGINE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

### Diagnostic Test

#### 1. NGC POWERTRAIN VERIFICATION TEST VER - 1

**Note:** 1. If this vehicle is equipped with an Electron Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use a scan tool to perform the ETC RELEARN function.

**Note:** 2. If the PCM or FCM have been replaced, the Pinion Factor **MUST** be programmed into the FCM. While programming the Pinion Factor into the FCM the scan tool will send the Pinion Factor information to the PCM at the same time. Refer to the scan tool for program procedure.

**Note:** 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM.

**Note:** 4. If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.

5. Inspect the vehicle to ensure that all components related to the repair are properly installed and connected.

6. Inspect the engine oil for fuel contamination. Replace the oil and filter as necessary.

7. Attempt to start the engine.

8. If the No Start condition is still present, refer to the Engine Electrical Diagnostic list and perform the diagnostic testing as necessary, refer to any Technical Service Bulletins that may apply.

9. Run the engine for one warm-up cycle to verify operation.

10. With the scan tool, confirm that no DTCs or Secondary Indicators are present and that all components are functioning properly.

**Note:** The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy or after any repair use the scan tool to ensure that the Adaptive Numerator is learned.

**Are any DTCs or symptoms remaining?**

**Yes** >> Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

**No** >> Repair is complete.

---

## NGC POWERTRAIN VERIFICATION TEST VER - 2

For the Engine circuit diagram (Refer to 9 - ENGINE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

### Diagnostic Test

#### 1. NGC POWERTRAIN VERIFICATION TEST VER - 2

**Note:** 1. If this vehicle is equipped with a Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use a scan tool to perform the ETC RELEARN function.

**Note:** 2. If the PCM or FCM have been replaced, the Pinion Factor **MUST** be programmed into the FCM. While programming the Pinion Factor into the FCM the scan tool will send the Pinion Factor information to the PCM at the same time. Refer to the scan tool for program procedure.

**Note:** 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM.

**Note:** 4. If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.

5. Inspect the vehicle to make sure that all components related to the repair are properly installed and connected.
6. With a scan tool, clear DTCs and Reset Memory all engine values.
7. Run the engine for one warm-up cycle to verify proper operation.
8. Road test the vehicle. Use all accessories that may be related to this repair.
9. With the scan tool, confirm that no DTC's or Secondary Indicators are present and that all components are functioning properly.
10. If this test is being performed after a No Trouble Code test, verify the symptom is no longer present.

**Note:** The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy or after any repair use the scan tool to ensure that the Adaptive Numerator is learned.

**Are any DTCs or symptoms remaining?**

**Yes** >> Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

**No** >> Repair is complete.

---

## NGC POWERTRAIN VERIFICATION TEST VER - 3

For the Engine circuit diagram (Refer to 9 - ENGINE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

#### 1. NGC POWERTRAIN VERIFICATION TEST VER - 3

1. If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly has been replaced use a scan tool to perform the ETC RELEARN function.

**Note: 2. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.**

**Note: 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM.**

**Note: 4. If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.**

5. Inspect the vehicle to make sure that all components related to the repair are properly installed and connected.

6. With the scan tool, clear DTCs.

7. Perform generator output test. Refer to the appropriate service information as necessary.

8. Start the engine and set engine speed to 2000 RPM for at least thirty seconds.

9. Cycle the ignition key off and on.

10. With the scan tool, read the DTCs.

**Note: The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy or after any repair use the scan tool to ensure that the Adaptive Numerator is learned.**

**Are any DTCs or symptoms remaining?**

**Yes** >> Check for any Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

**No** >> Repair is complete.

---

## NGC POWERTRAIN VERIFICATION TEST VER - 4

For the Engine circuit diagram (Refer to 9 - ENGINE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

#### 1. NGC POWERTRAIN VERIFICATION TEST VER - 4

**Note:** If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.

**Note:** 2. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.

**Note:** 3. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM.

**Note:** 4. If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.

5. Inspect the vehicle to make sure that all engine components are properly installed and connected.
6. Connect the scan tool to the data link connector and erase all codes.
7. Turn the speed control ON (if equipped, cruise light will be on).
8. Depress and release the SET Switch when the vehicle speed is greater than 35 MPH. The speed control should engage and hold the selected speed.
9. Press and hold the RESUME/ACCEL Switch. The vehicle speed should increase by at least 2 MPH.
10. Press and hold the COAST switch. The vehicle speed should decrease.
11. Using caution, press and release the brake pedal. The speed control should disengage.
12. Bring the vehicle speed back up to 35 MPH.
13. Press the RESUME/ACCEL switch. The speed control should resume the previously set speed.
14. Hold down the SET switch. The vehicle should decelerate.
15. Make sure vehicle speed is greater than 35 mph and release the SET Switch. The vehicle should adjust and set a new vehicle speed.
16. Press and release the CANCEL switch. The speed control should disengage.
17. Bring the vehicle speed back up above 35 mph and engage speed control.
18. Turn the Speed Control Off. (Cruise light will be off). The speed control should disengage.

**Note: OVERTHOOT/UNDERSHOOT FOLLOWING SPEED CONTROL SET.**

20. If the vehicle operator repeatedly presses and releases the SET button with their foot off of the accelerator (referred to as "lift foot set"), the vehicle may accelerate and exceed the desired set speed by up to 5 mph (8 km/h).
21. It may also decelerate to less than the desired set speed, before finally achieving the desired set speed.
22. The Speed Control System has an adaptive strategy that compensates for vehicle-to-vehicle variations in speed control cable lengths.
23. When the speed control is set with the vehicles operators foot off of the accelerator pedal, the speed control thinks there is excessive speed control cable slack and adapts accordingly.
24. If the "lift foot sets" are continually used, a speed control overshoot/undershoot condition will develop.
25. To "unlearn" the overshoot/undershoot condition, the vehicle operator has to press and release the set button while maintaining the desired set speed using the accelerator pedal (not decelerating or accelerating).
26. Then turn the cruise control switch to the OFF position (or press the CANCEL button if equipped) after waiting 10 seconds.
27. This procedure must be performed approximately 10-15 times to completely unlearn the overshoot/undershoot condition.

**NGC POWERTRAIN VERIFICATION TEST VER - 4 (CONTINUED)**

**Note:** The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy or after any repair use the scan tool to ensure that the Adaptive Numerator is learned.

**Did the Speed Control pass the above test?**

**Yes** >> Repair is complete.

**No** >> Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

---

## NGC POWERTRAIN VERIFICATION TEST VER - 5

For the Engine circuit diagram (Refer to 9 - ENGINE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

### Diagnostic Test

#### 1. NGC POWERTRAIN VERIFICATION TEST VER - 5

**Note:** 1. After completing the Powertrain Verification Test the Transmission Verification Test must be performed.

**Note:** 2. If the PCM has been replaced and the correct VIN and mileage have not been programmed, a DTC will set in the ABS Module, Airbag Module and the SKIM.

**Note:** 3. If the vehicle is equipped with a Sentry Key Immobilizer System, Secret Key data must be updated. Refer to the Service Information for the PCM, SKIM and the Transponder (ignition key) for programming information.

**Note:** 4. If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.

**Note:** 5. When replacing an O2 Sensor, the PCM RAM memory must be cleared, either by disconnecting the PCM C-1 connector or momentarily disconnecting the Battery negative terminal.

6. The NGC learns the characteristics of each O2 heater element and these old values should be cleared when installing a new O2 sensor. The customer may experience driveability issues if this is not performed.

7. Inspect the vehicle to ensure that all engine components are properly installed and connected. Reassemble and reconnect components as necessary.

8. Connect the scan tool to the data link connector.

9. Make sure the fuel tank has at least a quarter tank of fuel. Turn off all accessories.

10. If the Catalyst was replaced, with the scan tool go to the Miscellaneous Menu Option "Catalyst Replaced" and press enter.

11. If a Comprehensive Component DTC was repaired, perform steps 12 - 14. If a Major OBDII Monitor DTC was repaired skip those steps and continue verification.

12. After the ignition has been off for at least 10 seconds, restart the vehicle and run 2 minutes.

13. With the scan tool, monitor the appropriate pre-test enabling conditions until all conditions have been met. Once the conditions have been met, switch screen to the appropriate OBDII monitor, (Audible beeps when the monitor is running).

14. If the repaired OBDII trouble code has reset or was seen in the monitor while on the road test, the repair is not complete. Check for any related technical service bulletins or flash updates and return to Engine Electrical Diagnostic List.

15. If the conditions cannot be duplicated, erase all DTCs with the DRBIII®.

16. If another DTC has set, return to the Engine Electrical Diagnostic List and follow the path specified for that DTC.

**Note:** The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy or after any repair use the scan tool to ensure that the Adaptive Numerator is learned.

**Did the OBDII Monitor run successfully and has the Good Trip Counter changed to one or more?**

**Yes** >> Repair is complete.

**No** >> Check for any related Technical Service Bulletins and/or refer to the appropriate Diagnostic Procedure.

---

## NGC POWERTRAIN VERIFICATION TEST VER - 6

For the Engine circuit diagram (Refer to 9 - ENGINE - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

### Diagnostic Test

#### 1. NGC POWERTRAIN VERIFICATION TEST VER - 6

1. Install the Miller Tool #8404 Evaporative Emission Leak Detector (EELD) according to the instructions in the previous DTC table.
2. Set the smoke/air control switch to AIR.
3. Insert the tester's AIR supply tip (clear hose) into the appropriate calibration orifice on the tester's control panel (based on DTC leak size).
4. Press the remote smoke/air start button.
5. Position the red flag on the air flow meter so it is aligned with the indicator ball.
6. When the calibration is complete, release the remote button. The EELD flow meter is now calibrated in liters per minute to the size of leak indicated by the DTC set in the PCM.
7. Install the service port adapter #8404-14 on the vehicle's service port.
8. Connect the Air supply hose from the EELD to the vehicle.
9. Press the remote button to activate AIR flow.

**Note:** 10. Larger volume fuel tanks, lower fuel levels or if the vehicle is equipped with a Flow Management Valve may indicate high flow and will require 4 to 5 minutes to fill.

11. Compare the flow meter indicator ball reading to the red flag.
12. ABOVE the red flag indicates a leak present.
13. BELOW the red flag indicates a sealed system.

**Note:** If this vehicle is equipped with an Electronic Throttle Control system, and the APP Sensors, PCM, or Throttle Body Assembly have been replaced, use the scan tool to perform the ETC RELEARN function.

15. If the indicator ball shows a leak present, perform the smoke test indicated in the previous test and identify the leak and repair. Perform this verification test when the repair is complete.

**Note:** The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy or after any repair use the scan tool to ensure that the Adaptive Numerator is learned.

**Did the indicator ball indicate the a leak is present?**

**Yes** >> Repeat the DTC test to identify the leak and repair.

**No** >> Repair is complete.

---

## REMOVAL

**USE THE SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.**

To avoid possible voltage spike damage to PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

1. Disconnect negative battery cable.

2. Remove PCM bracket-to-body mounting bolt.
3. Remove assembly from vehicle.
4. Unlock and disconnect the electrical connectors from PCM.

5. Remove bracket from PCM.

6. Remove the rubber bumper from PCM.

## INSTALLATION

USE THE SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

1. Install rubber bumper to PCM back.
2. Check pins in electrical connectors for damage.  
Repair as necessary.
3. Install electrical connectors to PCM.

4. Install mounting bracket to PCM.

5. Install assembly to body. Install bolt and tighten 9 N·m (80 in. lbs.) torque.

6. Connect negative cable to battery.
7. Use the scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage.

## MODULE-TRANSMISSION CONTROL

### DESCRIPTION

#### TRANSMISSION CONTROL MODULE - 42RLE

The Transmission Control Module (TCM) is a sub-module within the Powertrain Control Module (PCM). The Powertrain Control Module (PCM) is located in the right rear of the engine compartment, just in front of the windshield.

## TRANSMISSION CONTROL MODULE - NAG1

The electronic control system consists of various components providing inputs to the transmission control module (TCM). The TCM monitors transmission sensors, shift lever position, and bus messages to determine transmission shift strategy. After shift strategies are determined, the TCM controls the actuation of transmission solenoids, which controls the routing of hydraulic fluid within the transmission, by moving a sequence of four valves to make a shift occur.

The NAG1 electronic transmission has a fully adaptive control system. The system performs its functions based on continuous real-time sensor feedback information. In addition the TCM receives information from the PCM (engine management) and ABS (chassis systems) controllers over the CAN bus. The CAN bus is a high-speed communication bus that allows real time control capability between various controllers. Most messages are sent every 20 milliseconds. This means critical information can be shared between the transmission, engine, and ABS controllers. The CAN bus is a two wire bus with a CAN Bus (+) circuit and a CAN Bus (-) circuit. These circuits are twisted pairs in the harness to reduce the potential of radio and noise interference.

The transmission control system automatically adapts to changes in engine performance, vehicle speed, and transmission temperature variations to provide consistent shift quality. The control system ensures that clutch operation during up-shifting and downshifting is more responsive without increased harshness. The TCM activates the solenoid valves and moves valves in the valve body to achieve the necessary gear changes. The required pressure level is calculated from the load condition, engine speed. Vehicle speed (from ABS module) and transmission oil temperature, matched to the torque to be transmitted. The TCM is located under the left side of the instrument panel.

## OPERATION

### TRANSMISSION CONTROL MODULE - 42RLE

The Transmission Control Module (TCM) controls all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hard wired to, and used specifically by the TCM. Indirect inputs are shared with the TCM via the vehicle communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor
- Transmission Range Sensor
- Pressure Switches
- Transmission Temperature Sensor
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor
- Line Pressure Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids
- Torque Reduction Request

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to cluster/CCN)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indexes (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with scan tool)

**Note:** If the TCM has been replaced, the “Quick Learn Procedure” must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

## BATTERY FEED

A fused, direct battery feed to the TCM is used for continuous power. This battery voltage is necessary to retain memory in the TCM. When the battery (B+) is disconnected, this memory is lost. When the battery (B+) is restored, this memory loss is detected by the TCM and a Diagnostic Trouble Code (DTC) is set.

## CLUTCH VOLUME INDEXES (CVI)

An important function of the TCM is to monitor Clutch Volume Indexes (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft rpm. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur.

Gear ratios can be determined by using the Scan Tool and reading the Input/Output Speed Sensor values in the "Monitors" display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 rpm and the output shaft is rotating at 500 rpm, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

CLUTCH VOLUMES		
Clutch	When Updated	Proper Clutch Volume
L/R	2-1 or 3-1 downshift	45 to 134
2C	3-2 kickdown shift	25 to 85
OD	2-3 upshift	30 to 100
4C	3-4 upshift	30 to 85
UD	4-3 kickdown shift	30 to 100

## SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Refer to the following chart to determine the appropriate operation expected, depending on driving conditions.

Schedule	Condition	Expected Operation
<b>Extreme Cold</b>	Oil temperature below -16° F	-Park, Reverse, Neutral and 1st and 3rd gear only in D position, 2nd gear only in Manual 2 or L -No EMCC
<b>Super Cold</b>	Oil temperature between -12° F and 10° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - Early 4-3 coastdown shift - High speed 4-2, 3-2, 2-1 kickdown shifts are prevented -Shifts at high throttle openings will be early. - No EMCC
<b>Cold</b>	Oil temperature between 10° F and 36° F	-Shift schedule is the same as Super Cold except that the 2-3 upshifts are not delayed.
<b>Warm</b>	Oil temperature between 40° F and 80° F	- Normal operation (upshift, kickdowns, and coastdowns) - No EMCC
<b>Hot</b>	Oil temperature between 80° F and 240° F	- Normal operation (upshift, kickdowns, and coastdowns) - Normal EMCC operation
<b>Overheat</b>	Oil temperature above 240° F or engine coolant temperature above 244° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - 3rd gear FEMCC from 30-48 mph - 3rd gear PEMCC above 35 mph - Above 25 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

## TRANSMISSION CONTROL MODULE - NAG1

The transmission control module (TCM) determines the current operating conditions of the vehicle and controls the shifting process for shift comfort and driving situations. It receives this operating data from sensors and broadcast messages from other modules.

The TCM uses inputs from several sensors that are directly hardwired to the controller and it uses several indirect inputs that are used to control shifts. This information is used to actuate the proper solenoids in the valve body to achieve the desired gear.

The shift lever assembly (SLA) has sensors that are monitored by the TCM to calculate shift lever position. The reverse light switch, an integral part of the SLA, controls the reverse light relay control circuit. The Brake/Transmission Shift Interlock (BTSI) solenoid and the park lockout solenoid (also part of the SLA) are controlled by the TCM.

The PCM and ABS broadcast messages over the controller area network (CAN) bus for use by the TCM. The TCM uses this information, with other inputs, to determine the transmission operating conditions.

The TCM:

- determines the momentary operating conditions of the vehicle.
- controls all shift processes.
- considers shift comfort and the driving situation.

The TCM controls the solenoid valves for modulating shift pressures and gear changes. Relative to the torque being transmitted, the required pressures are calculated from load conditions, engine rpm, vehicle speed, and ATF temperature.

The following functions are contained in the TCM:

- Shift Program
- Downshift Safety
- Torque Converter Lock-Up Clutch.
- Adaptation.

The TCM continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code (DTC). Some of these codes cause the transmission to go into "Limp-In" or "default" mode. Some DTCs cause permanent Limp-In and others cause temporary Limp-In. The NAG1 defaults in the current gear position if a DTC is detected, then after a key cycle the transmission will go into Limp-in, which is mechanical 2nd gear. Some DTCs may allow the transmission to resume normal operation (recover) if the detected problem goes away. A permanent Limp-In DTC will recover when the key is cycled, but if the same DTC is detected for three key cycles the system will not recover and the DTC must be cleared from the TCM with the appropriate scan tool.

**Note: If the TCM has been replaced, the "TCM Adaptation Procedure" must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)**

## TCM SIGNALS

The TCM registers one part of the input signals by direct inputs, the other part by CAN bus. In addition to the direct control of the actuators, the TCM sends various output signals by CAN bus to other control modules.

### Selector Lever Position

A series of sensors in the SLA inform the TCM of the position of the selector lever.

The TCM monitors the SLA for all shift lever positions through five position circuits. The SLA provides a low-current 12-volt signal to the TCM. The TCM compares the on/off signals to programmed combinations to determine the exact position of the shift lever.

### ATF Temperature Sensor

The ATF temperature sensor is a positive temperature co-efficient (PTC) thermistor. It measures the temperature of the transmission fluid and is a direct input signal for the TCM. The temperature of the ATF has an influence on the shifttime and resulting shift quality. As the temperature rises, resistance rises, and therefore, the probing voltage is decreasing. Because of its registration, the shifting process can be optimized in all temperature ranges.

The ATF temperature sensor is wired in series with the park/neutral contact. The temperature signal is transmitted to the TCM only when the reed contact of the park/neutral contact is closed because the TCM only reads ATF temperature while in any forward gear, or REVERSE. When the transmission is in PARK or NEUTRAL, the TCM will substitute the engine temperature for the ATF temperature.

### **Starter Interlock**

The TCM monitors a contact switch wired in series with the transmission temperature sensor to determine PARK and NEUTRAL positions. The contact switch is open in PARK and NEUTRAL. The TCM senses transmission temperature as high (switch supply voltage), confirming switch status as open. The TCM then broadcasts a message over CAN bus to confirm switch status. The PCM receives this information and allows operation of the starter circuit.

### **N2 and N3 Speed Sensors**

The N2 and N3 Input Speed Sensors are two Hall-effect speed sensors that are mounted internally in the transmission and are used by the TCM to calculate the transmission's input speed. Since the input speed cannot be measured directly, two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

### **CAN Bus Indirect Input Signals**

A 2.5-volt bias (operating voltage) is present on the CAN bus any time the ignition switch is in the RUN position. Both the TCM and the ABS apply this bias. On this vehicle, the CAN bus is used for module data exchange only. The indirect inputs used on the NAG1 electronic control system are:

- Wheel Speed Sensors.
- Transfer Case Switch Status.
- Brake Switch.
- Engine RPM.
- Engine Temperature.
- Cruise Control Status.
- Gear Limit Request.
- Throttle Position - 0% at idle, 100% at WOT. If open, TCM assumes idle (0% throttle opening).
- Odometer Mileage
- Maximum Effective Torque.
- Engine in Limp-In Mode/Mileage Where DTC Was Set.

### **BRAKE TRANSMISSION SHIFT INTERLOCK (BTSI)**

The BTSI solenoid prevents shifting out of the PARK position until the ignition key is in the RUN position and the brake pedal is pressed. The TCM controls the ground while the ignition switch supplies power to the BTSI solenoid. The PCM monitors the brake switch and broadcasts brake switch status messages over the CAN C bus. If the park brake is depressed and there is power (Run/Start) to SLA, the BTSI solenoid deactivates. The TCM monitors this for the SLA because the SLA does not communicate on the CAN bus.

## SHIFT SCHEDULES

The basic shift schedule includes up and downshifts for all five gears. The TCM adapts the shift program according to driving style, accelerator pedal position and deviation of vehicle speed. Influencing factors are:

- Road Conditions.
- Incline, Decline and Altitude.
- Trailer Operation, Loading.
- Engine Coolant Temperature.
- Cruise Control Operation.
- Sporty Driving Style.
- Low and High ATF Temperature.

<b>Upshift To:</b>	<b>1-2</b>	<b>2-3</b>	<b>3-4</b>	<b>4-5</b>
<b>Activated By Solenoid:</b>	1-2/4-5	2-3	3-4	1-2/4-5
<b>Shift Point (at 35.2% of throttle)</b>	29 km/h (18 mph)	48 km/h (30 mph)	68 km/h (42 mph)	85 km/h (53 mph)

<b>Downshift From:</b>	<b>5-4</b>	<b>4-3</b>	<b>3-2</b>	<b>2-1</b>
<b>Activated By Solenoid:</b>	1-2/4-5	3-4	2-3	1-2/4-5
<b>Shift Point</b>	55.7 km/h (34.61 mph)	40.5 km/h (25.17 mph)	24.4 km/h (15.16 mph)	15.1 km/h (9.38 mph)

## DOWNSHIFT SAFETY

Selector lever downshifts are not performed if inadmissible high engine rpm is sensed.

## ADAPTATION

To equalize tolerances and wear, an automatic adaptation takes place for:

- Shift Time.
- Clutch Filling Time.
- Clutch Filling Pressure.
- Torque Converter Lock-Up Control.

Adaptation data may be stored permanently and to some extent, can be diagnosed.

## Driving Style Adaptation

The shift point is modified in steps based on the information from the inputs. The control module looks at inputs such as:

- vehicle acceleration and deceleration (calculated by the TCM).
- rate of change as well as the position of the throttle pedal (fuel injection information from the PCM).
- lateral acceleration (calculated by the TCM).
- gear change frequency (how often the shift occurs).

Based on how aggressive the driver is, the TCM moves up the shift so that the present gear is held a little longer before the next upshift. If the driving style is still aggressive, the shift point is modified up to ten steps. If the driving returns to normal, then the shift point modification also returns to the base position.

This adaptation has no memory. The adaptation to driving style is nothing more than a shift point modification meant to assist an aggressive driver. The shift points are adjusted for the moment and return to base position as soon as the inputs are controlled in a more normal manner.

## CONTROLLER MODES OF OPERATION

### Permanent Limp-In Mode

When the TCM determines there is a non-recoverable condition present that does not allow proper transmission operation, it places the transmission in permanent Limp-In Mode. When the condition occurs the TCM turns off all solenoids as well as the solenoid supply output circuit. If this occurs while the vehicle is moving, the transmission remains in the current gear position until the ignition is turned off or the shifter is placed in the "P" position. When the shifter has been placed in "P," the transmission only allows 2nd gear operation. If this occurs while the vehicle is not moving, the transmission only allows operation in 2nd gear.

### Temporary Limp-In Mode

This mode is the same as the permanent Limp-In Mode except if the condition is no longer present, the system resumes normal operation.

### Under Voltage Limp-In Mode

When the TCM detects that system voltage has dropped below 8.5 volts, it disables voltage-dependant diagnostics and places the transmission in the temporary Limp-In Mode. When the TCM senses that the voltage has risen above 9.0 volts, normal transmission operation is resumed.

### Hardware Error Mode

When the TCM detects a major internal error, the transmission is placed in the permanent Limp-In Mode and ceases all communication over the CAN bus. When the TCM has entered this mode normal transmission operation does not resume until all DTCs are cleared from the TCM.

### Loss of Drive

If the TCM detects a situation that has resulted or may result in a catastrophic engine or transmission problem, the transmission is placed in the neutral position. Improper Ratio, Input Sensor Overspeed or Engine Overspeed DTCs cause the loss of drive.

### Controlled Limp-in Mode

When a failure does not require the TCM to shut down the solenoid supply, but the failure is severe enough that the TCM places the transmission into a predefined gear, there are several shift performance concerns. For instance, if the transmission is slipping, the controller tries to place the transmission into 3rd gear and maintain 3rd gear for all forward drive conditions.

## STANDARD PROCEDURE

### TCM QUICK LEARN - 42RLE Only

The quick learn procedure requires the use of the appropriate scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Solenoid Pack Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 rpm
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay in PARK until prompted to shift to overdrive

- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 60° and below 200°

## TCM ADAPTATION - NAG1 Only

The adaptation procedure requires the use of the appropriate scan tool. This program allows the electronic transmission system to re-calibrate itself. This will provide the proper baseline transmission operation. The adaptation procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Clutch Plate and/or Seal Replacement
- Electrohydraulic Unit Replacement or Recondition

1. With the scan tool, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings.

**Note: Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60°C (140°F) and less than 70°C (158°F). Failure to stay within these temperature ranges will void the procedure.**

2. Drive the vehicle until the transmission temperature is in the specified range.
3. Perform 4 to 5 coast downs from 5th to 4th gear and then 4th to 3rd gear.

**Note: For Upshift adaptation, the Transmission temperature must be greater than 60°C (140°F) and less than 100°C (212°F). Failure to stay within these temperature ranges will void this procedure.**

4. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times.
5. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever.
6. The TCM will store the adaptives every 10 minutes. After completion of the adaptation procedure make sure the vehicle stays running for at least 10 minutes.
7. It is possible to manually store the adaptives under the 10 minute time frame using the scan tool Store Adaptives procedure.

## BATTERY SYSTEM

### DESCRIPTION

This vehicle is equipped with a single 12-volt battery located in the rear floor area near the spare tire. The battery system for this vehicle covers the following related components:

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negatively charged battery terminal posts to the vehicle electrical system.
- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray.
- **Battery Retention Strap** - The battery retention strap securely holds the battery in place in the event of a rear impact collision.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery hold-down hardware.

For battery system maintenance schedules (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION). (Refer to LUBRICATION & MAINTENANCE/JUMP STARTING - STANDARD PROCEDURE) for the proper jump starting procedure. The battery must be fully-charged before any battery system diagnosis or testing procedures can be performed.

## OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

## DIAGNOSIS AND TESTING

### BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any inoperative system it detects. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for the proper charging system on-board diagnostic test procedures.

## MICRO 420 BATTERY TESTER

The Micro 420 automotive battery system tester is designed to help the dealership technicians diagnose the cause of a defective battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE) for directions on using the Micro 420 battery tester.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION
THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.	1. The electrical system ignition-off draw is excessive.	1. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - IGNITION-OFF DRAW TEST) for the proper test procedures. Repair the excessive ignition-off draw, as required.
	2. The charging system is faulty.	2. Determine if the charging system is performing to specifications. Repair the faulty charging system, as required.
	3. The battery is discharged.	3. Determine the battery state-of-charge using the Micro 420 battery tester, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE). Charge the faulty battery as required.
	4. The battery terminal connections are loose or corroded.	4. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - DIAGNOSIS AND TESTING). Clean and tighten the battery terminal connections, as required.
	5. The battery has an incorrect size or rating for this vehicle.	5. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper size and rating. Replace an incorrect battery, as required.
	6. The battery is faulty.	6. Determine the battery cranking capacity using the Micro 420 battery tester, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE). Replace the faulty battery, as required.
	7. The starting system is faulty.	7. Determine if the starting system is performing to specifications. Repair the faulty starting system, as required.
	8. The battery is physically damaged.	8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION

## STANDARD PROCEDURE

### BATTERY RECONNECTION

**Note:** This reconnection procedure is to be performed anytime the battery has been disconnected.

1. Connect the battery negative cable (2) to the battery post and tighten the clamp nut.
2. Install the rear compartment floor trim panel.

**CAUTION:** Once the battery has been connected, review and perform the following information as applicable.

### AUTO UP FRONT WINDOW

If the vehicle is equipped with the auto-up front window feature, once the battery is reconnected the door module needs to be calibrated. The door module requires calibration anytime the battery or door module has been disconnected for any length of time. To calibrate, perform the following:

1. Connect the battery cables.
2. Using the window switch, raise the window to the full UP position. Hold the switch in position for 1 second, then drive the window all the way down to the bottom.

### ELECTRONIC STABILITY PROGRAM (ESP)

If the vehicle is equipped with ESP, once the battery is reconnected, the Steering Angle Sensor (SAS) needs to be calibrated. The SAS requires calibration anytime the battery or an ABS (ESP) component has been disconnected for any length of time. To calibrate, perform the following:

1. Start the engine.
2. Center the steering wheel.
3. Turn the steering wheel all the way to the left until the internal stop in the steering gear is met, then turn the wheel all the way to the right until the opposite internal stop in the steering gear is met.
4. Center the steering wheel.
5. Stop the engine.

### CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service manual, (Refer to LUBRICATION & MAINTENANCE/ MAINTENANCE SCHEDULES - DESCRIPTION) it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.

2. Clean the battery tray and battery holddown hardware using a stiff bristle parts cleaning brush and a sodium bicarbonate (baking soda) and warm water cleaning solution.
3. If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover (3) with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

4. Clean any corrosion from the battery terminals with a wire brush or terminal cleaner (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.

## INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules, (Refer to LUBRICATION & MAINTENANCE/MAINTENANCE SCHEDULES - DESCRIPTION), it is recommended that these procedures be performed any time the battery or related components are removed for vehicle service.

1. Inspect the battery cable terminals for damage. Replace any battery cable that has a damaged or deformed terminal.
2. Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.
3. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminals for looseness. Batteries with damaged cases or loose terminals must be replaced.
4. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - BATTERY CHARGING).

## SPECIFICATIONS

### BATTERY

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correctly-sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for thirty seconds at -18° C (0° F). Terminal voltage must not fall below 7.2 volts during or after the thirty second discharge period. The CCA required is generally higher as engine displacement increases, depending also upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7° C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.

- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for twenty hours, with the voltage in the battery not falling below 10.5 volts. This rating is also sometimes identified as the twenty-hour discharge rating.

BATTERY CLASSIFICATIONS & RATINGS					
Part Number	BCI Group Size Classification	Cold Cranking Amperage	Reserve Capacity	Ampere - Hours	Load Test Amperage

## SPECIAL TOOLS

### BATTERY SYSTEM SPECIAL TOOLS

80c91c8d

## BATTERY

### DESCRIPTION

This vehicle is equipped with a single, 12-volt, maintenance-free battery located in the rear floor area near the spare tire. The battery is comprised of the following components:

- Positive Post (1)
- Vent (2)
- Cell Cap (3)
- Vent (4)
- Cell Cap (5)
- Vent (6)
- Negative Post (7)
- Indicator Eye (8) if equipped
- Electrolyte Level (9)
- Plate Groups (10)
- Maintenance Free Battery assembly (11)

This battery is designed to provide a safe, efficient and reliable means of storing electrical energy in a chemical form. This means of energy storage allows the battery to produce the electrical energy required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine and/or the charging system are not operating. The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups that are connected with lead straps to the positive terminal post, and negatively charged plate groups that are connected with lead straps to the negative terminal post. Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive and negative plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - SPECIFICATIONS) for the proper factory-installed battery specifications.

### OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

## DIAGNOSIS AND TESTING

### BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery cleaning and inspection procedures. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - BATTERY CHARGING) for the proper battery charging procedures.

### MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to help the dealership technicians diagnose the cause of an inoperative battery. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for instructions on the use of the Micro 420 battery tester.

**WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING OR LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.**

**WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.**

**WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.**

A battery that will not accept a charge is inoperative, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is inoperative and must be replaced.

**Note: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedures for the proper battery charging procedures.**

## STANDARD PROCEDURE

### BATTERY CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- All of the battery cells are gassing freely during battery charging.
- Open-circuit voltage of the battery is 12.4 volts or above.

**WARNING: NEVER EXCEED TWENTY AMPERES WHEN CHARGING A COLD (-1° C [30° F] OR LOWER) BATTERY. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.**

**WARNING: IF THE BATTERY SHOWS SIGNS OF FREEZING, LEAKING, LOOSE POSTS, DO NOT TEST, ASSIST-BOOST, OR CHARGE. THE BATTERY MAY ARC INTERNALLY AND EXPLODE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.**

**WARNING: EXPLOSIVE HYDROGEN GAS FORMS IN AND AROUND THE BATTERY. DO NOT SMOKE, USE FLAME, OR CREATE SPARKS NEAR THE BATTERY. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT.**

**WARNING: THE BATTERY CONTAINS SULFURIC ACID, WHICH IS POISONOUS AND CAUSTIC. AVOID CONTACT WITH THE SKIN, EYES, OR CLOTHING. IN THE EVENT OF CONTACT, FLUSH WITH WATER AND CALL A PHYSICIAN IMMEDIATELY. KEEP OUT OF THE REACH OF CHILDREN.**

**WARNING: IF THE BATTERY IS EQUIPPED WITH REMOVABLE CELL CAPS, BE CERTAIN THAT EACH OF THE CELL CAPS IS IN PLACE AND TIGHT BEFORE THE BATTERY IS RETURNED TO SERVICE. PERSONAL INJURY AND/OR VEHICLE DAMAGE MAY RESULT FROM LOOSE OR MISSING CELL CAPS.**

**CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.**

**CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.**

**CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.**

After the battery has been charged to 12.4 volts or greater, perform a load test to determine the battery cranking capacity, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is inoperative and must be replaced.

Clean and inspect the battery hold downs, tray, terminals, posts, and top before completing battery service. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING) and (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - INSPECTION) for the proper battery system cleaning and inspection procedures.

**CHARGING A COMPLETELY DISCHARGED BATTERY**

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.
3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the Charge Rate Table. If the charging current is still not measurable at the end of the charging time, the battery is inoperative and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE TABLE	
Voltage	Hours
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

## CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18° C (0° F) than at 27° C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The Battery Charging Time Table gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME TABLE			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

## USING MICRO 420 BATTERY TESTER

Always use the Micro 420 Instruction Manual that was supplied with the tester as a reference. If the Instruction Manual is not available the following procedure can be used:

**WARNING: ALWAYS WEAR APPROPRIATE EYE PROTECTION AND USE EXTREME CAUTION WHEN WORKING WITH BATTERIES.**

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - CLEANING).
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position is at the battery terminals.** If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.
3. Connect the tester to the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (-).

**Note: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.**

4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the test result table noted below.

**CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.**

6. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE & RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

**Note: The SERVICE CODE is required on every warranty claim submitted for battery replacement.**

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/ BATTERY - STANDARD PROCEDURE - BATTERY CHARGING).

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.

3. Using a voltmeter connected to the battery posts, measure the open-circuit voltage.

See the Open-Circuit Voltage Table. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER).

OPEN CIRCUIT VOLTAGE TABLE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.2 volts	50%
12.4 volts	75%
12.6 volts or more	100%

## IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Junction Block (JB). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.
- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the Electronic Module Ignition-Off Draw Table for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD) TABLE			
Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliamperes	N/A
Central Timer Module (CTM)	No	4.75 milliamperes (max.)	N/A
Powertrain Control Module (PCM)	No	0.95 milliamperes	N/A
ElectroMechanical Instrument Cluster (EMIC)	No	0.44 milliamperes	N/A
Combination Flasher	No	0.08 milliamperes	N/A

- Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
- Disconnect the battery negative cable.
- Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.
- After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or non-existent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to the appropriate wiring information for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliamperes scale of the multi-meter to check the low-amperage IOD.

**CAUTION:** Do not open any doors, or turn on any electrical accessories with the lowest milliamperes scale selected, or the multi-meter may be damaged.

- Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in Step 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

## REMOVAL

**WARNING:** A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.

**WARNING: REMOVE METALLIC JEWELRY TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.**

1. Make sure ignition switch is in OFF position and all accessories are turned OFF.
2. Remove the rear compartment floor, trim panel to gain access to the battery.
3. Disconnect the battery negative cable (2) from the battery terminal.
4. Disconnect the battery positive cable (1) from the battery terminal.
5. Unlatch the battery retention strap (4).

**CAUTION: Use care when disconnecting the battery vent tube from the battery. The vent tube nipple is made of plastic and is easily damaged if not disconnected properly.**

6. Gently disconnect the battery vent tube from the battery nipple.

7. Remove the battery hold down clamp and remove the battery from the vehicle.

## INSTALLATION

**WARNING: A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.**

**WARNING: REMOVE METALLIC JEWELRY TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.**

1. Position the battery in the battery tray.

2. Install the battery hold down clamp and bolt.  
Torque the bolt to 4 N·m (35 in. lbs.).

**CAUTION: Use care when connecting the battery vent tube to the battery. The vent tube nipple is made of plastic and is easily damaged if not connected properly.**

3. Gently connect the battery vent tube to the battery nipple.

4. Latch the battery retention strap (4).
5. Connect the battery positive cable (1).
6. Connect the battery negative cable (2).
7. Install the rear compartment floor trim panel.

## BATTERY HOLDDOWN

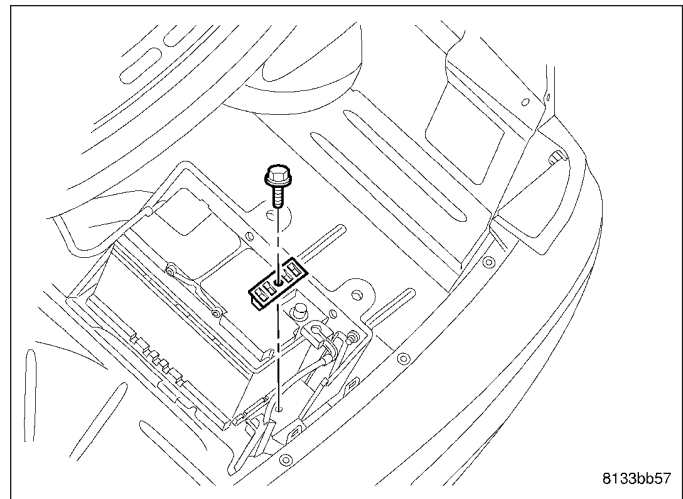

### REMOVAL

1. Verify that the ignition switch and all accessories are OFF.
2. Remove the rear compartment floor, trim panel to gain access to the battery.
3. Disconnect and isolate the battery negative cable.
4. Remove the bolt from the battery hold down and remove the hold down.

### INSTALLATION

1. Install the battery hold down clamp and bolt. Torque the bolt to 4 N·m (35 in. lbs.).
2. Connect the battery negative cable.
3. Install the rear compartment floor trim panel.

## BATTERY CABLES

### DESCRIPTION

The battery cables (1) and (2) are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a stamped brass clamping type female battery terminal crimped onto one end of the battery cable wire and then solder-dipped. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires (1) have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires (2) have a black insulating jacket and a smaller female battery terminal clamp.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to the appropriate wiring information for the location of the proper battery cable wire harness diagrams. The wiring information also includes proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

### OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

## DIAGNOSIS AND TESTING

### BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached. **EXAMPLE:** When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

### VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - BATTERY CHARGING) for the proper battery charging procedure.
  - The battery has successfully passed a load test, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE - USING MICRO 420 BATTERY TESTER) for the proper load test procedure.
  - Fully engage the parking brake.
  - If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
  - Verify that all lamps and accessories are turned off.
  - To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Power Distribution Center (PDC), in the engine compartment. See the fuse and relay layout label affixed to the underside of the PDC cover for ASD relay identification and location.
1. Remove the spare tire cover to gain access to the battery. Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

2. Connect the positive lead of the voltmeter to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

3. Using a suitable jumper wire, connect the voltmeter to measure between the battery negative cable terminal clamp and a good clean ground on the engine block. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the transmission housing. Repeat the test. If the reading is still above 0.2 volt, perform Step 4 and Step 5.

4. Connect the voltmeter to measure between the battery negative cable terminal clamp and the battery negative cable eyelet terminal connection at the vehicle body. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the vehicle body. Repeat the test. If the reading is still above 0.2 volt, replace the battery rear negative cable, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).

5. Connect the voltmeter to measure between the battery negative cable eyelet terminal connection at the right front strut tower and the battery negative cable eyelet terminal connection at the transmission housing. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the right front strut tower. Repeat the test. If the reading is still above 0.2 volt, replace the battery front negative cable, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).

6. Using a suitable jumper wire, connect the voltmeter to measure between the battery positive cable terminal clamp and the starter solenoid B(+) terminal stud. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, perform Step 7 and Step 8.

7. Remove the right front wheelhouse splash shield to gain access to the battery positive cable bulkhead outside terminal, (Refer to 23 - BODY/EXTERIOR/RF WHEELHOUSE SPLASH SHIELD - REMOVAL). Connect the voltmeter to measure between the battery positive cable bulkhead outside terminal and the starter solenoid B(+) terminal stud. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable bulkhead outside terminal connection. Repeat the test. If the reading is still above 0.2 volt, replace the battery front positive cable, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).

8. Remove the right front carpet to gain access to the battery positive cable bulkhead inside terminal. Connect the voltmeter to measure between the battery positive cable terminal clamp and the battery positive cable bulkhead inside terminal connection. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable bulkhead inside terminal connection. Repeat the test. If the reading is still above 0.2 volt, replace the battery rear positive cable, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/CABLES - REMOVAL).

## REMOVAL

### NEGATIVE - ENGINE COMPARTMENT

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable.
4. Remove the fastener securing the battery negative cable to the right front strut tower.

5. Raise vehicle on hoist, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
6. Remove the fastener securing the battery negative cable to the transmission housing.

7. One at a time, remove the battery cable retaining pushpins, fasteners and routing clips until the cable is free from the vehicle.
8. Remove the battery cable from the engine compartment.

**NEGATIVE - REAR COMPARTMENT**

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable (3).
4. Remove the fastener (4) securing the battery negative cable to the body.
5. Remove the cable from the vehicle.

**POSITIVE - BATTERY TO BULKHEAD**

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable (3).
4. Disconnect the battery positive cable (1).

5. Remove the Power Distribution Center (PDC) cover (2).
6. Remove the battery positive cable to rear PDC fastener (3).

7. One at a time, free the battery positive cable from the routing clips located in the rear compartment area.

8. Remove the right, front seat, (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
9. Remove the right, rear seat cushion. Pull upward at forward edge of each retainer loop of the rear seat cushion to disengage retainer loops from cups in floor.
10. Remove the right, front and rear door sill trim panels.
11. Remove the right, B - pillar lower trim panel, (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).
12. position carpet aside to gain access to the battery positive cable.

13. One at a time, free the battery positive cable from the routing clips located in the rear seat area.

14. Position the bulkhead insulator aside to gain access to the battery positive cable bulkhead fastener.

15. Remove the battery positive cable to bulkhead fastener.

16. Remove the battery positive cable from the vehicle making note of the cable routing under the floor cross members.

**POSITIVE - ENGINE COMPARTMENT**

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable (3).

4. Raise vehicle on hoist, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
5. Remove the right front wheelhouse splash shield to gain access to the battery positive cable bulkhead outside terminal, (Refer to 23 - BODY/EXTERIOR/RF WHEELHOUSE SPLASH SHIELD - REMOVAL).
6. Remove the battery positive cable to bulkhead fastener.

7. Remove the battery positive cable to starter fastener.

8. On the 2.7L and 3.5L free the battery positive cable from the routing clips located at the back of the engine.

9. On the 5.7L free the battery positive cable from the routing clip located at the back of the starter.
10. Remove the battery positive cable from the vehicle making note of the cable routing.

## INSTALLATION

### NEGATIVE - ENGINE COMPARTMENT

1. Position the battery negative cable in the engine compartment.
2. Raise vehicle on hoist, (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).
3. Install the fastener securing the battery negative cable to the transmission housing. Torque the bolt to 11 N·m (8 ft. lbs.).

4. One at a time, install the battery cable retaining pushpins, fasteners and routing clips until the cable is installed exactly where it was in the vehicle.
5. Lower vehicle.
6. Install the fastener securing the battery negative cable to the right front strut tower.

7. Connect the battery negative cable.
8. Install the spare tire cover.

**NEGATIVE - REAR COMPARTMENT**

1. Position the battery negative cable in the vehicle.
2. Install the fastener (4) securing the battery negative cable to the body.
3. Connect the battery negative cable (3).
4. Install the spare tire cover.

**POSITIVE - BATTERY TO BULKHEAD**

1. Position the battery positive cable in the vehicle taking care to route the cable under the floor cross members.

2. Position the bulkhead insulator aside to gain access to the battery positive cable bulkhead fastener.
3. Install the battery positive cable to bulkhead fastener.
4. Position the bulkhead insulator back to the normal position.

1. One at a time, secure the battery positive cable to the routing clips located in the rear seat area.

2. One at a time, secure the battery positive cable to the routing clips located in the rear compartment area.

3. Position the carpet back to the normal position.
4. Install the right, B - pillar lower trim panel, (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).
5. Install the right, front and rear door sill trim panels.
6. Install the right, rear seat cushion. Engage retainer loops into cup on floor kick up. Push downward at forward edge at each retainer loop of the rear seat cushion to engage retainers.
7. Install the right, front seat, (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).

8. Install the battery positive cable to rear Power Distribution Center (PDC) fastener (3).

9. Install the PDC cover (5).
10. Connect the battery positive cable (1).
11. Connect the battery negative cable (3).
12. Install the spare tire cover.

### POSITIVE - ENGINE COMPARTMENT

1. Position the battery positive cable in the engine compartment.
2. On the 2.7L and 3.5L secure the battery positive cable to the routing clips located at the back of the engine.

3. On the 5.7L secure the battery positive cable to the routing clip located at the back of the starter.

4. Install the battery positive cable to starter fastener.

5. Install the battery positive cable to bulkhead fastener.

6. Install the right front wheelhouse splash shield, (Refer to 23 - BODY/EXTERIOR/RF WHEELHOUSE SPLASH SHIELD - INSTALLATION).
7. Lower vehicle.
8. Connect the battery negative cable (3).
9. Install the spare tire cover.

## BATTERY TRAY

### REMOVAL

1. Remove the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - REMOVAL).
2. Using a small flat bladed tool, gently release the two mounting tabs that secure the Power Distribution Center (PDC) to the battery tray. Position the PDC aside.

3. Remove the battery tray mounting fasteners and remove the battery tray from the vehicle.

## INSTALLATION

1. Position the battery tray in the vehicle and install the mounting fasteners.

2. Position the Power Distribution Center (PDC) onto the battery tray mounting tabs. Gently apply downward pressure on the PDC until it snaps into place.

3. Install the battery, (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - INSTALLATION).

## CHARGING

### DESCRIPTION - CHARGING SYSTEM

The charging system consists of:

- Generator
- Decoupler Pulley (If equipped)
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM)
- Ignition switch (refer to the Ignition System section for information)
- Battery (refer to the Battery section for information)
- Ambient Air Temperature (If equipped)
- Inlet Air Temperature (calculated battery temperature)(If equipped)
- Voltmeter (refer to the Instrument Cluster section for information if equipped)
- Wiring harness and connections (refer to the Wiring section for information)
- Accessory drive belt (refer to the Cooling section for more information)
- Battery Temperature sensor (if equipped)

### OPERATION - CHARGING SYSTEM

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay is energized. The ASD relay is energized when the PCM grounds the ASD control circuit. This voltage is connected through the PCM or IPM (intelligent power module) (if equipped) and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The generator is driven by the engine through a serpentine belt and pulley or decoupler pulley arrangement.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

An Ambient air temperature sensor is mounted on the bumper used to calculate the temperature near the battery. This temperature data, along with data from monitored line voltage (battery voltage sense circuit), is used by the PCM to vary the battery charging rate. This is done by cycling the feed path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly to maintain system voltage at the targeted system voltage based on battery temperature.

All vehicles are equipped with On-Board Diagnostics (OBD). All OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects and illuminate the (MIL) lamp. Refer to On-Board Diagnostics in the Electronic Control Modules(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/ POWERTRAIN CONTROL MODULE - DESCRIPTION) section for more DTC information.

The Charging system "Battery" light indicates problems with the charging system (voltage too high/low, generator failure, etc.). If an extreme condition is indicated, the lamp will be illuminated. The signal to activate the lamp is sent via the PCI bus circuits. The lamp is located on the instrument panel. Refer to the Instrument Cluster section for additional information.

The PCM uses the inlet air temperature sensor or ambient temperature sensor to control the charge system voltage. This temperature, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. The system voltage is higher at cold temperatures and is gradually reduced as the calculated battery temperature increases.

The ambient temperature sensor is used to control the battery voltage based upon ambient temperature (approximation of battery temperature). The PCM maintains the optimal output of the generator by monitoring battery voltage and controlling it to a range of 13.5 - 14.7 volts based on battery temperature.

## DIAGNOSIS AND TESTING

### ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 40 good trip if the problem does not occur again.

### DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the DRBIII® scan tool. Refer to the appropriate Powertrain Diagnostic Procedures manual for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

### ERASING DIAGNOSTIC TROUBLE CODES

The DRBIII® Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to Ignition-Off Draw Test (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - STANDARD PROCEDURE)
- loose generator belt.

### INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

Refer to Diagnostic Trouble Codes in; Powertrain Diagnostic manual for more DTC information. This will include a complete list of DTC's including DTC's for the charging system.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the DRBIII® scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to the Battery section (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - DIAGNOSIS AND TESTING) for procedures.

2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) or IPM (if equipped) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to the Generator Removal/Installation section of this group for torque specifications (Refer to 8 - ELECTRICAL/CHARGING - SPECIFICATIONS).
5. Inspect generator drive belt condition and tension. Tighten or replace belt as required. Refer to Belt Tension Specifications(Refer to 7 - COOLING/ACCESSORY DRIVE - SPECIFICATIONS).
6. Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.
7. Inspect automatic belt tensioner (if equipped). Refer to the Cooling System for more information.
8. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

## SPECIFICATIONS

### TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Generator Mounting Bolts - 2.7L	65	48	-
Generator Mounting Bolts - 3.5L	65	48	-

Generator Support Bracket Bolt/Nuts - 5.7L	41	30	-
Generator B+ Output Cable Terminal Nut	12	-	108

## GENERATOR

### DESCRIPTION

The generator is belt-driven by the engine. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced. The generator produces DC voltage.

### OPERATION

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil.

The Y type stator winding connections deliver the induced AC current to 6 positive and 6 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicles electrical system through the generator, battery, and ground terminals.

Noise emitting from the generator may be caused by:

- Worn, loose or defective bearings
- Loose or defective drive pulley
- Incorrect, worn, damaged or misadjusted drive belt
- Loose mounting bolts
- Misaligned drive pulley
- Defective stator or diode
- Damaged internal fins

## REMOVAL

### 2.7L

1. Disconnect negative battery cable.
2. Remove generator drive belt. Refer to the Cooling System section.

3. Disconnect generator field circuit plug.
4. Remove B+ terminal nut and wire.
5. Remove 2 lower mounting bolts.

6. Remove upper bolt.

7. Remove generator.

### 3.5L

1. Disconnect negative battery cable.
2. Remove generator drive belt. Refer to the Cooling System section.

3. Remove bracket bolts.
4. Remove upper mounting bolt.

5. Raise and support vehicle.
6. Remove middle splash pan.
7. Disconnect generator field circuit plug.
8. Remove B+ terminal nut and wire.

9. Remove lower mounting bolts.

10. Remove generator.

## 5.7L

**WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.**

1. Disconnect negative battery cable at battery.
2. Remove generator drive belt. Refer to 7, Cooling System for procedure.
3. Raise and support vehicle.
4. Unsnap plastic insulator cap from B+ output terminal.
5. Remove B+ terminal mounting nut at rear of generator. Disconnect terminal from generator.
6. Disconnect field wire connector at rear of generator by pushing on connector tab.
7. Remove generator support bracket nut (4) and bolt (3). Remove support bracket (1).

8. Remove 2 generator mounting bolts (1).
9. Remove generator (2) from vehicle.

## INSTALLATION

### 2.7L

1. Install generator.

2. Install upper bolt mounting bolt.

3. Install 2 lower mounting bolts.

4. Tighten bolts to 65 N·m (48 ft. lbs.).

5. Install B+ terminal nut and wire. Tighten nut to 13 N·m (115 in. lbs.).

6. Connect generator field circuit plug.

7. Install generator drive belt. Refer to the Cooling System section.

8. Connect negative battery cable.

### 3.5L

1. Install generator.

2. Install lower mounting bolts (3). Loosen install the upper mounting bolt (4).
3. Tighten lower mounting bolts to 65 N·m (48 ft. lbs.).
4. Connect generator field circuit plug.
5. Install B+ terminal nut and wire. Tighten nut to 13 N·m (115 in. lbs.).
6. Install middle splash pan.
7. Lower vehicle.

8. Remove loose installed upper bolt (4).
9. Install bracket (2) and bracket bolt (1).
10. Install upper mounting bolt (4) and bracket (2).
11. Tighten upper mounting bolt to 65 N·m (48 ft. lbs.).
12. Tighten Bracket bolt to 54 N·m (40 ft. lbs.).
13. Install generator drive belt. Refer to the Cooling System section.
14. Connect negative battery cable.

## 5.7L

1. Position generator (2) to engine and install 2 mounting bolts (1).
2. Tighten bolts. Refer to Torque Specifications.

3. Position support bracket (1) to generator and install bolt (3) and nut (4). Tighten bolt / nut. Refer to Torque Specifications.

4. Snap field wire connector into rear of generator.
5. Install B+ terminal eyelet to generator output stud. Tighten mounting nut. Refer to Torque Specifications.
6. Lower vehicle.

**CAUTION:** Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

**CAUTION:** When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to over-heat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in 7, Cooling System.

7. Install generator drive belt. Refer to 7, Cooling System for procedure.
8. Install negative battery cable to battery.

## VOLTAGE REGULATOR

### DESCRIPTION

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

### OPERATION

The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generator's second rotor field terminal and its ground.

Voltage is regulated within the PCM on the NGC vehicles, to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage at the PDC and calculated battery temperature or inlet air temperature sensor (refer to Inlet Air Temperature Sensor, if equipped, for more information ). It then determines a target charging voltage. If sensed battery voltage is lower than the target voltage, the PCM feeds the field winding until sensed battery voltage is at the target voltage. A circuit in the PCM cycles the feed side of the generator field at 250 times per second (250Hz), but has the capability to feed the field control wire 100% of the time (full field) to achieve the target voltage. If the charging rate cannot be monitored (limp-in), a duty cycle of 20% is used by the PCM in order to have some generator output. Also refer to Charging System Operation for additional information.

## STARTING

### DESCRIPTION

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these groups include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

### OPERATION

These components form two separate circuits. A high amperage circuit that feeds the starter motor up to 300+ amps, and a control circuit that operates on less than 20 amps.

The PCM controls a double start over-ride safety that does not allow the starter to be engaged if the engine is already running.

### DIAGNOSIS AND TESTING

#### DIAGNOSIS AND TESTING - STARTING SYSTEM TEST

For circuit descriptions and diagrams, refer to the Wiring Diagrams.

**WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO THE PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.**

## INSPECTION

Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine the state-of-charge and cranking capacity of the battery. Charge or replace the battery, if required. Refer to the Battery section for more information.
- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections.
- **Transmission Range Sensor or Park/Neutral Switch** - Visually inspect the transmission range sensor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Relay** - Visually inspect the starter relay for indications of physical damage and loose or corroded wire harness connections.
- **Starter Motor** - Visually inspect the starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect the starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect the wire harness for damage. Repair or replace any faulty wiring, as required. Check for loose or corroded wire harness connections at main engine ground and remote jump post.
- **Power Distribution Center (PDC)** - Visually inspect the B+ connections at the PDC for physical damage and loose or corroded harness connections.

## STARTING SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO ENGAGE.	1. BATTERY DISCHARGED OR FAULTY. 2. STARTING CIRCUIT WIRING FAULTY. 3. STARTER RELAY FAULTY. 4. IGNITION SWITCH FAULTY. 5. PARK/NEUTRAL POSITION SWITCH (AUTO TRANS) FAULTY OR MIS-ADJUSTED. 6. CLUTCH INTERLOCK SWITCH (MAN TRANS) FAULTY. 7. STARTER SOLENOID FAULTY. 8. STARTER ASSEMBLY FAULTY. 9. FAULTY TEETH ON RING GEAR.	1. REFER TO THE BATTERY SECTION FOR MORE INFORMATION. CHARGE OR REPLACE BATTERY, IF REQUIRED. 2. REFER TO FEED CIRCUIT RESISTANCE TEST AND FEED CIRCUIT TEST IN THIS SECTION. 3. REFER TO RELAY TEST, IN THIS SECTION. REPLACE RELAY, IF NECESSARY. 4. REFER TO IGNITION SWITCH TEST, IN THE STEERING SECTION OR 8 WIRING DIAGRAMS. REPLACE SWITCH, IF NECESSARY. 5. REFER PARK/NEUTRAL POSITION SWITCH TEST, IN THE TRANSAXLE. SECTION FOR MORE INFORMATION. REPLACE SWITCH, IF NECESSARY. 6. REFER TO CLUTCH PEDAL POSITION SWITCH TEST, IN THE CLUTCH. SECTION. REPLACE SWITCH, IF NECESSARY. 7. REFER TO SOLENOID TEST, IN THIS SECTION. REPLACE STARTER ASSEMBLY, IF NECESSARY. 8. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY. 9. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.

CONDITION	POSSIBLE CAUSE	CORRECTION
	10. PCM DOUBLE START OVERRIDE OUTPUT FAILURE.	10. REFER TO PCM DIAGNOSTIC. CHECK FOR CONTINUITY BETWEEN PCM AND TERMINAL 85. REPAIR OPEN CIRCUIT AS REQUIRED. IF OK, PCM MAY BE DEFECTIVE.
STARTER ENGAGES, FAILS TO TURN ENGINE.	1. BATTERY DISCHARGED OR FAULTY. 2. STARTING CIRCUIT WIRING FAULTY. 3. STARTER ASSEMBLY FAULTY. 4. ENGINE SEIZED. 5. LOOSE CONNECTION AT BATTERY, PDC, STARTER, OR ENGINE GROUND. 6. FAULTY TEETH ON RING GEAR.	1. REFER TO THE BATTERY SECTION FOR MORE INFORMATION. CHARGE OR REPLACE BATTERY AS NECESSARY. 2. REFER TO THE FEED CIRCUIT RESISTANCE TEST AND THE FEED CIRCUIT TEST IN THIS SECTION. REPAIR AS NECESSARY. 3. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY. 4. REFER TO THE ENGINE SECTION, FOR DIAGNOSTIC AND SERVICE PROCEDURES. 5. INSPECT FOR LOOSE CONNECTIONS. 6. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS.	1. BROKEN TEETH ON STARTER RING GEAR. 2. STARTER ASSEMBLY FAULTY.	1. REMOVE STARTER. INSPECT RING GEAR AND REPLACE IF NECESSARY. 2. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY.
STARTER DOES NOT DISENGAGE.	1. STARTER IMPROPERLY INSTALLED. 2. STARTER RELAY FAULTY. 3. IGNITION SWITCH FAULTY. 4. STARTER ASSEMBLY FAULTY. 5. FAULTY TEETH ON RING GEAR.	1. INSTALL STARTER. TIGHTEN STARTER MOUNTING HARDWARE TO CORRECT TORQUE SPECIFICATIONS. 2. REFER TO RELAY TEST, IN THIS SECTION. REPLACE RELAY, IF NECESSARY. 3. REFER TO IGNITION SWITCH TEST, IN THE STEERING SECTION. REPLACE SWITCH, IF NECESSARY. 4. IF ALL OTHER STARTING SYSTEM COMPONENTS AND CIRCUITS CHECK OK, REPLACE STARTER ASSEMBLY. 5. ROTATE FLYWHEEL 360°, AND INSPECT TEETH AND RING GEAR REPLACED IF DAMAGED.

## DIAGNOSIS AND TESTING - FEED CIRCUIT RESISTANCE TEST

Before proceeding with this operation, review Diagnostic Preparation and Starter Feed Circuit Tests. The following operation will require a voltmeter, accurate to 1/10 of a volt.

**CAUTION:** Ignition and Fuel systems must be disabled to prevent engine start while performing the following tests.

1. To disable the Ignition and Fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for proper relay location.
2. Gain access to battery terminals.

3. With all wiring harnesses and components properly connected, perform the following:
  - a. Connect the negative lead of the voltmeter to the battery negative post, and positive lead to the battery negative cable clamp. Rotate and hold the ignition switch in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between cable clamp and post.
  - b. Connect positive lead of the voltmeter to the battery positive post, and negative lead to the battery positive cable clamp. Rotate and hold the ignition switch key in the START position. Observe the voltmeter. If voltage is detected, correct poor contact between the cable clamp and post.
  - c. Connect negative lead of voltmeter to battery negative terminal, and positive lead to engine block near the battery cable attaching point. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at ground cable attaching point. If voltage reading is still above 0.2 volt after correcting poor contacts, replace ground cable.
4. Connect positive voltmeter lead to the starter motor housing and the negative lead to the battery negative terminal. Hold the ignition switch key in the START position. If voltage reads above 0.2 volt, correct poor starter to engine ground.
  - a. Connect the positive voltmeter lead to the battery positive terminal, and negative lead to battery cable terminal on starter solenoid. Rotate and hold the ignition switch in the START position. If voltage reads above 0.2 volt, correct poor contact at battery cable to solenoid connection. If reading is still above 0.2 volt after correcting poor contacts, replace battery positive cable.
  - b. If resistance tests do not detect feed circuit failures, replace the starter motor.

## DIAGNOSIS AND TESTING - CONTROL CIRCUIT TEST

The starter control circuit has:

- Starter motor with integral solenoid
- Starter relay
- Transmission range sensor, or Park/Neutral Position switch with automatic transmissions
- Ignition switch
- Battery
- All related wiring and connections
- Powertrain Control Module (PCM)

**CAUTION:** Before performing any starter tests, the ignition and fuel systems must be disabled.

- To disable ignition and fuel systems, disconnect the Automatic Shutdown Relay (ASD). The ASD relay is located in the Power Distribution Center (PDC). Refer to the PDC cover for the proper relay location.

## STARTER SOLENOID

**WARNING:** CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK POSITION WITH THE PARKING BRAKE APPLIED. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.

1. Verify battery condition. Battery must be in good condition with a full charge before performing any starter tests. Refer to Battery Tests.
2. Perform Starter Solenoid test BEFORE performing the starter relay test.
3. Perform a visual inspection of the starter/starter solenoid for corrosion, loose connections or faulty wiring.
4. Locate and remove the starter relay from the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location.
5. Connect a remote starter switch or a jumper wire between the remote battery positive post and terminal 87 of the starter relay connector.
  - a. If engine cranks, starter/starter solenoid is good. Go to the Starter Relay Test.
  - b. If engine does not crank or solenoid chatters, check wiring and connectors from starter relay to starter solenoid and from the battery positive terminal to starter post for loose or corroded connections. Particularly at starter terminals.

- c. Repeat test. If engine still fails to crank properly, trouble is within starter or starter mounted solenoid, and replace starter. Inspect the ring gear teeth.

## STARTER RELAY

**WARNING: CHECK TO ENSURE THAT THE TRANSMISSION IS IN THE PARK/NEUTRAL POSITION WITH THE PARKING BRAKE APPLIED. THIS MAY RESULT IN PERSONAL INJURY OR DEATH.**

## RELAY TEST

The starter relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

Remove the starter relay from the PDC as described in this group to perform the following tests:

1. A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.
2. Resistance between terminals 85 and 86 (electromagnet) should be  $75 \pm 5$  ohms. If OK, go to Step 3. If not OK, replace the faulty relay.
3. Connect a battery B+ lead to terminals 85 and a ground lead to terminal 86 to energize the relay. The relay should click. Also test for continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, refer to Relay Circuit Test procedure. If not OK, replace the faulty relay.

CAV	FUNCTION
30	B (+)
85	IGNITION SWITCH OUTPUT
86	PCM-CONTROLLED GROUND
87	STARTER RELAY OUTPUT
87A	NO CONNECT

RELAY CIRCUIT TEST

1. The relay common feed terminal cavity (30) is connected to battery voltage and should be hot at all times. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.
2. The relay normally closed terminal (87A) is connected to terminal 30 in the de-energized position, but is not used for this application. Go to Step 3.
3. The relay normally open terminal (87) is connected to the common feed terminal (30) in the energized position. This terminal supplies battery voltage to the starter solenoid field coils. There should be continuity between the cavity for relay terminal 87 and the starter solenoid terminal at all times. If OK, go to Step 4. If not OK, repair the open circuit to the starter solenoid as required.
4. The coil battery terminal (85) is connected to the electromagnet in the relay. It is energized when the ignition switch is held in the Start position and the clutch pedal is depressed (manual trans). Check for battery voltage at the cavity for relay terminal 86 with the ignition switch in the Start position and the clutch pedal is depressed (manual trans), and no voltage when the ignition switch is released to the On position. If OK, go to Step 5. If not OK, check for an open or short circuit to the ignition switch and repair, if required. If the circuit to the ignition switch is OK, see the Ignition Switch Test procedure in this group.
5. The coil ground terminal (86) is connected to the electromagnet in the relay. It is grounded by the PCM if the conditions are right to start the car. For automatic trans. cars the PCM must see Park Neutral switch low and near zero engine speed (rpm). For manual trans. cars the PCM only needs to see near zero engine speed (rpm) and low clutch interlock input and see near zero engine speed (rpm). To diagnose the Park Neutral switch of the trans range sensor refer to the transaxle section. Check for continuity to ground while the ignition switch is in the start position and if equipped the clutch pedal depressed. If not OK and the vehicle has an automatic trans. verify Park Neutral switch operation. If that checks OK check for continuity between PCM and the terminal 86. Repair open circuit as required. Also check the clutch interlock switch operation if equipped with a manual transmission. If OK, the PCM may be defective.

SAFETY SWITCHES

For diagnostics of the Transmission Range Sensor, refer to the Transaxle section for more information.  
If equipped with Clutch Interlock/Upstop Switch, refer to Diagnosis and Testing in the Clutch section.

IGNITION SWITCH

After testing starter solenoid and relay, test ignition switch and wiring. Refer to the Ignition Section or Wiring Diagrams for more information. Check all wiring for opens or shorts, and all connectors for being loose or corroded.

BATTERY

For battery diagnosis and testing, refer to the Battery section for procedures.

## ALL RELATED WIRING AND CONNECTORS

Refer to Wiring Diagrams for more information.

## SPECIFICATIONS

### TORQUE

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
2.7L Starter Mounting bolts	54.2	40	-
3.5L Starter Mounting bolts	54.2	40	-
5.7L Starter Mounting bolts	54.2	40	-
Intermediate Shaft Pinch Bolt	43	32	-
Starter B+ Nut	11	-	97.4

## STARTER MOTOR

### REMOVAL

#### 2.7L

1. Disconnect negative battery cable
2. Install steering wheel holder locking steering wheel in straight-ahead position.
3. Raise vehicle and support.
4. Remove the underbody splash shield.
5. Starter assembly.

6. Remove the intermediate steering shaft center bolt.

7. Bolt removed.

8. Separate the intermediate steering shaft upper and lower shaft.

9. Disconnect the electrical connection from the starter.

10. Remove the 3 starter mounting bolts and wiring clip.

11. Pull starter forward and down.

12. Work starter up and around exhaust.

13. Work starter past the intermediate steering shaft.

14. Remove starter from vehicle.

### 3.5L

1. Disconnect negative battery cable
2. Install steering wheel holder locking steering wheel in straight-ahead position.
3. Raise vehicle and support.
4. Remove the underbody splash shield.
5. Starter assembly.

6. Remove the intermediate steering shaft center bolt.

7. Bolt removed.

8. Separate the intermediate steering shaft upper and lower shaft.

9. Disconnect the electrical connection from the starter.

10. Remove the 3 starter mounting bolts and wiring clip.

11. Pull starter forward and down.

12. Work starter up and around exhaust.

13. Work starter past the intermediate steering shaft.

14. Remove starter from vehicle.

**5.7L****REAR WHEEL DRIVE (RWD)**

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Remove three starter mounting bolts (1).
4. Move starter motor (2) towards front of vehicle far enough for nose of starter to clear. Always support starter motor (2) during this process. Do not let starter motor hang from wire harness.
5. Remove battery cable-to-solenoid nut.
6. Remove solenoid wire from solenoid stud.
7. Remove starter motor.

**ALL WHEEL DRIVE (AWD)**

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.

The steering gear assembly must be partially lowered to gain access to starter. Do not disconnect any hydraulic hoses or remove any steering linkage. Proceed.

3. Remove coupling bolt (pinch bolt) securing steering gear to steering column.
4. Remove three steering gear mounting bolts and slightly lower gear. Temporarily support the steering gear.
5. Remove steering gear heat-shield.
6. Remove two starter mounting bolts (2).
7. Move starter motor (1) towards front of vehicle far enough for nose of starter to clear. Always support starter motor (1) during this process. Do not let starter motor hang from wire harness.
8. Remove battery cable-to-solenoid nut.
9. Remove solenoid wire from solenoid stud.
10. Remove starter motor.

## INSTALLATION

### 2.7L

1. Work starter up and pass the transmission and exhaust.

2. Work starter up and pass the intermediate shafts.

3. Starter pass the intermediate shaft.

4. Angle starter up toward engine.

5. Install plastic retainer into starter dust shield. The dust shield has TOP marked on it and the plastic retainer goes in the hole.

6. Plastic retainer installed.
7. Install dust shield to the engine block using the plastic retainer to hold dust shield in place.

8. Install starter.
9. Install starter bolts.
10. Tighten bolts to 54.2 N·m (40 ft. lbs.).

11. Install electrical connection to starter.

12. Match flats inside intermediate shaft with that in intermediate shaft extension, then slide intermediate shaft onto extension.

13. Aline the hole in the shafts.

14. Install pinch bolt fastening intermediate shaft to intermediate shaft extension.  
15. Tighten pinch bolt to 43 N·m (32 ft. lbs.).  
16. Install the underbody splash shield.  
17. Lower vehicle.  
18. Remove the steering wheel holder.  
19. Connect negative battery cable.

**3.5L**

1. Work starter up and pass the transmission and exhaust.

2. Work starter up and pass the intermediate shafts.

3. Starter pass the intermediate shaft.

4. Angle starter up toward engine.

5. Install plastic retainer into starter dust shield. The dust shield has TOP marked on it and the plastic retainer goes in the hole.

6. Plastic retainer installed.
7. Install dust shield to the engine block using the plastic retainer to hold dust shield in place.

8. Install starter.
9. Install starter bolts.
10. Tighten bolts to 54.2 N·m (40 ft. lbs.).

11. Install electrical connection to starter.

12. Match flats inside intermediate shaft with that in intermediate shaft extension, then slide intermediate shaft onto extension.

13. Aline the hole in the shafts.

- 14. Install pinch bolt fastening intermediate shaft to intermediate shaft extension.
- 15. Tighten pinch bolt to 43 N·m (32 ft. lbs.).
- 16. Install the underbody splash shield.
- 17. Lower vehicle.
- 18. Remove the steering wheel holder.
- 19. Connect negative battery cable.

## 5.7L

### REAR WHEEL DRIVE (RWD)

1. Position starter (2) into transmission but do not install bolts.
2. Connect solenoid wire to starter motor (snaps on).
3. Position battery cable to solenoid stud. Install and tighten battery cable eyelet nut. Refer to Torque Specifications. Do not allow starter motor to hang from wire harness.
4. Install and tighten three mounting bolts (1). Refer to Torque Specifications.
5. Lower vehicle.
6. Connect negative battery cable.

### ALL WHEEL DRIVE (AWD)

1. Position starter (1) into transmission but do not install bolts.
2. Connect solenoid wire to starter motor (snaps on).
3. Position battery cable to solenoid stud. Install and tighten battery cable eyelet nut. Refer to Torque Specifications. Do not allow starter motor to hang from wire harness.
