2. Install the nuts (2) to hold the shifter assembly (1) onto the floor pan. Tighten nuts to 7 N·m (652 in.lbs.).

3. Place the floor shifter lever in PARK position.
4. Loosen the adjustment screw (5) on the gearshift cable (1).
5. Install the gearshift cable (1) to the shift lever pin (3).

6. Install the park lock cable (1) to the shift mechanism cam (3) and the notch in the shifter assembly (2).
7. Verify that the key is in the LOCK position and remains there until the cable is fully adjusted.
8. Verify that the park lock cable adjustment tab is pulled upward to the unlocked position.

9. Install the wiring harness connectors (2) to the shifter assembly.
10. Verify that the shift lever is in the PARK position.
11. Tighten the adjustment screw to 7 N·m (65 in.lbs.).
12. Verify that the key in the LOCK position and the shifter is in PARK.
13. Push downward on the park lock cable adjustment tab to lock the adjustment.
14. Verify correct shifter, park lock, and BTSI operation.
15. If necessary, install the shield, covering the gear-shift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
16. Install any console parts removed for access to shift lever assembly and shift cables. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION)

## SOLENOID

### DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed**. The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

- 1 - MANUAL VALVE
- 2 - LINE PRESSURE
- 3 - 2/4 - LOW REVERSE SOLENOID ENERGIZED
- 4 - UNDERDRIVE SOLENOID DE-ENERGIZED
- 5 - UNDERDRIVE CLUTCH

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

1. Increase the amount of current applied to the coil or
2. Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

- 1 - OVERDRIVE CLUTCH
- 2 - NO VENT
- 3 - OVERDRIVE SOLENOID ENERGIZED
- 4 - MANUAL VALVE
- 5 - LOW REVERSE/CONVERTER CLUTCH SOLENOID DE-ENERGIZED
- 6 - SOLENOID SWITCH VALVE
- 7 - TAPER
- 8 - VENT TO SUMP
- 9 - ORIFICE
- 10 - CHECK BALL

## OPERATION

When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

## **ASSEMBLY-TRANSMISSION SOLENOID/PRESSURE SWITCH**

### **DESCRIPTION**

The Solenoid/Pressure Switch Assembly (1) is inside the transmission and mounted to the valve body assembly. The assembly consists of four solenoids that control hydraulic pressure to the L/R, 2/4, OD, and UD friction elements (transmission clutches), and the torque converter clutch. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the TCM. Likewise, the pressure switches can only be serviced by replacing the assembly.

### **OPERATION**

#### **SOLENOIDS**

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which allows fluid to pass through in their relaxed or "off" state. By design, this allows transmission limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

#### **PRESSURE SWITCHES**

The TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

**PRESSURE SWITCH STATES**

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL

**OP = OPEN****CL = CLOSED**

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

The TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 rpm, the TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

**REMOVAL**

**Note:** If the Solenoid/Pressure Switch Assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Raise vehicle on hoist.
2. Remove valve body assembly from transmission.  
(Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - REMOVAL)
3. Remove Solenoid/Pressure Switch Assembly retaining screws (2) from solenoid.

4. Remove Solenoid/Pressure Switch Assembly (1) and screen from valve body (2).

## INSTALLATION

**Note:** If the Solenoid/Pressure Switch assembly is being replaced, the Quick Learn Procedure must be performed. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Install Solenoid/Pressure Switch Assembly (1) and screen (3) to the separator and transfer plates.

2. Install and tighten retaining screws (2) to 5.5 N·m (50 in. lbs.) torque.
3. Install valve body. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)

## CONVERTER-TORQUE

### DESCRIPTION

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

**CAUTION:** The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

**IMPELLER*****Impeller***

- 1 - ENGINE FLEXPLATE
- 2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION
- 3 - IMPELLER VANES AND COVER ARE INTEGRAL

- 4 - ENGINE ROTATION
- 5 - ENGINE ROTATION

The impeller is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

**TURBINE*****Turbine***

- 1 - TURBINE VANE
- 2 - ENGINE ROTATION
- 3 - INPUT SHAFT

- 4 - PORTION OF TORQUE CONVERTER COVER
- 5 - ENGINE ROTATION
- 6 - OIL FLOW WITHIN TURBINE SECTION

The turbine is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

## STATOR

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

The stator contains an over-running clutch (1-4), which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

## TORQUE CONVERTER CLUTCH (TCC)

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added to the turbine assembly (5) to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

## OPERATION

***Torque Converter Fluid Operation - Typical***

1 - APPLY PRESSURE  
2 - THE PISTON MOVES SLIGHTLY FORWARD

3 - RELEASE PRESSURE  
4 - THE PISTON MOVES SLIGHTLY REARWARD

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

## TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

## STATOR

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

- 1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
- 2 - FRONT OF ENGINE
- 3 - INCREASED ANGLE AS OIL STRIKES VANES
- 4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

## TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, and fourth gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear. If the control switch is in the OFF position, the clutch will engage after the shift to third gear.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the L/R-CC Solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

### NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

### PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

### FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine rpm.

## GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the L/R Solenoid duty cycle.

## REMOVAL

1. Remove transmission and torque converter from vehicle.(Refer to 21 - TRANSMISSION/AUTOMATIC - 545RFE/42RLE - REMOVAL)
2. Place a suitable drain pan under the converter housing end of the transmission.

**CAUTION:** Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

## INSTALLATION

**Note:** Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

**CAUTION:** Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle.
9. Fill the transmission with the recommended fluid.

## RELAY-TRANSMISSION CONTROL

### DESCRIPTION

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

### OPERATION

When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure

switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

## SENSOR-TRANSMISSION RANGE

### DESCRIPTION

The Transmission Range Sensor (TRS) (2) is mounted to the top of the valve body inside the transmission and can only be serviced by removing the valve body assembly. The electrical connector extends through the transmission case.

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM.

### OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position (SLP) to the TCM as a combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as “between gear” codes. This results in six codes which should never occur. These are called “invalid” codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

### TRS SWITCH STATES

SLP	T42	T41	T3	T1
P	CL	CL	CL	OP
R	CL	OP	OP	OP
N	CL	CL	OP	CL
D	OP	OP	OP	CL
2	OP	OP	CL	OP
1	CL	OP	CL	CL

## REMOVAL

1. Remove valve body assembly from vehicle.(Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/ VALVE BODY - REMOVAL)
2. Remove the manual shaft seal (1).

3. Remove manual shaft/TRS retaining screw (1).
4. Slide TRS off of manual valve shaft.

## INSTALLATION

1. Install the TRS (2) to the manual shaft. Make sure TRS locating pin rests in manual valve bore slot.
2. Install the TRS/manual shaft retaining screw (1) and torque to 5 N·m (45 in. lbs.) torque.

3. Install the manual shaft seal (1).
4. Install valve body to the transmission.(Refer to 21 - TRANSMISSION//AUTOMATIC - 42RLE/VALVE BODY - INSTALLATION)

## SENSOR-TRANSMISSION TEMPERATURE

### DESCRIPTION

The transmission temperature sensor (2) is located in the transmission range sensor (1) and communicates transmission sump temperature to the TCM.

### OPERATION

The transmission range sensor (TRS) has an integrated thermistor that the TCM uses to monitor the transmission's sump temperature. Since fluid temperature can affect transmission shift quality and convertor lock up, the TCM requires this information to determine which shift schedule to operate in. The TCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission "overheat" condition exists. If the thermistor circuit fails, the TCM will revert to calculated oil temperature usage.

### CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

## BODY-VALVE

### DESCRIPTION

The valve body assembly consists of a cast aluminum valve body (5), separator plate (4), and transfer plate (3). The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches.

Also mounted to the valve body assembly are the solenoid/pressure switch assembly and the transmission range sensor (2).

80865f21

**Valve Body - Exploded**

- 1 - VALVE BODY
- 2 - T/C REGULATOR VALVE
- 3 - L/R SWITCH VALVE
- 4 - CONVERTER CLUTCH CONTROL VALVE
- 5 - MANUAL VALVE
- 6 - CONVERTER CLUTCH SWITCH VALVE
- 7 - SOLENOID SWITCH VALVE
- 8 - REGULATOR VALVE

The valves contained within the valve body (1) include the following :

- Regulator valve(2)
- Solenoid switch valve(7)
- Manual valve(5)
- Converter clutch switch valve(6)
- Converter clutch control valve(4)
- Torque converter regulator valve(2)
- Low/Reverse switch valve(3)

In addition, the valve body also contains the thermal valve, #2, 3, 4 & 5 check balls and the 2/4 accumulator assembly.

## OPERATION

**Note:** (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE - SCHEMATICS AND DIAGRAMS) for a visual aid in determining valve location, operation and design.

## THERMAL VALVE

The thermal valve (1) is a bi-metallic shudder valve that helps control the venting rate of oil pressure in the underdrive clutch passage during release of the clutch. When the oil temperature is approximately 20 degrees Fahrenheit or less, the valve is fully open to assist in venting oil past the U1 orifice (2). At temperatures above 20 degrees, the valve starts to close and becomes fully closed at approximately 140 degrees. The thermal valve is located in the transfer plate of the valve body.

## REGULATOR VALVE

The regulator valve (9) controls hydraulic pressure in the transmission. It receives unregulated pressure from the pump (6), which works against spring tension (8) to maintain oil at specific pressures. A system of sleeves and ports allows the regulator valve to work at one of three predetermined pressure levels. Regulated oil pressure is also referred to as "line pressure."

- 1 - FROM OVERDRIVE CLUTCH CIRCUIT
- 2 - FROM MANUAL VALVE
- 3 - HYDRAULIC PRESSURE
- 4 - FILTER
- 5 - PUMP INLET
- 6 - PUMP OUTLET
- 7 - OIL PRESSURE REGULATED AT THIS POINT
- 8 - SPRING TENSION
- 9 - REGULATOR VALVE
- 10 - TORQUE CONVERTER CONTROL VALVE

## SOLENOID SWITCH VALVE

The solenoid switch valve controls line pressure from the LR/CC solenoid (4). In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves (7).

- 1 - 2/4 CLUTCH
- 2 - MANUAL VALVE
- 3 - UD CLUTCH
- 4 - LR/CC SOLENOID DE-ENERGIZED
- 5 - MANUAL VALVE
- 6 - LINE PRESSURE
- 7 - CONVERTER CLUTCH SWITCH AND CONTROL VALVES
- 8 - LR CLUTCH

## MANUAL VALVE

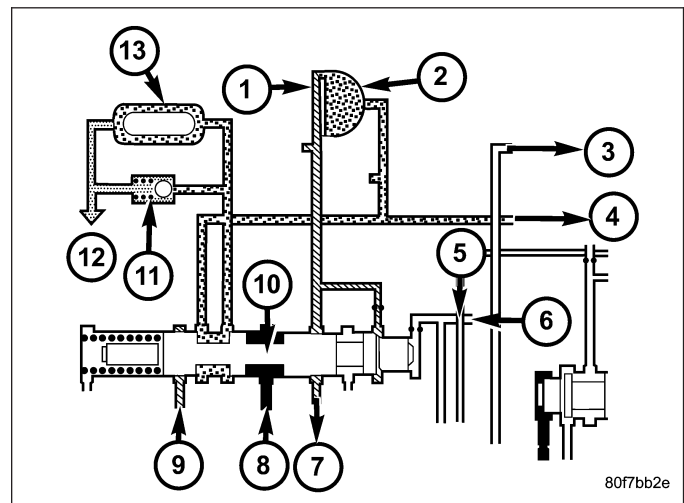

The manual valve (4) is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

- 1 - UD CLUTCH
- 2 - LR/CC CLUTCH
- 3 - REVERSE CLUTCH
- 4 - MANUAL VALVE
- 5 - REGULATOR VALVE
- 6 - REGULATOR VALVE
- 7 - CONVERTER CLUTCH CONTROL VALVE
- 8 - 2/4 CLUTCH
- 9 - 2/4 - L/R SOLENOID
- 10 - L/R CLUTCH

## CONVERTER CLUTCH SWITCH VALVE

The main responsibility of the converter clutch switch valve (10) is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve (5) is fed to the torque converter regulator valve (8). The pressure is then directed to the converter clutch switch valve (10) and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

- 10 - CONVERTER CLUTCH SWITCH VALVE
- 11 - BYPASS VALVE
- 12 - LUBE
- 13 - COOLER

## CONVERTER CLUTCH CONTROL VALVE

The converter clutch control valve (5) controls the back (on) side of the torque converter clutch (1). When the controller energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve (5) and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

- 5 - CONVERTER CLUTCH CONTROL VALVE
- 6 - TORQUE CONVERTER REGULATOR VALVE
- 7 - CONVERTER CLUTCH SWITCH VALVE
- 8 - BYPASS VALVE
- 9 - COOLER

## T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

## LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under these operating conditions.

## REMOVAL

**Note:** If valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure.(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Disconnect the TRS and solenoid wiring connectors.
2. Disconnect the shift cable from the shift lever (at the transmission).
3. Move the manual shift lever clockwise as far as it will go. This should be one position past the L position. Then remove the manual shift lever.

**Note:** One of the oil pan bolts has a sealing patch applied from the factory. Separate this bolts for reuse.

4. Remove transmission pan bolts (2).

5. Remove transmission oil pan (1).

6. Remove oil filter (1) from valve body. It is held in place by two screws.

7. Remove valve body bolts-to-case (1).

**CAUTION:** The overdrive and underdrive accumulators and springs may fall out when removing the valve body.

8. Carefully remove valve body assembly (1) from the transmission.

## DISASSEMBLY

**Note:** If the valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

1. Remove manual shaft seal.
2. Remove manual shaft screw (1).
3. Remove Transmission Range Sensor (TRS) (1) and manual shaft (2).

4. Remove Solenoid/Pressure Switch Assembly (1) from valve body.

5. Remove valve body stiffener plate (1).

6. Invert valve body assembly and remove transfer plate-to-valve body screws (1).

7. Remove transfer/seperator plate (1) from valve body (2)

8. Remove separator plate-to-transfer plate screws (2).

9. Remove separator plate (1) from transfer plate (2).

10. Remove the oil screen (1) from the transfer plate.

11. Remove thermal valve (1) from transfer plate.

80c07030

**Ball Check Location**

- 1 - (#4) BALL CHECK LOCATION
- 2 - (#2) BALL CHECK LOCATION
- 3 - (#5) BALL CHECK LOCATION
- 4 - (#3) BALL CHECK LOCATION

12. Remove valve body check balls (1-4). Note their location for assembly ease.

13. Remove 2/4 accumulator assembly (1-5).

811f69c

14. Remove dual retainer plate (2) from valve body.  
Use special tool 6301 (1) to remove plate (2).

15. Remove regulator valve spring retainer (2).

16. Remove remaining retainers (1, 2).

**Valve Body Assembly**

- 1 - VALVE BODY
- 2 - T/C REGULATOR VALVE
- 3 - L/R SWITCH VALVE
- 4 - CONVERTER CLUTCH CONTROL VALVE
- 5 - MANUAL VALVE
- 6 - CONVERTER CLUTCH SWITCH VALVE
- 7 - SOLENOID SWITCH VALVE
- 8 - REGULATOR VALVE

17. Remove all valves and springs.

18. Cleanliness through entire disassembly and assembly of the valve body cannot be overemphasized. When disassembling, each part should be washed in a suitable solvent, then dried by compressed air. **Do not wipe**

**parts with shop towels.** All mating surfaces in the valve body are accurately machined; therefore, careful handling of all parts must be exercised to avoid nicks or burrs.

## ASSEMBLY

**Note:** If the valve body assembly is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

80865f21

**Valve Body Assembly**

- 1 - VALVE BODY
- 2 - T/C REGULATOR VALVE
- 3 - L/R SWITCH VALVE
- 4 - CONVERTER CLUTCH CONTROL VALVE
- 5 - MANUAL VALVE
- 6 - CONVERTER CLUTCH SWITCH VALVE
- 7 - SOLENOID SWITCH VALVE
- 8 - REGULATOR VALVE

1. Install all valves and springs as shown.

2. Install regulator valve spring retainer (2).

3. Install dual retainer plate (2) using Tool 6301 (1).

4. Verify that all retainers (1, 2) are installed as shown. Retainers should be flush or below valve body surface.

5. Install 2/4 Accumulator components (1-5) as shown. Torque 2/4 Accumulator retainer plate to 5 N·m (45 in. lbs.).

80c07030

**Ball Check Location**

- 1 - (#4) BALL CHECK LOCATION
- 2 - (#2) BALL CHECK LOCATION
- 3 - (#5) BALL CHECK LOCATION
- 4 - (#3) BALL CHECK LOCATION

6. Install check balls into position as shown. If necessary, secure them with petrolatum or transmission assembly gel for assembly ease.

7. Install thermal valve (1) to the transfer plate.

80c07338

8. Install the oil screen (1) to the transfer plate.

9. Install separator plate (1) to transfer plate (2).

10. Install the two separator plate-to-transfer plate screws (2).

11. Install the transfer plate (1) to the valve body (2).

12. Install the transfer plate-to-valve body screws (1) and torque to 5 N·m (45 in. lbs.).

13. Install the stiffener plate (1).

14. Install the solenoid/pressure switch assembly (1) and screws to the transfer plate and torque to 5.5

N·m (50 in. lbs.).

15. Install the manual shaft/rooster comb (3) and transmission range sensor (1) to the valve body.

16. Install the TRS/manual shaft retaining screw (1) and torque to 5 N·m (45 in. lbs.).
17. Install manual shaft seal.

## INSTALLATION

1. Install valve body into position and start bolts (1).  
Torque valve body to transmission case bolts (1) to 12 N·m (105 in. lbs.) torque.

2. Install transmission oil filter (1).

**Note:** Before installing the oil pan bolt in the bolt hole (5) located between the torque converter clutch on and U/D clutch pressure tap circuits , it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock & Seal Adhesive.

3. Make sure oil pan (1) and case rail are clean and dry. Install an 1/8" bead of RTV to the transmission oil pan and install to case. Tighten bolts (2) to 20 N·m (14.5 ft. lbs.).
4. Lower vehicle and connect the TRS connector.
5. Connect solenoid/pressure switch assembly connector.
6. Lower vehicle.
7. Fill transmission with ATF+4, Automatic Transmission Fluid. Verify proper fluid level. (Refer to 21 - TRANSMISSION/AUTOMATIC - 42RLE/FLUID - STANDARD PROCEDURE)

**Note:** If the valve body has been reconditioned or replaced, it is necessary to perform the Quick Learn Procedure. (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES/TRANSMISSION CONTROL MODULE - STANDARD PROCEDURE)

TIRES/WHEELS

DIAGNOSIS AND TESTING

TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and force variation can cause vehicles to exhibit steering wheel vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise the vehicle on a suitable hoist. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as correct wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

Road test vehicle on a smooth road for a least five miles to warm tires (remove any flat spots). Lightly place hands on steering wheel at the 10:00 and 2:00 positions while slowly sweeping up and down from 90 to 110 km/h (55 to 70 mph) where legal speed limits allow.

Observe the steering wheel for:

- Visual Nibble (oscillation: clockwise/counterclockwise, usually due to tire imbalance)

- Visual Buzziness (high frequency, rapid vibration up and down)

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at speed; if vibration occurs or is enhanced, vibration is likely due to causes other than tire and wheel assemblies.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to causes other than tire and wheel assemblies.

For brake vibrations, (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTOR - DIAGNOSIS AND TESTING).

For powertrain vibrations, (Refer to 3 - DIFFERENTIAL & DRIVELINE - DIAGNOSIS AND TESTING).

For tire and wheel assembly vibrations, continue with this diagnosis and testing procedure.

## TIRE AND WHEEL BALANCE

1. Balance the tire and wheel assemblies as necessary following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. (Refer to 22 - TIRES/WHEELS - STANDARD PROCEDURE)
2. Road test the vehicle for at least 5 miles, following the format described in Road Test.
3. If the vibration persists, continue with this diagnosis and testing procedure.

## TIRE AND WHEEL RUNOUT/MATCH MOUNTING

1. **System Radial Runout.** This on-the-vehicle system check will measure the radial runout including the hub, wheel and tire.

- a. Raise vehicle so tires clear floor. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
- b. Apply masking tape around the circumference of the tire in the locations to be measured (1). Do not overlap the tape.
- c. Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) (2) and rotate the tire and wheel. System radial runout should not exceed 0.76 mm (0.030 inch) with no tread "dips" or "steps." Tread "dips" and "steps" can be identified by spikes of the dial indicator gauge.

- Tread "dips"; Rapid decrease then increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.
  - Tread "steps"; Rapid decrease or increase in dial indicator reading over 101.6 mm (4.0 inch) of tread circumference.
- d. If system runout is excessive, re-index the tire and wheel assembly on the hub. Remove assembly from vehicle and install it back on the hub two studs over from original mounting position. If re-indexing the tire and wheel assembly corrects or reduces system runout, check hub runout and repair as necessary (Refer to 5 - BRAKES - BASE/HYDRAULIC/MECHANICAL/ROTORS - DIAGNOSIS AND TESTING).
  - e. If system runout is still excessive, continue with this diagnosis and testing procedure.
2. **Tire and Wheel Assembly Radial Runout.** This radial runout check is performed with the tire and wheel assembly off the vehicle.
    - a. Remove tire and wheel assembly from vehicle and install it on a suitable wheel balancer.

- b. Check system runout using Dial Indicator Set, Special Tool C-3339A with 25-W wheel, or equivalent. Place the end of the indicator against each taped area (one at a time) and rotate the tire and wheel. Radial runout should not exceed 0.76 mm (0.030 inch) with no tread “dips” or “steps.” Tread “dips” and “steps” can be identified by spikes of the dial indicator gauge.

- c. If runout exceeds limits, mark the original location of the tire on the wheel at the valve stem (1)(4). Also, mark the tire and wheel to indicate the original high spot (2) of the assembly and record the runout measurement.
- d. If runout exceeds limits, the tire will need to be dismantled from the wheel to verify wheel vs. tire contribution. Refer to Wheel Runout below.

3. **Lateral Runout.** Lateral runout for the vehicle system as well as the tire and wheel assembly should be less than 0.76 mm (0.030 inch). The same procedure and theory described for radial runout can also be applied to identify and reduce lateral runout.
4. **Wheel Runout.** This runout check is performed as follows:
  - a. Dismount the tire from the wheel.
  - b. Mount the wheel back on the wheel balancer.

- c. Measure radial runout of the wheel at the tire bead seat (1, 6). Runout should not exceed 0.254 mm (0.010 inch) for aluminum wheels and 0.508 mm (.020 inch) for steel wheels. Replace the wheel if it exceeds the limit.

- d. Measure lateral runout of the wheel at the tire bead seat (1, 6). Runout should not exceed 0.762 mm (0.030 inch) for all wheels. Replace the wheel if it exceeds the limit.

5. **Match Mounting.** If the wheel runout is within specifications, tire and wheel assembly runout can be improved by re-indexing (match mounting) the tire to the wheel as described below.

- Remount the tire on the rim 180 degrees from its original location. Ensure the tire bead is properly seated.
- Re-measure the total runout. Mark the tire at the high spot and record the measurement.

If runout is still excessive, perform the following:

- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the tire, replace the tire.
- If the new high spot is within 102 mm (4.0 inch) of the first high spot on the wheel, the wheel may be out of specification. Refer to Wheel Runout above.
- If the new high spot is NOT within 102 mm (4.0 inch) of either high spot, draw an arrow on the tread from new high spot toward the original (2). Break down the tire and remount it 90 degrees on rim in that direction, then re-measure runout. This will normally reduce the runout to an acceptable amount.

6. Once back together, road test the vehicle for at least 5 miles, following the format described in Road Test. If vibration persists, and all components tested are within specification, the tires may have an excessive radial force condition. Radial force variation can only be checked as indicated below. If this equipment is not available, consult with the tire manufacturer.

## RADIAL FORCE VARIATION

Radial Force Variation can be checked using the Hunter GSP 9700 Vibration Control System (Wheel Balancer) or equivalent, if available. This type of equipment helps to correct ride disturbances by reducing the radial force variation of an assembly through re-indexing of the tire to wheel.

The equipment manufacturer or DaimlerChrysler Corporation may supply reference values as guidelines. Radial force measurements above the reference value may not always result in a ride disturbance, nor do they automatically mean the assembly components are out of specification. Do not replace components based on radial force values alone. Balancing, runout diagnosis, re-indexing, and subjective road testing must be performed as outlined in previous sections of this diagnosis and testing procedure.

Use the Radial Force equipment to identify suspect assemblies and minimize the radial forces. After all suspect assemblies are optimized, reinstall the assemblies and road test the vehicle. If a disturbance still exists and all other vibration diagnostic procedures have been completed, replace one tire or one wheel at a time, starting with the assembly having the highest force variation. Be sure to minimize each new assembly. Road test the vehicle following each replacement. Continue this process until the disturbance is resolved.

**Note:** When using Radial Force equipment, it is critically important to set proper tire inflation pressure and ensure centering of the wheel on the equipment spindle.

## RADIAL FORCE VARIATION REFERENCE VALUES

DESCRIPTION	SPECIFICATION
Total Radial Force Variation (RFV)	Less Than 22 Lbs. $\pm$ 2 Lbs.
Radial First Harmonic (R1H)	Less Than 16 Lbs. $\pm$ 2 Lbs.
Radial Second Harmonic (R2H)	Less Than 12 Lbs. $\pm$ 2 Lbs.

## STANDARD PROCEDURE

### TIRE AND WHEEL BALANCE

**Note:** Balance equipment must be calibrated and maintained per equipment manufacturer's specifications.

Wheel balancing can be accomplished with either on-vehicle or off-vehicle equipment.

**Note:** If using on-vehicle balancing equipment, on the driving axle, remove the opposite wheel and tire assembly.

It is recommended that a two-plane dynamic balancer be used when a tire and wheel assembly requires balancing. A static balancer should only be used when a two-plane balancer is not available.

Balance wheel and tire assemblies dynamically and statically to less than 0.25 (1/4) ounce.

For static balancing, find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot (3). Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3).

For dynamic balancing, the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

The aluminum wheels on this vehicle use a different wheel weight than do the steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the Balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the other should not be more than 0.125 (1/8) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

## TIRE AND WHEEL MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. This technique is used to reduce runout in the wheel and tire assembly. The high spot on the tire is marked with a paint mark or a bright colored adhesive label on the outboard sidewall. The low spot on the wheel is identified with a label on the outside of the rim and a dot or line in the drop well area of the rim (inside where the tire mounts). If the outside label has been removed, the tire will have to be removed to locate the dot or line on the inside of the rim. The tire can then be match mounted to the tire.

Information on match mounting the tire to the wheel can be found in Tire and Wheel Runout/Match Mounting, items (2) through (5), within Diagnosis And Testing - Tire And Wheel Vibration. (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING)

## TIRE AND WHEEL ROTATION

Tires on the front and rear operate at different loads and perform different steering, driving, and braking functions. For these reasons they wear at unequal rates and tend to develop irregular wear patterns. These effects can be reduced by rotating the tires at regular intervals. The benefits of tire rotation are:

- Increase tread life
- Maintain traction levels
- A smooth, quiet ride

The suggested method of tire rotation is shown in graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

## REMOVAL

### TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

1. Raise the vehicle so the tire and wheel assembly clears ground level.
2. If the vehicle is equipped with wheel center caps, remove the cap with an appropriate removal tool utilizing the notch formed into the wheel (2) near the valve stem (1). Use care not to damage the wheel coating while doing so.

3. Remove the five wheel mounting (lug) nuts (3) from the studs.
4. Remove the tire and wheel assembly (1) from the hub.

### TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

1. Raise and support the vehicle so the tire and wheel assembly clears ground level.

**CAUTION:** When removing the wheel cover, do not pry the wheel cover from the wheel. This can result in damage to the wheel cover. The wheel cover is attached using the wheel mounting nuts.

2. Remove the five wheel mounting (lug) nuts (3) from the studs.
3. Remove the wheel cover (2) using care not to let the tire and wheel assembly (1) fall off the vehicle.
4. Remove the tire and wheel assembly (1) from the hub.

## INSTALLATION

### TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

**WARNING: INSTALLING WHEELS WITHOUT GOOD METAL-TO-METAL CONTACT WITH THE MOUNTING SURFACE COULD CAUSE LOOSENING OF THE WHEEL MOUNTING (LUG) NUTS. THIS COULD ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE.**

**Note: Never use oil or grease on studs or wheel mounting (lug) nuts.**

1. Clean the wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between the wheel and the vehicle.
2. Position the tire and wheel assembly (1) on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.

**Note: Always use the original (OEM) style wheel mounting (lug) nuts. Do not use replacement parts of lesser quality or substitute design.**

3. Loosely install all five wheel mounting (lug) nuts (3).

4. Lightly snug the wheel mounting nuts, then progressively tighten them in the proper sequence shown. Tighten nuts to 150 N·m (110 ft. lbs.).
5. Lower the vehicle.

## TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

**WARNING: INSTALLING WHEELS WITHOUT GOOD METAL-TO-METAL CONTACT WITH THE MOUNTING SURFACE COULD CAUSE LOOSENING OF THE WHEEL MOUNTING (LUG) NUTS. THIS COULD ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE.**

**Note: Never use oil or grease on studs or wheel mounting nuts.**

1. Clean the wheel mounting surfaces, removing any corrosion build-up. It is important to have good metal-to-metal contact between the wheel and the vehicle.
2. Position the tire and wheel assembly (1) on the wheel mounting studs using the hub pilot as a guide. Place and hold the wheel flush up against the mounting surface.

**Note: Wheel mounting nuts must be installed on the studs as shown (2) to allow proper installation of the wheel cover.**

3. Using the valve stem as an index placed at the 12 O'clock position (1), install and **lightly tighten** two wheel mounting nuts on the studs located at the 2 O'clock and 10 O'clock positions as shown (2).

4. Place the wheel cover (3) on the wheel in the following fashion:
  - a. Align the valve notch in the wheel cover with the valve stem on the wheel (2).
  - b. At the same time, align the two holes in the wheel cover having the retaining tabs (1) with the two installed wheel nuts.
  - c. Press in on center of wheel cover until wheel cover retaining tabs (1) push past and engage rear of previously installed wheel mounting nuts. This will hold the wheel cover in place.

5. Install and **lightly tighten** the three remaining wheel mounting nuts (3) securing the wheel cover in place.

6. Progressively tighten all five wheel mounting nuts in the proper sequence. Tighten wheel nuts to 150 N·m (110 ft. lbs.) torque.
7. Lower the vehicle.

## TIRES

### DESCRIPTION

#### TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread-life potential.

#### TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the Tire Identification chart to decipher the code. For example purposes, the tire size P225/60 R 16 97 T is used in the chart. An All Season type tire will also have either M + S, M & S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the sidewall. The absence of an "XL" or "LL" marking infers a standard load tire.

#### TIRE IDENTIFICATION

<b>P</b>	TIRE TYPE (Not present on all tires)	P - Passenger T - Temporary C - Commercial LT - Light Truck
<b>225</b>	SECTIONAL WIDTH	SHOWN IN MILLIMETERS
<b>60</b>	ASPECT RATIO	SECTIONAL HEIGHT ÷ SECTIONAL WIDTH *
<b>R</b>	CONSTRUCTION TYPE	R - RADIAL B - BIAS BELTED D - DIAGONAL (BIAS)
<b>16</b>	WHEEL DIAMETER	SHOWN IN INCHES
<b>97</b>	LOAD INDEX	**
<b>T</b>	SPEED RATING	**

\* note: Height (2) ÷ Width (1) = Aspect Ratio.

**\*\* note: Consult the tire manufacturer regarding any questions on tire specifications or capabilities.**

## TIRE CHAINS

Refer to the owners manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

## REPLACEMENT TIRES

**WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.**

**WARNING: IN ORDER TO MAINTAIN THE SPEED CAPABILITY OF THE VEHICLE, REPLACEMENT TIRES MUST HAVE SPEED RATINGS EQUAL TO OR HIGHER THAN THOSE FITTED TO THE VEHICLE AS ORIGINAL EQUIPMENT. IF TIRES WITH LOWER SPEED RATINGS ARE FITTED, THE VEHICLE'S HANDLING MAY BE AFFECTED AND THE SPEED CAPABILITY OF THE VEHICLE MAY BE LOWERED TO THE MAXIMUM SPEED CAPABILITY OF THE REPLACEMENT TIRES. TO AVOID AN ACCIDENT RESULTING IN SEVERE OR FATAL INJURY, CONSULT THE TIRE MANUFACTURER IN REGARDS TO MAXIMUM SPEED RATINGS.**

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

SPARE TIRE

This vehicle comes with a compact spare tire and wheel assembly as standard equipment. A full-size spare is not available.

The tire and wheel diameters and the wheel offsets match those of the road wheels on the vehicle.

The compact (temporary) spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the compact (temporary) spare tire and wheel assembly. Refer to the Owner’s Manual for complete details.

DIAGNOSIS AND TESTING

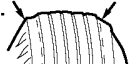

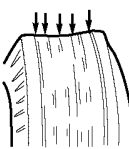

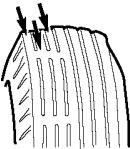

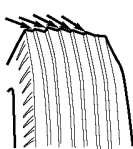

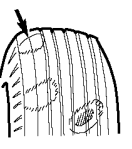

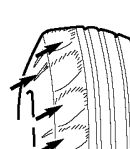

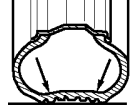

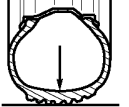

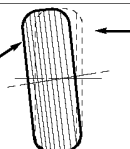

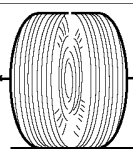

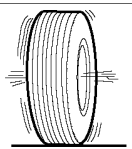

TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration issues, (Refer to 22 - TIRES/WHEELS - DIAGNOSIS AND TESTING). For irregular tire wear issues, (Refer to 22 - TIRES/WHEELS/TIRES - DIAGNOSIS AND TESTING).

TIRE/VEHICLE LEAD

(Refer to 2 - SUSPENSION/WHEEL ALIGNMENT - DIAGNOSIS AND TESTING)

TIRE WEAR PATTERNS

CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR
EFFECT	<div>1.</div> <div>2.</div>

\* HAVE TIRE INSPECTED FOR FUTURE USE.

812014d7

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire. Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

## TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (3).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

## STANDARD PROCEDURE

### TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire Inflation Pressure Label provided with the vehicle (usually on the driver's door opening).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

**WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING. THE TIRE CAN FAIL SUDDENLY, RESULTING IN LOSS OF VEHICLE CONTROL.**

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (1).

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (1).

## TIRE PRESSURE FOR HIGH SPEED OPERATION

Refer to the vehicle's Owners Manual Package.

## TIRE LEAK REPAIRING

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and progressively tighten the 5 wheel nuts to a torque of 150 N·m (110 ft. lbs.).

## CLEANING

### TIRE CLEANING

Before delivery of a vehicle, remove the protective coating on the tires with white sidewalls or raised white letters. To remove the protective coating, apply warm water and let it soak for a few minutes. Afterwards, scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

**CAUTION: DO NOT use gasoline, mineral oil, oil-based solvent or a wire brush for cleaning.**

## WHEELS

### DESCRIPTION

All vehicles use either steel or cast aluminum drop center wheels. The original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

Every wheel has raised sections between the rim flanges (1) and drop well (3) called safety humps (2). In case of air loss, these raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop. When being installed on the wheel, initial inflation of the tire forces the tire bead over these raised sections into place.

The wheels used on All-Wheel-Drive (AWD) vehicles have a shallower dish (larger offset) than Rear-Wheel-Drive (RWD) wheels to accommodate the AWD suspension geometry and half shaft package, while maintaining the same track as RWD vehicles.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

## DIAGNOSIS AND TESTING

### WHEEL INSPECTION

Inspect wheels for:

- Excessive runout
- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

**Note: Do not attempt to repair a wheel by hammering, heating or welding.**

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

**WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE.**

**WARNING: REPLACEMENT WITH USED WHEELS IS NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.**

## CLEANING

### WHEEL AND WHEEL TRIM CARE

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Mopar® Wheel Treatment or Mopar® Chrome Cleaner is recommended. Any of the "DO NOT USE" items listed below can damage wheels and wheel trim.

#### DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains an acid which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

## SPECIFICATIONS

## STUDS - FRONT

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

**CAUTION:** Wheel mounting studs **MUST NOT** be hammered out of hub flange of hub and bearing assembly. If a stud is removed by hammering it out, damage to hub and bearing assembly will occur leading to premature bearing failure.

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove front wheel and tire assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)
3. Access and remove front brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)

4. On wheel mounting stud to be removed, install a wheel mounting (lug) nut (1) far enough so the threads on the stud are even with end of nut. Install Remover (3), Special Tool C-4150A, on hub and bearing flange and wheel stud (5).
5. Tighten screw on Remover, pushing wheel stud (5) out of hub flange. Once shoulder of wheel stud is past flange, remove special tool. Remove nut from stud and remove stud from hub flange.

## INSTALLATION

1. Install replacement wheel stud into flange of hub and bearing from rear. Install stack of washers (1) on wheel stud, then install a standard type wheel mounting (lug) nut (3) on stud with flat side of lug nut against washers.
2. Tighten nut (3), pulling wheel stud into hub flange. Once head of stud is fully seated against rear of hub flange, remove nut and washers from stud.
3. Install brake rotor and caliper. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - INSTALLATION)
4. Install wheel and tire assembly (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting (lug) nuts in proper sequence to 150 N·m (110 ft. lbs.) torque.
5. Lower vehicle.
6. Road test vehicle to ensure proper operation of the brakes.

## STUDS - REAR

### REMOVAL

**Note:** Before proceeding, (Refer to 5 - BRAKES - WARNING)(Refer to 5 - BRAKES - CAUTION).

**CAUTION:** Wheel mounting studs **MUST NOT** be hammered out of hub flange of hub and bearing assembly. If a stud is removed by hammering it out, damage to hub and bearing assembly will occur leading to premature bearing failure.

1. Raise and support vehicle. (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE)
2. Remove rear wheel and tire assembly. (Refer to 22 - TIRES/WHEELS - REMOVAL)
3. Access and remove rear brake rotor. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - REMOVAL)

4. Back off shoe adjustment until adjuster (1) threads bottom.
5. Using appropriate tools, remove spring (3) at adjuster.
6. Pull upward on upper shoe near adjuster to provide enough slack to remove adjuster from shoes, then remove adjuster (1).

7. Install Remover (3), Special Tool C-4150A, on hub and bearing flange and wheel stud (1).
8. Tighten Remover forcing screw, pushing wheel stud (1) out of hub and bearing flange. Remove tool (1).
9. Remove stud from rear of hub flange. It may be necessary to rock hub flange back and forth to ease stud removal.

## INSTALLATION

1. Install replacement wheel stud into flange of hub and bearing from rear (2). Install a stack of washers (3) (approximately 5, depending on thickness) over stud, then install a standard wheel mounting (lug) nut (1) on stud with flat side of nut against washers.
2. Tighten wheel mounting nut (1), pulling wheel stud into flange of hub and bearing. Once head of stud (2) is fully seated against rear of hub flange, remove nut and washers from wheel stud.

3. Install parking brake shoe adjuster (1) between upper and lower parking brake shoes. Position end of adjuster with star wheel upward. Once in place, slide upper shoe downward against adjuster mounting slot, taking up any slack between two pieces.
4. Using appropriate tools, install spring (3) at adjuster.

**Note: When measuring brake drum diameter, diameter should be measured in center of shoe contact surface area.**

5. Using Brake Shoe Gauge, Special Tool C-3919, or equivalent, measure inside diameter of parking brake drum portion of rotor.

6. Place Gauge (1) over parking brake shoes at widest point.
7. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge. This will give a good preliminary adjustment of parking brake shoes, before a final adjustment is made at end of this procedure.
8. Install brake rotor and components removed to access it. (Refer to 5 - BRAKES/HYDRAULIC/MECHANICAL/ROTOR - INSTALLATION)
9. Install wheel and tire assembly (Refer to 22 - TIRES/WHEELS - INSTALLATION). Tighten wheel mounting (lug) nuts in proper sequence to 150 N·m (110 ft. lbs.) torque.
10. Adjust parking brake shoes. (Refer to 5 - BRAKES/PARKING BRAKE/SHOES - ADJUSTMENT)
11. Lower vehicle.
12. Road test vehicle to ensure proper operation of the brakes.

## BODY

### DESCRIPTION - VEHICLE IDENTIFICATION

Throughout this group, references to the DaimlerChrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. Refer to Introduction Group of this manual for detailed information on vehicle identification. If a procedure is common to all vehicles covered in this manual, no reference will be made to a vehicle family code.

## WARNING

### SAFETY PRECAUTIONS AND WARNINGS

**WARNING: USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**  
**AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**  
**DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.**

**CAUTION:** When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.

Always have a fire extinguisher ready for use when welding.

Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.

Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.

Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

## DIAGNOSIS AND TESTING

### DIAGNOSIS AND TESTING - WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

### VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

### WATER LEAK TESTS

**WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.**

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations (Refer to LUBRICATION & MAINTENANCE/HOISTING - STANDARD PROCEDURE).

### WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

### **MIRROR INSPECTION METHOD**

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

### **BRIGHT LIGHT LEAK TEST METHOD**

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

### **PRESSURIZED LEAK TEST METHOD**

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

## **DIAGNOSIS AND TESTING - WIND NOISE**

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

### **VISUAL INSPECTION BEFORE TESTS**

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

### **ROAD TESTING WIND NOISE**

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

### **POSSIBLE CAUSE OF WIND NOISE**

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

## STANDARD PROCEDURE

### STANDARD PROCEDURE - PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on DaimlerChrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

#### Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

#### Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

#### Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

#### Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

#### Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

## SAFETY PRECAUTION AND WARNINGS

#### WARNING:

- EYE PROTECTION SHOULD BE USED WHEN SERVICING COMPONENTS. PERSONAL INJURY CAN RESULT.
- USE AN OSHA APPROVED BREATHING MASK WHEN MIXING EPOXY, GRINDING, AND SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.
- AVOID PROLONGED SKIN CONTACT WITH RESIN, PETROLEUM, OR ALCOHOL BASED SOLVENTS. PERSONAL INJURY CAN RESULT.
- DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

#### Note:

- When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.
- Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.

**RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES**

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM
BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPHTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES
PBTP/EEBC	POLYBUTYLENE THEREPHTHALATE/EEBC ALLOY	BEXLOY, "M", PBTP/EEBC	FASCIAS, ROCKER PANEL, MOLDINGS
PC	POLYCARBONATE	LEXAN, MERLON, CALIBRE, MAKROLON PC	TAIL LIGHT LENSES, IP TRIM, VALANCE PANELS
PC/ABS	PC/ABS ALLOY	GERMAX, BAY BLENDS, PULSE	DOORS, INSTRUMENT PANELS
PPO	POLYPHENYLENE OXIDE	AZDEL, HOSTALEN, MARLEX, PRFAX, NORYL, GTX, PPO	INTERIOR TRIM, DOOR PANELS, SPLASH SHIELDS, STEERING COLUMN SHROUD
PPO/PA	POLYPHENYLENE/ POLYAMID	PPO/PA, GTX 910	FENDERS, QUARTER PANELS
PR/FV	FIBERGLASS REINFORCED PLASTIC	FIBERGLASS, FV, PR/FV	BODY PANELS
PS	POLYSTYRENE	LUSTREX, STYRON, PS	DOOR PANELS, DASH PANELS
RTM	RESIN TRANSFER MOLDING COMPOUND	RTM	BODY PANELS
SMC	SHEET MOLDED COMPOUND	SMC	BODY PANELS
TMC	TRANSFER MOLDING COMPOUND	TMC	GRILLES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
UP	UNSATURATED POLYESTER (THERMOSETTING)	SMC, BMC, TMC, ZMC, IMC, XSMC, UP	GRILLE OPENING PANEL, LIFTGATES, FLARESIDE FENDERS, FENDER EXTENSIONS
EEBC	ETHER/ESTER BLOCKED CO-POLYMER	EEBC	BUMPERS
EEBC/PBTP	EEBC/POLYBUTYLENE TEREPHTHALATE	EEBC, PBTP, BEXLOY	BUMPER, ROCKER PANELS
EMPP	ETHYLENE MODIFIED POLYPROPYLENE	EMPP	BUMPER COVERS
EPDM	ETHYLENE/ PROPPYLYENE DIENE MONOMER	EPDM, NORDEL, VISTALON	BUMPERS
EPM	ETHYLENE/ PROPPYLYENE CO-POLYMER	EPM	FENDERS
MPU	FOAM POLYURETHANE	MPU	SPOILERS
PE	POLYETHYLENE	ALATHON, DYLAN, LUPOLEN, MARLEX	-
PP	POLYPROPYLENE (BLENDS)	NORYL, AZDEL, MARLOX, DYLAN, PRAVEX	INNER FENDER, SPOILERS, KICK PANELS
PP/EPDM	PP/EPDM ALLOY	PP/EPDM	SPOILERS, GRILLES
PUR	POLYURETHANE	COLONELS, PUR, PU	FASCIAS, BUMPERS
PUR/PC	PUR/PC ALLOY	TEXIN	BUMPERS
PVC	POLYVINYL CHLORIDE	APEX, GEON, VINYLITE	BODY MOLDINGS, WIRE INSULATION, STEERING WHEELS
RIM	REACTION INJECTED MOLDED POLYURETHANE	RIM, BAYFLEX	FRONT FASCIAS, MODULAR WINDOWS
RRIM	REINFORCED REACTION INJECTED MOLDED	PUR, RRIM	FASCIAS, BODY PANELS, BODY TRIMS
TPE	THERMO POLYETHYLENE	TPE, HYTREL, BEXLOY-V	FASCIAS, BUMPERS, CLADDINGS
TPO	THERMOPOLYOLEFIN	POLYTROPE, RENFLEX, SANTOPRENE, VISAFLEX, ETA, APEX, TPO, SHIELDS, CLADDINGS	BUMPERS, END CAPS, TELCAR, RUBBER, STRIPS, SIGHT, INTERIOR B POST
TPP	THERMO-POLYPROPYLENE	TPP	BUMPERS
TPU	THERMOPOLYURETHANE, POLYESTER	TPU, HYTREL, TEXIN, ESTANE	BUMPERS, BODY SIDE, MOLDINGS, FENDERS, FASCIAS

## PANEL SECTIONING

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, Follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

## PANEL REINFORCEMENT

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and. Open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

When repairing plastic, the damaged area is first “V’d” out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20 degree angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when every possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

## VISUAL INSPECTION

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind (Fig. 7).

## PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

## PATCHING PANELS

An panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20 degrees to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

## PANEL PATCH FABRICATIONS

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

## PANEL PATCH INSTALLATION

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.
3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.

12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.
14. Apply a coat of adhesive to the exposed ends of the support squares.
15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.
17. Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.
18. Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.
19. Mix enough adhesive to cover the entire patch area.
20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

## PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

## STANDARD PROCEDURE - HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
  - a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
  - b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

## SPECIFICATIONS

## BODY LUBRICATION

### LUBRICATION REQUIREMENTS

Body mechanisms and linkages should be inspected, cleaned, and lubricated, as required, to maintain ease of operation and to provide protection against rust and wear. When performing other under hood services, the hood latch release mechanism and safety catch should be inspected, cleaned, and lubricated. During the winter season, external door lock cylinders should be lubricated to assure proper operation when exposed to water and ice.

Prior to the application of any lubricant, the parts concerned should be wiped clean to remove dust and grit. If necessary, a suitable solvent can be used to clean the item to be lubricated. After lubricating a component, any excess oil or grease should be removed.

### LUBRICANT APPLICATION

#### DOOR LOCK CYLINDERS

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

**Note: Do not add more lubricant.**

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

#### ALL OTHER BODY MECHANISMS

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

## LUBRICANT USAGE

### **ENGINE OIL**

- Door Hinges – Hinge Pin and Pivot Contact Areas
- Hood Hinges – Pivot Points
- Liftgate Hinges

### **MOPAR® SPRAY WHITE LUBE OR EQUIVALENT**

- Door Check Straps
- Liftgate Latches
- Liftgate Prop Pivots
- Ash Receiver
- Fuel Filler Door Remote Control Latch Mechanism
- Parking Brake Mechanism
- Sliding Seat Tracks
- Liftgate Latch

### **MOPAR® Multipurpose GREASE OR EQUIVALENT**

- All Other Hood Mechanisms

### **MOPAR® LOCK CYLINDER LUBRICANT OR EQUIVALENT**

- Door Lock Cylinders
- Liftgate Lock Cylinder

BUMPER

REMOVAL

LOWER

- 1. Open the deck lid.
- 2. Remove the push-pin fastener (1) that secures the lower bumper (2) to the rear fascia flange that extends over the deck opening lower panel.
- 3. Remove the bumper.

## UPPER

1. Open the deck lid.
2. Unscrew the upper bumper (2) from the lower flange of the deck lid inner panel (1).

## INSTALLATION

### LOWER

1. Position the lower bumper (2) to the rear fascia flange that extends over the deck opening lower panel.
2. Secure the bumper with a push-pin fastener.
3. Close the deck lid.

## UPPER

1. Screw the upper bumper (2) into the hole in the lower flange of the deck lid inner panel (1).
2. Thread the bumper in or out of the deck lid as necessary to achieve proper deck lid closing and alignment.
3. Close the deck lid.

## COVER

### REMOVAL

1. Open the deck lid.
2. Remove the four push-pin fasteners (4) that secure the latch cover (1) to the deck lid inner panel (3).
3. Disengage the emergency latch release T-handle from the cover.
4. Remove the cover from the deck lid inner panel.

## INSTALLATION

1. Position the latch cover (1) over the latch on the deck lid inner panel (3).
2. Engage the emergency latch release T-handle through the slit in the cover.
3. Align the mounting holes in the cover to the holes in the deck lid inner panel.
4. Install the four push-pin fasteners that secure the cover to the deck lid.
5. Close the deck lid.

## DECKLID

### REMOVAL

1. Open the deck lid.
2. Disconnect and isolate the battery negative cable.
3. Remove the cover from over the latch on the inside of the deck lid. (Refer to 23 - BODY/DECKLID/COVER - DECKLID LATCH - REMOVAL).
4. Disconnect the connector (2) of the body wire harness take out for the deck lid (1) from the latch connector receptacle (3).

5. Disengage the two retainers (4) that secure the deck lid take out (2) of the body wire harness to the underside of the deck lid.
6. Disengage the wire grommet (1) near the right hinge from the underside of the deck lid.
7. Carefully remove the deck lid take out of the body wire harness from between the inner and outer deck lid panels.

8. Mark both upper hinge bracket (3) locations on the deck lid inner panel (1) to aid reinstallation.
9. With the aid of an assistant, support the deck lid while removing the two screws (2) that secure each upper hinge bracket to the deck lid.
10. Remove the deck lid from the vehicle.

## INSTALLATION

1. With the aid of an assistant, support and position the deck lid (1) to the two upper hinge brackets (3) on the vehicle.
2. Install and tighten the two screws (2) that secure each upper hinge bracket to the deck lid. Tighten the screws to 28 N·m (21 ft. lbs.).

3. Carefully route the deck lid take out (2) of the body wire harness between the inner and outer deck lid panels.
4. Engage the wire grommet (1) into the hole near the right hinge on the underside of the deck lid.
5. Engage the two retainers (4) that secure the deck lid take out (2) of the body wire harness to the underside of the deck lid.

6. Reconnect the connector (2) of the body wire harness take out for the deck lid (1) to the latch connector receptacle (3).
7. Reinstall the cover over the latch on the inside of the deck lid. (Refer to 23 - BODY/DECKLID/COVER - DECKLID LATCH - INSTALLATION).
8. Reconnect the battery negative cable.
9. Close the deck lid.
10. Adjust the deck lid hinge positions and upper overslam bumpers as necessary to achieve proper spacing and operation.

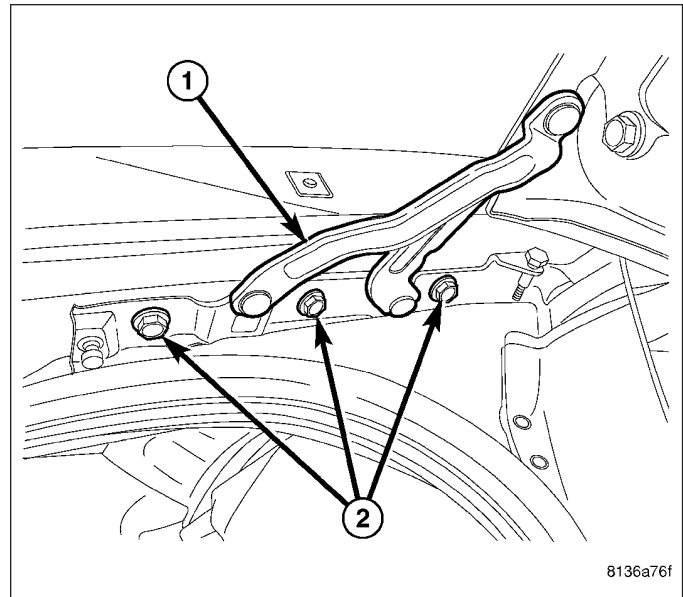

## HINGE

### REMOVAL

1. Open and support the deck lid (1) with a suitable prop or block.
2. Remove the support cylinder from the deck lid hinge. (Refer to 23 - BODY/DECKLID/CYLINDER - DECKLID SUPPORT - REMOVAL).
3. Mark the upper hinge bracket (3) location on the deck lid inner panel to aid reinstallation.
4. Remove the two screws (2) that secure the hinge to the deck lid.

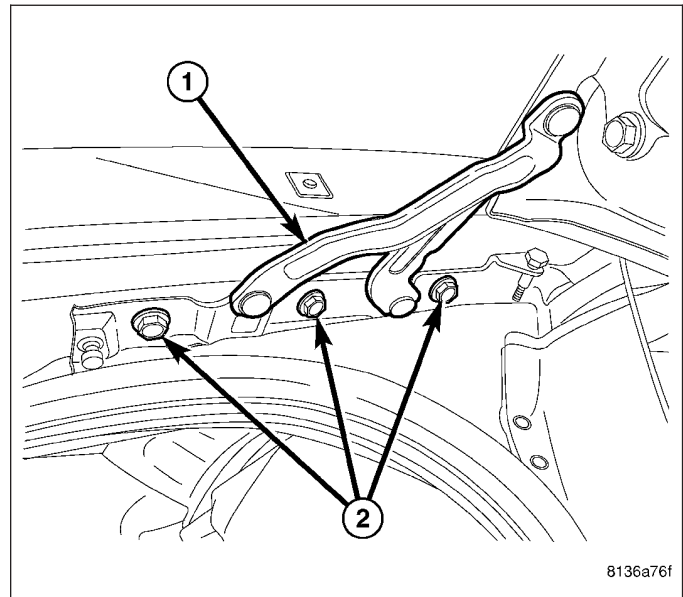

5. Mark the lower hinge bracket (1) location on the deck lid opening drain trough to aid reinstallation.
6. Remove the three screws (2) that secure the hinge to the drain trough.
7. Remove the deck lid hinge from the vehicle.

## INSTALLATION

1. Position the lower bracket of the deck lid hinge (1) to the drain trough on the vehicle.
2. Install and tighten the three screws (2) that secure the hinge to the drain trough. Tighten the screws to 28 N·m (21 ft. lbs.).

3. Position the deck lid (1) to the upper hinge bracket (3) on the vehicle.
4. Install and tighten the two screws (2) that secure the hinge to the deck lid. Tighten the screws to 28 N·m (21 ft. lbs.).
5. Reinstall the support cylinder onto the deck lid hinge. (Refer to 23 - BODY/DECKLID/CYLINDER - DECKLID SUPPORT - INSTALLATION).
6. Remove the fixture being used to support the deck lid for service and close the deck lid.
7. Adjust the deck lid hinge position as necessary to achieve proper spacing and operation.

## LATCH

### REMOVAL

1. Open the deck lid.
2. Disconnect and isolate the battery negative cable.
3. Remove the cover from over the latch on the inside of the deck lid. (Refer to 23 - BODY/DECKLID/COVER - DECKLID LATCH - REMOVAL).
4. Disconnect the connector (2) of the body wire harness take out for the deck lid (1) from the latch connector receptacle (3).

5. Remove the two screws (2) that secure the latch (3) to the inside of the deck lid (1).
6. Remove the latch from the inside of the deck lid.

## INSTALLATION

1. Position the latch (3) to the inside of the deck lid (1).
2. Install and tighten the two screws (2) that secure the latch to the inside of the deck lid. Tighten the screws to 8 N·m (71 in. lbs.).

3. Reconnect the connector (2) of the body wire harness take out for the deck lid (1) to the latch connector receptacle (3).
4. Reinstall the cover over the latch on the inside of the deck lid. (Refer to 23 - BODY/DECKLID/COVER - DECKLID LATCH - INSTALLATION).
5. Reconnect the battery negative cable.
6. Close the deck lid.

## LATCH STRIKER

### REMOVAL

1. Open the deck lid.
2. Remove the trunk rear trim panel from the inside of the deck opening lower panel (3). (Refer to 23 - BODY/INTERIOR/TRUNK REAR TRIM PANEL - REMOVAL).
3. Mark the deck lid latch striker (2) location on the inside of the deck opening lower panel to aid reinstallation.
4. Remove the two screws (1) that secure the latch striker to the inside of the deck opening lower panel.
5. Remove the latch striker from the vehicle.

### INSTALLATION

1. Position the deck lid latch striker (2) to the inside of the deck opening lower panel (3).
2. Install and tighten the two screws (1) that secure the latch striker to the deck opening lower panel. Tighten the screws to 28 N·m (21 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper deck lid latch operation.
4. Reinstall the trunk rear trim panel to the deck opening lower panel. (Refer to 23 - BODY/INTERIOR/TRUNK REAR TRIM PANEL - INSTALLATION).
5. Close the deck lid.

## SUPPORT CYLINDER

### REMOVAL

1. Open and support the deck lid with a suitable prop or block.

**WARNING:** To avoid personal injury or death, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of deck lid support.

2. Insert a small flat-bladed tool (3) into the notch on the outer face of one ball socket end (1) of the support cylinder and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the deck lid hinge.
3. Release the retaining clip to its installed position.
4. Repeat Step 2 and Step 3 for the opposite end of the support cylinder.
5. Remove the support cylinder (2) from the deck lid hinge (1).

## INSTALLATION

1. Position the ball socket on the cylinder end of the support cylinder (2) to the ball stud on the upper bracket of the deck lid hinge (1).
2. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
3. Position the ball socket on the rod end of the support cylinder to the ball stud on the lower bracket of the deck lid hinge.
4. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
5. Inspect to be certain that the retaining clip on each of the support cylinder ball socket ends is fully seated.
6. Remove the service prop or block and close the deck lid.

## DOOR

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Open the front door.
3. Disengage the front door wire harness boot and connector (1) from the outside of the lower A-pillar (2).

4. Carefully pull the door wire harness boot and connector (2) out from the A-pillar far enough to access and disconnect the body wire harness connector(s) (1).
5. Open the door to the full open position.
6. Support the door with a suitable lifting device.

7. Remove the screw (1) from both the upper and lower front door hinges that secures the door hinge bracket (3) to the body hinge bracket (2).
8. While still supporting the door, close the door to the intermediate detent position (one detent from the full open position).

9. Raise the front door (2) upward far enough to disengage the upper and lower hinge pins (3) from the pivots (1) on the upper and lower body hinge brackets.
10. Remove the front door from the vehicle.

## INSTALLATION

1. Support the front door (2) with a suitable lifting device.
2. Position the door with the upper and lower hinge pins (3) aligned over the pivots (1) on the upper and lower body hinge brackets.
3. Lower the door far enough to engage the hinge pins into the pivot holes.
4. While still supporting the door, open the door to the full open position.

5. Align the holes in the upper and lower front door hinge brackets (3) with those in the body hinge brackets (2).
6. Install and tighten the screw (1) into both the upper and lower front door hinge to secure the door hinge brackets to the body hinge brackets. Tighten the screws to 42 N·m (31 ft. lbs.).
7. Remove the lifting device supporting the door.

8. Carefully pull the body wire harness connector(s) (1) out from the A-pillar far enough to reconnect them to the door wire harness boot and connector (2).

9. Engage the front door wire harness boot and connector (1) into the wiring clearance hole on the outside of the lower A-pillar (2).
10. Reconnect the battery negative cable.

**Note:** For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE - BATTERY CONNECTION).

11. Adjust the door hinge positions as necessary to achieve proper door spacing and operation.

## EXTERIOR HANDLE

### REMOVAL

1. Remove the trim panel from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Remove the speaker from the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
3. Remove the watershield from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL).
4. Remove the screw (3) that secures the bottom of the pull cup bracket (2) and the bottom of the window regulator rear rail to the inside of the front door.
5. Loosen the screw (1) that secures the top of the pull cup bracket to the inside of the front door.
6. Disengage the upper pull cup bracket screw from the keyed hole and remove the bracket from the inside of the front door.

7. Reach up into the back of the door shell to unsnap the plastic clip (2) that secures the end of the latch release link to the exterior door handle (1) and disengage the latch release link from the handle.
8. For the driver side handle only, reach up into the back of the door shell to unsnap the plastic clip (3) that secures the end of the lock actuator link to the lock cylinder and disengage the link from the lock cylinder.

9. Remove the three screws (2) from the inside of the door that secure that exterior handle to the door.
10. Remove the handle from the outside of the door.

## INSTALLATION

1. Position the exterior handle (1) to the mounting holes on the outside of the door.
2. From the inside of the door, install and tighten the three screws (2) that secure that exterior handle to the door. Tighten the screws to 5 N·m (44 in. lbs.).

3. For the driver side handle only, reach up into the back of the door shell to engage the lock actuator link (3) to the lock cylinder and snap the plastic clip over the link to secure it to the lock cylinder.
4. Reach up into the back of the door shell to engage the latch release link (2) to the exterior door handle (1) and snap the plastic clip over the link to secure it to the handle.

5. With the upper screw (1) hand-started into the pull cup bracket (2), position the screw into the keyed hole on the inside of the front door.
6. Install and tighten the screw (3) that secures the bottom of the pull cup bracket and the bottom of the window regulator rear rail to the inside of the front door. Tighten the screw to 11 N·m (100 in. lbs.).
7. Tighten the screw that secures the top of the pull cup bracket to the inside of the front door. Tighten the screw to 10 N·m (90 in. lbs.).
8. Reinstall the watershield onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION).
9. Reinstall the speaker onto the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
10. Reinstall the trim panel onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

## GLASS

### REMOVAL

1. Remove the trim panel from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Remove the speaker from the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
3. Remove the inner belt weatherstrip from the front door. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR INNER BELT WEATHERSTRIP - REMOVAL - FRONT).
4. Remove the watershield from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL).
5. Using the regulator, adjust the front door glass (1) position up or down as required for access to the two window regulator glass clamps (3).
6. Loosen the screw (2) in each of the glass clamps far enough to release the glass.
7. From the outside of the front door, lift the glass (1) upward far enough to disengage it from the two glass clamps (2).
8. Lift the rear side of the glass upward and out from the top of the door shell first to unload the glass from the door.

## INSTALLATION

1. From the outside of the front door, insert the front side of the glass (1) into the top of the door shell first to load the glass into the door.
2. Engage the glass into the two window regulator glass clamps (2).

3. Using the regulator, lower the window as required for access to the two window regulator glass clamp screws (2).
4. Tighten the screw in each of the glass clamps. Tighten the screws to 10 N·m (90 in. lbs.).
5. Reinstall the watershield onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION).
6. Reinstall the inner belt weatherstrip onto the front door. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR INNER BELT WEATHERSTRIP - INSTALLATION - FRONT).
7. Reinstall the speaker onto the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
8. Reinstall the trim panel onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

## HINGE

### REMOVAL

1. Remove the front door from the vehicle. (Refer to 23 - BODY/DOOR - FRONT/DOOR - REMOVAL).
2. Mark the upper or lower hinge bracket (2) location on the outside of the lower A-pillar to aid reinstallation.
3. Remove the three screws (1) that secure the hinge bracket to the outside of the lower A-pillar.
4. Remove the hinge bracket from the A-pillar.

5. Mark the upper (1) or lower (4) door hinge location on the hinge face of the front door (2) to aid reinstallation.
6. Remove the screw (5) that secures the hinge to the door.
7. Remove the nut (3) that secures the hinge to the stud on the door.
8. Remove the upper or lower hinge from the hinge face of the door.

## INSTALLATION

1. Position the upper (1) or lower (4) hinge to the hinge face of the front door.
2. Install and tighten the nut (3) that secures the hinge to the stud on the door. Tighten the nut to 28 N·m (21 ft. lbs.).
3. Install and tighten the screw (5) that secures the hinge to the door. Tighten the screw to 28 N·m (21 ft. lbs.).

4. Position the upper or lower hinge bracket (2) onto the outside of the lower A-pillar.
5. Install and tighten the three screws (1) that secure the hinge bracket to the outside of the lower A-pillar. Tighten the screws to 30 N·m (22 ft. lbs.).
6. Reinstall the front door onto the vehicle. (Refer to 23 - BODY/DOOR - FRONT/DOOR - INSTALLATION).

## LATCH

### REMOVAL

1. Remove the trim panel from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Remove the speaker from the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
3. Remove the watershield from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL).
4. Remove the screw (3) that secures the bottom of the pull cup bracket (2) and the bottom of the window regulator rear rail to the inside of the front door.
5. Loosen the screw (1) that secures the top of the pull cup bracket to the inside of the front door.
6. Disengage the upper pull cup bracket screw from the keyed hole and remove the bracket from the inside of the front door.
7. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the interior door latch lock link (1) to the latch lever and disengage the link from the latch (2).

8. Remove the interior door latch lock link and knob unit (2) from the front door (1).

9. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the interior door handle latch release link (4) to the latch lever and disengage the link from the latch (3).
10. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the exterior door handle latch release link (1) to the latch lever and disengage the link from the latch.
11. For the driver side front door only, reach into the back of the door shell to unsnap the plastic clip that secures the end of the lock cylinder lock actuator link (2) to the latch lever and disengage the link from the latch.

12. Remove the three screws (2) that secure the latch (1) to the outer latch face of the front door.

**Note:** Wiring connector can be disconnected much easier after all links are disconnected from latch and latch is unscrewed from door.

13. Reach into the back of the door shell (3) and pull the latch forward far enough to access and disconnect the door wire harness connector (1) from the front door latch (2) connector receptacle.
14. Remove the latch from the interior of the door shell.

## INSTALLATION

**Note:** Wiring connector can be connected much easier with all links disconnected from latch and latch is unscrewed from door.

1. Connect the door wire harness connector (1) to the door latch (2).

2. Position the latch (1) to the latch face on the interior of the front door shell.
3. Install and tighten the three screws (2) that secure the latch to the outer latch face of the front door. Tighten the screws to 12 N·m (108 in. lbs.).

4. For the driver side front door only, reach into the back of the door shell to engage the lock cylinder actuator link (2) to the latch lever and snap the plastic clip over the link to secure it to the latch (3).
5. Reach into the back of the door shell to engage the exterior door handle latch release link (1) to the latch lever and snap the plastic clip over the link to secure it to the latch.
6. Reach into the back of the door shell to engage the end of the interior door handle latch release link (4) to the latch lever and snap the plastic clip over the link to secure it to the latch.

7. Position the interior door latch lock link and knob unit (2) into the front door (1).

8. Reach into the back of the door shell to engage the end of the interior door latch lock link (1) to the latch lever and snap the plastic clip over the link to secure it to the latch (2).

9. With the upper screw (1) hand-started into the pull cup bracket (2), position the screw into the keyed hole on the inside of the front door.
10. Install and tighten the screw (3) that secures the bottom of the pull cup bracket and the bottom of the window regulator rear rail to the inside of the front door. Tighten the screw to 11 N·m (100 in. lbs.).
11. Tighten the screw that secures the top of the pull cup bracket to the inside of the front door. Tighten the screw to 10 N·m (90 in. lbs.).
12. Reinstall the watershield onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/ WATERSHIELD - INSTALLATION).
13. Reinstall the speaker onto the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/ SPEAKER - INSTALLATION).

14. Reinstall the trim panel onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).
15. Use a wrench inserted through the access slot on the outer latch face of the front door shell (1) to loosen the hex socket latch release adjusting screw (3) on the latch (2).
16. Cycle the door outside latch release handle through its full travel two or three times.
17. Tighten the adjusting screw.

## LOCK CYLINDER

### REMOVAL

**Note:** A door lock cylinder is used only on the driver side front door exterior handle.

1. Remove the handle (1) from the outside of the driver side front door. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - REMOVAL).
2. Using hand pressure, push on the face of the lock cylinder (2) until it pops out of the cavity in the back of the door handle.

## INSTALLATION

**Note:** A door lock cylinder is used only on the driver side front door exterior handle.

1. Insert the lock cylinder (2) into the cavity on the back of the door handle (1).
2. Align the lock cylinder in the handle by engaging the tab (3) on the outer circumference of the cylinder in the slot of the tab (4) on the wall of the handle cavity.
3. Reinstall the handle onto the outside of the driver side front door. (Refer to 23 - BODY/DOOR - FRONT/EXTERIOR HANDLE - INSTALLATION).

## STRIKER

### REMOVAL

1. Open the front door.
2. Mark the front door latch striker (3) location on the face of the outer B-pillar (1) to aid reinstallation.
3. Remove the two screws (2) that secure the striker to the B-pillar.
4. Remove the striker from the B-pillar.

## INSTALLATION

1. Position the front door latch striker (3) on the face of the outer B-pillar (1).
2. Install and tighten the two screws (2) that secure the striker to the B-pillar. Tighten the screws to 33 N·m (24 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper door spacing and latch operation.

## TRIM PANEL

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Unsnap and fold back the screw cap below the trim panel pull cup to access and remove the screw (5) that secures the panel (2) to the pull cup bracket.
3. Unsnap and fold back the screw cap within the interior remote handle recess of the trim panel to access and remove the screw (4) that secures the panel to the inside of the door (1).
4. Remove the four screws (6) that secure the bottom and front lower corner of the trim panel to the inside of the door.
5. Remove the three push-pin retainers (3) that secure the trim panel to the inside of the door.

6. Pull the trim panel (2) away from the inside of the door far enough to disengage the locator pins near the top of the panel from the door, then lift the rear of the panel upward far enough to disengage the interior door latch lock link and knob (1) from the clearance hole at the upper rear corner of the panel.

7. Reach between the top of the trim panel (3) and the inside of the door shell to unsnap the plastic clip that secures the end of the interior door handle latch release link (1) to the handle lever (2) and disengage the link from the handle.

8. Pull the trim panel (1) away from the inside of the door shell far enough to access and disconnect the door wire harness (4) connectors from the power window/lock/mirror switches (2), the door module (6), and the door courtesy lamp (5) as the vehicle is equipped.
9. Disengage the retainers (3) that secure the door wire harness to the inside of the trim panel.
10. Remove the trim panel from the inside of the door.

## INSTALLATION

1. Check to be certain that the five spring nuts (1 and 3) are properly installed and in good condition on the inside of the door (2).

2. Check to be certain that the three plug grommets (1 and 2) are properly installed and in good condition on the inside of the door.

3. Position the trim panel (1) close enough to the inside of the door to engage the retainers (3) that secure the door wire harness (4) to the inside of the trim panel.
4. Reconnect the door wire harness connectors to the power window/lock/mirror switches (2), the door module (6), and the door courtesy lamp (5) as the vehicle is equipped.

5. Reach between the top of the trim panel (3) and the inside of the door shell to engage the end of the interior door handle latch release link (1) to the handle lever (2) and snap the plastic clip over the link to secure it to the handle.

6. Lift the trim panel (2) over the inside of the door far enough to engage the interior door latch lock link and knob (1) into the clearance hole at the upper rear corner of the panel.

7. Position the two locator pins (4) on the back of the trim panel (2) to the locator holes (3) on the inside of the door panel and simultaneously push the three upper pins (1) into the grommet plugs near the top of the door. Make certain that the upper edges of the trim panel are engaged in the grooves of the window moldings.

8. Install and tighten the screw (4) that secures the interior remote handle recess of the trim panel (2) to the inside of the door (1). Tighten the screw to 2 N·m (16 in. lbs.). Fold and snap the screw cap over the screw.
9. Install and tighten the screw (5) that secures the trim panel (2) to the pull cup bracket below the trim panel pull cup. Tighten the screw to 2 N·m (16 in. lbs.). Fold and snap the screw cap over the screw.
10. Install the three push-pin retainers (3) that secure the trim panel to the inside of the door.
11. Install and tighten the four screws (6) that secure the bottom and front lower corner of the trim panel to the inside of the door. Tighten the screws to 2 N·m (16 in. lbs.).

**Note:** For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. (Refer to 8 - ELECTRICAL/BATTERY SYSTEM - STANDARD PROCEDURE - BATTERY CONNECTION).

12. Reconnect the battery negative cable.

## WATERSHIELD

### REMOVAL

**CAUTION:** Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Remove the trim panel from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Carefully separate the lower half of the watershield (2) from the inside of the door (1).
3. Lift the lower half of the watershield upward far enough to access and pull the trim panel take outs of the door wire harness out of the slit near the center of the watershield.
4. Carefully separate the upper half of the watershield from the inside of the door.
5. Lift the upper half of the watershield upward far enough to disengage the inside latch lock knob and link and the inside remote latch release handle link from the slit near the upper rear corner of the watershield.
6. Remove the watershield from the door.

## INSTALLATION

**CAUTION:** Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Thread the inside latch lock knob and link and the inside remote latch release handle link through the slit near the upper rear corner of the watershield (2).
2. Place the front and rear dimple formations located in the upper watershield into their respective locator holes in the door (1) inner panel.
3. Apply firm and even pressure to the adhesive bead along the upper edge of the watershield to seal it to the inside of the door.
4. Lift the lower half of the watershield upward far enough to access and pull the trim panel take outs of the door wire harness out of through the slit near the center of the watershield.
5. Apply firm and even pressure to the adhesive bead along the remaining edges of the watershield to seal it to the inside of the door. Be certain that the watershield is sealed to the inside of the door.
6. Reinstall the trim panel onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

## WINDOW REGULATOR

### REMOVAL

1. Remove the trim panel from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - REMOVAL).
2. Remove the speaker from the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - REMOVAL).
3. Remove the watershield from the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - REMOVAL).
4. Remove the screw (3) that secures the bottom of the pull cup bracket (2) and the bottom of the window regulator rear rail to the inside of the front door.
5. Loosen the screw (1) that secures the top of the pull cup bracket to the inside of the front door.
6. Disengage the upper pull cup bracket screw from the keyed hole and remove the bracket from the inside of the front door.

7. Using the regulator, adjust the front door glass (1) position up or down as required for access to the two window regulator glass clamps (3).
8. Loosen the screw (2) in each of the glass clamps far enough to release the glass.
9. Lift the glass out of the regulator clamps and into its full up position, then tape the glass securely into place.

10. Remove the two screws (6) that secure the bottom of the front regulator rail (5) and the regulator motor support bracket (4) to the inside of the door.
11. Loosen the two screws (2) that secure the tops of both regulator rails to the keyed holes (1) on the inside of the door.
12. Lift the front regulator rail upward within the door far enough to disengage the screw from the keyed hole in the door.

13. Lower the front regulator rail within the door (1) far enough to access and disconnect the door wire harness connector (4) from the regulator motor (2) through the speaker mounting hole (3) on the inside of the door near the front.
14. Lift the rear regulator rail upward within the door far enough to disengage the screw from the keyed hole in the door.
15. Remove the regulator through the large access hole on the inside of the door near the rear.

## INSTALLATION

1. Load the regulator into the door through the large access hole on the inside of the door near the rear.
2. Engage the screw (2) at the top of the rear regulator rail (3) into the keyed hole (1) on the inside of the door near the rear.

3. Position the front regulator rail within the door (1) so that the door wire harness connector (4) can be reconnected to the regulator motor (2) through the speaker mounting hole (3) on the inside of the door near the front.
4. Engage the screw at the top of the front regulator rail into the keyed hole on the inside of the door near the front.
5. Install and tighten the two screws that secure the bottom of the front regulator rail and the regulator motor support bracket to the inside of the door. Tighten the screws to 10 N·m (90 in. lbs.).
6. Tighten the two screws that secure the tops of both regulator rails to the keyed holes on the inside of the door. Tighten the screws to 10 N·m (90 in. lbs.).

7. Remove the tape securing the door glass in its full up position, then lower the glass to engage it into the two window regulator glass clamps (3).
8. Using the regulator, lower the glass far enough to access the two window regulator glass clamp screws (2).
9. Tighten the screw in each of the glass clamps. Tighten the screws to 10 N·m (90 in. lbs.).

10. With the upper screw (1) hand-started into the pull cup bracket (2), position the screw into the keyed hole on the inside of the front door.
11. Install and tighten the screw (3) that secures the bottom of the pull cup bracket and the bottom of the window regulator rear rail to the inside of the front door. Tighten the screw to 11 N·m (100 in. lbs.).
12. Tighten the screw that secures the top of the pull cup bracket to the inside of the front door. Tighten the screw to 10 N·m (90 in. lbs.).
13. Install the watershield onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/WATERSHIELD - INSTALLATION).
14. Install the speaker onto the inside of the front door. (Refer to 8 - ELECTRICAL/AUDIO/SPEAKER - INSTALLATION).
15. Install the trim panel onto the inside of the front door. (Refer to 23 - BODY/DOOR - FRONT/TRIM PANEL - INSTALLATION).

## DOOR

## REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Open the rear door.
3. Disengage the rear door wire harness boot and connector (1) from the outside of the lower B-pillar (2).

4. Carefully pull the door wire harness boot and connector (2) out from the B-pillar far enough to access and disconnect the body wire harness connector (1).
5. Open the door to the full open position.
6. Support the door with a suitable lifting device.

7. Remove the screw (1) from both the upper and lower rear door hinges that secures the door hinge bracket (3) to the body hinge bracket (2).
8. While still supporting the door, close the door to the intermediate detent position (one detent from the full open position).

9. Raise the rear door (2) upward far enough to disengage the upper and lower hinge pins (3) from the pivots (1) on the upper and lower body hinge brackets.
10. Remove the rear door from the vehicle.

## INSTALLATION

1. Support the rear door (2) with a suitable lifting device.
2. Position the door with the upper and lower hinge pins (3) aligned over the pivots (1) on the upper and lower body hinge brackets.
3. Lower the door far enough to engage the hinge pins into the pivot holes.
4. While still supporting the door, open the door to the full open position.

5. Align the holes in the upper and lower rear door hinge brackets (3) with those in the body hinge brackets (2).
6. Install and tighten the screw (1) into both the upper and lower rear door hinge to secure the door hinge brackets to the body hinge brackets. Tighten the screws to 42 N·m (31 ft. lbs.).
7. Remove the lifting device supporting the door.

8. Carefully pull the body wire harness connector (1) out from the B-pillar far enough to reconnect it to the door wire harness boot and connector (2).

9. Engage the rear door wire harness boot and connector (1) into the wiring clearance hole on the outside of the lower B-pillar (2).
10. Reconnect the battery negative cable.
11. Adjust the door hinge positions as necessary to achieve proper door spacing and operation.

## EXTERIOR HANDLE

### REMOVAL

1. Remove the trim panel from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - REMOVAL).
2. Remove the watershield from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - REMOVAL).
3. Remove the door glass channel and bracket from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/GLASS RUN CHANNEL - REMOVAL).
4. Remove the latch from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/LATCH - REMOVAL).
5. Remove the three screws (2) from the inside of the door that secure that exterior handle (1) to the door.
6. Remove the handle from the outside of the door.

## INSTALLATION

1. Position the exterior handle (1) to the mounting holes on the outside of the door.
2. From the inside of the door, install and tighten the three screws (2) that secure that exterior handle to the door. Tighten the screws to 5 N·m (44 in. lbs.).
3. Reinstall the latch to the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/LATCH - INSTALLATION).
4. Reinstall the door glass channel and bracket to the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/GLASS RUN CHANNEL - INSTALLATION).
5. Reinstall the watershield onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - INSTALLATION).
6. Reinstall the trim panel onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - INSTALLATION).

## GLASS

### REMOVAL

1. Remove the trim panel from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - REMOVAL).
2. Remove the inner belt weatherstrip from the rear door. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR INNER BELT WEATHERSTRIP - REMOVAL-REAR).
3. Remove the watershield from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - REMOVAL).
4. Remove the glass channel and bracket from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/GLASS RUN CHANNEL - REMOVAL).
5. Using the regulator, adjust the rear door glass (1) position up or down as required for access to the two window regulator glass clamps (2).
6. Loosen the screw (2) in each of the glass clamps far enough to release the glass.

7. From the outside of the rear door, lift the glass (1) upward far enough to disengage it from the two glass clamps (2).
8. Lift the glass upward and out from the top of the door shell to unload the glass from the door.

## INSTALLATION

1. From the outside of the rear door, insert the rear door glass (1) into the top of the door shell to load the glass into the door.
2. Engage the glass into the two window regulator glass clamps (2).

3. Using the regulator, lower the window as required for access to the two window regulator glass clamp screws (3).
4. Tighten the screw in each of the glass clamps. Tighten the screws to 10 N·m (90 in. lbs.).
5. Reinstall the glass channel and bracket onto the inside of the rear door. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION).
6. Reinstall the watershield onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - INSTALLATION).
7. Reinstall the inner belt weatherstrip onto the rear door. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR INNER BELT WEATHERSTRIP - INSTALLATION-REAR).

8. Reinstall the trim panel onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - INSTALLATION).

## GLASS RUN CHANNEL

### REMOVAL

1. Remove the trim panel from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - REMOVAL).
2. Remove the watershield from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - REMOVAL).
3. Loosen the two screws (1) that secure the rear door glass channel and bracket (2) to the inside of the rear door.
4. Disengage the two screws from the keyed holes near the back of the inner door panel and remove the channel and bracket from the interior of the rear door.

### INSTALLATION

1. Position the rear door glass channel and bracket (2) into the interior of the rear door.
2. Engage the two screws (1) into the keyed holes near the back of the inner door panel.
3. Tighten the two screws that secure the channel and bracket to the inside of the rear door. Tighten the screws to 10 N·m (90 in. lbs.).
4. Reinstall the watershield onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - INSTALLATION).
5. Reinstall the trim panel onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - INSTALLATION).

## HINGE

### REMOVAL

1. Remove the rear door from the vehicle. (Refer to 23 - BODY/DOOR - REAR/DOOR - REMOVAL).
2. Mark the upper (2) or lower (4) hinge bracket location on the outside of the lower B-pillar (1) to aid reinstallation.
3. Remove the two screws (3) that secure the hinge bracket to the outside of the lower B-pillar.
4. Remove the hinge bracket from the B-pillar.

5. Mark the upper (1) or lower (4) door hinge location on the hinge face of the rear door (3) to aid reinstallation.
6. Remove the screw (6) that secures the hinge to the door.
7. Remove the nut (5) that secures the hinge to the stud (2) on the door.
8. Remove the upper or lower hinge from the hinge face of the door.

## INSTALLATION

1. Position the upper (1) or lower (4) hinge to the hinge face of the rear door (3).
2. Install and tighten the nut (5) that secures the hinge to the stud (2) on the door. Tighten the nut to 28 N·m (21 ft. lbs.).
3. Install and tighten the screw (6) that secures the hinge to the door. Tighten the screw to 28 N·m (21 ft. lbs.).

4. Position the upper (2) or lower (4) hinge bracket onto the outside of the lower B-pillar (1).
5. Install and tighten the two screws (3) that secure the hinge bracket to the outside of the lower B-pillar. Tighten the screws to 30 N·m (22 ft. lbs.).
6. Reinstall the rear door onto the vehicle. (Refer to 23 - BODY/DOOR - REAR/DOOR - INSTALLATION).

## LATCH

### REMOVAL

1. Remove the trim panel from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - REMOVAL).
2. Remove the watershield from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - REMOVAL).
3. Remove the door glass channel and bracket from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/GLASS RUN CHANNEL - REMOVAL).
4. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the interior door latch lock link (1) to the latch lever and disengage the link from the latch (2).
5. Remove the interior door latch lock link and knob unit from the rear door.
6. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the interior door handle latch release link (3) to the latch lever and disengage the link from the latch.
7. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the exterior door handle latch release link (4) to the latch lever and disengage the link from the latch.
8. Remove the three screws (2) that secure the latch (3) to the outer latch face of the rear door (1).

**Note:** Wiring connector can be disconnected much easier after all links are disconnected from latch and latch is unscrewed from door.

9. Reach into the back of the door shell (3) and pull the latch forward far enough to access and disconnect the door wire harness connector (1) from the front door latch (2).
10. Remove the latch from the interior of the door shell.

## INSTALLATION

**Note:** Wiring connector can be connected much easier with all links disconnected from latch and latch is unscrewed from door.

1. Connect the door wire harness connector (1) to the door latch (2).

2. Position the latch (3) to the latch face on the interior of the rear door shell (1).
3. Install and tighten the three screws (2) that secure the latch to the outer latch face of the rear door. Tighten the screws to 12 N-m (108 in. lbs.).

4. Reach into the back of the door shell to engage the exterior door handle latch release link (4) to the latch (2) lever and snap the plastic clip over the link to secure it to the latch.
5. Reach into the back of the door shell to engage the end of the interior door handle latch release link (3) to the latch lever and snap the plastic clip over the link to secure it to the latch.

6. Position the interior door latch lock link and knob unit (2) into the rear door (1).
7. Reach into the back of the door shell to engage the end of the interior door latch lock link to the latch lever and snap the plastic clip over the link to secure it to the latch.
8. Reinstall the door glass channel and bracket to the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/GLASS RUN CHANNEL - INSTALLATION).
9. Reinstall the watershield onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - INSTALLATION).
10. Reinstall the trim panel onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - INSTALLATION).

11. Use a wrench inserted through the access slot on the outer latch face of the rear door shell to loosen the hex socket latch release adjusting screw (2) on the latch (1).
12. Cycle the door outside latch release handle through its full travel two or three times.
13. Tighten the adjusting screw.

## STRIKER

### REMOVAL

1. Open the rear door.
2. Mark the rear door latch striker (3) location on the face of the outer C-pillar (1) to aid reinstallation.
3. Remove the two screws (2) that secure the striker to the C-pillar.
4. Remove the striker from the C-pillar.

### INSTALLATION

1. Position the rear door latch striker (3) on the face of the outer C-pillar (1).
2. Install and tighten the two screws (2) that secure the striker to the C-pillar. Tighten the screws to 33 N·m (24 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper door spacing and latch operation.

## TRIM PANEL

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Unsnap and fold back the screw cap below the trim panel pull cup to access and remove the screw (5) that secures the panel (2) to the pull cup bracket.
3. Unsnap and fold back the screw cap within the interior remote handle recess of the trim panel to access and remove the screw (4) that secures the panel to the inside of the door (1).
4. Remove the four screws (6) that secure the bottom and front lower corner of the trim panel to the inside of the door.
5. Remove the three push-pin retainers (3) that secure the trim panel to the inside of the door.

6. Pull the trim panel (2) away from the inside of the door far enough to disengage the locator pins near the top of the panel from the door, then lift the rear of the panel upward far enough to disengage the interior door latch lock link and knob (1) from the clearance hole at the upper rear corner of the panel.

7. Reach between the top of the trim panel (3) and the inside of the door shell to unsnap the plastic clip that secures the end of the interior door handle latch release link (1) to the handle lever (2) and disengage the link from the handle.
8. Pull the trim panel away from the inside of the door shell far enough to access and disconnect the door wire harness connector (5) from the power window switch (4).
9. Remove the trim panel from the inside of the door.

## INSTALLATION

1. Check to be certain that the five spring nuts (1 and 2) are properly installed and in good condition on the inside of the door (3).

2. Check to be certain that the two plug grommets (2) are properly installed and in good condition on the inside of the door (1).

3. Position the trim panel (3) close enough to the inside of the door to reconnect the door wire harness connector (5) to the power window switch (4).
4. Reach between the top of the trim panel and the inside of the door shell to engage the end of the interior door handle latch release link (1) to the handle lever (2) and snap the plastic clip over the link to secure it to the handle.

5. Lift the trim panel (2) over the inside of the door far enough to engage the interior door latch lock link and knob (1) into the clearance hole at the upper rear corner of the panel.

6. Position the two locator pins (4) on the back of the trim panel (2) to the locator holes (3) on the inside of the door panel and simultaneously push the two upper pins (1) into the grommet plugs near the top of the door. Make certain that the upper edges of the trim panel are engaged in the grooves of the window moldings.

7. Install and tighten the screw (4) that secures the interior remote handle recess of the trim panel (2) to the inside of the door (1). Tighten the screw to 2 N·m (16 in. lbs.). Fold and snap the screw cap over the screw.
8. Install and tighten the screw (5) that secures the trim panel (2) to the pull cup bracket below the trim panel pull cup. Tighten the screw to 2 N·m (16 in. lbs.). Fold and snap the screw cap over the screw.
9. Install the three push-pin retainers (3) that secure the trim panel to the inside of the door.
10. Install and tighten the four screws (6) that secure the bottom and front lower corner of the trim panel to the inside of the door. Tighten the screws to 2 N·m (16 in. lbs.).
11. Reconnect the battery negative cable.

## WATERSHIELD

### REMOVAL

**CAUTION:** Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

**Do not damage the watershield during removal and installation.**

**If the watershield becomes contaminated or damaged, replace the watershield.**

1. Remove the trim panel from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - REMOVAL).
2. Carefully separate the lower half of the watershield (2) from the inside of the door (1).
3. Lift the lower half of the watershield upward far enough to access and pull the trim panel take out of the door wire harness out of the slit near the front of the watershield.
4. Carefully separate the upper half of the watershield from the inside of the door.
5. Pull the upper front half of the watershield away from the inside of the door far enough to disengage the inside remote latch release handle link from the slit in the upper center area of the watershield.
6. Lift the upper half of the watershield upward far enough to disengage the inside latch lock knob and link from the slit in the upper rear corner of the watershield.
7. Remove the watershield from the door.

## INSTALLATION

**CAUTION:** Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Thread the inside latch lock knob and link through the slit near the upper rear corner of the watershield (2).
2. Thread the inside remote latch release handle link through the slit in the upper center area of the watershield.
3. Place the front and rear dimple formations located in the upper watershield into their respective locator holes in the door (1) inner panel.
4. Apply firm and even pressure to the adhesive bead along the upper edge of the watershield to seal it to the inside of the door.
5. Lift the lower half of the watershield upward far enough to access and pull the trim panel take out of the door wire harness out of through the slit near the front of the watershield.
6. Apply firm and even pressure to the adhesive bead along the remaining edges of the watershield to seal it to the inside of the door. Be certain that the watershield is sealed to the inside of the door.
7. Reinstall the trim panel onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - INSTALLATION).

## WINDOW REGULATOR

### REMOVAL

1. Remove the trim panel from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - REMOVAL).
2. Remove the watershield from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATER-SHIELD - REMOVAL).
3. Remove the door glass channel and bracket from the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/GLASS RUN CHANNEL - REMOVAL).
4. Remove the screw (2) that secures the bottom of the pull cup bracket (1) to the inside of the rear door.
5. Loosen the screw that secures the top of the pull cup bracket to the inside of the rear door.
6. Disengage the upper pull cup bracket screw from the keyed hole and remove the bracket from the inside of the rear door.

7. Using the regulator, adjust the rear door glass (1) position up or down as required for access to the two window regulator glass clamps (2).
8. Loosen the screw (2) in each of the glass clamps far enough to release the glass.
9. Lift the glass out of the regulator clamps and into its full up position, then tape the glass securely into place.

10. Remove the screw (1) that secures the top of the rear regulator rail (2) to the inside of the door.
11. Remove the screw (4) that secures the regulator motor support bracket to the inside of the door.
12. Loosen the screw that secures the bottom of the regulator rail to the keyed hole (3) on the inside of the door.
13. Lift the rear regulator rail upward within the door far enough to disengage the screw from the keyed hole in the door.

14. Lower the rear regulator within the door (3) far enough to access and disconnect the door wire harness connector (1) from the regulator motor (2) through the large access hole on the inside of the door near the front.
15. Remove the regulator through the large access hole on the inside of the door.

## INSTALLATION

1. Load the regulator into the door (3) through the large access hole on the inside of the door near the front.
2. Position the rear regulator within the door so that the door wire harness connector (1) can be reconnected to the regulator motor (2) through the large access hole on the inside of the door.

3. Engage the screw at the bottom of the rear regulator rail (2) into the keyed hole (3) on the inside of the door near the bottom.
4. Install and tighten the screw (1) that secures the top of the rear regulator rail to the inside of the door. Tighten the screw to 10 N·m (90 in. lbs.).
5. Install and tighten the screw (4) that secures the regulator motor support bracket to the inside of the door. Tighten the screw to 10 N·m (90 in. lbs.).
6. Tighten the screw that secures the bottom of the regulator rail to the keyed hole on the inside of the door. Tighten the screw to 10 N·m (90 in. lbs.).

7. Remove the tape securing the door glass in its full up position, then lower the glass to engage it into the two window regulator glass clamps (2).
8. Using the regulator, lower the glass far enough to access the two window regulator glass clamp screws (3).
9. Tighten the screw in each of the glass clamps. Tighten the screws to 10 N·m (90 in. lbs.).

10. With the upper screw hand-started into the pull cup bracket (1), position the screw into the keyed hole on the inside of the rear door.
11. Install and tighten the screw (2) that secures the bottom of the pull cup bracket to the U-nut (3) on the inside of the rear door. Tighten the screw to 11 N·m (100 in. lbs.).
12. Tighten the screw that secures the top of the pull cup bracket to the inside of the rear door. Tighten the screw to 10 N·m (90 in. lbs.).
13. Reinstall the glass channel and bracket onto the inside of the rear door. (Refer to 23 - BODY/DOORS - REAR/GLASS RUN CHANNEL - INSTALLATION).
14. Reinstall the watershield onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/WATERSHIELD - INSTALLATION).
15. Reinstall the inner belt weatherstrip onto the rear door. (Refer to 23 - BODY/WEATHERSTRIP/SEALS/DOOR INNER BELT WEATHERSTRIP - INSTALLATION-REAR).
16. Reinstall the trim panel onto the inside of the rear door. (Refer to 23 - BODY/DOOR - REAR/TRIM PANEL - INSTALLATION).

BELLY PAN

REMOVAL

1. Raise and support the vehicle.
2. Remove the screws (1) that secure the front belly pan (2) to the underside of the vehicle.
3. Remove the front belly pan from the underside of the vehicle.

4. Remove the screws (1) that secure the rear belly pan (2) to the underside of the vehicle.
5. Remove the rear belly pan from the underside of the vehicle.

## INSTALLATION

1. Position the rear belly pan (2) to the underside of the vehicle.
2. Install the screws (1) that secure the rear belly pan to the underside of the vehicle. Tighten the screws securely.

3. Position the front belly pan (2) to the underside of the vehicle.
4. Install the screws (1) that secure the front belly pan to the underside of the vehicle. Tighten the screws securely.
5. Lower the vehicle.

## CLADDING-BODY SIDE

### REMOVAL

1. Raise and support the vehicle.
2. Remove the wheels from the side of the vehicle being serviced (Refer to 22 - TIRES/WHEELS - REMOVAL).
3. Remove the pop rivets (2 and 5) from the front fender (1) and rear quarter panel (6).
4. Remove the rear body side cladding (4) by disengaging the cladding retaining clips from the rocker panel (7).
5. Remove the front body side cladding (3) by disengaging the retaining clip from the front fender.

### INSTALLATION

1. Position the front body side cladding (3) to the front fender (1).
2. Engaging the front cladding retaining clip to the front fender.
3. Position the rear body side cladding (4) to the rocker panel (6).
4. Engaging the rear cladding retaining clips to the rocker panel.
5. Install the pop rivets (2 and 5).

6. Install the wheels (Refer to 22 - TIRES/WHEELS - INSTALLATION).
7. Lower the vehicle.

## PANEL-COWL TOP

### REMOVAL

1. Remove the two push pins (2) that secure the front cowl top panel (1) to the right rear corner of the engine compartment
2. Remove the front cowl top panel.

3. Remove the windshield wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).
4. Remove the push-pin (2) that secures each end of the cowl top panel (1) to each front fender (7).
5. Disengage the two 1/4-turn fasteners (3) that secure the cowl top panel to the dash panel (5).
6. Remove the six push-pins (4) that secure the cowl top panel to the strut tower support (6).
7. Disengage the integral retaining clips that secure the cowl top panel to the dash panel and remove the cowl panel from the engine compartment.

## INSTALLATION

1. Position the cowl top panel (1) into the engine compartment.
2. Engage the integral retaining clips that secure the cowl top panel to the dash panel (5).
3. Install the six push-pins (4) that secure the cowl top panel to the strut tower support (6).
4. Engage the 1/4-turn fasteners (3) that secure cowl top panel to the dash panel.
5. Install the push-pin (2) that secures each end of the cowl top panel to each front fender (7).
6. Install the windshield wiper arms (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

7. Position the front cowl top panel (1) to the right rear corner of the engine compartment.
8. Install the two push-pins (2) that secure the front cowl top panel.

## GRILLE

### REMOVAL

**Note:** Take the proper precautions to protect the face of the front fascia from cosmetic damage.

1. Remove the front fascia (1) and place it on a work-bench (Refer to 13 - FRAME & BUMPERS/BUMPERS/Front fascia - Removal).
2. Remove the screws (2) that secure the grille (3) to the inside of the front fascia.
3. Remove the grille from the front fascia.

### INSTALLATION

1. Position the grille into the front fascia.
2. Install the screws that secure the grille to the front fascia. Tighten the screws securely.
3. Install the front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/Front fascia - Installation).

## RACK-LUGGAGE

### REMOVAL

1. If equipped, remove the luggage rack crossbars (Refer to 23 - BODY/EXTERIOR/LUGGAGE RACK CROSSBAR - REMOVAL).
2. Remove the end caps (1) from the luggage rack bars (2) by gently prying up on the end cap to disengage the two integral retainers (3).

3. Remove the two nuts (1) that secure each end of the luggage rack crossbars (2) to the top of the vehicle.
4. Remove the luggage rack crossbars from the top of the vehicle.

### INSTALLATION

1. Position the luggage rack crossbars (2) onto the top of the vehicle.
2. Install the two nuts (1) that secure each end of the luggage rack crossbars to the top of the vehicle. Tighten the nuts to 7 N·m (60 in. lbs.).

3. Position the end cap (1) onto each end of the luggage rack crossbars (2).
4. Push down firmly on the end caps until the integral retainers (3) fully engage the crossbars.
5. If removed, install the luggage rack crossbars (Refer to 23 - BODY/EXTERIOR/LUGGAGE RACK CROSSBAR - INSTALLATION).

## RACK-LUGGAGE - CROSSBAR

### REMOVAL

1. Remove the two screws (1) that secure the front luggage rack crossbar (2) to the luggage rack bars (3).
2. Lift the handle on the four luggage rack crossbar levers (4) and then turn the levers counter - clock-wise to loosen lower clamps (5).
3. Turn the lower clamps towards the center of the vehicle.
4. Remove the front luggage rack crossbar and the rear luggage rack crossbar (6) from the luggage rack bars.

## INSTALLATION

**Note:** Do not place the front luggage rack crossbar directly over the sunroof glass, if equipped.

1. Position the front luggage rack crossbar (2) onto the luggage rack bars (3).
2. Install the two screws (1) that secure the front luggage rack crossbar to the luggage rack bars. Tighten the screws securely.
3. Position the rear luggage rack crossbar (6) onto the luggage rack bars.
4. Turn the lower clamps (5) towards the outside of vehicle.
5. Turn the handle on the four luggage rack crossbar levers (4) clockwise until the lower clamps are tight on the luggage rack bars.
6. Flip the handle on the four luggage rack crossbar levers down and attempt to move the crossbars to ensure that they are properly locked into position.

7.

## CROSSMEMBER-HEADLAMP MOUNTING

### REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - REMOVAL).
3. Remove the headlamp units (1) (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).

4. Disconnect the headlamp wire harness from the horns.
5. Remove the bolts that secure the horns to the headlamp mounting crossmember and remove the horns.

6. Mark the location of the hood latch (2) on the front of the headlamp mounting crossmember (1) to aid in reinstallation.
7. Remove the two bolts (3) that secure the hood latch to the headlamp mounting crossmember and position the hood latch and cable out of the way.

8. Remove the bolts (2) that secure the radiator mounting brackets (1) to the headlamp mounting crossmember.

**Note:** Mark the location of the headlamp mounting crossmember to the other body components prior to removal of the crossmember to aid in reinstallation.

9. Mark the location of the headlamp mounting crossmember (1) to the front fenders.
10. Remove the bolts (2 and 3) that secure the headlamp mounting crossmember to the front fenders.
11. Remove the bolts (4) that secure the headlamp mounting crossmember to the front frame rails (5).
12. Remove the headlamp mounting crossmember from the engine compartment.

## INSTALLATION

1. Position the headlamp mounting crossmember (1) into the engine compartment.
2. Loosely install the bolts (2 and 3) that secure the headlamp mounting crossmember to the front fenders.
3. Loosely install the bolts (4) that secure the headlamp mounting crossmember to the front frame rails (5).
4. Align the headlamp mounting crossmember using the alignment marks previously indicated and tighten all of the retaining bolts to 28 N·m (21 ft. lbs.).

5. Install the bolts (2) that secure the radiator mounting bracket (1) to the headlamp mounting crossmember. Tighten the bolts to 5 N·m (45 in. lbs.).

6. Position the latch (2) to the front of the crossmember (1).
7. Loosely install the two bolts (3) that secure the hood latch to the headlamp mounting crossmember.
8. Align the hood latch using the alignment marks previously indicated and tighten the hood latch bolts to 28 N·m (21 ft. lbs. ).

9. Install the horns onto the headlamp mounting crossmember. Tighten the bolts to 28 N·m (21 ft. lbs. ).
10. Connect the headlamp wire harness to the horns.

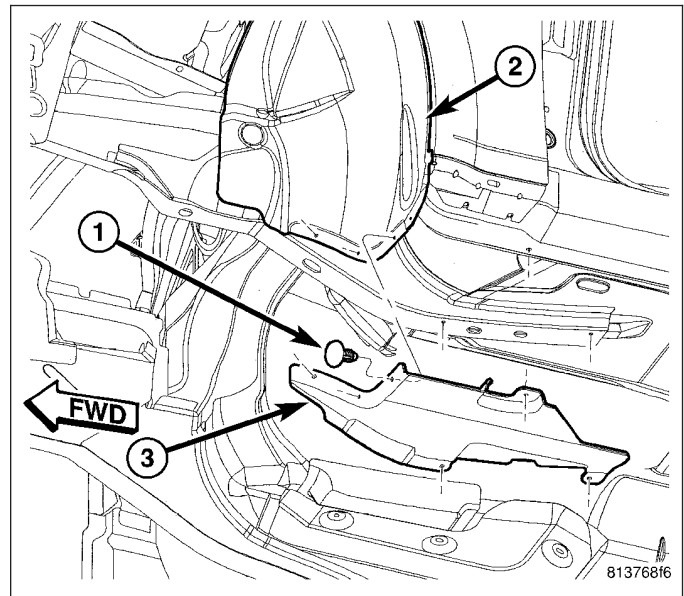

11. Install the headlamp units (1) (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).
12. Install the front fascia (Refer to 13 - FRAME & BUMPERS/BUMPERS/FRONT FASCIA - INSTALLATION).
13. Reconnect the negative battery cable.
14. Carefully close the hood and verify hood latch and panel alignment. Adjust as necessary.

## SHIELD-WHEELHOUSE - FRONT

### REMOVAL

1. Raise and support the vehicle.
2. Remove the wheels from the side of the vehicle being serviced (Refer to 22 - TIRES/WHEELS - REMOVAL).
3. Remove the body side cladding from the side of the vehicle being serviced (Refer to 23 - BODY/EXTERIOR/BODY SIDE CLADDING - REMOVAL).
4. Remove the push-pins (1) that secure the lower front wheelhouse shield (3) to the front wheelhouse shield (3) and the body.
5. Remove lower front wheelhouse shield from the vehicle.

6. Remove the front belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - REMOVAL).
7. Remove the push-pins (2) that secure the front wheelhouse shield (1) to the body.
8. Remove the front wheelhouse shield from the vehicle.

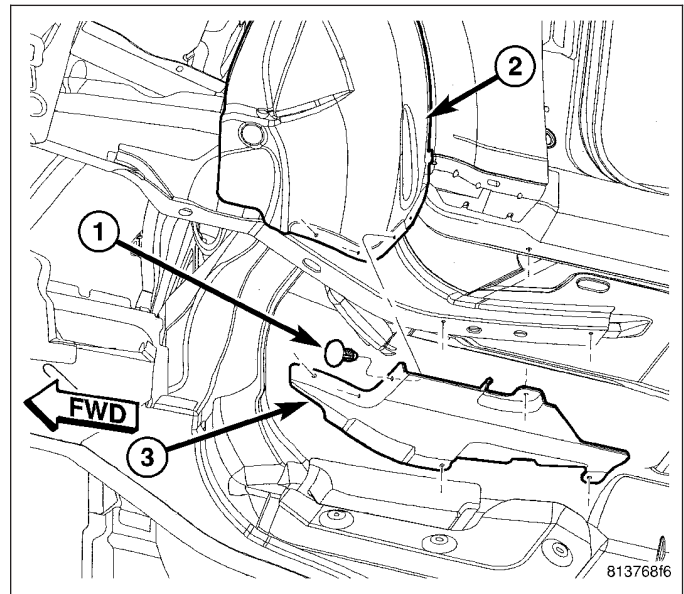

## INSTALLATION

1. Position the front wheelhouse shield (1) into the front fenderwell.
2. Install the push-pin (2) that secure the front wheelhouse shield to the body.
3. Install the front belly pan (Refer to 23 - BODY/EXTERIOR/BELLY PAN - INSTALLATION).

4. Position the lower front wheelhouse shield (3) onto the body.
5. Install the push-pins (1) that secure the lower front wheelhouse shield to the front wheelhouse shield (2) and the body.
6. Install the body side cladding (Refer to 23 - BODY/EXTERIOR/BODY SIDE CLADDING - INSTALLATION).
7. Install the front wheels (Refer to 22 - TIRES/WHEELS - INSTALLATION).
8. Lower the vehicle.

## SHIELD-WHEELHOUSE - REAR

### REMOVAL

1. Raise and support the vehicle.
  2. Remove the wheels from the side of the vehicle being serviced (Refer to 22 - TIRES/WHEELS - REMOVAL).
  3. Remove the rear portion of the body side cladding from the side of the vehicle being serviced (Refer to 23 - BODY/EXTERIOR/BODY SIDE CLADDING - REMOVAL).
  4. Remove the nuts (1), bolt (2) and the push-pins (4), that secure the lower rear wheelhouse shield (3) to the body.
  5. Remove lower rear wheelhouse shield from the vehicle.
- 
6. Remove the push-pins (1) that secure the rear wheelhouse shield (2) to the body.
  7. Remove the rear wheelhouse shield from the vehicle.

## INSTALLATION

1. Position the rear wheelhouse shield (2) into the rear wheelwell.
2. Install the push-pins (1) that secure the rear wheelhouse shield to the body.

3. Position the lower rear wheelhouse shield (3) onto the body.
4. Install the nuts (1), bolt (2) and the push-pins (4) that secure the lower rear wheelhouse shield to the body. Tighten the nuts and the bolt securely.
5. Install the rear portion of the body side cladding (Refer to 23 - BODY/EXTERIOR/BODY SIDE CLADDING - INSTALLATION).
6. Install the wheels (Refer to 22 - TIRES/WHEELS - INSTALLATION).
7. Lower the vehicle.

## SPOILER

### REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the lift gate upper trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
3. Disconnect the rear washer fluid supply hose (1).
4. Disconnect the CHMSL wire harness connector (2).
5. Remove the nuts (3) that secure the rear spoiler to the liftgate (4).

6. Partially remove the rear spoiler (1) from the liftgate to access the wire harness and washer fluid supply hose (2).
7. Remove the rubber grommet from the right top of the lift gate and route the wire harness and washer fluid supply hose through the opening in the liftgate.
8. Remove rear spoiler from the vehicle.

## INSTALLATION

1. Position the rear spoiler (1) to the vehicle.
2. Route the wire harness and rear washer fluid supply hose (2) through the opening in the liftgate and install the grommet to the liftgate.
3. Install the rear spoiler onto the liftgate.

4. Install the nuts (3) that secure the rear spoiler to the liftgate (4). Tighten the nuts securely.
5. Connect the CHMSL wire harness connector (2) and the washer fluid supply hose (1).
6. Install the liftgate upper trim panel (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).
7. Connect the negative battery cable.

## MIRROR-SIDE VIEW

### REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the trim panel from the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/PANEL-TRIM - REMOVAL).
3. Remove the two push pins (2) that secure the window trim molding (1) to the front door.
4. Remove the window trim molding to gain access to the mirror fasteners.

5. Disconnect the door wire harness connector (4) from the mirror electrical connector (2).
6. Remove the three nuts (1) that secure the outside rearview mirror (3) to the front door.
7. Remove the outside rearview mirror from the front door.

## INSTALLATION

1. Position the outside rearview mirror (3) to the front door.
2. Install the three nuts (1) that secure the mirror to the front door. Tighten the nuts to 7 N·m (60 in. lbs.).
3. Connect the door wire harness connector (4) to the mirror electrical connector (2).

4. Install the window trim molding (1) onto the front door.
5. Install the two push pins (2) that secure the window trim molding to the front door.
6. Install the trim panel to the inside of the front door (Refer to 23 - BODY/DOOR - FRONT/PANEL-TRIM - INSTALLATION).
7. Reconnect the negative battery cable.

## GLASS-SIDE VIEW MIRROR

### REMOVAL

**WARNING:** Always wear eye and hand protection when servicing the mirror glass. Failure to observe these warnings may result in personal injury from broken glass.

1. Position the mirror glass (1) so that it is facing in toward the vehicle as far as possible.
2. Disconnect and isolate the negative battery cable.
3. Using a trim stick C-4755 or equivalent flat bladed tool (2), release the two outer mirror glass holder retaining clips from the mirror motor by inserting the trim stick between the mirror glass holder and the mirror motor.

4. Carefully pull/pry the outside edges of the mirror glass holder (1) away from the mirror motor (2) to disengage the remaining six mirror glass retaining clips (3) from the mirror motor.
5. Separate the mirror glass holder from the mirror motor and disconnect the mirror wire harness from the heated glass electrical connector, if equipped.

## INSTALLATION

1. Connect the mirror wire harness to the heated glass electrical connector, if equipped.
2. Position the mirror glass holder (1) to the mirror assembly and align the eight mirror glass retaining clips (3) to the mirror motor (2).

**Note:** Pressure must be applied equally over the center portion of the mirror glass to fully engage the mirror glass retaining clips to the mirror motor.

3. Using one hand, carefully push the mirror glass holder (1) onto the mirror motor, while at the same time supporting the mirror housing (2) from the backside with the other hand. Firmly push on the mirror glass holder until all eight mirror glass retaining clips are fully engaged.
4. Verify retention of the mirror glass holder by gently pulling outward on the glass.
5. Reconnect the negative battery cable.

# HOOD

## ADJUSTMENT BUMPER

### REMOVAL

1. Open and support the hood.
2. Unscrew the hood adjuster bumper (1) from the mounting hole in the top of the headlamp mounting crossmember (2).
3. Remove the bumper from the vehicle.

### INSTALLATION

1. Screw the hood adjuster bumper (1) into the mounting hole in the top of the headlamp mounting crossmember (2).
2. Thread the bumper in or out of the crossmember as necessary to achieve proper hood closing and alignment.
3. Close the hood.

## HINGE

### REMOVAL

1. Open and support the hood (2) with a suitable prop or block.
2. If the vehicle is so equipped, disconnect the upper end of the gas support cylinder from the upper bracket of the hood hinge (3). (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - REMOVAL).
3. Mark the location of the hood hinge upper bracket on the hood (2) inner panel to aid reinstallation.
4. Remove the two screws (1) that secure the hinge to the hood.
5. Mark the hinge lower bracket location on the inside of the front fender ledge (5) to aid reinstallation.
6. Remove the two screws (4) that secure the hinge to the fender.
7. Remove the hood hinge from the vehicle.

### INSTALLATION

1. Position the lower bracket of the hood hinge (3) to the inside of the front fender ledge (5) on the vehicle.
2. Install and tighten the two screws (4) that secure the hinge to the fender. Tighten the screws to 28 N·m (21 ft. lbs.).
3. Position the hood panel (2) to the upper hinge bracket on the vehicle.
4. Install and tighten the two screws (2) that secure the hinge to the hood. Tighten the screws to 28 N·m (21 ft. lbs.).
5. If the vehicle is so equipped, reinstall the upper end of the gas support cylinder to the upper hinge bracket. (Refer to 23 - BODY/HOOD/SUPPORT CYLINDER - INSTALLATION).
6. Remove the fixture being used to support the hood for service and close the hood.
7. Adjust the hood hinge position as necessary to achieve proper spacing and operation.

## HOOD

### REMOVAL

1. Open and support the hood (2).
2. Disconnect the washer supply hose between the body and the two washer nozzles on the underside of the hood.
3. Mark both upper hinge bracket (3) locations on the hood inner panel to aid reinstallation.
4. With the aid of an assistant, support the hood while removing the two screws (1) that secure each upper hinge bracket to the hood.
5. Remove the hood from the vehicle.

### INSTALLATION

1. With the aid of an assistant, support and position the hood panel (2) to the two upper hinge brackets (3) on the vehicle.
2. Install and tighten the two screws (1) that secure each upper hinge bracket to the hood. Tighten the screws to 28 N·m (21 ft. lbs.).
3. Reconnect the washer supply hose between the body and the two washer nozzles on the underside of the hood.
4. Close the hood.
5. Adjust the hood hinge positions and the hood adjuster bumpers as necessary to achieve proper spacing and operation.

## LATCH

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Unsnap the left underhood appearance cover (4) from the headlamp mounting crossmember (1).
3. Disengage the interlocking feature on the inboard end of the left underhood appearance cover from the inboard end of the right cover (2) and remove it from the vehicle.
4. Unsnap the right underhood appearance cover from the headlamp mounting crossmember and remove it from the vehicle.

5. Mark the location of the hood latch (2) on the front of the headlamp mounting crossmember (1) to aid reinstallation.
6. Remove the two screws (3) that secure the latch to the front of the crossmember.

7. Pull the latch (1) away from the front of the crossmember far enough to access and disengage the hood latch release cable housing from the latch and the cable ball end (2) from the latch lever.
8. Remove the hood latch from the vehicle.

## INSTALLATION

1. Position the hood latch (1) close enough to the front of the headlamp mounting crossmember to access and engage the hood latch release cable ball end (2) to the latch lever and the cable housing to the latch.

2. Position the latch (2) to the front of the crossmember (1).
3. Install and tighten the two screws (3) that secure the latch to the crossmember. Tighten the screws to 28 N·m (21 ft. lbs.).
4. Adjust the latch position as necessary to achieve proper hood latch operation.

5. Position the right underhood appearance cover (2) to the headlamp mounting crossmember (1).
6. Using hand pressure, press the right appearance cover downward until each of the integral clips (3) snaps into the receptacles in the headlamp mounting crossmember.
7. Engage the interlocking feature on the inboard end of the left appearance cover (4) with the inboard end of the right cover and position it to the headlamp mounting crossmember.
8. Using hand pressure, press the left appearance cover downward until each of the integral clips snaps into the receptacles in the headlamp mounting crossmember.
9. Reconnect the battery negative cable.

## LATCH RELEASE CABLE

### REMOVAL

1. Remove the hood latch (2) from the vehicle. (Refer to 23 - BODY/HOOD/LATCH - REMOVAL).
2. Remove the left headlamp unit from the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - REMOVAL).
3. Disengage the hood latch release cable from the integral routing clips on the headlamp mounting crossmember and the routing clips (1) along the left side of the engine compartment.

4. From the passenger compartment, remove the closeout panel from beneath the left side of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
5. Unseat the hood latch release cable grommet (1) from the dash panel.
6. Remove the two screws (4) that secure the hood latch release handle (3) to the lower instrument panel reinforcement (2).
7. Remove the hood latch release handle and cable through the passenger compartment of the vehicle.

## INSTALLATION

1. Position the hood latch release handle and cable (3) under the left side of the instrument panel in the passenger compartment of the vehicle.
2. Thread the cable through the appropriate hole in the dash panel far enough to seat the cable grommet (1) into the hole.
3. Position the hood latch release handle to the lower instrument panel reinforcement (2).
4. Install and tighten the two screws (4) that secure the handle to the reinforcement. Tighten the screws to 5 N·m (45 in. lbs.).
5. Reinstall the closeout panel beneath the left side of the instrument panel. (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).

6. Route the hood latch release cable from the dash panel along the left side of the engine compartment to the center of the headlamp mounting crossmember as shown.
7. Fully engage the cable into the integral routing clips on the headlamp mounting crossmember and the routing clips (1) along the left side of the engine compartment.
8. Reinstall the left headlamp unit to the vehicle. (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP UNIT - INSTALLATION).
9. Reinstall the hood latch (2) to the vehicle. (Refer to 23 - BODY/HOOD/LATCH - INSTALLATION).

## LATCH STRIKER

### REMOVAL

1. Open and support the hood (3).
2. Remove the two screws (2) that secure the latch striker (1) to the hood inner reinforcement.
3. Remove the striker from the vehicle.

### INSTALLATION

1. Position the latch striker (1) to the underside of the hood (3).
2. Install and tighten the two screws (2) that secure the striker to the hood inner reinforcement. Tighten the screws to 28 N·m (21 ft. lbs.).
3. Close the hood.

## PROP ROD

### REMOVAL

1. Open and support the hood.
2. Remove the blind rivet (1) that secures the hood prop rod (2) pivot bracket to the right side of the headlamp mounting crossmember (3).
3. Disengage the prop rod from the rod clip (4) on the left side of the headlamp mounting crossmember.
4. Remove the hood prop rod from the vehicle.

### INSTALLATION

1. Position the hood prop rod (2) pivot bracket to the right side of the headlamp mounting crossmember (3).
2. Secure the pivot bracket to the headlamp mounting crossmember with a new blind rivet (1).
3. Engage the prop rod into the rod clip (4) on the left side of the headlamp mounting crossmember.
4. Close the hood.

## SUPPORT CYLINDER

### REMOVAL

1. Open and support the hood with a suitable prop or block.
2. Insert a small flat-bladed tool into the lower notch of the retainer (1) of the lower ball socket end (2) of the support cylinder on the top of the fender load beam and carefully pry the retaining clip upward to the installation position.

**WARNING:** To avoid personal injury or death, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of hood support.

3. Insert a small flat-bladed tool (3) into the notch on the outer face of the upper ball socket end (1) of the support cylinder and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the upper hood hinge bracket.
4. Release the retaining clip to its installed position.
5. Disengage the lower ball socket from the ball stud.
6. Remove the support cylinder from the vehicle.

## INSTALLATION

1. Check to be certain that the ball stud (3) on the top of the fender load beam is in good condition and properly installed. Tighten the ball stud to 28 N·m (21 ft. lbs.).
2. Position the ball socket on the rod end of the support cylinder (1) to the ball stud on the top of the fender load beam.

3. Check to be certain that the ball stud (1) secured by a U-nut (3) to the upper bracket (2) of the hood hinge is in good condition and properly installed. Tighten the ball stud to 28 N·m (21 ft. lbs.).
4. Position the ball socket on the cylinder end of the support cylinder (4) to the ball stud on the upper bracket of the hood hinge.
5. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
6. Inspect to be certain that the retaining clip on each of the support cylinder ball socket ends is fully seated.
7. Remove the service prop or block and close the hood.

ASH RECEIVER

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the gear shift center bezel from the floor console (4) (Refer to 23 - BODY/INTERIOR/CONSOLE-FLOOR - REMOVAL).
3. Set the emergency brake and place the gear shift lever into Low gear.
4. Using a trim stick C-4755 or equivalent (1), remove the ash receiver (2) from the instrument panel (3) by releasing the snap retainers from the instrument panel.

5. If equipped, disconnect the wire harness connectors (2) from the heated seat switches and remove the switches as required(Refer to 8 - ELECTRICAL/HEATED SEATS/SWITCH-HEATED SEAT - REMOVAL).
6. Disconnect the wire harness connector (3) from the lighter and remove the lighter assembly as required.
7. Remove the ash receiver from the vehicle.

## INSTALLATION

1. If equipped and removed, install the heated seat switches into the ash receiver (Refer to 8 - ELECTRICAL/ HEATED SEATS/SEAT SWITCH - INSTALLATION) and connect the wire harness connectors (2) to the switches.
2. If removed, install the lighter assembly into the ash receiver and connect the wire harness connector (3) to the lighter.
3. Install the ash receiver assembly (1) into the instrument panel by carefully pushing the receiver housing into the instrument panel until the snap retainers are fully seated.
4. Install the gear shift center bezel onto the floor console (4)
5. Place the gear shift lever into Park and release the emergency brake.
6. Reconnect the negative battery cable.

## ASSEMBLY-INSTRUMENT PANEL

### REMOVAL

**WARNING:** To avoid personal injury or death, on vehicles equipped with air bags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

**WARNING:** To avoid personal injury or death, never strike or drop the occupant restraint controller, as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment.

**CAUTION:** On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

8131ad9b

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Disconnect and isolate negative battery cable.
3. Raise and support the vehicle.
4. Disconnect the steering column from the steering coupling (Refer to 19 - STEERING/COLUMN/STEERING COUPLING - REMOVAL).
5. Lower the vehicle.
6. Remove the left and right side instrument panel silencers (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
7. Remove the screws (2 and 6) that secure the steering column cover (1) to the instrument panel.
8. Disconnect the wire harness connector (3) from the trunk release switch.
9. Disconnect the hood release cable (4) from the hood release handle (5) and remove the steering column cover from the vehicle.

10. Remove the screws (3) that secure the instrument panel steering column cover reinforcement (1) to the bracket (2) and remove the reinforcement from the vehicle.

11. Disconnect the body wire harness connectors (1 and 3) from the instrument panel wire harness connectors.
12. Disconnect the body wire harness connectors (2 and 4) from the transmission control module.

13. Remove the center floor console (Refer to 23 - BODY/INTERIOR/CONSOLE-FLOOR - REMOVAL).
14. Remove the ash receiver from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ASH RECEIVER - REMOVAL).
15. Disconnect the instrument panel wire harness connector (1) from the occupant restraint controller (ORC) module.

16. Disconnect the antenna coax (1) from the instrument panel coax extension.
17. Disconnect the wire harness connectors (2, 4, 5 and 6) from the instrument panel wire harness connectors (3).

18. Remove the A-pillar trim panels (Refer to 23 - BODY/INTERIOR/PANEL-A-PILLAR TRIM - REMOVAL).
19. Disconnect the wire harness connectors (1 and 2) located on the A-pillars.

20. Remove the end caps from the left and right side of the instrument panel to access the instrument panel side support bolts (1) and remove the bolts.
21. Remove the defroster grille to access the instrument panel top retaining bolts (2) and remove the bolts (Refer to 23 - BODY/INSTRUMENT PANEL/GRILLE-DEFROSTER - REMOVAL).
22. Remove the bolts (3) that secure the bottom of the instrument panel.

23. Lift the instrument panel assembly (2) off of the supports (1 and 5). Guide the steering column end (4) through the opening in the dash panel (3) and remove the instrument panel through the passenger door.
24. If required, remove the spring nuts (1) from the dash panel.

## INSTALLATION

**WARNING:** To avoid personal injury or death, on vehicles equipped with air bags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment.

**WARNING:** To avoid personal injury or death, never strike or drop the occupant restraint controller, as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment.

**CAUTION:** On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. If required, install new spring nuts (1) into the dash panel.

8131db07

3. Position the instrument panel assembly (3) into the vehicle through the drivers side door. Guide the steering column end (4) through the opening in the dash panel (3) and install the instrument panel onto the supports (1 and 5).

4. Loosely install all the bolts that secure the instrument panel to the body. Then tighten the bolts in the following order:
  - Top of instrument panel (2) to 8 N·m (70 in. lbs.).
  - Side support bolts (1) to 27 N·m (20 ft. lbs.).
  - Bottom of instrument panel (3) to 6 N·m (55 in. lbs.).
5. Install the end caps to the left and right side of the instrument panel.
6. Install the defroster grille to the top of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GRILLE-DEFROSTER - INSTALLATION).

8131ac51

7. Connect the wire harness connectors (1 and 2) located on the A-pillars.
8. Install the A-pillar trim panels (Refer to 23 - BODY/INTERIOR/PANEL-A-PILLAR TRIM - INSTALLATION).

9. Connect the wire harness connectors (2, 4, 5 and 6) to the instrument panel wire harness connector (3).
10. Connect the antenna coax (1) to the instrument panel coax extension.

11. Connect the instrument panel wire harness connector (1) to the occupant restraint controller (ORC) module.
12. Install the ash receiver into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ASH RECEIVER - INSTALLATION).
13. Install the center floor console (Refer to 23 - BODY/INTERIOR/CONSOLE-FLOOR - INSTALLATION).

14. Connect the body wire harness connectors (2 and 4) to the transmission control module.
15. Connect the body wire harness connectors (1 and 3) to the instrument panel wire harness connectors.

16. Position the instrument panel steering column cover reinforcement (1) onto the bracket (2).
17. Install the screws (3) that secure the instrument panel steering column cover reinforcement to the bracket. Tighten the screws securely.

18. Position the steering column cover (1) into the vehicle.
19. Connect the hood release cable (4) to the hood release handle (5).
20. Connect the wire harness connector (3) to the trunk release switch.
21. Install the screws (2 and 6) that secure the steering column cover (1) to the instrument panel. Tighten the screws securely.
22. Install the left and right side instrument panel silencers (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION.)
23. Raise and support the vehicle.
24. Connect the steering column to the steering coupling (Refer to 19 - STEERING/COLUMN/STEERING COUPLING - INSTALLATION).

25. Lower the vehicle.

**CAUTION:** Do not reconnect the negative battery cable at this time. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component.

26. Perform the supplemental restraint system verification test (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).

## BEZEL-CENTER

### REMOVAL

#### CHRYSLER

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Using a trim stick C-4755 or equivalent (1), remove the center bezel (2) from the instrument panel (3) by releasing the snap retainers from the instrument panel.

3. Disconnect the electrical connectors (3) from the A/C - heater control (4) and the clock and remove the center bezel (1) from the vehicle.

**DODGE**

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Using a trim stick C-4755 or equivalent (1), remove the center bezel (2) from the instrument panel (3) by releasing the snap retainers from the instrument panel.

3. Disconnect the electrical connectors (3) from the A/C - heater control (4) and the switch pod and remove the center bezel (1) from the vehicle.

## INSTALLATION

### CHRYSLER

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Position the center bezel (1) near the instrument panel (2).
3. Connect the electrical connectors (3) to the A/C - heater control (4) and the clock.

4. Install the center bezel (1) onto the instrument panel (2) and carefully push on the outside edges of the center bezel to fully seat the snap clip retainers into the instrument panel.

**DODGE**

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Position the center bezel (1) near the instrument panel (2).
3. Connect the electrical connectors (3) to the A/C - heater control (4) and the switch pod.

4. Install the center bezel (1) onto the instrument panel (2) and carefully push on the outside edges of the center bezel to fully seat the snap clip retainers into the instrument panel.

## BEZEL-CLUSTER

### REMOVAL

#### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Using a trim stick C-4755 or equivalent (1), gently pry between the ignition switch bezel (2) and the instrument cluster bezel (3) to release the snap retainers that secure the switch bezel.
3. Remove the ignition switch bezel from the vehicle.

4. Using a trim stick C-4755 or equivalent (1), gently pry between the instrument panel (2) and the cluster bezel (3) to release the snap clip retainers that secure the cluster bezel.

**DODGE**

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Using a trim stick C-4755 or equivalent (1), gently pry between the ignition switch bezel (2) and the instrument cluster bezel (3) to release the snap retainers that secure the switch bezel.
3. Remove the ignition switch bezel from the vehicle.

4. Using a trim stick C-4755 or equivalent (1), gently pry between the cluster bezel (2) and the instrument panel (3) to release the snap clip retainers that secure the cluster bezel.
5. Disconnect the wire harness connector from the headlamp switch (4) and remove the cluster bezel from the vehicle.
6. If required, remove the headlamp switch from the cluster bezel (Refer to 8 - ELECTRICAL/LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - REMOVAL).

## INSTALLATION

### INSTALLATION

1. Position the cluster bezel (1) onto the instrument panel (2).
2. Carefully push on the cluster bezel to fully seat the snap clip retainers into the instrument panel.

3. Position the ignition switch bezel (1) into the cluster bezel (2).
4. Carefully push on the ignition switch bezel to engage the snap retainers that secure the switch bezel.

## INSTALLATION

1. If removed, install the headlamp switch (1) into the cluster bezel (2) (Refer to 8 - ELECTRICAL/ LAMPS/LIGHTING - EXTERIOR/HEADLAMP SWITCH - INSTALLATION).
2. Position the cluster bezel into the vehicle and connect the wire harness connector to the headlamp switch.
3. Install the cluster bezel onto the instrument panel (3) and carefully push on the cluster bezel to fully seat the snap clip retainers into the instrument panel.

4. Position the ignition switch bezel (1) into the cluster bezel (2).
5. Carefully push on the ignition switch bezel to engage the snap retainers that secure the switch bezel.

## BIN-GLOVE BOX

### REMOVAL

1. Open the glove box bin (1).
2. Push in on both sides of glove box bin to disengage the glove box stops (2) and lower the bin.
3. Pivot the glove box bin downward and disengage the bin hinge hooks (3) from the instrument panel hinge brackets (4) located at each end of the bin.

4. Turn the glove box bin (1) sideways and remove the support strap and retainer assembly (2) from the outboard end of the bin.
5. Remove the glove box bin from the vehicle.

## INSTALLATION

1. Position the glove box bin (1) into the vehicle.
2. Turn the glove box bin sideways and install the support strap and retainer assembly (2) onto the outboard end of the bin.

3. Engage the glove box bin hinge hooks (3) onto the instrument panel hinge brackets (4) located at each end of the glove box bin (1) and pivot the bin upward.
4. To engage the glove box stops (2), push inward on both sides of the glove box bin and pivot the bin into the instrument panel.
5. Close the glove box bin.

## COVER-STEERING COLUMN OPENING

### REMOVAL

8131ad9b

1. Disconnect and isolate negative battery cable.
2. Remove the screws (2 and 6) that secure the steering column cover (1) to the instrument panel.
3. Pull the steering column cover rearward at the top and right side of the cover to release the snap retainers from the instrument panel.
4. Disconnect the wire harness connector (3) from the trunk release switch, if equipped.
5. Disconnect the release cable (4) from the emergency brake release handle (5) and remove the steering column cover from the vehicle.

6. If required, remove the screws (3) that secure the instrument panel steering column cover reinforcement (1) to the bracket (2) and remove the reinforcement from the vehicle.

## INSTALLATION

1. If removed, position the instrument panel steering column cover reinforcement (1) onto the bracket (2).
2. Install the screws (3) that secure the instrument panel steering column cover reinforcement to the bracket. Tighten the screws securely.

8131ad9b

3. Position the steering column cover (1) into the vehicle.
4. Connect the release cable (4) to the emergency brake release handle (5).
5. Connect the wire harness connector (3) to the trunk release switch, if equipped.
6. Install the steering column cover onto the instrument panel and carefully push on the top and right side of the cover to fully seat the snap clip retainers into the instrument panel.
7. Install the screws (2 and 6) that secure the steering column cover (1) to the instrument panel. Tighten the screws securely.

## GRILLE-DEFROSTER

### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Using a trim stick C-4755 or equivalent, gently pry between the instrument panel top cover and the defroster grille (1) to release the snap clip retainers that secure the defroster grille.
3. Remove the defroster grille.

### INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/INSTRUMENT PANEL - WARNING).
2. Position the defroster grille (1) onto the top of the instrument panel.
3. Carefully push down on the defroster grille to fully seat the snap clip retainers into the instrument panel top cover.

## LATCH-GLOVE BOX

### REMOVAL

1. Open the glove box bin.
2. Remove the two screws (2) that secure the latch assembly (3) to the glove box door (1) and remove the latch assembly.
3. If required, remove the glove box lock cylinder from the latch (Refer to 23 - BODY/INSTRUMENT PANEL/LOCK CYLINDER-GLOVE BOX - REMOVAL).

### INSTALLATION

1. If removed, install the glove box lock cylinder into the latch (Refer to 23 - BODY/INSTRUMENT PANEL/LOCK CYLINDER-GLOVE BOX - INSTALLATION).
2. Install the latch assembly (3) into the glove box door (1).
3. Install the two screws (2) that secure the latch assembly to the glove box door. Tighten the screws securely.
4. Close the glove box bin.

## LOCK CYLINDER-GLOVE BOX

### REMOVAL

1. Remove the glove box latch (1) from the glove box door and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/LATCH-GLOVE BOX - REMOVAL).
2. Insert the ignition key (2) into the glove box lock cylinder (3) and rotate the ignition key 90 degrees clockwise.

3. Using a small pointed tool, press in on the lock pin (1) showing through the opening in the glove box latch housing (2) and rotate the ignition key (3) an additional 45 degrees clockwise.

4. Pull the ignition key (1) and the glove box lock cylinder (2) out of the glove box latch (3) as an assembly.

**Note:** For reinstallation purposes, when removing the tumblers from the glove box lock, be sure to make note of the location of each tumbler within the lock cylinder.

5. If required, remove the tumblers (1) and the springs (2) from the glove box lock cylinder (3). Note the location of each tumbler within the lock.

## INSTALLATION

**Note:** Be sure to install each tumble into their correct location within the lock cylinder.

1. If removed, install the springs (2) and the tumblers (1) into the glove box lock cylinder (3) in the order in which they were removed.

2. Install the ignition key (1) and the glove box lock cylinder (2) into the glove box latch (3) as an assembly.

3. Rotate the ignition key (1) counterclockwise until the lock cylinder (2) is fully retained in the glove box latch (3).
4. Install the glove box latch onto the glove box door (Refer to 23 - BODY/INSTRUMENT PANEL/LATCH-GLOVE BOX - INSTALLATION).

## SILENCER-INSTRUMENT PANEL

### REMOVAL

#### DRIVER SIDE

1. Remove the two push-pins (4) that secure the instrument panel silencer (1) to the instrument panel bracket (2).
2. Pull the instrument panel silencer rearward to disengage it from the brackets (3) located near the dash panel.
3. Remove the instrument panel silencer from the vehicle.

#### PASSENGER SIDE

1. Remove the two push-pins (3) that secure the instrument panel silencer (2) to the instrument panel.
2. Pull the instrument panel silencer rearward to disengage it from the brackets (1) located near the dash panel.
3. Remove the instrument panel silencer from the vehicle.

## INSTALLATION

### DRIVER SIDE

1. Position the instrument panel silencer (1) into the vehicle.
2. Install the instrument panel silencer above the brackets (3) located near the dash panel.
3. Install the two push-pins (4) that secure the instrument panel silencer to the instrument panel bracket (2).

### PASSENGER SIDE

1. Position the instrument panel silencer (2) into the vehicle.
2. Install the instrument panel silencer above the brackets (1) located near the dash panel.
3. Install the two push-pins (3) that secure the instrument panel silencer to the instrument panel.

## STRIKER-LATCH-GLOVE BOX

### REMOVAL

1. Open the glove box door (1).
2. Remove the two screws (2) that secure the glove box latch striker (3) to the instrument panel (4).
3. Remove the glove box latch striker from the instrument panel.

### INSTALLATION

1. Position the glove box latch striker (3) onto the instrument panel (4).
2. Install the two screws (2) that secure the glove box latch striker onto the instrument panel. Tighten the screws securely.
3. Close glove box door (1).

## A-PILLAR TRIM

### REMOVAL

1. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the upper end of the A-pillar trim (1) rearward from the inside of the A-pillar (3) far enough to disengage the two spring clip retainers that secure the trim to the slots in the pillar.
2. Disengage the base of the A-pillar trim from the end of the instrument panel top cover.
3. Remove the A-pillar trim from the vehicle.

### INSTALLATION

1. Check to be certain that the energy absorbing cartridge (1) is properly installed and in good condition on the inside of the A-pillar (2). Replace the cartridge if any damage is evident. Tighten the screws (3) to 3 N·m (25 in. lbs.).

2. Check to be certain that the grommet (2) for the front tether of the side curtain airbag is properly installed and in good condition. Replace the grommet if any damage is evident. (Refer to 8 - ELECTRICAL/RESTRAINTS/CURTAIN AIRBAG - REMOVAL).
3. Engage the base of the A-pillar trim (1) to the end of the instrument panel top cover.
4. Align the two spring clip retainers on the trim with the slots in the inner A-pillar (3).
5. Using hand pressure, press firmly and evenly forward on the trim over each of the spring clip locations until the retainers snap into place.

## B-PILLAR TRIM

### REMOVAL

#### LOWER

1. Loosen the front door sill portion of the lower cowl trim at the rear of the front door opening for access to the forward lower B-pillar trim screw. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL).
2. Loosen the front of the scuff plate trim from the rear door sill for access to the rearward lower B-pillar trim screw. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - REMOVAL).
3. Move aside the seat belt webbing to access and remove the two screws (2) that secure the upper end of the lower B-pillar trim (3) to the inside of the B-pillar (1).
4. Remove the two screws (4) that secure the lower end of the B-pillar trim to the front and rear door sills.
5. Disengage the seat belt webbing from the slot in the upper end of the lower B-pillar trim through the slit in the trim and remove the trim from the inside of the B-pillar.

## UPPER

1. Remove the lower trim from the inside of the B-pillar (2). (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL).
2. Unsnap and remove the trim cover (3) from the seat belt turning loop on the inside of the upper B-pillar.
3. Remove the screw (1) that secures the turning loop to the seat belt height adjuster on the upper B-pillar.
4. Lower the seat belt (4) and turning loop from the B-pillar.

5. Remove the screw (1) that secures the lower end of the upper trim (4) to the inside of the B-pillar (3).
6. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the lower end of the upper B-pillar trim away from the inside of the B-pillar far enough to disengage the two spring clip retainers that secure the trim to the slots in the pillar.
7. Lift the lower end of the upper trim upward to disengage the locator tab (2) from the locator hole and remove the trim from the inside of the B-pillar.

## INSTALLATION

### LOWER

1. Engage the seat belt webbing through the slit and into the slot in the upper end of the lower B-pillar trim (3) and position the trim to the inside of the B-pillar (1). Be certain the webbing is not twisted.
2. Press fit the lower end of the lower B-pillar trim to the front and rear door opening sills.
3. Install and tighten the two screws (4) that secure the lower end of the B-pillar trim to the front and rear door sills. Tighten the screws to 2 N·m (22 in. lbs.).
4. Move aside the seat belt webbing to install and tighten the two screws (2) that secure the upper end of the lower B-pillar trim to the inside of the B-pillar. Tighten the screws to 2 N·m (22 in. lbs.).
5. Reinstall the scuff plate trim onto the rear door sill. (Refer to 23 - BODY/INTERIOR/DOOR SILL SCUFF PLATE - INSTALLATION).
6. Reinstall the lower cowl trim onto the front door opening sill. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION).

### UPPER

1. Engage the locator tab (2) on the back of the upper trim (4) into the locator hole on the inside of the B-pillar (3).
2. Align the two spring clip retainers on the trim with the slots in the inner B-pillar.
3. Using hand pressure, press firmly and evenly on the trim over each of the spring clip locations until the retainers snap into place.
4. Install and tighten the screw (1) that secures the lower end of the upper trim to the inside of the B-pillar. Tighten the screw to 3 N·m (25 in. lbs.).

5. Position the seat belt (4) and turning loop to the height adjuster on the upper B-pillar (2). Be certain that the webbing is not twisted.
6. Install and tighten the screw (1) that secures the turning loop to the seat belt height adjuster on the upper B-pillar. Tighten the screw to 40 N·m (30 ft. lbs.).
7. Position the trim cover (3) over the seat belt turning loop on the inside of the upper B-pillar.
8. Using hand pressure, press the trim cover and turning loop together until the cover snaps into place.
9. Reinstall the lower trim onto the inside of the B-pillar. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION).

## C-PILLAR TRIM

### REMOVAL

#### UPPER - SEDAN

1. Remove the rear seat cushion from the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
2. Remove the lower trim from the inside of the C-pillar. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL-LOWER).
3. Remove the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel.
4. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the upper edge of the upper C-pillar trim (3) away from the quarter inner panel (1) far enough to disengage the upper spring clip retainers that secure the trim to the slots in the quarter inner panel and (if equipped) the curtain airbag support.
5. Rotate the upper edge of the upper C-pillar trim downward to disengage the locator pin (2) on the back of the panel from the locator hole in the quarter inner panel.
6. Pull the outboard rear seat belt webbing and lower anchor through the slot in the upper C-pillar trim.
7. Carefully pry the lower edge of the upper C-pillar trim away from the quarter inner panel far enough to disengage the lower spring clip retainers that secure the trim to the slots in the quarter inner panel and remove the trim from the vehicle.

## LOWER

1. Remove the rear seat cushion from the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
2. Remove the rear seat back side bolster from the quarter inner panel (1). (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION/COVER - REMOVAL).
3. Remove the screw (4) that secures the upper end of the lower C-pillar trim (5) to the rear shelf panel (3).
4. Remove the two screws that secure the lower C-pillar trim to the quarter inner panel.
5. Remove the lower C-pillar trim from the quarter inner panel.

## UPPER - WAGON

1. Remove the rear seat cushion from the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).
2. Loosen the front edge of the quarter trim panel from the inside of the lower C-pillar. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
3. Remove the screw (3) that secures the lower end of the upper C-pillar trim (1) to the quarter inner panel (4).
4. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the rear edge of the upper C-pillar trim away from the quarter inner panel far enough to disengage the upper spring clip retainer that secures the trim to the slot in the quarter inner panel.
5. Pull the lower edge of the upper C-pillar trim away and down to disengage the locator tab (2) on the back of the panel from the locator hole in the quarter inner panel.
6. Remove the upper C-pillar trim from the vehicle.

## INSTALLATION

### UPPER - SEDAN

1. If the vehicle is so equipped, be certain that the curtain airbag support (3) is properly installed and in good condition on the quarter inner panel (1). Replace the support if any damage is evident. Tighten the screws (4) into the spring nuts (2) to 2 N·m (15 in. lbs.).

2. Align the spring clip retainers on the lower edge of the upper C-pillar trim (3) with the installation holes in the quarter inner panel (1) and pull the outboard rear seat belt webbing and lower anchor through the slot in the trim.
3. Rotate the top of the upper C-pillar trim upwards far enough to engage the locating pin (2) into the locating hole in the quarter inner panel.
4. Align the spring clip retainers on the trim with the slots in the quarter inner panel and (if equipped) the curtain airbag support..
5. Using hand pressure, press firmly and evenly on the trim over each of the spring clip locations until the retainers snap into place.
6. Reinstall the lower trim onto the inside of the C-pillar. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION-LOWER).

7. Position the outboard rear seat belt lower anchor to the quarter inner panel.
8. Install and tighten the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel. Tighten the screw to 32 N·m (24 ft. lbs.).
9. Reinstall the rear seat cushion into the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).

## LOWER

1. Check to be certain that the spring nuts (2) are properly installed and in good condition on the quarter inner panel (1). Replace the spring nut if any damage is evident.
2. Position the lower C-pillar trim (5) onto the quarter inner panel with the lower edge sequenced over the rear extension of the rear door sill scuff plate (6).
3. Install and tighten the two screws (4) that secure the lower C-pillar trim to the quarter inner panel. Tighten the screws to 1 N·m (11 in. lbs.).
4. Install and tighten the screw that secures the lower C-pillar trim to the rear shelf panel (3). Tighten the screw to 1 N·m (11 in. lbs.).
5. Reinstall the rear seat back side bolster onto the quarter inner panel. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION/COVER - INSTALLATION).
6. Reinstall the rear seat cushion into the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).

## UPPER - WAGON

1. Check to be certain that the spring nut (5) is properly installed and in good condition on the quarter inner panel (4). Replace the spring nut if any damage is evident.
2. Position the upper C-pillar trim (1) to the quarter inner panel in the vehicle.
3. Engage the locator tab (2) on the back of the upper C-pillar trim into the locator hole in the quarter inner panel.
4. Align the spring clip retainer on the upper rear corner of the upper C-pillar trim with the installation hole in the quarter inner panel.
5. Using hand pressure, press firmly and evenly on the trim over the spring clip location until the retainer snaps into place.
6. Install and tighten the screw (3) that secures the lower end of the upper C-pillar trim to the quarter inner panel. Tighten the screw to 2 N·m (15 in. lbs.).
7. Reinstall the front edge of the quarter trim panel onto the inside of the lower C-pillar. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).
8. Reinstall the rear seat cushion into the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).

## CARPET

### REMOVAL

#### FRONT

**Note:** The front carpet consists of two individual carpets, one for the driver side and one for the passenger side. These carpets can be removed from and installed into the vehicle individually.

1. Remove the driver and/or passenger front seat from the vehicle as appropriate. (Refer to 23 - BODY/SEATS/SEAT-FRONT - REMOVAL).
2. Remove the center console from the front floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
3. Remove the trim from the driver or passenger side lower cowl side inner panel as appropriate. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL-LOWER).
4. Remove the two push-pin fasteners (1) that secure the outboard edge of the front carpet (3) to the front door opening sill.
5. On the driver side only, remove the push-pin fastener (2) that secures the front carpet to the cowl side inner panel above the foot rest.
6. On the driver side only, remove the push-pin fastener (3) that secures the inboard edge of the front carpet (1) to the transmission shifter bracket (2).
7. Remove the front carpet from the floor panel.

## REAR

1. Remove the driver and passenger front seats from the vehicle. (Refer to 23 - BODY/SEATS/SEAT-FRONT - REMOVAL).
2. Remove the center console from the front floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
3. Remove the trim from the inside of both lower B-pillars. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL-LOWER).
4. Remove the rear seat cushion from the vehicle. (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION COVER - REMOVAL).
5. Remove the scuff plate from both rear door sills. (Refer to 23 - BODY/INTERIOR/REAR DOOR SILL SCUFF PLATE - REMOVAL).
6. Remove the push-pin fasteners (2) that secure the outboard edges of the rear carpet (3) near the front of each rear door opening (1) sill.
7. Lift the rear carpet from the floor panel far enough to extract the body wire harness take outs and connectors through the appropriate slits in the carpeting.
8. Remove the rear carpet from the vehicle through one of the rear door openings.

## TRUNK - SEDAN

1. If equipped, remove the cargo liner and/or cargo net from the luggage compartment.
2. Fold and remove the spare tire cover/trunk floor carpet (1) from over the spare tire well (2).

## CARGO AREA - WAGON

1. If equipped, remove the cargo net from the rear cargo area.
2. Fold and remove the cargo floor carpet (1) from the rear cargo area.
3. If equipped, remove the cargo liner and/or the cargo organizer from the cargo compartment.
4. Fold and remove the spare tire cover/cargo compartment carpet (3) from over the spare tire well (2).

## INSTALLATION

### FRONT

**Note:** The front carpet consists of two individual carpets, one for the driver side and one for the passenger side. These carpets can be removed from and installed into the vehicle individually.

1. Position and fit the front carpet (3) onto the floor panel. Be certain that the rear of the front carpet is fitted over the floor panel front crossmember and butts up against the front of the rear carpet without interference with the rear floor air duct opening. Be certain that the front of the front carpet is fitted to the dash panel without interference with the steering column, the accelerator or the heater and air conditioner unit. On the driver side only, be certain the slit (4) on the inboard edge of the carpet is engaged around the left instrument panel support bracket (5) on the top of the floor panel transmission tunnel.
2. Install the two push-pin fasteners (1) that secure the outboard edge of the front carpet to the front door opening sill.
3. On the driver side only, install the push-pin fastener (2) that secures the front carpet to the cowl side inner panel above the foot rest.

4. On the driver side only, install the push-pin fastener (3) that secures the inboard edge of the front carpet (1) to the transmission shifter bracket (2).
5. Reinstall the trim onto the driver or passenger side lower cowl side inner panel as appropriate. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION-LOWER).
6. Reinstall the center console onto the front floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).
7. Reinstall the driver and/or passenger front seat into the vehicle as appropriate. (Refer to 23 - BODY/SEATS/SEAT-FRONT - INSTALLATION).

## REAR

1. Position the rear carpet (3) into the vehicle through one of the rear door openings.
2. Pull the body wire harness take outs and connectors through the appropriate slits in the rear carpet.
3. Fit the rear carpet to the floor panel. Be certain to align the holes in the carpet with the corresponding holes in the floor panel. Be certain that the rear edge of the carpet is fitted over the rear seat kick-up area and over the rear seat cushion cups on the top of the kick-up area. Be certain that the front edge of the carpet is fitted over the front seat rear crossmember and butts up against the rear of the front seat front crossmember.
4. Install the push-pin fasteners (2) that secure the outboard edges of the rear carpet near the front of each rear door opening (1) sill.
5. Reinstall the scuff plate onto both rear door sills. (Refer to 23 - BODY/INTERIOR/REAR DOOR SILL SCUFF PLATE - INSTALLATION).
6. Reinstall the rear seat cushion into the vehicle. (Refer to 23 - BODY/SEATS/REAR SEAT CUSHION COVER - INSTALLATION).
7. Reinstall the trim onto the inside of both lower B-pillars. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION-LOWER).
8. Reinstall the center console onto the front floor panel transmission tunnel. (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).
9. Reinstall the driver and passenger front seats into the vehicle. (Refer to 23 - BODY/SEATS/SEAT-FRONT - INSTALLATION).

## TRUNK - SEDAN

1. Fold the spare tire cover/trunk floor carpet (1) and place it within the luggage compartment.
2. Unfold, position and fit the spare tire cover/trunk floor carpet over the spare tire well (2) in the luggage compartment.
3. If equipped, reinstall the cargo liner and/or cargo net into the luggage compartment.

## CARGO AREA - WAGON

1. Fold the spare tire cover/cargo compartment carpet (3) and place it into the rear cargo area.
2. Unfold, position and fit the spare tire cover/cargo compartment carpet over the spare tire well (2) in the rear cargo area.
3. If equipped, reinstall the cargo liner and/or the cargo organizer into the cargo compartment.
4. Fold the cargo floor carpet (1) and place it into the rear cargo area.
5. Unfold, position and fit the cargo floor carpet into the rear cargo area.
6. If equipped, reinstall the cargo net into the rear cargo area.

## CONSOLE-FLOOR

### REMOVAL

1. Apply the parking brake.
2. Turn the ignition switch to the On position, apply the service brakes and place the gear selector lever into the Neutral position.
3. Turn the ignition switch to the Off position and release the service brakes.
4. Disconnect and isolate the battery negative cable.
5. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the shifter trim ring (3) upward to unsnap it from the console shifter bezel (4).
6. Remove the shifter trim ring from around the gear selector lever.
7. Remove the mat (2) from the cubby bin at the front of the floor console.
8. Open the lid of the console rear bin and remove the mat (5) from the rear bin.
9. Remove the two screws (1) that secure the front of the console shifter bezel to the console.
10. Lift the console shifter bezel upward from the console far enough to access and disconnect the bezel pigtail connector from the takeout of the body wire harness (6).
11. Remove the shifter bezel from around the gear selector lever.

12. Remove the three screws (2) from the rear bin that secure the console to the floor panel transmission tunnel.

13. Remove the two screws (1) that secure the front of the console to the instrument panel.
14. Tip the rear of the console upward far enough to access and disconnect the jumper wire connector (3) from the accessory power outlet on the underside of the console.
15. Remove the floor console from the vehicle.

## INSTALLATION

81371191

1. Position the floor console into the vehicle.
2. Tip the rear of the console upward far enough to access and reconnect the jumper wire connector (3) to the accessory power outlet on the underside of the console.
3. Position the console over the center floor duct and engage the two alignment holes at the front of the console over the two alignment pins on the instrument panel.
4. Engage the locating pin on the underside of the console rear bin into the slot in the top of the floor panel transmission tunnel.
5. Install and tighten the two screws (1) that secure the front of the console to the instrument panel. Tighten the screws to 3 N·m (23 in. lbs.).
6. Install and tighten the three screws (2) into the rear bin that secure the console to the floor panel transmission tunnel. Tighten the screws to 5 N·m (40 in. lbs.).

7. Position the console shifter bezel (4) over the gear selector lever.
8. Reconnect the shifter bezel pigtail connector to the takeout of the body wire harness (6).
9. Position the tabs on the underside of the console shifter bezel into the holes in the floor console.
10. Install and tighten the two screws (1) that secure the front of the console shifter bezel to the console. Tighten the screws to 3 N·m (23 in. lbs.).
11. Position the mat (5) into the console rear bin with the curved edge oriented forward in the vehicle.
12. Position the mat (2) into the cubby bin at the front of the floor console.
13. Position the shifter trim ring (3) around the gear selector lever.
14. Position the tabs on the left underside of the shifter trim ring into the console shifter bezel, then use hand pressure to press downward firmly and evenly on the right side of the trim ring to snap the right side tabs into the bezel.
15. Place the gear selector lever into the Park position.
16. Reconnect the battery negative cable.

## COWL TRIM

### REMOVAL

#### UPPER

1. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the upper cowl trim (2) rearward from the front of the front door opening far enough to disengage the two spring clip retainers that secure the trim to the slots in the cowl (1).
2. Remove the upper cowl trim from the vehicle.

## LOWER

1. Remove the upper cowl trim from the front of the front door opening. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL-UPPER).
2. Using a trim stick or another suitable wide flat-bladed tool and starting nearest the B-pillar trim (2), carefully pry the lower cowl trim (3) upward from the front door opening sill far enough to disengage the three spring clip retainers that secure the trim to the slots in the sill.
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the lower cowl trim rearward from the front of the front door opening far enough to disengage the spring clip retainer that secures the trim to the slot in the cowl (1).
4. Remove the lower cowl trim from the vehicle.

## INSTALLATION

### UPPER

1. Position the upper cowl trim (2) to the cowl (1) at the front of the front door opening and the lower cowl trim (3).
2. Align the two spring clip retainers on the trim with the slots in the cowl.
3. Using hand pressure, press firmly and evenly downward on the trim over each of the spring clip locations until the retainers snap into place.

## LOWER

1. Check to be certain that the three plastic nuts are properly installed and in good condition in the slots of the front door opening sill. Replace a plastic nut if any damage is evident.
2. Position the vertical portion of the lower cowl trim (3) to the cowl (1) at the front of the front door opening.
3. Align the spring clip retainer on the trim with the slot in the cowl (1).
4. Using hand pressure, press firmly and evenly forward on the trim over the spring clip location until the retainer snaps into place.
5. Position the horizontal portion of the lower cowl trim to the front door sill and the B-pillar trim (2).
6. Align the three spring clip retainers on the trim with the slots in the sill.
7. Using hand pressure, press firmly and evenly downward on the trim over each of the spring clip locations until the retainers snap into place.
8. Reinstall the upper cowl trim to the front of the front door opening. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION-UPPER).

## D-PILLAR TRIM

### REMOVAL

1. Remove the trim plate from the upper liftgate opening header (1). (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
2. Loosen the rear edge of the quarter trim panel (4) from the inside of the lower D-pillar. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the upper edge of the upper D-pillar trim (2) away from the headliner far enough to disengage the two upper spring clip retainers that secure the trim to the slots in the upper liftgate opening header and the inside of the D-pillar.
4. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the lower half of the upper D-pillar trim away from the D-pillar far enough to disengage the two lower spring clip retainers that secure the trim to the slots in the pillar.
5. Disengage the lower edge of the upper D-pillar trim from under the quarter trim panel.
6. Remove the upper D-pillar trim from the vehicle.

## INSTALLATION

1. Engage the lower edge of the upper D-pillar trim (2) under the upper edge of the quarter trim panel (4) at the inner D-pillar (3).
2. Align the two lower spring clip retainers on the back of the trim with the slots in the inside of the D-pillar.
3. Using hand pressure, press firmly and evenly on the trim over each of the lower spring clip locations until the retainers snap into place.
4. Align the two upper spring clip retainers on the back of the trim with the slots in the inside of the D-pillar and the upper liftgate opening header (1).
5. Using hand pressure, press firmly and evenly on the trim over each of the spring clip locations until the retainers snap into place.
6. Reinstall the rear edge of the quarter trim panel to the inside of the lower D-pillar. (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).
7. Reinstall the trim plate onto the upper liftgate opening header. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).

## FRONT FLOOR FOOT REST

### REMOVAL

1. Remove the trim from the driver side lower cowl side inner panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - REMOVAL-LOWER).
2. Remove the three push-pin fasteners that secure the driver side front carpet to the cowl side inner panel and the front door opening sill.
3. Pull the front floor carpet up and away from the foot rest (1) far enough to access and remove the nut (2) that secures the foot rest to the weld stud (5) on the front floor panel.
4. Lift the base of the foot rest upward far enough to disengage the tab (3) at the top of the foot rest from the slot (4) in the dash panel.
5. Remove the foot rest from the vehicle.

## INSTALLATION

1. Pull the outboard edge of the driver side front floor carpet up and away from the floor far enough to position the foot rest (1) between the front floor panel and the carpet.
2. Engage the tab (3) at the top of the foot rest into the slot (4) in the dash panel.
3. Position the hole at the base of the foot rest over the weld stud (5) on the front floor panel.
4. Install and tighten the nut (2) that secures the foot rest to the weld stud. Tighten the nut to 16 N·m (12 ft. lbs.).
5. Reposition the driver side front carpet to the cowl side inner panel and the front door opening sill and secure with three push-pin fasteners.
6. Reinstall the trim onto the driver side lower cowl side inner panel. (Refer to 23 - BODY/INTERIOR/COWL TRIM - INSTALLATION-LOWER).

## HEADLINER

### REMOVAL

#### SEDAN

1. Disconnect and isolate the battery negative cable.
2. Remove the trim from both upper A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
3. Disengage the headliner wire harnesses from the retainers on each inner A-pillar and disconnect the connectors (11) from the body wire harness connectors near the base of each A-pillar.

4. Remove the trim from both upper B-pillars. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL-UPPER).
5. Remove the trim from both upper C-pillars. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL-UPPER-SEDAN).
6. If the vehicle is so equipped, remove the overhead console from the center of the headliner (1) near the windshield header (3). (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
7. If the vehicle is so equipped, disconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout(s) and connector(s) of the headliner wire harness from the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
8. Remove both sun visors and both visor receptacles from the headliner near the windshield header.
9. Remove both grab handle/coat hook/rear dome/reading lamp units from the headliner at the inner rear roof side rails (4).
10. If the vehicle is so equipped, remove the trim welt from the headliner sunroof opening.
11. Fold down both rear seat backs.
12. Recline both front seat backs.
13. Carefully pull the headliner downward at the windshield header far enough to disengage the spring clip retainers at each sun visor mounting location (2), at each visor receptacle location (9), and at the overhead console location (10).
14. Carefully pull the headliner downward at the inner rear roof side rails far enough to disengage the spring clip retainers at each grab handle location (5).
15. Carefully pull the headliner downward near the center of the rear roof header (7) far enough to disengage the rear spring clip retainer (8).
16. If the vehicle is equipped with a sunroof, reach between the headliner and the roof panel from the right rear door opening to access and disconnect the sunroof jumper wire connector from the headliner wire harness sunroof take out and connector (6).
17. Carefully bow the headliner longitudinally as necessary to remove the unit through the right rear door opening.

## WAGON

813c57b9

1. Disconnect and isolate the battery negative cable.
2. Remove the trim from both upper A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - REMOVAL).
3. Disengage the headliner wire harnesses from the retainers on each inner A-pillar and disconnect the connectors (11) from the body wire harness connectors near the base of each A-pillar.
4. Remove the trim from both upper B-pillars. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - REMOVAL-UPPER).
5. Remove the trim from both upper C-pillars. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL-UPPER-WAGON).
6. Remove the trim from both upper D-pillars. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
7. If the vehicle is so equipped, remove the overhead console from the center of the headliner (1) near the windshield header (3). (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - REMOVAL).
8. If the vehicle is so equipped, disconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout(s) and connector(s) of the headliner wire harness from the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
9. Remove both sun visors and both visor receptacles from the headliner near the windshield header.
10. Remove both grab handle/coat hook/rear dome/reading lamp units from the headliner at the inner rear roof side rails (4).
11. If the vehicle is so equipped, remove the trim welt from the headliner sunroof opening.
12. Fold down both rear seat backs.
13. Recline both front seat backs.
14. Carefully pull the headliner downward at the windshield header far enough to disengage the spring clip retainers at each sun visor mounting location (2), at each visor receptacle location (9), and at the overhead console location (10).
15. Carefully pull the headliner downward at the inner rear roof side rails far enough to disengage the spring clip retainers at each grab handle location (5).
16. Carefully pull the headliner downward near the center of the liftgate opening header (7) far enough to disengage the rear spring clip retainer (8).

17. If the vehicle is equipped with a sunroof, reach between the headliner and the roof panel from the right rear door opening to access and disconnect the sunroof jumper wire connector from the headliner wire harness sunroof take out and connector (6).
18. Carefully bow the headliner longitudinally as necessary to remove the unit through the liftgate opening.

## INSTALLATION

### SEDAN

1. Carefully bow the headliner (1) longitudinally as necessary to position the unit into the vehicle through the right rear door opening.
2. If the vehicle is equipped with a sunroof, reach between the headliner and the roof panel from the right rear door opening to access and reconnect the sunroof jumper wire connector to the headliner wire harness sunroof take out and connector (6).

**Note:** In order to ease installation and ensure proper headliner positioning it is important to install the headliner spring clip retainers in the correct sequence as follows.

3. Position the spring clip at the right visor receptacle location (9) to the appropriate hole in the windshield header (3) and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.
4. Position the rear spring clip retainer (8) to the appropriate hole near the center of the rear roof header (7) and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.
5. Position the two spring clip retainers at each grab handle location (5) to the appropriate holes in the inner rear roof side rails (4) and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
6. Position the spring clip retainers at each sun visor mounting location (2), at the left visor receptacle location (9), and at the overhead console location (10) to the appropriate holes in the windshield header and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
7. If the vehicle is so equipped, reinstall the trim welt onto the headliner sunroof opening.
8. Reinstall both grab handle/coat hook/rear dome/reading lamp units into the headliner at the inner rear roof side rails.

9. Reinstall both sun visors and both visor receptacles onto the headliner near the windshield header.
10. If the vehicle is so equipped, reconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout and connector of the headliner wire harness to the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
11. If the vehicle is so equipped, reinstall the overhead console to the center of the headliner near the windshield header. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
12. Reinstall the trim onto both upper C-pillars. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION-UPPER-SEDAN).
13. Reinstall the trim onto both upper B-pillars. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION-UPPER).
14. Engage the headliner wire harnesses into the retainers on each inner A-pillar and reconnect the connectors (11) to the body wire harness connectors near the base of each A-pillar. Be certain the harnesses are not twisted and that the connectors are both fully engaged.
15. Reinstall the trim onto both upper A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
16. Reconnect the battery negative cable.

## WAGON

813c57b9

1. Carefully bow the headliner (1) longitudinally as necessary to position the unit into the vehicle through the liftgate opening.
2. If the vehicle is equipped with a sunroof, reach between the headliner and the roof panel from the right rear door opening to access and reconnect the sunroof jumper wire connector to the headliner wire harness sunroof take out and connector (6).

**Note:** In order to ease installation and ensure proper headliner positioning it is important to install the headliner spring clip retainers in the correct sequence as follows.

3. Position the spring clip at the right visor receptacle location (9) to the appropriate hole in the windshield header (3) and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.
4. Position the rear spring clip retainer (8) to the appropriate hole near the center of the liftgate opening header (7) and press firmly and evenly upward on the headliner over the retainer location until it snaps into place.

5. Position the two spring clip retainers at each grab handle location (5) to the appropriate holes in the inner rear roof side rails (4) and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
6. Position the spring clip retainers at each sun visor mounting location (2), at the left visor receptacle location (9), and at the overhead console location (10) to the appropriate holes in the windshield header and press firmly and evenly upward on the headliner over each retainer location until it snaps into place.
7. If the vehicle is so equipped, reinstall the trim welt onto the headliner sunroof opening.
8. Reinstall both grab handle/coat hook/rear dome/reading lamp units into the headliner at the inner rear roof side rails.
9. Reinstall both sun visors and both visor receptacles onto the headliner near the windshield header.
10. If the vehicle is so equipped, reconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout and connector of the headliner wire harness to the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
11. If the vehicle is so equipped, reinstall the overhead console to the center of the headliner near the windshield header. (Refer to 8 - ELECTRICAL/OVERHEAD CONSOLE - INSTALLATION).
12. Reinstall the trim onto both upper D-pillars. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).
13. Reinstall the trim onto both upper C-pillars. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION-UPPER-SEDAN).
14. Reinstall the trim onto both upper B-pillars. (Refer to 23 - BODY/INTERIOR/B-PILLAR TRIM - INSTALLATION-UPPER).
15. Engage the headliner wire harnesses into the retainers on each inner A-pillar and reconnect the connectors (11) to the body wire harness connectors near the base of each A-pillar. Be certain the harnesses are not twisted and that the connectors are both fully engaged.
16. Reinstall the trim onto both upper A-pillars. (Refer to 23 - BODY/INTERIOR/A-PILLAR TRIM - INSTALLATION).
17. Reconnect the battery negative cable.

## LIFTGATE OPENING UPPER TRIM

### REMOVAL

1. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the rear edge of the trim plate (3) down from the upper liftgate opening header (2) far enough to disengage the four spring clip retainers from the slots in the header.
2. Pull the trim plate rearward to disengage it from the rear edge of the headliner (1).
3. Remove the trim plate from the vehicle.

## INSTALLATION

1. Fit the forward edge of the liftgate opening header trim plate (3) to the rear edge of the headliner (1).
2. Align the four spring clip retainers on the trim plate to the slots in the upper liftgate opening header (2).
3. Using hand pressure, press firmly and evenly upward on the trim plate over each of the retainer locations until they snap into place.
4. Be certain that ends of the trim plate are properly engaged over the inboard edges of the right and left upper D-pillar trim.

## LIFTGATE SCUFF PLATE

### REMOVAL

1. Remove the two screws (2) that secure the tie-down loops (1) and the scuff plate trim panel (5) to the top of the liftgate opening lower panel (4).
2. Remove the two screws (6) that secure the scuff plate trim panel to the inside of the liftgate opening lower panel.
3. Remove the scuff plate trim panel from the vehicle.

## INSTALLATION

1. Check to be certain that two spring nuts (3) are properly installed and in good condition in the top of the liftgate opening lower panel (4).
2. Position the scuff plate trim panel (5) to the inside of the liftgate opening lower panel.
3. Install and tighten the two screws (6) that secure the trim panel to the inside of the liftgate opening lower panel. Tighten the screws to 11 N·m (8 ft. lbs.).
4. Position the two tie-down loops (1) to the top of the trim panel.
5. Install and tighten the two screws that secure the tie-down loops and the scuff plate trim panel to the top of the liftgate opening lower panel. Tighten the screws to 11 N·m (8 ft. lbs.).

## QUARTER TRIM PANEL

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the rear seat cushion from the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL).

3. Remove the rear seat back side bolster from the quarter inner panel (1). (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION/COVER - REMOVAL).
4. Remove the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel.
5. Remove the trim from the upper D-pillar. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - REMOVAL).
6. Remove the speaker bezel from the quarter trim panel. (Refer to 23 - BODY/INTERIOR/SPEAKER BOX TRIM COVER - REMOVAL).
7. Remove the two screws (2) that secure the quarter trim panel (5) to the speaker bracket above the rear wheel house.
8. Remove the screw that secures the tie-down loop, the liftgate scuff plate trim panel and the rear extension of the quarter trim panel to the top of the liftgate opening lower panel.
9. Remove the three screws (3) that secure the tie-down loop (6) and the quarter trim panel to the quarter inner panel.
10. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the quarter trim panel away from the side of the liftgate opening far enough to disengage the three spring clip retainers that secure the trim to the slots in the quarter inner panel behind the rear wheel house.
11. Move the back of the quarter trim panel away from the base of the upper D-pillar trim far enough to access and disconnect the body wire harness connector from the back of the auxiliary power outlet, if equipped.
12. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the quarter trim panel away from the base of the upper C-pillar trim far enough to disengage the spring clip retainer that secures the trim to the slot in the quarter inner panel.
13. Lift the quarter trim panel up and over the outboard rear seat belt retractor on the top of the rear wheel house while feeding the loose belt webbing and lower anchor through the retractor clearance hole in the top of the panel.
14. Remove the quarter trim panel from the vehicle through the liftgate opening.

**INSTALLATION**

1. Check to be certain that the three spring nuts (3) are properly installed and in good condition on the quarter inner panel (1). Replace a spring nut if any damage is evident.
2. Position the quarter trim panel (5) into the vehicle through the liftgate opening.
3. Lift the quarter trim panel up and over the outboard rear seat belt retractor on the top of the rear wheel house while pulling the loose belt webbing and lower anchor through the retractor clearance hole in the top of the panel.
4. Align the spring clip retainer on the back of the quarter trim panel with the slot in the quarter inner panel at the base of the upper C-pillar trim.
5. Using hand pressure, press firmly and evenly on the trim over the spring clip location until the retainer snaps into place.
6. Move the rear of the quarter trim panel away from the base of the upper D-pillar trim far enough to access and reconnect the body wire harness connector to the back of the auxiliary power outlet, if equipped.
7. Align the three spring clip retainers on the back of the quarter trim panel with the slots in the quarter inner panel behind the rear wheel house.
8. Using hand pressure, press firmly and evenly on the trim over the spring clip locations until the retainers snap into place.
9. Position the rear extension of the quarter trim panel onto the top of the liftgate opening lower panel with the extension sequenced under the end of the liftgate scuff plate.
10. Install and tighten the three screws (4) that secure the tie-down loop (6) and the quarter trim panel to the quarter inner panel. Tighten the screws to 11 N·m (8 ft. lbs.).
11. Install and tighten the screw that secures the tie-down loop, the liftgate scuff plate and the rear extension of the quarter trim panel to the top of the liftgate opening lower panel. Tighten the screw to 11 N·m (8 ft. lbs.).
12. Install and tighten the two screws (2) that secure the quarter trim panel to the speaker bracket above the rear wheel house. Tighten the screws to 11 N·m (8 ft. lbs.).
13. Reinstall the speaker bezel onto the quarter trim panel. (Refer to 23 - BODY/INTERIOR/SPEAKER BOX TRIM COVER - INSTALLATION).

14. Reinstall the trim onto the upper D-pillar. (Refer to 23 - BODY/INTERIOR/D-PILLAR TRIM - INSTALLATION).
15. Install and tighten the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel. Tighten the screw to 32 N·m (24 ft. lbs.).
16. Reinstall the rear seat back side bolster onto the quarter inner panel. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION/COVER - INSTALLATION).
17. Reinstall the rear seat cushion into the vehicle. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION).

## QUARTER TRIM SPEAKER BEZEL

### REMOVAL

1. Remove the screw in the cargo cover cradle formation of the quarter trim speaker bezel (2) that secures the bezel to the quarter trim panel (3) on top of the rear wheel house.
2. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the front edge of the speaker bezel upward from the quarter trim panel far enough to disengage the two spring clip retainers that secure the bezel to the slots in the trim panel.
3. Disengage the rear outboard seat belt webbing (1) from the quarter trim speaker bezel through the slit below the slot at the front of the bezel.
4. Lift the front of the quarter trim speaker bezel upward and pull it forward far enough to disengage the tabs at the back of the bezel from the slots in the back of the quarter trim panel opening.
5. Remove the quarter trim speaker bezel from the vehicle.

### INSTALLATION

1. Position the quarter trim speaker bezel (2) to the quarter trim panel (3) above the rear wheel house.
2. Engage the rear outboard seat belt webbing (1) into the slot of the quarter trim speaker bezel through the slit below the slot at the front of the bezel. Be certain the webbing is not twisted.
3. Lift the front of the quarter trim speaker bezel upward and engage the tabs at the back of the bezel into the slots in the back of the quarter trim panel opening.
4. Align the two spring clip retainers on the bezel with the slots in the quarter trim panel.
5. Using hand pressure, press firmly and evenly on the bezel over each of the spring clip locations until the retainers snap into place.
6. Install and tighten the screw into the cargo cover cradle formation of the quarter trim speaker bezel that secures the bezel to the quarter trim panel on top of the rear wheel house. Tighten the screw to 2 N·m (15 in. lbs.).

## REAR DOOR SILL SCUFF PLATE

### REMOVAL

1. Remove the screw (2) that secures the rear door scuff plate (4) to the quarter inner panel.
2. Remove the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel.
3. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the scuff plate upwards from the sill far enough to disengage the two spring clip retainers that secure the scuff plate to the slots in the sill.
4. Disengage the rear extension of the scuff plate from under the lower C-pillar trim (Sedan) or quarter trim panel (Wagon) (3).
5. Remove the rear door scuff plate from the vehicle.

### INSTALLATION

1. Check to be certain that spring nut (5) is properly installed and in good condition in the quarter inner panel (1).
2. Check to be certain that a plastic nut is properly installed and in good condition in the slot of the rear door opening sill. Replace the plastic nut if any damage is evident.
3. Engage the rear extension of the rear door scuff plate (4) under the lower C-pillar trim (Sedan) or quarter trim panel (Wagon) (3) on the quarter inner panel.
4. Align the two spring clip retainers on the scuff plate with the slots in the rear door sill.
5. Using hand pressure, press firmly and evenly downward on the scuff plate over each of the spring clip locations until the retainers snap into place.
6. Position the outboard rear seat belt lower anchor to the quarter inner panel.
7. Install and tighten the screw that secures the outboard rear seat belt lower anchor to the quarter inner panel. Tighten the screw to 32 N·m (24 ft. lbs.).
8. Install and tighten the screw (2) that secures the scuff plate trim panel and the lower C-pillar trim (Sedan) or quarter trim panel (Wagon) to the quarter inner panel. Tighten the screw to 11 N·m (8 ft. lbs.).

## REAR SHELF TRIM PANEL

### REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the right and left lower and upper C-pillar trim from the vehicle. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - REMOVAL).
3. Remove the nut that secures the center rear seat belt lower anchor to the stud on the floor panel and feed the seat belt webbing back through the opening in the top of the rear shelf panel trim (2) to the retractor.
4. Remove the push-pin fastener (1) that secures the trim to the rear shelf panel (3).
5. Slide the trim forward to disengage the S-clip that secures the underside of the trim to the center of the shelf panel.
6. Remove the trim from the rear shelf panel.

### INSTALLATION

1. Position the trim (2) onto the rear shelf panel (3).
2. Slide the rear edge of the trim rearward to engage the lens bezel of the center high-mounted stop lamp and far enough to engage the S-clip that secures the underside of the trim to the center of the shelf panel.
3. Install the push-pin fastener (1) that secures the trim to the rear shelf panel.
4. Pull the center rear seat belt lower anchor and belt webbing from the retractor through the opening in the top of the rear shelf panel trim and back down to the stud on the floor panel.
5. Install and tighten the nut that secures the seat belt lower anchor to the stud on the floor panel. Tighten the nut to 34 N·m (25 ft. lbs.).
6. Reinstall the right and left upper and lower C-pillar trim to the vehicle. (Refer to 23 - BODY/INTERIOR/C-PILLAR TRIM - INSTALLATION).
7. Reconnect the battery negative cable.

## MIRROR-INSIDE REARVIEW

### REMOVAL

1. If the vehicle is equipped with either the electrochromic (automatic dimming) or the telematic (hands-free phone) mirror option, disconnect and isolate the battery negative cable.
2. If the vehicle is so equipped, disconnect the electrochromic mirror takeout and connector (1) and/or the telematic mirror takeout and connector (2) of the headliner wire harness from the connector receptacle on the back (windshield side) of the mirror housing (3).

3. Remove the set screw (3) that secures the rear view mirror (2) to the support bracket/button (1) on the inside of the windshield glass.
4. Slide the rear view mirror upward far enough to disengage it from the support bracket/button.

## INSTALLATION

### MIRROR

1. Position and slide the rear view mirror (2) downward over the support bracket/button (1) on the inside of the windshield glass.
2. Install and tighten the set screw (3) that secures the rear view mirror to the support bracket/button. Tighten the screw to 2 N·m (17 in. lbs.).

3. If the vehicle is so equipped, route the electrochromic (automatic dimming) mirror takeout and connector (1) and/or the telematic (hands-free phone) mirror takeout and connector (2) of the headliner wire harness to the left of the mirror support bracket and reconnect it to the connector receptacle on the back (windshield side) of the mirror housing (3).
4. If the vehicle is equipped with either the electrochromic or the telematic mirror option, reconnect the battery negative cable.

### SUPPORT BRACKET

**Note:** The rear view mirror support bracket (or button) is permanently bonded to the inside of the windshield glass. If the bracket should become separated from the glass, it may be rebonded using the following procedure. This procedure requires the use of a Rear View Mirror Adhesive kit that is available through Mopar in single application packages that include a two-part adhesive and an accelerant with applicator.

1. Mark the proper position for the mirror bracket on the outside of the windshield glass with a wax pencil. The residual adhesive on the inside of the glass from the prior mirror bracket installation can be used as a guide.
2. Clean the bracket contact area on the inside of the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the bonding surface (the smaller side) of the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerant to the bonding surface of the bracket according to the following instructions:
  - Crush the accelerant vial to saturate the felt applicator.
  - Remove the paper sleeve.

- Apply accelerant to the bonding surface of the bracket.
  - Allow the accelerant to dry for five minutes.
  - Do not touch the bracket bonding surface after the accelerant has been applied.
5. Apply adhesive accelerant to the bracket contact area on the inside of the windshield glass. Allow the accelerant to dry for one minute. Do not touch the bracket contact area of the glass after the accelerant has been applied.
  6. Install the bracket according to the following instructions:
    - Apply one drop of adhesive at the center of the bracket contact area on the inside of the windshield glass.
    - Apply an even coat of adhesive to the bonding surface of the bracket.
    - Align the bracket with the marked position on the windshield glass.
    - Press and hold the bracket in place for at least one minute.

**Note:** Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before reinstalling the mirror.

## TRUNK LINING

### REMOVAL

1. Remove the spare tire cover/trunk floor carpet from over the spare tire well. (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - REMOVAL-TRUNK).
2. Remove the trunk rear trim panel from the luggage compartment. (Refer to 23 - BODY/INTERIOR/TRUNK REAR TRIM PANEL - REMOVAL).
3. Remove the three push-pin fasteners (2) that secure the right or the left trunk side trim (1) to the appropriate locations within the luggage compartment.
4. Remove the trunk side trim from the luggage compartment.

## INSTALLATION

1. Position and fit the right or the left trunk side trim (1) within the luggage compartment.
2. Install the three push-pin fasteners (2) that secure side trim to the appropriate locations within the luggage compartment.
3. Reinstall the trunk rear trim panel into the luggage compartment. (Refer to 23 - BODY/INTERIOR/TRUNK REAR TRIM PANEL - INSTALLATION).
4. Reinstall the spare tire cover/trunk floor carpet over the spare tire well in the luggage compartment. (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION-TRUNK).

## TRUNK REAR TRIM PANEL

### REMOVAL

1. Remove the four push-pin fasteners (1) that secure the trunk rear trim panel (2) to the inside of the deck opening lower panel (3).
2. Remove the trim panel from the vehicle.

## INSTALLATION

1. Position the trunk rear trim panel (2) to the inside of the deck opening lower panel (3).
2. Reinstall the four push-pin fasteners (1) that secure the trim panel to the deck opening lower panel.

# LIFTGATE

<b>LATCH HANDLE</b>		LOWER	190
REMOVAL	185	UPPER	191

## BUMPER

### REMOVAL

1. Open the liftgate.
2. Remove the two screws (3) that secure the stabilizer bumper (2) to the liftgate opening drain trough (1).
3. Remove the bumper from the trough.

## INSTALLATION

1. Position the stabilizer bumper (2) to the two mounting holes on the liftgate opening drain trough (1) with the arrow molded into the bumper pointed inboard.
2. Install and tighten the two screws (3) that secure the bumper to the trough. Tighten the screws to 12 N·m (9 ft. lbs.).
3. Close the liftgate.

## GAS PROP

### REMOVAL

1. Open and support the liftgate with a suitable prop or block.

**WARNING:** To avoid personal injury or death, during service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of deck lid support.

2. Insert a small flat-bladed tool (3) into the notch on the outer face of one ball socket end (1) of the support cylinder and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the liftgate or the liftgate opening trough.
3. Release the retaining clip to its installed position.
4. Repeat Step 2 and Step 3 for the opposite end of the support cylinder.
5. Remove the support cylinder from the liftgate and liftgate opening.

## INSTALLATION

1. Check to be certain that the ball studs (2) on the liftgate and on the liftgate opening trough (3) are in good condition and properly installed. Tighten the ball studs to 28 N·m (21 ft. lbs.).
2. Position the ball socket on the cylinder end of the support cylinder (1) to the ball stud on the liftgate opening trough.
3. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.

4. Position the ball socket on the rod end of the support cylinder (3) to the ball stud (2) on the liftgate (1).
5. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
6. Inspect to be certain that the retaining clip on each of the support cylinder ball socket ends is fully seated.
7. Remove the service prop or block and close the liftgate.

## HINGE

### REMOVAL

1. Open and support the liftgate (2) with a suitable prop or block.
2. Remove the trim plate from the upper liftgate opening header (4). (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
3. Mark the hinge (1) liftgate half location on the liftgate inner panel to aid reinstallation.
4. Remove the two screws (3) that secure the hinge to the liftgate.
5. Mark the hinge body half location on the upper liftgate opening header to aid reinstallation.
6. Carefully pull the rear edge of the headliner downward from the header far enough to access and remove the two nuts (5) that secure the hinge studs to the underside of the header.
7. Remove the hinge from the vehicle.

### INSTALLATION

1. Position the body half of the liftgate hinge (1) to the upper liftgate opening header (4) on the vehicle.
2. Carefully pull the rear edge of the headliner downward from the header far enough to install and tighten the two nuts (5) that secure the hinge studs to the underside of the header. Tighten the nuts to 28 N·m (21 ft. lbs.).
3. Position the liftgate (2) to the liftgate half of the hinge on the vehicle.
4. Install and tighten the two screws (3) that secure the hinge to the liftgate. Tighten the screws to 28 N·m (21 ft. lbs.).
5. Remove the fixture being used to support the liftgate for service.
6. Adjust the liftgate hinge position as necessary to achieve proper spacing and operation.
7. Reinstall the trim plate onto the upper liftgate opening header. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).

## LATCH

### REMOVAL

1. Open the liftgate.
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim panel from the inside of the liftgate (1). (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL/LOWER - REMOVAL).
4. Disconnect the pigtail wire connector of the latch (5) from the take out of the liftgate wire harness (3) on the inside of the liftgate.
5. Remove the three nuts (4) that secure the latch to the studs (2) on the inside of the liftgate.
6. Remove the liftgate latch from the vehicle.

### INSTALLATION

1. Position the latch (5) onto the studs (2) on the inside of the liftgate (1).
2. Install and tighten the three nuts (4) that secure the latch to the studs on the inside of the liftgate. Tighten the nuts to 12 N·m (9 ft. lbs.).
3. Reconnect the pigtail wire connector of the latch to the take out of the liftgate wire harness (3) on the inside of the liftgate.
4. Reinstall the lower trim panel onto the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL/LOWER - INSTALLATION).
5. Reconnect the battery negative cable.
6. Close the liftgate.

## LATCH HANDLE

### REMOVAL

1. Open the liftgate (4).
2. Disconnect and isolate the battery negative cable.
3. Remove the lower trim panel from the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL/LOWER - REMOVAL).
4. Disconnect the pigtail wire connector of the latch handle (2) from the take out of the liftgate wire harness (3) on the inside of the liftgate.
5. Reach through the clearance hole in the inside of the liftgate panel on each side of the latch to access and remove the two screws (1) that secure the handle to the liftgate.
6. Remove the latch handle from the outside of the liftgate.

### INSTALLATION

1. Position the latch handle (2) onto the outside of the liftgate (4).
2. Reach through the clearance hole in the inside of the liftgate panel on each side of the latch to install and tighten the two screws (1) that secure the handle to the liftgate. Tighten the screws to 9 N·m (7 ft. lbs.).
3. Reconnect the pigtail wire connector of the latch handle to the take out of the liftgate wire harness (3) on the inside of the liftgate.
4. Reinstall the lower trim panel onto the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL/LOWER - INSTALLATION).
5. Reconnect the battery negative cable.
6. Close the liftgate.

## LATCH STRIKER

### REMOVAL

1. Open the liftgate.
2. Remove the scuff plate trim panel from the inside of the liftgate opening lower panel (3). (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - REMOVAL).
3. Mark the latch striker (2) location on the inside of the liftgate opening lower panel to aid reinstallation.
4. Remove the two screws (1) that secure the latch striker to the inside of the liftgate opening lower panel.
5. Remove the latch striker from the vehicle.

### INSTALLATION

1. Position the liftgate latch striker (2) to the inside of the liftgate opening lower panel (3).
2. Install and tighten the two screws (1) that secure the latch striker to the liftgate opening lower panel. Tighten the screws to 28 N·m (21 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper liftgate latch operation.
4. Reinstall the scuff plate trim panel to the liftgate opening lower panel. (Refer to 23 - BODY/INTERIOR/LIFTGATE SCUFF PLATE - INSTALLATION).
5. Close the liftgate.

## LIFTGATE

### REMOVAL

1. Open the liftgate (7).
2. Disconnect and isolate the battery negative cable.
3. Remove the upper and lower trim panels from the inside of the liftgate. (Refer to 23 - BODY/DECK-LID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - REMOVAL).
4. Disconnect the washer supply hose (2) in the right body wire harness (3) from the liftgate spoiler washer nozzle hose on the underside of the liftgate.
5. Disconnect the take out and connector (1) of the right body wire harness from the antenna amplifier module on the inside of the liftgate near the right upper corner of the glass opening.
6. Disconnect the two connectors (6) of the liftgate wire harness from the two take outs and connectors of the left body wire harness (5).
7. Disengage the retainers that secure the liftgate take outs of the right and left body wire harnesses to the underside of the liftgate.
8. Disengage the wire grommets (4) of the right and left body wire harnesses inboard of the liftgate hinges from the underside of the liftgate.
9. Carefully remove the liftgate take outs of the right and left body wire harnesses from between the inner and outer liftgate panels.
10. Disconnect the gas props from the ball studs on each side of the liftgate (2). (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/GAS PROP - REMOVAL).
11. Remove the trim plate from the underside of the upper liftgate opening header (3). (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - REMOVAL).
12. Mark the liftgate hinge body bracket (1) locations on the upper liftgate opening header to aid reinstallation.
13. Carefully pull the rear edge of the headliner downward from the header far enough to access and remove the four nuts (4) that secure the two studs of each hinge to the underside of the header.
14. With the aid of an assistant, lift the liftgate far enough to disengage the hinge studs from the header and remove the liftgate from the vehicle.

## INSTALLATION

1. With the aid of an assistant, support and position the liftgate (2) with the studs of the two hinge body half brackets (1) inserted into the holes of the upper liftgate opening header (3) on the vehicle.
2. Carefully pull the rear edge of the headliner downward from the header far enough to install and tighten the four nuts (4) that secure the hinge studs to the underside of the header. Tighten the nuts to 28 N·m (21 ft. lbs.).
3. Reinstall the gas props to the ball studs on each side of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/GAS PROP - INSTALLATION).
4. Remove the fixture being used to support the liftgate for service.

5. Carefully route the liftgate take outs of the right (3) and left (5) body wire harnesses between the inner and outer panels of the liftgate (7).
6. Engage the wire grommets (4) of the right and left body wire harnesses into the holes inboard of the liftgate hinges on the underside of the liftgate.
7. Engage the retainers that secure the liftgate take outs of the right and left body wire harnesses to the underside of the liftgate.
8. Reconnect the two connectors (6) of the liftgate wire harness to the two take outs and connectors of the left body wire harness.
9. Reconnect the take out and connector (1) of the right body wire harness to the antenna amplifier module on the inside of the liftgate near the right upper corner of the glass opening.

10. Reconnect the washer supply hose (2) in the right body wire harness to the liftgate spoiler washer nozzle hose on the underside of the liftgate.
11. Adjust the liftgate hinge, bumper, latch and latch striker positions as necessary to achieve proper spacing and operation.
12. Reinstall the trim plate onto the upper liftgate opening header. (Refer to 23 - BODY/INTERIOR/LIFTGATE OPENING UPPER TRIM - INSTALLATION).
13. Reinstall the upper and lower trim panels onto the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).
14. Reconnect the battery negative cable.
15. Close the liftgate.

## TRIM PANEL

### REMOVAL

#### LOWER

1. Disconnect and isolate the battery negative cable.
2. Remove the lamp from the lower liftgate trim panel.
3. Remove the two screws (6) within the pull cup formation to the right of the latch that secure the lower trim panel (1) to the inside of the liftgate (4).
4. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the trim panel away from the inside of the liftgate to release the seven push-in plastic fasteners (7) that secure the panel to the liftgate.
5. Remove the liftgate lower trim panel from the vehicle.

## REMOVAL

1. Open the liftgate (6).
2. Remove the lower trim panel from the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/ TAILGATE/TRIM PANEL/LOWER - REMOVAL).
3. Remove the two screws (4) that secure the lower corners of the upper trim panel (3) to the inside of the liftgate.
4. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the trim panel away from the inside of the liftgate to release the eight push-in plastic fasteners (7) that secure the panel to the liftgate.
5. Remove the liftgate upper trim panel from the vehicle.

## INSTALLATION

### LOWER

1. Check to be certain that the two U-nuts (5) are properly installed and in good condition on the inside of the liftgate (4).
2. Check to be certain that the seven push-in plastic fasteners (7) are properly installed and in good condition on the inside of the lower trim panel (1).
3. Position the upper corners of the lower trim panel over the lower corners of the upper trim panel on the inside of the liftgate.
4. Align the three locator pins (2) on the back of the trim panel to the locator holes (3) on the inside of the liftgate.
5. Using hand pressure, press firmly and evenly on the trim panel over each of the seven push-in plastic fastener locations until the fasteners are fully engaged in the holes on the inside of the liftgate.
6. Install and tighten the two screws (6) within the pull cup formation to the right of the latch that secure the lower trim panel to the U-nuts on the inside of the liftgate. Tighten the screws to 3 N·m (27 in. lbs.).
7. Reinstall the lamp into the lower liftgate trim panel.
8. Reconnect the battery negative cable.

## UPPER

1. Check to be certain that the eight push-in plastic fasteners (5) are properly installed and in good condition on the inside of the liftgate upper trim panel (3).
2. Position the upper trim panel over the inside of the liftgate (6).
3. Align the two locator pins (2) on the back of the trim panel to the locator holes (1) on the inside of the liftgate.
4. Using hand pressure, press firmly and evenly on the trim panel over each of the eight push-in plastic fastener locations until the fasteners are fully engaged in the holes on the inside of the liftgate.
5. Install and tighten the two screws (6) that secure the lower corners of the upper trim panel to the inside of the liftgate. Tighten the screws to 2 N·m (16 in. lbs.).
6. Reinstall the lower trim panel onto the inside of the liftgate. (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/ TAILGATE/TRIM PANEL/LOWER - INSTALLATION).
7. Close the liftgate.

## BASE COAT/CLEAR COAT FINISH

## DESCRIPTION

The original equipment finish is a multi step process that involves cleaning, applying electro de-position (E-coat), anti-chip primer, basecoat, and clearcoat steps.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. The clear coat protects the basecoat from ultraviolet light and provides a durable high-gloss finish.

**CAUTION:** Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result. Do not use harsh alkaline based cleaning solvents on painted surfaces. Damage to finish or color can result.

## FINESSE SANDING/BUFFING & POLISHING

### DESCRIPTION

**CAUTION:** Do not remove more than .5 mils of clearcoat finish, if equipped. Basecoat paint must retain clearcoat for durability.

Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine film thickness before and after the repair.

Minor acid etching, orange peel, or smudging in clearcoat or single-stage finishes can be reduced with light finesse sanding, hand buffing, and polishing. **If the finish has been finesse sanded in the past, it cannot be repeated. Finesse sanding operation should be performed by a trained automotive paint technician.**

## PAINT CODE

### DESCRIPTION

Exterior vehicle body colors are identified on the Vehicle Certification Label (Refer to VEHICLE DATA/VEHICLE INFORMATION/VEHICLE CERTIFICATION LABEL - DESCRIPTION). The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers. (Refer to 23 - BODY/PAINT - SPECIFICATIONS)

## PAINT TOUCH-UP

### DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use MOPAR® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat.

**WARNING: USE AN OSHA APPROVED RESPIRATOR AND SAFETY GLASSES WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.**

### STANDARD PROCEDURE

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with MOPAR® Tar/Road Oil Remover or equivalent, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.
5. On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

**WARNING: AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT. AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL – BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.**

SEATS

WARNING

RESTRAINT SYSTEM

**WARNING:** During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the DaimlerChrysler Mopar parts catalog. Failure to follow these instructions may result in personal injury or death.

**WARNING:** On vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment. Failure to follow these instructions may result in personal injury or death.

**WARNING:** On vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the airbag control module (acm). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in personal injury or death.

**WARNING:** Replace all restraint system components only with parts specified in the DaimlerChrysler Mopar parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in personal injury or death.

**WARNING:** The fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar parts catalog. Failure to follow these instructions may result in personal injury or death.

**WARNING:** On vehicles equipped with the occupant classification system (ocs) do not hang any after market devices from the front passengers seat back. Do not install a front drivers seat back cover with map pocket onto the passenger seat. Failure to follow these instructions may result in personal injury or death.

**WARNING:** The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

**WARNING:** The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

**WARNING:** When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

## ADJUSTERS-FRONT

### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat cushion as necessary. (Refer to 23 - BODY/SEATS/SEAT CUSHION / COVER - FRONT - REMOVAL)

### Power

1. Remove the seat risers. (Refer to 23 - BODY/SEATS/SEAT RISER - FRONT - REMOVAL)
2. Remove the bolts and nuts (2 & 4) and separate the height adjuster assembly from the length adjuster assembly (3).

**Note:** Bolt (4) is a different size from the other three bolts (2). Note the location for proper installation.

**WARNING: A SEAT STRUCTURE THAT HAS SEEN SIGNIFICANT LOAD MAY HAVE THE LOCKING MECHANISM ACTIVATED AND MAY EXHIBIT THE FOLLOWING SYMPTOMS:**

- LOCKING PAWL (2) LOOSE
- LOCKING PAWL (2) ENGAGED INTO THE SEAT FRAME SIDE MEMBER (1)
- HEIGHT ADJUSTER ONLY WORKS ON OUT-BOARD SIDE
- BROKEN OR MISSING SHEAR PIN (3)

**IF ANY ONE OR MORE OF THESE SYMPTOMS EXIST REPLACE THE HEIGHT ADJUSTER ASSEMBLY. DO NOT ATTEMPT ANY REPAIRS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY OR DEATH.**

## Manual

1. Remove the spring clip.

2. Squeeze the towel bar together and pull the towel bar out of the left and right seat tracks.

3. Remove the bolts (1 & 4), nuts (6) and spacers (2) and separate the side member assembly (3) from the length adjuster assembly (5).

## INSTALLATION

### Power

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

**WARNING: A SEAT STRUCTURE THAT HAS SEEN SIGNIFICANT LOAD MAY HAVE THE LOCKING MECHANISM ACTIVATED AND MAY EXHIBIT THE FOLLOWING SYMPTOMS:**

- LOCKING PAWL (2) LOOSE
- LOCKING PAWL (2) ENGAGED INTO THE SEAT FRAME SIDE MEMBER (1)
- HEIGHT ADJUSTER ONLY WORKS ON OUT-BOARD SIDE
- BROKEN OR MISSING SHEAR PIN (3)

**IF ANY ONE OR MORE OF THESE SYMPTOMS EXIST REPLACE THE HEIGHT ADJUSTER ASSEMBLY. DO NOT ATTEMPT ANY REPAIRS. FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN PERSONAL INJURY OR DEATH.**

2. Install the seat risers. (Refer to 23 - BODY/SEATS/ SEAT RISER - INSTALLATION)
3. Position the height adjuster assembly (1) onto the length adjuster assembly (3) and install the nuts, bolts and spacers on the inboard side.

**Note: Bolts (2) and (4) are different and need to be installed into the correct positions.**

4. Tighten the bolts to 21 N·m (15 ft. lbs.).
5. Install the seat cushion and install the seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION)

## Manual

1. Install the seat risers. (Refer to 23 - BODY/SEATS/ SEAT RISER - INSTALLATION)
2. Position the side member assembly (3) onto the length adjuster assembly (5) and install the nuts (6), bolts (1 & 4) and spacers (2) on the inboard side.
3. Tighten the bolts to 42 N·m (31 ft. lbs.).

4. Squeeze the towel bar together and insert the ends into the bushings on both tracks.

5. Install the spring clip.
6. Install the seat cushion and install the seat. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - INSTALLATION)

## ARMREST-REAR

### REMOVAL

1. Fold down 40 side rear seat back.
2. Remove arm rest bolt.
3. Remove retaining C-clip.
4. Remove arm rest.

### INSTALLATION

1. Place arm rest in bracket.
2. Install arm rest bolt. Tighten to 12 N·m (9 ft. lbs.) torque.
3. Install retaining C-clip.
4. Reposition the seats.

## CUSHION/COVER-CUSHION - FRONT

### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Move the seat to the forward position and disconnect and isolate the batter negative cable.
3. Remove the bolts (2) and the clamps (1) and remove the seat cushion.
4. Disconnect the electrical connector, if equipped.

5. Separate the j-straps (1 & 2) and seat cushion cover and foam.

### INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the cushion cover and foam over the seat pan and connect the j-straps (1 & 2).

3. Position the seat cushion assembly onto the seat frame and install the clamps (1).
4. Connect the wire harness to the seat cushion pan, if equipped.
5. Install the bolts (2) and tighten to 10 N·m (90 in. lbs.).
6. Connect battery negative cable.

## CUSHION/COVER-CUSHION - SECOND ROW

### REMOVAL

1. Pull upward at forward edge of cushion each retainer loop of the rear seat cushion to disengage retainer loops from cups in floor.
2. Remove rear seat cushion (4) from vehicle.

3. Disengage the J-straps attaching seat cover to the cushion.

4. Fold rear of the seat cover forward to uncover hog rings.

5. Start on the rear side of the cushion and cut hog rings.

6. Cut the hog rings on the outer side of the cushion.

7. Work around the outer edges and cut the hog rings.

8. Fold cover up to access the inner hog rings and cut them.
9. Repeat operation on the other side of cushion.
10. Remove seat cushion cover from seat cushion.

11. If replacing cushion, remove the cushion support by cutting the hog rings attaching it to the foam and remove.

## INSTALLATION

1. Install hog rings attaching cushion support, if remove.

2. Place seat cover into position on the foam.
3. Install the attaching hog rings on the inner side of the seat cover and cushion.

4. Install hog rings on the on the front side the seat cover.

5. Install hog rings on the outer side of the seat cover. Check for seat cover wrinkles.

6. Install the hog rings on the rear side of seat cover.
7. Repeat the operation for the other side of cushion.

8. Position seat cover in to position on the foam and check for seat cover wrinkles.

9. Connect the J-straps, and smooth out seat cover.
10. Steam wrinkles from seat cushion, if necessary.

11. Place seat cushion (4) into position.
12. Engage retainer loops into cup on floor kick up.
13. Push downward at forward edge at each retainer loop of the rear seat cushion to engage retainers.

## CUSHION/COVER-SEAT BACK - FRONT

### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the front seat. (Refer to 23 - BODY/SEATS/SEAT - FRONT - REMOVAL)
3. Remove the lumbar and recliner handles (1).
4. Remove the screws and remove the side shields (2).

5. Remove the belt buckle.

6. Remove the seat back bolts from both sides.

7. Push in the buttons on both headrest sleeves, pull the headrest up and remove.

8. Separate the j-straps (1 & 2) and pull cover up over frame and remove cushion.
9. Pinch both headrest sleeve ribs from inside the seat back frame with pliers or equivalent.
10. Strike the bottom of the sleeve with a rubber mallet or equivalent, and remove the headrest sleeves.

## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Position the seat back cover over the seat back frame and install the headrest sleeves.
3. Position the seat back cushion on the frame and position the cover over the cushion.
4. Connect the j-straps (1 & 2).

5. Install the seat back bolts and tighten to 40 N·m (30 ft. lbs.).

6. Position the front seat belt buckle lower anchor onto the stud near the rear of the inboard seat cushion frame. Be certain the anti-rotation tab on the anchor is engaged in the clearance hole of the frame.
7. Tighten the nut to 43 N·m (32 ft. lbs.)

8. Install the side shields (2) and install the screws.
9. Install the lumbar and recliner handles (1 & 4).

## CUSHION/COVER-SEAT BACK - SECOND ROW

### REMOVAL

1. Remove the seat cushion. (Refer to 23 - BODY/ SEATS/SEAT CUSHION COVER - REMOVAL)
2. Remove the nut and disconnect the seat belt anchor.

### 60/40 Seat Back - Wagon

#### 40% SEAT BACK SIDE

1. Fold the 40% section of the seat (2) down.
2. Remove the nuts (5).
3. Pivot the seat back off the pivot pin (3) located on the 60% seat back.
4. Remove the seat back from vehicle.

## 60/40 Seat Back - Wagon

### 60% SEAT BACK SIDE

1. With the 40% seat back removed.
2. Fold the 60% section of the seat down.
3. Remove the four nuts attaching seat back (5).
4. Remove the seat back for vehicle.

## 60/40 Seat Back - Domestic Sedan

### 40% SEAT BACK SIDE

1. Fold the 40% section of the seat (3) down.
2. Remove the two nuts (4) attaching seat back.
3. Pivot the seat back off the pivot pin (1) located on the 60% seat back (2).
4. Remove the seat back from vehicle.

## 60/40 Seat Back - Domestic Sedan

### 60% SEAT BACK SIDE

1. With the 40% seat back removed.
2. Fold the 60% section of the seat down.
3. Remove the four nuts attaching seat back (5).
4. Remove the seat back for vehicle.

## 60/40 Seat Back - Export Sedan

### 40% SEAT BACK SIDE

1. Fold the 40% section of the seat (3) down.
2. Remove the three nuts (4) attaching seat back.
3. Remove the seat back from vehicle.

## 60/40 Seat Back - Export Sedan

### 60% SEAT BACK SIDE

1. With the 40% seat back removed.
2. Remove the four nuts (1) and (3) attaching seat back.
3. Remove the seat back from vehicle.

## INSTALLATION

### REMOVAL

1. Place seat belt into position and install the seat belt anchor nut. Tighten nut to 32 N·m (24 ft. lbs.) torque.
2. Place the seat cushion into position and push downward on the forward edge of the seat cushion to lock into position. (Refer to 23 - BODY/SEATS/ SEAT CUSHION COVER - REMOVAL)

## 60/40 Seat Back - Wagon

### 60% SEAT BACK SIDE

1. With the 40% seat back removed.
2. Place 60% seat back (5) into position on the studs.
3. Fold the 60% section of the seat down.
4. Install the four nuts (6) attaching seat back (5). Tighten nuts to 57 N·m (42 ft. lbs.) torque.

## 60/40 Seat Back - Wagon

### 40% SEAT BACK SIDE

1. Place the 40% section (2) into position.
2. Slide 40% seat back onto the pivot pin (3) located on the 60% seat back.
3. Install the two nuts (5) attaching seat back. Tighten nuts to 57 N·m (42 ft. lbs.) torque.

## 60/40 Seat Back Domestic Sedan

### 60% SEAT BACK SIDE

1. With the 40% seat back removed.
2. Place 60% seat back (2) into position on the studs.
3. Fold the 60% section of the seat down.
4. Install the four nuts (1) and (3) attaching seat back (2). Tighten nuts to 57 N·m (42 ft. lbs.) torque.

## 60/40 Seat Back Domestic Sedan

### 40% SEAT BACK SIDE

1. Place the 40% section (3) into position.
2. Slide 40% seat back onto the pivot pin (1) located on the 60% seat back (2).
3. Install the two nuts (5) attaching seat back. Tighten nuts to 57 N·m (42 ft. lbs.) torque.

## 60/40 Seat Back Export Sedan

### 60% SEAT BACK SIDE

1. With the 40% seat back removed.
2. Place 60% seat back (2) into position on the studs.
3. Fold the 60% section of the seat down.
4. Install the four nuts (1) and (3) attaching seat back (2). Tighten nuts to 57 N·m (42 ft. lbs.) torque.

## 60/40 Seat Back Export Sedan

### 40% SEAT BACK SIDE

1. Place the 40% section (3) into position onto the studs.
2. Fold the 40% section of the seat down.
3. Install the four nuts (4) attaching seat back (3). Tighten nuts to 57 N·m (42 ft. lbs.) torque.

## RISER-FRONT

### REMOVAL

#### Manual Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
3. Move the seat to the forward position on the tracks and remove the seat adjuster bolts/nuts (3).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (3).

**Note:** Passenger seat with strain gauges shown, drivers side seat similar.

5. Disconnect strain gauge electrical connectors (1), if equipped.
6. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.

#### Power Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Unbolt the seat from the floor as necessary to gain access to the riser bolts. (Refer to 23 - BODY/SEATS/SEAT - REMOVAL)
3. Move the seat to the forward position on the tracks, tip the seat backwards in vehicle and remove the seat adjuster bolts/nuts (3).
4. Move the seat to the reward position on the tracks and remove the front seat adjuster bolts/nuts (3).

**Note:** Manual seat length adjuster shown, power similar.

5. If the seat cannot be moved forward or backward, remove the seat cushion. (Refer to 23 - BODY/SEATS/SEAT CUSHION COVER - REMOVAL)
6. Remove the four bolts (1) and remove the motor and cable assembly (2) from the length adjuster assembly.

**CAUTION:** When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.

7. Disconnect and isolate battery negative cable.
8. Remove the seat off of the risers and disconnect the electrical connectors.
9. Disconnect strain gauge electrical connectors (1), if equipped.
10. If equipped, remove the strain gauge bolts (2) and remove the strain gauges as necessary.

## INSTALLATION

### Manual Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)

**Note:** Passenger seat with strain gauges shown, drivers side seat similar.

2. If equipped, install the strain gauges and install the bolts (2).
3. Tighten the bolts to 40 N·m (30 ft. lbs.).
4. If necessary, connect the electrical connections (1).
5. Move the seat to the forward position on the tracks and install the rear seat adjuster bolts/nuts (3).
6. Tighten the bolts to 45 N·m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts to 45 N·m (33 ft. lbs.).
9. Install the seat. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

## Power Length Adjuster

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. If equipped, install the strain gauges and install the bolts (2).
3. Tighten the bolts to 40 N·m (30 ft. lbs.).
4. Position the seat into the vehicle onto the risers and connect the electrical connectors.
5. Move the seat to the forward position on the tracks and install the seat adjuster bolts/nuts (3).
6. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N·m (33 ft. lbs.).
7. Move the seat to the reward position on the tracks and install the front seat adjuster bolts/nuts (3).
8. Tighten the bolts attaching the adjuster to the risers/strain gauges to 45 N·m (33 ft. lbs.).
9. If necessary, connect the strain gauge electrical connections (1).

**CAUTION:** When the motor and cable assembly are removed from the tracks discard the length adjuster assembly and replace with a new one.

10. Bolt the seat to the floor. (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION)

## SEAT-FRONT

### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING).
2. Remove the cover (1) and lower seat belt anchor bolt (2).

**FRONT SEAT - LEFT SIDE**

1. Remove the left side front seat two front attaching bolts (1).

2. Move the seat forward to gain access to the rear bolts.
3. Remove the left side front seat two rear attaching bolts (1) and (2).
4. Disconnect and isolate battery negative cable.
5. Disconnect the electrical connectors.
6. Remove the seat.

**FRONT SEAT - RIGHT SIDE**

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ SEATS - WARNING).

**WARNING:** The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

**WARNING:** When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. Remove the right side front seat with OCS sensor two front attaching bolts (1).

3. Move the seat forward to gain access to the rear bolts.
4. Remove the right side front seat with OCS sensor two rear attaching bolts (2) and (3).
5. Ensure that the ignition key is in the off position.
6. Disconnect and isolate battery negative cable.
7. Disconnect the electrical connectors.
8. Remove the seat.

## INSTALLATION

### FRONT SEAT - RIGHT SIDE

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/ SEATS - WARNING)

**WARNING:** The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

**WARNING:** When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

2. With battery negative cable disconnected.
3. Place seat into position in vehicle.

**WARNING:** The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

4. Connect the electrical connectors.
5. Place the ignition key in the run position.
6. Connect battery negative cable.
7. Place ignition key in the off position.
8. Move the seat forward to gain access to the rear bolts, as necessary.
9. Install the front seat attaching rear bolts (1) and (2).
10. Install the front seat front attaching bolts (1).
11. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. (Refer to 8 - ELECTRICAL/RESTRAINTS - STANDARD PROCEDURE - VERIFICATION TEST).
12. Following successful completion of the supplemental restraint system verification test procedure, perform the Occupant Classification System Verification Test using a scan tool. (Refer to 8 - ELECTRICAL/RESTRAINTS - \*OCS VERIFICATION TEST - VER 1)

**FRONT SEAT - LEFT SIDE**

1. Place seat into position in vehicle.
2. Connect the electrical connectors.
3. Connect battery negative cable.
4. Move the seat forward to gain access to the rear bolts.
5. Install the front seat attaching rear bolts (1) and (2).

6. Install the front seat front attaching bolts (1).

1. Install the cover (1) and lower seat belt anchor bolt (2).

## STRIKER-SEAT BACK LATCH - SECOND ROW

### REMOVAL

1. Remove the sedan seat back striker (2), remove the attaching screws (3) and remove seat back striker from the vehicle.
2. Remove the wagon seat back striker (2), remove the attaching screws (1) and remove seat back striker from the vehicle.

3. Remove the export sedan seat back striker (2), remove the attaching screws (3) and remove seat back striker from the vehicle.

**INSTALLATION**

1. Spring nut(s) (1) replace, if necessary.
2. Place the sedan back seat striker (2) into position and Install attaching screws (3).
3. Place the wagon back seat striker (2) into position and Install attaching screws (1).

8131b54c

4. Spring nut(s) (1) replace, if necessary.
5. Place the (Export) sedan back seat striker (2) into position and Install attaching screws (3).

## SUPPORT-LUMBAR

### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Remove the seat back cushion/cover. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - FRONT - REMOVAL)
3. Release the lumbar mat side wires (1) by pulling out on the wire supports and then pulling them in.

8125f6d0

4. Squeeze the lower support wires (1) in and release the lower wires.

5. Pull the upper support wires (1) down and release the lumbar mat from the seat back frame.

6. Remove the rivet (1) and remove the lumbar mechanism (2).

## INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/SEATS - WARNING)
2. Install the lumbar mechanism (2) and install a new rivet (1).

3. Place lumbar mat onto seat back frame and insert the upper support wires (1) into the frame.

4. Squeeze the lower support wires (1) together and insert into the lower frame.

5. Squeeze the side support wires together and insert them into the sides of the seat back frame.
6. Install the seat back cushion/cover. (Refer to 23 - BODY/SEATS/SEAT BACK CUSHION / COVER - FRONT - INSTALLATION)

## STATIONARY GLASS

## WARNING

## WINDSHIELD SAFETY PRECAUTIONS

**WARNING:** Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- Urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, pvc (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.
- Daimlerchrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufactures warrant will restore a vehicle to the requirements of fmvss 212. Technicians should also insure that primers and cleaners are compatible with the particular adhesive used.
- Be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.
- Vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.
- Skin contact with urethane adhesive should be avoided. Personal injury may result.
- Always wear eye and hand protection when working with glass.

**CAUTION:** Protect all painted and trimmed surfaces from coming in contact with urethane or primers. Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

## BACKLITE

### REMOVAL

**Note:** Windshield removal shown, backlite similar.

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove quarter trim panels (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - REMOVAL).
3. Remove the trim panel from the rear shelf (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - REMOVAL).
4. Disconnect the wire connectors from rear window defogger terminals and, rear window mounted radio antenna, if equipped.

**CAUTION:** Be careful not to damage painted surfaces when cutting urethane around the backlight.

5. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the backlite to the backlite fence.
6. Carefully remove the backlite from the vehicle.

### INSTALLATION

**CAUTION:** To help prevent water leaks, partially roll down the left and right door glass before installing the backlite. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

**CAUTION:** Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

1. If the backlite (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

**Note:** To prevent corrosion, do not damage paint on the backlite fence when removing original urethane.

**Note:** The backlite fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Replace any missing or damaged spacers around the perimeter of the backlite fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the backlite fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.
3. Install a new rubber seal (1) around the top and side edges of backlite (2).
4. Using an assistant, position the backlite into the backlite opening and against the backlite fence (3).
5. Verify the backlite lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the backlite.
6. Mark the backlite and fence with a grease pencil or pieces of masking tape to use as a reference for installation.
7. Using an assistant, remove the backlite from the backlite opening and place it on a suitable padded work surface.

**WARNING:** Do not use solvent based glass cleaners to clean the backlite before applying glass prep and primer or poor glass adhesion may result.

8. Clean the inside of the backlite with an ammonia based glass cleaner and a lint-free cloth.
9. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the backlight (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
10. Apply glass primer 25 mm (1 in.) wide around the perimeter of the backlight and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
11. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the backlite.
12. Re-prime any area that is not fully and evenly primed.

13. Clean the backlite fence with an ammonia based glass cleaner and a lint-free cloth.
14. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the backlite fence (2). Allow at least three minutes drying time.
15. Using a flashlight, verify that the primer is completely and evenly installed along the backlite fence.
16. Re-prime any area that is not fully and evenly primed.

**CAUTION:** Always apply the bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying the adhesive.

**Note:** If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

17. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the backlite.
18. Run the end of the adhesive bead (1) on the backlite (2) parallel to the start of the bead and smooth the ends flush.

19. Using an assistant, position the backlite (2) over the backlite opening.
20. Using the grease pencil marks or tape as reference points, align the backlite to the opening.
21. Carefully lower the backlite onto the backlite fence (3). Guide the backlite and the rubber seal (1) around the backlite into its proper location.

**CAUTION:** It is not possible to move the backlite after installation. The backlite should never be pressed into place by more than one person, because the backlite can break if pressed simultaneously on both sides.

22. Push the backlite inward until the backlite comes into contact with the spacers located on each side of the backlite fence.
23. Connect the wire connectors to the rear window defogger terminals and, rear window mounted radio antenna, if equipped.
24. Install the trim panel to the rear shelf (Refer to 23 - BODY/INTERIOR/REAR SHELF TRIM PANEL - INSTALLATION).
25. Install the quarter trim panels (Refer to 23 - BODY/INTERIOR/QUARTER TRIM PANEL - INSTALLATION).

## GLASS-LIFTGATE

### REMOVAL

**Note:** Windshield removal shown, liftgate glass similar.

1. Before proceeding with the following repair procedure, review all warnings and cautions. (Refer to 23 - BODY/STATIONARY GLASS - WARNING)
2. Remove the liftgate trim panels (Refer to 23 - BODY/LIFTGATE/TRIM PANEL - REMOVAL).
3. Remove rear window wiper arm, if equipped (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - REMOVAL).
4. Disconnect the wire connectors from rear window defogger terminals and, rear window mounted radio antenna, if equipped.
5. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the backlite to the liftgate.
6. Carefully remove the backlite from the vehicle.

### INSTALLATION

**CAUTION:** To help prevent water leaks, partially roll down the left and right door glass before installing the liftgate glass. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

**CAUTION:** Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

1. If the liftgate glass (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

**Note:** To prevent corrosion, do not damage paint on the liftgate glass fence when removing original urethane.

**Note:** The liftgate glass fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Replace any missing or damaged spacers around the perimeter of the liftgate glass fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the liftgate glass fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.
3. Replace any damaged or missing spacers (1 and 3).
4. Using an assistant, position the liftgate glass (2) into the liftgate glass opening and against the support spacers.
5. Verify the liftgate glass lays evenly against the liftgate fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the liftgate glass.
6. Mark the liftgate glass and fence with a grease pencil or pieces of masking tape to use as a reference for installation.
7. Using an assistant, remove the liftgate glass from the liftgate glass opening and place it on a suitable padded work surface.

**WARNING:** Do not use solvent based glass cleaners to clean the liftgate glass before applying glass prep and primer or poor glass adhesion may result.

8. Clean the inside of the liftgate glass with an ammonia based glass cleaner and a lint-free cloth.
9. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the liftgate glass (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
10. Apply glass primer 25 mm (1 in.) wide around the perimeter of the liftgate glass and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
11. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the liftgate glass.
12. Re-prime any area that is not fully and evenly primed.
13. Clean the liftgate glass fence with an ammonia based glass cleaner and a lint-free cloth.
14. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the liftgate glass fence (2). Allow at least three minutes drying time.
15. Using a flashlight, verify that the primer is completely and evenly installed along the liftgate glass fence.
16. Re-prime any area that is not fully and evenly primed.

**CAUTION:** Always apply the bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying the adhesive.

**Note:** If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

17. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the glass.

18. Run the end of the adhesive bead (1) on the liftgate glass (2) parallel to the start of the bead and smooth the ends flush.

19. Using an assistant, position the liftgate glass (2) over the liftgate glass opening and against the support spacers (1 and 3).
20. Using the grease pencil marks or tape as reference points, align the liftgate glass to the opening.
21. Carefully lower the liftgate glass onto the liftgate glass fence.

**CAUTION:** It is not possible to move the liftgate glass after installation. The liftgate glass should never be pressed into place by more than one person, because the glass can break if pressed simultaneously on both sides.

22. Push the liftgate glass inward until the glass comes into contact with the spacers located on each side of the liftgate glass fence.
23. Connect the wire connectors to the rear window defogger terminals and, rear window mounted radio antenna, if equipped.
24. Install the liftgate trim panels (Refer to 23 - BODY/DECKLID/HATCH/LIFTGATE/TAILGATE/TRIM PANEL - INSTALLATION).
25. Install the rear window wiper arm, if equipped (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER ARMS - INSTALLATION).

## GLASS-QUARTER

### REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove the quarter panel trim from the side of the vehicle being serviced (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - REMOVAL).
3. Carefully pull down the headliner to access the upper mounting studs (1) that secure the quarter glass (2) to the window fence (3) and, remove the nuts from the studs.
4. Remove the nuts that secure the lower mounting studs (4) to the window fence and, remove the nuts from the studs.
5. Using razor knife, cut butyl sealer between the mounting studs that secure the quarter glass to window fence.
6. Carefully push the quarter window glass from the opening.

### INSTALLATION

**CAUTION:** Roll down the left and right front door glass and open the rear glass slider (if available) before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

**Note:** The quarter glass fence should be cleaned of all old butyl sealer. Do not grind sealer off the fence, the paint finish will be adversely affected.

1. Apply 6 mm (0.25 in.) wide butyl tape around perimeter of the quarter glass approximately 5 mm (0.2 in.) from the edge of the glass. Ensure the butyl tape is wrapped around the mounting studs.
2. Place the quarter glass into the window opening and insert mounting studs through the holes in the window fence.
3. Install the nuts that secure the quarter glass to the window fence. Tighten the nuts to 4.5 N·m (40 in. lbs.).
4. Install quarter panel trim (Refer to 23 - BODY/INTERIOR/QUARTER PANEL TRIM - INSTALLATION).

## WINDSHIELD

### DESCRIPTION

The windshield is attached to the window frame (fence) with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the rubber seals are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and seals from the parts supplier.

## REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions (Refer to 23 - BODY/STATIONARY GLASS - WARNING).
2. Remove the rear view mirror (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - REMOVAL).
3. Remove the cowl grille (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL.)

**CAUTION:** Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

4. Remove the windshield side moldings (Refer to 23 - BODY/WEATHERSTRIP/SEALS/WINDSHIELD A-PILLAR WEATHERSTRIP - INSTALLATION).
5. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the windshield to the windshield fence.
6. Carefully remove the windshield from the vehicle.

## INSTALLATION

**WARNING:** Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

**CAUTION:** To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

**CAUTION:** Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

1. If the windshield (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

**Note:** To prevent corrosion, do not damage paint on windshield fence when removing original urethane.

**Note:** The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.
3. Install a new rubber seal (1) along the top of the windshield (2).
4. Using an assistant, position the windshield into the windshield opening and against the windshield fence (3).
5. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
6. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.
7. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.

**WARNING:** Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

8. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
9. Apply glass prep/adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
10. Apply glass primer 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
11. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.

12. Re-prime any area that is not fully and evenly primed.
13. Clean the windshield fence with an ammonia based glass cleaner and a lint-free cloth.
14. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the windshield fence (2). Allow at least three minutes drying time.
15. Using a flashlight, verify that the primer is completely and evenly installed along the windshield fence.
16. Re-prime any area that is not fully and evenly primed.

**CAUTION:** Always apply the bead of adhesive to the windshield. Always install the windshield within 5 minutes after applying the adhesive.

**Note:** If the original urethane adhesive has been exposed for more than 12 hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

17. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the windshield.
18. Run the end of the adhesive bead (1) on the windshield (2) parallel to the start of the bead and smooth the ends flush.

19. Using an assistant, position the windshield (2) over the windshield opening.
20. Using the grease pencil marks or tape as reference points, align the windshield to the opening.
21. Carefully lower the windshield onto the windshield fence. Guide the windshield and the rubber seal at the top the windshield into its proper location.

**CAUTION:** It is not possible to move the windshield after installation. The windshield should never be pressed into place by more than one person, because the windshield can break if pressed simultaneously on both sides.

22. Push the windshield inward until the windshield comes into contact with the spacers located on each side of the windshield fence (2).
23. Install the windshield side moldings(Refer to 23 - BODY/WEATHERSTRIP/SEALS/WINDSHIELD A-PILLAR WEATHERSTRIP - INSTALLATION).
24. Install the cowl grill (Refer to 23 - BODY/EXTERIOR/COWL GRILLE - REMOVAL).
25. Install the rear view mirror (Refer to 23 - BODY/INTERIOR/REAR VIEW MIRROR - INSTALLATION).

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

## OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active. If the sunroof is moving when the key is turned to the START position (crank engine), all motions stop until the key is released, then the previously requested sunroof motion will resume. The sunroof will also complete a requested motion if the Accessory Delay system goes inactive while the motion is in progress.

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - OPERATION) for additional information.

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. Pressing the "open" or "close" end of the rocker switch moves the sunroof glass panel to the full open or full closed position, respectively. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.
2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

The motor/module is programmed to learn the speed required to drive the panel based on position and recalibrates itself as needed. If the sunroof becomes uncalibrated, it will only respond to the vent switch. If the vent switch is pressed, the glass will move toward vent; if the switch is released, all motion stops. In the event that the sunroof system becomes uncalibrated perform the sunroof position calibration procedure, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE -SUNROOF POSITION CALIBRATION).

## DIAGNOSIS AND TESTING

### POWER TOP - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

**Refer to the appropriate diagnostic information.**

### SUNROOF

Refer to SUNROOF DIAGNOSIS CHART for possible causes. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist. Refer to Wiring Diagrams, in this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof controller, refer to Wiring Diagrams, for circuit information. If battery voltage of more than 10 volts is detected at the controller, proceed with the following tests (the controller will not operate at less than 10 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

Every time the sunroof module loses power it must be initialized. This is done by connecting power to the sunroof and moving the sunroof toward the closed position. When initialization occurs a slight "kick" in the sunroof module will be seen and heard. This is the indication that the sunroof module is initialized.

**SUNROOF DIAGNOSIS CHART**

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof module, control switch, and body harness. Faulty power circuit between sunroof module, control switch, and body harness. Faulty sunroof drive motor. Faulty sunroof module.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Broken or disengaged trough guide Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof module. Faulty drive motor.
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty sunroof module.
Sunroof does not vent	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty sunroof module.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Glass panel compression to the roof opening not consistent. Wind deflector not deploying properly. Glass not installed or adjusted properly. Faulty glass panel seal.
Buzz, Squeak, Rattles from sunroof	Loose or broken attaching hardware. No lubrication in track. Worn or broken mechanism. Cables bunched or kinked.
Sunshade will not function or does not operate smoothly	Sunshade feet are broken.  Sunshade feet are in the wrong track. Track obstructions or interference. Trim lace incorrectly installed in track.
Glass movement not consistent or glass does not operate smoothly	Glass and Track timing.  Glass and Track alignment. Cables and Guide alignment.
Broken or jammed guide mechanism	Mechanism cover was not installed correctly.

## WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a business card or equivalent, between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

**Note:** Care must be taken not to fold or kink the headliner upon removal.

1. Lower headliner as necessary to gain access to sunroof housing drain tubes. (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL)
2. Repair as necessary.

## ASSEMBLY-MODULE

### REMOVAL

**WARNING:** The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION) for the appropriate procedure.

1. Move glass panel to the fully closed position.
2. Disconnect and isolate the battery negative cable.
3. Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
4. Disconnect the sunroof wire harness electrical connector.

5. Disconnect the four drain tubes (1) from sunroof housing.

6. Remove the eight fasteners (3) attaching sunroof assembly.
7. With the aid of a helper, support the sunroof and remove the fasteners (2) attaching sunroof assembly (1) to roof panel.
8. Remove the sunroof (1) from vehicle.

## INSTALLATION

**WARNING:** The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION) for the appropriate procedure.

1. Verify that glass panel is loose and slightly retracted.
2. Raise sunroof module assembly (1) and guide it carefully into position.

3. While supporting the sunroof assembly start the 12 attaching screws and tighten the attaching screws to 6 N·m (53 in. lbs.) using the sequence shown.
4. Connect the electrical connector.

5. Connect the drain tubes to the sunroof (1).
6. Adjust the sunroof glass. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS)
7. Connect battery negative cable.
8. Install the vehicle headliner, (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).
9. Perform the sunroof position calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION).
10. Perform the Excessive Force Limitation (EFL) calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION).
11. Verify proper operation of the power sunroof system.

## CHANNEL-DRAIN

### REMOVAL

1. Remove glass panel (2). (Refer to 23 - BODY/SUNROOF/GLASS PANEL - REMOVAL)
2. Separate the drain channel arms (2) from the guide mechanisms (1) one at a time.

**CAUTION:** Do not pry the channel arms apart at the same time or you could break the drain channel.

3. Carefully slide the drain channel (1) forward to the notches (2) in the frame and remove from the vehicle.

## INSTALLATION

1. Carefully position the drain channel (1) into the notches (2) in the frame and slide rearward.

2. Install the drain channel arms (2) into the mechanism (1) holes one at a time with the reinforcements on the inside of mechanism arms.

**CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.**

3. Install the sunroof glass. (Refer to 23 - BODY/SUNROOF/GLASS PANEL - INSTALLATION)

## COVER-GUIDE MECHANISM

### REMOVAL

1. Move the glass panel to the full closed position.
2. Slide sunshade rearward to the open position.
3. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

4. Hold both mechanism covers down and open the sunroof fully.
5. Slide the mechanism covers (1) out the front of the guide in the frame (2).

## INSTALLATION

1. With the sunroof in the open position, snap the mechanism cover into the lower guide channel.
2. Hold down each cover and close the sunroof.
3. Snap the upper portion of the cover into the retaining clips (1) on the glass panel between the locating features.

## DEFLECTOR-WIND

### REMOVAL

1. Open the sunroof fully.
2. Remove the strap screws (2) from the beam area release the strap (3).

3. Rotate the deflector up and remove springs (2) from the holes in the frame (1).

## INSTALLATION

1. Position the deflector spring arms (2) into the holes of the frame (1).

2. Rotate the deflector down, attach the straps (3) and install the strap screws (2) into the front beam.
3. Verify sunroof operation and alignment.

## GLASS

### REMOVAL

1. Move the glass panel (2) to the full closed position.
2. Slide sunshade rearward to the open position.
3. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

4. Remove the glass panel screws (2).
5. Lift off glass panel and remove from vehicle.

## INSTALLATION

1. Position glass panel on to mechanism lift arms.

**CAUTION:** Verify that the retaining tabs are located on the **INSIDE** of the guide mechanism arms.

2. Start the attaching screws (2).
3. Connect a 12v power supply and verify that the sunroof is in the closed position.
4. Adjust sunroof glass to fit flush with roof line (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
5. Tighten the screws to 5.5 N·m (49 in. lbs.).
6. Position the mechanism covers (2) over the glass tabs (1) between the locating features and seat fully.
7. Verify sunroof operation and alignment.

## ADJUSTMENTS

### ADJUSTMENT

1. Move the sunshade rearward to the open position.
2. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

3. Verify the sunroof glass panel is in the fully closed position.
4. Loosen the forward attaching screws (2) on each side enough to permit the front of the glass to adjust up or down.
5. Adjust the front surface of the sunroof glass panel 0.00 mm to 2 mm (0.00 in. to 0.08 in.) **below** the top surface of the roof.
6. Tighten the front glass panel attaching screws to 5.5 N·m (49 in. lbs.).
7. Loosen the rear screws (2) on each side enough to make the rear adjustment.
8. Adjust the rear surface of the sunroof glass panel 0.00 mm to 2 mm (0.03 in. to 0.08 in.) **above** the top surface of the roof.
9. Tighten the rear glass panel attaching screws to 5.5 N·m (49 in. lbs.).
10. Check for proper fit. If not OK, repeat glass panel adjustment.

11. Position the mechanism covers (2) over the glass tabs (1) between the locating features and seat fully.
12. Verify sunroof operation and alignment.

## GUIDE-SUNROOF GLASS

### REMOVAL

1. Place the sunroof in the vent position.
2. Remove the sunroof assembly. (Refer to 23 - BODY/SUNROOF/ASSEMBLY-MODULE - REMOVAL)
3. Remove the motor. (Refer to 8 - ELECTRICAL/POWER TOP - SUNROOF SERVICE INFO/MOTOR/MODULE-SUNROOF - REMOVAL)
4. Remove the glass. (Refer to 23 - BODY/SUNROOF/GLASS - REMOVAL)
5. Remove the wind deflector. (Refer to 23 - BODY/SUNROOF/DEFLECTOR-WIND - REMOVAL)
6. Separate the drain channel arms (2) from the guide mechanisms (1) one at a time.

**CAUTION:** Do not pry the channel arms apart at the same time or you could break the drain channel.

7. Slide the drain channel rearward out of the way.

8. Remove the hard stop screw from the frame.

9. push the drive cable and guide plate forward past the hard stop screw location until the glass guide comes loose.

10. Rotate the guide (1) up and out of the front beam (3) and release the front foot (2) from the channel guide.

## INSTALLATION

1. With the drive cable plate aligned insert the front foot (2) into the guide channel and engage the feet with the front beam (3).

2. Rotate the guide plate (1) inboard until the feet of the guide are engaged into the front beam (2).

3. Push the guide assembly (1) and drive cable rearward past the hard stop location.
4. Install the hard stop screw (2) and push the drive cable and guide assembly (1) up against the hard stop screw (2).
5. Verify that the opposite guide assembly is also positioned up against the hard stop screw.
6. Install the wind deflector as necessary. (Refer to 23 - BODY/SUNROOF/DEFLECTOR-WIND - INSTALLATION)
7. Install the motor as necessary. (Refer to 8 - ELECTRICAL/POWER TOP - SUNROOF SERVICE INFO/MOTOR/MODULE-SUNROOF - INSTALLATION)

8. Install the drain channel arms (2) into the mechanism (1) holes one at a time with the reinforcements on the inside of mechanism arms.

**CAUTION:** Do not pry the channel arms apart at the same time or you could break the drain channel.

9. Install the sunroof assembly into the vehicle. (Refer to 23 - BODY/SUNROOF/ASSEMBLY-MODULE - INSTALLATION)
10. Perform the sunroof position calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - SUNROOF POSITION CALIBRATION).
11. Perform the Excessive Force Limitation (EFL) calibration, (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - STANDARD PROCEDURE - EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION).
12. Install the glass as necessary. (Refer to 23 - BODY/SUNROOF/GLASS - INSTALLATION)
13. Adjust sunroof glass to fit flush with roof line (Refer to 23 - BODY/SUNROOF/GLASS PANEL - ADJUSTMENTS).
14. Verify proper operation of the power sunroof system.

## HOSE-DRAIN

### REMOVAL

#### FRONT HOSES

1. Remove headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - REMOVAL).
2. Disconnect the drain hose from the sunroof housing (3).
3. Separate the lower tube from the grommet in the body (4).
4. Drain any liquid from hose connection, if necessary.
5. Release the clips (2) and remove the tube (1).

## REAR HOUSING HOSE

1. Remove headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - REMOVAL).
2. Disconnect the drain hose from the sunroof housing (1).
3. Drain any liquid from hose connection, if necessary.
4. Release the push pin fasteners (2) and separate the lower tube from the grommet in the body (4).

## INSTALLATION

### FRONT HOSES

1. Position the lower portion through the grommet in the body (4).
2. Connect the new drain hose (1) to the sunroof housing (3) and test drainage.
3. Position the hose (1) into the support clips (2).
4. Install headliner (Refer to 23 - BODY/INTERIOR/ HEADLINER - INSTALLATION).

## REAR HOUSING HOSE

1. Install the rear hose (3) and seat the push pin fasteners (2) fully.
2. Position the lower portion through the grommet in the body (4).
3. Connect the new drain hose (3) to the sunroof housing (1) and test drainage.
4. Install headliner (Refer to 23 - BODY/INTERIOR/HEADLINER - INSTALLATION).

## MOTOR

### DESCRIPTION

For service information refer to (Refer to 8 - ELECTRICAL/POWER TOP/MOTOR - DIAGNOSIS AND TESTING).

## SUNSHADE

### REMOVAL

1. Remove the drain channel. (Refer to 23 - BODY/SUNROOF/CHANNEL-DRAIN - REMOVAL)
2. Push up the front center of the sunshade (1) to pop out the front two feet.

3. Rotate the sunshade (2) so that the other feet (1) are removed from the guide track.

## INSTALLATION

1. Verify the sunshade track is free of obstructions like the trim lace.
2. Start with sunshade (2) at an angle with one foot (1) in the track.
3. Rotate the sunshade so the other rear foot is in the track as well as the 2 other feet (3) on the same side as the first foot.

4. To insert the remaining two feet (2) apply force to the middle front of sunshade (3) and guide them into the track.
5. Check that all the feet are in the right track and verify sunshade operation.
6. Install the drain channel. (Refer to 23 - BODY/SUNROOF/CHANNEL-DRAIN - INSTALLATION)

## SWITCH-SUNROOF

### DESCRIPTION

For service information refer to (Refer to 8 - ELECTRICAL/POWER TOP/SWITCH - DIAGNOSIS AND TESTING).

### TRIM LACE

#### REMOVAL

1. Remove trim lace (2) by holding one end of the trim lace at the butt joint and pulling horizontally into the opening until lace is completely loose from the headliner/sunroof joint.

#### INSTALLATION

1. Place butt joint of trim lace into position starting at the drivers side middle of the opening at the butt joint notch in the u-frame.
2. Push lace into position.
3. Ensure that the corner radii is fully engage.
4. Once the trim lace is attached to sunroof module using a trim stick C-4755 or equivalent, begin tucking the headliner under the lip on the trim lace working all the way around the opening. When installing a new trim lace, begin tucking the headliner under the lip as the tear cord (1) is removed working all the way around the opening.

## HVAC - ELECTRICAL DIAGNOSTICS

### DIAGNOSIS AND TESTING

## 11–MODE POT OPEN (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the mode pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

### Diagnostic Test

#### 1. REPLACE THE A/C HEATER CONTROL

#### Repair

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

12-MODE POT SHORTED (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the mode pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## 13–TEMP POT OPEN (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the temp pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

## Diagnostic Test

### 1. REPLACE THE A/C HEATER CONTROL

#### Repair

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

14–TEMP POT SHORTED (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the temp pot fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

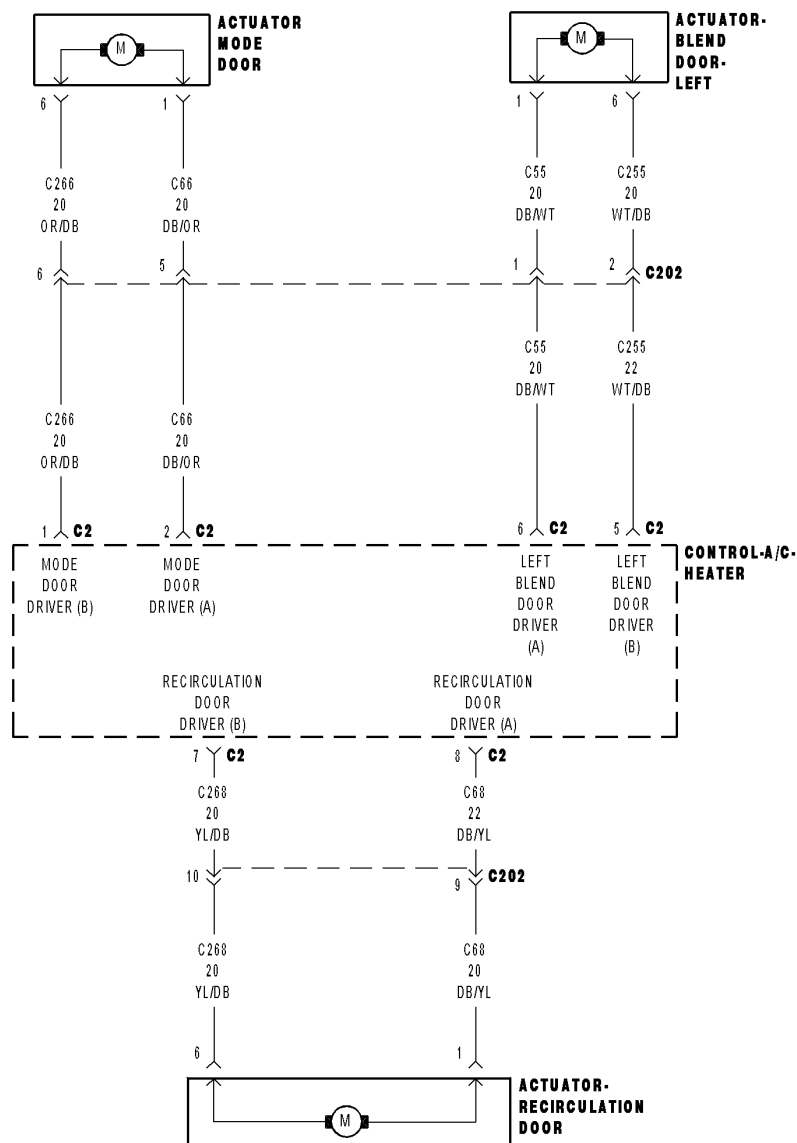

Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

Repair

Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

# 15-MODE NOT RESPONDING/STALLED (MTC)

**15-MODE NOT RESPONDING/STALLED (MTC) (CONTINUED)**

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Mode Door Actuator.
- **Set Condition:**  
If the A/C Heater Control fails to detect commutator pulses.

Possible Causes
MODE DOOR SEIZED, BINDING, OBSTRUCTED (C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO VOLTAGE (C266) MODE DOOR DRIVER (B) CIRCUIT SHORTED TO VOLTAGE (C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO GROUND (C266) MODE DOOR DRIVER (B) CIRCUIT SHORTED TO GROUND (C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S) (C266) MODE DOOR DRIVER (B) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S) (C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO (C266) MODE DOOR DRIVER (B) CIRCUIT (C66) MODE DOOR DRIVER (A) CIRCUIT OPEN (C266) MODE DOOR DRIVER (B) CIRCUIT OPEN MODE DOOR ACTUATOR A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

**Diagnostic Test****1. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Actuate the Actuator Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note:** The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 22?**

- Yes** >> Diagnose and Repair the DTC. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

**15-MODE NOT RESPONDING/STALLED (MTC) (CONTINUED)****2. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C66) Mode Door Driver (A) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C66) Mode Door Driver (A) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C266) MODE DOOR DRIVER (B) CIRCUIT FOR A SHORT TO VOLTAGE**

Measure the voltage of the (C266) Mode Door Driver (B) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C266) Mode Door Driver (B) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**15-MODE NOT RESPONDING/STALLED (MTC) (CONTINUED)****4. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance of the (C66) Mode Door Driver (A) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C66) Mode Door Driver (A) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**5. CHECK (C266) MODE DOOR DRIVER (B) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (C266) Mode Door Driver (B) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C266) Mode Door Driver (B) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 6

**15-MODE NOT RESPONDING/STALLED (MTC) (CONTINUED)****8. CHECK MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C66) Mode Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**What is the resistance?**

**Below 30 Ohms**

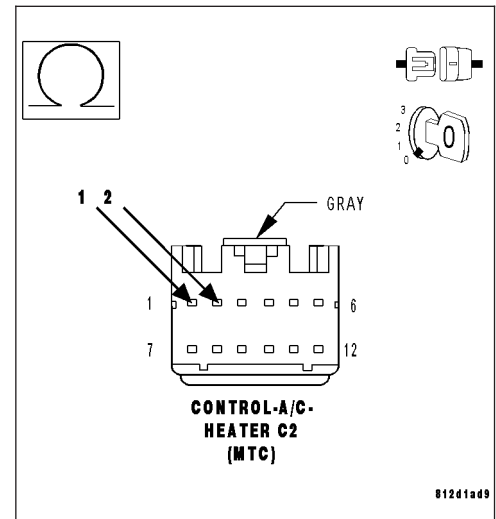

Go To 9

**Above 70 Ohms**

Go To 10

**30 to 70 Ohms**

Go To 12

**9. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR A SHORT TO (C266) MODE DOOR DRIVER (B) CIRCUIT**

Disconnect the Mode Door Actuator harness connector.

Measure the resistance between the (C66) Mode Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C66) Mode Door Driver (A) circuit for a short to the (C266) Mode Door Driver (B) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Mode Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## 15-MODE NOT RESPONDING/STALLED (MTC) (CONTINUED)

### 10. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR AN OPEN

Disconnect the Mode Door Actuator harness connector.

Measure the resistance of the (C66) Mode Door Driver (A) circuit between the A/C Heater Control C2 harness connector and the Mode Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 11

**No** >> Repair the (C66) Mode Door Driver (A) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

### 11. CHECK (C266) MODE DOOR DRIVER (B) CIRCUIT FOR AN OPEN

Measure the resistance of the (C266) Mode Door Driver (B) circuit between the A/C Heater Control C2 harness connector and the Mode Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Mode Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (C266) Mode Door Driver (B) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**15-MODE NOT RESPONDING/STALLED (MTC) (CONTINUED)****12. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Reconnect the A/C Heater Control C2 harness connector.

Actuate the Actuator Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 15?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

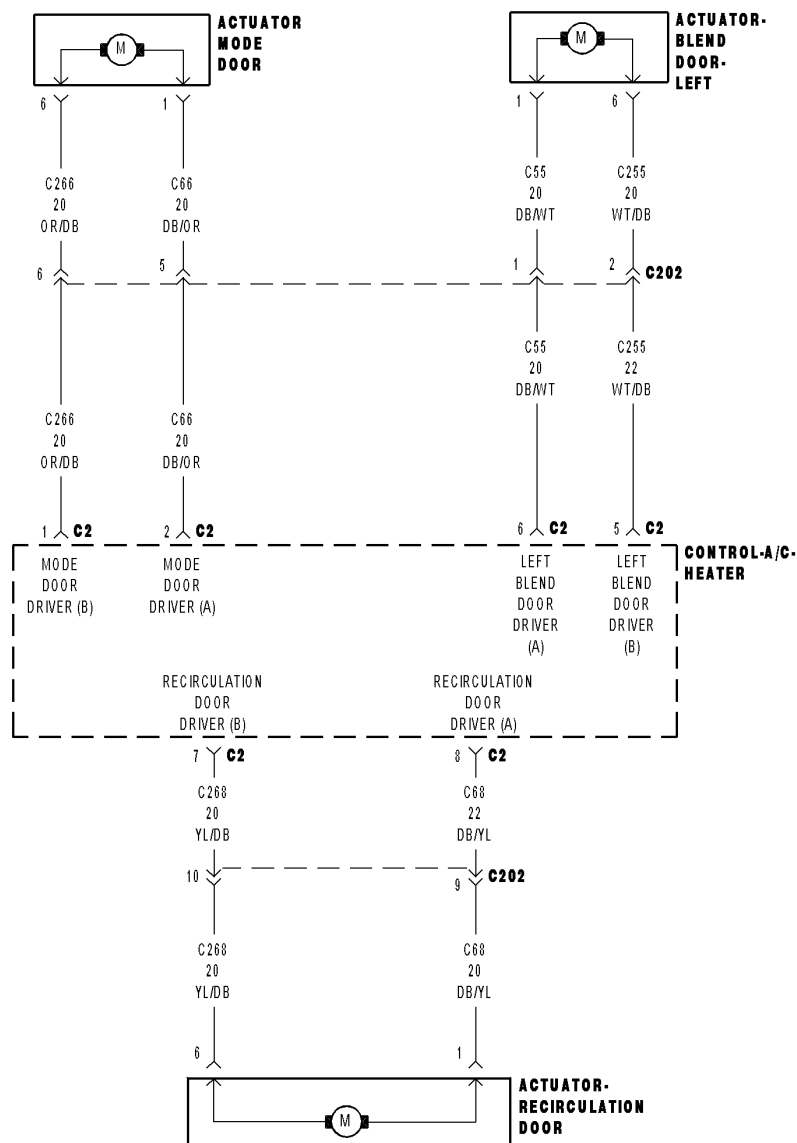

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Using the wiring diagram as a guide inspect the wiring and connectors for a condition causing an intermittent loss of commutator pulses from the Mode Door Actuator.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

## 17-BLEND NOT RESPONDING/STALLED (MTC)

**17-BLEND NOT RESPONDING/STALLED (MTC) (CONTINUED)**

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Blend Door Actuator.
- **Set Condition:**  
If the A/C Heater Control fails to detect commutator pulses.

Possible Causes
BLEND DOOR SEIZED, BINDING, OBSTRUCTED (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO VOLTAGE (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO VOLTAGE (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO GROUND (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO GROUND (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S) (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S) (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT OPEN (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT OPEN BLEND DOOR ACTUATOR A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

**Diagnostic Test****1. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Actuate the Actuator Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note:** The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 18?**

**Yes** >> Diagnose and Repair the DTC. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 2

**17-BLEND NOT RESPONDING/STALLED (MTC) (CONTINUED)****2. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C55) Left Blend Door Driver (A) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C55) Left Blend Door Driver (A) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO VOLTAGE**

Measure the voltage of the (C255) Left Blend Door Driver (B) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C255) Left Blend Door Driver (B) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**17-BLEND NOT RESPONDING/STALLED (MTC) (CONTINUED)****4. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance of the (C55) Left Blend Door Driver (A) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C55) Left Blend Door Driver (A) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**5. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (C255) Left Blend Door Driver (B) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C255) Left Blend Door Driver (B) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 6

**17-BLEND NOT RESPONDING/STALLED (MTC) (CONTINUED)****6. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C55) Left Blend Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C55) Left Blend Door Driver (A) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Driver (A) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 7

**7. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C255) Left Blend Door Driver (B) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C255) Left Blend Door Driver (B) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver (B) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 8

**17-BLEND NOT RESPONDING/STALLED (MTC) (CONTINUED)****8. CHECK BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C55) Left Blend Door Driver (A) circuit and the (C255) Left Blend Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**What is the resistance?**

**Below 30 Ohms**

Go To 9

**Above 70 Ohms**

Go To 10

**30 to 70 Ohms**

Go To 12

**9. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT**

Disconnect the Blend Door Actuator harness connector.

Measure the resistance between the (C55) Left Blend Door Driver (A) circuit and the (C255) Left Blend Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C55) Left Blend Door Driver (A) circuit for a short to the (C255) Left Blend Door Driver (B) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Blend Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**17-BLEND NOT RESPONDING/STALLED (MTC) (CONTINUED)****10. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR AN OPEN**

Disconnect the Blend Door Actuator harness connector.

Measure the resistance of the (C55) Left Blend Door Driver (A) circuit between the A/C Heater Control C2 harness connector and the Blend Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 11

**No** >> Repair the (C55) Left Blend Door Driver (A) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1)..

**11. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR AN OPEN**

Measure the resistance of the (C255) Left Blend Door Driver (B) circuit between the A/C Heater Control C2 harness connector and the Blend Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Blend Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (C255) Left Blend Door Driver (B) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**17-BLEND NOT RESPONDING/STALLED (MTC) (CONTINUED)****12. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Reconnect the A/C Heater Control C2 harness connector.

Actuate the Actuator Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 17?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for a condition causing an intermittent loss of commutator pulses from the Blend Door Actuator.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

## 18-BLEND RANGE TOO SMALL (MTC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Blend Door is less than the low range limit.

Possible Causes
BLEND DOOR SEIZED, BINDING, OBSTRUCTED
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

**Are there any physical or mechanical problems with the door, housing, linkage, or actuator?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

#### 2. CHECK BLEND DOOR TRAVEL

Remove the Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 190 degrees of travel.

**Does the door operate smoothly in both directions over approximately 190 degrees of travel?**

- Yes** >> Replace the Blend Door Actuator in accordance with the Service Information. Then, Go To 3.
- No** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**18-BLEND RANGE TOO SMALL (MTC) (CONTINUED)****3. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Actuate the Actuator Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 18?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

## 21-BLEND RANGE TOO LARGE (MTC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is greater than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Blend Door exceeds the high range limit.

Possible Causes
BLEND DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
BLEND DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. CHECK FOR A BROKEN BLEND DOOR ACTUATOR

Turn the ignition off.

Remove the Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

**Does the actuator turn in either direction?**

- Yes** >> Replace the Blend Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

#### 2. CHECK BLEND DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 190 degrees.

**Are there any physical or mechanical problems with the door or housing?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Blend Door Actuator in accordance with the Service Information. Then, Go To 3.

**21-BLEND RANGE TOO LARGE (MTC) (CONTINUED)****3. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Actuate the Actuator Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 21?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

## 22–MODE RANGE TOO SMALL (MTC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Mode Door is less than the low range limit.

Possible Causes
MODE DOOR SEIZED, BINDING, OBSTRUCTED
MODE DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

**Are there any physical or mechanical problems with the door, housing, linkage, or actuator?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

#### 2. CHECK MODE DOOR TRAVEL

Remove the Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 240 degrees of travel.

**Does the door operate smoothly in both directions over approximately 240 degrees of travel?**

- Yes** >> Replace the Mode Door Actuator in accordance with the Service Information. Then, Go To 3.
- No** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**22-MODE RANGE TOO SMALL (MTC) (CONTINUED)****3. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Actuate the Actuator Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 22?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

## 23—MODE RANGE TOO LARGE (MTC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is greater than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Mode Door exceeds the high range limit.

Possible Causes
MODE DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
MODE DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. CHECK FOR A BROKEN MODE DOOR ACTUATOR

Turn the ignition off.

Remove the Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

**Does the actuator turn in either direction?**

- Yes** >> Replace the Mode Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

#### 2. CHECK MODE DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 240 degrees.

**Are there any physical or mechanical problems with the door or housing?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Mode Door Actuator in accordance with the Service Information. Then, Go To 3.

**23-MODE RANGE TOO LARGE (MTC) (CONTINUED)****3. RUN THE ACTUATOR CALIBRATION FUNCTION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Actuate the Door Calibration function by performing the following:

- Turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

Read DTCs from the flashing A/C status indicator.

**Does the A/C status indicator flash DTC 23?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

26–MODE ACTUATOR ACCUMULATED ERROR TOO LARGE (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
When driving the Mode Door Actuator.
- **Set Condition:**  
If the A/C Heater Control detects an excessive loss or gain of commutator pulses.

Possible Causes
MODE DOOR ACTUATOR

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE MODE DOOR ACTUATOR

Repair

Replace the Mode Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

28–BLEND ACTUATOR ACCUMULATED ERROR TOO LARGE (MTC)

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
When driving the Blend Door Actuator.
- **Set Condition:**  
If the A/C Heater Control detects an excessive loss or gain of commutator pulses.

Possible Causes
BLEND DOOR ACTUATOR

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. REPLACE THE BLEND DOOR ACTUATOR

Repair

Replace the Blend Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

### 31-EVAPORATOR SENSOR OPEN (MTC)

31-EVAPORATOR SENSOR OPEN (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
  - **Set Condition:**  
If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN (C121) SENSOR GROUND CIRCUIT OPEN EVAPORATOR TEMPERATURE SENSOR A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

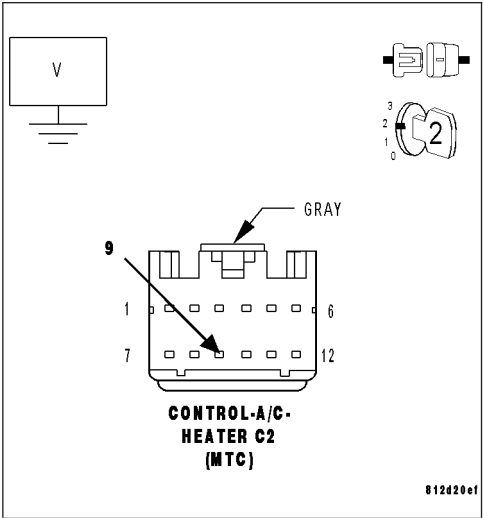

1. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.  
Disconnect the A/C Heater Control C2 harness connector.  
Turn the ignition on.  
Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.

- Is the voltage above 0.2 volts?**

**Yes**    >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No**      >> Go To 2

**31-EVAPORATOR SENSOR OPEN (MTC) (CONTINUED)****2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT, (C121) SENSOR GROUND CIRCUIT, & EVAPORATOR TEMPERATURE SENSOR**

Turn the ignition off.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector. The approximate circuit resistance should be as follows:

- 2925 ohms @ 38°C (100°F)
- 4050 ohms @ 30°C (86°F)
- 4985 ohms @ 25°C (77°F)
- 6498 ohms @ 19°C (66°F)
- 8989 ohms @ 12°C (54°F)
- 13307 ohms @ 4°C (39°F)
- 14860 ohms @ 2°C (36°F)

**Is the resistance within the specifications?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Disconnect the Evaporator Temperature Sensor harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**31-EVAPORATOR SENSOR OPEN (MTC) (CONTINUED)****4. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

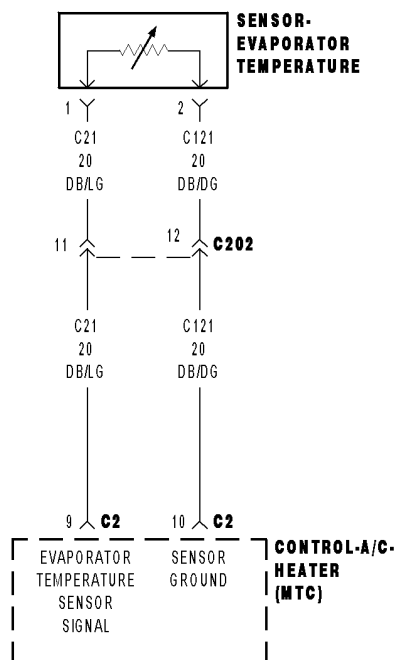

Measure the resistance of the (C121) Sensor Ground circuit between the Evaporator Temperature Sensor harness connector and the A/C Heater Control C2 harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Repair the (C121) Sensor Ground circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## 32-EVAPORATOR SENSOR SHORTED (MTC)

32-EVAPORATOR SENSOR SHORTED (MTC) (CONTINUED)

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
  - **Set Condition:**  
If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT EVAPORATOR TEMPERATURE SENSOR A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

Diagnostic Test

1. CHECK FOR DTC 32-EVAPORATOR SENSOR SHORTED WITH EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED

Turn the ignition off.

Disconnect the Evaporator Temperature Sensor harness connector.

Actuate the Clear DTC function by performing the following:

- Turn the ignition on.
  - Turn the blower control on.
  - Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.
  - When the A/C status indicator begins flashing DTCs, press the A/C mode switch down for 3 seconds and then release the switch.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
  - Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note:** The A/C status indicator displays active DTCs when the EBL status indictor is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the flashing A/C status indictor.

Does the A/C status indicator flash DTC 32?

- Yes

>> Go To 2
- No

>> Replace the Evaporator Temperature Sensor in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**32-EVAPORATOR SENSOR SHORTED (MTC) (CONTINUED)****2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND CIRCUIT**

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

### 33–A/C MODE SWITCH STUCK (MTC)

For a complete wiring diagram **Refer to Section 8W.**

#### Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the A/C mode switch is stuck in a pushed position.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

#### Diagnostic Test

##### 1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION & THEN VERIFY DTC IS STILL ACTIVE

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object. Actuate the Clear DTC function by performing the following:

- Turn the ignition on.
- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.
- When the A/C status indicator begins flashing DTCs, press the A/C mode switch down for 3 seconds and then release the switch.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note:** The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the flashing A/C status indicator.

##### Does the A/C status indicator flash DTC 33?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

### 34–EBL MODE SWITCH STUCK (MTC)

For a complete wiring diagram **Refer to Section 8W.**

#### Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Rear Defrost mode switch is stuck in a pushed position.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

#### Diagnostic Test

##### 1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION & THEN VERIFY DTC IS STILL ACTIVE

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object. Actuate the Clear DTC function by performing the following:

- Turn the ignition on.
- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.
- When the A/C status indicator begins flashing DTCs, press the A/C mode switch down for 3 seconds and then release the switch.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note:** The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

Read DTCs from the flashing A/C status indicator.

##### Does the A/C status indicator flash DTC 34?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## 35-FAILED COOL DOWN (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When the Cooldown Test is executed.
- **Set Condition:**  
If the A/C system is unable to lower the evaporator temperature 11.11°C (20°F).

Possible Causes
PREREQUISITES NOT MET BEFORE RUNNING THE TEST ANOTHER RELATED SYSTEM NOT FUNCTIONING CORRECTLY POWERTRAIN SYSTEM FAULTS PRESENT

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

## Diagnostic Test

### 1. VERIFY THAT ALL OF THE PREREQUISITES WERE MET

Review the list of test prerequisites.

- DTCs 11, 12, 13, 14, 15, 17, 18, 21, 22, 23, 31 or 32 must not be active.
- The blower motor must operate correctly in all speeds.
- The work area ambient temperature must be above 18.3°C (65°F).
- The evaporator temperature must be above 18.3°C (65°F).
- The A/C compressor must be turned off.
- The refrigerant system must be adequately charged.

**Were all of the prerequisites met before running the Cooldown Test?**

**Yes** >> Go To 2

**No** >> Rerun the Cooldown Test after all of the prerequisites are met. Then, if DTC 35 is still active, Go To 2. Otherwise, perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

### 2. CHECK FOR DTCs IN THE PCM

With the scan tool, select PCM.

**Are any DTCs present in the PCM?**

**Yes** >> Diagnose and repair the DTC(s). (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for PCM DTCs. Rerun the Cooldown Test after the repair is complete.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Refer to the Service Information for additional Cooldown Test related diagnostic information and testing procedures. Rerun the Cooldown Test after the repair is complete.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

### 36-EEPROM CHECKSUM ERROR (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the calculated checksum does not match the stored value.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

### Diagnostic Test

#### 1. REPLACE THE A/C HEATER CONTROL

#### Repair

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

### 37–ROM CHECKSUM ERROR (MTC)

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the calculated checksum does not match the stored value.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (MTC) for stored DTC test procedures.

### Diagnostic Test

1. REPLACE THE A/C HEATER CONTROL

### Repair

Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B10AD–RIGHT BLEND DOOR TRAVEL TOO SMALL (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Right Blend Door is less than the low range limit.

Possible Causes
RIGHT BLEND DOOR SEIZED, BINDING, OBSTRUCTED
RIGHT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

**Are there any physical or mechanical problems with the door, housing, linkage, or actuator?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

#### 2. CHECK RIGHT BLEND DOOR TRAVEL

Remove the Right Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 190 degrees of travel.

**Does the door operate smoothly in both directions over approximately 190 degrees of travel?**

- Yes** >> Replace the Right Blend Door Actuator in accordance with the Service Information. Then, Go To 3.
- No** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

#### 3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B10AD–RIGHT BLEND DOOR TRAVEL TOO SMALL?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B10AE–RIGHT BLEND DOOR TRAVEL TOO LARGE (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is greater than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Right Blend Door exceeds the high range limit.

Possible Causes
RIGHT BLEND DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
RIGHT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. CHECK FOR A BROKEN RIGHT BLEND DOOR ACTUATOR

Turn the ignition off.

Remove the Right Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

**Does the actuator turn in either direction?**

- Yes**    >> Replace the Right Blend Door Actuator in accordance with the Service Information.  
            Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No**      >> Go To 2

---

#### 2. CHECK RIGHT BLEND DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 190 degrees.

**Are there any physical or mechanical problems with the door or housing?**

- Yes**    >> Repair as necessary in accordance with the Service Information.  
            Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No**      >> Replace the Right Blend Door Actuator in accordance with the Service Information. Then, Go To 3.
-

**B10AE–RIGHT BLEND DOOR TRAVEL TOO LARGE (ATC) (CONTINUED)****3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B10AE–RIGHT BLEND DOOR TRAVEL TOO LARGE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**B10AF–RIGHT BLEND DOOR ACTUATOR PERFORMANCE (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Right Blend Door Actuator.
- **Set Condition:**  
If the A/C Heater Control detects an excessive loss or gain of commutator pulses.

Possible Causes
RIGHT BLEND DOOR ACTUATOR

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

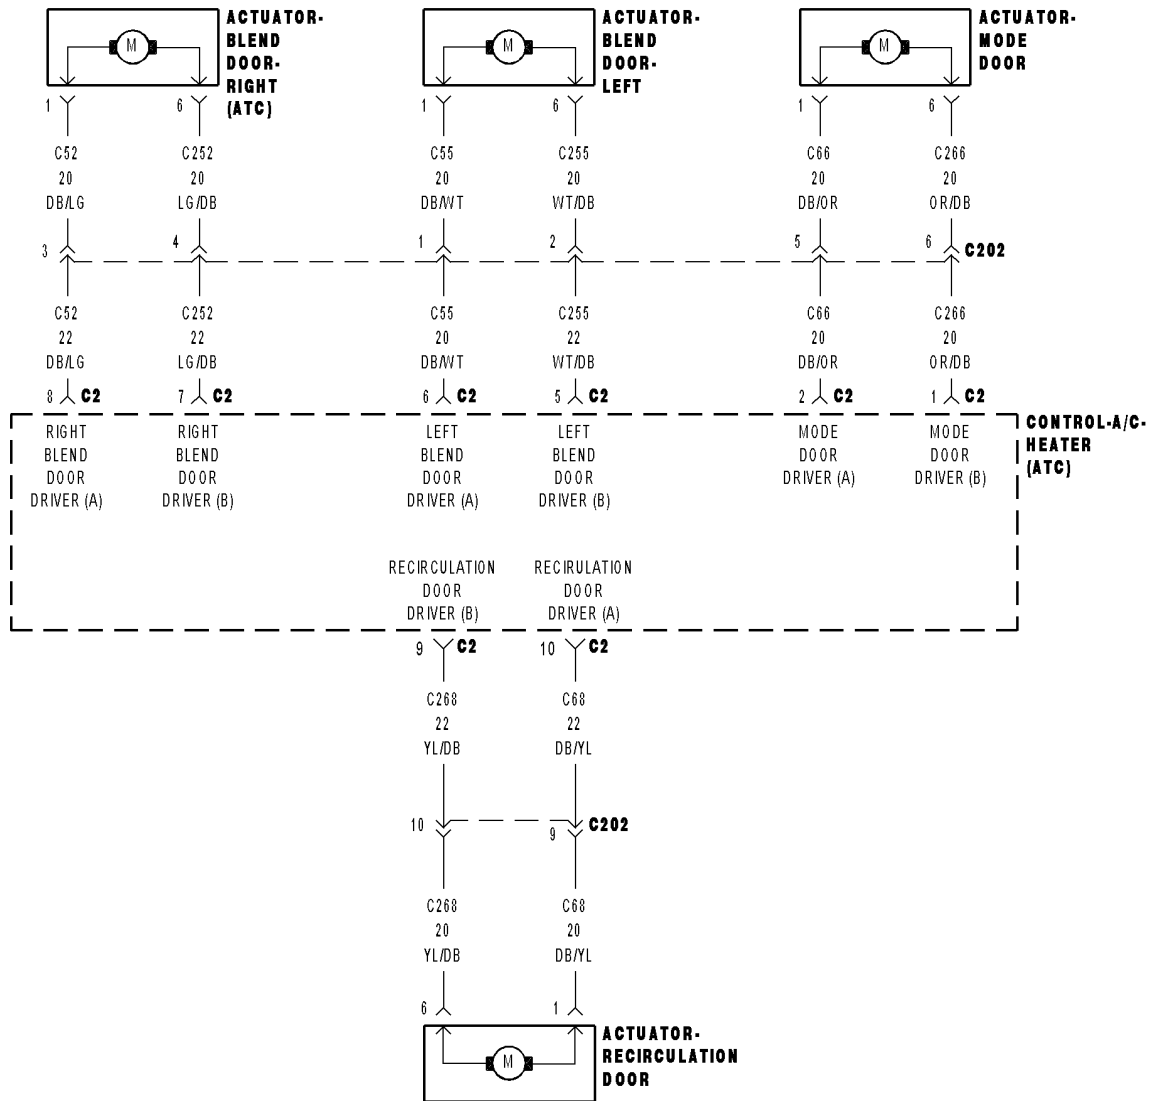

**Diagnostic Test**

1. REPLACE THE RIGHT BLEND DOOR ACTUATOR

**Repair**

Replace the Right Blend Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

# B10A2-LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

**B10A2–LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Left Blend Door Actuator.
- **Set Condition:**  
If the A/C Heater Control fails to detect commutator pulses.

Possible Causes
LEFT BLEND DOOR SEIZED, BINDING, OBSTRUCTED
(C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO VOLTAGE
(C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO VOLTAGE
(C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO GROUND
(C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO GROUND
(C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT
(C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT OPEN
(C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT OPEN
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

**Diagnostic Test**

**1. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.  
With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

- Does the scan tool display: B10A6 LEFT BLEND DOOR TRAVEL TOO SMALL?**
- Yes**    >> Diagnose and Repair the DTC. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.  
            Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No**      >> Go To 2

**B10A2-LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****2. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C55) Left Blend Door Driver (A) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C55) Left Blend Door Driver (A) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO VOLTAGE**

Measure the voltage of the (C255) Left Blend Door Driver (B) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C255) Left Blend Door Driver (B) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**B10A2-LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****4. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance of the (C55) Left Blend Door Driver (A) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C55) Left Blend Door Driver (A) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**5. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (C255) Left Blend Door Driver (B) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C255) Left Blend Door Driver (B) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 6

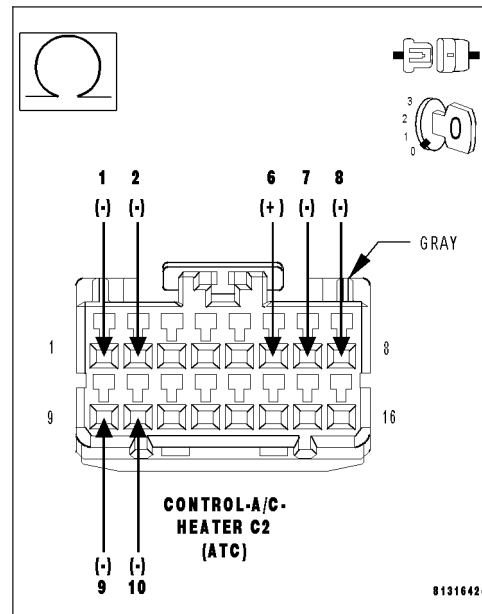

**B10A2-LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****6. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C55) Left Blend Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C252) Right Blend Door Driver (B) circuit, the (C52) Right Blend Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C55) Left Blend Door Driver (A) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C55) Left Blend Door Driver (A) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 7

**7. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C255) Left Blend Door Driver (B) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C252) Right Blend Door Driver (B) circuit, the (C52) Right Blend Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C255) Left Blend Door Driver (B) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C255) Left Blend Door Driver (B) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 8

**B10A2-LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****8. CHECK LEFT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C55) Left Blend Door Driver (A) circuit and the (C255) Left Blend Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**What is the resistance?**

**Below 30 Ohms**

Go To 9

**Above 70 Ohms**

Go To 10

**30 to 70 Ohms**

Go To 12

**9. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT**

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance between the (C55) Left Blend Door Driver (A) circuit and the (C255) Left Blend Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C55) Left Blend Door Driver (A) circuit for a short to the (C255) Left Blend Door Driver (B) circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Left Blend Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B10A2-LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****10. CHECK (C55) LEFT BLEND DOOR DRIVER (A) CIRCUIT FOR AN OPEN**

Disconnect the Left Blend Door Actuator harness connector.

Measure the resistance of the (C55) Left Blend Door Driver (A) circuit between the A/C Heater Control C2 harness connector and the Left Blend Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 11

**No** >> Repair the (C55) Left Blend Door Driver (A) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1)..

**11. CHECK (C255) LEFT BLEND DOOR DRIVER (B) CIRCUIT FOR AN OPEN**

Measure the resistance of the (C255) Left Blend Door Driver (B) circuit between the A/C Heater Control C2 harness connector and the Left Blend Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Left Blend Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (C255) Left Blend Door Driver (B) circuit for an open.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B10A2–LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****12. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B10A2–LEFT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for a condition causing an intermittent loss of commutator pulses from the Left Blend Door Actuator.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

## B10A6–LEFT BLEND DOOR TRAVEL TOO SMALL (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Left Blend Door is less than the low range limit.

Possible Causes
LEFT BLEND DOOR SEIZED, BINDING, OBSTRUCTED
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

**Are there any physical or mechanical problems with the door, housing, linkage, or actuator?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

#### 2. CHECK LEFT BLEND DOOR TRAVEL

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 190 degrees of travel.

**Does the door operate smoothly in both directions over approximately 190 degrees of travel?**

- Yes** >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 3.
- No** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

#### 3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B10A6–LEFT BLEND DOOR TRAVEL TOO SMALL?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B10A7–LEFT BLEND DOOR TRAVEL TOO LARGE (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is greater than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Left Blend Door exceeds the high range limit.

Possible Causes
LEFT BLEND DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
LEFT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. CHECK FOR A BROKEN LEFT BLEND DOOR ACTUATOR

Turn the ignition off.

Remove the Left Blend Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

**Does the actuator turn in either direction?**

- Yes**    >> Replace the Left Blend Door Actuator in accordance with the Service Information.  
            Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No**      >> Go To 2

---

#### 2. CHECK LEFT BLEND DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 190 degrees.

**Are there any physical or mechanical problems with the door or housing?**

- Yes**    >> Repair as necessary in accordance with the Service Information.  
            Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No**      >> Replace the Left Blend Door Actuator in accordance with the Service Information. Then, Go To 3.
-

**B10A7–LEFT BLEND DOOR TRAVEL TOO LARGE (ATC) (CONTINUED)****3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B10A7–LEFT BLEND DOOR TRAVEL TOO LARGE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**B10A8–LEFT BLEND DOOR ACTUATOR PERFORMANCE (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Left Blend Door Actuator.
- **Set Condition:**  
If the A/C Heater Control detects an excessive loss or gain of commutator pulses.

Possible Causes
LEFT BLEND DOOR ACTUATOR

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

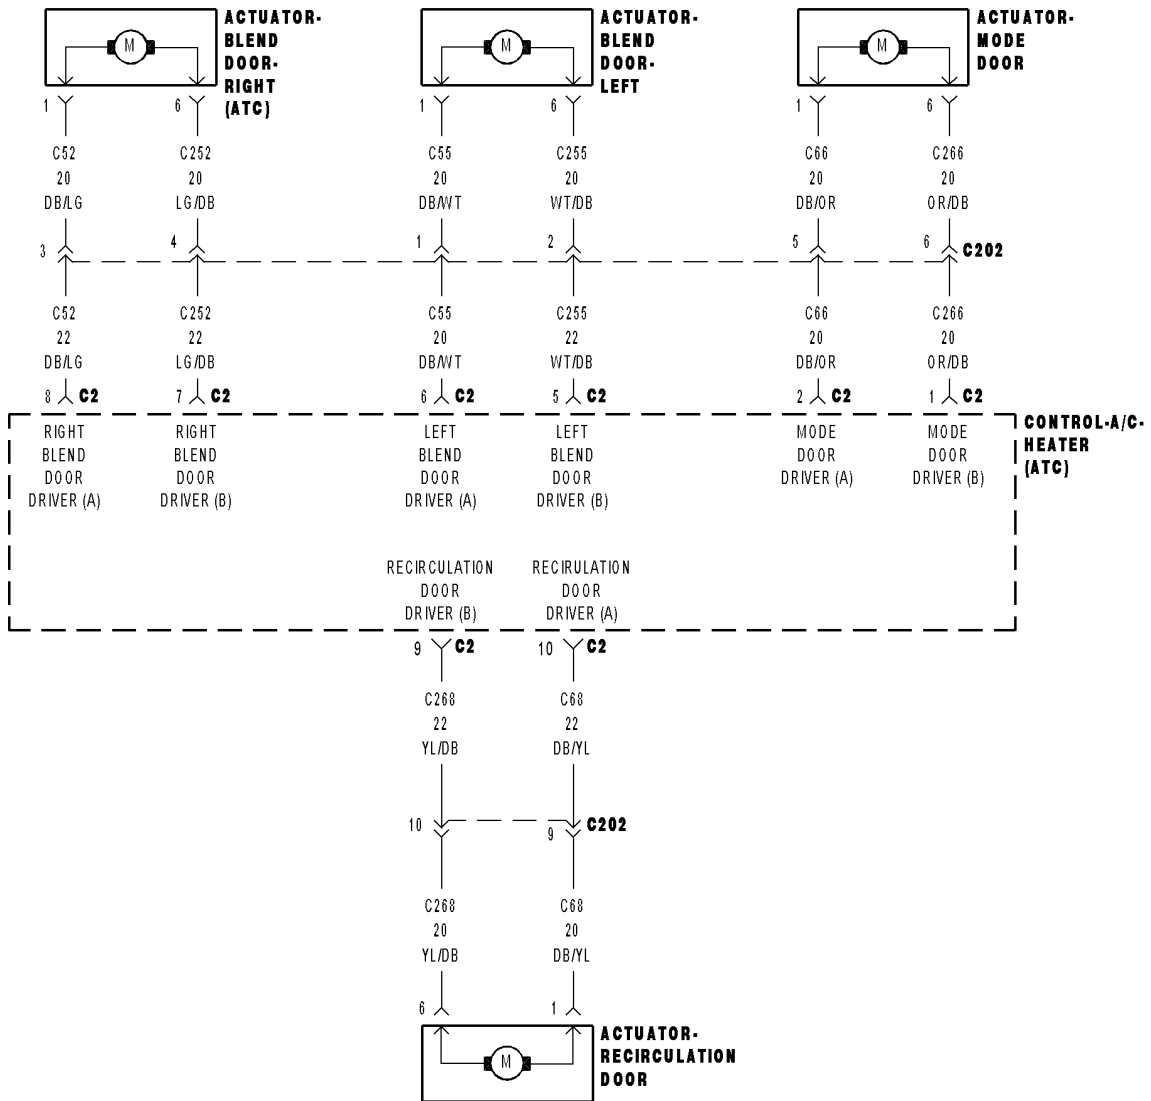

**Diagnostic Test**

1. REPLACE THE LEFT BLEND DOOR ACTUATOR

**Repair**

Replace the Left Blend Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B10A9—RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC)

**ACTUATOR-BLEND DOOR-LEFT**

**ACTUATOR-BLEND DOOR-RIGHT (ATC)**

**ACTUATOR-MODE DOOR**

**ACTUATOR-RECIRCULATION DOOR**

**CONTROL-A/C-HEATER C2 (ATC)**

**B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Right Blend Door Actuator.
- **Set Condition:**  
If the A/C Heater Control fails to detect commutator pulses.

Possible Causes
RIGHT BLEND DOOR SEIZED, BINDING, OBSTRUCTED
(C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO VOLTAGE
(C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO VOLTAGE
(C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO GROUND
(C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO GROUND
(C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT SHORTED TO (C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT
(C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT OPEN
(C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT OPEN
RIGHT BLEND DOOR ACTUATOR
A/C HEATER CONTROL

**Diagnostic Test**

**1. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.  
With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

- Does the scan tool display: B10AD RIGHT BLEND DOOR TRAVEL TOO SMALL?**
- Yes**    >> Diagnose and Repair the DTC. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.  
            Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No**      >> Go To 2

**B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****2. CHECK (C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C52) Right Blend Door Driver (A) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C52) Right Blend Door Driver (A) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO VOLTAGE**

Measure the voltage of the (C252) Right Blend Door Driver (B) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C252) Right Blend Door Driver (B) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****4. CHECK (C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance of the (C52) Right Blend Door Driver (A) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C52) Right Blend Door Driver (A) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**5. CHECK (C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (C252) Right Blend Door Driver (B) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C252) Right Blend Door Driver (B) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 6

**B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****6. CHECK (C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C52) Right Blend Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C255) Left Blend Door Driver (B) circuit, the (C55) Left Blend Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C52) Right Blend Door Driver (A) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C52) Right Blend Door Driver (A) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 7

**B10A9-RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****7. CHECK (C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C252) Right Blend Door Driver (B) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C255) Left Blend Door Driver (B) circuit, the (C55) Left Blend Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C252) Right Blend Door Driver (B) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C252) Right Blend Door Driver (B) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 8

**8. CHECK RIGHT BLEND DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C52) Right Blend Door Driver (A) circuit and the (C252) Right Blend Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**What is the resistance?**

**Below 30 Ohms**

Go To 9

**Above 70 Ohms**

Go To 10

**30 to 70 Ohms**

Go To 12

**B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****9. CHECK (C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT FOR A SHORT TO (C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT**

Disconnect the Right Blend Door Actuator harness connector.

Measure the resistance between the (C52) Right Blend Door Driver (A) circuit and the (C252) Right Blend Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

- Yes** >> Repair the (C52) Right Blend Door Driver (A) circuit for a short to the (C252) Right Blend Door Driver (B) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Right Blend Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**10. CHECK (C52) RIGHT BLEND DOOR DRIVER (A) CIRCUIT FOR AN OPEN**

Disconnect the Right Blend Door Actuator harness connector.

Measure the resistance of the (C52) Right Blend Door Driver (A) circuit between the A/C Heater Control C2 harness connector and the Right Blend Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Go To 11
- No** >> Repair the (C52) Right Blend Door Driver (A) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1)..

**B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****11. CHECK (C252) RIGHT BLEND DOOR DRIVER (B) CIRCUIT FOR AN OPEN**

Measure the resistance of the (C252) Right Blend Door Driver (B) circuit between the A/C Heater Control C2 harness connector and the Right Blend Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Right Blend Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Repair the (C252) Right Blend Door Driver (B) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**12. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B10A9–RIGHT BLEND DOOR CONTROL CIRCUIT/PERFORMANCE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Using the wiring diagram as a guide, inspect the wiring and connectors for a condition causing an intermittent loss of commutator pulses from the Right Blend Door Actuator.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B10B0–INFRARED SENSOR THERMISTOR CIRCUIT LOW (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test****1. REPLACE THE A/C HEATER CONTROL****Repair**

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B10B1–INFRARED SENSOR THERMISTOR CIRCUIT HIGH (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test**

1. REPLACE THE A/C HEATER CONTROL

**Repair**

Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B10B2–A/C COOL DOWN TEST PERFORMANCE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When the Cooldown Test is executed.
- **Set Condition:**  
If the A/C system is unable to lower the evaporator temperature 11.11°C (20°F) within two minutes.

Possible Causes
PREREQUISITES NOT MET BEFORE RUNNING THE TEST
ANOTHER RELATED SYSTEM NOT FUNCTIONING CORRECTLY
POWERTRAIN SYSTEM FAULTS PRESENT

## Diagnostic Test

### 1. VERIFY THAT ALL OF THE PREREQUISITES WERE MET

Review the list of test prerequisites.

- DTCs B1031, B1032, B1040, B1044, B1045, B1058, B105C, B105D, B1099, B109A, B10A2, B10A6, B10A7, B10A8, B10A9, B10AD, B10AE, B10AF, B222A, B2214, and U0141 must not be active.
- The refrigerant system must be adequately charged.
- The blower motor must operate correctly in all speeds.
- The work area ambient temperature must be above 18.3°C (65°F).
- The evaporator temperature must be above 18.3°C (65°F).
- The A/C compressor must be turned off.

**Were all of the prerequisites met before running the Cooldown Test?**

**Yes** >> Go To 2

**No** >> Rerun the Cooldown Test after all of the prerequisites are met. Then, if DTC B10B2 is still active, Go To 2. Otherwise, Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

### 2. CHECK FOR DTCs IN THE PCM

With the scan tool, select PCM.

**Are any DTCs present in the PCM?**

- Yes** >> Diagnose and repair the DTC(s). (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING) for PCM DTCs. Rerun the Cooldown Test after the repair is complete.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Refer to the Service Information for additional Cooldown Test related diagnostic information and testing procedures. Rerun the Cooldown Test after the repair is complete.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B100A–RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Recirculation mode switch is stuck in a pushed position for more than two minutes.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

### Diagnostic Test

#### 1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION & THEN VERIFY DTC IS STILL ACTIVE

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object. Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

**Does the scan tool display active: B100A–RECIRCULATION SWITCH REQUEST INPUT CIRCUIT LOW?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B105C–RECIRCULATION DOOR TRAVEL RANGE TOO SMALL (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Recirculation Door is less than the low range limit.

Possible Causes
RECIRCULATION DOOR SEIZED, BINDING, OBSTRUCTED
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

**Are there any physical or mechanical problems with the door, housing, linkage, or actuator?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

#### 2. CHECK RECIRCULATION DOOR TRAVEL

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 100 degrees of travel.

**Does the door operate smoothly in both directions over approximately 100 degrees of travel?**

- Yes** >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 3.
- No** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

#### 3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B105C–RECIRCULATION DOOR TRAVEL RANGE TOO SMALL?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B105D–RECIRCULATION DOOR TRAVEL RANGE TOO LARGE (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is greater than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Recirculation Door exceeds the high range limit.

Possible Causes
RECIRCULATION DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
RECIRCULATION DOOR ACTUATOR
A/C HEATER CONTROL

### Diagnostic Test

#### 1. CHECK FOR A BROKEN RECIRCULATION DOOR ACTUATOR

Turn the ignition off.

Remove the Recirculation Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

**Does the actuator turn in either direction?**

- Yes** >> Replace the Recirculation Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

---

#### 2. CHECK RECIRCULATION DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 100 degrees.

**Are there any physical or mechanical problems with the door or housing?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Recirculation Door Actuator in accordance with the Service Information. Then, Go To 3.
-

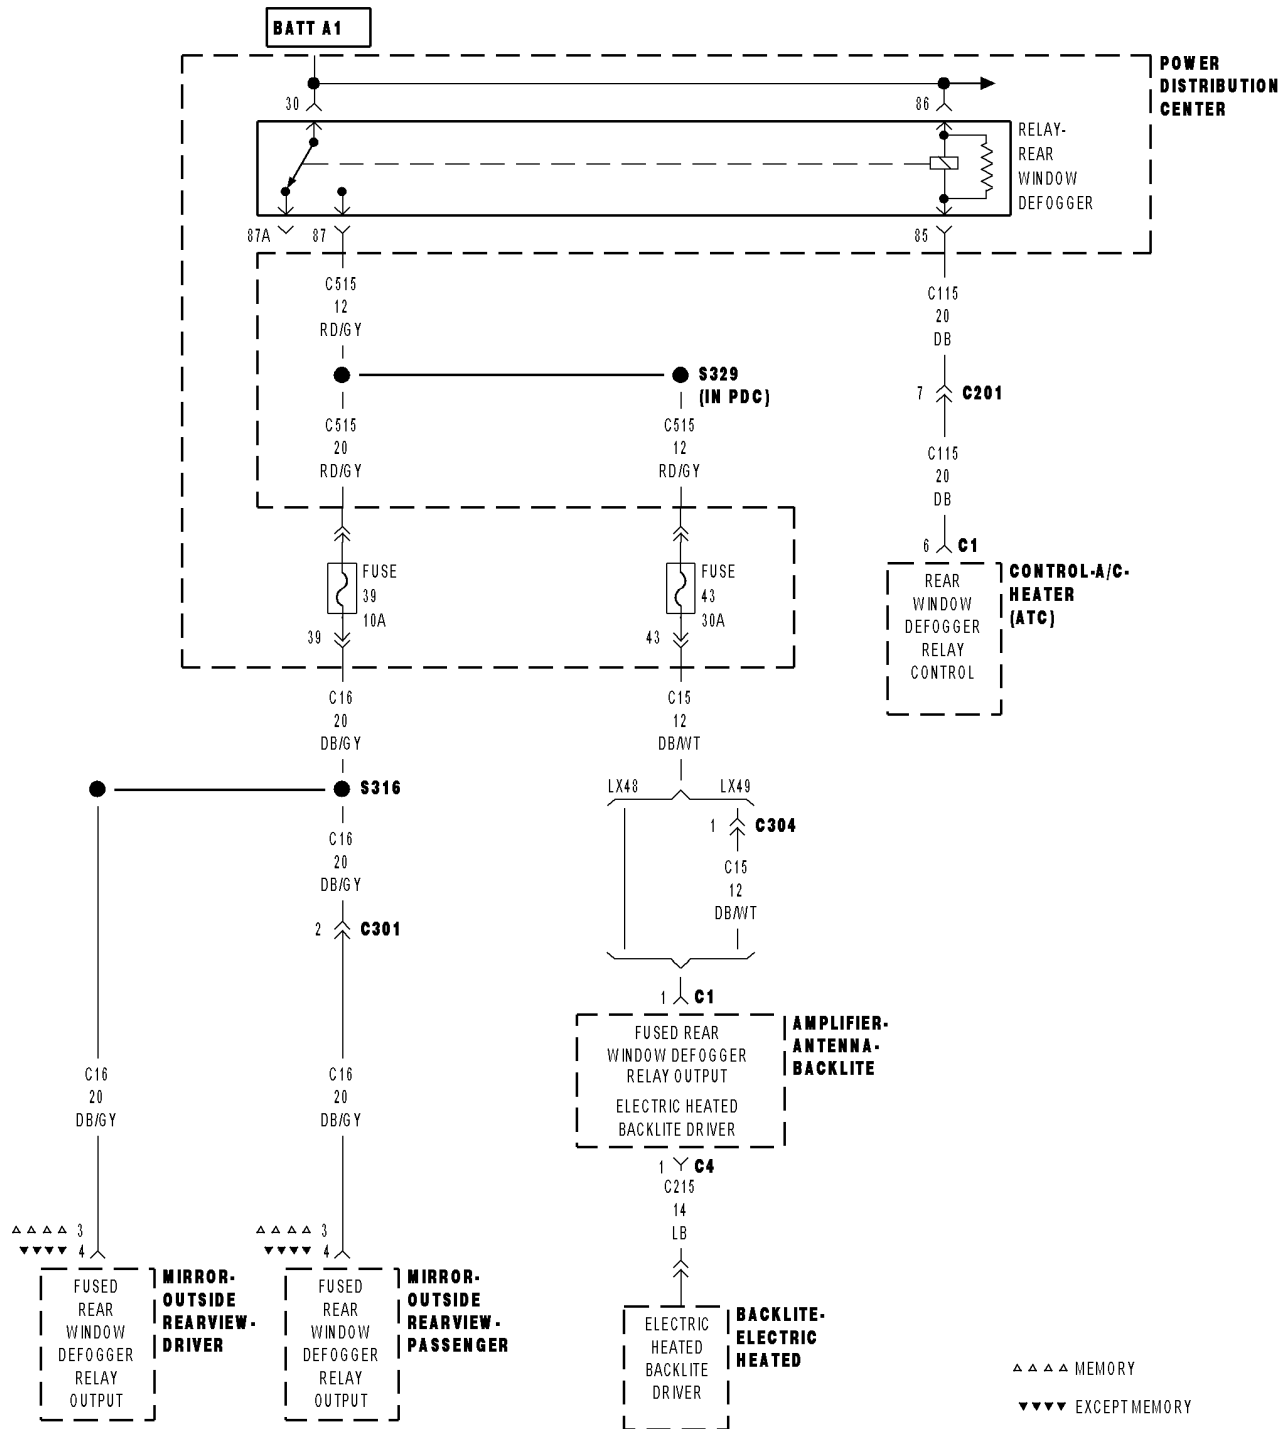

**B105D–RECIRCULATION DOOR TRAVEL RANGE TOO LARGE (ATC) (CONTINUED)****3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B105D–RECIRCULATION DOOR TRAVEL RANGE TOO LARGE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**B106B-REAR DEFROST CONTROL CIRCUIT LOW (ATC)****CONTROL-A/C-HEATER C1 (ATC)**

**B106B–REAR DEFROST CONTROL CIRCUIT LOW (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Following the Start Up Wait Time after ignition on with the EBL output turned off.

- **Set Condition:**

If the (C115) Rear Window Defogger Relay Control circuit is shorted to ground.

Possible Causes
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT SHORTED TO GROUND
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT OPEN
REAR WINDOW DEFOGGER RELAY
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test****1. INSTALL A SUBSTITUTE REAR WINDOW DEFOGGER RELAY & THEN CHECK FOR DTC B106B–REAR DEFROST CONTROL CIRCUIT LOW**

Turn the ignition on.

Verify that the EBL mode switch is off.

Turn the ignition off.

Install a substitute Rear Window Defogger Relay.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read HVAC DTCs.

**Does the scan tool display: B106B–REAR DEFROST CONTROL CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> Replace the original Rear Window Defogger Relay in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B106B-REAR DEFROST CONTROL CIRCUIT LOW (ATC) (CONTINUED)****2. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Remove the substitute Rear Window Defogger Relay.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (C115) Rear Window Defogger Relay Control circuit between ground and the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C115) Rear Window Defogger Relay Control circuit for a short to ground. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR AN OPEN**

Measure the resistance of the (C115) Rear Window Defogger Relay Control circuit between the Rear Window Defogger Relay connector terminal 85 in the PDC and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information. Reinstall the original Rear Window Defogger Relay.

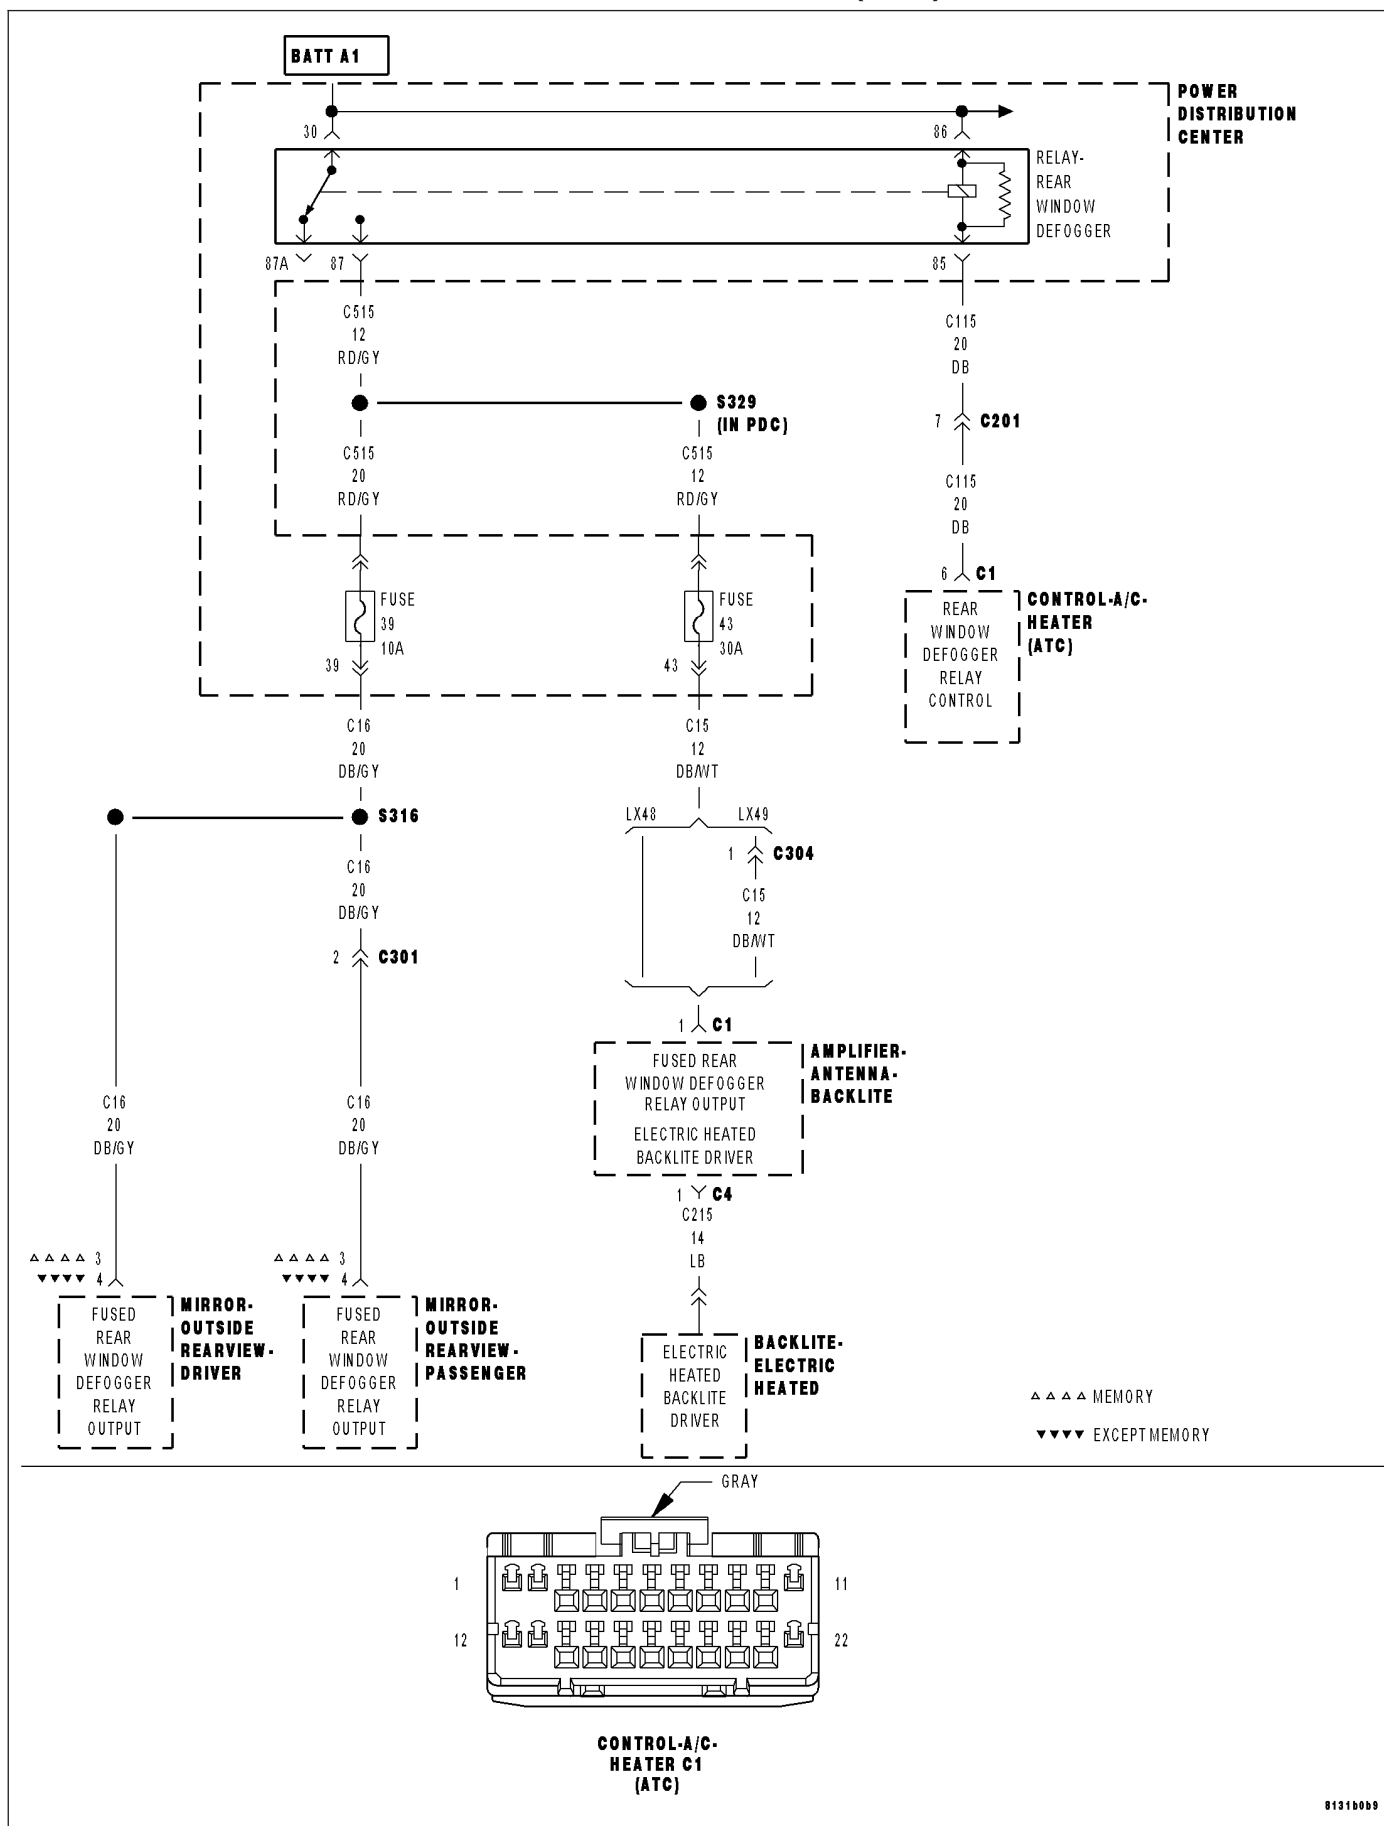

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the (C115) Rear Window Defogger Relay Control circuit for an open. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

# B106C-REAR DEFROST CONTROL CIRCUIT HIGH (ATC)

**B106C–REAR DEFROST CONTROL CIRCUIT HIGH (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the EBL output is turned on and the (C115) Rear Window Defogger Relay Control circuit is either shorted to voltage or open.

Possible Causes
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT SHORTED TO VOLTAGE
(C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT OPEN
REAR WINDOW DEFOGGER RELAY
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test**

**1. INSTALL A SUBSTITUTE REAR WINDOW DEFOGGER RELAY & THEN CHECK FOR DTC B106C–REAR DEFROST CONTROL CIRCUIT HIGH**

- Turn the ignition on.
- Verify that the EBL mode switch is off.
- Turn the ignition off.
- Install a substitute Rear Window Defogger Relay.
- Turn the ignition on.
- With the scan tool, erase HVAC DTCs.
- Turn the ignition off, wait 10 seconds, and turn the ignition on.
- Press the EBL mode switch is on.
- With the scan tool, read HVAC DTCs.

**Does the scan tool display: B106C–REAR DEFROST CONTROL CIRCUIT HIGH?**

- Yes** >> Go To 2
- No** >> Replace the original Rear Window Defogger Relay in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B106C-REAR DEFROST CONTROL CIRCUIT HIGH (ATC) (CONTINUED)****2. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition on.

Verify that the EBL mode switch is off.

Turn the ignition off.

Remove the substitute Rear Window Defogger Relay.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (C115) Rear Window Defogger Relay Control circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C115) Rear Window Defogger Relay Control circuit for a short to voltage. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK (C115) REAR WINDOW DEFOGGER RELAY CONTROL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Measure the resistance of the (C115) Rear Window Defogger Relay Control circuit between the Rear Window Defogger Relay connector terminal 85 in the PDC and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the (C115) Rear Window Defogger Relay Control circuit for an open. Reinstall the original Rear Window Defogger Relay.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B109A–PANEL MODE DOOR 1 ACTUATOR PERFORMANCE (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Mode Door Actuator.
- **Set Condition:**  
If the A/C Heater Control detects an excessive loss or gain of commutator pulses.

Possible Causes
MODE DOOR ACTUATOR

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test**

1. REPLACE THE MODE DOOR ACTUATOR

**Repair**

Replace the Mode Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

## B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW (ATC)

For a complete wiring diagram **Refer to Section 8W.**

### Theory of Operation

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the A/C mode switch is stuck in a pushed position for more than two minutes.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

### Diagnostic Test

#### 1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION & THEN VERIFY DTC IS STILL ACTIVE

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object. Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

#### Does the scan tool display active: B1001–A/C SWITCH REQUEST INPUT CIRCUIT LOW?

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The switch input changes when the switch is pushed down. An active DTC indicates that the switch is stuck in a pushed position. A stored DTC indicates that the switch was stuck in a pushed position for more than two minutes, but has since returned to its normal state.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Rear Defrost mode switch is stuck in a pushed position for more than two minutes.

Possible Causes
OBJECT HOLDING SWITCH IN A PUSHED POSITION
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test****1. INSPECT FOR OBJECT HOLDING SWITCH IN A PUSHED POSITION & THEN VERIFY DTC IS STILL ACTIVE**

Inspect the A/C Heater Control for an object holding the switch in a pushed position. If present, remove the object. Turn the ignition on.

With the scan tool, erase HVAC DTCs.

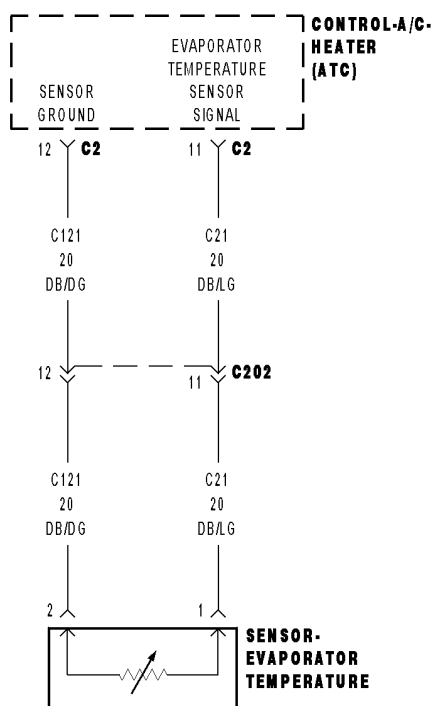

Turn the ignition off, wait 10 seconds, and then turn the ignition on.

Wait two minutes, then with the scan tool, read HVAC DTCs.

**Does the scan tool display active: B1016–REAR DEFROST SWITCH REQUEST INPUT CIRCUIT LOW?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

# B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC)

**B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Evaporator Temperature Sensor input is out of range toward the low voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO GROUND (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO (C121) SENSOR GROUND CIRCUIT EVAPORATOR TEMPERATURE SENSOR A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test**

**1. CHECK FOR DTC B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW WITH EVAPORATOR TEMPERATURE SENSOR HARNESS CONNECTOR DISCONNECTED**

Turn the ignition off.  
Disconnect the Evaporator Temperature Sensor harness connector.  
Turn the ignition on.  
With the scan tool, erase HVAC DTCs.  
Turn the ignition off, wait 10 seconds, and turn the ignition on.  
With the scan tool, read HVAC DTCs.

**Does the scan tool display: B1031–EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW?**

- Yes**    >> Go To 2
- No**    >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1031-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT LOW (ATC) (CONTINUED)****2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO (C121) SENSOR GROUND CIRCUIT**

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to the (C121) Sensor Ground circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC)

**B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

Following the Start Up Wait Time after ignition on.

- **Set Condition:**

If the Evaporator Temperature Sensor input is out of range toward the high voltage threshold.

Possible Causes
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT SHORTED TO VOLTAGE
(C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT OPEN
(C121) SENSOR GROUND CIRCUIT OPEN
EVAPORATOR TEMPERATURE SENSOR
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

## Diagnostic Test

### 1. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C21) Evaporator Temperature Sensor Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 2

**B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)****2. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT, (C121) SENSOR GROUND CIRCUIT, & EVAPORATOR TEMPERATURE SENSOR**

Turn the ignition off.

Measure the resistance between the (C21) Evaporator Temperature Sensor Signal circuit and the (C121) Sensor Ground circuit in the A/C Heater Control C2 harness connector. The approximate circuit resistance should be as follows:

- 2925 ohms @ 38°C (100°F)
- 4050 ohms @ 30°C (86°F)
- 4985 ohms @ 25°C (77°F)
- 6498 ohms @ 19°C (66°F)
- 8989 ohms @ 12°C (54°F)
- 13307 ohms @ 4°C (39°F)
- 14860 ohms @ 2°C (36°F)

**Is the resistance within the specifications?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK (C21) EVAPORATOR TEMPERATURE SENSOR SIGNAL CIRCUIT FOR AN OPEN**

Disconnect the Evaporator Temperature Sensor harness connector.

Measure the resistance of the (C21) Evaporator Temperature Sensor Signal circuit between the A/C Heater Control C2 harness connector and the Evaporator Temperature Sensor harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (C21) Evaporator Temperature Sensor Signal circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1032-EVAPORATOR FIN TEMPERATURE SENSOR CIRCUIT HIGH (ATC) (CONTINUED)****4. CHECK (C121) SENSOR GROUND CIRCUIT FOR AN OPEN**

Measure the resistance of the (C121) Sensor Ground circuit between the A/C Heater Control C2 harness connector and the Evaporator Temperature Sensor harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Evaporator Temperature Sensor in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (C121) Sensor Ground circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1034–INFRARED TEMPERATURE SENSOR INPUT CIRCUIT LOW (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test**

1. REPLACE THE A/C HEATER CONTROL

**Repair**

Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B1035—INFRARED TEMPERATURE SENSOR INPUT CIRCUIT HIGH (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the IR Sensor fails the internal self test.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

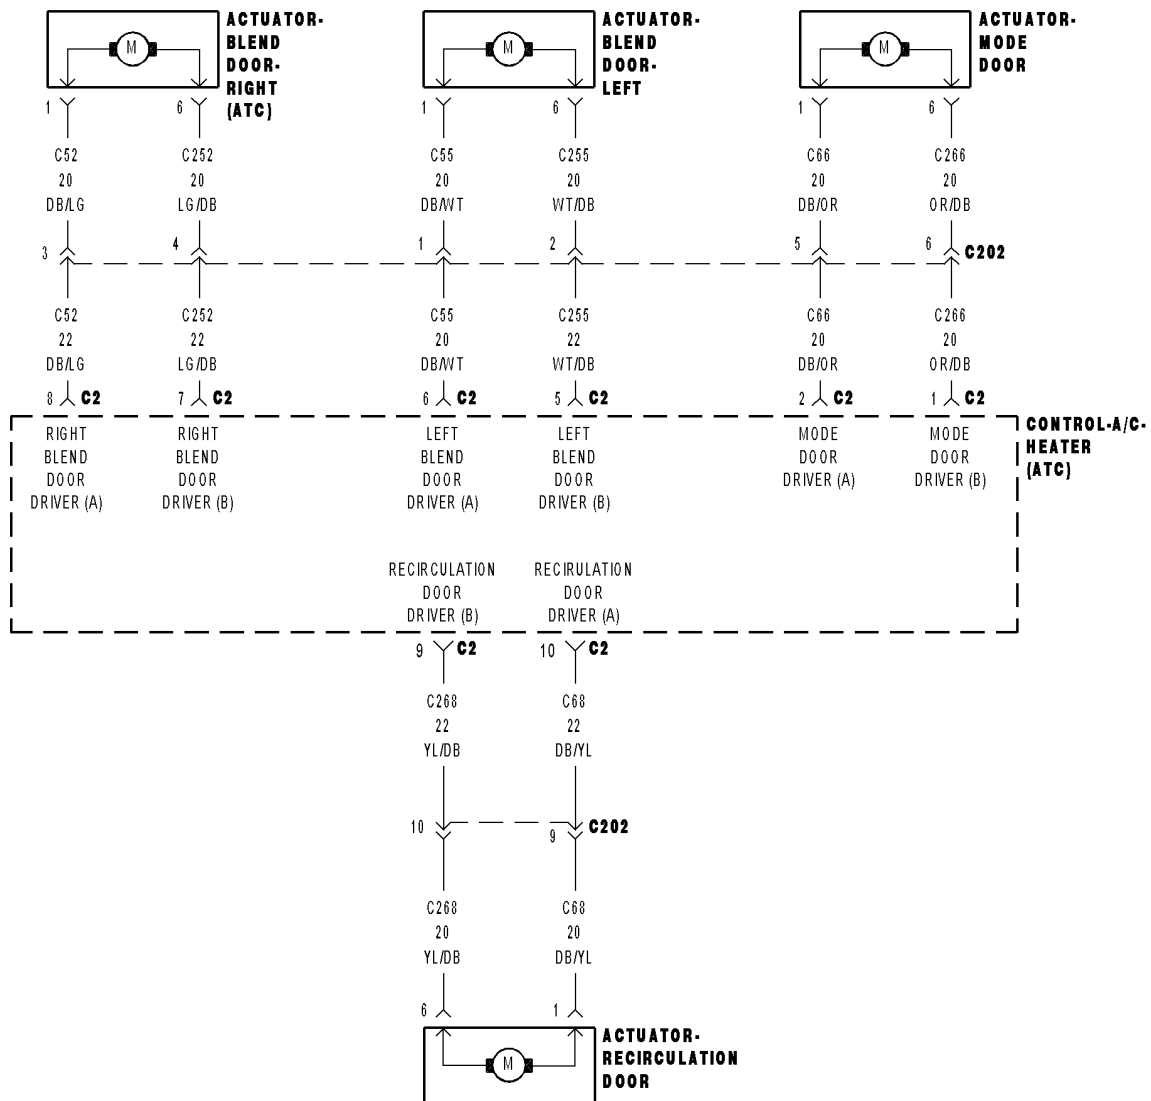

**Diagnostic Test****1. REPLACE THE A/C HEATER CONTROL****Repair**

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**B1040—PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC)****ACTUATOR-BLEND DOOR-LEFT****ACTUATOR-BLEND DOOR-RIGHT (ATC)****ACTUATOR-MODE DOOR****ACTUATOR-RECIRCULATION DOOR****CONTROL-A/C-HEATER C2 (ATC)**

**B1040–PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Mode Door Actuator.
- **Set Condition:**  
If the A/C Heater Control fails to detect commutator pulses.

Possible Causes
MODE DOOR SEIZED, BINDING, OBSTRUCTED
(C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO VOLTAGE
(C266) MODE DOOR DRIVER (B) CIRCUIT SHORTED TO VOLTAGE
(C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO GROUND
(C266) MODE DOOR DRIVER (B) CIRCUIT SHORTED TO GROUND
(C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C266) MODE DOOR DRIVER (B) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S)
(C66) MODE DOOR DRIVER (A) CIRCUIT SHORTED TO (C266) MODE DOOR DRIVER (B) CIRCUIT
(C66) MODE DOOR DRIVER (A) CIRCUIT OPEN
(C266) MODE DOOR DRIVER (B) CIRCUIT OPEN
MODE DOOR ACTUATOR
A/C HEATER CONTROL

**Diagnostic Test****1. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B1044 PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL?**

**Yes** >> Diagnose and Repair the DTC. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 2

**B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****2. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C66) Mode Door Driver (A) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C66) Mode Door Driver (A) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C266) MODE DOOR DRIVER (B) CIRCUIT FOR A SHORT TO VOLTAGE**

Measure the voltage of the (C266) Mode Door Driver (B) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C266) Mode Door Driver (B) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****4. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance of the (C66) Mode Door Driver (A) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C66) Mode Door Driver (A) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**5. CHECK (C266) MODE DOOR DRIVER (B) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (C266) Mode Door Driver (B) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C266) Mode Door Driver (B) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 6

**B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****6. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

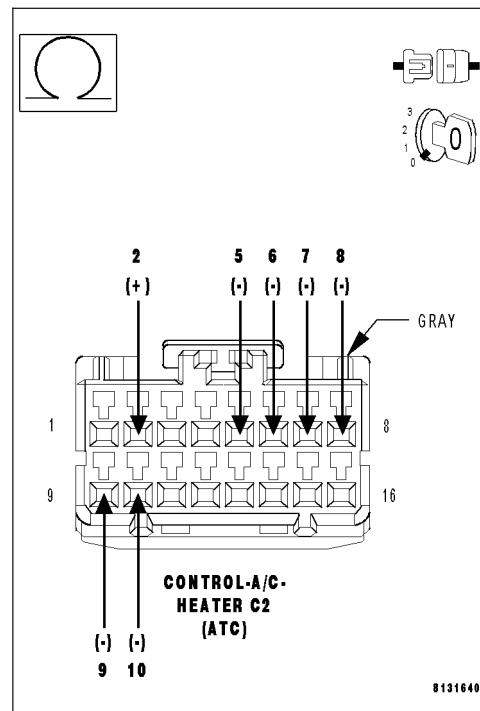

Measure the resistance between the (C66) Mode Door Driver (A) circuit and the (C255) Left Blend Door Driver (B) circuit, the (C55) Left Blend Door Driver (A) circuit, the (C252) Right Blend Door Driver (B) circuit, the (C52) Right Blend Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C66) Mode Door Driver (A) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C66) Mode Door Driver (A) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 7

**7. CHECK (C266) MODE DOOR DRIVER (B) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

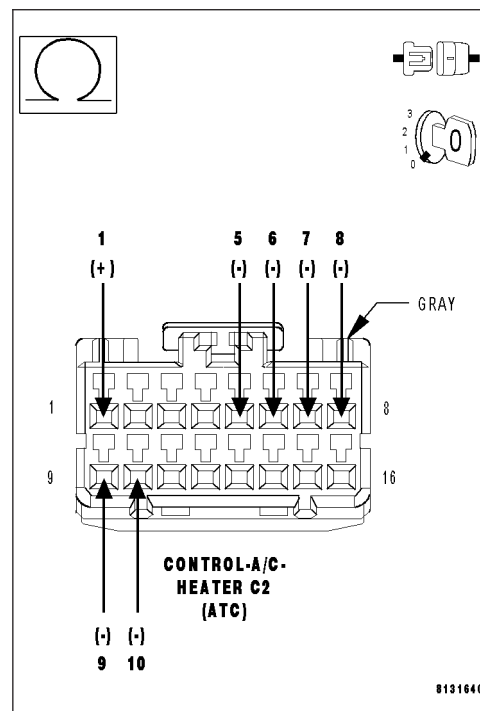

Measure the resistance between the (C266) Mode Door Driver (B) circuit and the (C255) Left Blend Door Driver (B) circuit, the (C55) Left Blend Door Driver (A) circuit, the (C252) Right Blend Door Driver (B) circuit, the (C52) Right Blend Door Driver (A) circuit, the (C268) Recirculation Door Driver (B) circuit, and the (C68) Recirculation Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C266) Mode Door Driver (B) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C266) Mode Door Driver (B) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 8

**B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****8. CHECK MODE DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C66) Mode Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**What is the resistance?**

**Below 30 Ohms**

Go To 9

**Above 70 Ohms**

Go To 10

**30 to 70 Ohms**

Go To 12

**9. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR A SHORT TO (C266) MODE DOOR DRIVER (B) CIRCUIT**

Disconnect the Mode Door Actuator harness connector.

Measure the resistance between the (C66) Mode Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C66) Mode Door Driver (A) circuit for a short to the (C266) Mode Door Driver (B) circuit.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Replace the Mode Door Actuator in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B1040-PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****10. CHECK (C66) MODE DOOR DRIVER (A) CIRCUIT FOR AN OPEN**

Disconnect the Mode Door Actuator harness connector.

Measure the resistance of the (C66) Mode Door Driver (A) circuit between the A/C Heater Control C2 harness connector and the Mode Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Go To 11

**No** >> Repair the (C66) Mode Door Driver (A) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**11. CHECK (C266) MODE DOOR DRIVER (B) CIRCUIT FOR AN OPEN**

Measure the resistance of the (C266) Mode Door Driver (B) circuit between the A/C Heater Control C2 harness connector and the Mode Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the Mode Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Repair the (C266) Mode Door Driver (B) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B1040–PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****12. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B1040–PANEL MODE DOOR 1 CONTROL CIRCUIT/PERFORMANCE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Using the wiring diagram as a guide inspect the wiring and connectors for a condition causing an intermittent loss of commutator pulses from the Mode Door Actuator.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**B1044–PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is less than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Mode Door is less than the low range limit.

Possible Causes
MODE DOOR SEIZED, BINDING, OBSTRUCTED
MODE DOOR ACTUATOR
A/C HEATER CONTROL

**Diagnostic Test****1. INSPECT ACTUATOR & HOUSING ASSEMBLY FOR A CONDITION CAUSING THE DOOR TO SEIZE OR BIND**

Turn the ignition off.

Inspect the actuator, linkage, and housing assembly for a condition causing the door to seize or bind.

**Are there any physical or mechanical problems with the door, housing, linkage, or actuator?**

**Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 2

**2. CHECK MODE DOOR TRAVEL**

Remove the Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the door in both directions. The door should operate smoothly in both directions over approximately 240 degrees of travel.

**Does the door operate smoothly in both directions over approximately 240 degrees of travel?**

**Yes** >> Replace the Mode Door Actuator in accordance with the Service Information. Then, Go To 3.

**No** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B1044 PANEL MODE DOOR 1 TRAVEL RANGE TOO SMALL?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

**Theory of Operation**

The purpose of actuator calibration is to determine the total span of door travel between physical stops. To calibrate the actuator, the A/C Heater Control first moves the door to its soft stop, and then counts the number of pulses it takes to move the door to its other stop. An expected range of span is stored in the control's memory. If the measured calibration value is greater than the expected range for this actuator, this DTC will set. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING for additional information.

- **When Monitored:**  
During actuator calibration.
- **Set Condition:**  
If the total span of the Mode Door exceeds the high range limit.

Possible Causes
MODE DOOR OR A/C HEATER HOUSING COMPONENTS WARPED, WORN, DAMAGED, MISSING, BROKEN
MODE DOOR ACTUATOR
A/C HEATER CONTROL

**Diagnostic Test****1. CHECK FOR A BROKEN MODE DOOR ACTUATOR**

Turn the ignition off.

Remove the Mode Door Actuator from the A/C Heater Housing Assembly.

By hand, attempt to rotate the actuator in both directions.

**Does the actuator turn in either direction?**

- Yes** >> Replace the Mode Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Go To 2

**2. CHECK MODE DOOR & A/C HEATER HOUSING FOR WARPED, WORN, DAMAGED, MISSING, & BROKEN COMPONENTS**

Inspect for excessively worn, disconnected, missing, or broken door linkage. Inspect for a damaged or broken A/C Heater Housing Assembly. Inspect for a warped or broken door, and missing door seals. Rotate the door from stop to stop. The door should rotate approximately 240 degrees.

**Are there any physical or mechanical problems with the door or housing?**

- Yes** >> Repair as necessary in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Mode Door Actuator in accordance with the Service Information. Then, Go To 3.

**3. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B1045–PANEL MODE DOOR 1 TRAVEL RANGE TOO LARGE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**Wiring Diagram for 81316409 Actuator Assembly**

The diagram illustrates the electrical connections for the actuator assembly, which includes the following components:

- ACTUATOR-BLEND DOOR-RIGHT (ATC)**: Motor (M) connected to terminals 1 and 6.
- ACTUATOR-BLEND DOOR-LEFT**: Motor (M) connected to terminals 1 and 6.
- ACTUATOR-MODE DOOR**: Motor (M) connected to terminals 1 and 6.
- ACTUATOR-RECIRCULATION DOOR**: Motor (M) connected to terminals 1 and 6.
- CONTROL-A/C-HEATER (ATC) C2**: Control unit with terminals 1 through 12.

**Wiring Connections:**

- Right Blend Door (ATC)**:
  - Terminal 1: C52 20 DB/LG
  - Terminal 6: C252 20 LG/DB
- Left Blend Door**:
  - Terminal 1: C55 20 DB/NT
  - Terminal 6: C255 20 WT/DB
- Mode Door**:
  - Terminal 1: C66 20 DB/OR
  - Terminal 6: C266 20 OR/DB
- Recirculation Door**:
  - Terminal 1: C68 20 DB/YL
  - Terminal 6: C268 20 YL/DB
- Control-A/C-Heater (ATC) C2**:
  - Terminal 1: C2 1 MODE DOOR DRIVER (B)
  - Terminal 2: C2 2 MODE DOOR DRIVER (A)
  - Terminal 5: C2 5 LEFT BLEND DOOR DRIVER (B)
  - Terminal 6: C2 6 LEFT BLEND DOOR DRIVER (A)
  - Terminal 7: C2 7 RIGHT BLEND DOOR DRIVER (B)
  - Terminal 8: C2 8 RIGHT BLEND DOOR DRIVER (A)
  - Terminal 9: C2 9 RECIRCULATION DOOR DRIVER (B)
  - Terminal 10: C2 10 RECIRCULATION DOOR DRIVER (A)

**Physical Assembly Details:**

- ACTUATOR-BLEND DOOR-LEFT**: BLACK
- ACTUATOR-BLEND DOOR-RIGHT (ATC)**: BLACK
- ACTUATOR-MODE DOOR**: BLACK
- ACTUATOR-RECIRCULATION DOOR**: BLACK
- CONTROL-A/C-HEATER C2 (ATC)**: GRAY

**B1058–RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Recirculation Door Actuator.
- **Set Condition:**  
If the A/C Heater Control fails to detect commutator pulses.

Possible Causes
RECIRCULATION DOOR SEIZED, BINDING, OBSTRUCTED (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT SHORTED TO VOLTAGE (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT SHORTED TO VOLTAGE (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT SHORTED TO GROUND (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT SHORTED TO GROUND (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S) (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT SHORTED TO OTHER DOOR DRIVER CIRCUIT(S) (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT SHORTED TO (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT OPEN (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT OPEN RECIRCULATION DOOR ACTUATOR A/C HEATER CONTROL

**Diagnostic Test****1. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B105C RECIRCULATION DOOR TRAVEL RANGE TOO SMALL?**

**Yes** >> Diagnose and Repair the DTC. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 2

**B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****2. CHECK (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C68) Recirculation Door Driver (A) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C68) Recirculation Door Driver (A) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 3

**3. CHECK (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT FOR A SHORT TO VOLTAGE**

Measure the voltage of the (C268) Recirculation Door Driver (B) circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (C268) Recirculation Door Driver (B) circuit for a short to voltage.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 4

**B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****4. CHECK (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Measure the resistance of the (C68) Recirculation Door Driver (A) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C68) Recirculation Door Driver (A) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 5

**5. CHECK (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT FOR A SHORT TO GROUND**

Measure the resistance of the (C268) Recirculation Door Driver (B) circuit between ground and the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C268) Recirculation Door Driver (B) circuit for a short to ground.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 6

**B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****6. CHECK (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C68) Recirculation Door Driver (A) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C255) Left Blend Door Driver (B) circuit, the (C55) Left Blend Door Driver (A) circuit, the (C252) Right Blend Door Driver (B) circuit, and the (C52) Right Blend Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C68) Recirculation Door Driver (A) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C68) Recirculation Door Driver (A) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 7

**B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****7. CHECK (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT FOR A SHORT TO OTHER DOOR DRIVER CIRCUIT(S)**

Measure the resistance between the (C268) Recirculation Door Driver (B) circuit and the (C266) Mode Door Driver (B) circuit, the (C66) Mode Door Driver (A) circuit, the (C255) Left Blend Door Driver (B) circuit, the (C55) Left Blend Door Driver (A) circuit, the (C252) Right Blend Door Driver (B) circuit, and the (C52) Right Blend Door Driver (A) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms between the (C268) Recirculation Door Driver (B) circuit and any of the other door driver circuits?**

**Yes** >> Repair the circuits with a resistance below 10k ohms for a short to the (C268) Recirculation Door Driver (B) circuit.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**No** >> Go To 8

**8. CHECK RECIRCULATION DOOR ACTUATOR CIRCUIT RESISTANCE**

Measure the resistance between the (C68) Recirculation Door Driver (A) circuit and the (C268) Recirculation Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**What is the resistance?**

**Below 30 Ohms**

Go To 9

**Above 70 Ohms**

Go To 10

**30 to 70 Ohms**

Go To 12

**B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****9. CHECK (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT FOR A SHORT TO (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT**

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance between the (C68) Recirculation Door Driver (A) circuit and the (C268) Recirculation Door Driver (B) circuit in the A/C Heater Control C2 harness connector.

**Is the resistance below 10k ohms?**

- Yes** >> Repair the (C68) Recirculation Door Driver (A) circuit for a short to the (C268) Recirculation Door Driver (B) circuit. Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Replace the Recirculation Door Actuator in accordance with the Service Information. Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**10. CHECK (C68) RECIRCULATION DOOR DRIVER (A) CIRCUIT FOR AN OPEN**

Disconnect the Recirculation Door Actuator harness connector.

Measure the resistance of the (C68) Recirculation Door Driver (A) circuit between the A/C Heater Control C2 harness connector and the Recirculation Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Go To 11
- No** >> Repair the (C68) Recirculation Door Driver (A) circuit for an open. Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE (ATC) (CONTINUED)****11. CHECK (C268) RECIRCULATION DOOR DRIVER (B) CIRCUIT FOR AN OPEN**

Measure the resistance of the (C268) Recirculation Door Driver (B) circuit between the A/C Heater Control C2 harness connector and the Recirculation Door Actuator harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Recirculation Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Repair the (C268) Recirculation Door Driver (B) circuit for an open.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**12. RUN ACTUATOR CALIBRATION & THEN CHECK FOR DTCS IN THE A/C HEATER CONTROL**

Reconnect the A/C Heater Control C2 harness connector.

Turn the ignition on.

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display: B1058-RECIRCULATION DOOR CONTROL CIRCUIT/PERFORMANCE?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- No** >> Using the wiring diagram as a guide inspect the wiring and connectors for a condition causing an intermittent loss of commutator pulses from the Recirculation Door Actuator.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B1082–HVAC MUX CIRCUIT LOW

**B1082–HVAC MUX CIRCUIT LOW (CONTINUED)**

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the Instrument Cluster (CCN) detects voltage below 0.55 volts for 10 seconds on the (C105) HVAC MUX Control circuit.

Possible Causes
(C105) HVAC MUX CONTROL CIRCUIT SHORTED TO GROUND
INSTRUMENT CLUSTER (CCN)
A/C HEATER CONTROL

**Diagnostic Test****1. VERIFY DTC B1082–HVAC MUX CIRCUIT LOW IS ACTIVE**

Turn the ignition on.

With the scan tool, erase CCN DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read CCN DTCs.

**Does the scan tool display active: B1082–HVAC MUX CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK FOR DTC B1082–HVAC MUX CIRCUIT LOW WITH A/C HEATER CONTROL C1 HARNESS CONNECTOR DISCONNECTED**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

With the scan tool, erase CCN DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read CCN DTCs.

**Does the scan tool display: B1082–HVAC MUX CIRCUIT LOW?**

**Yes** >> Go To 3

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1082-HVAC MUX CIRCUIT LOW (CONTINUED)****3. CHECK (C105) HVAC MUX CONTROL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance of the (C105) HVAC MUX Control circuit between ground and the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (C105) HVAC MUX Control circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

# B1083-HVAC MUX CIRCUIT HIGH

**B1083–HVAC MUX CIRCUIT HIGH (CONTINUED)**

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram Refer to Section 8W.

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the Instrument Cluster (CCN) detects voltage above 4.5 volts for 10 seconds on the (C105) HVAC MUX Control circuit.

Possible Causes
(C105) HVAC MUX CONTROL CIRCUIT SHORTED TO VOLTAGE
(C105) HVAC MUX CONTROL CIRCUIT OPEN
INSTRUMENT CLUSTER (CCN)
A/C HEATER CONTROL

**Diagnostic Test**

**1. VERIFY DTC B1083–HVAC MUX CIRCUIT HIGH IS ACTIVE**

Turn the ignition on.  
With the scan tool, erase CCN DTCs.  
Turn the ignition off, wait 10 seconds, and turn the ignition on.  
With the scan tool, read CCN DTCs.

**Does the scan tool display active: B1083–HVAC MUX CIRCUIT HIGH?**

- Yes**    >> Go To 2
- No**    >> Check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**2. CHECK (C105) HVAC MUX CONTROL CIRCUIT VOLTAGE AT A/C HEATER CONTROL C1 HARNESS CONNECTOR**

Turn the ignition off.  
Disconnect the A/C Heater Control C1 harness connector.  
Turn the ignition on.  
Measure the voltage of the (C105) HVAC MUX Control circuit.

- What is the voltage?**
- Below 4.8 Volts**  
Go To 3
- 4.8 to 5.2 Volts**  
Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- Above 5.2 Volts**  
Go To 4

**B1083–HVAC MUX CIRCUIT HIGH (CONTINUED)****3. CHECK (C105) HVAC MUX CONTROL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Measure the resistance of the (C105) HVAC MUX Control circuit between the A/C Heater Control C1 harness connector and the Instrument Cluster C2 harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (C105) HVAC MUX Control circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**4. CHECK (C105) HVAC MUX CONTROL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the Instrument Cluster C2 harness connector.

Turn the ignition on.

Measure the voltage of the (C105) HVAC MUX Control circuit.

**Is the voltage above 0.2 volts?**

- Yes** >> Repair the (C105) HVAC MUX Control circuit for a short to voltage.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Replace the Instrument Cluster (CCN) in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1099–RECIRCULATION DOOR ACTUATOR PERFORMANCE (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
When driving the Recirculation Door Actuator.
- **Set Condition:**  
If the A/C Heater Control detects an excessive loss or gain of commutator pulses.

Possible Causes
RECIRCULATION DOOR ACTUATOR

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

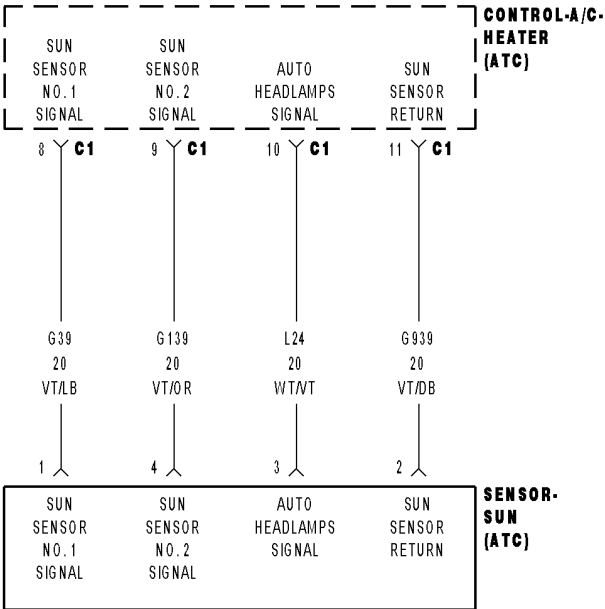

**Diagnostic Test**

1. REPLACE THE RECIRCULATION DOOR ACTUATOR

**Repair**

Replace the Recirculation Door Actuator in accordance with the Service Information.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

B1601-LEFT SOLAR SENSOR CIRCUIT LOW (ATC)

**B1601–LEFT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Left Sunload Sensor input is out of range toward the low voltage threshold.

Possible Causes
(G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO GROUND
(G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO (G939) SUN SENSOR RETURN CIRCUIT
SUN SENSOR
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test**

**1. CHECK FOR DTC B1601–LEFT SOLAR SENSOR CIRCUIT LOW WITH SUN SENSOR HARNESS CONNECTOR DISCONNECTED**

- Turn the ignition off.
- Disconnect the Sun Sensor harness connector.
- Turn the ignition on.
- With the scan tool, erase HVAC DTCs.
- Turn the ignition off, wait 10 seconds, and turn the ignition on.
- With the scan tool, read HVAC DTCs.

**Does the scan tool display: B1601–LEFT SOLAR SENSOR CIRCUIT LOW?**

- Yes** >> Go To 2
- No** >> Replace the Sun Sensor in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1601-LEFT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)****2. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G39) Sun Sensor No. 1 Signal circuit between ground and the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (G39) Sun Sensor No. 1 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR A SHORT TO (G939) SUN SENSOR RETURN CIRCUIT**

Measure the resistance between the (G39) Sun Sensor No. 1 Signal circuit and the (G939) Sun Sensor Return circuit in the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (G39) Sun Sensor No. 1 Signal circuit for a short to the (G939) Sun Sensor Return circuit.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1602-LEFT SOLAR SENSOR CIRCUIT HIGH (ATC)

**B1602–LEFT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Left Sunload Sensor input is out of range toward the high voltage threshold.

Possible Causes
(G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT OPEN
(G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G939) SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test****1. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT VOLTAGE**

Turn the ignition off.

Disconnect the Sun Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (G39) Sun Sensor No. 1 Signal circuit.

**What voltage is present?**

**Above 5.2 Volts**

Go To 2

**4.8 Volts to 5.2 Volts**

Go To 3

**Below 4.8 Volts**

Go To 5

**2. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (G39) Sun Sensor No. 1 Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (G39) Sun Sensor No. 1 Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1602-LEFT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)****3. CHECK (G939) SUN SENSOR RETURN CIRCUIT FUNCTION**

Turn the ignition off.

Connect a jumper wire between the (G39) Sun Sensor No. 1 Signal circuit and the (G939) Sun Sensor Return circuit in the Sun Sensor harness connector.

Turn the ignition on.

With the scan tool in HVAC, select Data Display and read the Left Solar Sensor voltage.

**Is the voltage below 0.2 volts?**

**Yes** >> Replace the Sun Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**4. CHECK (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G939) Sun Sensor Return circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the (G939) Sun Sensor Return circuit for an open. Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1602-LEFT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)****5. CHECK (G39) SUN SENSOR NO. 1 SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G39) Sun Sensor No. 1 Signal circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the (G39) Sun Sensor No. 1 Signal circuit for an open.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1604–RIGHT SOLAR SENSOR CIRCUIT LOW (ATC)

**B1604–RIGHT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Right Sunload Sensor input is out of range toward the low voltage threshold.

Possible Causes
(G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO GROUND
(G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO (G939) SUN SENSOR RETURN CIRCUIT
SUN SENSOR
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test****1. CHECK FOR DTC B1604–RIGHT SOLAR SENSOR CIRCUIT LOW WITH SUN SENSOR HARNESS CONNECTOR DISCONNECTED**

Turn the ignition off.

Disconnect the Sun Sensor harness connector.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

With the scan tool, read HVAC DTCs.

**Does the scan tool display: B1604–RIGHT SOLAR SENSOR CIRCUIT LOW?**

**Yes** >> Go To 2

**No** >> Replace the Sun Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1604-RIGHT SOLAR SENSOR CIRCUIT LOW (ATC) (CONTINUED)****2. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G139) Sun Sensor No. 2 Signal circuit between ground and the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (G139) Sun Sensor No. 2 Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR A SHORT TO (G939) SUN SENSOR RETURN CIRCUIT**

Measure the resistance between the (G139) Sun Sensor No. 2 Signal circuit and the (G939) Sun Sensor Return circuit in the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (G139) Sun Sensor No. 2 Signal circuit for a short to the (G939) Sun Sensor Return circuit.

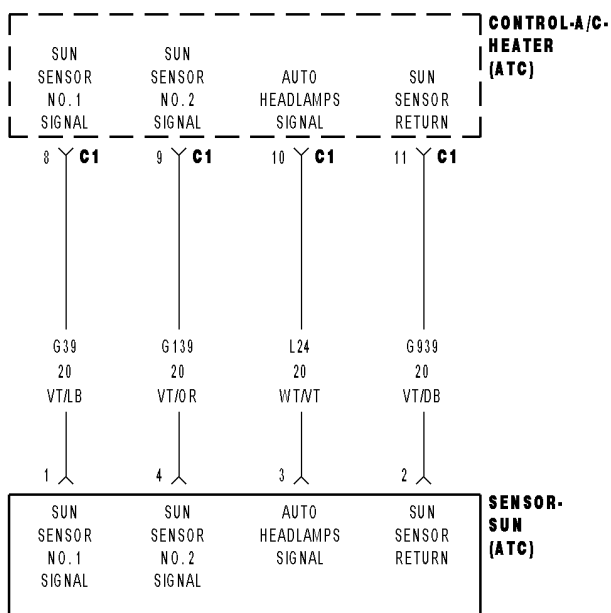

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## B1605—RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC)

**B1605–RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Right Sunload Sensor input is out of range toward the high voltage threshold.

Possible Causes
(G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT OPEN
(G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G939) SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT VOLTAGE

Turn the ignition off.

Disconnect the Sun Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (G139) Sun Sensor No. 2 Signal circuit.

- What voltage is present?**
- Above 5.2 Volts**  
Go To 2
- 4.8 Volts to 5.2 Volts**  
Go To 3
- Below 4.8 Volts**  
Go To 5

**B1605–RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)****2. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (G139) Sun Sensor No. 2 Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (G139) Sun Sensor No. 2 Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK (G939) SUN SENSOR RETURN CIRCUIT FUNCTION**

Turn the ignition off.

Connect a jumper wire between the (G139) Sun Sensor No. 2 Signal circuit and the (G939) Sun Sensor Return circuit in the Sun Sensor harness connector.

Turn the ignition on.

With the scan tool in HVAC, select Data Display and read the Right Solar Sensor voltage.

**Is the voltage below 0.2 volts?**

**Yes** >> Replace the Sun Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B1605-RIGHT SOLAR SENSOR CIRCUIT HIGH (ATC) (CONTINUED)****4. CHECK (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G939) Sun Sensor Return circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (G939) Sun Sensor Return circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**5. CHECK (G139) SUN SENSOR NO. 2 SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G139) Sun Sensor No. 2 Signal circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (G139) Sun Sensor No. 2 Signal circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1610–AMBIENT LIGHT SENSOR INPUT CIRCUIT LOW (ATC)

**B1610–AMBIENT LIGHT SENSOR INPUT CIRCUIT LOW (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Ambient Light Sensor input is out of range toward the low voltage threshold.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO GROUND
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO (G939) SUN SENSOR RETURN CIRCUIT
SUN SENSOR
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test**

**1. CHECK FOR DTC B1610–AMBIENT LIGHT SENSOR INPUT CIRCUIT LOW WITH SUN SENSOR HARNESS CONNECTOR DISCONNECTED**

- Turn the ignition off.
- Disconnect the Sun Sensor harness connector.
- Turn the ignition on.
- With the scan tool, erase HVAC DTCs.
- Turn the ignition off, wait 10 seconds, and turn the ignition on.
- With the scan tool, read HVAC DTCs.

**Does the scan tool display: B1610–AMBIENT LIGHT SENSOR INPUT CIRCUIT LOW?**

- Yes** >> Go To 2
- No** >> Replace the Sun Sensor in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**B1610–AMBIENT LIGHT SENSOR INPUT CIRCUIT LOW (ATC) (CONTINUED)****2. CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO GROUND**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (L24) Auto Headlamps Signal circuit between ground and the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (L24) Auto Headlamps Signal circuit for a short to ground.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 3

**3. CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO (G939) SUN SENSOR RETURN CIRCUIT**

Measure the resistance between the (L24) Auto Headlamps Signal circuit and the (G939) Sun Sensor Return circuit in the A/C Heater Control C1 harness connector.

**Is the resistance below 10k ohms?**

**Yes** >> Repair the (L24) Auto Headlamps Signal circuit for a short to the (G939) Sun Sensor Return circuit.

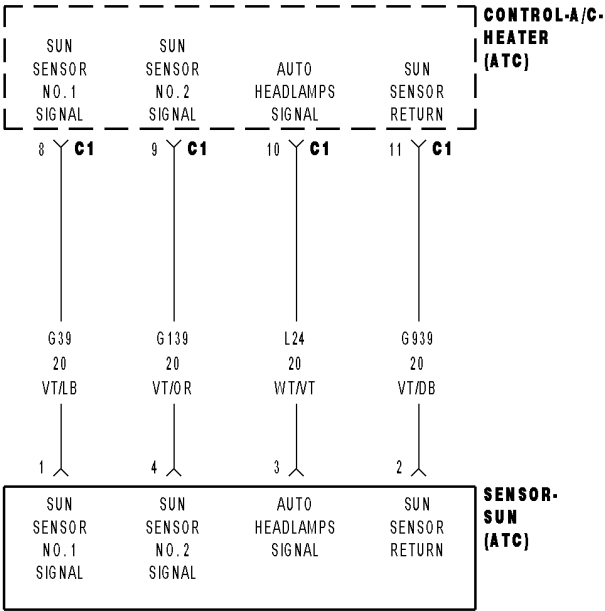

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B1611–AMBIENT LIGHT SENSOR INPUT CIRCUIT HIGH (ATC)

**B1611-AMBIENT LIGHT SENSOR INPUT CIRCUIT HIGH (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If the Ambient Light Sensor input is out of range toward the high voltage threshold.

Possible Causes
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT OPEN
(L24) AUTO HEADLAMPS SIGNAL CIRCUIT SHORTED TO VOLTAGE
(G939) SUN SENSOR RETURN CIRCUIT OPEN
SUN SENSOR
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test****1. CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT VOLTAGE**

Turn the ignition off.

Disconnect the Sun Sensor harness connector.

Turn the ignition on.

Measure the voltage of the (L24) Auto Headlamps Signal circuit.

**What voltage is present?**

**Above 5.2 Volts**

Go To 2

**4.8 Volts to 5.2 Volts**

Go To 3

**Below 4.8 Volts**

Go To 5

**B1611-AMBIENT LIGHT SENSOR INPUT CIRCUIT HIGH (ATC) (CONTINUED)****2. CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR A SHORT TO VOLTAGE**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Turn the ignition on.

Measure the voltage of the (L24) Auto Headlamps Signal circuit.

**Is the voltage above 0.2 volts?**

**Yes** >> Repair the (L24) Auto Headlamps Signal circuit for a short to voltage.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**3. CHECK (G939) SUN SENSOR RETURN CIRCUIT FUNCTION**

Turn the ignition off.

Connect a jumper wire between the (L24) Auto Headlamps Signal circuit and the (G939) Sun Sensor Return circuit in the Sun Sensor harness connector.

Turn the ignition on.

With the scan tool in HVAC, select Data Display and read the Ambient Light Sensor voltage.

**Is the voltage below 0.2 volts?**

**Yes** >> Replace the Sun Sensor in accordance with the Service Information.

Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Go To 4

**B1611-AMBIENT LIGHT SENSOR INPUT CIRCUIT HIGH (ATC) (CONTINUED)****4. CHECK (G939) SUN SENSOR RETURN CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (G939) Sun Sensor Return circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (G939) Sun Sensor Return circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**5. CHECK (L24) AUTO HEADLAMPS SIGNAL CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the A/C Heater Control C1 harness connector.

Measure the resistance of the (L24) Auto Headlamps Signal circuit between the Sun Sensor harness connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 5.0 ohms?**

- Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No** >> Repair the (L24) Auto Headlamps Signal circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

B222A–VEHICLE LINE MISMATCH (ATC)

For a complete wiring diagram Refer to Section 8W.

Theory of Operation

The EBL and AC status indicators will flash when this DTC is active. The status indicators will continue to flash across ignition cycles and battery disconnects. The vehicle line and country code data transmitted on the CAN B Bus must correspond with data stored in the A/C Heater Control to stop the status indicators from flashing.

- **When Monitored:**  
Following the Start Up Wait Time after ignition on.
- **Set Condition:**  
If vehicle line and country code data transmitted on the CAN B Bus doesn't correspond with data stored in the A/C Heater Control.

Possible Causes
INCORRECT PCM
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

Diagnostic Test

1. CHECK VEHICLE LINE IN PCM

With the scan tool compare the vehicle line that is programmed into the PCM to the vehicle line of the vehicle.

- Does the vehicle line programmed into the PCM match the vehicle?**
- Yes**    >> Replace the A/C Heater Control in accordance with the service information.  
            Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).
- No**      >> Replace and program the Powertrain Control Module in accordance with the service information. Ensure the PCM is replaced with the correct vehicle line PCM.  
            Perform (NGC) POWERTRAIN VERIFICATION TEST VER - 5. (Refer to 9 - ENGINE - DIAGNOSIS AND TESTING)

**B2214--(HVAC) CLIMATE CONTROL INTERNAL (ATC)**

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
With the ignition on.
- **Set Condition:**  
If the A/C Heater Control has an internal fault.

Possible Causes
A/C HEATER CONTROL

**Note:** This DTC must be active for the results of this test to be valid. Do not perform this test if this DTC is stored. Refer to HVAC System Test (ATC) for stored DTC test procedures.

**Diagnostic Test****1. REPLACE THE A/C HEATER CONTROL****Repair**

Replace the A/C Heater Control in accordance with the Service Information.

Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

The diagram illustrates the wiring for the Control-A/C-Heater C1 (ATC) module. It shows two main sections: the **MODULE FRONT CONTROL** at the top and the **CONTROL-A/C-HEATER (ATC)** at the bottom.

**MODULE FRONT CONTROL:**

- Top Left:** CAN B BUS (-) connected to pin 3 of connector C1.
- Top Right:** CAN B BUS (+) connected to pin 2 of connector C1.
- Middle Left:** Pin 4 of connector C102 is connected to pin 4 of connector C1 via a 20-pin D54 connector (WT).
- Middle Right:** Pin 5 of connector C102 is connected to pin 5 of connector C1 via a 20-pin D55 connector (WT/OR).
- Bottom Left:** Pin 4 of connector C1 is connected to a sensor S218 via a 20-pin D54 connector (WT).
- Bottom Right:** Pin 5 of connector C1 is connected to a sensor S219 via a 20-pin D55 connector (WT/OR).

**CONTROL-A/C-HEATER (ATC):**

- Top Left:** CAN B BUS (-) connected to pin 4 of connector C1.
- Top Right:** CAN B BUS (+) connected to pin 5 of connector C1.

**Connector Views:**

- CONTROL-A/C-HEATER C1 (ATC):** A 24-pin connector with a GRAY tab. Pins are numbered 1, 11, 12, and 22.
- MODULE-FRONT CONTROL C1:** A 24-pin connector with a BLACK tab. Pins are numbered 1, 13, 12, and 24.

**U0019–CAN B BUS (ATC) (CONTINUED)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**  
Continuously
- **Set Condition:**  
If the CAN B Bus (+) or CAN B Bus (-) circuit is open, shorted to voltage, or shorted to ground.

Possible Causes
ACTIVE U0019 CAN B BUS DTC IN FRONT CONTROL MODULE (D55) CAN B BUS (+) CIRCUIT OPEN (D54) CAN B BUS (-) CIRCUIT OPEN A/C HEATER CONTROL

**Diagnostic Test****1. VERIFY DTC U0019–CAN B BUS IS ACTIVE**

Turn the ignition on.

With the scan tool, read HVAC DTCs.

**Does the scan tool display active: U0019–CAN B BUS?**

**Yes** >> Go To 2

**No** >> If the DTC is stored, check for an intermittent condition by inspecting the related wiring harness for chaffed, pierced, pinched, and partially broken wires. Also, inspect the related connectors for broken, bent, pushed out, spread, corroded, or contaminated terminals.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

**2. CHECK FOR ACTIVE CAN B BUS RELATED DTCs IN THE FRONT CONTROL MODULE (FCM)**

With the scan tool, read Front Control Module (FCM) DTCs

**Does the scan tool display any active CAN B BUS related DTCs?**

**Yes** >> Diagnose and repair the DTC(s). (Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING).

**No** >> Go To 3

**U0019-CAN B BUS (ATC) (CONTINUED)****3. CHECK (D55) CAN B BUS (+) CIRCUIT FOR AN OPEN**

Turn the ignition off.

Disconnect the negative battery cable.

Disconnect the A/C Heater Control C1 harness connector.

Disconnect the Front Control Module (FCM) C1 harness connector.

Measure the resistance of the (D55) CAN B Bus (+) circuit between the Front Control Module C1 harness connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Go To 4

**No** >> Repair the (D55) CAN B Bus (+) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**4. CHECK (D54) CAN B BUS (-) CIRCUIT FOR AN OPEN**

Measure the resistance of the (D54) CAN B Bus (-) circuit between the Front Control Module C1 connector and the A/C Heater Control C1 harness connector.

**Is the resistance below 2.0 ohms?**

**Yes** >> Replace the A/C Heater Control in accordance with the Service Information.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

**No** >> Repair the (D54) CAN B Bus (-) circuit for an open.  
Perform BODY VERIFICATION TEST - VER 1. (Refer to BODY VERIFICATION TEST - VER 1).

## **U0141—LOST COMMUNICATION WITH FRONT CONTROL MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Front Control Module (FCM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0151—LOST COMMUNICATION WITH OCCUPANT RESTRAINT CONTROLLER (ORC) (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Occupant Restraint Controller (ORC).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0154—LOST COMMUNICATION WITH OCCUPANT CLASSIFICATION MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Occupant Classification Module (OCM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## U0155—LOST COMMUNICATION WITH CLUSTER/CCN (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Cluster (CCN).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## U0156—LOST COMMUNICATION WITH EOM (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Compass Temperature Module (EOM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## U0159—LOST COMMUNICATION WITH PARKING ASSIST CONTROL MODULE (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Parktronic (PTS).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## U0168—LOST COMMUNICATION WITH VEHICLE SECURITY CONTROL MODULE (SKREEM/WCM) (ATC)

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Vehicle Security Control Module (SKREEM/WCM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0169—LOST COMMUNICATION WITH SUNROOF CONTROL MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Sunroof Control Module (SCM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0181—LOST COMMUNICATION WITH HEADLAMP LEVELING TRANSLATOR (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Headlamp Leveling Translator.

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0184—LOST COMMUNICATION WITH RADIO (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Radio.

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0186—LOST COMMUNICATION WITH AUDIO AMPLIFIER (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Amplifier (AMP).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0195—LOST COMMUNICATION WITH SDARS (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Satellite Audio Receiver (SDARS).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0197—LOST COMMUNICATION WITH HANDS FREE PHONE MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Hands Free Phone Module (HFM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0199—LOST COMMUNICATION WITH DRIVER DOOR MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Driver Door Module (DDM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **U0200—LOST COMMUNICATION WITH PASSENGER DOOR MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Passenger Door Module (PDM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0208—LOST COMMUNICATION WITH HEATED SEAT CONTROL MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Heated Seat Module (HSM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0209—LOST COMMUNICATION WITH MEMORY SEAT CONTROL MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Memory Seat Module (MSM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0212—LOST COMMUNICATION WITH SCCM - CAN-B (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Steering Column Control Module (SCCM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

**U0231—LOST COMMUNICATION WITH RAIN SENSING MODULE (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

- **When Monitored:**

With the ignition on.

- **Set Condition:**

If the A/C Heater Control loses communication with the Rain Sensing Module (RSM).

**(Refer to 8 - ELECTRICAL/ELECTRONIC CONTROL MODULES - DIAGNOSIS AND TESTING)** for the diagnostic test procedure.

## **\*HVAC SYSTEM TEST (ATC)**

For the Automatic Temperature Control (ATC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

### **Diagnostic Test**

#### **1. HVAC SYSTEM TEST**

**Note:** The HVAC System Test consists of three tests. Test 2 tests A/C system performance, Test 3 tests for mode switch and door actuator circuit faults, Test 4 tests for door actuator calibration faults. Either perform all three tests for a complete system test or perform an individual test if diagnosing a specific symptom.

**Note:** Active DTCs must be resolved before diagnosing stored DTCs.

Turn the ignition on.

With the scan tool, erase HVAC DTCs.

**Choose a diagnostic test to perform.**

**Complete HVAC System Test**

Go To 2

**A/C System Performance Test**

Go To 2

**Mode Switch & Door Actuator Ckt Test**

Go To 3

**Actuator Calibration Test**

Go To 4

---

**\*HVAC SYSTEM TEST (ATC) (CONTINUED)****2. A/C SYSTEM PERFORMANCE TEST**

**Note:** The following are prerequisites of the Cooldown Test. Verify each of the following before running the test:

- The test will not start if DTC B1031, B1032, B1040, B1044, B1045, B1058, B105C, B105D, B1099, B109A, B10A2, B10A6, B10A7, B10A8, B10A9, B10AD, B10AE, B10AF, B222A, or U0141 is active. If active, diagnose and repair the DTCs before proceeding. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
- The Cooldown test will not start if the refrigerant pressure is not within specifications. Check and repair as necessary before proceeding.
- Verify that the blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding.
- Verify that the work area ambient temperature is above 18.3°C (65°F) before proceeding. Move the vehicle to a warmer work area if necessary.
- Verify that the evaporator temperature is above 18.3°C (65°F) before proceeding.
- Verify that the A/C compressor is not running. If the compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

Once all of the prerequisites have been met, actuate the Cooldown Test by performing the following:

Start the engine.

With the scan tool in HVAC, select System Tests and then select Cooldown test.

**Note:** The Cooldown Test can take up to two minutes to run. The test will stop running if any of the following occurs:

- The ignition is turned off.
- The compressor is requested off.
- The blower control is moved to the off position, unless the control was in the off position when the test was started. In this case, moving the blower control out of the off position and then returning it to the off position will stop the test
- DTC B1031 or B1032 sets during the test.
- the control receives a bus message to stop the test.

**Note:** Running the test will cause the EBL status indicator to flash. If the test passes, the EBL status indicator will stop flashing. If the test fails, both the EBL and A/C status indicators will flash alternately.

Allow the test to run to completion before proceeding.

With the scan tool, select View DTCs.

**Does the scan tool display any DTCs?**

- Yes** >> Diagnose and Repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms. Rerun the Cooldown Test after the repair is complete.
- No** >> As necessary, either Go To 3 or 4, or Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**\*HVAC SYSTEM TEST (ATC) (CONTINUED)****3. MODE SWITCH & DOOR ACTUATOR CIRCUIT TEST**

**Note:** If at anytime a DTC becomes active during this test, proceed to the conclusion question.

**Note:** If multiple DTCs become active, diagnose those that relate to a short circuit first.

If not done so previously, start the engine.

Turn the blower control to manual low.

Turn the Left and Right Blend controls to full cold.

Turn the Mode control to panel.

Monitor the scan tool for active HVAC DTCs while performing the following test steps.

Press the A/C mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the Rear Defrost mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the Recirculation mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Turn the Left Blend control to full hot, wait 30 seconds, turn it to full cold, and then proceed to the next step.

Turn the Right Blend control to full hot, wait 30 seconds, turn it to full cold, and then proceed to the next step.

Turn the Mode control to every door position. Leave it in each position for 30 seconds.

**Does the scan tool display any active DTCs?**

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
- No** >> As necessary, either Go To 4 or Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
- 

**4. ACTUATOR CALIBRATION TEST**

With the scan tool, select System Tests and then select Actuator Calibration Test. When the test is complete, select View DTCs.

**Does the scan tool display any DTCs?**

- Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.
- No** >> No problem found.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**\*HVAC SYSTEM TEST (MTC)**

For the Manual Temperature Control (MTC) circuit diagram (Refer to 24 - HEATING & AIR CONDITIONING - SCHEMATICS AND DIAGRAMS).

For a complete wiring diagram **Refer to Section 8W.**

**Diagnostic Test****1. HVAC SYSTEM TEST**

**Note:** The HVAC System Test consists of three tests. Test 2 tests A/C system performance, Test 3 tests for mode switch, mode and temp pot, and door actuator circuit faults, Test 4 tests for door actuator calibration faults. Either perform all three tests for a complete system test or perform an individual test if diagnosing a specific symptom.

**Note:** Active DTCs must be resolved before diagnosing stored DTCs.

Choose a diagnostic test to perform.

**Complete HVAC System Test**

**Actuator Calibration Test**

Go To 4

---

**\*HVAC SYSTEM TEST (MTC) (CONTINUED)****2. A/C SYSTEM PERFORMANCE TEST**

**Note:** The following are prerequisites of the Cooldown Test. Verify each of the following before running the test:

- The test will not start if DTC 31 or 32 is active. If active, diagnose and repair the DTCs before proceeding. Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.
- Verify that the blower motor operates correctly in all speeds. Diagnose and repair all blower related faults before proceeding.
- Verify that the work area ambient temperature is above 18.3°C (65°F) before proceeding. Move the vehicle to a warmer work area if necessary.
- Verify that the evaporator temperature is above 18.3°C (65°F) before proceeding.
- Verify that the A/C compressor is not running. If the compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

Once all of the prerequisites have been met, actuate the Cooldown Test by performing the following:

- Turn the ignition off.
- Turn the blower control to off.
- Start the engine.
- Press the A/C mode switch down, turn the blower control to high speed, wait 3 seconds and then release the A/C mode switch.

•

**Note:** The Cooldown Test can take up to two minutes to run. The test will stop running if either the ignition or the blower is turned off or if DTC 31 or 32 sets during the test.

•

**Note:** Running the test will cause the EBL status indicator to flash. If the test passes, the EBL status indicator will stop flashing. If the test fails, both the EBL and A/C status indicators will flash alternately.

- Allow the test to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note:** The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.

**Is the A/C status indicator flashing DTCs?**

- Yes** >> Diagnose and Repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms. Rerun the Cooldown Test after the repair is complete.
- No** >> As necessary, either Go To 3 or 4, or Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).
-

**\*HVAC SYSTEM TEST (MTC) (CONTINUED)****3. MODE SWITCH, MODE & TEMP POT, & DOOR ACTUATOR CIRCUIT TEST**

If not done so previously, start the engine.

Turn the blower control on.

Turn the Blend control to full cold.

Turn the Mode control to panel.

Press the A/C mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Press the Rear Defrost mode switch on, wait 30 seconds, press it off, and then proceed to the next step.

Turn the Blend control to full hot, wait 30 seconds, turn it to full cold, and then proceed to the next step.

Turn the Mode control to every door position. Leave it in each position for 30 seconds. When complete, proceed to the next step.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- If not done so previously, turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

**Note: If multiple DTCs are active, diagnose those that relate to a short circuit first.**

**Is the A/C status indicator flashing DTCs?**

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of HVAC related symptoms.

**No** >> As necessary, either Go To 4 or Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

---

**4. ACTUATOR CALIBRATION TEST**

Actuate the Actuator Calibration function by performing the following:

- If not done so previously, turn the ignition on.
- Turn the blower control to off.
- Press the EBL mode switch down for 5 seconds and then release it.
- Wait approximately 90 seconds for the calibration process to run to completion before proceeding.

Turn the ignition off, wait 10 seconds, and turn the ignition on.

Actuate the Display DTC function by performing the following:

- Turn the blower control on.
- Press the A/C mode switch down, turn the blower control to off, wait 3 seconds and then release the A/C mode switch.

**Note: The A/C status indicator displays active DTCs when the EBL status indicator is not illuminated and stored DTCs when the EBL status indicator is illuminated.**

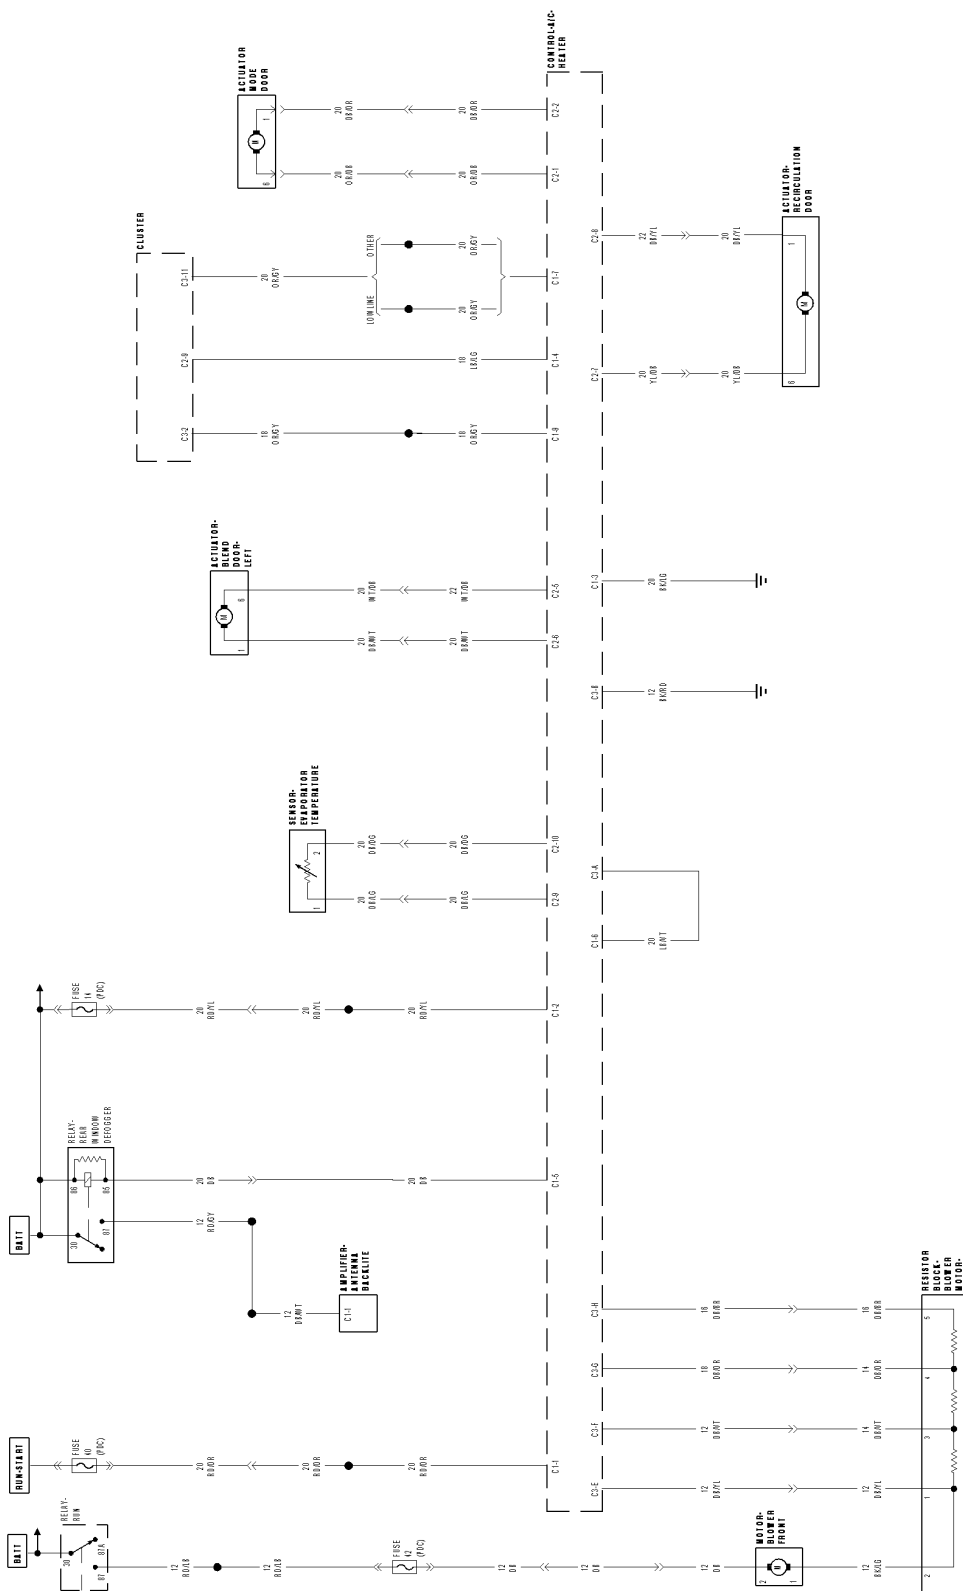

**Is the A/C status indicator flashing DTCs?**

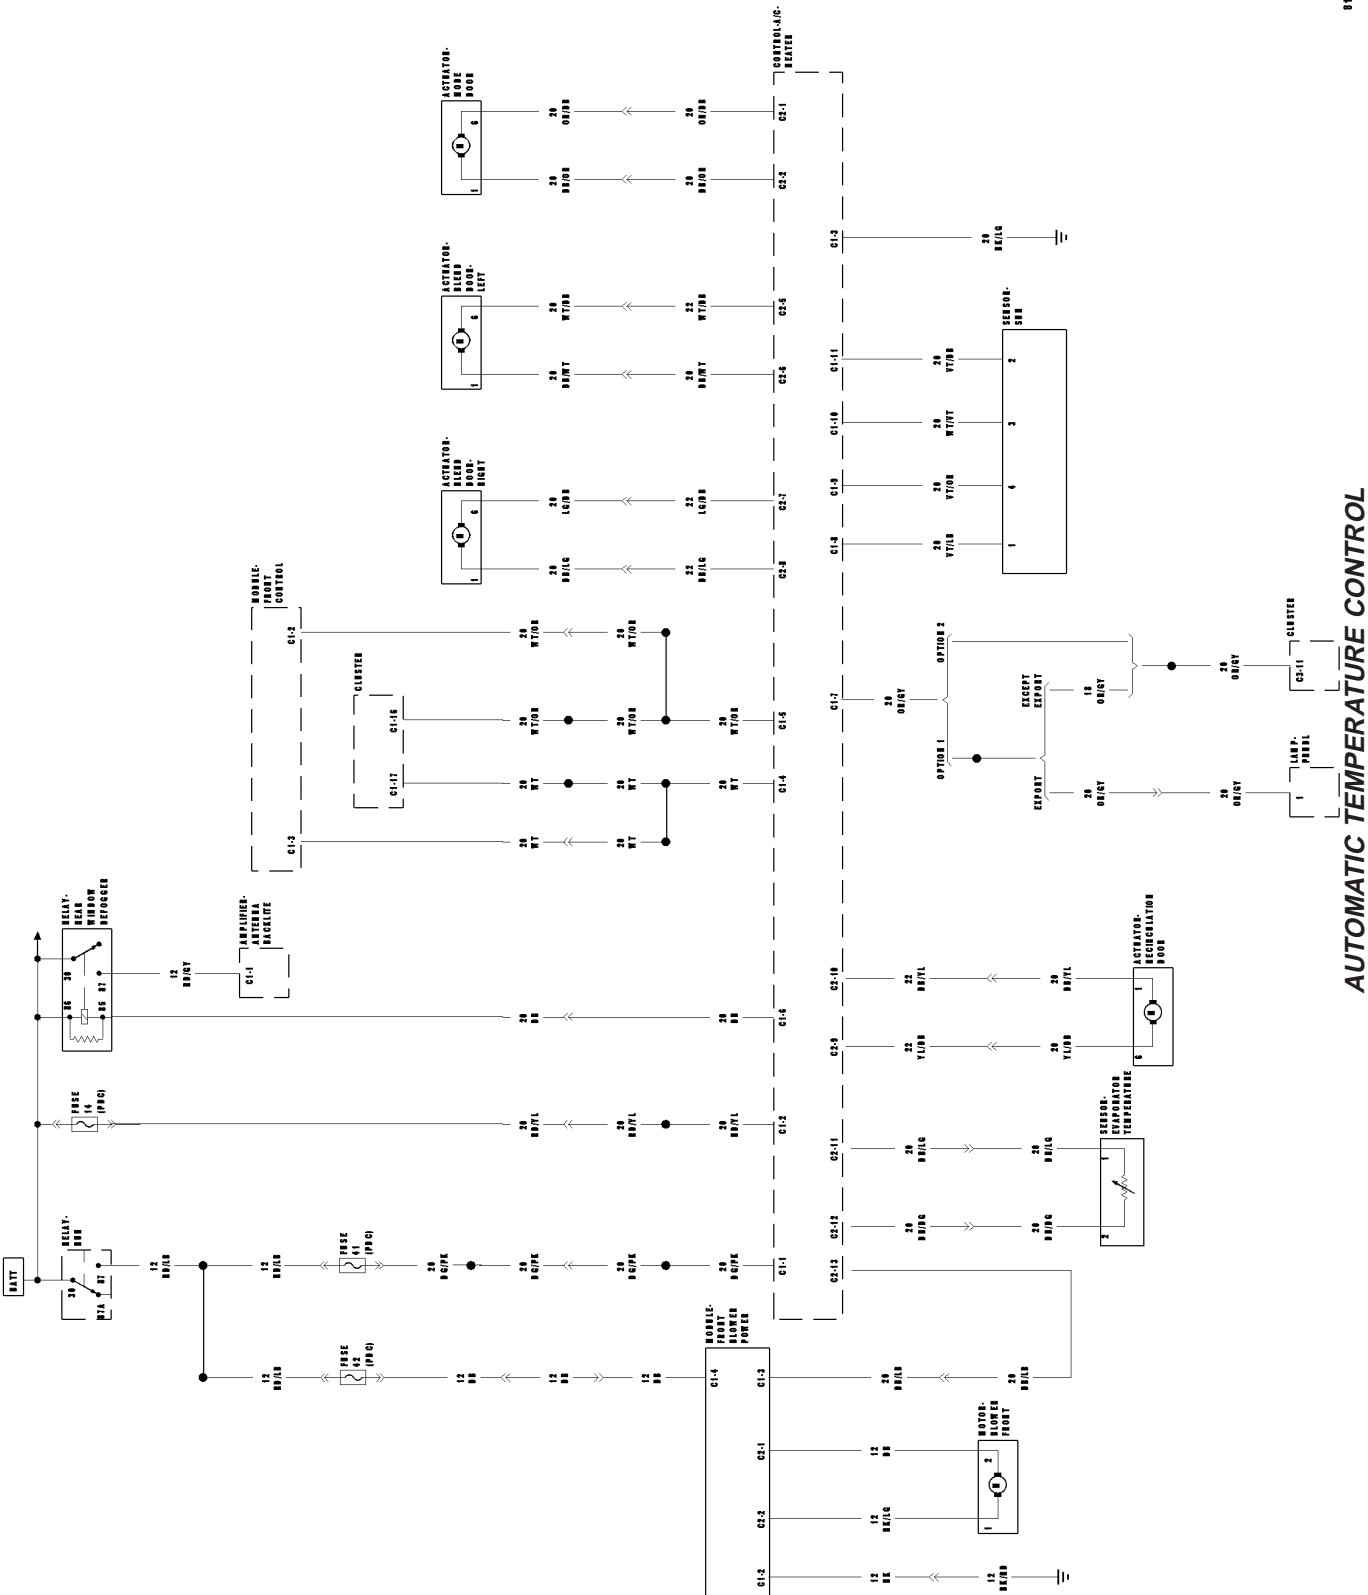

**Yes** >> Diagnose and repair the DTC(s). Refer to the Table of Contents in this Section for a complete list of all HVAC related symptoms.

**No** >> No problem found.  
Perform BODY VERIFICATION TEST – VER 1. (Refer to BODY VERIFICATION TEST – VER 1).

HVAC - SERVICE INFORMATION

DESCRIPTION

HEATING AND AIR CONDITIONING SYSTEMS

A manual temperature control (MTC) single zone type heating-A/C system or a fully adjustable automatic temperature control (ATC) dual zone type heating-A/C system is available on this vehicle.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. Refer to 7 - Cooling for more information before opening or attempting any service to the engine cooling system.

All vehicles are equipped with a common heater, ventilation and air conditioning (HVAC) housing (1). The heating-A/C system combines A/C, heating, and ventilating capabilities in a single HVAC housing mounted within the passenger compartment beneath the instrument panel. The HVAC housing includes:

- Recirculation-air door and actuator (2)
- Blend-air door(s) and actuator(s) (3)
- Blower motor (4)
- Blower motor resistor (MTC) or blower motor power module (ATC) (5)
- Evaporator temperature sensor (6)
- Mode-air doors and actuator (7)
- Heater core (8)
- A/C evaporator (9)

Based upon the system and selected mode, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC housing and the floor outlets are located on the bottom of the HVAC housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlets** - Two large defroster outlets are located near the center of the instrument panel top cover, near the base of the windshield.

- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel top cover, near the belt line at the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and one located on each side of the instrument panel center bezel.
- **Floor Outlets** - There is one floor outlet located above each side of the floor panel center tunnel near the dash panel. There is also one outlet located under each front seat.
- **Console Outlets** - There are two console outlets located at the back of the center floor console facing the rear of the vehicle.

## OPERATION

Both the manual temperature control (MTC) and the automatic temperature control (ATC) heating-A/C system are blend-air type systems. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core. In the available dual zone system, two blend-air doors are used to provide completely independent side-to-side temperature control of the discharge air. The temperature control(s) determines the discharge air temperature(s) by operating the blend door actuator(s), which move the blend-air door(s). This design allows almost immediate control of output air temperature(s).

The heating-A/C system pulls outside (ambient) air through the cowl opening at the base of the windshield, then into the air inlet housing and through the A/C evaporator (3). Air flow can be directed either through or around the heater core (1). This is done by adjusting the blend-air door(s) (2) with the temperature control(s) located on the A/C-heater control in the instrument panel. The air flow can then be directed from the panel, floor and defrost outlets in various combinations using the mode control located on the A/C-heater control. Air flow velocity can be adjusted with the blower speed control located on the A/C-heater control.

The outside (fresh) air intake can be shut off by selecting the Recirculation Mode with the mode control. This will operate an electrically actuated recirculation-air door (4) that closes off the fresh air intake and recirculates the air that is already inside the vehicle.

The A/C compressor can be engaged in any mode by pressing the snowflake, A/C on/off button. It can also be engaged by placing the mode control in the mix to defrost positions. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to also direct the conditioned air to the selected system outlets. The mode control uses an electric actuator to control the mode-air doors (5 and 6).

The two slot-type defroster outlets receive airflow from the HVAC housing through the molded plastic defroster ducts, which connect to the HVAC housing defroster outlets. The airflow from the defroster outlets is directed by fixed vanes in the defroster outlet grilles and cannot be adjusted. The defroster outlet grilles are integral to the instrument panel top cover.

The side window demister outlets receive airflow from the HVAC housing through the molded plastic demister ducts. The demisters direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are serviceable from the instrument panel. The demisters operate when the controls are set in Heat, Bi-level, Mix and Defrost modes.

The four instrument panel outlets receive airflow from the HVAC housing through two molded plastic main panel ducts. One duct directs air flow out of the right side instrument panel outlets, while the other duct delivers air flow to the left side outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution ducts which are integral to the rear cover of the HVAC air distribution housing. Two plastic rear distribution ducts and one center console duct attach to the rear cover and provide conditioned air to the rear seating positions. The two console outlets can be individually adjusted to direct the flow of air, but the floor outlets cannot be adjusted.

**Note:** It is important to keep the HVAC air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

The A/C system is designed for the use of non-CFC, R-134a refrigerant and uses an A/C expansion valve to meter the flow of refrigerant to the A/C evaporator. The A/C evaporator cools and dehumidifies the incoming air prior to blending it with the heated air. To maintain minimum evaporator temperatures and prevent evaporator freezing, an evaporator temperature sensor is used. The sensor is located downstream of the evaporator and supplies an evaporator temperature signal to the A/C-heater control. For the ATC system, the A/C-heater control broadcasts the A/C request on the controller area network (CAN) B bus, where it is read and processed by the front control module (FCM), which in turn broadcasts it on the CAN C bus, where it is read and processed by the powertrain control module (PCM). For the MTC system, the A/C-heater control sends the request for A/C to the CCN via a dedicated mux circuit. The CCN then broadcasts the A/C request on the CAN B bus, where it is read and processed by the FCM, which in turn broadcasts it on the CAN C bus, where it is read and processed by the PCM.

## DIAGNOSIS AND TESTING

### HEATING AND A/C SYSTEMS

#### SETTING FAULTS - MTC AND ATC SYSTEMS

Both the automatic temperature control (ATC) and the manual temperature control (MTC) systems are controlled by the A/C-heater control located on the center bezel of the instrument panel. The ATC system communicates on the controller area network (CAN) B bus and is fully addressable with a scan tool. The MTC system is NOT connected to the CAN bus and is NOT addressable with a scan tool. The A/C-heater control for both heating-A/C systems continuously monitors various internal parameters during normal system operation. If the control detects a fault, both an active and a stored diagnostic trouble code (DTC) will set for that parameter. When the offending parameter returns to an acceptable value, the control automatically clears the active DTC. However, the stored DTC remains until cleared (either manually or automatically). Note that DTCs will not set or clear if supply voltage is low.

The setting and resetting of some active DTCs requires a wait time. Both the MTC and the ATC A/C-heater controls use two independent wait times for setting faults and one for resetting faults. The three different wait times are as follows:

- **Start Up Wait Time** - This is only used immediately after an ignition transition from low to high. It defines how long the system waits after the ignition line has gone high before setting any active DTCs. The duration of the Start Up Wait Time is 1.0 second.
- **Set Wait Time** - This is used at the conclusion of the Start Up Wait Time. It defines the duration a monitored parameter must remain continuously outside of the acceptable range before an active DTC will set. The duration of the Set Wait Time is 1.5 seconds.
- **Reset Wait Time** - It defines the duration a monitored parameter must remain continuously within the acceptable range before an active DTC resets. The duration of the Reset Wait Time is 1.5 seconds.

#### STORING FAULTS - MTC AND ATC SYSTEMS

The A/C-heater control for both the MTC and ATC systems stores the most recent fault by code number in data record number 1. For each new fault, the data records push up one level. After recording eight faults, the system deletes the oldest from the stack. If a fault clears in the middle of the stack due to key cycles, all of the faults below move up one level. To prevent a single fault from filling up the record, the system will only capture an active fault once upon its first detection. However, the system will record an active fault again if it clears and then reoccurs, such as in the case of an intermittent failure condition.

#### DISPLAYING FAULTS AND READING FAULTS - ATC SYSTEM

Use a scan tool to display DTCs stored in the A/C-heater control of the ATC system (Refer to 24 - HVAC - Electrical Diagnostics for more information).

## DISPLAYING FAULTS AND READING FAULTS - MTC SYSTEM

Use the A/C-heater control to display DTCs stored in the A/C-heater control of the MTC system. Begin testing the MTC system with the Lamp Test Mode, which checks for failed LED circuits that could prevent the system from correctly displaying DTCs. Once the Lamp Test Mode is completed and the LEDs of the MTC A/C-heater control illuminate correctly, enter the Display DTC Mode.

### ENTERING LAMP TEST MODE - MTC SYSTEM

To enter the MTC system's Lamp Test Mode, perform the following:

1. Turn the ignition to the On position.
2. Turn the blower motor control (1) to the On position.
3. Press the A/C mode switch (2) down and turn the blower motor control to the Off position. Do not release the A/C mode switch until all of the LEDs (3) illuminate. If all LED indicators do not illuminate, repeat the entire procedure a second time to confirm indicator operation. If any LED fails to function as specified, replace the A/C-heater control (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C HEATER CONTROL - REMOVAL).
4. To exit Lamp Test Mode, release the A/C mode switch.

### ENTERING DISPLAY DTC MODE - MTC SYSTEM

To enter the MTC system's Display DTC Mode, perform the following:

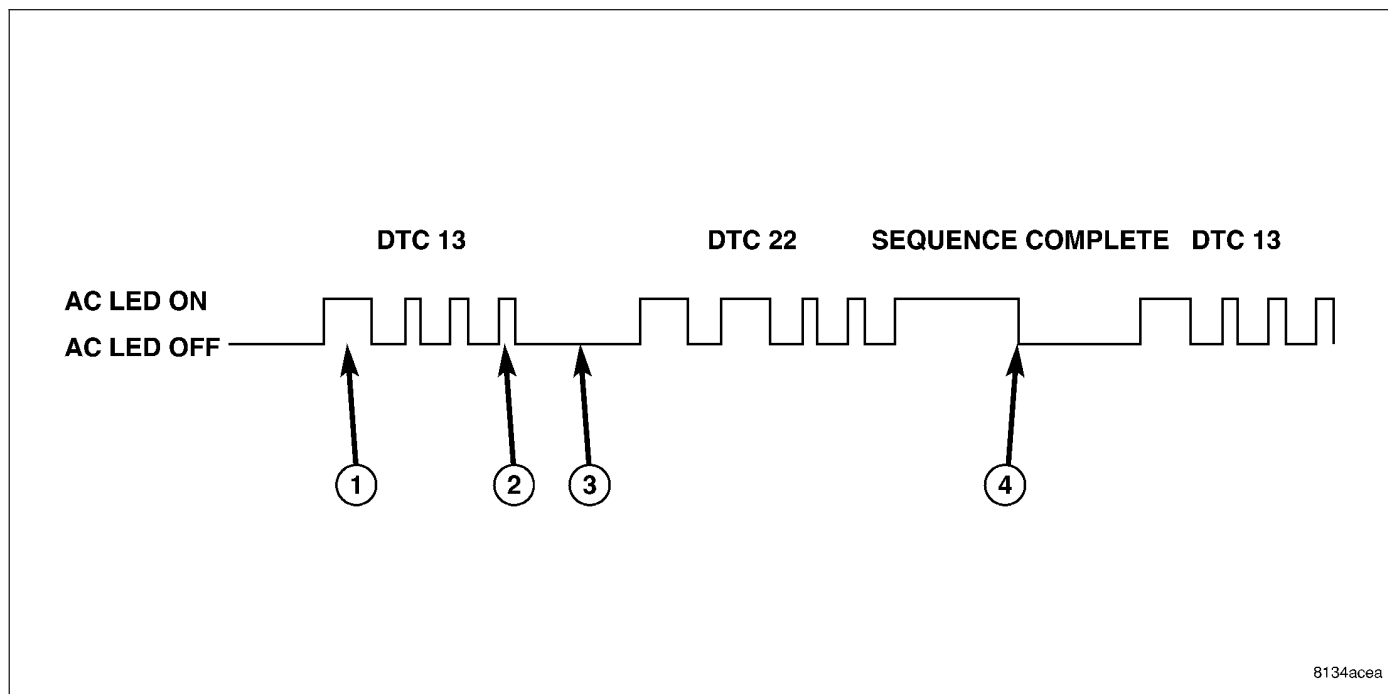

1. Turn the ignition to the On position.
2. Turn the blower motor control (1) to the On position.
3. Press the A/C mode switch (2) down, turn the blower motor control to the Off position, wait three seconds and then release the A/C switch. The MTC system automatically switches from Lamp Test Mode to Display DTC Mode. If there are active or stored DTCs to display, the A/C status indicator (3) will begin to flash. If there are no active or stored DTCs to display, the LEDs on the A/C-heater control (4) will turn off and the system will automatically exit the mode of operation.
4. To manually exit Display DTC Mode, either turn the blower motor control to any speed setting, or turn the ignition off, or disconnect the negative battery cable from the battery.

### DISPLAY SEQUENCING - MTC SYSTEM

MTC system DTCs will display in ascending numerical order but not in chronological order. Active DTCs will display before stored DTCs. If there are active and stored DTCs for the same parameter, the A/C-heater control will NOT display the stored DTC for that parameter. The EBL status indicator will illuminate and remain illuminated while the A/C-heater control is displaying stored DTCs. After displaying all active and stored DTCs the A/C-heater control restarts at the beginning, displaying all DTCs again. To restart the sequence from the beginning while the A/C-heater control is displaying DTCs, press the EBL mode switch down, and then release it. This will cause the A/C-heater control to quit displaying the present code, turn off all LEDs for 2.0 seconds, and then it will begin flashing all DTCs again from the beginning.

### READING DIAGNOSTIC TROUBLE CODES - MTC SYSTEM

All active and stored DTCs for the MTC system have an assigned code number. The A/C status indicator flashes in a series of pulses to display the code numbers. The tens unit value (which is indicated with a long pulse) (1) is flashed first followed by the ones unit value (which is indicated with a short pulse) (2). The long pulse has an indicator on time of 0.80 seconds and the short pulse has an indicator on time of 0.2 seconds, with a 0.5 second indicator off-time between long and short pulses. When displaying multiple DTCs, the A/C status indicator will go off for two seconds (3) before displaying the next DTC. To indicate that the A/C-heater control has completed displaying all DTCs, the A/C status indicator will illuminate for two seconds and then go off for two seconds (4) before beginning to flash the DTCs over again.

### ACTIVE DTCs - MTC AND ATC SYSTEMS

Refer to 24 - HVAC - Electrical Diagnostics to diagnose HVAC system DTCs.

### STORED DTCs - MTC AND ATC SYSTEMS

The HVAC System Test, found in 24 - HVAC - Electrical Diagnostics, provides a means for diagnosing stored DTCs. The HVAC System Test consists of three diagnostic procedures:

- A/C System Performance
- System Controls
- Air-door Functionality

Either perform all three diagnostic procedures for a complete system test or perform an individual procedure if diagnosing a specific symptom.

## ACTUATOR CALIBRATION - MTC AND ATC SYSTEMS

The Actuator Calibration function homes and repositions the air-door actuators, removes accumulated positioning errors, and checks for air-door span faults. The Actuator Calibration function will either run automatically 10 minutes after turning the ignition off after a specified number of ignition cycles or upon turning the ignition on after reconnecting the battery or it can be actuated manually. Once actuated, the calibration function will run to completion for both systems, even if the ignition is turned off. The entire process takes approximately 90 seconds. Upon completion, all air-door actuators should return to the position that the system is currently requesting. Running the Actuator Calibration function is the only way to detect air-door travel too large and air-door travel too small faults. Always check for DTCs in the A/C-heater control after performing an Actuator Calibration.

### STARTING ACTUATOR CALIBRATION - ATC SYSTEM

Use a scan tool to start the Actuator Calibration function for the ATC system.

### STARTING ACTUATOR CALIBRATION - MTC SYSTEM

To start the Actuator Calibration function for the MTC system, perform the following:

1. Turn the ignition to the On position.
2. Turn the blower motor control (1) to the Off position.
3. Press the EBL mode switch (2) down for five seconds and release it.

## COOLDOWN TEST PREREQUISITES - MTC AND ATC SYSTEMS

The Cooldown Test checks A/C system performance by measuring the system's ability to lower the evaporator temperature 11.11° C (20° F) as measured by the evaporator temperature sensor. The following are prerequisites of the Cooldown Test. Verify each of the following before running the Cooldown Test:

- For the ATC system, the Cooldown Test will NOT start if DTC B1031, B1032, B1040, B1044, B1045, B1058, B105C, B105D, B1099, B109A, B10A2, B10A6, B10A7, B10A8, B10A9, B10AD, B10AE, B10AF, B222A, B2214, or U0141 is active. If active, diagnose and repair the DTC(s) before proceeding (Refer to 24 - HVAC - Electrical Diagnostics for a complete list of HVAC related symptoms).
- For the MTC system, the Cooldown Test will NOT start if DTC 31 or 32 is active. In addition, DTC 11, 12, 13, 14, 15, 17, 18, 21, 22, or 23 should not be active. If active, diagnose and repair the DTC(s) before proceeding (Refer to 24 - HVAC - Electrical Diagnostics for a complete list of HVAC related symptoms).
- For either system, verify that the refrigerant system has an adequate charge. Check and repair as necessary before proceeding (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS).
- For either system, verify that the blower motor operates correctly in all speeds. Diagnose and repair all blower motor related faults before proceeding.
- For either system, verify that the ambient temperature of the work area is above 18.3° C (65° F) before proceeding. Move the vehicle to a warmer work area if necessary.
- For either system, verify that the evaporator temperature is above 18.3° C (65° F) before proceeding.

- For either system, verify that the A/C compressor is NOT running. If the A/C compressor is running, turn the A/C off and allow the evaporator to warm up before proceeding.

### COOLDOWN TEST - ATC SYSTEM

Once all of the prerequisites have been met, the Cooldown Test for the ATC system can be actuated by sending a command with a scan tool. Once started, the ATC A/C-heater control automatically sets the blower speed and positions the air-doors for optimal A/C performance. It also sends a request for A/C operation on the CAN B bus. The Cooldown Test can take up to two minutes to run and, will stop running if any of the following occurs:

- The ignition is turned off.
- The A/C compressor is requested off.
- The blower motor control is moved to the Off position, unless the control was in the Off position when the Cooldown Test was started. In this case, moving the blower motor control out of the Off position and then returning it to the Off position will stop the test.
- DTC B1031 or B1032 sets during the Cooldown Test.
- The A/C-heater control receives a bus message to stop the Cooldown Test.

While the Cooldown Test is running, the EBL status indicator will flash. During this time the A/C-heater control will ignore most of its inputs. If the ATC system passes the test, the EBL status indicator will stop flashing. However, if the ATC system fails the test, both the A/C and EBL status indicators will flash alternately and an active DTC B10B2 will set. The status indicators will continue to flash until either a successful Cooldown Test is executed or until the vehicle is driven a specified number of miles. In addition, DTC B10B2 will remain active until a successful Cooldown Test is executed. Always check for DTCs in the A/C-heater control after running the Cooldown Test.

### COOLDOWN TEST - MTC SYSTEM

Once all of the prerequisites have been met, the Cooldown Test for the MTC system can be actuated by performing the following:

1. Verify that the ignition is in the Off position.
2. Turn the blower motor control (1) to the Off position.
3. Start the engine.
4. Press the A/C mode switch (2) down and turn the blower motor control to the highest speed. Wait three seconds and then release the A/C mode switch.

Once actuated, the MTC A/C-heater control automatically positions the air-doors for optimal A/C performance and sends a request for A/C operation to the cluster (CCN) via hardwired circuits. The Cooldown Test can take up to two minutes to run. The test will stop running if any of the following occurs:

- The ignition is turned to the Off position.
- The blower motor control is turned to the Off position.
- DTC 31 or 32 sets during the Cooldown Test.

While the Cooldown Test is running, the EBL status indicator will flash. During this time the A/C-heater control will ignore most of its inputs. If the MTC system passes the test, the EBL status indicator will stop flashing. However, if the MTC system fails the test, both the A/C and EBL status indicators will flash alternately and an active DTC 35 will set. The status indicators will continue to flash until either a successful Cooldown Test is executed or until the vehi-

cle's ignition on time has exceeded a specified value. In addition, DTC 35 will remain active until a successful Cooldown Test is executed. Always check for and diagnose DTCs present in the A/C-heater control after running the Cooldown Test. If the Cooldown Test fails, service the heating-A/C system as required.

### CLEARING FAULTS - MTC AND ATC SYSTEMS

For every fault that sets, the A/C-heater control maintains an independent count of the number of key cycles since the active DTC cleared, the odometer reading when the DTC set (ATC system), and the elapsed ignition on time that the DTC was active. When the number of key cycles (by parameter) reaches a global number, the system automatically clears all of the information associated with that DTC. A loss of battery voltage will also clear all active DTCs and associated data from memory. However, upon reconnecting the battery and activating the A/C-heater control ("Ignition" line going "HIGH"), the system will again evaluate all parameters and will set active DTCs for parameters outside of acceptable limits.

DTCs can also be cleared manually from the A/C-heater control (which also resets key cycle counters). Use a scan tool to clear DTCs stored in the A/C-heater control of the ATC system (Refer to 24 - HVAC - Electrical Diagnostics for more information). To clear DTCs stored in the A/C-heater control of the MTC system, perform the following:

1. Turn the ignition to the On position.
2. Turn the blower motor control (1) to the lowest speed setting.
3. Press the A/C mode switch (2) down and turn the blower motor control to the Off position. Wait three seconds and then release the A/C switch.
4. When the A/C status indicator begins flashing DTCs, press the A/C mode switch down for three seconds and then release the A/C switch to clear the faults.

8134ace8

### A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system. The ambient air temperature in the location where the vehicle will be tested must be a minimum of 21° C (70° F) for this test.

## A/C PERFORMANCE TEST

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Perform the A/C System Performance Test found within the HVAC System Test (refer to 24 - HVAC Electrical Diagnostics). If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), go to Step 2. If any DTCs are found, repair as required, then proceed to Step 2.
2. Connect a tachometer and a manifold gauge set.
3. Set the A/C-heater control to the Recirculation mode (max-A/C) position, the temperature control to the full cool position, and the blower motor control to the highest speed position.
4. Start the engine and hold the idle at 1,000 rpm with the compressor clutch engaged. If the A/C compressor does not engage, see the A/C Diagnosis chart.
5. The engine should be at operating temperature, the doors should be closed and the windows opened.
6. Insert a thermometer in the driver side center panel outlet. Operate the A/C system until it stabilizes.
7. With the A/C compressor clutch engaged, compare the air temperature at the center panel outlet and the A/C compressor discharge pressure (high side) to the A/C Performance and Pressure chart. The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, use the readings obtained before the clutch disengaged.

### A/C PERFORMANCE TEMPERATURE AND PRESSURE

Ambient Air Temperature	21°C (70°F)	27°C (80°F)	32°C (90°F)	38°C (100°F)	43°C (110°F)
Maximum Allowable Air Temperature at Center Panel Outlet	9°C (48°F)	9°C (48°F)	12°C (54°F)	15°C (59°F)	18°C (65°F)
Suction Pressure at Service Port (Low Side)	138 to 207 kPa (20 to 30 psi)	138 to 207 kPa (20 to 30 psi)	207 to 276 kPa (30 to 40 psi)	207 to 276 kPa (30 to 40 psi)	241 to 310 kPa (35 to 45 psi)
Discharge Pressure at Service Port (High Side)	1034 to 1724 kPa (150 to 250 psi)	1379 to 2068 kPa (200 to 300 psi)	1551 to 2241 kPa (225 to 325 psi)	1724 to 2413 kPa (250 to 350 psi)	2068 to 2758 kPa (300 to 400 psi)

8. If the air outlet temperature fails to meet the specifications in the A/C Performance Temperature and Pressure chart, or if the A/C compressor discharge pressure is high, refer to the A/C Pressure Diagnosis chart.

## A/C PRESSURE DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C compressor clutch cycling (ten or more cycles per minute).	Low refrigerant system charge.	See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Faulty fuse.	2. Check the fuses in the Integrated Power Module. Repair the shorted circuit or component and replace the fuses, if required. Refer to Group 8.
	3. Faulty A/C compressor clutch coil.	3. See A/C Compressor Clutch Coil in this group. Test the compressor clutch coil and replace, if required.
	4. Faulty A/C compressor clutch relay.	4. See A/C Compressor Clutch Relay in this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required.
	5. Improperly installed or faulty evaporator temperature sensor.	5. See Evaporator Temperature Sensor in this group. Test the sensor and replace, if required.
	6. Faulty A/C pressure transducer.	6. See A/C Pressure Transducer in this group. Test the sensor and replace, if required.
	7. Faulty Powertrain Control Module (PCM).	7. Refer to Group 9 - Engine Electrical Diagnostics for testing of the PCM. Test the PCM and replace, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See Refrigerant Oil Level in this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator (s) improperly installed or faulty.	2. See Blend Door Actuator in this group. Inspect the actuator(s) for proper operation and replace, if required.
	3. Blend-air door(s) inoperative or sealing improperly.	3. See HVAC Housing in this group. Inspect the blend-air door(s) for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See A/C Evaporator in this group. Replace the restricted A/C evaporator, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the A/C compressor, if required.

Condition	Possible Causes	Correction
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the receiver/drier is restricted.	2. See Receiver/Drier in this group. Replace the restricted receiver/drier, if required.
	3. Inoperative radiator cooling fan.	3. Test the radiator cooling fan and replace, if required. Refer to Group 7 - Cooling.
	4. Refrigerant system overcharged.	4. See Refrigerant System Charge in this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required.
	5. Air in the refrigerant system.	5. See Refrigerant System Leaks in this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. Test the engine cooling system and repair, if required. Refer to Group 7 - Cooling.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. Inspect the accessory drive belt condition and tension. Repair as required. Refer to Group 7 - Cooling.
	2. Faulty A/C orifice valve.	2. See A/C Orifice Valve in this group. Replace the valve, if required.
	3. Faulty A/C compressor.	3. See A/C Compressor in this group. Replace the A/C compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See Liquid Line, Suction Line and Discharge Line in this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C orifice valve.	2. See A/C Orifice Valve in this group. Replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See A/C Condenser in this group. Replace the restricted A/C condenser, if required.

## HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Perform the A/C System Performance Test, which is found within the HVAC System Test (refer to 24 - HVAC Electrical Diagnostics). If any diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), repair as necessary.

## MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

**HEATER TEMPERATURE REFERENCE**

<b>Ambient Air Temperature</b>	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
<b>Minimum Heater System Air Outlet Temperature</b>	52.2° C (126° F)	56.1° C (133° F)	59.4° C (139° F)	62.2° C (144° F)

If the heater outlet air temperature is below the minimum specification, refer to Group 7 - Cooling. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling for more information.

**OBSTRUCTED COOLANT FLOW**

Possible locations or causes of obstructed coolant flow are as follows:

- Faulty water pump.
- Faulty thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

**MECHANICAL PROBLEMS**

Possible locations or causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Blend-air door(s) or actuator(s) not functioning properly.
- Faulty blower motor system
- Faulty A/C-heater control

**TEMPERATURE CONTROL**

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Faulty A/C-heater control.
- Faulty blend door actuator(s).
- Faulty, obstructed or improperly installed blend-air door.
- Faulty related wiring harness or connectors.
- Improper engine coolant temperature.

## SPECIFICATIONS

### A/C SYSTEM

Item	Description	Notes
A/C Compressor	Denso 10S17	ND-8 PAG oil
Freeze-up Control	Evaporator Temperature Sensor	HVAC housing mounted
Low psi Control	A/C Pressure Transducer	Liquid line mounted - opens below 110 kPa (16 psi), closes above 220 kPa (32 psi)
High psi Control	A/C Pressure Transducer	Liquid line mounted - opens above 3219 kPa (476 psi), closed below 2937 kPa (426 psi)
Refrigerant Type	R-134a	
Refrigerant Capacity	Refer to the A/C Underhood Specification Label located in the engine compartment	
Compressor Clutch Coil Draw	3.3 amps	@ 12V $\pm$ 0.5V @ 21° C (70° F)
Compressor Clutch Coil Resistance	3.6 ohms	When measured across coil lead connector
Compressor Clutch Air Gap	0.35 - 0.60 mm (0.014 - 0.024 in.)	

**SPECIAL TOOLS****HEATING-A/C SYSTEM**

Snap Ring Pliers C-4574 is required to service the A/C clutch and field coil.

## ACTUATOR-BLEND DOOR

### DESCRIPTION

The blend door actuators (1) are reversible, 12 volt direct current (DC), servo motors. Models equipped with the MTC single zone heating-A/C system have a single blend-air door, which is controlled by a single blend door actuator. Models with the ATC dual zone heating-A/C system have two blend-air doors, which are controlled by two blend door actuators.

The blend door actuator for the single zone heating-A/C system is located on the driver side end of the HVAC air distribution housing, close to the dash panel.

For the dual zone heating-A/C system, the same blend door actuator used for the single zone system becomes the driver side blend door actuator, which is mechanically connected to only the driver side blend-air door. A second separate blend door actuator is also located on the passenger side of the HVAC air distribution housing which is mechanically connected to only the passenger side blend-air door.

The blend door actuators are interchangeable with each other, as well as with the actuators for the mode-air door and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connects it to its respective door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the HVAC housing. The blend door actuators do not require mechanical indexing to the blend-air doors, as they are electronically calibrated by the A/C-heater control.

### OPERATION

The blend door actuators are connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The blend door actuator(s) can move the blend-air door(s) in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door(s) stops and will not move.

On ATC equipped vehicles, the A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuators and the blend-air doors. The A/C-heater control learns the blend-air doors stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits.

On MTC equipped vehicles, the A/C-heater control uses a timer-type calibration procedure to check relative position of the blend door actuator and the blend-air door. The A/C-heater control learns the blend-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuits.

The blend door actuator(s) are diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The blend door actuator(s) cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

## REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** The single zone heater-A/C system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend-air door and one for the passenger side blend-air door.

### SINGLE ZONE/DUAL ZONE DRIVER SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
3. Remove the three screws (1) that secure the blend door actuator (2) to the driver side of the HVAC air distribution housing (3).
4. Remove the blend door actuator from the air distribution housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the blend door actuator from the vehicle.

### DUAL ZONE PASSENGER SIDE

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - REMOVAL).
3. Remove the three screws (1) that secure the blend door actuator (2) to the passenger side of the HVAC air distribution housing (3).
4. Remove the blend door actuator from the air distribution housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the blend door actuator from the vehicle.

## INSTALLATION

**Note:** The single zone heater-A/C system is equipped with a single blend door actuator. The dual zone system has two blend door actuators, one for the driver side blend-air door and one for the passenger side blend-air door.

### SINGLE ZONE/DUAL ZONE DRIVER SIDE

1. Position the blend door actuator (1) into the vehicle.
2. Install the blend door actuator onto the driver side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the blend door cam (4).

3. Install the screws (1) that secure the blend door actuator (2) to the driver side of the air distribution housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the blend door actuator.
5. Install the instrument panel silencer onto the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).
6. Reconnect the negative battery cable.

**DUAL ZONE PASSENGER SIDE**

1. Position the blend door actuator (1) into the vehicle.
2. Install the blend door actuator onto the passenger side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the blend door cam (4).

3. Install the screws (1) that secure the blend door actuator (2) to the passenger side of the air distribution housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the blend door actuator.
5. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/GLOVE BOX - INSTALLATION).
6. Reconnect the negative battery cable.

## ACTUATOR-MODE DOOR

### DESCRIPTION

The mode door actuator (1) is a reversible, 12-volt direct current (DC), servo motor. The mode door actuator is located on the driver side end of the HVAC air distribution housing, close to the instrument panel. The mode door actuator is mechanically connected to the floor, defrost/demist and the panel-air doors.

The mode door actuator is interchangeable with the actuators for the blend-air door(s) and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connects it to its door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the HVAC housing. The mode door actuator does not require mechanical indexing to the mode-air doors, as it is electronically calibrated by the A/C-heater control.

### OPERATION

The mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The mode door actuator can move the floor, defrost/demist and the panel-air doors in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode-air doors will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode-air doors moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the mode-air doors stop and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuator and the mode-air doors. The A/C-heater control learns the mode-air doors stop position during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits.

The mode door actuator is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The mode door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
3. Remove the screws (1) that secure the mode door actuator (2) to the driver side of the HVAC air distribution housing (3).
4. Remove the mode door actuator from the air distribution housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the mode door actuator from the vehicle.

## INSTALLATION

1. Position the mode door actuator (1) into the vehicle.
2. Install the mode door actuator onto the driver side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the mode door cam (4).

3. Install the screws (1) that secure the mode door actuator (2) to the driver side of the air distribution housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the mode door actuator.
5. Install the instrument panel silencer onto the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).
6. Reconnect the negative battery cable.

## ACTUATOR-RECIRCULATION DOOR

### DESCRIPTION

The recirculation door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. The recirculation door actuator is located on the left side of the HVAC air inlet housing and is directly connected to the pivot shaft of the recirculation-air door.

The recirculation door actuator is interchangeable with the actuators for the blend-air door(s) and the mode-air doors. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connects it to its door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the air inlet housing. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

### OPERATION

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator can move the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the recirculation-air door stops and will not move.

On ATC equipped vehicles, the A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits.

On MTC equipped vehicles, the A/C-heater control uses a timer-type calibration procedure to check relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits.

The recirculation door actuator is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The recirculation door actuator cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - REMOVAL).
3. Remove the three screws (1) that secure the recirculation door actuator (2) to the left side of the HVAC air inlet housing (3).
4. Remove the recirculation door actuator from the air inlet housing and disconnect the HVAC wire harness connector (4) from the actuator.
5. Remove the recirculation door actuator from the vehicle.

## INSTALLATION

1. Position the recirculation door actuator (1) into the vehicle.
2. Install the recirculation door actuator onto the left side of the HVAC air inlet housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the recirculation door pivot shaft (4).

3. Install the three screws (1) that secure the recirculation door actuator (2) to the left side of the HVAC air inlet housing (3). Tighten the screws to 2 N·m (17 in. lbs.).
4. Connect the HVAC wire harness connector (4) to the recirculation door actuator.
5. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).
6. Reconnect the negative battery cable.

## CLUTCH-A/C COMPRESSOR

### DESCRIPTION

The A/C compressor clutch assembly consists of a stationary electromagnetic A/C clutch field coil (4), pulley bearing and pulley assembly (3), clutch plate (2) and shims (7). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings (5 and 6). The clutch plate is splined to the compressor shaft and secured with a bolt (1).

### OPERATION

The A/C compressor clutch components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley.

A/C compressor clutch engagement is controlled by the powertrain control module (PCM) in the engine compartment.

The A/C compressor clutch components cannot be repaired and, if faulty or damaged, they must be replaced.

### DIAGNOSIS AND TESTING

#### A/C COMPRESSOR CLUTCH COIL

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) through the A/C clutch relay. The A/C clutch coil can be tested by either measuring clutch field coil resistance or by measuring current draw. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

#### PRELIMINARY CHECKS

1. If the A/C compressor clutch will not engage, refer to 24 - HVAC Electrical Diagnostics to perform the A/C System Performance Test, which is found within the HVAC System Test. If no diagnostic trouble codes (DTCs) are found in the A/C-heater control or the powertrain control module (PCM), go to Step 2. If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DIAGNOSIS AND TESTING - REFRIGERANT SYSTEM LEAKS). If the refrigerant charge level is OK, go to COIL RESISTANCE TEST and/or COIL CURRENT DRAW TEST. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

#### COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch field coil lead connector.
3. Use an ohm meter and measure the resistance of the clutch coil at the coil lead connector terminals.

4. Refer to the A/C Clutch Coil Specifications chart for the acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).
  - a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
  - b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

### COIL CURRENT DRAW TEST

1. Verify the battery state of charge (Refer to 8 - ELECTRICAL/BATTERY SYSTEM/BATTERY - DIAGNOSIS AND TESTING).
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch coil feed terminal. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C compressor clutch should engage immediately, and the clutch coil supply voltage should be within two volts of the battery voltage. If the coil supply voltage is OK, go to Step 5. If the coil supply voltage is not within two volts of battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as necessary.
5. Refer to the A/C Clutch Coil Specifications chart for the acceptable A/C clutch coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
  - a. If the A/C clutch coil current reading is zero, the coil is open and must be replaced.
  - b. If the A/C clutch coil current reading is above specifications, the coil is shorted and must be replaced.

### A/C CLUTCH COIL SPECIFICATIONS

Compressor	Current Draw	Coil Resistance
Denso 10S17	3.3 amps @ 11.5 - 12.5 volts	3.6 ohms

## STANDARD PROCEDURE

### A/C CLUTCH PLATE INSPECTION

**Note:** The compressor clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. Replace the pulley and bearing assembly, if required.

## A/C CLUTCH BREAK-IN

After a new A/C compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the A/C-heater controls to the A/C Recirculation Mode, the blower motor in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

## REMOVAL

**Note:** The A/C compressor clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
3. Disconnect the engine wire harness connector for the A/C compressor clutch coil from the clutch field coil wire harness connector on the top of the A/C compressor.
4. Remove the bolts that secure the A/C compressor to the engine and support the A/C compressor.
5. Remove the compressor shaft bolt (1). A band-type oil filter wrench or a strap wrench may be used to secure the clutch plate (2) during bolt removal.

**CAUTION:** Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

**Note:** Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

6. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1). Remove the clutch plate and shim(s) (3) from the compressor shaft.

7. Using snap ring pliers (Special Tool C-4574 or equivalent) (2), remove the external snap ring (1) that secures the pulley and bearing assembly (3) to the front cover of the A/C compressor, then slide the pulley and bearing assembly off of the A/C compressor.

8. Remove the screw that secures the clutch coil pigtail wire connector bracket and ground clip to the top of the compressor housing (3).
9. Using snap ring pliers (Special Tool C-4574 or equivalent) (1), remove the external snap ring (4) that secures the clutch field coil (2) to the front cover of the compressor housing, then slide the clutch field coil off of the A/C compressor.

## INSTALLATION

1. Align the dowel pin on the back of the clutch field coil (2) with the hole in the compressor front cover (3) and position the clutch field coil onto the A/C compressor. Be certain that the clutch coil wire harness is properly oriented and routed so that it is not pinched between the compressor front cover and the clutch field coil.

**CAUTION:** The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

**Note:** A new snap ring must be used to secure the clutch field coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the clutch field coil dowel pin location on the A/C compressor.

2. Using snap ring pliers (Special Tool C-4574 or equivalent) (1), install the external snap ring (4) that secures the clutch field coil to the front cover of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.
3. Install the screw that secures the clutch field coil wire harness connector bracket and ground clip to the top of the compressor housing. Tighten the screw securely.

**CAUTION:** When installing the pulley and bearing assembly, **DO NOT** mar the friction surfaces of the pulley or premature failure of the clutch will result.

4. Install the pulley and bearing assembly (1) onto the front cover of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

**CAUTION:** The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

**Note:** A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

5. Using snap ring pliers (Special Tool C-4574 or equivalent) (2), install the external snap ring (1) that secures the pulley and bearing assembly (3) to the front cover of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

6. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) on the compressor shaft (1) against the shoulder. If a new clutch plate and/or pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick on the compressor shaft against the shoulder.

7. Install the clutch plate (2) onto the compressor shaft.
8. Install the compressor shaft bolt (1). Tighten the bolt to 17.5 N·m (155 in. lbs.).

**Note:** The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

9. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly faces with a feeler gauge. The air gap should be between specifications (Refer to 24 - HEATING & AIR CONDITIONING - SPECIFICATIONS). If the proper air gap is not obtained, add or subtract shims as needed until the desired air gap is obtained.
10. Install the bolts that secure the A/C compressor to the engine (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - INSTALLATION).

11. Connect the engine wire harness connector to the A/C compressor clutch coil.
12. Install the accessory drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
13. Reconnect the negative battery cable.

## CONTROL-A/C HEATER

### DESCRIPTION

#### MANUAL SINGLE ZONE

The A/C-heater control (1) for the manual temperature control (MTC) single zone heating-A/C system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The A/C-heater control and integral computer is located in the instrument panel and contains:

- a rotary control knob for temperature control of the discharged air (2).
- a rotary control knob for recirculation and mode control of the discharged air (3).
- a push button rear window defogger on/off control (4). The defogger button contains an LED that illuminates when the rear window defogger system is in operation.
- a push button A/C on/off control (5). The Snowflake button contains an LED that illuminates when the A/C system is in operation.
- a rotary control knob for fan speed selection and turning the heating-A/C system off (6).

Prior to replacing an A/C-heater control, run the calibration procedure to verify that the concern is not a system issue. Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information.

The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced.

## AUTOMATIC DUAL ZONE

The A/C-heater control (1) for the automatic temperature control (ATC) dual zone heating-A/C system allows both the driver and the front seat passenger the ability to individually regulate air temperature for their side of the vehicle. All controls are identified by ISO graphic symbols.

The ATC A/C-heater control and integral computer is located in the instrument panel and contains:

- a push button A/C on/off control (2). The Snowflake button contains an LED that illuminates when the A/C system is in operation.
- a push button rear window defogger on/off control (3). The defogger button contains an LED that illuminates when the rear window defogger system is in operation.
- an infrared sensor (4) that detects thermal radiation emitted by the front seat occupants and their surroundings
- a push button air recirculation control (5). The Recirculation button contains an LED that illuminates when the recirculation function is manually activated.
- a rotary control knob for mode control of the discharged air (6).
- two rotary control knobs for individual driver and front seat passenger temperature control of the discharged air (7).
- a rotary control knob for manual and automatic fan speed selection and turning the heating-A/C system off (8).
- Auto mode provides variable air recirculation under high temperature and humidity conditions. Because recirculation is generally accompanied by increased fan noise, the proportion of recirculated to outside air gradually approaches full recirculation over a broad temperature range.

The A/C-heater control for the ATC dual zone heating-A/C system is diagnosed using a scan tool. Prior to replacing an A/C-heater control, run the calibration procedure to verify that the concern is not a system issue. (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The A/C-heater control cannot be repaired and, if faulty or damaged, it must be replaced.

The A/C-heater control utilizes integrated circuitry and information carried on the controller area network (CAN) B bus to monitor many sensors and switch inputs throughout the vehicle. In response to those inputs, the internal circuitry and programming of the A/C-heater control allows it to control electronic functions and features of the ATC heating-A/C system.

Some of the inputs received by the A/C-heater control of the ATC heating-A/C system on the CAN B bus are as follows:

- Dimming
- Refrigerant Pressure
- A/C Clutch Engage
- Vehicle Identification Number
- Vehicle Odometer
- Engine Coolant Temperature
- Ambient Air Temperature
- System Voltage
- Vehicle Speed
- Engine Speed

Some of the messages broadcasted by the A/C-heater control of the ATC heating-A/C system on the CAN B bus are as follows:

- A/C Request
- A/C Select
- EBL Status
- Auto Headlamp Signal

## REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (1) from the instrument panel (2), disconnect the wire harness connector(s) (3) from the A/C-heater control (4) and place the center bezel on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL).

3. Remove the four screws (1) that secure the A/C-heater control (2) to the instrument panel center bezel (3).
4. Remove the A/C-heater control from the instrument panel center bezel.

## INSTALLATION

1. Position the A/C-heater control (2) into the instrument panel center bezel (3).
2. Install the four screws (1) that secure the A/C-heater control to the instrument panel center bezel. Tighten the screws to 2 N·m (17 in. lbs.).

3. Connect the wire harness connector(s) (3) to the A/C-heater control (4) and install the instrument panel center bezel (1) to the instrument panel (2) (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - INSTALLATION).
4. Reconnect the negative battery cable.

## MODULE-POWER-BLOWER MOTOR

### DESCRIPTION

A blower motor power module is used on this model when it is equipped with the automatic temperature control (ATC) heating-A/C system. Models equipped with the manual temperature control (MTC) heating-A/C system use a blower motor resistor, instead of the blower motor power module (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/RESISTOR-BLOWER MOTOR - DESCRIPTION).

The blower motor power module is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor power module consists of a molded plastic mounting plate with two integral connector receptacles (1). Concealed behind the mounting plate is the power module electronic circuitry and a large finned heat sink (2). The blower motor power module is accessed for service by removing the glove box.

### OPERATION

The blower motor power module is connected to the vehicle electrical system through a dedicated lead and connector of the HVAC wire harness. A second connector receptacle receives the wire harness connector from the blower motor. The blower motor power module allows the microprocessor-based automatic temperature control (ATC) A/C-heater control to calculate and provide infinitely variable blower motor speeds based upon either manual blower switch input or the ATC programming using a pulse width modulated (PWM) circuit strategy.

The PWM voltage is applied to a comparator circuit which compares the PWM signal voltage to the blower motor feedback voltage. The resulting output drives the power module circuitry, which provides a linear output voltage to change or maintain the desired blower speed.

The blower motor power module is diagnosed using a scan tool. Refer to 24 - HVAC Electrical Diagnostics for more information.

The blower motor power module cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**WARNING:** The heat sink for the blower motor power module may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor power module, wait five minutes to allow the heat sink to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - REMOVAL).
3. Disconnect the two wire harness connectors (1) from the blower motor power module (2).
4. Remove the two screws (3) that secure the blower motor power module to the HVAC housing (4).
5. Remove the blower motor power module from the HVAC housing.

## INSTALLATION

1. Position the blower motor power module (2) into the HVAC housing (4).
2. Install the two screws (3) that secure the blower motor power module to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the two wire harness connectors (1) to the blower motor power module.
4. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).
5. Reconnect the negative battery cable.

## RELAY-A/C CLUTCH

### DESCRIPTION

The A/C clutch relay (1) is a International Standards Organization (ISO) micro-relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The ISO micro-relay terminal functions are the same as a conventional ISO relay. However, the ISO micro-relay terminal pattern (or footprint) is different, the current capacity is lower, and the physical dimensions are smaller than those of the conventional ISO relay.

The A/C clutch relay is located in the integrated power module (IPM) in the engine compartment.

### OPERATION

The A/C clutch relay is an electromechanical switch that uses a low current input controlled by the powertrain control module (PCM) to control the high current output to the A/C clutch electromagnetic field coil. The movable common feed relay contact is held against the normally closed contact point by spring pressure. When the relay coil is energized, an electromagnetic field is produced by the coil windings. This electromagnetic field draws the movable relay contact away from the normally closed contact point, and holds it against the normally open contact point. When the relay coil is de-energized, spring pressure returns the movable relay contact back against the normally closed contact point. The resistor or diode is connected in parallel with the relay coil in the relay, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The A/C clutch relay terminals are connected to the vehicle electrical system through a receptacle in the integrated power module (IPM). The inputs and outputs of the A/C clutch relay include:

- The common feed terminal (30) receives battery current through a fused B(+) circuit at all times.
- The coil ground terminal (85) receives a ground through the A/C clutch relay control circuit only when the PCM electronically pulls the circuit to ground.
- The coil battery terminal (86) receives battery current from the IPM through a fused ignition switch output (run-start) circuit only when the ignition switch is in the On or Start positions.
- The normally open terminal (87) provides battery current to the A/C clutch coil through the A/C clutch relay output circuit only when the A/C clutch relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the A/C clutch relay coil is de-energized.

The A/C clutch relay cannot be repaired and, if faulty or damaged, it must be replaced. Refer to the appropriate wiring information for diagnosis and testing of the micro-relay and for complete HVAC wiring diagrams.

## REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Open the cover of the integrated power module (IPM) (1) located in the engine compartment.
3. Remove the A/C clutch relay (2) from the IPM.

## INSTALLATION

1. Position the A/C clutch relay (2) into the receptacle of the integrated power module (IPM) (1).
2. Align the A/C clutch relay terminals with the terminal cavities in the IPM receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the IPM.
4. Reconnect the negative battery cable.

## RESISTOR-BLOWER MOTOR

### DESCRIPTION

A blower motor resistor is used on vehicles equipped with the manual temperature control (MTC) heating-A/C system. Vehicles equipped with the automatic temperature control (ATC) heating-A/C system use a blower motor power module, instead of the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/POWER MODULE - DESCRIPTION).

The blower motor resistor is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are coiled resistor wires contained within a ceramic heat sink (3). The blower motor resistor is accessed for service by removing the glove box.

### OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated wire lead and connector of the HVAC wire harness. The blower motor resistor has multiple resistor wires, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor switch in the MTC heating-A/C system directs the ground path for the blower motor through the correct resistor wire to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistor wires. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed.

The blower motor resistor cannot be adjusted or repaired and, if faulty or damaged (such as a cracked ceramic heat sink), it must be replaced.

### DIAGNOSIS AND TESTING

#### BLOWER MOTOR RESISTOR

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

For circuit descriptions and diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS -FRONT/RESISTOR-BLOWER MOTOR - REMOVAL).
3. Check for continuity between each of the blower motor switch input terminals of the blower motor resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

## REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**WARNING:** The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistors to cool before performing diagnosis or service. Failure to take this precaution can result in possible personal injury.

**CAUTION:** Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - REMOVAL).
3. Disengage the wire harness connector locking tab (1) and disconnect the wire harness connector (2) from the blower motor resistor (3).
4. Remove the two screws (4) that secure the blower motor resistor to the HVAC housing (5).
5. Remove the blower motor resistor from the HVAC housing.

## INSTALLATION

1. Position the blower motor resistor (3) into the HVAC housing (5).
2. Install the two screws (4) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Connect the wire harness connector (2) to the blower motor resistor and engage the wire harness connector locking tab (1).
4. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).
5. Reconnect the negative battery cable.

## SENSOR-AMBIENT AIR TEMPERATURE

### DESCRIPTION

The ambient air temperature sensor is a variable resistor that monitors the air temperature outside of the vehicle. The ATC system uses the sensor data to maintain optimum cabin temperature levels. The ambient air temperature sensor is mounted onto the bottom of the front bumper beam.

### OPERATION

The ambient air temperature sensor is a variable resistor that operates on a 5-volt reference signal sent by the front control module (FCM). The ambient air temperature sensor is connected to the FCM through a two-wire lead and connector of the vehicle wire harness. The ambient air temperature sensor changes its internal resistance in response to changes in the outside air temperature, which either increases or decreases the reference signal voltage read by the FCM. The FCM converts and broadcasts the sensor data over the controller area network (CAN) B bus, where it is read by the ATC A/C-heater control and other vehicle control modules.

The ambient air temperature sensor is diagnosed using the scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

The ambient air temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Remove the front end splash shields (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).
4. Disconnect the wire harness connector (1) from the ambient air temperature sensor (2).
5. Remove the push pin (3) that secures the ambient air temperature sensor to the bottom of the front bumper beam (4).
6. Remove the ambient air temperature sensor from the front bumper beam.

## INSTALLATION

1. Position the ambient air temperature sensor (2) onto the bottom of the front bumper beam (4).
2. Install the push pin (3) that secures the ambient air temperature sensor to the front bumper beam.
3. Connect the wire harness connector (1) to the ambient air temperature sensor.
4. Install the front end splash shields (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).
5. Lower the vehicle.
6. Reconnect the negative battery cable.

## SENSOR-EVAPORATOR TEMPERATURE

### DESCRIPTION

The evaporator temperature sensor (1) measures the temperature of the conditioned air downstream of the A/C evaporator (2). The evaporator temperature sensor is an electrical thermistor within a molded plastic case that is inserted into the HVAC housing (3) near the coldest point of the A/C evaporator. Two terminals within the connector receptacle (4) connect the sensor to the vehicle electrical system through a wire lead and connector of the HVAC wire harness.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.

### OPERATION

The evaporator temperature sensor is a thermistor that operates on a 5-volt reference signal sent out by the A/C-heater control. The sensor connects to the A/C-heater control through a two-wire lead and connector of the HVAC wire harness. The sensor monitors the temperature of the conditioned air downstream of the A/C evaporator and changes its internal resistance in response to changes in the air temperature. As the temperature increases, the sensor's resistance decreases which increases the reference signal voltage read by the A/C-heater control. As the temperature decreases, the sensor's resistance increases which decreases the reference signal voltage read by the A/C-heater control.

The A/C-heater control also uses the reference signal voltage as an indication that conditions are correct to request A/C operation, should the operator (manually) or the A/C-heater control (automatically) so desire this function. For the ATC system, the A/C-heater control broadcasts the A/C request on the controller area network (CAN) B bus, where it is read and processed by the front control module (FCM), which in turn broadcasts it on the CAN C bus, where it is read and processed by the powertrain control module (PCM). For the MTC system, the A/C-heater control sends the request for A/C to the CCN via a dedicated mux circuit. The CCN then broadcasts the A/C request on the CAN B bus, where it is read and processed by the FCM, which in turn broadcasts it on the CAN C bus, where it is read and processed by the PCM.

The evaporator temperature sensor is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The evaporator temperature sensor cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - REMOVAL).
3. Disconnect the HVAC wire harness connector (1) from the evaporator temperature sensor (2) located on the HVAC housing (3).
4. Remove the evaporator temperature sensor from the HVAC housing.

## INSTALLATION

1. Install the evaporator temperature sensor (2) into HVAC housing (3).
2. Connect the HVAC wire harness connector (1) to the evaporator temperature sensor.
3. Install the glove box into the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/ GLOVE BOX - INSTALLATION).
4. Reconnect the negative battery cable.

## SENSOR-INFRARED

### DESCRIPTION

The infrared sensor is used only on models equipped with the automatic temperature control (ATC) heating-A/C system. The infrared temperature sensor consists of an infrared transducer concealed behind a clear lens (1) located within the instrument panel mounted A/C-heater control (2).

### OPERATION

The infrared sensor detects thermal radiation emitted by the driver and front passenger seat occupants and their surroundings and converts its data into a linear pulse width modulated (PWM) output signal which is read by the automatic temperature control (ATC) A/C-heater control. The ATC A/C-heater control uses the infrared sensor data as one of the inputs necessary to automatically control the interior cabin temperature level. By using thermal radiation (surface temperature) measurement, rather than an air temperature measurement, the ATC heating-A/C system is able to adjust itself to the comfort level as perceived by the occupant. This allows the ATC system to compensate for other ambient conditions affecting comfort levels, such as solar heat gain or evaporative heat loss.

The ATC system logic responds to the infrared sensor message by calculating and adjusting the air flow temperature and air flow rate needed to properly obtain and maintain the selected comfort level temperature of the occupants. The A/C-heater control continually monitors the infrared sensor circuits, and will store diagnostic trouble codes (DTCs) for any problem it detects.

The infrared sensor is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The infrared sensor cannot be adjusted or repaired and, if faulty or damaged, the entire ATC A/C-heater control must be replaced.

## SENSOR-SUN

### DESCRIPTION

The automatic temperature control (ATC) heating-A/C system uses a sun sensor assembly (1) to measure sun light intensity. The sun sensor assembly incorporates two sun sensors (2) within a molded plastic case which is mounted to the instrument panel and a clear lens (3) that protrudes through the defroster grille. The wire harness receptacle (4) connects the sun sensors to the vehicle electrical system through a wire lead and connector of the instrument panel wire harness.

### OPERATION

The ATC heating-A/C system uses two sun sensors to balance the system in response to side-to-side variations in sun light intensity. Passengers in sun and shadow require different functional settings because they experience very different temperatures. The sun sensor assembly provides data to the A/C heater control to help determine proper mode and blend-air door positions and blower motor speeds. The sun sensors are not thermistor type sensors, but rather photo diodes. For this reason the sun sensors responds to sun light intensity rather than temperature. The sun sensor assembly is also used to sense day and night conditions for automatic headlight control, if equipped.

The sun sensor is diagnosed using a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

The sun sensor assembly cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

### DIAGNOSIS AND TESTING

#### SUN SENSOR

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

The sun sensor assembly is located so that the sun rays will hit the sensors in the same way that it will hit the driver and the passenger. It is important that the area in front of the sun sensor assembly be unobstructed. Check for the following:

- Windshield wipers are properly adjusted.
- Defroster grille or sun sensor is properly installed. The sun sensor lens should protrude above the defroster grille.
- Any stickers on the windshield are not directly in front of the sun sensor.
- Any items laying on top of the instrument panel are not covering the sun sensor.

If the vehicle exhibits a lack of passenger comfort in sunny weather such as in the early afternoon, inspect the position of the sun sensor assembly. The sun sensor lens should protrude above the defroster grille to insure proper operation. If the sun sensor is not properly positioned, perform the following procedure:

1. Confirm that the defroster grille is properly installed. If not, repair as required.
2. Remove the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).
3. Verify that the sun sensor is properly installed to the instrument panel (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/SENSOR-SUN - INSTALLATION).
4. Install the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - INSTALLATION).

The sun sensor can be tested in the vehicle with a scan tool (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING and to 24 - HVAC Electrical Diagnostics for more information).

## REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in an accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).
3. Using a trim stick or another suitable wide flat-blade tool (1), gently pry between both sides of the sun sensor assembly (2) and the instrument panel (3) to release the snap clip retainers that secure the sun sensor.

4. Disconnect the wire harness connector (1) from the sun sensor assembly (2).
5. Remove the sun sensor assembly from the instrument panel (3).

## INSTALLATION

1. Position the sun sensor assembly (2) near the instrument panel (3).
2. Connect the wiring harness connector (1) to the sun sensor assembly (2).

3. Align the tab on the sun sensor assembly (1) with the opening in the instrument panel (2).
4. Gently push the sun sensor assembly into the instrument panel until the sensor snap clip retainers (3) are securely engaged.
5. Install the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - INSTALLATION).
6. Reconnect the negative battery cable.

## TRANSDUCER-A/C PRESSURE

### DESCRIPTION

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C liquid line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting on the A/C liquid line. A rubber O-ring seals the connection between the A/C pressure transducer and the liquid line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

### OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C liquid line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the liquid line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The powertrain control module (PCM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer, then monitors the output voltage of the A/C pressure transducer on a sensor return circuit to determine refrigerant pressure. The PCM is programmed to respond to the A/C pressure transducer and other sensor inputs by controlling the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM will disengage the A/C compressor clutch when high side pressure rises above 3082 kPa (447 psi) and re-engage the clutch when high side pressure drops below 2937 kPa (426 psi). The A/C pressure transducer will also disengage the A/C compressor clutch if the high side pressure drops below 110 kPa (16 psi) and will re-engage the clutch when the high side pressure rises above 221 kPa (32 psi). If the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan. The A/C pressure transducer input to the PCM will also prevent the A/C compressor clutch from engaging when ambient temperatures are below about 4.5° C (40° F) due to the pressure/temperature relationship of the refrigerant.

The A/C pressure transducer cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

The A/C pressure transducer is diagnosed using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

## REMOVAL

**Note: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.**

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2).
3. Remove the A/C pressure transducer from the A/C liquid line (3).
4. Remove the O-ring seal from the liquid line fitting and discard.

## INSTALLATION

**Note: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.**

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the liquid line fitting.
2. Install the A/C pressure transducer (2) onto the A/C liquid line (3). Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

## DUCT-DEFROSTER

## REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the four screws (1) that secure the defroster duct (2) to the top of the HVAC air distribution housing (3).
3. Remove the defroster duct from the top of the air distribution housing.

## INSTALLATION

1. Position the defroster duct (2) onto the top of the HVAC air distribution housing (3).
2. Install the four screws (1) that secure the defroster duct to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

## DUCT-FLOOR CONSOLE

### REMOVAL

1. Remove the center floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - REMOVAL).
2. Remove the two screws (1) that secure the floor console duct (2) to the center floor panel (3).
3. Disconnect the floor console duct from the floor distribution duct (4) and remove the floor console duct from the vehicle.

### INSTALLATION

1. Position the floor console duct (2) into the vehicle.
2. Connect the floor console duct to the floor distribution duct (4).
3. Install the two screws (1) that secure the floor console duct to the center floor panel (3). Tighten the screws to 2.2 N·m (20 in. lbs.).
4. Install the center floor console (Refer to 23 - BODY/INTERIOR/CENTER CONSOLE - INSTALLATION).

## DUCT-FLOOR DISTRIBUTION

### REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

### FRONT FLOOR DISTRIBUTION DUCT

1. Remove the HVAC air distribution housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - REMOVAL).
2. Remove the six screws (1) that secure the front floor distribution duct (2) to the bottom of the air distribution housing (3).
3. Remove the front floor distribution duct from the air distribution housing.

### INTERMEDIATE FLOOR DISTRIBUTION DUCTS

1. Remove the center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - REMOVAL).
2. Remove the front seats (Refer to 23 - BODY/SEATS/SEAT - REMOVAL).
3. Roll back the front floor carpet from under the instrument panel toward the rear of the vehicle (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - REMOVAL).
4. Remove the push pin fastener (1) that secures the right front intermediate floor distribution duct (2) to the floor support (4).
5. Disconnect the right front intermediate floor distribution duct from the front floor distribution duct (8).
6. Disconnect the right front intermediate floor distribution duct from the right rear intermediate floor distribution duct (3).
7. Remove the right rear intermediate floor distribution duct from the floor support.
8. Remove the push pin fastener (6) that secures the left rear intermediate floor distribution duct (5) to the floor support.
9. Disconnect the left front intermediate floor distribution duct (7) from the front floor distribution duct.
10. Disconnect the left front intermediate floor distribution duct from the left rear intermediate floor distribution duct.
11. Remove the left rear intermediate floor distribution duct from the floor support.

## INSTALLATION

### FRONT FLOOR DISTRIBUTION DUCT

1. Position the front floor distribution duct (2) to the bottom of the HVAC air distribution housing (3).
2. Install the six screws (1) that secure the front floor distribution duct to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
3. Install the air distribution housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

### INTERMEDIATE FLOOR DISTRIBUTION DUCTS

1. Install the left rear intermediate floor distribution duct (5) and the right rear intermediate floor distribution duct (3) into the slots in the floor support (4).
2. Connect the left front intermediate floor distribution duct (7) to the left rear intermediate floor distribution duct.
3. Connect the left front intermediate floor distribution duct to the front floor distribution duct (8).
4. Install the push-pin fastener (6) that secures the left rear intermediate floor distribution duct to the floor support.
5. Connect the right front intermediate floor distribution duct (2) to the right rear intermediate floor distribution duct.
6. Connect the right front intermediate floor distribution duct to the front floor distribution duct.
7. Install the push-pin fastener (1) that secures the right front intermediate floor distribution duct to the floor support.
8. Install the carpet onto the front floor panel and under the instrument panel (Refer to 23 - BODY/INTERIOR/CARPETS AND FLOOR MATS - INSTALLATION).
9. Install the front seats (Refer to 23 - BODY/SEATS/SEAT - INSTALLATION).
10. Install the center floor console (Refer to 23 - BODY/INTERIOR/FLOOR CONSOLE - INSTALLATION).

## DUCT-INSTRUMENT PANEL

### REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2).
3. Remove the four screws that secure the driver side instrument panel duct and demister duct assembly (3) to the instrument panel and remove the duct assembly.
4. Remove the four screws that secure the passenger side instrument panel duct and demister duct assembly (4) to the instrument panel and remove the duct assembly.

### INSTALLATION

1. Position the passenger side instrument panel duct and demister duct assembly (4) into the instrument panel.
2. Install the passenger side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
3. Install the four screws that secure the passenger side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).
4. Position the driver side instrument panel duct and demister duct assembly (3) into the instrument panel.
5. Install the driver side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.

6. Install the four screws that secure the driver side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).
7. Install the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2). Tighten the screw to 2.2 N·m (20 in. lbs.).
8. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

## DUCT-INSTRUMENT PANEL DEMISTER

### REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

1. Remove the instrument panel and place it on a workbench (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
2. Remove the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2).
3. Remove the four screws that secure the driver side instrument panel duct and demister duct assembly (3) to the instrument panel and remove the duct assembly.
4. Remove the four screws that secure the passenger side instrument panel duct and demister duct assembly (4) to the instrument panel and remove the duct assembly.

## INSTALLATION

1. Position the passenger side instrument panel duct and demister duct assembly (4) into the instrument panel.
2. Install the passenger side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
3. Install the four screws that secure the passenger side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).
4. Position the driver side instrument panel duct and demister duct assembly (3) into the instrument panel.
5. Install the driver side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
6. Install the four screws that secure the driver side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N·m (20 in. lbs.).
7. Install the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2). Tighten the screw to 2.2 N·m (20 in. lbs.).
8. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

## FILTER-PARTICULATE AIR

### DESCRIPTION

Some models are equipped with a particulate air filter (1) that helps purify the outside air entering the HVAC housing. The filter is mounted in the engine compartment, inside of the fresh air inlet housing of the heating-A/C system.

The filter should be checked and replaced at least once every 24,000 km (15,000 miles) and checked if heating-A/C system performance seems lower than expected. The particulate air filter is labeled with "REAR OF VEHICLE" and an arrow (2) to indicate air flow direction through the filter.

## REMOVAL

1. Remove the air inlet grille (1) from the wiper module screen (2) located near the dash panel in the engine compartment.
2. Open the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5).

**Note:** To aid in reinstallation, note the installed position of the particulate air filter prior to removal of the filter.

3. Remove the particulate air filter (1) from the particulate air filter housing (2) located inside of the dash panel plenum (3). Note the direction of air flow indicated by an arrow (4) on the filter.

## INSTALLATION

**Note:** The particulate air filter is labeled with “REAR OF VEHICLE” and an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

1. Install the particulate air filter (1) into the particulate air filter housing (2) located inside of the dash panel plenum (3). Insert the particulate air filter down directly into the filter housing with the arrow (4) on the filter pointing to the rear of the vehicle. The particulate air filter is held in place by friction between the filter element and the filter housing, so no fasteners are required.

2. Close the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5).
3. Install the air inlet grille (1) onto the wiper module screen (2).

## HOUSING-HVAC

### DESCRIPTION

All models are equipped with a common HVAC housing assembly that combines A/C and heating capabilities into a single unit mounted within the passenger compartment. The HVAC housing assembly consists of three separate housings:

- **HVAC housing** — The HVAC housing (1) is mounted to the dash panel behind the instrument panel and contains the evaporator core and the blower motor resistor block or power model, depending on application. The HVAC housing consists of an upper and a lower housing that are attached together and has mounting provisions for the air inlet housing, blower motor, air distribution housing and the HVAC wire harness.
- **Air inlet housing** — The air inlet housing (2) is mounted to the right end of the HVAC housing and contains the recirculation-air door and actuator.
- **Air distribution housing** — The air distribution housing (3) is mounted to the rear of the HVAC housing and contains the heater core, blend-air door(s) and actuator(s), mode-air doors and actuator and door linkage.

812d60a4

The heating-A/C system is a blend-air type system. The blend-air doors control the amount of conditioned air that is allowed to flow through, or around, the heater core. The dual zone heating A/C system uses two blend door actuators while the single zone system uses only one blend door actuator.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. A temperature control determines the discharge air temperature by operating the blend door actuator(s), which moves the blend-air door(s). This allows an almost immediate control of the output air temperature of the system. The mode door actuator operates the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. The recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric door actuators are connected to the vehicle electrical system by the HVAC wire harness. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housings at the selected speed by use of the blower motor resistor block or power model, depending on application.

The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door. The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

### REMOVAL

#### AIR DISTRIBUTION HOUSING

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

1. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
2. Disconnect and isolate the negative battery cable.
3. Remove the instrument panel from the passenger compartment (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
4. Remove the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-DEFROSTER - REMOVAL).
5. Remove the floor console duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCT-FLOOR CONSOLE - REMOVAL).
6. Disconnect the HVAC wire harness (1) from the mode door actuator (2) and the blend door actuator (3) located on the driver side of the air distribution housing (4).
7. If equipped with dual zone heating-A/C, disconnect the HVAC wire harness from the blend door actuator (5) located on the passenger side of the air distribution housing.
8. Remove the two screws (1) that secure the flange (2) to the front of the HVAC housing (3).
9. Remove the flange and the heater core tubes (4) from the HVAC housing.

**Note:** Take proper precautions to protect the carpeting from spilled engine coolant. Have absorbent toweling readily available to clean up any spills.

10. Remove the two retaining clamps (1) that secure the heater core tubes (2) to the heater core (3).
11. Disconnect the heater core tubes from the heater core and remove and discard the O-ring seals.
12. Install plugs in, or tape over the opened heater core tubes and heater core ports.

13. Remove the two screws (1) that secure the air distribution housing (2) to the rear of the HVAC housing (3).
14. Tilt the top of the air distribution housing rearward to disconnect the distribution housing from the tab-and-slot type retainers located at the bottom of the housing.
15. Disconnect the air distribution housing from rear floor distribution ducts.
16. Remove the air distribution housing from the vehicle.
17. If required, disassemble the air distribution housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC ASSEMBLY - DISASSEMBLY).

## AIR INLET HOUSING

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Disconnect and isolate the negative battery cable.
2. Remove the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC ASSEMBLY - REMOVAL).
3. Disconnect the HVAC wire harness (1) from the recirculation door actuator (2).
4. Carefully cut the foam seal (3) along the parting line (4) of the air inlet housing (6). If the seal is deformed or damaged, it must be replaced.
5. Remove the five screws (5) that secure the air inlet housing to HVAC housing (7).
6. Remove the air inlet housing from the HVAC housing.
7. If required, disassemble the air inlet housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC ASSEMBLY - DISASSEMBLY).

## HVAC HOUSING ASSEMBLY

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
3. Disconnect and isolate the negative battery cable.
4. Remove the wiper module assembly from the dash panel (7) (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/MODULE-WIPER - REMOVAL).
5. Disconnect the A/C liquid line and the A/C suction line from the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - REMOVAL).
6. Disconnect the heater hoses from the heater core tubes.

7. Remove the two nuts (1) that secure the air inlet water separator (2) or particulate air filter (3) and housing (4) to the dash panel (depending on application).

8. Remove the fresh air inlet water separator or particulate air filter housing from the fresh air inlet housing (5) (depending on application).
9. Reach into the fresh air inlet housing and remove the nut (6) that secures the HVAC housing to the engine compartment side of the dash panel.
10. Remove the two nuts (8) that secure the HVAC housing to the engine compartment side of the dash panel.
11. Remove the instrument panel from the passenger compartment (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - REMOVAL).
12. Disconnect the floor console duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ DUCT-FLOOR CONSOLE - REMOVAL).
13. Disconnect the rear floor distribution ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR DISTRIBUTION - REMOVAL).
14. Remove the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/ DUCTS-DEFROSTER - REMOVAL).
15. Remove the two nuts (1) that secure the HVAC housing (2) to the passenger compartment side of the dash panel (5).
16. Pull the HVAC housing assembly rearward so that the mounting studs clear the dash panel.
17. Lift the HVAC housing assembly upwards so that the condensate drain tube clears the grommet (4) in the floor panel (3) and remove the HVAC housing assembly from the passenger compartment.
18. If required, disassemble the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC ASSEMBLY - DISASSEMBLY).

## DISASSEMBLY

### AIR DISTRIBUTION HOUSING

**Note:** The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

1. Remove the air distribution housing (1) from the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - REMOVAL).
2. Remove the screws (2) that secure the mode door actuator (4) and the blend door actuator (7) to the driver side of the air distribution housing and remove the actuators.
3. Remove the screws (5) that secure the blend door actuator mounting bracket (6) and the mode door actuator mounting bracket (3) to the driver side of the air distribution housing and remove the mounting brackets.

4. Remove the instrument panel door linkage (3) from the pivot shaft located on the driver side of the air distribution housing (8) and carefully disconnect the linkage rod (2) from the instrument panel door lever (1).
5. Remove the defrost/demister door linkage (7) from the pivot shaft on the air distribution housing and carefully disconnect the linkage rod (12) from the defrost/demister door lever (11).
6. Remove the mode door cam (6) from the air distribution housing.
7. Remove the floor door linkage (5) from the floor door lever (4) and the air distribution housing.
8. Remove the blend door cam (9) from the blend door lever (10) and the air distribution housing.

9. Remove the screw (1) that secures the heater core retaining bracket (2) to the driver side of the air distribution housing (3) and remove the bracket.
10. Carefully pull the heater core (4) out of the air distribution housing.

11. If equipped with dual zone heating-A/C, remove the screws (1) that secure the blend door actuator (2) to the passenger side of the air distribution housing (3) and remove the actuator.
12. Remove the screws (4) that secure the blend door actuator mounting bracket (5) to the passenger side of the air distribution housing and remove the mounting bracket.

13. If equipped with dual zone heating-A/C, remove the blend door cam (1) from blend door lever (2) and the pivot shaft located on the passenger side of the air distribution housing (3).

14. Remove the six screws (1) that secure the front floor distribution duct (2) to the bottom of the air distribution housing (3) and remove the duct.

15. Carefully cut the foam seal (1) along the parting line (2) of the two halves of the air distribution housing (3). If the seal is deformed or damaged, it must be replaced.
16. Remove the screws (4) that secure the two halves of the air distribution housing together.

17. Carefully separate the left half of the air distribution housing (1) from the right half of the housing (2).
18. Remove the center partition (3).

19. To remove the air doors (1) from the air distribution housing (2), first carefully push down on the tab (3) of the air door lever (4) located in the pivot shaft of the air door being removed.

**Note: If the seal on the air door is deformed or damaged, the air door must be replaced.**

20. Gently pull the air door lever out of the pivot shaft and remove the air door(s) from the air distribution housing as required.

## AIR INLET HOUSING

**Note: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

1. Remove the air inlet housing (1) from the HVAC housing and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR INLET HOUSING - REMOVAL)
2. Remove the three screws (2) that secure the recirculation door actuator (3) to the left side of the air inlet housing and remove the actuator.
3. Remove the recirculation-air door (4) from the air inlet housing.

## HVAC HOUSING

**Note:** The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

1. Remove the HVAC housing assembly and place it on a workbench (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION /HOUSING-HVAC - HVAC HOUSING ASSEMBLY - REMOVAL).
2. Remove the air distribution housing (3) from the HVAC housing (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - REMOVAL).
3. Remove the air inlet housing (2) from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR INLET HOUSING - REMOVAL).

4. Remove the two screws (1) that secure the flange (2) to the front of the HVAC housing (3).
5. Remove the flange and the heater core tubes (4) from the HVAC housing.

6. Disconnect the HVAC wiring harness (1) from the evaporator temperature sensor (2), blower motor resistor or power module (3) (depending on application) and the blower motor (4).
7. Disengage the two HVAC wire harness retainers (5) from the blower motor and remove the blower motor from the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/MOTOR-BLOWER - REMOVAL).
8. Remove the blower motor resistor or power module, depending on application (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - REMOVAL) or (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODULE-POWER-BLOWER MOTOR - REMOVAL).
9. Remove the evaporator temperature sensor (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/SENSOR-EVAPORATOR TEMPERATURE - REMOVAL).
10. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block located within the foam seal (3).
11. Remove the A/C expansion valve from the evaporator tube tapping block and foam seal.
12. Remove the O-ring seals from the evaporator tube fittings and discard.
13. Install plugs in, or tape over the opened evaporator tube fittings and all expansion valve ports.

14. Remove the HVAC wiring harness (1).
15. Remove the ten screws (2) that secure the upper half of the HVAC housing (3) to the lower half of the HVAC housing (4).
16. Separate the two halves of the HVAC housing.

17. Carefully lift the A/C evaporator (1) and foam seal (2) out of the lower half of the HVAC housing (3).
18. If required, remove the foam seal from the tapping block of the A/C evaporator. If the seal is deformed or damaged, it must be replaced.

## ASSEMBLY

### AIR DISTRIBUTION HOUSING

**Note:** The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

1. Install the air door(s) (1) into the air distribution housing (2) as required. Align the air door with the pivot shaft hole in the housing.
2. Align and install the air door lever (4) into the pivot shaft of the air door. Make sure that the tab (3) on the door lever is securely engaged to the pivot shaft.

3. Align the air door pivot shafts with the pivot holes in the center partition (3) and install the partition onto the left half of the air distribution housing (1).
4. Align the air door pivot shafts to each other and carefully install the left half of the air distribution housing to the right half of the housing (2).

5. Install the screws (4) that secure the two halves of the air distribution housing (3) together. Tighten the screws to 2.2 N·m (20 in. lbs.).
6. Inspect the foam seal (1), especially at the parting line (2). If the seal is deformed or damaged, it must be replaced.

7. Position the front floor distribution duct (2) onto the air distribution housing (3).
8. Install the six screws (1) that secure the front floor distribution duct to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).

9. If equipped with dual zone heating-A/C, install the blend door cam (1) onto the blend door lever (2) and the pivot shaft located on the passenger side of the air distribution housing (3).

10. If equipped with dual zone heating-A/C, position the blend door actuator mounting bracket (5) onto the passenger side of the air distribution housing (3).
11. Install the screws (4) that secure the blend door actuator mounting bracket to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
12. Position the blend door actuator (2) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door cam (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - INSTALLATION).
13. Install the screws (1) that secure the blend door actuator to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).

14. Carefully install the heater core (4) into the driver side of the HVAC air distribution housing (3).
15. Install heater core retaining bracket (2) onto the air distribution housing.
16. Install the screw (1) that secures the heater core retaining bracket onto the air distribution housing. Tighten the screw to 2.2 N·m (20 in. lbs.).

17. Install the blend door cam (9) onto the blend door lever (10) and the pivot shaft located on the driver side of the air distribution housing (8).
18. Install the floor door linkage (5) onto the floor door lever (4) and the pivot shaft on air distribution housing.

**Note:** Align the guide pin on the floor door linkage with the guides on the mode door cam during installation of the floor door linkage.

19. Install the mode door cam (6) onto the pivot shaft on air distribution housing.
20. Connect the defrost/demister door linkage rod (12) onto the defrost/demister door lever (11).

**Note:** Align the guide pin on the defrost/demister linkage with the guides on the mode door cam during installation of the defrost/demister linkage.

21. Install the defrost/demister linkage (7) onto the pivot shaft on air distribution housing.
22. Connect the instrument panel door linkage rod (2) onto the instrument panel door lever (1).

**Note:** Align the guide pin on the instrument panel linkage with the guides on the mode door cam during installation of the instrument panel linkage.

23. Install the instrument panel linkage (3) onto the pivot shaft on air distribution housing.

24. Position the blend door actuator mounting bracket (6) and the mode door actuator mounting bracket (3) onto the driver side of the air distribution housing (1).
25. Install the screws (5) that secure the mounting brackets to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
26. Position the blend door actuator (7) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door cam (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - INSTALLATION).
27. Position the mode door actuator (4) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the mode door cam (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-MODE DOOR - INSTALLATION).
28. Install the screws (2) that secure the blend door actuator to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
29. Position the mode door actuator mounting bracket (6) onto the driver side of the air distribution housing (1).
30. Install the screws that secure the blend door actuator mounting bracket to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
31. Position the blend door actuator (7) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend-air door linkage (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - INSTALLATION).
32. Install the screws (2) that secure the blend door and mode door actuators to the air distribution housing. Tighten the screws to 2 N·m (17 in. lbs.).
33. Install the air distribution housing onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - INSTALLATION).

## AIR INLET HOUSING

**Note:** The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Position the recirculation-air door (4) into the air inlet housing (1).

**CAUTION:** Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the air inlet housing.

2. Install the recirculation door actuator (3) onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the recirculation door pivot shaft (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-RECIRCULATION DOOR - INSTALLATION).
3. Install the three screws (2) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 2 N·m (17 in. lbs.).

4. Install the air inlet housing onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HVAC HOUSING - INSTALLATION).

## HVAC HOUSING

1. If removed, install the foam seal (2) over the tapping block of the A/C evaporator (1). If the seal is deformed or damaged, it must be replaced.
2. Install the A/C evaporator into the lower half of the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.

3. Install the upper half of the HVAC housing (3) onto the lower half of the HVAC housing (4).
4. Install the screws (2) that secure the two halves of the HVAC housing together. Tighten the screws to 2.2 N·m (20 in lbs.).
5. Install the HVAC wiring harness (1). Make sure the harness is routed through all wiring retainers.

6. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
7. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C expansion valve (2) onto the evaporator tube tapping block located within the foam seal (3).
9. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).

10. Install the evaporator temperature sensor (2) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS - FRONT/EVAPORATOR TEMPERATURE SENSOR - INSTALLATION).
11. Install the blower motor resistor or power module (3), depending on application (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/RESISTOR-BLOWER MOTOR - INSTALLATION) or (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/MODULE-POWER-BLOWER MOTOR - INSTALLATION).
12. Install the blower motor (4) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/MOTOR-BLOWER - INSTALLATION).
13. Connect the HVAC wire harness (1) to the evaporator temperature sensor, blower motor resistor or power module (depending on application) and the blower motor.
14. Install the two HVAC wire harness retainers (5) onto the blower motor.
15. Install the heater core tubes (4) and the flange (2) to the front of the HVAC housing (3).
16. Install the two screws (1) that secure the flange to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

17. Install the air inlet housing (2) onto the HVAC housing (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR INLET HOUSING - INSTALLATION).
18. Install the air distribution housing (3) onto the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - AIR DISTRIBUTION HOUSING - INSTALLATION).
19. Install the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - HVAC HOUSING ASSEMBLY - INSTALLATION).

## INSTALLATION

### AIR DISTRIBUTION HOUSING

**Note:** The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

1. Position the air distribution housing (1) into the vehicle.
2. Install the air distribution housing onto the rear of the HVAC housing (2) by inserting the tabs on the bottom of the distribution housing into the slots located on the bottom of the HVAC housing and tipping the distribution housing forward until it is properly aligned with the HVAC housing.
3. Connect the floor distribution ducts to the air distribution housing.
4. Install the screws (3) that secure the air distribution housing to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

5. Remove the tape or plugs from the heater core tubes and heater core ports.
6. Lubricate new rubber O-ring seals with clean engine coolant and install them onto the heater core tube fittings. Use only the specified O-ring as they are made of a special material for the engine cooling system.
7. Install the heater core tubes (2) onto the heater core (3).
8. Install the two retaining clamps (1) that secure the heater core tubes to the heater core. Make sure that the clamps are installed correctly and securely.

9. Install the heater core tubes (4) and the flange (2) to the front of the HVAC housing (3).
10. Install the two screws (1) that secure the flange to the HVAC housing. Tighten the screws to 2.2 N-m (20 in. lbs.).

11. Connect the HVAC wire harness (1) to the mode door actuator (2) and the blend door actuator (3) located on the driver side of the air distribution housing (4).
12. If equipped with dual zone heating-A/C, connect the HVAC wire harness to the blend door actuator (5) located on the passenger side of the air distribution housing.
13. Install the floor console duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-FLOOR CONSOLE - INSTALLATION).
14. Install the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-DEFROSTER - INSTALLATION).
15. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).
16. Reconnect the negative battery cable.

17. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

## AIR INLET HOUSING

**Note:** The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

1. Position the air inlet housing (6) onto the HVAC housing (7).

**CAUTION:** Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the top of the HVAC housing.

2. Install the five screws (5) that secure the air inlet housing to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
3. Inspect the foam seal (3). If the seal is deformed or damaged, it must be replaced.
4. Connect the HVAC wire harness (1) to the recirculation door actuator (2).
5. Install the HVAC housing assembly (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC ASSEMBLY - INSTALLATION)
6. Reconnect the negative battery cable.

## HVAC HOUSING ASSEMBLY

**Note:** The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

1. Position the HVAC housing assembly (2) into the passenger compartment with the mounting studs in their proper locations in the dash panel (5) and the condensate drain tube into the grommet (4) on the floor panel (3).
2. Install the two nuts (1) that secure the HVAC housing to the passenger compartment side of the dash panel. Tighten the nuts to 3 N·m (26 in. lbs.).
3. Install the defroster ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/DUCTS-DEFROSTER - INSTALLATION).
4. Connect the floor distribution ducts (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION - FRONT/DUCTS-FLOOR DISTRIBUTION - INSTALLATION).
5. Connect the floor console duct (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/FLOOR CONSOLE DUCTS - INSTALLATION).
6. Install the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL ASSEMBLY - INSTALLATION).

7. Install the two nuts (8) that secure the HVAC housing to the engine compartment side of the dash panel (7). Tighten the nuts to 7 N·m (62 in. lbs.).
8. Reach into the fresh air inlet housing (5) and install the nut (6) that secures the HVAC housing to the engine compartment side of the dash panel. Tighten the nut to 7 N·m (62 in. lbs.).

**Note:** Make sure to install the lead-in on the bottom edge of the water separator or the filter housing (depending on application) into the slot located at the bottom of the fresh air inlet housing.

9. Install the fresh air inlet water separator (2) or particulate air filter housing (4) and filter (3) (depending on application) into the fresh air inlet housing.
10. Install the two nuts (1) that secure the fresh air inlet water separator or particulate air filter housing to the dash panel (depending on application). Tighten the nuts to 7 N·m (62 in. lbs.).
11. Connect the heater hoses to the heater core tubes.
12. Connect the A/C suction line and A/C liquid line to the A/C evaporator (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING /LINE-A/C LIQUID - INSTALLATION).
13. Install the wiper module assembly onto the dash panel (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).
14. Reconnect the negative battery cable.
15. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).
16. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
17. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## MOTOR-BLOWER

### DESCRIPTION

The blower motor (1) is a 12-volt, direct current (DC) motor mounted within a plastic housing with an integral wire harness connector (2) and squirrel cage-type blower wheel (3) that is secured to the blower motor shaft (4). The blower motor wheel is located in the HVAC air inlet housing which is mounted to the passenger side end of the HVAC housing. The blower motor can be accessed for service from underneath the instrument panel.

## OPERATION

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed or, in the ATC system, at the selected or programmed speed.

On models equipped with the manual temperature control (MTC) heating-A/C system, the blower motor will operate whenever the ignition switch is in the On position and the blower motor control in any position except Off. On models equipped with the automatic temperature control (ATC) system, the blower motor will operate whenever the ignition switch is in the On position and the A/C-heater control power is turned on.

Blower motor speed for the MTC system is controlled by regulating the path to ground through the blower motor resistor and through the blower motor control located within the A/C-heater control.

For the ATC system, blower motor speed is controlled by the blower motor power module which provides the blower motor with power and a path to ground. The blower motor power module also sends a blower control signal to the A/C-heater control. Using input from the blower motor control (manual mode ) or sensor data (automatic mode), the A/C-heater control processes the blower control signal from the power module and sets the speed at which the blower motor will run.

The blower motor and blower motor wheel are factory balanced and cannot be adjusted or repaired. If faulty or damaged, the blower motor and blower wheel must be replaced as an assembly.

## DIAGNOSIS AND TESTING

### MOTOR-BLOWER

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

**Note:** For circuit descriptions and diagrams, refer to Air Conditioning/Heater in Group 8W - Wiring Diagrams.

### OPERATION

Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor resistor or power module (depending on application)
- Faulty blower motor switch
- Faulty mode control switch
- Faulty blower motor
- Faulty blower motor circuit wiring or wire harness connectors

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor resistor or power module (depending on application)
- Faulty blower motor switch
- Faulty blower motor
- Faulty blower motor circuit wiring or wire harness connectors

### VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Deformed blower wheel

- Out of balance blower wheel due to foreign material in the wheel
- Faulty blower motor

## NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material in the HVAC air inlet housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Faulty blower motor

## REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the passenger side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL)
3. Disengage the wire harness connector locking tab and disconnect the wire harness connector (1) and wire harness retainers from the blower motor (2).
4. Remove the four screws (3) that secure the blower motor to the HVAC housing (4).
5. Remove the blower motor from the HVAC housing.

## INSTALLATION

1. Position the blower motor (2) into the HVAC housing (4).
2. Install the four screws (3) that secure the blower motor to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor and engage the wire harness connector locking tab.
4. Install the HVAC wire harness retainers onto the blower motor.
5. Install the instrument panel silencer onto the passenger side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION)
6. Reconnect the negative battery cable.

## OUTLETS-AIR

### DESCRIPTION

#### CHRYSLER

There are two defroster air outlets (1) in the defroster grille (2) located on the top of the instrument panel (3). The airflow from the defroster outlets is directed by fixed vanes in the defroster grille and cannot be adjusted. The defroster air outlets are not serviceable from the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).

There are two side window demister air outlets (4). One located on each end of the instrument panel top cover. The airflow from the side window demister air outlets is directed by fixed vanes in the outlets and cannot be adjusted. The side window demister air outlets are only serviced with the outboard instrument panel air outlets.

There are four instrument panel air outlets (5). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and two air outlets are located at the top of the instrument panel center bezel. Each of the instrument panel air outlets contain a non-serviceable grille with movable vanes (6) that are used to direct or shut off the flow of the conditioned air leaving the instrument panel outlets. Only the outboard instrument panel air outlets can be serviced separately. For service of the other instrument panel air outlets, refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL.

## DODGE

There are two defroster air outlets (1) in the defroster grille (2) located on the top of the instrument panel (3). The airflow from the defroster outlets is directed by fixed vanes in the defroster grille and cannot be adjusted. The defroster air outlets are not serviceable from the defroster grille (Refer to 23 - BODY/INSTRUMENT PANEL/DEFROSTER GRILLE - REMOVAL).

There are two side window demister air outlets (4). One located on each end of the instrument panel top cover. The airflow from the side window demister air outlets is directed by fixed vanes in the outlets and cannot be adjusted. The side window demister air outlets are not serviceable from the instrument panel top pad (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL TOP PAD - REMOVAL).

There are four instrument panel air outlets (5). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and two air outlets are located at the top of the instrument panel center bezel. Each of the instrument panel air outlets contain a replaceable grille with movable vanes (6) that are used to direct or shut off the flow of the conditioned air leaving the instrument panel outlets. Only the passenger side outboard instrument panel air outlet can be serviced separately. For service of the other instrument panel air outlets, refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL and 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL.

## REMOVAL

### AIR OUTLET - CHRYSLER

**Note:** Only the outboard instrument panel air outlets can be serviced separately. For service of the other instrument panel air outlets refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL.

1. Using a trim stick or another suitable wide flat-bladed tool (1), gently pry on both sides of the outboard instrument panel air outlet(s) (2) until the air outlet snap clip retainers are released from the face of the instrument panel (3).
2. Gently slide the air outlet(s) rearward to release the top of the outlet (demister outlet) from the instrument panel.

## AIR OUTLET - DODGE

**Note:** Only the outboard passenger side instrument panel air outlet can be serviced separately. For service of the other instrument panel air outlets refer to 23 - BODY/INSTRUMENT PANEL/CLUSTER BEZEL - REMOVAL and to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL CENTER BEZEL - REMOVAL.

1. Rotate the top of the outboard passenger side air outlet barrel (1) downwards.

2. Gently pull out on the bottom edge of the air outlet (1) to release the snap clip retainers that secure the outlet to the instrument panel (2).
3. Remove the air outlet from the instrument panel.

## AIR OUTLET BARRELS - DODGE

**Note:** The instrument panel air outlet barrels are retained to the pivots within the air outlets by a snap fit.

1. Using a trim stick or another suitable wide flat-bladed tool (1), gently pry the air outlet barrel(s) (2) out of the instrument panel air outlet(s) (3) as required.

## INSTALLATION

### AIR OUTLET - CHRYSLER

1. Position the outboard air outlet (1) into its location on the instrument panel (2).

**Note:** Make sure that the air outlet is properly aligned to the duct within the instrument panel opening and that the foam seal on the outlet is properly installed.

2. Align the air outlet foam seal (3) with the duct in the instrument panel (4) and slide the top portion of the air outlet into the instrument panel top pad. Gently push on the sides of the air outlet until the snap clip retainers on the outlet are fully engaged to the instrument panel.

## AIR OUTLET - DODGE

1. Position the air outlet (1) into it's location on the outboard passenger side of the instrument panel (2).

**Note:** Make sure that the air outlet is properly aligned to the duct within the instrument panel opening and that the foam seal on the outlet is properly installed.

2. Align the air outlet foam seal (3) with the duct in the instrument panel (4) and gently push on the air outlet until the snap clip retainers on the outlet are fully engaged to the instrument panel.

## AIR OUTLET BARRELS - DODGE

1. Install the air outlet barrel (1) onto the pivot shaft (2) on the right side of the instrument panel air outlet (3).

2. Gently push the air outlet barrel (1) onto the pivot shaft (2) on the left side of the instrument panel air outlet (3).

## PLUMBING

### DESCRIPTION

**CAUTION:** The system must be completely empty before opening any fitting or connection in the refrigeration system. Open fittings with caution even after the system has been emptied. If any pressure is noticed as a fitting is loosened, retighten fitting and evacuate the system again.

The use of correct wrenches when making connections is very important. Improper wrenches or improper use of wrenches can damage the fittings.

The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a refrigerant line or hose, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

When opening a refrigeration system, have everything you will need to repair the system ready to minimize the amount of time the system is opened. Cap or plug all refrigerant line fittings as soon as they are opened. This will help prevent the entrance of dirt and moisture. All new lines and components should be capped or sealed until they are ready to be used. Before connecting a refrigerant line or hose, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.

All tools, including the refrigerant dispensing manifold, manifold gauge set and test hoses should be kept clean and dry.

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a system on this vehicle consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant lines are made from lightweight aluminum or steel, and commonly use braze-less fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant in the system. The radius of all bends in the flexible hose refrigerant lines should be at least ten times the diameter of the hose and the refrigerant lines should be routed so they are at least 80 millimeters (3 inches) away from the exhaust manifold(s) and exhaust pipe(s).

### OPERATION

High pressures are produced in the refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled to other A/C system components with block-type fittings. A flat steel gasket with an integral O-ring (dual plane seal) is used to mate the refrigerant line fittings with A/C system components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

## WARNING

### ENGINE COOLING SYSTEM

**WARNING:** The engine cooling system is designed to develop internal pressures of 97 to 123 kilopascals (14 to 18 pounds per square inch). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

### A/C SYSTEM

**WARNING:** The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Severe personal injury or death may result from improper service procedures. Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the air conditioning refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately. Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended.

If accidental system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and death.

The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage, personal injury or death.

### CAUTION - A/C SYSTEM

**CAUTION:** Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.

Never add R-12 to a refrigerant system designed to use R-134a and do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.

R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible and damage to the system will result.

Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause noise and system failure.

Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.

Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

Keep service tools and the work area clean. Contamination of the refrigerant system must be avoided.

**CAUTION:** The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/re-charging equipment and/or A/C systems.

Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. DaimlerChrysler recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes.

Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

## DIAGNOSIS AND TESTING

### REFRIGERANT SYSTEM LEAKS

**WARNING:** R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage, personal injury or death.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

If the A/C system is not cooling properly, determine if the refrigerant system is fully charged with R-134a. This is accomplished by performing a system Charge Level-Check or Fill. If while performing this test A/C liquid line pressure is less than 345 kPa (50 psi) proceed to System Empty procedure. If liquid line pressure is greater than 345 kPa (50 psi) proceed to System Low procedure. If the refrigerant system is empty or low in refrigerant charge, a leak at any line fitting or component seal is likely. A review of the fittings, lines and components for oily residue is an indication of the leak location. To detect a leak in the refrigerant system, perform one of the following procedures as indicated by the symptoms.

#### SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately 28 in Hg.). Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to Step 2.
2. Prepare a 0.284 Kg. (10 oz.) refrigerant charge to be injected into the refrigerant system.
3. Connect and dispense 0.284 Kg. (10 oz.) of refrigerant into the evacuated refrigerant system.
4. Proceed to Step 2 of System Low procedure.

#### SYSTEM LOW

1. Determine if there is any R-134a refrigerant in the system.
2. Position the vehicle in a wind free work area. This will aid in detecting small leaks.
3. Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run for five minutes with the A/C system set to the following:
  - Transmission in Park or Neutral with parking brake set
  - Engine idling
  - Mode control set to the outside air position
  - Blower control set to the high speed position
  - A/C set to the ON position
  - All windows open

**CAUTION:** A leak detector only designed for R-12 refrigerant will not detect leaks in a R-134a refrigerant system.

4. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only DaimlerChrysler approved refrigerant dye.

## STANDARD PROCEDURE

### REFRIGERANT SYSTEM SERVICE EQUIPMENT

**WARNING:** Eye protection must be worn when servicing an A/C refrigerant system. Turn all valves off (rotate clockwise) on the equipment being used before connecting or disconnecting service equipment from the refrigerant system. Failure to observe these warnings may result in personal injury or death.

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

When servicing the A/C system, a R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 must be used (1). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

### MANIFOLD GAUGE SET CONNECTIONS

**CAUTION:** Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

**RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE** – The center manifold hose (Yellow, or White, with Black stripe) (3) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

**HIGH PRESSURE GAUGE HOSE** – The high pressure hose (Red with Black stripe) (4) attaches to the high side service port. This service port is located on the A/C liquid line next to the left shock tower. On this model, an A/C pressure transducer is also installed on the liquid line. A/C high-side pressures can be read using a scan tool. Refer to 9 - Engine Electrical Diagnostics for more information.

**LOW PRESSURE GAUGE HOSE** – The low pressure hose (Blue with Black stripe) (5) attaches to the low side service port. This service port is located on the A/C suction line behind the left shock tower.

## REFRIGERANT SYSTEM RECOVERY

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION). Failure to follow the warnings and cautions could result in possible personal injury or death.

An R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2210 must be used to recover the refrigerant from the R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

## REFRIGERANT SYSTEM EVACUATE

**Note:** Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time. It is recommended that the refrigerant oil be drained and replaced with new oil or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. To evacuate the refrigerant system:

**Note:** When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM SERVICE EQUIPMENT).
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads -88 kPa (- 26 in. Hg) vacuum or greater for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach

specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.

4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## REFRIGERANT SYSTEM CHARGE

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** Always refer to the underhood HVAC Specification Label for the refrigerant fill specification of the vehicle being serviced.

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system. For the proper amount of the refrigerant charge, refer to the underhood HVAC Specification Label.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

## CHARGING PROCEDURE

**CAUTION:** A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
2. A manifold gauge set and an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2210 should be connected to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a steady high idle (about 1400 rpm). If the A/C compressor does not engage, test the compressor clutch control circuit and repair as required.
7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.

**WARNING:** Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning could result in possible personal injury or death.

8. Disconnect the charging station and manifold gauge set from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

## COMPRESSOR-A/C

### DESCRIPTION

#### A/C COMPRESSOR

The A/C system uses a Denso 10S17C ten cylinder, double-acting swash plate-type A/C compressor (1). This A/C compressor has a fixed displacement of 170 cubic centimeters (10.374 cubic inches), and has both the suction and discharge ports (2) located on the cylinder head (3) at the rear of the compressor.

A label identifying the use of R-134a refrigerant is located on the A/C compressor.

812c0f81

#### HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head, which is at the rear of the A/C compressor. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components, caused by condenser air flow restriction or an overcharge of refrigerant.

### OPERATION

#### A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

The A/C compressor cannot be repaired. If faulty or damaged, the A/C compressor assembly must be replaced. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service.

#### HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

## DIAGNOSIS AND TESTING

### A/C COMPRESSOR

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/CLUTCH-A/C COMPRESSOR - INSTALLATION).
3. To duplicate a high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - DESCRIPTION - REFRIGERANT LINES)
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY), (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE). If the high pressure relief valve still does not seat properly, replace the A/C compressor (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/COMPRESSOR-A/C - REMOVAL).

## REMOVAL

### 2.7L ENGINE

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil, engine, engine cylinder head or the generator.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
5. Disconnect the wire harness connector from the A/C compressor clutch coil connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.
9. Raise and support the vehicle.
10. Remove the front end splash shield (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).
11. Remove the bolts (1 and 2) that secure the automatic transmission cooler line bracket (3) and the A/C compressor (4) to the cylinder block (5).
12. Position the cooler lines out of the way and remove the A/C compressor from the engine compartment.

### 3.5L ENGINE

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil, engine, engine cylinder head or the generator.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
5. Disconnect the wire harness connector from the A/C compressor clutch coil connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.
9. Raise and support the vehicle.
10. Remove the front end splash shield (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).
11. Remove the bolts (1 and 2) that secure the automatic transmission cooler line bracket (3) and the A/C compressor (4) to the cylinder block (5).
12. Position the cooler lines out of the way and remove the A/C compressor from the engine compartment.

## 5.7L ENGINE

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil, engine, engine cylinder head or the generator.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - REMOVAL).
5. Disconnect the wire harness connector from the A/C compressor clutch coil connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.
9. Raise and support the vehicle.
10. Remove the front end splash shield (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).
11. Remove the bolts (1) that secure the automatic transmission cooler line bracket (2) and the A/C compressor (3) to the cylinder block (4).
12. Position the cooler lines out of the way and remove the A/C compressor from the engine compartment.

## INSTALLATION

### 2.7L ENGINE

**Note:** Be certain to check the refrigerant oil level if the A/C compressor is being replaced. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the A/C compressor (4) into the engine compartment.
2. Install the bolts (1 and 2) that secure the A/C compressor and the automatic transmission cooler line bracket (3) to the cylinder block (5). Tighten the bolts to 55 N·m (41 ft. lbs.).
3. Install the front end splash shields (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).
4. Lower the vehicle.

5. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
6. Lubricate the new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the suction and discharge lines onto the A/C compressor (5).
8. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N·m (17 ft. lbs.).
9. Connect the wire harness connector to the A/C compressor clutch coil connector (1).
10. Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).

11. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

### 3.5L ENGINE

**Note:** Be certain to check the refrigerant oil level if the A/C compressor is being replaced. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the A/C compressor (4) into the engine compartment.
2. Install the bolts (1 and 2) that secure the A/C compressor and the automatic transmission cooler line bracket (3) to the cylinder block (5). Tighten the bolts to 55 N·m (41 ft. lbs.).
3. Install the front end splash shields (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).
4. Lower the vehicle.

5. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
6. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the suction and discharge lines onto the A/C compressor (5).
8. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N·m (17 ft. lbs.).
9. Connect the wire harness connector to the A/C compressor clutch coil connector (1).
10. Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).
11. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## 5.7L ENGINE

**Note:** Be certain to check the refrigerant oil level if the A/C compressor is being replaced. See Refrigerant Oil Level in this group for the procedures. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the A/C compressor (3) into the engine compartment.
2. Install the bolts (1) that secure the A/C compressor and the automatic transmission cooler line bracket (2) to the cylinder block (4). Tighten the bolts to 55 N·m (41 ft. lbs.).
3. Install the front end splash shields (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).
4. Lower the vehicle.

5. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
6. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Install the suction and discharge lines onto the A/C compressor (5).
8. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N·m (17 ft. lbs.).
9. Connect the wire harness connector to the A/C compressor clutch coil connector (1).
10. Install the serpentine drive belt (Refer to 7 - COOLING/ACCESSORY DRIVE/BELTS-DRIVE - INSTALLATION).

11. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
12. Reconnect the negative battery cable.
13. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
14. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## CONDENSER-A/C

### DESCRIPTION

The A/C condenser (1) is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with an integral automatic transmission cooler (2), a tapping block (3) for the receiver/drier (4) and mounting provisions for the power steering cooler (5).

### OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

The A/C condenser cannot be repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the front fascia (Refer to 23 - BODY/EXTERIOR/FRONT FASCIA - REMOVAL).
4. Disconnect the automatic transmission cooler lines (1) from the left end of the A/C condenser (5) (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING).
5. Install plugs in, or tape over the automatic transmission cooler line fittings and the cooler ports.
6. Disconnect the A/C discharge line (2) and the A/C liquid line (4) from A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - REMOVAL) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C DISCHARGE - REMOVAL).
7. Position the power steering fluid cooler (7) out of the way (Refer to 19 - STEERING/PUMP/FLUID COOLER - REMOVAL).
8. Remove the receiver/drier (6) from the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/RECEIVER/DRIER - REMOVAL).
9. Remove the four bolts (3) that secure A/C condenser to the radiator (8).
10. Carefully tilt the bottom of the A/C condenser forward and lower the condenser out of the vehicle.
11. If required, place the A/C condenser onto a workbench and remove the power steering cooler brackets.

## INSTALLATION

**Note:** If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. If required, install the power steering cooler brackets onto the A/C condenser.
2. Carefully position the A/C condenser (5) onto the radiator (8).
3. Install the four bolts (3) that secure the A/C condenser to the radiator. Tighten the bolts to 5 N·m (45 in. lbs.).
4. Install the receiver/drier (6) onto the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/RECEIVER / DRIER - INSTALLATION).
5. Install the power steering fluid cooler (7) onto the A/C condenser (Refer to 19 - STEERING/PUMP/FLUID COOLER - INSTALLATION).
6. Connect the A/C discharge line (2) and the A/C liquid line (4) onto the A/C condenser (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C DISCHARGE - INSTALLATION) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING/LINE-A/C LIQUID - INSTALLATION).
7. Remove the tape or plugs from the automatic transmission cooler lines (1) and the cooler ports.

8. Connect the automatic transmission cooler lines to the cooler ports at the top of the A/C condenser (Refer to 7 - COOLING/TRANSMISSION - STANDARD PROCEDURE - TRANSMISSION COOLER LINE QUICK CONNECT FITTING).
9. Install the front fascia (Refer to 23 - BODY/EXTERIOR/FRONT FASCIA - INSTALLATION).
10. Reconnect the negative battery cable.
11. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
12. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).
13. Check the automatic transmission fluid level (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC/FLUID AND FILTER - STANDARD PROCEDURE - CHECK OIL LEVEL). Fill as required (Refer to 21 - TRANSMISSION/TRANSAXLE/AUTOMATIC /FLUID AND FILTER - STANDARD PROCEDURE - TRANSMISSION FILL).

## CORE-HEATER

### DESCRIPTION

The heater core (1) is mounted into the driver side of HVAC air distribution housing (2), located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes and fins and is secured to the air distribution housing by a plastic retaining bracket (3). The heater core tubes (4) are attached to the side of the heater core and are secured to the HVAC housing by a removable flange (5).

The heater core can be serviced in the vehicle without removing the HVAC housing assembly.

### OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door(s) allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

**WARNING:** On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

1. Drain the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM DRAIN).
2. Disconnect and isolate the negative battery cable.
3. Carefully disconnect the heater hoses from the heater core tubes (7).
4. Remove the instrument panel silencer from the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - REMOVAL).
5. Remove the blend door actuator (1) from the driver side of the HVAC air distribution housing (2) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - REMOVAL).
6. Remove the two screws (9) that secure the flange (8) to the front of the HVAC housing (10) near the dash panel.
7. Remove the flange from the HVAC housing.

812cb6c7

**Note:** Take proper precautions to protect the carpeting from spilled engine coolant. Have absorbent towel- ing readily available to clean up any spills.

8. Remove the retaining clamps (3) that secure the heater core tubes to the heater core (5).
9. Disconnect the heater core tubes from the heater core and remove and discard the O-ring seals.
10. Carefully pull the heater core tubes through the dash panel.
11. Install plugs in, or tape over the opened heater core ports.
12. Remove the screw (6) that secures the heater core retaining bracket (4) to the driver side of the HVAC air distribution housing (2).
13. Remove the heater core retaining bracket from the air distribution housing.
14. Carefully pull the heater core out of the air distribution housing.

## INSTALLATION

1. Carefully install the heater core (5) into the driver side of the HVAC air distribution housing (2).
2. Install heater core retaining bracket (4) onto the air distribution housing.
3. Install the screw (6) that secures the heater core retaining bracket onto the air distribution housing. Tighten the screw to 2.2 N·m (20 in. lbs.).
4. Remove the tape or plugs from the heater core ports.
5. Lubricate new rubber O-ring seals with clean engine coolant and install them onto the heater core tube fittings. Use only the specified O-ring as they are made of a special material for the engine cooling system.
6. Install the heater core tubes (7) through the dash panel and onto the heater core.
7. Install the two retaining clamps (3) that secure the heater core tubes to the heater core. Make sure that the clamps are installed correctly and securely.
8. Install the flange (8) over the heater core tubes and onto the HVAC housing (10) near the dash panel.
9. Install the two screws (9) that secure the flange to the HVAC housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

812cb6c7

10. Install the blend door actuator (1) to the driver side of the air distribution housing (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/ACTUATOR-BLEND DOOR - INSTALLATION).
11. Install the instrument panel silencer onto the driver side of the instrument panel (Refer to 23 - BODY/INSTRUMENT PANEL/INSTRUMENT PANEL SILENCER - INSTALLATION).
12. Connect the heater hoses to the heater core tubes.
13. Connect the negative battery cable.
14. Refill the engine cooling system (Refer to 7 - COOLING - STANDARD PROCEDURE - COOLING SYSTEM REFILL).

## CORE-VALVE-SERVICE PORT

### DESCRIPTION

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The high side service port (1) is located on the liquid line (2) near the left shock tower (3). The low side service port (4) is located on the suction line (5) near the left shock tower. Both the high side and low side A/C service port valve cores are serviceable.

**Note:** The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap (6) installed over it from the factory. The service port caps are serviceable items.

812cc5d4

### REMOVAL

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note: Typical A/C service port shown.**

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in or tape over the opened service port(s).

## INSTALLATION

**Note: Typical A/C service port shown.**

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

**CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adaptors.**

3. Using a Schrader-type valve core tool, install and tighten the valve core into the service port(s).
4. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
5. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

**Note: The protective cap helps aid in service port sealing and helps protects the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.**

6. Install the protective cap (1) onto the service port.

## EVAPORATOR-A/C

### DESCRIPTION

The A/C evaporator (1) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator and its insulator (2) are positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (3) are connected and sealed to the A/C expansion valve by use of rubber O-rings (4) a tapping block (5).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

### OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

The A/C evaporator cannot be repaired and, if faulty or damaged, it must be replaced.

### REMOVAL

1. Remove the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - REMOVAL).
2. Disassemble the HVAC housing as necessary to access the A/C evaporator (1) (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - DISASSEMBLY).
3. Carefully lift the A/C evaporator and the foam seal (2) out of the lower half of the HVAC housing (3).
4. If required, remove the foam seal from the tapping block of the A/C evaporator. If the seal is deformed or damaged, it must be replaced.

## INSTALLATION

**Note:** If the front A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. If removed, install the foam seal (2) over the tapping block of the A/C evaporator (1). If the seal is deformed or damaged, it must be replaced.
2. Install the A/C evaporator into the lower half of the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.
3. Assemble the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - ASSEMBLY).
4. Install the HVAC housing (Refer to 24 - HEATING & AIR CONDITIONING/DISTRIBUTION/HOUSING-HVAC - INSTALLATION).

## LINE-A/C DISCHARGE

### DESCRIPTION

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser (2).

**CAUTION:** Use only seals specified for the vehicle. Failure to use the correct seals will cause the refrigerant system connections to leak.

The A/C discharge line has no serviceable parts except for the dual plane seals. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C discharge line is removed and installed.

If the A/C discharge line is found to be leaking or is damaged, it must be replaced.

## REMOVAL

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Reach through the headlamp opening in the upper radiator support and remove the nut (1) that secures the A/C discharge line (2) to the A/C condenser (5).
5. Disconnect the A/C discharge line from the A/C condenser and remove and discard the dual plane seal.
6. Install plugs in, or tape over the discharge line fitting and condenser inlet port.
7. Remove the nut (2) that secures the A/C discharge line (4) to the A/C compressor (5).
8. Disconnect the A/C discharge line from the A/C compressor and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened refrigerant line fitting and the compressor port.
10. Remove the A/C discharge line from the engine compartment.

## INSTALLATION

1. Position the A/C discharge line (2) into the engine compartment.
2. Remove the tape or plugs from the opened discharge line fitting and the inlet port on the A/C condenser (5).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C discharge line onto the A/C condenser.
5. Reach through the headlamp opening in the upper radiator support and install the nut (1) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 22 N·m (16 ft. lbs.).

6. Remove the tape or plugs from the opened fitting on the A/C discharge line (4) and the outlet port on the A/C compressor (5).
7. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C discharge line onto the A/C compressor.
9. Install the nut (2) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 23 N·m (17 ft. lbs.).

10. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## LINE-A/C LIQUID

### DESCRIPTION

The A/C liquid line is the refrigerant line that carries refrigerant from the A/C condenser to the A/C evaporator. The A/C liquid line is serviced in two sections. The front section of the liquid line (1) connects to the rear section of the liquid line (5) with a nut (2) and includes the high side service port (8). The rear section of the A/C liquid line includes the fitting for the A/C pressure transducer (6) and a mounting bracket (7) and is secured to the A/C expansion valve by a tapping plate (4). The rear section of the A/C liquid line is serviced as an assembly with the rear section of the A/C suction line (3).

**CAUTION:** Use only seals specified for the vehicle. Failure to use the correct seals will cause the refrigerant system connections to leak.

The A/C liquid line has no serviceable parts except for the dual plane seals, high-side service port valve and its protective cap. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C liquid line is removed and installed.

If either section of the A/C liquid line is found to be leaking or damaged, it must be replaced.

### REMOVAL

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** The A/C liquid line is serviced in two sections. The rear section of the liquid line is serviced as an assembly with the rear section of the A/C suction line.

## FRONT SECTION

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Raise and support the vehicle.
5. Remove the front end splash shields (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - REMOVAL).
6. Remove the nut (3) that secures the front section of the A/C liquid line (4) to the A/C condenser (5).
7. Disconnect the A/C liquid line from the A/C condenser and remove and discard the dual plane seal.
8. Install plugs in, or tape over the opened liquid line fitting and condenser outlet port.
9. Lower the vehicle.
10. Remove the nut (1) that secures the front section of the A/C liquid line (2) to the rear section of the liquid line (3).
11. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
12. Install plugs in, or tape over the opened liquid line fittings.
13. Remove the front section of the A/C liquid line from the engine compartment.

## REAR SECTION

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove the nut (6) that secures the front section of the A/C liquid line (8) to the rear section of the liquid line (10).
5. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened liquid line fittings.
7. Remove the nut (7) that secures the front section of the A/C suction line (9) to the rear section of the suction line (12).
8. Disconnect the front section of the A/C suction line from the rear section of the suction line and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened suction line fittings.
10. Disconnect the wire harness (3) from the A/C pressure transducer (2).
11. Remove the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4).
12. Remove the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve (1).
13. Disconnect the rear section of the A/C liquid and suction lines from the A/C expansion valve.
14. Remove the dual plane seal from the suction and liquid line fittings and discard.
15. Install plugs in, or tape over the opened suction and liquid line fittings and the expansion valve ports.
16. Remove the rear section of the A/C liquid and suction lines as an assembly from the engine compartment.
17. If required, remove the A/C pressure transducer from the rear section of the A/C liquid line (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/TRANSDUCER-A/C PRESSURE - REMOVAL).

## INSTALLATION

**Note:** The A/C liquid line is serviced in two sections. The rear section of the liquid line is serviced as an assembly with the rear section of the A/C suction line.

**FRONT SECTION**

1. Position the front section of the liquid line (2) into the engine compartment.
2. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
5. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line. Tighten the nut to 22 N·m (16 ft. lbs.).

6. Raise and support the vehicle.
7. Remove the tape or plugs from the fitting on the front section of the A/C liquid line (4) and the outlet port of the A/C condenser (5).
8. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the A/C liquid line to the A/C condenser.
10. Install the nut (3) that secures the front section of the A/C liquid line to the A/C condenser. Tighten the nut to 22 N·m (16 ft. lbs.).
11. Install the front end splash shields (Refer to 23 - BODY/EXTERIOR/FRONT END SPLASH SHIELDS - INSTALLATION).

12. Lower the vehicle.
13. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
14. Reconnect the negative battery cable.
15. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
16. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

**REAR SECTION**

1. If removed, install the A/C pressure transducer (2) onto the A/C liquid line (10) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - INSTALLATION).
2. Position the rear section of the A/C liquid line (10) and the rear section of the A/C suction line (12) as an assembly into the engine compartment.
3. Remove the tape or plugs from the suction and liquid line fittings and the ports in the A/C expansion valve (1).
4. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the rear section of the A/C liquid and suction lines to the A/C expansion valve.
6. Install the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
7. Install the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4). Tighten the bolt to 11 N·m (100 in. lbs.).
8. Connect the wire harness (3) to the A/C pressure transducer.
9. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line (8) to the rear section of the A/C liquid line.
10. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
12. Install the nut (6) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line. Tighten the nut to 22 N·m (16 ft. lbs.).
13. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line (9) to the rear section of the A/C suction line.
14. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
16. Install the nut (7) that secures the front section of the A/C suction line to the rear section of the A/C suction line. Tighten the nut to 22 N·m (16 ft. lbs.).
17. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
18. Reconnect the negative battery cable.
19. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
20. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## LINE-A/C SUCTION

### DESCRIPTION

The A/C suction line is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C compressor. The A/C suction line is serviced in two sections. The front section of the suction line (1) connects to the rear section of the suction line (3) with a nut (6). The rear section of the A/C suction line includes the low side service port (2) and is secured to the A/C expansion valve by a tapping plate (4). The rear section of the A/C suction line is serviced as an assembly with the rear section of the A/C liquid line (5).

**CAUTION:** Use only seals specified for the vehicle. Failure to use the correct seals will cause the refrigerant system connections to leak.

The A/C suction line has no serviceable parts except for the dual plane seals, low-side service port valve and it's protective cap. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C suction line is removed and installed. If either section of the A/C suction line is found to be leaking or damaged, it must be replaced.

81318dd8

### REMOVAL

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** The A/C suction line is serviced in two sections. The rear section of the suction line is serviced as an assembly with the rear section of the A/C liquid line.

### FRONT SECTION

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove the nut (2) that secures the front section of the A/C suction line (3) to the A/C compressor (5).
5. Disconnect the A/C suction line from the A/C compressor and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened suction line fitting and compressor inlet port.

812c1346

7. Remove the nut (1) that secures the front section of the A/C suction line (2) to the rear section of the suction line (3).
8. Disconnect the front section of the A/C suction line from the rear section of the suction line and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened suction line fittings.
10. Remove the front section of the A/C suction line from the engine compartment.

## REAR SECTION

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
4. Remove the nut (7) that secures the front section of the A/C suction line (9) to the rear section of the suction line (12).
5. Disconnect the front section of the A/C suction line from the rear section of the suction line and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened suction line fittings.
7. Remove the nut (6) that secures the front section of the A/C liquid line (8) to the rear section of the liquid line (10).
8. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened liquid line fittings.
10. Disconnect the wire harness (3) from the A/C pressure transducer (2).
11. Remove the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4).
12. Remove the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve (1).
13. Disconnect the rear section of the A/C suction and liquid lines from the A/C expansion valve.
14. Remove the dual plane seal from the suction and liquid line fittings and discard.
15. Install plugs in, or tape over the opened suction and liquid line fittings and the expansion valve ports.
16. Remove the rear section of the A/C suction and liquid lines as an assembly from the engine compartment.
17. If required, remove the A/C pressure transducer from the rear section of the A/C liquid line (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/TRANSDUCER-A/C PRESSURE - REMOVAL).

## INSTALLATION

**Note:** The A/C suction line is serviced in two sections. The rear section of the suction line is serviced as an assembly with the rear section of the A/C liquid line.

### FRONT SECTION

1. Position the front section of the A/C suction line (2) into the engine compartment.
2. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line to the rear section of the A/C suction line (3).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
5. Install the nut (1) that secures the front section of the A/C suction line to the rear section of the A/C suction line. Tighten the nut to 22 N·m (16 ft. lbs.).

6. Remove the tape or plugs from the fitting on the front section of the A/C suction line (3) and the inlet port of the A/C compressor (5).
7. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Connect the A/C suction line to the A/C compressor.
9. Install the nut (2) that secures the front section of the A/C suction line to the A/C compressor. Tighten the nut to 22 N·m (16 ft. lbs.).

10. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - INSTALLATION).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

**REAR SECTION**

1. If removed, install the A/C pressure transducer (2) onto the A/C liquid line (10) (Refer to 24 - HEATING & AIR CONDITIONING/CONTROLS/A/C PRESSURE TRANSDUCER - INSTALLATION).
2. Position the rear section of the A/C suction line (12) and the rear section of the A/C liquid line (10) as an assembly into the engine compartment.
3. Remove the tape or plugs from the suction and liquid line fittings and the ports in the A/C expansion valve (1).
4. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the rear section of the A/C liquid and suction lines to the A/C expansion valve.
6. Install the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
7. Install the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4). Tighten the bolt to 11 N·m (100 in. lbs.).
8. Connect the wire harness (3) to the A/C pressure transducer.
9. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line (8) to the rear section of the A/C liquid line.
10. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
12. Install the nut (6) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line. Tighten the nut to 22 N·m (16 ft. lbs.).
13. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line (9) to the rear section of the A/C suction line.
14. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
16. Install the nut (7) that secures the front section of the A/C suction line to the rear section of the A/C suction line. Tighten the nut to 22 N·m (16 ft. lbs.).
17. Install the air cleaner housing (Refer to 9 - ENGINE/AIR INTAKE SYSTEM/AIR CLEANER HOUSING - REMOVAL).
18. Reconnect the negative battery cable.
19. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
20. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## OIL-A/C REFRIGERANT

### DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, polyalkylene glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The Denso 10S17 A/C compressor used in this vehicle is designed to use ND-8 PAG refrigerant oil. Use only this type of refrigerant oil the refrigerant system.

### OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

### STANDARD PROCEDURE

#### REFRIGERANT OIL LEVEL

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

**Note: The oil used in the Denso 10S17 A/C compressor is ND-8 PAG R-134a refrigerant oil. Only refrigerant oil of the same type should be used to service the A/C system. Do not use any other refrigerant oil. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.**

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when a receiver/drier, A/C evaporator or A/C condenser is replaced. See the Refrigerant Oil Capacities chart. When an A/C compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new A/C compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

**REFRIGERANT OIL CAPACITIES**

COMPONENT NAME	ml.	oz.
Total System Fill	180 ml.	6.1 oz.
A/C Condenser	30 ml.	1.0 oz.
A/C Evaporator	60 ml.	2.0 oz.
Receiver/drier	30 ml.	1.0 oz.
A/C Compressor	Drain and measure the oil from the old compressor. See text.	

**RECEIVER/DRIER-A/C****DESCRIPTION**

The receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The receiver/drier is installed on the high-side of the A/C system and is connected directly to the right end of the A/C condenser. The receiver/drier can be easily serviced by removing the front fascia.

**OPERATION**

The receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the receiver/drier acts as a reservoir to store surplus refrigerant.

The receiver/drier cannot be repaired. If the receiver/drier is faulty or damaged, or if the refrigerant system has been contaminated or left open to the atmosphere for an indeterminable period or if the A/C compressor has failed, it must be replaced.

**REMOVAL**

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the front fascia (Refer to 23 - BODY/EXTERIOR/FRONT FASCIA - REMOVAL).
4. Remove the screw (1) that secures the receiver/drier mounting bracket (2) to the right end of the A/C condenser (3).
5. Remove the bolt (4) that secures the receiver/drier (5) to the A/C condenser.
6. Disconnect the receiver/drier from the A/C condenser and remove and discard the dual-plane seal.
7. Install plugs in, or tape over the opened receiver/drier fitting and the condenser ports.

## INSTALLATION

**Note:** If the receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only the refrigerant oil of the type recommended for the A/C compressor in the vehicle.

1. Position the receiver/drier (5) into the engine compartment.
2. Remove the tape or plugs from the receiver/drier fitting and the ports of the A/C condenser (3).
3. Lubricate a new dual-plane seal with clean refrigerant oil and install it onto the receiver/drier fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the receiver/drier to the right end of the A/C condenser.
5. Install the bolt (4) that secures the receiver/drier to the A/C condenser. Tighten the bolt to 22 N·m (16 ft. lbs.).
6. Install the receiver/drier mounting bracket (2) onto the A/C condenser.
7. Install the screw (1) that secures the receiver/drier mounting bracket onto the A/C condenser. Tighten the screw to 5 N·m (44 in. lbs.).
8. Install the front fascia (Refer to 23 - BODY/EXTERIOR/FRONT FASCIA - INSTALLATION).
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
11. Charge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## REFRIGERANT-A/C

### DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

### OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

## VALVE-A/C EXPANSION

### DESCRIPTION

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator and is of a thermostatic expansion valve (TXV) design. The A/C expansion valve consists of an aluminum H-valve type body (1) with an integral thermal sensor (2) and is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.

### OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the A/C evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

## DIAGNOSIS AND TESTING

### VALVE-A/C EXPANSION

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - FRONT - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

**Note:** The A/C expansion valve should only be tested following testing of the A/C compressor.

**Note:** Liquid CO<sup>2</sup> is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO<sup>2</sup> is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85° F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. Verify the refrigerant charge level.
2. Close all doors, windows and vents to the passenger compartment.
3. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
4. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.
5. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to Step 6. If not OK, replace the faulty A/C expansion valve.

**WARNING:**

**Protect the skin and eyes from exposure to liquid CO<sup>2</sup> or personal injury can result.**

6. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO<sup>2</sup> or another suitable super-cold material. **Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to Step 7. If not OK, replace the faulty A/C expansion valve.
7. Allow the expansion valve control head to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the faulty A/C expansion valve.
8. When expansion valve testing is complete, test the overall A/C system performance (Refer to 24 - HEATING & AIR CONDITIONING - DIAGNOSIS AND TESTING - A/C PERFORMANCE TEST).

### REMOVAL

**WARNING:** Refer to the applicable warnings and cautions for this system before performing the following operation (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - WARNING - A/C PLUMBING) and (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - CAUTION - A/C PLUMBING). Failure to follow the warnings and cautions could result in possible personal injury or death.

1. Recover the refrigerant from the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/ PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM RECOVERY).
2. Disconnect and isolate the negative battery cable.
3. Remove the bolt (5) that secures the refrigerant line mounting bracket (6) to the left front shock tower (4).
4. Remove the nut (9) that secures the refrigerant line tapping block (10) to the A/C expansion valve (1).
5. Disconnect the wire harness (3) from the A/C pressure transducer (2) to help allow access to the A/C expansion valve.
6. Disconnect the A/C suction line (7) and the A/C liquid line (8) from the A/C expansion valve and position the refrigerant lines out of the way.
7. Remove the dual plane seal from the suction and liquid line fittings and discard.
8. Install plugs in, or tape over the opened suction and liquid line fittings.
9. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block located within the foam seal (3).
10. Remove the A/C expansion valve from the evaporator tube tapping block and foam seal.
11. Remove the dual plane seal from the evaporator tube fittings and discard.
12. Install plugs in, or tape over the opened evaporator tube fittings and all expansion valve ports.

## INSTALLATION

1. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
2. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the evaporator tube fittings. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block located within the foam seal (3).
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N·m (97 in. lbs.).

5. Remove the tape or plugs from the suction and liquid line fittings.
6. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C suction line (7) and the A/C liquid line (8) to the A/C expansion valve (1).
8. Install the nut (9) that secures the refrigerant line tapping block (10) to the A/C expansion valve. Tighten the nut to 23 N·m (17 ft. lbs.).
9. Install the bolt (5) that secures the refrigerant line mounting bracket (6) to the left front shock tower (4). Tighten the bolt to 11 N·m (100 in. lbs.).
10. Connect the wire harness (3) to the A/C pressure transducer (2).

11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM EVACUATE).
13. Recharge the refrigerant system (Refer to 24 - HEATING & AIR CONDITIONING/PLUMBING - STANDARD PROCEDURE - REFRIGERANT SYSTEM CHARGE).

## EMISSIONS CONTROL

### DESCRIPTION

#### MONITORED COMPONENT

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks as well as continuity tests (opens/shorts). Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

The following is a list of the monitored components:

- Catalyst Monitor
- Comprehensive Components
- EGR (if equipped)
- Fuel Control (rich/lean)
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Purge
- Misfire
- Natural Vacuum Leak Detection (NVLD)

#### COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

1. Circuit Continuity
  - Open
  - Shorted high
  - Shorted to ground
2. Rationality or Proper Functioning
  - Inputs tested for rationality
  - Outputs tested for functionality

**Note: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply. All will set a DTC and illuminate the MIL in 1- trip.**

**Input Rationality**—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the input signal is compared against other inputs and information to see if it makes sense under the current conditions.

PCM sensor inputs that are checked for rationality include:

- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S) (slow response)
- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Ambient/Battery Temperature Sensors
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Natural Vacuum Leak Detection (NVLD)
- P/N Switch
- Trans Controls

**Output Functionality**—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:

- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Idle Air Control
- Purge Solenoid
- EGR Solenoid
- Radiator Fan Control
- Trans Controls

## OXYGEN SENSOR (O2S) MONITOR

**DESCRIPTION**—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean

condition, misfire or exhaust leak, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR, Catalyst and Fuel Monitors, and purge.

The O2S may fail in any or all of the following manners:

- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

**Slow Response Rate (Big Slope)**—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called 'Big Slope'. The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

**Reduced Output Voltage (Half Cycle)**—The output voltage of the O2S ranges from 2.5 to 5 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Many times the condition is only temporey and the sensor will recover. Under normal conditions the voltage signal surpasses the threshold, and a counter is incremented by one. This is called the Half Cycle Counter.

**Heater Performance**—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

**OPERATION**—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and a Freeze Frame is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Signal Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

**Enabling Conditions**—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time
- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear (automatic only)
- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Ambient air temperature
- Barometric pressure
- Engine RPM within acceptable range of desired idle
- Closed throttle speed

**Pending Conditions**—The Task Manager typically does not run the Oxygen Sensor Signal Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor

- Engine Coolant Temperature Sensor
- Throttle Position Sensor
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- Idle Air Control Motor
- EVAP Electrical
- EGR Solenoid Electrical
- Intake Air Temperature
- 5 Volt Feed

**Conflict**—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress
- Ethanol content learn is taking place and the ethanol used once flag is set

**Suspend**—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if any of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

### OXYGEN SENSOR HEATER MONITOR (NGC)

**DESCRIPTION**—If the Oxygen sensor (O2S) DTC as well as a O2S heater DTC is present, the O2S Heater DTC MUST be repaired first. After the O2S Heater is repaired, verify that the sensor circuit is operating correctly.

The voltage reading taken from the O2S are very temperature sensitive. The readings taken from the O2S are not accurate below 300 degrees C. Heating the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly. Starting with the introduction on the NGC module the strategy for checking the heater circuit has changed. The heater resistance is checked by the NGC almost immediately after the engine is started. The same O2S heater return pin used to read the heater resistance is capable of detecting an open circuit, a shorted high or shorted low condition.

### CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a high oxygen condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly.

An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

**Monitor Operation**—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O<sub>2</sub> switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O<sub>2</sub> sensor switches is divided by the number of Front O<sub>2</sub> sensor switches to determine the switching ratio.

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor is enabled to run another test during that trip. When the test fails three times, the counter increments to three, a malfunction is entered, and a Freeze Frame is stored. When the counter increments to three during the next trip, the code is matured and the MIL is illuminated. If the test passes the first, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 80% of the upstream rate (60% for manual transmissions). The failure percentages are 90% and 70% respectively.

**Enabling Conditions**—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time
- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Accumulated throttle position sensor
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

**Pending Conditions**—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All TPS faults
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality
- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Idle Air Control (IAC) motor functionality

- Vehicle Speed Sensor
- Brake switch
- Intake air temperature

**Conflict**—The catalyst monitor does not run if any of the following conditions are present:

- EGR Monitor in progress
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds
- Low fuel level
- Low ambient air temperature
- Ethanol content learn is taking place and the ethanol used once flag is set

**Suspend**—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Upstream Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

## VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

## TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 40°F in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 160°F
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1—good trip.

## NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failure modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

## **FUEL PRESSURE**

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

## **SECONDARY IGNITION CIRCUIT**

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also see misfire detection. There are DTC's that can detect misfire and Ionization shorts in the secondary ignition circuit, refer to the Powertrain Diagnostic manual for more information

## **CYLINDER COMPRESSION**

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

## **EXHAUST SYSTEM**

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

## **FUEL INJECTOR MECHANICAL MALFUNCTIONS**

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

## **EXCESSIVE OIL CONSUMPTION**

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

## **THROTTLE BODY AIR FLOW**

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

## **VACUUM ASSIST**

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

## **PCM SYSTEM GROUND**

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, including when diagnostics are performed.

## **PCM CONNECTOR ENGAGEMENT**

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

## **DESCRIPTION - MONITORED SYSTEMS**

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

**Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.**

### **OXYGEN SENSOR (O2S) MONITOR**

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt (voltages are offset by 2.5 volts on NGC vehicles). A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

### **OXYGEN SENSOR HEATER MONITOR**

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault **MUST** be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly.

The O2S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S output voltage from the other effects.

### **EGR MONITOR (if equipped)**

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O2S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O2S data should indicate an increase in the O2 concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O2S data whether the EGR system is operating correctly. Because the O2S is being used, the O2S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

### **MISFIRE MONITOR**

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic converter damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy, use the scan tool to ensure that the Adaptive Numerator is learned.

### **FUEL SYSTEM MONITOR**

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O2S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O2S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

### **CATALYST MONITOR**

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O<sub>2</sub>S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

### **NATURAL VACUUM LEAK DETECTION (NVLD) (if equipped)**

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020" (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the "Gas Law". This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

The NVLD seals the canister vent during engine off conditions. If the EVAP system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1" H<sub>2</sub>O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies (described below), utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1" H<sub>2</sub>O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3" to 6" H<sub>2</sub>O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will "blow off" at about 0.5" H<sub>2</sub>O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to "breathe" during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

### **HIGH AND LOW LIMITS**

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

## OPERATION

### SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

**Note:** Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the scan tool to erase all DTC's and extinguish the MIL.

Technicians can display stored DTC's. For obtaining the DTC information, use the Data Link Connector with the scan tool.

### DRB III® STATE DISPLAY TEST MODE

#### OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

## EVAPORATIVE EMISSIONS

### DESCRIPTION

#### MONITORED COMPONENT

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks as well as continuity tests (opens/shorts). Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum and 1600 rpm.

Any component that has an associated limp in will set a fault after 1 trip with the malfunction present.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

The following is a list of the monitored components:

- Catalyst Monitor
- Comprehensive Components
- EGR (if equipped)
- Fuel Control (rich/lean)
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Purge
- Misfire
- Natural Vacuum Leak Detection (NVLD)

## COMPREHENSIVE COMPONENTS

Along with the major monitors, OBD II requires that the diagnostic system monitor any component that could affect emissions levels. In many cases, these components were being tested under OBD I. The OBD I requirements focused mainly on testing emissions-related components for electrical opens and shorts.

However, OBD II also requires that inputs from powertrain components to the PCM be tested for **rationality**, and that outputs to powertrain components from the PCM be tested for **functionality**. Methods for monitoring the various Comprehensive Component monitoring include:

1. Circuit Continuity
  - Open
  - Shorted high
  - Shorted to ground
2. Rationality or Proper Functioning
  - Inputs tested for rationality
  - Outputs tested for functionality

**Note: Comprehensive component monitors are continuous. Therefore, enabling conditions do not apply. All will set a DTC and illuminate the MIL in 1- trip.**

**Input Rationality**—While input signals to the PCM are constantly being monitored for electrical opens and shorts, they are also tested for rationality. This means that the input signal is compared against other inputs and information to see if it makes sense under the current conditions.

PCM sensor inputs that are checked for rationality include:

- Manifold Absolute Pressure (MAP) Sensor
- Oxygen Sensor (O2S) (slow response)
- Engine Coolant Temperature (ECT) Sensor
- Camshaft Position (CMP) Sensor
- Vehicle Speed Sensor
- Crankshaft Position (CKP) Sensor
- Intake Air Temperature (IAT) Sensor
- Throttle Position (TPS) Sensor
- Ambient/Battery Temperature Sensors
- Power Steering Switch
- Oxygen Sensor Heater
- Engine Controller
- Brake Switch
- Natural Vacuum Leak Detection (NVLD)
- P/N Switch
- Trans Controls

**Output Functionality**—PCM outputs are tested for functionality in addition to testing for opens and shorts. When the PCM provides a voltage to an output component, it can verify that the command was carried out by monitoring specific input signals for expected changes. For example, when the PCM commands the Idle Air Control (IAC) Motor to a specific position under certain operating conditions, it expects to see a specific (target) idle speed (RPM). If it does not, it stores a DTC.

PCM outputs monitored for functionality include:

- Fuel Injectors
- Ignition Coils
- Torque Converter Clutch Solenoid
- Idle Air Control
- Purge Solenoid
- EGR Solenoid
- Radiator Fan Control
- Trans Controls

## OXYGEN SENSOR (O2S) MONITOR

**DESCRIPTION**—Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. When there is a large amount of oxygen in the exhaust caused by a lean condition, misfire or exhaust leak, the sensor produces a low voltage, below 450 mV. When the oxygen content is lower, caused by a rich condition, the sensor produces a higher voltage, above 450mV.

The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR, Catalyst and Fuel Monitors, and purge.

The O2S may fail in any or all of the following manners:

- Slow response rate (Big Slope)
- Reduced output voltage (Half Cycle)
- Heater Performance

**Slow Response Rate (Big Slope)**—Response rate is the time required for the sensor to switch from lean to rich signal output once it is exposed to a richer than optimum A/F mixture or vice versa. As the PCM adjusts the air/fuel ratio, the sensor must be able to rapidly detect the change. As the sensor ages, it could take longer to detect the changes in the oxygen content of the exhaust gas. The rate of change that an oxygen sensor experiences is called 'Big Slope'. The PCM checks the oxygen sensor voltage in increments of a few milliseconds.

**Reduced Output Voltage (Half Cycle)**—The output voltage of the O2S ranges from 2.5 to 5 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value. Many times the condition is only temporey and the sensor will recover. Under normal conditions the voltage signal surpasses the threshold, and a counter is incremented by one. This is called the Half Cycle Counter.

**Heater Performance**—The heater is tested by a separate monitor. Refer to the Oxygen Sensor Heater Monitor.

**OPERATION**—As the Oxygen Sensor signal switches, the PCM monitors the half cycle and big slope signals from the oxygen sensor. If during the test neither counter reaches a predetermined value, a malfunction is entered and a Freeze Frame is stored. Only one counter reaching its predetermined value is needed for the monitor to pass.

The Oxygen Sensor Signal Monitor is a two trip monitor that is tested only once per trip. When the Oxygen Sensor fails the test in two consecutive trips, the MIL is illuminated and a DTC is set. The MIL is extinguished when the Oxygen Sensor monitor passes in three consecutive trips. The DTC is erased from memory after 40 consecutive warm-up cycles without test failure.

**Enabling Conditions**—The following conditions must typically be met for the PCM to run the oxygen sensor monitor:

- Battery voltage
- Engine temperature
- Engine run time
- Engine run time at a predetermined speed
- Engine run time at a predetermined speed and throttle opening
- Transmission in gear (automatic only)
- Fuel system in Closed Loop
- Long Term Adaptive (within parameters)
- Power Steering Switch in low PSI (no load)
- Engine at idle
- Fuel level above 15%
- Ambient air temperature
- Barometric pressure
- Engine RPM within acceptable range of desired idle
- Closed throttle speed

**Pending Conditions**—The Task Manager typically does not run the Oxygen Sensor Signal Monitor if overlapping monitors are running or the MIL is illuminated for any of the following:

- Misfire Monitor
- Front Oxygen Sensor and Heater Monitor
- MAP Sensor
- Vehicle Speed Sensor
- Engine Coolant Temperature Sensor
- Throttle Position Sensor
- Engine Controller Self Test Faults
- Cam or Crank Sensor
- Injector and Coil
- Idle Air Control Motor
- EVAP Electrical
- EGR Solenoid Electrical
- Intake Air Temperature
- 5 Volt Feed

**Conflict**—The Task Manager does not run the Oxygen Sensor Monitor if any of the following conditions are present:

- A/C ON (A/C clutch cycling temporarily suspends monitor)
- Purge flow in progress
- Ethanol content learn is taking place and the ethanol used once flag is set

**Suspend**—The Task Manager suspends maturing a fault for the Oxygen Sensor Monitor if any of the following are present:

- Oxygen Sensor Heater Monitor, Priority 1
- Misfire Monitor, Priority 2

## OXYGEN SENSOR HEATER MONITOR (NGC)

**DESCRIPTION**—If the Oxygen sensor (O2S) DTC as well as a O2S heater DTC is present, the O2S Heater DTC MUST be repaired first. After the O2S Heater is repaired, verify that the sensor circuit is operating correctly.

The voltage reading taken from the O2S are very temperature sensitive. The readings taken from the O2S are not accurate below 300 degrees C. Heating the O2S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S must be tested to ensure that it is heating the sensor properly. Starting with the introduction on the NGC module the strategy for checking the heater circuit has changed. The heater resistance is checked by the NGC almost immediately after the engine is started. The same O2S heater return pin used to read the heater resistance is capable of detecting an open circuit, a shorted high or shorted low condition.

## CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a high oxygen condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O<sub>2</sub>S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O<sub>2</sub>S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O<sub>2</sub>S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O<sub>2</sub>S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

**Monitor Operation**—To monitor catalyst efficiency, the PCM expands the rich and lean switch points of the heated oxygen sensor. With extended switch points, the air/fuel mixture runs richer and leaner to overburden the catalytic converter. Once the test is started, the air/fuel mixture runs rich and lean and the O<sub>2</sub> switches are counted. A switch is counted when an oxygen sensor signal goes from below the lean threshold to above the rich threshold. The number of Rear O<sub>2</sub> sensor switches is divided by the number of Front O<sub>2</sub> sensor switches to determine the switching ratio.

The test runs for 20 seconds. As catalyst efficiency deteriorated over the life of the vehicle, the switch rate at the downstream sensor approaches that of the upstream sensor. If at any point during the test period the switch ratio reaches a predetermined value, a counter is incremented by one. The monitor is enabled to run another test during that trip. When the test fails three times, the counter increments to three, a malfunction is entered, and a Freeze Frame is stored. When the counter increments to three during the next trip, the code is matured and the MIL is illuminated. If the test passes the first, no further testing is conducted during that trip.

The MIL is extinguished after three consecutive good trips. The good trip criteria for the catalyst monitor is more stringent than the failure criteria. In order to pass the test and increment one good trip, the downstream sensor switch rate must be less than 80% of the upstream rate (60% for manual transmissions). The failure percentages are 90% and 70% respectively.

**Enabling Conditions**—The following conditions must typically be met before the PCM runs the catalyst monitor. Specific times for each parameter may be different from engine to engine.

- Accumulated drive time
- Enable time
- Ambient air temperature
- Barometric pressure
- Catalyst warm-up counter
- Engine coolant temperature
- Accumulated throttle position sensor
- Vehicle speed
- MAP
- RPM
- Engine in closed loop
- Fuel level

**Pending Conditions**—

- Misfire DTC
- Front Oxygen Sensor Response
- Front Oxygen Sensor Heater Monitor
- Front Oxygen Sensor Electrical
- Rear Oxygen Sensor Rationality (middle check)
- Rear Oxygen Sensor Heater Monitor
- Rear Oxygen Sensor Electrical
- Fuel System Monitor
- All TPS faults
- All MAP faults
- All ECT sensor faults
- Purge flow solenoid functionality

- Purge flow solenoid electrical
- All PCM self test faults
- All CMP and CKP sensor faults
- All injector and ignition electrical faults
- Idle Air Control (IAC) motor functionality
- Vehicle Speed Sensor
- Brake switch
- Intake air temperature

**Conflict**—The catalyst monitor does not run if any of the following conditions are present:

- EGR Monitor in progress
- Fuel system rich intrusive test in progress
- EVAP Monitor in progress
- Time since start is less than 60 seconds
- Low fuel level
- Low ambient air temperature
- Ethanol content learn is taking place and the ethanol used once flag is set

**Suspend**—The Task Manager does not mature a catalyst fault if any of the following are present:

- Oxygen Sensor Monitor, Priority 1
- Upstream Oxygen Sensor Heater, Priority 1
- EGR Monitor, Priority 1
- EVAP Monitor, Priority 1
- Fuel System Monitor, Priority 2
- Misfire Monitor, Priority 2

## VEHICLE EMISSION CONTROL INFORMATION LABEL

All models have a Vehicle Emission Control Information (VECI) Label. Chrysler permanently attaches the label in the engine compartment. It cannot be removed without defacing information and destroying the label.

The label contains the vehicle's emission specifications and vacuum hose routings. All hoses must be connected and routed according to the label.

## TRIP DEFINITION

A "Trip" means vehicle operation (following an engine-off period) of duration and driving mode such that all components and systems are monitored at least once by the diagnostic system. The monitors must successfully pass before the PCM can verify that a previously malfunctioning component is meeting the normal operating conditions of that component. For misfire or fuel system malfunction, the MIL may be extinguished if the fault does not recur when monitored during three subsequent sequential driving cycles in which conditions are similar to those under which the malfunction was first determined.

Anytime the MIL is illuminated, a DTC is stored. The DTC can self erase only after the MIL has been extinguished. Once the MIL is extinguished, the PCM must pass the diagnostic test for the most recent DTC for 40 warm-up cycles (80 warm-up cycles for the Fuel System Monitor and the Misfire Monitor). A warm-up cycle can best be described by the following:

- The engine must be running
- A rise of 40°F in engine temperature must occur from the time when the engine was started
- Engine coolant temperature must crossover 160°F
- A "driving cycle" that consists of engine start up and engine shut off.

Once the above conditions occur, the PCM is considered to have passed a warm-up cycle. Due to the conditions required to extinguish the MIL and erase the DTC, it is most important that after a repair has been made, all DTC's be erased and the repair verified by running 1-good trip.

## NON-MONITORED CIRCUITS

The PCM does not monitor all circuits, systems and conditions that could have malfunctions causing driveability problems. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other

systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

The major non-monitored circuits are listed below along with examples of failures modes that do not directly cause the PCM to set a DTC, but for a system that is monitored.

### **FUEL PRESSURE**

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor, fuel system, or misfire diagnostic trouble code.

### **SECONDARY IGNITION CIRCUIT**

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables. The misfire will however, increase the oxygen content in the exhaust, deceiving the PCM in to thinking the fuel system is too lean. Also see misfire detection. There are DTC's that can detect misfire and Ionization shorts in the secondary ignition circuit, refer to the Powertrain Diagnostic manual for more information

### **CYLINDER COMPRESSION**

The PCM cannot detect uneven, low, or high engine cylinder compression. Low compression lowers O2 content in the exhaust. Leading to fuel system, oxygen sensor, or misfire detection fault.

### **EXHAUST SYSTEM**

The PCM cannot detect a plugged, restricted or leaking exhaust system. It may set a EGR (if equipped) or Fuel system or O2S fault.

### **FUEL INJECTOR MECHANICAL MALFUNCTIONS**

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

### **EXCESSIVE OIL CONSUMPTION**

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

### **THROTTLE BODY AIR FLOW**

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

### **VACUUM ASSIST**

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

### **PCM SYSTEM GROUND**

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, including when diagnostics are performed.

### **PCM CONNECTOR ENGAGEMENT**

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

## DESCRIPTION - MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the a scan tool.

The following is a list of the system monitors:

- EGR Monitor (if equipped)
- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Evaporative System Leak Detection Monitor (if equipped)

Following is a description of each system monitor, and its DTC.

**Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.**

### OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. The PCM is programmed to maintain the optimum air/fuel ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrous oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the EGR (if equipped), Catalyst and Fuel Monitors.

The O2S may fail in any or all of the following manners:

- Slow response rate
- Reduced output voltage
- Dynamic shift
- Shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt (voltages are offset by 2.5 volts on NGC vehicles). A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

### OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) DTC as well as a O2S heater DTC, the O2S heater fault **MUST** be repaired first. After the O2S fault is repaired, verify that the heater circuit is operating correctly.

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperatures of 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O<sub>2</sub>S are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O<sub>2</sub>S is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O<sub>2</sub>S must be tested to ensure that it is heating the sensor properly.

The O<sub>2</sub>S circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O<sub>2</sub>S output voltage from the other effects.

### **EGR MONITOR (if equipped)**

The Powertrain Control Module (PCM) performs an on-board diagnostic check of the EGR system.

The EGR monitor is used to test whether the EGR system is operating within specifications. The diagnostic check activates only during selected engine/driving conditions. When the conditions are met, the EGR is turned off (solenoid energized) and the O<sub>2</sub>S compensation control is monitored. Turning off the EGR shifts the air fuel (A/F) ratio in the lean direction. The O<sub>2</sub>S data should indicate an increase in the O<sub>2</sub> concentration in the combustion chamber when the exhaust gases are no longer recirculated. While this test does not directly measure the operation of the EGR system, it can be inferred from the shift in the O<sub>2</sub>S data whether the EGR system is operating correctly. Because the O<sub>2</sub>S is being used, the O<sub>2</sub>S test must pass its test before the EGR test. Also looks at EGR linear potentiometer for feedback.

### **MISFIRE MONITOR**

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic converter damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

The PCM can detect and compensate for variances in the engine and its components. To learn these variations, the PCM uses the input of the actual crankshaft rotation pattern and ideal crankshaft rotation pattern that has been calibrated into the PCM. The PCM then compares the two patterns. The variation between the two values is the Adaptive Numerator. If the Adaptive Numerator is not learned by the PCM, the misfire monitor will not run and the Multi-Cylinder Displacement System (MDS) will not operate. Without MDS operation, the customer will experience decreased fuel economy. If the customer experiences decrease fuel economy, use the scan tool to ensure that the Adaptive Numerator is learned.

### **FUEL SYSTEM MONITOR**

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the air fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio. This is done by making short term corrections in the fuel injector pulse width based on the O<sub>2</sub>S output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual air-fuel ratio with the O<sub>2</sub>S (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

### **CATALYST MONITOR**

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O<sub>2</sub>S's) to monitor the efficiency of the converter. The dual O<sub>2</sub>S's strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O<sub>2</sub>S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic con-

verter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (Check Engine lamp) will be illuminated.

### **NATURAL VACUUM LEAK DETECTION (NVLD) (if equipped)**

The Natural Vacuum Leak Detection (NVLD) system is the next generation evaporative leak detection system that will first be used on vehicles equipped with the Next Generation Controller (NGC). This new system replaces the leak detection pump as the method of evaporative system leak detection. This is to detect a leak equivalent to a 0.020" (0.5 mm) hole. This system has the capability to detect holes of this size very dependably.

The basic leak detection theory employed with NVLD is the "Gas Law". This is to say that the pressure in a sealed vessel will change if the temperature of the gas in the vessel changes. The vessel will only see this effect if it is indeed sealed. Even small leaks will allow the pressure in the vessel to come to equilibrium with the ambient pressure. In addition to the detection of very small leaks, this system has the capability of detecting medium as well as large evaporative system leaks.

The NVLD seals the canister vent during engine off conditions. If the EVAP system has a leak of less than the failure threshold, the evaporative system will be pulled into a vacuum, either due to the cool down from operating temperature or diurnal ambient temperature cycling. The diurnal effect is considered one of the primary contributors to the leak determination by this diagnostic. When the vacuum in the system exceeds about 1" H2O (0.25 KPA), a vacuum switch closes. The switch closure sends a signal to the NGC. The NGC, via appropriate logic strategies (described below), utilizes the switch signal, or lack thereof, to make a determination of whether a leak is present.

The NVLD device is designed with a normally open vacuum switch, a normally closed solenoid, and a seal, which is actuated by both the solenoid and a diaphragm. The NVLD is located on the atmospheric vent side of the canister. The NVLD assembly may be mounted on top of the canister outlet, or in-line between the canister and atmospheric vent filter. The normally open vacuum switch will close with about 1" H2O (0.25 KPA) vacuum in the evaporative system. The diaphragm actuates the switch. This is above the opening point of the fuel inlet check valve in the fill tube so cap off leaks can be detected. Submerged fill systems must have recirculation lines that do not have the in-line normally closed check valve that protects the system from failed nozzle liquid ingestion, in order to detect cap off conditions.

The normally closed valve in the NVLD is intended to maintain the seal on the evaporative system during the engine off condition. If vacuum in the evaporative system exceeds 3" to 6" H2O (0.75 to 1.5 KPA), the valve will be pulled off the seat, opening the seal. This will protect the system from excessive vacuum as well as allowing sufficient purge flow in the event that the solenoid was to become inoperative.

The solenoid actuates the valve to unseal the canister vent while the engine is running. It also will be used to close the vent during the medium and large leak tests and during the purge flow check. This solenoid requires initial 1.5 amps of current to pull the valve open but after 100 ms. will be duty cycled down to an average of about 150 mA for the remainder of the drive cycle.

Another feature in the device is a diaphragm that will open the seal in the NVLD with pressure in the evaporative system. The device will "blow off" at about 0.5" H2O (0.12 KPA) pressure to permit the venting of vapors during refueling. An added benefit to this is that it will also allow the tank to "breathe" during increasing temperatures, thus limiting the pressure in the tank to this low level. This is beneficial because the induced vacuum during a subsequent declining temperature will achieve the switch closed (pass threshold) sooner than if the tank had to decay from a built up pressure.

The device itself has 3 wires: Switch sense, solenoid driver and ground. It also includes a resistor to protect the switch from a short to battery or a short to ground. The NGC utilizes a high-side driver to energize and duty-cycle the solenoid.

## HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

## OPERATION

### SYSTEM

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the code applies to a non-emissions related component or system, and the problem is repaired or ceases to exist, the PCM cancels the code after 40 warmup cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator Lamp (MIL). Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

**Note: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, use the scan tool to erase all DTC's and extinguish the MIL.**

Technicians can display stored DTC's. For obtaining the DTC information, use the Data Link Connector with the scan tool.

## DRB III® STATE DISPLAY TEST MODE

### OPERATION

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. From the state display screen, access either State Display Inputs and Outputs or State Display Sensors.

## DIAGNOSIS AND TESTING

### OBD II Monitor Information

Comprehensive Components Monitor (Includes All Engine Hardware Sensor, Switches, Solenoids, etc.)	Major Monitors Non Fuel Control & Non Misfire (Monitors Entire Emission System)	Major Monitors Fuel Control & misfire (Monitors Entire System)
Most are one trip Faults	Most are Two Trips Faults	Two Trip Faults
Usually Turns on The Mil and Sets DTC After One Failure	Turns On The Mil and Sets DTC after Two Consecutive Failure	The Mil and Sets DTC After Two Consecutive Failure
<b>Priority 3</b>	<b>Priority 1 or 3</b>	<b>Priority 2 or 4</b>
All Checked For Continuity	Done Stop Test = Yes	<b>Fuel Control Monitor</b>
Open	Oxygen Sensor Heater	Monitors Fuel Control System For:  Fuel System Lean  Fuel System Rich
Short To Ground	Oxygen Sensor Response	
Short To Voltage	Catalytic Converter	Requires 3 Consecutive Fuel System Good Trips to Extinguish the MIL
Inputs Checked For Rationality	Efficiency Except EWMA	
Outputs Checked For Functionality	up to 6 test per trip and a one trip fault (SBEC) and two trip fault on (JTEC)	
	<b>EGR System</b>	<b>Misfire Monitor</b>
	Evaporative Emission System (purge and leak)  Non-LDP  LDP	Monitors for Engine Misfire At:  4 X 1000 RPM Counter (4000 Revs) (Type B)  **200 X 3 (600) RPM counter (Type A)
Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL*	Requires 3 Consecutive Global Good Trips to Extinguish the MIL
*40 Warm Up Cycles are required to erase DTCs after the MIL has been extinguished		** Type A misfire is a one trip failure on pre-1999, 2 trip failure on 1999 and later. The MIL will illuminate at the first or second failure, based on MY.

### OBD II MONITOR RUN PROCESS

The following procedure has been established to assist Chrysler Dealer Technicians in the field with enabling and running OBD II Monitors. The order listed in the following procedure is intended to allow the technician to effectively complete each monitor and to set the CARB Readiness Status in the least time possible.

**Note: A. Once the monitor run process has begun, do not turn off the ignition. By turning the ignition key off, monitor enabling conditions will be lost. NVLD Monitor runs after key off. B. By performing a Battery Disconnect, or Selecting Erase DTCs, the CARB Readiness and all additional OBD II information will be cleared.**

### Monitor Preliminary Checks:

1. Plug a SCAN TOOL into the vehicle's Data Link Connector (DLC).
2. Turn the ignition, KEY ON - ENGINE OFF. Watch for MIL lamp illumination during the bulb check. MIL lamp must have illuminated, if not, repair MIL lamp.
3. On the SCAN TOOL Select #1 Stand-alone.
4. Select #1 1998-2004 Diagnostics.
5. Select #1 Engine.
6. Select #2 DTCs and Related Functions.
7. Select #1 Read DTCs.
  - Verify that No Emissions Related DTCs are Present.
  - \* If an Emissions DTC is Present, the OBD II Monitors may not run and the CARB Readiness will not update.
  - The Emissions related DTC, will need to be repaired, then cleared. By clearing DTCs, the OBD Monitors will need to be run and completed to set the CARB Readiness Status.
8. Return to Engine Select Function Menu and Select #9, OBD II Monitors.
9. Select #3 CARB Readiness Status.

Do all the CARB Readiness Status Locations read YES?.

- \*YES, then all monitors have been completed and this vehicle is ready to be I/M or Emission Tested.
- \*NO, then the following procedure needs to be followed to run/complete all available monitors.

**Note: A. Only the monitors, which are not YES in the CARB Readiness Status, need to be completed. B. Specific criteria need to be met for each monitor. Each monitor has a Pre-Test screen to assist in running the monitor. For additional information, refer to the DaimlerChrysler Corporation Technical Training Workbook titled On Board Diagnostics: OBD II/EOBD, part number 81-699-01050. C. The most efficient order to run the monitors has been outlined below, including suggestions to aid the process.**

### Natural Vacuum Leak Detection with Purge Monitor

This monitor requires a cool down cycle, usually an overnight soak for at least 8 hours without the engine running. The ambient temperature must decrease overnight - parking the vehicle outside is advised. To run this test the fuel level must be between 15-85% full. For the monitor run conditions select the EVAP MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu. The Purge monitor will run if the small leak test reports a pass. Criteria for NVLD monitor:

- Engine off time greater than @ one hour.
- Fuel Level between 15% and 85 %.
- Start Up ECT and IAT within 10 C (18 F).
- Vehicle started and run until Purge Monitor reports a result.

**Note: If the vehicle does not report a result and the conditions where correct. It may take up to two weeks to fail the small leak monitor. DO NOT use this test to attempt to determine a fault. Use the appropriate service information procedure for finding a small leak. If there are no faults and the conditions are correct this test will run and report a pass. Note the Small leak test can find leaks less than 10 thousands of an inch. If a small leak is present it takes approximately one week of normal driving to report a failure.**

### Catalyst / O2 Monitor

With NGC, Catalyst and O2 Monitor information are acquired and processed at the same time. Most vehicles will need to be driven at highway speed (< 50 mph) for a few minutes. Some trucks run the monitor at idle in drive. If the vehicle is equipped with a manual transmission, using 4th gear may assist in meeting the monitor running criteria. For the monitor run conditions, select the BANK 1 CAT MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

### EGR Monitor

The EGR monitor now runs in a closed throttle decel or at idle on a warm vehicle. However, it is necessary to maintain the TPS, Map and RPM ranges to allow the monitor to complete itself. For the monitor run conditions, select the EGR PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

## O2 Sensor Heater Monitor

This monitor is now continuously running once the heaters are energized. Pass information will be processed at power down. For the monitor run conditions, select the O2S HEATER MON PRE-TEST in the SCAN TOOL, OBD II Monitors Menu.

## SOLENOID-PROPORTIONAL PURGE

### REMOVAL

The solenoid attaches to a bracket near the right rear of the engine. The solenoid will not operate unless it is installed correctly.

1. Location for 5.7L engine.

2. Location for 2.7 and 3.5L engine.

3. Disconnect electrical connector from solenoid.

4. Disconnect vacuum tubes from solenoid.

5. Remove solenoid from bracket.

### INSTALLATION

The solenoid attaches to a bracket near the air cleaner. The solenoid will not operate unless it is installed correctly. The top of the solenoid has TOP printed on it. The solenoid will not operate unless it is installed correctly.

1. Location for 2.7 and 3.5L engines.

2. Location for 5.7L engine.
3. Install solenoid on bracket.
4. Connect vacuum tube to solenoid.
5. Connect electrical connector to solenoid.

## ASSEMBLY-NATURAL VAC LEAK DETECTION

### REMOVAL

1. Disconnect negative battery cable.
2. Raise and support vehicle.
3. Remove the right rear tire.
4. Remove the inner splash shield.
5. Natural Vacuum Leak Detection Pump (NVLD) location.

6. Remove vapor canister and NVLD pump assembly from vehicle.

7. Squeeze tab and pull pump from bracket.

8. Remove hoses from pump assembly and remove pump.

## INSTALLATION

1. Install pump assembly to hoses.

2. Install pump assembly to bracket.

3. Install vapor canister and pump assembly to vehicle.

4. Install inner splash shield.
5. Install right rear tire.
6. Lower vehicle.
7. Connect negative battery cable.

## PCV VALVE

### REMOVAL

#### 5.7L

The PCV valve (3) is mounted into the top/right side of the intake manifold (2).

1. The PCV valve (1) is sealed to the intake manifold with two O-rings (2).
2. Remove PCV valve by rotating counter-clockwise 90 degrees until locating tabs (3) have been freed. After tabs have cleared, pull valve straight up from intake manifold.
3. After valve is removed, check condition of two valve O-rings (2).

## INSTALLATION

### 5.7L

1. Clean out intake manifold opening.
2. Check condition of two O-rings (2) on PCV valve (1).
3. Apply engine oil to two O-rings.

4. Place PCV valve (3) into intake manifold and rotate 90 degrees clockwise for installation.

## CANISTER-VAPOR

### REMOVAL

1. Disconnect negative battery cable.
  2. Raise vehicle and support.
  3. Remove the right rear tire.
  4. Remove the inner splash shield.
- 
5. Disconnect the EVAP line.
  6. Unlock and disconnect electrical connector from pump.

7. Remove mounting nut.

8. Slide assembly forward off of rear mounting brackets.

9. Make sure that you do not lose the rubber mounts in canister brackets.

10. Disconnect vapor lines from EVAP canister.

11. Squeeze connector and pull.

12. Remove mounting nuts from canister.

13. Remove vapor canister from bracket.

## INSTALLATION

1. Install canister to bracket and tighten nuts.

2. Connect hoses to vapor canister.

3. Hose connected.

4. Install rubber isolator in canister brackets.

5. Slide canister brackets with rubber isolators onto mounting brackets.

6. Install assembly mounting nut.

7. Connect electrical connector to pump and lock.

- 8. Connect the EVAP line.
- 9. Install the inner splash shield.
- 10. Install tire.
- 11. Lower vehicle.
- 12. Connect negative battery cable.

EXHAUST GAS RECIRCULATION

DESCRIPTION	N·m	Ft. Lbs.	In. Lbs.
Tube to Exhaust Manifold Bolts	31	23	275
Tube to EGR valve Bolts	11	-	95
EGR Valve to Cyl. Head Bolts	31	23	275

## TUBE-EXHAUST GAS RECIRCULATION

### REMOVAL

#### 2.7L - LOWER TUBE

1. Disconnect negative battery cable.

2. Remove purge solenoid from bracket.

3. Relocate the purge solenoid.
4. Unlock and disconnect the electrical connector from EGR valve.

5. Remove the bolts from the lower tube to exhaust manifold.
6. Remove the lower tube bolts to EGR valve.
7. Remove lower tube from vehicle.
8. When removing EGR upper tube assembly being careful not to drop the silicone rubber seals in the intake manifold. Clean gasket surfaces on the EGR valve. Note that any loose dirt can lodge between the pintle and the seat and cause valve leakage that will give a rough idle and depressed manifold vacuum.
9. Clean mounting surface.

## 2.7L - UPPER TUBE

1. EGR system components and location. Upper tube (2), EGR valve (1), and Lower tube (3).
2. Disconnect negative battery cable.

3. Remove purge solenoid from bracket.

4. Relocate the purge solenoid.

5. Unlock and disconnect the electrical connector from EGR valve.

6. Remove upper tube bolts to EGR valve (2).

7. Remove upper tube from intake manifold.

8. When removing EGR upper tube assembly being careful not to drop the silicone rubber seals in the intake manifold. Clean gasket surfaces on the EGR valve. Note that any loose dirt can lodge between the pintle and the seat and cause valve leakage that will give a rough idle and depressed manifold vacuum.

9. Clean mounting surface.

**3.5L**

1. Disconnect negative battery cable.
2. Remove purge solenoid from bracket.

3. Relocate the purge solenoid.

4. Unlock and disconnect the electrical connector from EGR valve.
5. Remove the wiper module, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).
6. Remove shock tower brace and relocate.
7. Remove the upper intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

8. EGR valve (2) and tube (1).

9. Remove tube bolts (1) to EGR valve (2).

10. Remove tube (1) from intake manifold.

11. When removing EGR upper tube assembly being careful not to drop the silicone rubber seals in the intake manifold. Clean gasket surfaces on the EGR valve. Note that any loose dirt can lodge between the pintle and the seat and cause valve leakage that will give a rough idle and depressed manifold vacuum.

12. Clean mounting surface.

## INSTALLATION

### 2.7L - LOWER TUBE

1. Clean mounting surface.

2. Install the lower tube to vehicle.
3. Install the lower tube bolts to EGR valve.
4. Install the lower tube bolts to exhaust manifold.
5. Tighten the lower tube to EGR valve bolts to 11 N·m (95 in. lbs.) torque.
6. Tighten the lower tube to exhaust manifold bolts to 31 N·m (275 in. lbs.) torque.

7. Connect the electrical connector to EGR valve and lock.
8. Relocate the purge solenoid.
9. Install purge solenoid to bracket.
10. Connect negative battery cable.

## 2.7L - UPPER TUBE

1. Clean mounting surface.
2. Inspect rubber silicone seals on intake manifold end of EGR tube.
3. Install upper tube into the intake manifold, being careful that the silicone rubber seals are correctly installed and undamaged..
4. Install new gasket between the EGR valve and tube and install bolts (2).
5. Tighten the upper tube to EGR valve bolts to 11 N·m (95 in. lbs.) torque.

6. Connect the electrical connector to EGR valve and lock.
7. Relocate the purge solenoid.

8. Install purge solenoid to bracket.
9. Connect negative battery cable.

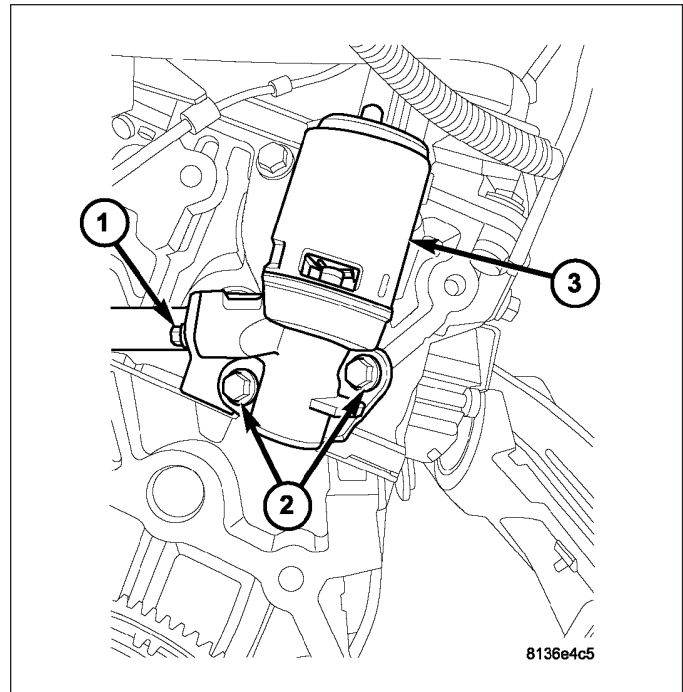

### 3.5L

1. Clean mounting surface.
2. Inspect rubber silicone seals on intake manifold end of EGR tube.
3. Install tube into the intake manifold being careful that the silicone rubber seals are correctly installed and undamaged.

4. Install the tube bolts to EGR valve.
5. Tighten the EGR tube to EGR valve bolts to 11 N·m (95 in. lbs.) torque.

6. Connect the electrical connector to EGR valve and lock.
7. Install upper intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
8. Install the shock tower brace.
9. Install the wiper module, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).
10. Relocate the purge solenoid.

11. Install purge solenoid to bracket.
12. Connect negative battery cable.

## ASSEMBLY-EXHAUST GAS RECIRCULATION VALVE

### DESCRIPTION

The EGR valve consists of three major components. First there is the pintle, valve seat, and housing which contains and regulates the gas flow. Second there is the armature, return spring, and solenoid coil to provide the operating force to regulate the flow by changing the pintle position. The solenoid coil assembly is in parallel with a diode and connects to the two connectors in the connector assembly. The third major component which senses pintle position and is connected to the three connectors in the electrical connector.

### OPERATION

The exhaust gas recirculation flow is determined by the engine controller. For a given set of conditions, the engine controller knows the ideal exhaust gas recirculation flow to optimize NOx and fuel economy as a function of the pintle position. Pintle position is obtained from the position sensor. The engine controller adjusts the duty cycle of 128 Hz power supplied to the solenoid coil to obtain the correct position.

### REMOVAL

#### 2.7L

1. EGR system components and location. Upper tube (2), EGR valve (1), and Lower tube (3).
2. Disconnect negative battery cable.

3. Remove purge solenoid from bracket.

4. Relocate the purge solenoid.
5. Unlock and disconnect the electrical connector from EGR valve.

6. Remove the bolts from the EGR tube to exhaust manifold.
7. Remove the lower tube bolts to EGR valve and remove tube(3).
8. Remove upper tube bolts to EGR valve (2).
9. Remove the EGR valve mounting bolts (1).
10. Remove valve from vehicle.
11. Clean mounting surface.

### 3.5L

1. Disconnect negative battery cable.
2. Remove purge solenoid from bracket.

3. Relocate the purge solenoid.

4. Unlock and disconnect the electrical connector from EGR valve.
5. Remove the wiper module, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - REMOVAL).
6. Remove shock tower brace and relocate.
7. Remove the upper intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - REMOVAL).

8. EGR valve (2) and tube (1).

9. Remove tube bolts (1) to EGR valve (3).
10. Remove tube (1) from intake manifold.
11. When removing EGR upper tube assembly being careful not to drop the silicone rubber seals in the intake manifold. Clean gasket surfaces on the EGR valve. Note that any loose dirt can lodge between the pintle and the seat and cause valve leakage that will give a rough idle and depressed manifold vacuum.
12. Remove EGR valve mounting bolts (2).
13. Remove EGR valve from vehicle.
14. Clean mounting surface.

## 5.7L

The electronic EGR valve and solenoid assembly (3) is attached to the front of the right cylinder head (1). An exhaust gas routing tube connects the EGR valve to the intake manifold.

1. Disconnect electrical connector (1) from EGR solenoid (2).
2. Remove two bolts (3) connecting EGR tube (4) to valve assembly.
3. Remove gasket located between EGR tube flange and EGR valve assembly.

4. Remove two mounting bolts (2).
5. Separate valve assembly (3) from cylinder head (1).
6. Remove and discard metal gasket located between cylinder head and valve assembly.

## INSTALLATION

### 2.7L

1. Clean mounting surface.

2. Install EGR valve.

3. Install the EGR valve mounting bolts (1).

4. Inspect rubber silicone seals on intake manifold end of EGR tube.

5. Install upper tube into the intake manifold, being careful that the silicone rubber seals are correctly installed and undamaged..

6. Install new gasket between the EGR valve and upper tube and install bolts (2).

7. Install the lower tube to exhaust manifold.

8. Install new gasket between the EGR valve and lower tube and install bolts (3).

9. Tighten the lower tube to EGR valve bolts (3) to 11 N·m (95 in. lbs.) torque.

10. Tighten the lower tube to exhaust manifold bolts to 31 N·m (275 in. lbs.) torque.

11. Tighten the upper tube to EGR valve bolts (2) to 11 N·m (95 in. lbs.) torque.

12. Tighten EGR valve to cylinder head bolts (1) to 31 N·m (275 in. lbs.) torque.

13. Connect the electrical connector to EGR valve and lock.
14. Relocate the purge solenoid.

15. Install purge solenoid to bracket.
16. Connect negative battery cable.

### 3.5L

1. Clean mounting surface.
2. Inspect rubber silicone seals on intake manifold end of EGR tube.
3. Install tube into the intake manifold being careful that the silicone rubber seals are correctly installed and undamaged.

4. Install new gasket between the EGR valve (3) and tube and install bolts (1).
5. Tighten the EGR tube to EGR valve bolts to 11 N·m (95 in. lbs.) torque.

6. Connect the electrical connector to EGR valve and lock.
7. Install upper intake manifold, (Refer to 9 - ENGINE/MANIFOLDS/INTAKE MANIFOLD - INSTALLATION).
8. Install the shock tower brace.
9. Install the wiper module, (Refer to 8 - ELECTRICAL/WIPERS/WASHERS/WIPER MODULE - INSTALLATION).
10. Relocate the purge solenoid.

11. Install purge solenoid to bracket.
12. Connect negative battery cable.

**5.7L**

1. Position a new metal gasket between cylinder head (1) and valve assembly (3).
2. Install two mounting bolts (2) and tighten. Refer to Torque Specifications.

3. Clean EGR tube where it joins EGR valve.
4. Position new gasket between EGR tube flange and EGR valve assembly.
5. Install two bolts (3) connecting EGR tube (4) to valve assembly (2). Tighten bolts. Refer to Torque Specifications.
6. Connect electrical connector (1) to EGR solenoid (2).

# ON-BOARD DIAGNOSTICS

## TABLE OF CONTENTS

	page		page
<b>TASK MANAGER</b>		<b>OPERATION</b>	57
DESCRIPTION .....	57		

## TASK MANAGER

### DESCRIPTION

The PCM is responsible for efficiently coordinating the operation of all the emissions-related components. The PCM is also responsible for determining if the diagnostic systems are operating properly. The software designed to carry out these responsibilities is called the "Task Manager".

### OPERATION

The Task Manager determines when tests happen and when functions occur. Many of the diagnostic steps required by OBD II must be performed under specific operating conditions. The Task Manager software organizes and prioritizes the diagnostic procedures. The job of the Task Manager is to determine if conditions are appropriate for tests to be run, monitor the parameters for a trip for each test, and record the results of the test. Following are the responsibilities of the Task Manager software:

- Test Sequence
- MIL Illumination
- Diagnostic Trouble Codes (DTCs)
- Trip Indicator
- Freeze Frame Data Storage
- Similar Conditions Window

### Test Sequence

In many instances, emissions systems must fail diagnostic tests more than once before the PCM illuminates the MIL. These tests are known as 'two trip monitors.' Other tests that turn the MIL lamp on after a single failure are known as 'one trip monitors.' A trip is defined as 'start the vehicle and operate it to meet the criteria necessary to run the given monitor.'

Many of the diagnostic tests must be performed under certain operating conditions. However, there are times when tests cannot be run because another test is in progress (conflict), another test has failed (pending) or the Task Manager has set a fault that may cause a failure of the test (suspend).

- **Pending**

Under some situations the Task Manager will not run a monitor if the MIL is illuminated and a fault is stored from another monitor. In these situations, the Task Manager postpones monitors **pending** resolution of the original fault. The Task Manager does not run the test until the problem is remedied.

For example, when the MIL is illuminated for an Oxygen Sensor fault, the Task Manager does not run the Catalyst Monitor until the Oxygen Sensor fault is remedied. Since the Catalyst Monitor is based on signals from the Oxygen Sensor, running the test would produce inaccurate results.

- **Conflict**

There are situations when the Task Manager does not run a test if another monitor is in progress. In these situations, the effects of another monitor running could result in an erroneous failure. If this **conflict** is present, the monitor is not run until the conflicting condition passes. Most likely the monitor will run later after the conflicting monitor has passed.

For example, if the Fuel System Monitor is in progress, the Task Manager does not run the catalyst Monitor. Since both tests monitor changes in air/fuel ratio and adaptive fuel compensation, the monitors will conflict with each other.

- **Suspend**

Occasionally the Task Manager may not allow a two trip fault to mature. The Task Manager will **suspend** the maturing of a fault if a condition exists that may induce an erroneous failure. This prevents illuminating the MIL for the wrong fault and allows more precise diagnosis.

For example, if the PCM is storing a one trip fault for the Oxygen Sensor and the catalyst monitor, the Task Manager may still run the catalyst Monitor but will suspend the results until the Oxygen Sensor Monitor either passes or fails. At that point the Task Manager can determine if the catalyst system is actually failing or if an Oxygen Sensor is failing.

### **MIL Illumination**

The PCM Task Manager carries out the illumination of the MIL. The Task Manager triggers MIL illumination upon test failure, depending on monitor failure criteria.

The Task Manager Screen shows both a Requested MIL state and an Actual MIL state. When the MIL is illuminated upon completion of a test for a good trip, the Requested MIL state changes to OFF. However, the MIL remains illuminated until the next key cycle. (On some vehicles, the MIL will actually turn OFF during the third good trip) During the key cycle for the third good trip, the Requested MIL state is OFF, while the Actual MIL state is ON. After the next key cycle, the MIL is not illuminated and both MIL states read OFF.

### **Diagnostic Trouble Codes (DTCs)**

With OBD II, different DTC faults have different priorities according to regulations. As a result, the priorities determine MIL illumination and DTC erasure. DTCs are entered according to individual priority. DTCs with a higher priority overwrite lower priority DTCs.

#### **Priorities**

- Priority 1 One-Trip Failure of Non-Fuel or Non-Mis-Fire Fault (e.g., Cat Mon Failure)
- Priority 3 Matured Fault (either One-Trip or Two-Trip) Non-Fuel & Non-Mis-Fire
- Priority 4 One-Trip Failure of Fuel System or Mis-Fire Fault
- Priority 6 Matured Fault for Fuel System or Mis-Fire (either One-Trip or Two-Trip)

Non-emissions related failures have no priority. One trip failures of two trip faults have low priority. Two trip failures or matured faults have higher priority. One and two trip failures of fuel system and misfire monitor take precedence over non-fuel system and non-misfire failures.

### **DTC Self Erasure**

With one trip components or systems, the MIL is illuminated upon test failure and DTCs are stored.

Two trip monitors are components requiring failure in two consecutive trips for MIL illumination. Upon failure of the first test, the Task Manager enters a maturing code. If the component fails the test for a second time the code matures and a DTC is set.

After three good trips the MIL is extinguished and the Task Manager automatically switches the trip counter to a warm-up cycle counter. DTCs are automatically erased following 40 warm-up cycles if the component does not fail again.

For misfire and fuel system monitors, the component must pass the test under a Similar Conditions Window in order to record a good trip. A Similar Conditions Window is when engine RPM is within  $\pm 375$  RPM and load is within  $\pm 20\%$  of when the fault occurred.

**Note: It is important to understand that a component does not have to fail under a similar window of operation to mature. It must pass the test under a Similar Conditions Window when it failed to record a Good Trip for DTC erasure for misfire and fuel system monitors.**

DTCs can be erased anytime with a scan tool. Erasing the DTC with the scan tool erases all OBD II information. The scan tool automatically displays a warning that erasing the DTC will also erase all OBD II monitor data. This includes all counter information for warm-up cycles, trips and Freeze Frame.

### **Trip Indicator**

The **Trip** is essential for running monitors and extinguishing the MIL. In OBD II terms, a trip is a set of vehicle operating conditions that must be met for a specific monitor to run. All trips begin with a key cycle.

## Good Trip

The Good Trip counters are as follows:

- Global Good Trip
- Fuel System Good Trip
- Misfire Good Trip
- Alternate Good Trip (appears as a Global Good Trip on scan tool)
  - Comprehensive Components
  - Major Monitor
- Warm-Up Cycles

### Global Good Trip

To increment a Global Good Trip, the Oxygen sensor and Catalyst efficiency monitors must have run and passed, and 2 minutes of engine run time.

### Fuel System Good Trip

To count a good trip (three required) and turn off the MIL, the following conditions must occur:

- Engine in closed loop
- Operating in Similar Conditions Window
- Short Term multiplied by Long Term less than threshold
- Less than threshold for a predetermined time

If all of the previous criteria are met, the PCM will count a good trip (three required) and turn off the MIL.

### Misfire Good Trip

If the following conditions are met the PCM will count one good trip (three required) in order to turn off the MIL:

- Operating in Similar Condition Window
- 1000 engine revolutions with no misfire

### Alternate Good Trip

Alternate Good Trips are used in place of Global Good Trips for Comprehensive Components and Major Monitors. If the Task Manager cannot run a Global Good Trip because a component fault is stopping the monitor from running, it will attempt to count an Alternate Good Trip.

The Task Manager counts an Alternate Good Trip for Comprehensive components when the following conditions are met:

- Two minutes of engine run time, idle or driving
- No other faults occur

The Task Manager counts an Alternate Good Trip for a Major Monitor when the monitor runs and passes. Only the Major Monitor that failed needs to pass to count an Alternate Good Trip.

### Warm-Up Cycles

Once the MIL has been extinguished by the Good Trip Counter, the PCM automatically switches to a Warm-Up Cycle Counter that can be viewed on the scan tool. Warm-Up Cycles are used to erase DTCs and Freeze Frames. Forty Warm-Up cycles must occur in order for the PCM to self-erase a DTC and Freeze Frame. A Warm-Up Cycle is defined as follows:

- Engine coolant temperature must start below and rise above 160° F
- Engine coolant temperature must rise by 40° F
- No further faults occur

### Freeze Frame Data Storage

Once a failure occurs, the Task Manager records several engine operating conditions and stores it in a Freeze Frame. The Freeze Frame is considered one frame of information taken by an on-board data recorder. When a fault occurs, the PCM stores the input data from various sensors so that technicians can determine under what vehicle operating conditions the failure occurred.

The data stored in Freeze Frame is usually recorded when a system fails the first time for two trip faults. Freeze Frame data will only be overwritten by a different fault with a higher priority.

**CAUTION:** Erasing DTCs, either with the scan tool; or by disconnecting the battery, also clears all Freeze Frame data.

### Similar Conditions Window

The Similar Conditions Window displays information about engine operation during a monitor. Absolute MAP (engine load) and Engine RPM are stored in this window when a failure occurs. There are two different Similar conditions Windows: Fuel System and Misfire.

#### FUEL SYSTEM

- **Fuel System Similar Conditions Window** — An indicator that 'Absolute MAP When Fuel Sys Fail' and 'RPM When Fuel Sys Failed' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Fuel Sys Fail** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Fuel Sys Fail** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **Upstream O2S Volts** — A live reading of the Oxygen Sensor to indicate its performance. For example, stuck lean, stuck rich, etc.
- **SCW Time in Window (Similar Conditions Window Time in Window)** — A timer used by the PCM that indicates that, after all Similar Conditions have been met, if there has been enough good engine running time in the SCW without failure detected. This timer is used to increment a Good Trip.
- **Fuel System Good Trip Counter** — A Trip Counter used to turn OFF the MIL for Fuel System DTCs. To increment a Fuel System Good Trip, the engine must be in the Similar Conditions Window, Adaptive Memory Factor must be less than calibrated threshold and the Adaptive Memory Factor must stay below that threshold for a calibrated amount of time.
- **Test Done This Trip** — Indicates that the monitor has already been run and completed during the current trip.

#### MISFIRE

- **Same Misfire Warm-Up State** — Indicates if the misfire occurred when the engine was warmed up (above 160° F).
- **In Similar Misfire Window** — An indicator that 'Absolute MAP When Misfire Occurred' and 'RPM When Misfire Occurred' are all in the same range when the failure occurred. Indicated by switching from 'NO' to 'YES'.
- **Absolute MAP When Misfire Occurred** — The stored MAP reading at the time of failure. Informs the user at what engine load the failure occurred.
- **Absolute MAP** — A live reading of engine load to aid the user in accessing the Similar Conditions Window.
- **RPM When Misfire Occurred** — The stored RPM reading at the time of failure. Informs the user at what engine RPM the failure occurred.
- **Engine RPM** — A live reading of engine RPM to aid the user in accessing the Similar Conditions Window.
- **Adaptive Memory Factor** — The PCM utilizes both Short Term Compensation and Long Term Adaptive to calculate the Adaptive Memory Factor for total fuel correction.
- **200 Rev Counter** — Counts 0–100 720 degree cycles.
- **SCW Cat 200 Rev Counter** — Counts when in similar conditions.
- **SCW FTP 1000 Rev Counter** — Counts 0–4 when in similar conditions.
- **Misfire Good Trip Counter** — Counts up to three to turn OFF the MIL.
