

2011-2014 DODGE CHALLENGER

ENGINE

3.5L - Service Information - Challenger

DESCRIPTION

3.5L

8136b5ae

Fig. 1: 3.5L ENGINE
Courtesy of CHRYSLER LLC

The 3.5 Liter (214 Cubic Inches) 60°V-6 engine is a single overhead camshaft design with hydraulic lifters and four valves per cylinder. The engine does not have provisions for a free wheeling valve train.

80as647a

Fig. 2: Cylinder Numbering and Firing Order
Courtesy of CHRYSLER LLC

The cylinders are numbered from front to rear, with the right bank odd numbered, and the left bank even numbered. The firing order is 1-2-3-4-5-6.

81130b73

Fig. 3: ENGINE IDENTIFICATION
Courtesy of CHRYSLER LLC

- 1 - REAR OF LEFT CYLINDER HEAD

2 - ENGINE IDENTIFICATION NUMBER

The engine identification number (2) is located on the rear of engine block just below the left cylinder head (1).

DIAGNOSIS AND TESTING

INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either mechanical (e.g., a strange noise), or performance (e.g., engine idles rough and stalls).

See **ENGINE PERFORMANCE** and **ENGINE MECHANICAL** for possible causes and corrections of malfunctions. Refer to **FUEL SYSTEM** for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that cannot be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following:

- Cylinder Compression Pressure Test: Refer to **CYLINDER COMPRESSION PRESSURE TEST**.
- Cylinder Combustion Pressure Leakage Test: Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE TEST**.
- Cylinder Head Gasket Failure Diagnosis: Refer to **CYLINDER HEAD GASKET**.
- Intake Manifold Leakage Diagnosis: Refer to **MANIFOLD, Intake**.
- Lash Adjuster (Tappet) Noise Diagnosis: Refer to **LASH ADJUSTER (TAPPET) NOISE DIAGNOSIS**.
- Engine Oil Leak Inspection: Refer to **ENGINE OIL LEAK INSPECTION**.

ENGINE PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery.	1. Test battery. Charge or replace as necessary. Refer to <u>Electrical/Battery System/BATTERY - Description</u> .
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Apply a coat of light mineral grease to terminals.
	3. Faulty starter.	3. Test starting system. Refer to

	<p>4. Faulty coil(s) or control unit.</p> <p>5. Incorrect spark plug gap.</p> <p>6. Contamination in fuel system.</p> <p>7. Faulty fuel pump.</p> <p>8. Incorrect engine timing.</p>	<p><u>Electrical/Starting - Diagnosis and Testing .</u></p> <p>4. Test and replace as needed. (Refer to Appropriate Diagnostic Information)</p> <p>5. Check and adjust gap as needed.</p> <p>6. Clean system and replace fuel filter.</p> <p>7. Test fuel pump and replace as needed. (Refer to Appropriate Diagnostic Information)</p> <p>8. Check for a skipped timing belt or a loose camshaft sprocket.</p>
ENGINE STALLS OR IDLES ROUGH	<p>1. Idle speed too low.</p> <p>2. Incorrect fuel mixture.</p> <p>3. Intake manifold leakage.</p> <p>4. Faulty coil(s).</p>	<p>1. Test minimum air flow. (Refer to Appropriate Diagnostic Information)</p> <p>2. (Refer to Appropriate Diagnostic Information)</p> <p>3. Inspect intake manifold gasket, manifold, and vacuum hoses.</p> <p>4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)</p>
ENGINE LOSS OF POWER	<p>1. Dirty or incorrectly gapped plugs.</p> <p>2. Contamination in fuel system.</p> <p>3. Faulty fuel pump.</p> <p>4. Incorrect valve timing.</p> <p>5. Leaking cylinder head gasket.</p> <p>6. Low compression.</p> <p>7. Burned, warped, or pitted valves.</p> <p>8. Plugged or restricted exhaust system.</p>	<p>1. Set gap as needed or replace plug(s).</p> <p>2. Clean system and replace fuel filter.</p> <p>3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)</p> <p>4. Correct valve timing as needed.</p> <p>5. Replace cylinder head gasket.</p> <p>6. Test compression of each cylinder.</p> <p>7. Replace valves.</p> <p>8. Check exhaust system restriction. Replace parts, as</p>

	9. Faulty coil(s).	necessary. 9. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES ON ACCELERATION	1. Dirty or incorrectly gapped spark plugs. 2. Contamination in Fuel System. 3. Burned, warped, or pitted valves. 4. Faulty coil(s).	1. Set gap as needed or replace plug(s). 2. Clean fuel system and replace fuel filter. 3. Replace valves. 4. Test and replace as necessary. (Refer to Appropriate Diagnostic Information)
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrect spark plug gap. 2. Faulty coil(s). 3. Dirty fuel injector(s). 4. Contamination in fuel system.	1. Set gap as needed or replace plug(s). 2. Test and replace as necessary. (Refer to Appropriate Diagnostic Information) 3. Test and replace as necessary. (Refer to Appropriate Diagnostic Information) 4. Clean system and replace fuel filter.

ENGINE MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES	1. High or low oil level in crankcase. 2. Thin or diluted oil. 3. Thick oil 4. Low oil pressure. 5. Dirt in tappets/lash adjusters. 6. Worn rocker arms.	1. Check and correct engine oil level. 2. Change oil to correct viscosity. 3. (a.) Change oil and filter. (b.) Run engine to operating temperature. (c.) Change oil and filter again. 4. Check and correct engine oil level. 5. Replace rocker arm/hydraulic lash adjuster assembly. 6. Inspect oil supply to rocker

	<p>7. Worn tappets/lash adjusters.</p> <p>8. Worn valve guides.</p> <p>9. Excessive runout of valve seats on valve faces.</p> <p>10. Missing adjuster pivot.</p>	<p>arms.</p> <p>7. Install new rocker arm/hydraulic lash adjuster assembly.</p> <p>8. Replace cylinder head(s).</p> <p>9. Grind valve seats and valves.</p> <p>10. Replace rocker arm/hydraulic lash adjuster assembly.</p>
CONNECTING ROD NOISE	<p>1. Insufficient oil supply.</p> <p>2. Low oil pressure.</p> <p>3. Thick/Thin or diluted oil.</p> <p>-</p> <p>(b.) Run engine to operating temperature.</p> <p>(c.) Change oil and filter again.</p> <p>4. Excessive bearing clearance.</p> <p>5. Connecting rod journal out-of-round.</p> <p>6. Misaligned connecting rods.</p>	<p>1. Check engine oil level.</p> <p>2. Check engine oil level. Inspect oil pump relief valve and spring.</p> <p>3. Change oil to correct viscosity.</p> <p>3. (a.) Change oil and filter.</p> <p>4. Measure bearings for correct clearance. Repair as necessary.</p> <p>5. Replace crankshaft or grind surface.</p> <p>6. Replace bent connecting rods.</p>
MAIN BEARING NOISE	<p>1. Insufficient oil supply.</p> <p>2. Low oil pressure.</p> <p>3. Thick/Thin or diluted oil.</p> <p>-</p> <p>(b.) Run engine to operating temperature.</p> <p>(c.) Change oil and filter again.</p> <p>4. Excessive bearing clearance.</p> <p>5. Excessive end play.</p> <p>6. Crankshaft journal out-of-round or worn.</p> <p>7. Loose flywheel or torque</p>	<p>1. Check engine oil level.</p> <p>2. Check engine oil level. Inspect oil pump relief valve and spring.</p> <p>3. Change oil to correct viscosity.</p> <p>3. (a.) Change oil and filter.</p> <p>4. Measure bearings for correct clearance. Repair as necessary.</p> <p>5. Check thrust bearing for wear on flanges.</p> <p>6. Replace crankshaft or grind journals.</p> <p>7. Tighten to correct torque.</p>

	converter.	
OIL PRESSURE DROP	<ol style="list-style-type: none"> 1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn parts in oil pump. 6. Thin or diluted oil. 7. Oil pump relief valve stuck. 8. Oil pump suction tube loose. 9. Oil pump cover warped or cracked. 10. Excessive bearing clearance. 	<ol style="list-style-type: none"> 1. Check engine oil level. 2. Install new sending unit. 3. Check sending unit and main bearing oil clearance. 4. Install new oil filter. 5. Replace worn parts or pump. 6. Change oil to correct viscosity. 7. Remove valve and inspect, clean, or replace. 8. Remove oil pan and install new tube or clean, if necessary. 9. Install new oil pump. 10. Measure bearings for correct clearance.
OIL LEAKS	<ol style="list-style-type: none"> 1. Misaligned or deteriorated gaskets. 2. Loose fastener, broken or porous metal part. 3. Misaligned or deteriorated cup or threaded plug. 	<ol style="list-style-type: none"> 1. Replace gasket(s). 2. Tighten, repair or replace the part. 3. Replace as necessary.
OIL CONSUMPTION OR SPARK PLUGS FOULED	<ol style="list-style-type: none"> 1. PCV system malfunction. 2. Worn, scuffed or broken rings. 3. Carbon in oil ring slots. 4. Rings fitted too tightly in grooves. 5. Worn valve guide(s). 6. Valve stem seal(s) worn or damaged. 	<ol style="list-style-type: none"> 1. Check system and repair as necessary. (Refer to Appropriate Diagnostic Information) 2. Hone cylinder bores. Install new rings. 3. Clean pistons and install new rings. 4. Remove rings and check grooves. If groove is not proper width, replace piston. 5. Replace cylinder head(s). 6. Replace seal(s).

CYLINDER COMPRESSION PRESSURE TEST

The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Check engine oil level and add oil if necessary.
2. Drive the vehicle until engine reaches normal operating temperature. Select a route free from traffic and other forms of congestion, observe all traffic laws, and accelerate through the gears several times briskly.
3. Remove all spark plugs from engine. As spark plugs are being removed, check electrodes for abnormal firing indicators such as fouled, hot, oily, etc. Record cylinder number of spark plug for future reference.
4. Remove the Auto Shutdown (ASD) relay from the TIPM.
5. Insert compression gauge adaptor Special Tool 8116 or the equivalent, into the #1 spark plug hole in cylinder head. Connect the 0-500 psi (Blue) pressure transducer (Special Tool CH7059) with cable adaptors to the scan tool. For Special Tool identification, see **Engine - Special Tools**.
6. Crank engine until maximum pressure is reached on gauge. Record this pressure as #1 cylinder pressure.
7. Repeat the previous step for all remaining cylinders.
8. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
9. If one or more cylinders have abnormally low compression pressures, repeat the compression test.
10. If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question. **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

CYLINDER COMBUSTION PRESSURE LEAKAGE TEST

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
- Leaks between adjacent cylinders or into water jacket.
- Any causes for combustion/compression pressure loss.

WARNING: DO NOT REMOVE THE PRESSURE CAP WITH THE SYSTEM HOT AND UNDER PRESSURE BECAUSE SERIOUS BURNS FROM COOLANT CAN OCCUR.

1. Check the coolant level and fill as required. DO NOT install the pressure cap.
2. Start and operate the engine until it attains normal operating temperature, then turn the engine

OFF.

3. Clean spark plug recesses with compressed air.
4. Remove the spark plugs.
5. Remove the oil filler cap.
6. Remove the air cleaner.
7. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum, with 552 kPa (80 psi) recommended.
8. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the coolant.
9. All gauge pressure indications should be equal, with no more than 25% leakage per cylinder.
10. **FOR EXAMPLE:** At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

ENGINE OIL LEAK INSPECTION

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil level indicator to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair as necessary.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.
5. **If the oil leak source is not positively identified at this time**, proceed with the AIR LEAK DETECTION TEST METHOD as follows:
 - Disconnect the fresh air hose (make-up air) at the cylinder head cover and plug or cap the nipple on the cover.
 - Remove the PCV valve hose from the cylinder head cover. Cap or plug the PCV valve nipple on the cover.
 - Attach an air hose with pressure gauge and regulator to the oil level indicator tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

- Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provides the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified,

repair per service information procedures.

- If the leakage occurs at the crankshaft rear oil seal area, refer to **INSPECTION FOR REAR SEAL AREA LEAKS**.

6. If no leaks are detected, turn off the air supply. Remove the air hose, all plugs, and caps. Install the PCV valve and fresh air hose (make-up air). Proceed to next step.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

NOTE: If oil leakage is observed at the oil level indicator tube to block location; remove the tube, clean and reseal using Mopar® Stud AND Bearing Mount (press fit tube applications only), and for O-ring style tubes, remove tube and replace the O-ring seal.

CAUTION: Do not exceed 20.6 kPa (3 psi).

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak. If a leak is present in this area, remove transmission for further inspection.
 - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - b. Where leakage tends to run straight down, possible causes are a porous block, oil gallery cup plug, bedplate to cylinder block mating surfaces and seal bore. See appropriate component repair procedures for these items.
4. If no leaks are detected, pressurize the crankcase as previously described in step 5 under ENGINE OIL LEAK INSPECTION.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.
7. After the oil leak root cause and appropriate corrective action have been identified, replace component(s) as necessary.

STANDARD PROCEDURE

FORM-IN-PLACE GASKETS AND SEALERS

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is

specially made to seal the area between the bedplate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. Can be used on threaded and machined parts under all temperatures. This material is used on engines with multi-layer steel (MLS) cylinder head gaskets. This material also will prevent corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or 4oz./16 oz. can w/applicator.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Gasket Sealant in an aerosol can should be applied using a thin, even coat sprayed completely over both surfaces to be joined, and both sides of a gasket. Then proceed with assembly. Material in a can w/applicator can be brushed on evenly over the sealing surfaces. Material in an aerosol can should be used on engines with multi-layer steel gaskets.

ENGINE GASKET SURFACE PREPARATION

Fig. 4: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER |
|--|

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper
- Abrasive pad or paper to clean cylinder block and head
- High speed power tool with an abrasive pad or a wire brush.

NOTE: **Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper.
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow).

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

REPAIR OF DAMAGED OR WORN THREADS

Damaged or worn threads (excluding spark plug and camshaft bearing cap attaching threads) can be repaired. Essentially, this repair consists of drilling out worn or damaged threads, tapping the hole with a special Heli-Coil Tap, (or equivalent) and installing an insert into the tapped hole. This brings the hole back to its original thread size.

CAUTION: Be sure that the tapped holes maintain the original center line.

Heli-Coil tools and inserts are readily available from automotive parts jobbers.

HYDROSTATIC LOCKED ENGINE

When an engine is suspected to be hydrostatically locked, regardless of what caused the problem,

the following steps should be used.

CAUTION: DO NOT use starter motor to rotate the engine, severe damage may occur.

1. Inspect air cleaner, induction system and intake manifold to insure system is dry and clear of foreign material.
2. Remove negative battery cable.
3. Place a shop towel around the spark plugs when removing them from the engine. This will catch any fluid that may possibly be in the cylinder under pressure.
4. With all spark plugs removed, rotate engine crankshaft using a breaker bar and socket.
5. Identify the fluid in the cylinder(s) (i.e., coolant, fuel, oil or other).
6. Make sure all fluid has been removed from the cylinders. Inspect engine for damage (i.e., connecting rods, pistons, valves, etc.)
7. Repair engine or components as necessary to prevent this problem from reoccurring.

CAUTION: Squirt approximately one teaspoon of oil into the cylinders, rotate engine to lubricate the cylinder walls to prevent damage on restart.

8. Install new spark plugs.
9. Drain engine oil and remove oil filter.
10. Install a new oil filter.
11. Fill engine with specified amount of approved oil.
12. Connect negative battery cable.
13. Start engine and check for any leaks.

ENGINE CORE AND OIL GALLERY PLUGS

Fig. 5: Core Hole Plug Removal
Courtesy of CHRYSLER LLC

- 1 - CYLINDER BLOCK
- 2 - REMOVE PLUG WITH PLIERS
- 3 - STRIKE HERE WITH HAMMER
- 4 - DRIFT PUNCH
- 5 - CUP PLUG

Using a blunt tool such as a drift (3) and a hammer, strike the bottom edge of the cup plug (5). With the cup plug rotated, grasp firmly with pliers (2) or other suitable tool and remove plug (5).

CAUTION: Do not drive cup plug into the casting as restricted cooling can result and cause serious engine problems.

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer. Lightly coat inside of cup plug hole with Mopar® Stud and Bearing Mount. Make certain the new plug is cleaned of all oil or grease. Using proper drive plug, drive plug into hole so that the sharp edge of the plug is at least 0.5 mm (0.020 in.) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be refilled and the vehicle placed in service immediately.

REMOVAL

REMOVAL

Fig. 6: Removing/Installing Cowl Panel
Courtesy of CHRYSLER LLC

1. Perform the fuel pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .
2. Center and secure the steering wheel.
3. Disconnect and isolate the negative battery cable.
4. Evacuate and recover the refrigerant system. Refer to **Heating and Air Conditioning/Plumbing - Standard Procedure** .
5. Remove the hood. Refer to **Body/Hood/HOOD - Removal** .
6. Remove the windshield cowl panel assembly (1). Refer to **Body/Exterior/COVER, Cowl Panel - Removal** .
7. Remove and reposition the strut tower support (6).

49. Remove the upper radiator hose (1).

81ad3280

Fig. 35: Identifying Coil & Fuel Injector Connectors
Courtesy of CHRYSLER LLC

50. Unlock and disconnect six electrical connectors (2) from the ignition coils.
51. Disconnect six electrical connectors (1) from the fuel injectors.

Fig. 36: Ground Wire & Bolt
 Courtesy of CHRYSLER LLC

52. Disconnect the electrical connector from the right upstream oxygen sensor.
53. Remove the bolt (2) and ground wire (1) from the left cylinder head.

Fig. 37: Electrical Connector - 3.5L
 Courtesy of CHRYSLER LLC

54. Unlock and disconnect the electrical connector from the EGR valve.

Fig. 38: KNOCK SENSOR CONNECTOR
 Courtesy of CHRYSLER LLC

55. Disconnect the electrical connector from the knock sensor.

Fig. 39: Ignition Capacitor - 3.5L
 Courtesy of CHRYSLER LLC

56. Disconnect the ignition capacitor electrical connector (3).
57. Remove the mounting bolt (1) and the ignition capacitor (2).

Fig. 40: Wire Harness Support Bracket & Nuts
 Courtesy of CHRYSLER LLC

58. Remove two nuts (2) from the wire harness support bracket (1) and reposition the wiring harness to the rear of the engine compartment.

Fig. 41: Remove/Install Transmission
 Courtesy of CHRYSLER LLC

1 - ENGINE 2 - BOLTS 3 - TRANSMISSION

59. Remove the four remaining transmission housing to engine mounting bolts (2).

Fig. 42: ENGINE LIFTING BRACKET #8534
Courtesy of CHRYSLER LLC

- | |
|----------------------------------|

| 2 - ENGINE LIFTING BRACKET #8534 |
| 3 - CAM POSITION SENSOR |
| 4 - EGR VALVE |
| 5 - BOLTS |
| 6 - COOLANT PIPE |

60. Connect the engine lifting bracket (2) from the Engine Support Fixture 8534B to the right rear of the cylinder head outer most bolt access hole. Tighten the bolt (5) to 21 N.m (15 ft. lbs.).
61. Install a bolt into the inner most bolt access hole next to the engine lifting bracket to assure lifting bracket positioning. Tighten the bolt (5) to 21 N.m (15 ft. lbs.).

Fig. 43: ENGINE LIFTING POINT
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - LIFTING CHAIN
2 - UPPER TIMING CHAIN COVER
3 - POWER STEERING PUMP
4 - THERMOSTAT HOUSING |
|--|

62. Support the transmission with a jack stand.
63. Connect an engine hoisting chain (1) to the engine lifting point on the left side of the rear timing cover (2) and the previously installed 8534B engine lifting bracket.

Fig. 44: A/C Compressor Mounting Bolt & Transmission Cooling Lines
Courtesy of CHRYSLER LLC

CAUTION: While slowly separating the engine from the vehicle, constant checks must be made to assure proper positioning and that no damage to other components or wiring harnesses occur during separation.

NOTE: As the engine is hoisted from the engine bay area, remove the loosened A/C compressor bolt (1) retaining the transmission cooler lines (2) and direct the lines aside.

64. Carefully remove the engine from the engine bay area.

INSTALLATION

INSTALLATION

CAUTION: Care must be taken when installing the engine to prevent pinching the power steering rack sensor with the left engine mount.

Fig. 45: ENGINE LIFTING BRACKET 8534B
Courtesy of CHRYSLER LLC

- 1 - LIFTING CHAIN
- 2 - ENGINE LIFTING BRACKET from 8534B
- 3 - CAM POSITION SENSOR

- 4 - EGR VALVE
- 5 - BOLTS
- 6 - COOLANT PIPE

1. Connect the engine lifting bracket (2) from the Engine Support Fixture 8534B to the right rear of the cylinder head outer most bolt access hole. Tighten the bolt (5) to 21 N.m (15 ft. lbs.).
2. Install a bolt into the inner most bolt access hole next to the engine lifting bracket to assure lifting bracket positioning. Tighten the bolt (5) to 21 N.m (15 ft. lbs.).

Fig. 46: ENGINE LIFTING POINT
Courtesy of CHRYSLER LLC

- 1 - LIFTING CHAIN
- 2 - UPPER TIMING CHAIN COVER
- 3 - POWER STEERING PUMP
- 4 - THERMOSTAT HOUSING

3. Connect an engine hoisting chain (1) to the engine lifting point on the left side of the rear timing cover (2) and the previously installed 8534B engine lifting bracket.

Fig. 47: A/C Compressor Mounting Bolt & Transmission Cooling Lines
 Courtesy of CHRYSLER LLC

NOTE: As the engine is lowered into the engine bay area, install and hand tighten the A/C compressor bolt (1) retaining the transmission cooler lines (2).

Fig. 48: Remove/Install Transmission
 Courtesy of CHRYSLER LLC

CAUTION: Care must be taken when installing the engine to prevent pinching the power steering rack sensor with the left engine mount. Constantly check to assure proper positioning and no damage

occurs to other components or harnesses until union is made.

4. Carefully install the engine into the engine bay area and complete the union with the transmission.
5. Route the engine wiring harness behind the engine and tighten the four accessible transmission housing to engine mounting bolts (2) to 68 N.m (50 ft. lbs.).

Fig. 49: Wire Harness Support Bracket & Nuts
Courtesy of CHRYSLER LLC

6. Install the wire harness support bracket (1) onto the upper most transmission bolts with two nuts (2). Tighten the nuts (2) to 21 N.m (15 ft. lbs.).

Fig. 50: Ignition Capacitor - 3.5L
Courtesy of CHRYSLER LLC

7. Install the ignition capacitor (2) and tighten the mounting bolt (1) to 21 N.m (15 ft. lbs.).
8. Connect the ignition capacitor electrical connector (3).

Fig. 51: KNOCK SENSOR CONNECTOR
Courtesy of CHRYSLER LLC

9. Connect the electrical connector to the knock sensor.

Fig. 52: Electrical Connector - 3.5L

- 1 - BOLT
- 2 - CCV HOSE
- 3 - THROTTLE
- 4 - IAT SENSOR
- 5 - INLET AIR DUCT
- 6 - AIR CLEANER ELEMENT HOUSING

33. Install the air cleaner body (6). See **Engine/Air Intake System/BODY, Air Cleaner - Installation**.

Fig. 68: Identifying Engine Mounts, Oil Pan, Drain Plug & Oil Filter
Courtesy of CHRYSLER LLC

34. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.
35. Install the engine mount to cradle nuts (1) and tighten to 75 N.m (55 ft. lbs.).

81376109

Fig. 69: Removing/Installing Transmission To Oil Pan Bolts - 3.5L
Courtesy of CHRYSLER LLC

36. Install the four bolts (1) securing the engine oil pan (2) to the transmission (3) and tighten to 55 N.m (40 ft. lbs.).

8134b2cc

Fig. 70: Remove/Install Transmission
Courtesy of CHRYSLER LLC

37. Install the two remaining engine to transmission housing mounting bolts (2) accessible from below the vehicle and tighten to 68 N.m (50 ft. lbs.).

81376c0b

Fig. 71: Removing/Installing Torque Converter Bolts
Courtesy of CHRYSLER LLC

38. Install the torque converter bolts (3):

81376c0d

Fig. 72: Removing/Installing Torque Converter Access Cover - 3.5L
Courtesy of CHRYSLER LLC

- If equipped with the 42RLE transmission, tighten the four bolts to 75 N.m (55 ft. lbs.).
 - If equipped with the NAG1 transmission, tighten the six bolts to 42 N.m (31 ft. lbs.).
39. Install the torque converter access cover (1). Tighten the bolt (2) to 12 N.m (105 in. lbs.).

Fig. 73: Starter And Fasteners
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - STARTER
2 - BOLTS
3 - CLOSEOUT PLATE |
|--|

40. Install the starter (1) and closeout plate (3). Refer to **Electrical/Starting/STARTER - Installation** .

Fig. 74: RIGHT EXHAUST PIPE TO MANIFOLD UNION
 Courtesy of CHRYSLER LLC

41. Connect the right exhaust pipe to the exhaust manifold (1) and tighten the ball flange nuts to 34 N.m (25 ft. lbs.).
42. Connect the electrical connector to the right downstream oxygen sensor (2).

Fig. 75: Left Exhaust Pipe To Manifold Union
Courtesy of CHRYSLER LLC

1 - HO2S #1 2 - EXHAUST UNION 3 - HO2S-#2

43. Connect the left exhaust pipe to the exhaust manifold (2) and tighten the ball flange nuts to 34 N.m (25 ft. lbs.).
44. Connect the electrical connector (1) to the left downstream oxygen sensor (3).

Fig. 76: Removing/Installing Crankshaft Position Sensor
 Courtesy of CHRYSLER LLC

45. Install the crankshaft position sensor. Refer to **Fuel System/Fuel Injection/SENSOR, Crankshaft Position - Installation** .

Fig. 77: ENGINE BLOCK HEATER
 Courtesy of CHRYSLER LLC

- | |
|----------------------------|
| 1 - NEGATIVE BATTERY CABLE |
| 2 - NEGATIVE BATTERY CABLE |

- 3 - BLOCK HEATER HARNESS
- 4 - ENGINE BLOCK HEATER

46. Install the ground strap (3) to the transmission mounting bolt. Tighten the nut to 21 N.m (15 ft. lbs.).
47. Attach the power cord to the engine block heater (4) (if equipped).

Fig. 78: A/C Compressor Mounting Bolt & Transmission Cooling Lines
Courtesy of CHRYSLER LLC

48. Tighten the previously installed A/C compressor mounting bolt (1) securing the transmission cooling lines (2) to 26 N.m (19 ft. lbs.).

Fig. 79: Engine Coolant Tube & Heater Hose
Courtesy of CHRYSLER LLC

49. Connect the heater hose (2) to the oil cooler (if equipped) or to the engine coolant tube (1).

Fig. 80: Steering Coupling
Courtesy of CHRYSLER LLC

CAUTION: Prior to coupling installation, make sure gear is centered in its travel to match clockspring centering in steering column.

50. Align the coupling (2) with the input shaft (3) and install the steering coupling. Install a new pinch bolt (1). Tighten the bolt to 54 N.m (40 ft. lbs.).

Fig. 81: Alternator Electrical Connection
Courtesy of CHRYSLER LLC

51. Connect the generator electrical connections. Refer to **Electrical/Charging/GENERATOR - Installation** .

81348617

Fig. 82: RADIATOR HOSES
Courtesy of CHRYSLER LLC

52. Connect the lower radiator hose (2).
53. Install a new oil filter. See **Engine/Lubrication/FILTER, Engine Oil - Installation**.
54. Install the belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .

813768c8

Fig. 83: Removing/Installing Cowl Panel
Courtesy of CHRYSLER LLC

55. Lower the vehicle.
56. Fill the cooling system to the proper level using the appropriate coolant. Refer to **Cooling - Standard Procedure** .
57. Fill engine crankcase with proper oil to correct level. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** .
58. Evacuate and recharge the air conditioning system. Refer to **Heating and Air Conditioning/Plumbing - Standard Procedure** .
59. Install the strut tower support (6) with four bolts. Tighten the bolts to 20 N.m (15 ft. lbs.).
60. Install the windshield cowl panel assembly (1). Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .
61. Install the hood. Refer to **Body/Hood/HOOD - Installation** .
62. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
63. Start and operate the engine until operating temperature is reached and the radiator fans cycle.

NOTE: **The Cam/Crank Variation Relearn procedure must be performed anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. Refer to DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure .**

SPECIFICATIONS

3.5L ENGINE

DESCRIPTION	SPECIFICATION	
Type	60° SOHC V-6 24-Valve	
Displacement	3.5L	
Firing Order	1-2-3-4-5-6	
Compression Ratio	10:1	
Lead Cylinder	#1 Right Bank	
-	Metric	Standard
Displacement	3.5L Liters	214 cu. in.
Bore	96.0 mm	3.780 in.
Stroke	81.0 mm	3.189 in.

1. Align the housing (6) with the lower air inlet duct and alignment grommet in the wheel housing.
2. Properly fit the housing (6) and install housing retaining bolt (1) .
3. Connect the inlet air duct (5) to the housing (6) and tighten clamp.
4. Connect the CCV hose (2) to housing.

CYLINDER HEAD

DESCRIPTION

DESCRIPTION

The aluminum alloy cylinder heads feature cross- flow type intake and exhaust ports. Valve guides and seat inserts are powdered metal. Valves are arranged in a "V", with each camshaft on center. To improve combustion speed the chambers are a compact spherical design with a squish area of approximately 30 percent of the piston top area. The cylinder heads are common to either cylinder bank by reversing the direction of installation.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test. See **CYLINDER COMPRESSION PRESSURE TEST**. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50-70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: WITH COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP, BY CONTINUOUS ENGINE OPERATION, MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

REMOVAL

RIGHT CYLINDER HEAD

Fig. 117: Air Cleaner Housing
Courtesy of CHRYSLER LLC

1. Perform the fuel system pressure relief procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **Cooling - Standard Procedure** .
4. Remove the air cleaner element housing. See **Engine/Air Intake System/BODY, Air Cleaner - Removal**.

Fig. 118: Intake Manifold Braces
 Courtesy of CHRYSLER LLC

5. Remove the upper intake manifold (1) including the wiper module, strut tower support and EGR tube. See **Engine/Manifolds/MANIFOLD, Intake - Removal**.

Fig. 119: FUEL RAIL AND LOWER INTAKE MANIFOLD
 Courtesy of CHRYSLER LLC

6. Remove the fuel rail (1) and lower intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Removal**.

35. Remove the cylinder head bolts in REVERSE of the tightening sequence shown in illustration.
36. Push the camshaft out of the back of the cylinder head approximately 3.5 inches and remove

the cylinder head.

37. Clean and inspect all mating surfaces. If replacing the cylinder head, transfer the exhaust manifold.

CLEANING

CLEANING

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Remove all gasket material from cylinder head and block. See Engine - Standard Procedure. Be careful not to gouge or scratch the aluminum head sealing surface.

Clean all engine oil passages.

INSPECTION

INSPECTION

Fig. 153: Checking Cylinder Head Flatness
Courtesy of CHRYSLER LLC

1. Before cleaning, check for leaks, damage and cracks.
2. Clean cylinder head and oil passages.
3. Check cylinder head for flatness .
4. Cylinder head must be flat within:

CAUTION: 0.20 mm (0.008 in.) MAX is a combined total dimension of the stock removal limit from cylinder head and block top surface (Deck)

together.

- Standard dimension = less than 0.05 mm (0.002 inch.)
- Service Limit = 0.2 mm (0.008 inch.)
- Grinding Limit = Maximum of 0.2 mm (0.008 inch.) is permitted.

INSTALLATION

INSTALLATION

RIGHT CYLINDER HEAD

Fig. 154: Check for Stretched Bolts
Courtesy of CHRYSLER LLC

- | |
|--|
| <p>1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT</p> |
|--|

CAUTION: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

1. Check the cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 155: Right Cylinder Head
Courtesy of CHRYSLER LLC

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

2. Clean the sealing surfaces of the cylinder head and block. See Engine - Standard Procedure.
3. Install the camshaft (5) in the cylinder head.

CAUTION: THE CYLINDER HEAD GASKETS ARE NOT INTERCHANGEABLE BETWEEN CYLINDER HEADS AND ARE CLEARLY MARKED RIGHT OR LEFT.

CAUTION: Ensure that the correct head gaskets are used and are oriented correctly on cylinder block.

4. Push the camshaft (5) out of the back of the cylinder head approximately 3.5 inches. Install the head gasket and cylinder head over the locating dowels.

NOTE: Before installing the cylinder head bolts, lubricate the threads with clean engine oil.

5. Install and finger tighten eight head bolts (2).

80aff4ed

Fig. 156: Cylinder Head Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

6. Tighten the cylinder head bolts in the sequence shown in illustration, using the 4 step torque-turn method to the following torque values:
 - Step 1: All to 61 N.m (45 ft. lbs.)
 - Step 2: All to 88 N.m (65 ft. lbs.)
 - Step 3: All (again) to 88 N.m (65 ft. lbs.)
 - Step 4: + 90° Turn **Do not use a torque wrench for this step.**
7. Bolt torque after the 90° turn (Step 4) should be over 122 N.m (90 ft. lbs.) in the tightening direction. If not, replace the bolt.

80c78e41

Fig. 157: Rear Timing Belt Cover Fasteners
Courtesy of CHRYSLER LLC

8. Install three inner timing cover to cylinder head bolts (1). Tighten the bolts to 54 N.m (40 ft. lbs.).

Fig. 158: RIGHT CAMSHAFT SPROCKET
Courtesy of CHRYSLER LLC

1 - LOOSENED ROCKER ASSEMBLY 2 - RIGHT CAMSHAFT TDC
--

CAUTION: The camshaft sprockets are keyed and not interchangeable from side to side because of the camshaft position sensor pick-up.

9. Push the camshaft back into the cylinder head and install the camshaft sprocket (2).
10. Install a **NEW** sprocket attaching bolt into place. The 255 mm (10 in.) bolt is to be installed in the left camshaft and the 213 mm (8 3/8 in.) bolt is to be installed into the right camshaft. Counterhold the camshaft sprocket (2) and tighten the camshaft sprocket bolt to 102 N.m (75 ft. lbs.) plus a 90° turn.

Fig. 159: Cam Thrust Plate Gasket
 Courtesy of CHRYSLER LLC

11. Install the camshaft thrust plate (1) and gasket (3). Tighten three bolts (2) to 28 N.m (250 in. lbs.).

Fig. 160: EGR Valve Mounting Bolts - 3.5L
 Courtesy of CHRYSLER LLC

12. Install a new gasket between the EGR solenoid/valve (3) and the rear of the cylinder head.
13. Position the EGR solenoid/valve assembly to the rear of the cylinder head. Install and tighten two mounting bolts (2) to 8 N.m (80 in. lbs.).

8136#76

Fig. 161: Identifying Timing Gear Components

1 - RIGHT CAMSHAFT GEAR ALIGNMENT MARK	7 - LEFT CAMSHAFT GEAR
2 - RIGHT CAMSHAFT GEAR	8 - LEFT CAMSHAFT GEAR ALIGNMENT MARK
3 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - RIGHT	9 - CRANKSHAFT GEAR ALIGNMENT MARK
4 - TIMING BELT	10 - CRANKSHAFT GEAR
5 - WATER PUMP PULLEY	11 - TIMING BELT TENSIONER PULLEY
6 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - LEFT	12 - TIMING BELT TENSIONER

14. Rotate the right camshaft gear (2) to align its timing mark (1). Verify that the left camshaft gear (7) timing mark (8) and crankshaft gear (10) timing mark (9) are still aligned.
15. Install the timing belt (4) starting at the crankshaft sprocket (10) going in a counterclockwise direction. Install the belt around the last sprocket. Maintain tension on the belt as it is positioned around the tensioner pulley (11).
16. Holding the tensioner pulley (11) against the belt, install the tensioner (12) into the housing and tighten two bolts to 28 N.m (250 in. lbs.). Each camshaft sprocket mark should remain aligned with the cover marks.
17. When the tensioner is in place, pull the retaining pin to allow the tensioner to extend to the tensioner pulley bracket.
18. Rotate the crankshaft sprocket two revolutions and check the timing marks on the camshafts

and crankshaft. The marks should line up within their respective locations. If the marks do not line up, repeat the procedure.

NOTE: With the camshaft gears in these positions the lobes are in a neutral position (no load to the valve). This will allow the rocker arm shaft assembly to be tightened into position with little or no valve spring load on it.

Fig. 162: Camshaft, Rocker Arm Assembly & Cylinder Head
Courtesy of CHRYSLER LLC

19. Install the rocker arm and shaft assembly (2) and ten bolts making sure that the identification marks face toward the front of engine for the left head and toward the rear of the engine for the right head.

Fig. 163: Rocker Arm/Shaft Assembly Bolt Tightening Sequence

Courtesy of CHRYSLER LLC

20. Tighten the ten rocker arm/shaft assembly bolts in the sequence shown in illustration to 31 N.m (275 in. lbs.).

80b171f3

Fig. 164: Cylinder Head Cover Gasket and Spark Plug Tube Seals
Courtesy of CHRYSLER LLC

21. Clean the cylinder head and cover mating surfaces. Inspect and replace the gasket (1) and seals (2) as necessary. See Engine/Cylinder Head/COVER(S), Cylinder Head - Installation.
22. Install the cylinder head cover and eight bolts. Tighten bolts to 12 N.m (105 in. lbs.).

8134b4b3

Fig. 165: Ignition Coils - Right Cylinder Head
Courtesy of CHRYSLER LLC

23. Install the spark plugs. Tighten to 28 N.m (20 ft. lbs.). Refer to Electrical/Ignition Control/SPARK PLUG - Installation .

24. Install the ignition coils (2) into the cylinder head.
25. Install and tighten the coil mounting bolts to 8 N.m (71 in. lbs.).
26. Reposition the engine wire harness and install the wire harness track retaining tabs (4).
Connect and lock electrical connectors to the ignition coils (2), capacitor (3) and EGR valve.

| 1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT |
|--|

CAUTION: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

1. Check the cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 177: Right Cylinder Head
Courtesy of CHRYSLER LLC

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

2. Clean the sealing surfaces of the cylinder head and block. See **Engine - Standard Procedure**.
3. Install the camshaft (5) in the cylinder head.

CAUTION: THE CYLINDER HEAD GASKETS ARE NOT INTERCHANGEABLE BETWEEN CYLINDER HEADS AND ARE CLEARLY MARKED RIGHT OR LEFT.

CAUTION: Ensure that the correct head gaskets are used and are oriented correctly on cylinder block.

4. Push the camshaft (5) out of the back of the cylinder head approximately 3.5 inches. Install the head gasket and cylinder head over the locating dowels.

NOTE: Before installing the cylinder head bolts, lubricate the threads with clean engine oil.

5. Install and finger tighten eight head bolts (2).

Fig. 178: Cylinder Head Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

6. Tighten the cylinder head bolts in the sequence shown in illustration, using the 4 step torque-turn method to the following torque values:
- Step 1: All to 61 N.m (45 ft. lbs.)
 - Step 2: All to 88 N.m (65 ft. lbs.)
 - Step 3: All (again) to 88 N.m (65 ft. lbs.)
 - Step 4: + 90° Turn **Do not use a torque wrench for this step.**
7. Bolt torque after the 90° turn (Step 4) should be over 122 N.m (90 ft. lbs.) in the tightening direction. If not, replace the bolt.

80c78e41

Fig. 179: Rear Timing Belt Cover Fasteners

43. Install the air cleaner element housing. See **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
44. Connect the negative battery cable. Tighten nut to 5 N.m (45 in. lbs.).
45. Fill and level check the coolant system. Refer to **Cooling - Standard Procedure**.

CAMSHAFT, ENGINE

Description

DESCRIPTION

A single overhead camshaft per cylinder head provides valve actuation. The left camshaft accommodates a cam sensor pick-up wheel and is therefore longer. Each camshaft is supported by four bearing journals. A thrust plate attached to the rear of each cylinder head controls camshaft end play. Right and left camshaft driving sprockets support a timing mark, are keyed, and not interchangeable because of the cam sensor pick-up wheel on the left sprocket. Camshaft bearing lubrication is provided via a oil supply passage through each rocker shaft pedestal dowel.

Operation

OPERATION

The camshaft is driven by the crankshaft via drive sprockets and belt. The camshaft has precisely machined lobes to provide accurate valve timing and duration.

Removal

REMOVAL

Fig. 197: Spark Plug Tube, Rocker Arm Assembly, Camshaft & Seal
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - SPARK PLUG TUBE
2 - ROCKER ARM ASSEMBLY
3 - CAMSHAFT
4 - SEAL |
|--|

NOTE: Camshafts are removed from the rear of each cylinder head.

1. Remove the cylinder head. See Engine/Cylinder Head - Removal.

CAUTION: Care must be taken not to nick or scratch the journals when removing the camshaft.

2. Carefully remove the camshaft (3) from the rear of the cylinder head.

Inspection

INSPECTION

Fig. 198: Camshaft Inspection
Courtesy of CHRYSLER LLC

- 1 - ACTUAL WEAR
- 2 - LEFT CAMSHAFT
- 3 - RIGHT CAMSHAFT
- 4 - BEARING JOURNAL
- 5 - LOBE

1. Inspect camshaft bearing journals (4) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Check the cam lobe (5) and bearing surfaces for abnormal wear and damage. Replace camshaft if defective.

NOTE: If camshaft is replaced due to lobe wear or damage, always replace the rocker arms.

3. Measure the lobe (5) actual wear and replace camshaft if out of limit. Standard value is 0.0254 mm (0.001 in.), wear **limit** is 0.254 mm (0.010 in.).

Installation

INSTALLATION

81131101

3. Install cylinder head cover and bolts. Tighten bolts to 12 N.m (105 in. lbs.).
4. Install the ground strap retaining bolt (3) to the cylinder head cover.
5. Install the wire harness track (4).
6. Install the ignition coils (2). Tighten mounting screws to 6.7 N.m (60 in. lbs.). Refer to **Electrical/Ignition Control/COIL, Ignition - Installation** .
7. Connect the ignition coil electrical connectors (2).
8. Install upper intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Installation**.
9. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

ROCKER ARM, VALVE

Description

ROCKER ARM

Fig. 210: Rocker Arm Assembly
Courtesy of CHRYSLER LLC

- 1 - RETAINER
- 2 - SWIVEL PAD
- 3 - ROLLER

Rocker arms are made of light weight permanent mold aluminum alloy with a roller (3) type follower operating against the camshaft . The valve actuating end of the rocker arms are machined to retain hydraulic lash adjusters, eliminating the need for manual valve lash adjustment.

ROCKER ARM SHAFTS

Fig. 211: Rocker Arms and Shafts
Courtesy of CHRYSLER LLC

The rocker arm shafts are tubular steel and are supported by several forged aluminum alloy pedestals, which are fastened to the cylinder head. Four shafts are used, one for each intake and exhaust rocker arm bank on each cylinder head. The shafts are hollow to provide a duct for lubricating oil flow from the cylinder head to the valve mechanisms. One hollow dowel per pedestal is used to locate the pedestal to the cylinder head, orient the exhaust rocker shaft, and serve as a cam bearing oil feed passage.

Operation

OPERATION

The rocker arm is the pivot point between the camshaft lobe and the valve.

Diagnosis and Testing

LASH ADJUSTER (TAPPET) NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of a NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to the following chart indicating possible lash adjuster (tappet) noise sources and possible sources that could lead to a misdiagnosis.

Refer to Lash Adjuster (Tappet) Noise Chart for Possible Causes and Correction of a lash adjuster (tappet) type noise.

POSSIBLE NOISE SOURCES	POSSIBLE NOISE MISDIAGNOSIS SOURCES
Spongy/soft/aerated lash adjusters.	Exhaust leak.
Missing lash adjuster swivel contact pads.	Exhaust rocker arm-to-cylinder head cover contact.
Intake rocker-to-camshaft bearing journal contact.	Piston pin bore fit.
Rocker arm bind-up.	Timing drive hydraulic tensioner tick.
Intake rocker arm-to-spark plug tube contact.	Accessory drive belt deterioration.
Excessive cam end play.	Piston-to-bore clearance knock.
Broken valve spring.	Crankshaft bearing noise.
Broken/loose camshaft sprocket bolt.	
Incomplete cam lobe machining.	
Cracked lash adjuster cartridge body.	

LASH ADJUSTER (TAPPET) NOISE CHART

POSSIBLE CAUSES	CORRECTION
1. Engine oil level-too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct engine oil level.

2. Insufficient running time after rebuilding cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in lash adjuster (after 1 hour run time).	3. See below: (a) Check lash adjusters for sponginess while installed in cylinder head. Depress part of rocker arm over adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) Before proceeding, perform Lash Adjuster Bleeding procedure. (c) If lash adjuster(s) are still spongy, replace with new adjuster/rocker arm assembly*.
4. Low oil pressure	4. See below: (a) Check and correct engine oil level. (b) Check engine oil pressure. (c) Check for excessive bearing clearance and correct. (d) Check for worn oil pump.
5. Oil passage to cylinder head(s) plugged with debris.	5. Check cylinder head oil passages and cylinder head gasket restrictor for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Ream guide(s) and replace valve(s) with oversize valves and seal(s).
7. Air injected into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary.
8. Collapsed lash adjuster due to debris injection.	8. Clean debris from engine and replace lash adjuster/rocker assembly*.
9. Intake rocker arm roller clevis ear(s) contacting camshaft bearing journal(s) on side.	9. Inspect camshaft end play and all valve train components for wear. Replace as necessary.
*Lash adjusters are serviced with the rocker arms-do not disassemble.	

Standard Procedure

HYDRAULIC LASH ADJUSTER BLEEDING

Fig. 212: Rocker Arm Positioned On Base Circle Of Camshaft
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - CAMSHAFT BASE CIRCLE
2 - HIGH-PRESSURE CHAMBER |
|---|

Use this procedure to manually bleed aerated oil from the lash adjuster and remove sponginess.

1. Run the engine, bringing it to operating temperature in order to freshly pressurize and warm the valvetrain system oil supply.
2. Remove cylinder head cover(s).
3. Ensure the rocker arm is positioned on the base circle (1) of the cam . Rotate engine as necessary.

Fig. 213: Purging Air From Lash Adjuster

|---|
| 1 - SPECIAL TOOL 8351
2 - OIL AIR RELIEF SERVICE ACCESS HOLE
3 - ROCKER ARM ASSEMBLY
4 - INTERNAL CHECK BALL
5 - VALVE TIP
6 - HYDRAULIC LASH ADJUSTER WITHIN ROCKER ARM |
|---|

4. For intake rocker arm positions:
 - a. Adjust Special Tool 8351 (1) Release Probe's gauge pin to extend approximately 20 mm (0.787 in.). Then, carefully insert the release probe gauge pin into the lash adjuster (6) service access hole (2) .
 - b. Gently unseat lash adjuster's internal check ball (4).
 - c. While the internal check ball (4) is held unseated, press the rocker arm (3) into the valve tip (5), allowing the lash adjuster (6) to fully collapse. Hold this fully collapsed position for about one second, or longer.
 - d. Slowly release the rocker arm (3), thereby allowing the lash adjuster (6) to extend, which in turn refills the high pressure chamber with non-aerated oil.
 - e. Remove probe to allow check ball (4) to seat.
 - f. Recheck for sponginess. If the lash adjuster (6) sponginess is not completely or nearly eliminated, then repeat procedure.
 - g. If the spongy condition cannot be removed, replace effected rocker arm(s) (3).
5. For exhaust rocker arm (3) positions:
 - a. Adjust Special Tool 8351 (1) Release Probe gauge pin to extend approximately 20 mm

(0.787 in.). Then, using two release probes, carefully insert gauge pins into the lash adjuster service access holes .

- b. Gently unseat BOTH lash adjuster's internal check ball (4) at the same time.
 - c. While the internal check ball (4) is held unseated, press the rocker arm (6) into the valve tip, allowing the lash adjuster to fully collapse. Hold this fully collapsed position for about one second, or longer.
 - d. Slowly release the rocker arm (3), thereby allowing the lash adjuster (6) to extend, which in turn refills the high pressure chamber with non-aerated oil.
 - e. Remove probes (1) to allow check balls (4) to seat.
 - f. Recheck for sponginess. If the lash adjuster (6) sponginess is not completely or nearly eliminated, then repeat procedure.
 - g. If the spongy condition cannot be removed, replace effected rocker arm(s) (3).
6. Install cylinder head cover(s).

Removal

REMOVAL

2557653

Fig. 214: Rocker Arm Assembly Bolts Torque Sequence
 Courtesy of CHRYSLER LLC

1. Remove the cylinder head covers. See Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.

**CAUTION: DO NOT use a number stamp or a punch to mark the rocker arms.
Damage to the rocker arms could occur.**

2. Using a permanent ink or paint marker, identify the location and position on each rocker arm.
3. Remove the rocker arm assembly bolts in the sequence shown in illustration.

81131101

Fig. 215: Spark Plug Tube, Rocker Arm Assembly, Camshaft & Seal
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - SPARK PLUG TUBE
2 - ROCKER ARM ASSEMBLY
3 - CAMSHAFT
4 - SEAL |
|--|

4. Remove the rocker arm assembly (2).

NOTE: To prevent air ingestion into the lash adjusters, avoid turning the rocker arm assembly upside down.

CAUTION: Do not allow rocker arm assembly to rest on lash adjusters, as damage may occur to lash adjusters and/or plastic retainers.

Disassembly

DISASSEMBLY

2557653

Fig. 216: Rocker Arm Assembly Bolts Torque Sequence
 Courtesy of CHRYSLER LLC

CAUTION: DO NOT use a number stamp or a punch to mark the rocker arms. Damage to the rocker arms could occur.

1. Using a permanent ink or paint marker, identify the location and position on each rocker arm and remove the rocker arm and shaft assembly. See **Engine/Cylinder Head/ROCKER ARM, Valve - Removal.**

Fig. 217: Rocker Arms and Shaft - Disassembly
 Courtesy of CHRYSLER LLC

- | |
|------------------------|
| 1 - 4 mm SCREW AND NUT |
| 2 - 4 mm SCREW AND NUT |
| 3 - WASHER |
| 4 - SPACER |
| 5 - DOWEL |
| 6 - DOWEL |
| 7 - SPACER |
| 8 - WASHER |

- Remove the dowel pins using a 4 mm screw, nut, spacer, and washer installed into the pin. Thread the screw into the pin, then loosen the nut on the screw. This will pull the dowel out of the shaft support. Do not reuse the dowel pins.

2557761

Fig. 218: Identification Marks
Courtesy of CHRYSLER LLC

NOTE: The identification marks (notches) (1) face toward the front of the engine for the left head and toward the rear of the engine for the right head.

- Remove the rocker arms and pedestals in order.
- Check the rocker arm mounting portion of the shafts for wear or damage. Replace if damaged or heavily worn.
- Check the shaft oil holes for clogging with a small wire, clean as required.

Inspection

INSPECTION

Fig. 219: Rocker Arms and Shafts
Courtesy of CHRYSLER LLC

The rocker arm shafts are hollow and are used as lubrication oil ducts. The rocker arm and shaft assembly on the **right** side of the engine has an oil passage hole from the cylinder head located at the third rocker shaft support pedestal. The rocker arm and shaft assembly on the **left** side of the engine has an oil passage hole from the cylinder head located at the second rocker shaft support pedestal.

NOTE: To prevent air ingestion into lash adjusters, avoid turning rocker arm assembly upside down.

CAUTION: Do not allow rocker arm assembly to rest on lash adjusters, as damage may occur to lash adjuster and plastic retainer.

The intake and exhaust rocker arms are different. They should be identified before disassembling the assembly .

Fig. 220: Rocker Arm Assembly
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - RETAINER
2 - SWIVEL PAD
3 - ROLLER |
|--|

Check rocker arms for wear or damage :

- Roller scuffing or wear
- Shaft bore scuffing or wear
- Swivel pad on lash adjuster missing or broken
- Rocker arm showing signs of fatigue or cracking
- Roller axle protruding from arm

Replace assembly as necessary if any rocker arms shows signs of wear.

CAUTION: Do Not remove lash adjuster from rocker arm assembly. Damage to the adjuster and rocker arm will result.

Assembly

ASSEMBLY

2557761

Fig. 221: Identification Marks
Courtesy of CHRYSLER LLC

CAUTION: The rocker arm shafts are hollow and are used as lubrication oil passages. The rocker arm and shaft assembly on the **RIGHT** side of the engine has an oil passage hole from the cylinder head to the third rocker shaft support. The rocker arm shaft assembly on the **LEFT** side of the engine has an oil passage hole from the cylinder head to the second rocker shaft support.

NOTE: A new fully assembled rocker arm and shaft assembly can be installed on either the right or left side of the engine. The identification marks (notches) (1) face toward the front of the engine for the left head and toward the rear of the engine for the right head.

1. Position the shafts with the notches (1) facing up. Install the rocker arms and pedestals onto the shafts.

Fig. 222: Assemble Rocker Arms and Shaft
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - HYDRAULIC LASH ADJUSTERS
2 - DOWEL PIN
3 - PEDESTAL
4 - ROLLER |
|---|

CAUTION: New dowel pins must be installed when reassembling.

2. Install the dowel pins (2). The dowel pins (2) pass through the pedestal (3) into the exhaust rocker shafts. Dowel pins (2) should be pressed in until they bottom-out against the rocker shaft in the pedestal (3).
3. Install the rocker arm and shafts assembly. See **Engine/Cylinder Head/ROCKER ARM, Valve - Installation.**

Installation

INSTALLATION

2557845

Fig. 223: Identification Marks (Notches) and Rocker Arm And Shaft Assembly Bolts
 Courtesy of CHRYSLER LLC

NOTE: The rocker arm and shaft assembly can be installed either prior to or after (preferred) cylinder head installation.

1. Rotate camshaft gears clockwise to where the number one cylinder intake valves would just start to open. The camshaft lobes are now in a neutral position (no load to the valve). This will allow the rocker arm shaft assembly to be tightened into position with little or no valve spring load on it.

NOTE: A new fully assembled rocker arm and shaft assembly can be installed on either the right or left side of the engine. The identification marks (notches) (1) face toward the front of the engine for the left head and toward the rear of the engine for the right head.

2. Install the rocker arm and shaft assembly making sure that the identification marks (1) face toward the front of engine for left head and toward the rear of the engine for right head.
3. Tighten the rocker arm/shaft assembly bolts in the sequence shown in illustration to 31 N.m (275 in. lbs.).
4. Install the cylinder head covers. See Engine/Cylinder Head/COVER(S), Cylinder Head - Installation.

SEAL(S), CAMSHAFT

Removal

REMOVAL

RIGHT CYLINDER HEAD

Fig. 224: Intake Manifold Braces
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Partially drain the cooling system. Refer to Cooling - Standard Procedure .
3. Remove the upper intake manifold (1). See Engine/Manifolds/MANIFOLD, Intake - Removal.
4. Cover lower intake manifold openings during service.

13. Maneuver the camshaft (2) rearward and out of the cylinder head (3) approximately 3.5 inches.

NOTE: Care must be taken not to damage the cylinder head to seal or camshaft journal surfaces when removing the camshaft seal.

14. Using an appropriate driver (1) carefully remove camshaft oil seal.

Installation

INSTALLATION

RIGHT CYLINDER HEAD

Fig. 241: CAMSHAFT SEAL INSTALLATION
Courtesy of CHRYSLER LLC

1 - REAR TIMING COVER 2 - SPECIAL TOOL MD-998306

1. Position the camshaft seal into the cylinder head.
2. Using Camshaft Installer MD-998306 (2) tap the seal into place.

8112283b

Fig. 242: CAMSHAFT INSTALLATION
Courtesy of CHRYSLER LLC

1 - REAR TIMING COVER 2 - SPECIAL TOOL 6788 3 - CAMSHAFT
--

3. Apply light coat of clean engine oil to the camshaft oil seal lip and Cam Seal Protector 6788 (2).
4. Install Cam Seal Protector 6788 (2) onto the camshaft (3).
5. Slide the camshaft (3) forward, inserting the seal protector (2) through the camshaft seal until the camshaft (3) seats.
6. Remove Seal Protector (2) from the camshaft.

Fig. 243: Cam Thrust Plate Gasket
 Courtesy of CHRYSLER LLC

7. Install the camshaft thrust plate (1) and gasket (3). Tighten three bolts (2) to 28 N.m (250 in. lbs.).

Fig. 244: EGR Valve Mounting Bolts - 3.5L
 Courtesy of CHRYSLER LLC

8. Install new gasket between EGR solenoid/valve (3) and rear of cylinder head.
9. Position EGR solenoid/valve assembly to rear of cylinder head. Install and tighten two mounting bolts (2) to 30 N.m (22 ft. lbs.).

Fig. 245: RIGHT CAMSHAFT SPROCKET
Courtesy of CHRYSLER LLC

1 - LOOSENED ROCKER ASSEMBLY 2 - RIGHT CAMSHAFT TDC
--

10. Install the right camshaft sprocket onto the camshaft.
11. Install **NEW** sprocket attaching bolt into place. The 213 mm (8 3/8 in.) bolt is to be installed into the right camshaft and the 255 mm (10 in.) bolt is to be installed into the left camshaft.
12. Counterhold the right camshaft sprocket with a 36 mm (1 7/16 in.) box end wrench while tightening the retaining bolt. Tighten the bolt to 102 N.m (75 ft. lbs.) +90° turn.

8136#76

Fig. 246: Identifying Timing Gear Components

5 - WATER PUMP PULLEY	11 - TIMING BELT TENSIONER PULLEY
6 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - LEFT	12 - TIMING BELT TENSIONER

13. Rotate the right camshaft gear (2) to align its timing mark (1). Verify that the left camshaft gear (7) timing mark (8) and crankshaft gear (10) timing mark (9) are still aligned.
14. Install the timing belt (4) starting at the crankshaft sprocket (10) going in a counterclockwise direction. Install the belt around the last sprocket. Maintain tension on the belt as it is positioned around the tensioner pulley (11).
15. Holding the tensioner pulley (11) against the belt, install the tensioner (12) into the housing and tighten two bolts to 28 N.m (250 in. lbs.). Each camshaft sprocket mark should remain aligned with the cover marks.
16. When tensioner is in place pull retaining pin to allow the tensioner to extend to the tensioner pulley bracket.
17. Rotate crankshaft sprocket two revolutions and check the timing marks on the camshafts and

crankshaft. The marks should line up within their respective locations. If marks do not line up, repeat procedure.

NOTE: With the camshaft gears in these positions the lobes are in a neutral position (no load to the valve). This will allow the rocker arm shaft assembly to be tightened into position with little or no valve spring load on it.

Fig. 247: Camshaft, Rocker Arm Assembly & Cylinder Head
Courtesy of CHRYSLER LLC

18. Install the rocker arm and shaft assembly (2) and ten bolts making sure that the identification marks face toward the front of engine for left head and toward the rear of the engine for right head.

Fig. 248: Rocker Arm/Shaft Assembly Bolt Tightening Sequence

Courtesy of CHRYSLER LLC

19. Tighten the ten rocker arm/shaft assembly bolts in the sequence shown in illustration to 31 N.m (275 in. lbs.).

80b171f3

Fig. 249: Cylinder Head Cover Gasket and Spark Plug Tube Seals
Courtesy of CHRYSLER LLC

20. Clean cylinder head and cover mating surfaces. Inspect and replace gasket (1) and seals (2) as necessary. See **Engine/Cylinder Head/COVER(S), Cylinder Head - Installation**.
21. Install cylinder head cover and eight bolts. Tighten bolts to 12 N.m (105 in. lbs.).

81916192

Fig. 250: Removing/Installing Ignition Coil Assembly
Courtesy of CHRYSLER LLC

22. Install the spark plugs. Tighten to 28 N.m (20 ft. lbs.). Refer to **Electrical/Ignition Control/SPARK PLUG - Installation**.
23. Install ignition coils (3) into cylinder head.
24. Install and tighten coil mounting bolts (2) to 6.7 N.m (60 in. lbs.).
25. Reposition engine wire harness and install retainers to cylinder head cover. Connect and lock electrical connectors to ignition coils (1) and EGR valve.

6 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - LEFT	12 - TIMING BELT TENSIONER

9. Install water pump. Refer to **Cooling/Engine/PUMP, Water - Installation**.
10. Install the camshaft sprockets. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Installation**.
11. Rotate the left camshaft gear (7) to align its timing mark (8). Verify that the right camshaft gear (2) timing mark (1) and crankshaft gear (10) timing mark (9) are still aligned.
12. Install the timing belt (4) starting at the crankshaft sprocket (10) going in a counterclockwise

direction. Install the belt around the last sprocket. Maintain tension on the belt as it is positioned around the tensioner pulley (11).

13. Holding the tensioner pulley (11) against the belt, install the tensioner into the housing and tighten two bolts to 28 N.m (250 in. lbs.). Each camshaft sprocket mark should remain aligned with the cover marks.
14. When tensioner is in place pull retaining pin to allow the tensioner to extend to the tensioner pulley bracket.
15. Rotate crankshaft sprocket two revolutions and check the timing marks on the camshafts and crankshaft. The marks should line up within their respective locations. If marks do not line up, repeat procedure.

NOTE: With the camshaft gears in these positions the lobes are in a neutral position (no load to the valve). This will allow the rocker arm shaft assembly to be tightened into position with little or no valve spring load on it.

Fig. 263: Camshaft, Rocker Arm Assembly & Cylinder Head
Courtesy of CHRYSLER LLC

16. Install the rocker arm and shaft assembly (2) and ten bolts making sure that the identification marks face toward the front of engine for left head and toward the rear of the engine for right head.

Fig. 264: Rocker Arm/Shaft Assembly Bolt Tightening Sequence
 Courtesy of CHRYSLER LLC

17. Tighten the ten rocker arm/shaft assembly bolts in the sequence shown in illustration to 31 N.m (275 in. lbs.).

Fig. 265: Cylinder Head Cover Gasket and Spark Plug Tube Seals
 Courtesy of CHRYSLER LLC

18. Clean cylinder head and cover mating surfaces. Inspect and replace gasket (1) and seals (2) as necessary. See **Engine/Cylinder Head/COVER(S), Cylinder Head - Installation**.
19. Install cylinder head cover and eight bolts. Tighten bolts to 12 N.m (105 in. lbs.).

- | |
|--|
| 1 - SPRING RETAINER
2 - GARTER SPRING
3 - VALVE SPRING SEAT TOP
4 - CYLINDER HEAD SURFACE |
|--|

1. The valve stem seal/valve spring seat should be pushed firmly and squarely over the valve guide using the valve stem as guide. **Do Not Force** seal against top of guide. When installing the valve retainer locks, compress the spring **only enough** to install the locks.

CAUTION: Do not remove garter spring (2) around the seal at the top of the valve stem seal .

2. Install valve spring. See Engine/Cylinder Head/SPRING(S), Valve - Installation.

SPRING(S), VALVE

Description

DESCRIPTION

Fig. 276: Valve Spring Identification
 Courtesy of CHRYSLER LLC

- 1 - YELLOW OR WHITE DYE
 2 - ORANGE DYE

The valve springs are made from chrome silicon alloy wire and incorporate a "bee-hive" design. Valve spring retainers and locks are common from valve-to-valve. The valve spring seat is integral with the valve stem oil seal, which incorporates a garter spring to maintain consistent lubrication control to the valve stem.

The valve springs are unique for intake compared to exhaust. Both have different lengths and are wound in opposite directions. The valve springs are color coded, intake spring is right hand coil direction with orange dye on the top coils, and the exhaust spring is left hand coil direction with a yellow or white dye on the top coils .

The exhaust spring with the white dye on the top of the coils has an increased open and closed load when compared to the exhaust spring with the yellow dye. A yellow and a white exhaust valve spring **should never** be used on a single forked rocker arm. Color coated exhaust springs should always be used in pairs for a forked exhaust rocker springs.

Operation

OPERATION

The valve spring returns the valve against its seat for a positive seal of the combustion chamber.

Removal

CYLINDER HEAD OFF

1. Compress valve spring with valve spring compressor C-3422-D and adapter 6526A. See **Engine - Special Tools**.
2. Remove valve retaining locks. Release valve spring compressor. Remove valve spring retainer and valve spring.
3. Remove valve stem seal assembly. See **Engine/Cylinder Head/SEAL(S), Valve Guide -**

Removal.

CYLINDER HEAD ON

| 1 - MD 998772A
2 - SPARK PLUG TUBES
3 - CYLINDER HEAD
4 - 6527 - ADAPTOR
5 - VALVE SPRING RETAINER |
|--|

1. Disconnect negative battery cable.
2. Remove upper intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Removal.**
3. Remove cylinder head cover(s). See **Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.**
4. Remove rocker arm and shaft assembly. See **Engine/Cylinder Head/ROCKER ARM, Valve - Removal.**
5. Remove spark plugs.
6. Rotate the crankshaft clockwise, until the number 1 piston is at Top Dead Center (TDC) on the compression stroke.
7. With air hose attached to spark plug adapter installed in number 1 spark plug hole, apply 620.5 to 689 kPa (90 to 100 psi) air pressure. This is to hold valves into place while servicing components.

8. Using Tool MD 998772A (1) with adapter 6527 (4) or equivalent, compress valve spring and remove valve locks (5). Release tension on valve spring, remove retainer (5) and valve spring. See **Engine - Special Tools** .
9. Remove valve stem seal, if required. See **Engine/Cylinder Head/SEAL(S), Valve Guide - Removal**.
10. Follow the same procedure on the remaining 5 cylinders using the firing sequence 1-2-3-4-5-6. **Make sure piston is at TDC in each cylinder of the valve spring that is being removed.**
11. Remove spark plug adapter tool.

Inspection

INSPECTION

Fig. 278: Testing Valve Spring
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL C-647

When valves have been removed for inspection, reconditioning or replacement, valve springs should be tested . **As an example**; the compression length of the spring to be tested is 38.00 mm (1.496 in.). Turn table of Tool C-647 until surface is in line with the 38.00 mm (1.496 inches.) mark on the threaded stud and the zero mark on the front. Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by two. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to Engine Specifications to obtain specified height and allowable tensions. See **Engine - Specifications**. Replace springs that do not meet specifications.

Installation

- | |
|---|
| <p>1 - SPARK PLUG TUBE
2 - ROCKER ARM ASSEMBLY
3 - CAMSHAFT
4 - CAMSHAFT SEAL</p> |
|---|

1. Apply Mopar® Stud and Bearing Mount to a new tube (1) approximately 1 mm (0.039 in.) from the end of tube, in a 3 mm (0.118 in.) wide area .
2. Install sealer end of tube (1) into the cylinder head. Then carefully install the tube (1) using a hardwood block and mallet. Install the tube (1) until it is seated into the bottom of the bore.
3. For spark plug tube (1) seal replacement, see **Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.**
4. Install cylinder head cover(s). See **Engine/Cylinder Head/COVER(S), Cylinder Head - Installation.**

VALVES, INTAKE AND EXHAUST

Description

DESCRIPTION

Valves are made of highly heat-resistant steel and are chrome plated to prevent stem scuffing. The intake valve is a one-piece forging, while the exhaust valve has a forged head with a welded stem for lock groove hardness. The four valves (two intake and two exhaust) employ a three-groove lock design to help facilitate valve rotation.

Operation

OPERATION

The intake valve allows the air/fuel mixture to enter the combustion chamber. The exhaust valve allows the burned air/fuel mixture to exit the combustion chamber. Also, the intake and exhaust valves seal the combustion chamber during the compression and power strokes.

Standard Procedure

VALVE AND VALVE SEAT REFACING

VALVES

Fig. 284: Intake and Exhaust Valves
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - MARGIN
2 - FACE
3 - STEM
4 - VALVE SPRING RETAINER LOCK GROOVES |
|--|

1. Inspect the remaining margin (1) after the valves are refaced. See **Engine - Specifications**.

VALVE SEATS

Fig. 285: Valve Face and Seat
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA |
|---|

1. When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.
2. Measure the concentricity of valve seat using dial indicator. Total runout should not exceed 0.051 mm (0.002 inch.) total indicator reading.
3. Inspect the valve seat (3) with Prussian blue to determine where the valve (1) contacts the seat. To do this, coat valve seat (1) **LIGHTLY** with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face (2), contact is satisfactory. If the blue is transferred to top edge of valve face (2), then lower valve seat (3) with a 15° stone. If the blue is transferred to the bottom edge of valve face (2), then raise valve seat (3) with a 65° stone.

NOTE: **Valve seats (1) which are worn or burned can be reworked, provided that correct angle and seat width (1) are maintained. Otherwise cylinder head must be replaced.**

4. When seat is properly positioned the width of the intake seats should be 0.75 to 1.25 mm (0.0296 to 0.0493 in.) and exhaust seats should be 1.25 to 1.75 mm (0.049 to 0.069 in.) .

VALVE AND SPRING INSTALLED HEIGHT

80570e02

Fig. 286: Checking Valve Tip Height and Valve Spring Installed Height
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - SPRING RETAINER
2 - GARTER SPRING
3 - VALVE SPRING SEAT TOP
4 - CYLINDER HEAD SURFACE |
|--|

1. Coat valve stems with clean engine oil and insert them in cylinder head.
2. If valves or seats have been refaced, check valve tip height (A) . If valve tip height is greater than 43.65 mm (1.7185 in.) intake or 46.48 mm (1.8299 in.) exhaust, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.
3. Install valve seal/spring seat assembly over valve guides on all valve stem . Ensure that the garter spring is intact around the top of the rubber seal.

80be4660

Fig. 287: Valve Spring Identification
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - YELLOW OR WHITE DYE
2 - ORANGE DYE |
|---|

4. Place valve spring (color-coded end facing up) and valve retainer into position on spring seat .

9309-150

Courtesy of CHRYSLER LLC

1 - VALVE
2 - VALVE RETAINING LOCKS
3 - VALVE SPRING RETAINER
4 - VALVE SPRING
5 - VALVE SEAL AND VALVE SPRING SEAT ASSEMBLY

5. Compress valve springs (4) with valve spring compressor C-3422-D and adapter 6526A, install locks (2) and release tool. See **Engine - Special Tools**.
6. If valves (1) and/or seats are refaced, measure the installed height of springs . Measurements are taken from top of spring (4) seat to the bottom surface of spring retainer. If height is greater than 38.75 mm (1.5256 in.), install a 0.762 mm (0.030 in.) spacer in head counterbore under the valve spring seat to bring spring height back within specification.

Removal

REMOVAL

1. Remove cylinder head(s). See **Engine/Cylinder Head - Removal**.
2. Remove rocker arm assembly. See **Engine/Cylinder Head/ROCKER ARM, Valve - Removal**.
3. Remove valve spring(s). See **Engine/Cylinder Head/SPRING(S), Valve - Removal**.
4. Before removing valve, **remove any burrs from valve stem lock grooves to prevent damage to the valve guides**. Identify valves to insure installation in original location.

5. Remove valve(s) from cylinder head.

Cleaning

CLEANING

1. Clean all valves thoroughly and discard burned, warped and cracked valves.

Inspection

VALVES

Fig. 289: Intake and Exhaust Valves
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - MARGIN
2 - FACE
3 - STEM
4 - VALVE SPRING RETAINER LOCK GROOVES |
|--|

1. Measure valve stems for wear approximately 60 mm (2.36 in.) below the valve lock grooves.
2. Compare measurement to specifications. See **Engine - Specifications**.

NOTE: Valve stems are chrome plated and should not be polished .

VALVE GUIDES

Fig. 290: Measuring Valve Guide Wear
 Courtesy of CHRYSLER LLC

1. Measure valve stem-to-guide clearance as follows:
2. Install valve into cylinder head so it is 15 mm (0.590 inch.) off the valve seat. A small piece of hose may be used to hold valve in place.
3. Attach dial indicator Tool C-3339A to cylinder head and set it at right angle of valve stem being measured .
4. Move valve to and from the indicator.
5. Note dial indicator reading and compare to engine specifications. See **Engine - Specifications.**

NOTE: **Replace cylinder head if stem-to-guide clearance exceeds specifications, or if guide is loose in cylinder head.**

Installation

INSTALLATION

1. Coat valve stems with clean engine oil and insert them in cylinder head.
2. If valves or seats have been reground, check valve tip height (A) . If valve tip height is greater than 43.65 mm (1.7185 in.) intake or 46.48 mm (1.8299 in.) exhaust, grind valve tip until within specifications. Make sure measurement is taken from cylinder head surface to the top of valve stem.
3. Install new valve stem seals.
4. Install valve springs. See **Engine/Cylinder Head/SPRING(S), Valve - Installation**.
5. Install cylinder head(s). See **Engine/Cylinder Head - Installation**.

ENGINE BLOCK

DESCRIPTION

DESCRIPTION

813a1637

Fig. 292: Cylinder Block & Crankshaft
Courtesy of CHRYSLER LLC

- 1 - MAIN CAPS
- 2 - BOLTS
- 3 - MAIN BEARING-LOWER
- 4 - CRANKSHAFT
- 5 - THRUST WASHERS
- 6 - MAIN BEARING-UPPER
- 7 - ENGINE BLOCK

The cylinder block is made of heat treated aluminum with cast-in-place iron liners. The block is a closed deck design with the right bank forward. To provide high rigidity and improved noise, vibration

and harshness (NVH), the block has cast-in contours and ribs, along with powdered metal 6 bolt main caps (4 vertical, 2 horizontal), with a die cast aluminum structural beam windage tray mounted to the main caps.

CLEANING

CLEANING

Clean cylinder block thoroughly using a suitable cleaning solvent.

INSPECTION

INSPECTION

ENGINE BLOCK

1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.
2. If new core plugs are to be installed, see **Engine - Standard Procedure**.
3. Examine block and cylinder bores for cracks or fractures.
4. Check block deck surfaces for flatness. Deck surface must be within service limit of 0.1 mm (0.004 in.).

CYLINDER BORE

Fig. 293: Cylinder Bore Measurement
Courtesy of CHRYSLER LLC

NOTE: The cylinder bores should be measured at normal room temperature, 21°C (70° F).

The cylinder walls should be checked for out-of-round and taper with Tool C119 cylinder bore gauge, or equivalent . See **Engine - Specifications**. If the cylinder walls are badly scuffed or scored, the cylinder block should be replaced, and new pistons and rings fitted.

Measure the cylinder bore at three levels in directions A and B . Top measurement should be 10 mm (3/8 in.) down and bottom measurement should be 10 mm (3/8 in.) up from bottom of bore. See **Engine - Specifications**.

BEARING(S), CONNECTING ROD

Standard Procedure

CONNECTING RODS AND BEARINGS

Fig. 294: CONNECTING ROD BEARING CLEARANCE
Courtesy of CHRYSLER LLC

CAUTION: The bearing caps are not interchangeable and should be paint marked or scribed at removal to insure correct assembly. **DO NOT** use a metal stamp.

The bearing shells must be installed with the tangs inserted into the machined grooves in the rods and caps. Install cap with the tangs on the same side as the rod.

Fit all rods on one bank until complete.

Limits of out-of-round on any crankshaft journals should be held to 0.008 mm (0.0003 in.). Bearings are available in standard, 0.025 mm (0.001 in.), and 0.254 mm (0.010 in.) undersizes. **Install the bearings in pairs. Do not use a new bearing half with an old bearing half. Do not file the rods or bearing caps.**

1. For measuring main bearing clearance and connecting rod bearing clearance use plastigage . For more information on using plastigage. See **Engine - Standard Procedure**. Refer to Engine Specifications for bearing clearance specifications. See **Engine - Specifications**.

NOTE: The rod bearing bolts should be examined before reuse. If the threads are necked down the bolts must be replaced .

CONNECTING ROD BOLTS

Fig. 295: Check for Stretched Bolts
Courtesy of CHRYSLER LLC

- | |
|--|
| <p>1 - STRETCHED BOLT
2 - THREADS ARE NOT STRAIGHT ON LINE
3 - THREADS ARE STRAIGHT ON LINE
4 - UNSTRETCHED BOLT</p> |
|--|

1. Examine connecting rod bolts for stretching (1). Stretching (1) can be checked by holding a scale or straight edge against the threads. If all the threads do not contact the scale the bolt must be replaced.
2. Before installing the bolts the threads should be cleaned and inspected.
3. Install clean bolts finger tight. Then alternately torque each bolt to assemble the cap properly.
4. Tighten the connecting rod cap bolts to specification. See **Engine - Specifications**.

CONNECTING ROD SIDE CLEARANCE

Fig. 296: Connecting Rod Side Clearance Measuring
Courtesy of CHRYSLER LLC

1. Mount a dial indicator to a stationary point on engine. Locate probe perpendicular to and resting against the connecting rod cap being checked. Move connecting rod all the way to rear of its travel. Zero the dial indicator. Move connecting rod forward to limit of travel and read the dial indicator . Compare measurement to specification listed in engine specifications. See **Engine - Specifications**. Repeat procedure for each connecting rod. Turn crankshaft for connecting rod accessibility.

BEARING(S), CRANKSHAFT, MAIN

Standard Procedure

CRANKSHAFT MAIN BEARING FITTING

Fig. 297: ENGINE BLOCK MAIN BORE GRADE
 Courtesy of CHRYSLER LLC

The main bearings are a "select fit" to achieve proper oil clearances. For main bearing selection, the block and crankshaft have grade identification marks.

The marks for the cylinder block main bore grade are located on the right front side of the engine block. These grade marks (1, 2, or 3) are read left to right, corresponding to main bore 1, 2, 3, 4. The 5th digit is a check some digit for plant validation during manufacturing.

Fig. 298: CRANKSHAFT MAIN JOURNAL GRADE MARKING LOCATION - REAR OF BLOCK

Courtesy of CHRYSLER LLC

The grade marks for the crankshaft are located on the rearmost crankshaft counter weight as shown in illustration. The crankshaft journal grade marks (A, B, or C) are read left to right, corresponding with journal number 1, 2, 3, 4.

Refer to the **MAIN BEARING SELECTION CHART** to properly select the main bearings. For an example, if the main bore grade is 3 and the journal grade is B, the proper select fit bearing would be a (2) +0.003 mm (+0.0002 in.).

Fig. 299: Main Bearing Grade Marks
Courtesy of CHRYSLER LLC

- | |
|--|
| <ul style="list-style-type: none">1 - LOWER MAIN BEARING2 - UPPER MAIN BEARING3 - OIL FEED HOLE AND GROOVE4 - GRADE SELECTION INK MARKS |
|--|

NOTE: Service main bearings have a number from (1-5) marked in ink on the bearing surface . For verification, refer to the **MAIN BEARING SELECTION CHART** for number to size identification.

The upper main bearing (2) has a oil feed hole and a center groove to allow lubrication of the main journal and must be properly positioned in the block.

MAIN BEARING SELECTION CHART

Removal

REMOVAL

Fig. 300: Main Bearing Cap Identification
Courtesy of CHRYSLER LLC

Bearing caps are not interchangeable and are marked to insure correct assembly . Upper and lower bearing halves are NOT interchangeable.

1. Remove oil pan. See **Engine/Lubrication/PAN, Oil - Removal**
2. Remove oil pick-up tube and windage tray.
3. Identify bearing caps before removal .

Fig. 301: Removing and Installing Upper Main Bearing With Special Tool C- 3059A

- | |
|--------------------------|
| 1 - SPECIAL TOOL C-3059A |
| 2 - BEARING |
| 3 - SPECIAL TOOL C-3059A |
| 4 - BEARING |

- Remove bearing caps one at a time. Remove upper half of bearing by inserting Main Bearing Tool C-3059A into the oil hole of crankshaft.
- Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

Installation

INSTALLATION

Fig. 302: Main Bearing Identification
 Courtesy of CHRYSLER LLC

Bearing caps are not interchangeable and are marked to insure correct assembly. Upper and lower bearing halves are NOT interchangeable .

CAUTION: Main bearings are select fit. See Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure.

NOTE: Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

1. Lubricate main bearing (4) with clean engine oil.
2. Start bearing (4) in place, and insert Main Bearing Tool C-3059A (3) into oil hole of crankshaft .
3. Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Main Bearing Tool C-3059A.

NOTE: **Lubricate main bearing cap bolts with engine oil before installation.**

4. Lubricate and install lower bearing half and main cap Tighten bolts finger tight.

- 6 - MAIN BEARING-UPPER
- 7 - ENGINE BLOCK

The main bearing cap bolts (2) must be tightened in the proper sequence. First the inner main cap bolts, secondly the windage tray bolts, lastly the main cap tie (horizontal) bolts.

6. Install each main bearing cap (1) and tighten inner bolts finger tight.
7. Tighten inner main bearing cap bolts (2) to 20 N.m + 1/4 turn (15 ft. lbs. + 1/4 turn).
8. Measure crankshaft end play. See **Engine/Engine Block/CRANKSHAFT - Standard Procedure**.
9. Install windage tray. Lubricate bolts with engine oil and tighten to 27 N.m + 1/4 turn (20 ft. lbs. + 1/4 turn).

Fig. 306: Main Bearing Cap Identification
Courtesy of CHRYSLER LLC

10. Install the main cap tie (horizontal) bolts and tighten to 28 N.m (250 in. lbs.)
11. Install oil pick-up tube.
12. Install oil pan. See **Engine/Lubrication/PAN, Oil - Installation**.
13. Fill engine crankcase with proper oil to correct level.

CRANKSHAFT

Description

DESCRIPTION

The crankshaft is constructed of a forged micro alloy steel. A six throw, nine counterweight crankshaft is supported by four select fit main bearings with number two serving as the thrust washer location. The six separate connecting rod throws are an even-firing design which reduces torque fluctuations while a torsional vibration damper is used to control torsion caused vibration of the crankshaft. Rubber lipped seals are used at front and rear. The front seal is retained in the oil pump case and the

rear seal is retained in a block-mounted housing.

Operation

OPERATION

The crankshaft transfers force generated by combustion within the cylinder to the flywheel or flexplate.

Standard Procedure

MEASURING CRANKSHAFT END PLAY

Fig. 307: Measuring Crankshaft End Play
Courtesy of CHRYSLER LLC

1. Mount a dial indicator to front of engine with the locating probe on nose of crankshaft.
2. Move crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move crankshaft all the way to the front and read the dial indicator. Crankshaft end play must be within specification. See **Engine - Specifications**.

Removal

REMOVAL

9. Remove crankshaft rear oil seal retainer (1).

Fig. 310: Main Bearing Cap Identification
Courtesy of CHRYSLER LLC

NOTE: Do not use a metal stamp to mark the bearing caps. Do use a scribe or

paint mark.

10. Identify rod bearing caps before removal. Also scribe a location reference mark from the #2 main bearing cap to the engine block to use as a guide during reassembly.
11. Remove connecting rod bearing caps. Connecting rod bearing caps are not interchangeable and should be paint marked or scribed before removal to insure correct assembly.

Fig. 311: Cylinder Block & Crankshaft
Courtesy of CHRYSLER LLC

12. Remove main bearing caps (1). Main bearing caps are not interchangeable and are marked to insure correct assembly and location.
13. Remove crankshaft (4) from cylinder block (7).

NOTE: Before installing crankshaft, refer to fitting of main bearings and installation of connecting rod bearings. See Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure. See Engine/Engine Block/BEARING(S), Connecting Rod - Standard Procedure.

Inspection

INSPECTION

The crankshaft journals should be checked for excessive wear, taper and scoring. Limits of taper on any crankshaft journals should be held to 0.010 mm (0.0004 in.). Limits for journal roundness should be 0.008 mm (0.0003 in.). Journal grinding should not exceed 0.254 mm (0.010 in.) under the standard journal diameter. DO NOT grind thrust faces of Number 2 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all passages. Crank journals must be polished smooth 0.10 micron ra.

CAUTION: With a forged steel crankshaft it is important that the final paper or cloth polish after any journal regrind be in the same direction as normal rotation in the engine.

Installation

INSTALLATION

Fig. 312: Main Bearing Identification
Courtesy of CHRYSLER LLC

CAUTION: Main bearings are select fit. See Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure for proper bearing size selection.

1. Install crankshaft upper main bearings in cylinder block. Ensure oil holes in bearings line up with oil holes in cylinder block. See **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
2. Install the crankshaft to cylinder block.

Fig. 313: Thrust Washer Installation
Courtesy of CHRYSLER LLC

1 - FRONT THRUST WASHER

3. Move crankshaft forward to limit of travel. Lubricate and install the front thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
4. Move crankshaft rearward to limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

936714

Fig. 314: Main Bearings Assembly
Courtesy of CHRYSLER LLC

5. Install lower main bearings (3) into main bearing caps (1).
6. Lubricate lower main bearings (3) with clean engine oil.

NOTE: Lubricate main bearing cap inner bolts (2) with engine oil before installation.

7. Install each main cap (1) and tighten inner bolts (2) finger tight. Align the location reference mark scribed on the #2 main bearing cap during disassembly.

885545

Fig. 315: Moving Crankshaft Forward
Courtesy of CHRYSLER LLC

CAUTION: The #2 main bearing cap must be centered over the inner bolt holes located on the block. Failure to center the bearing cap can result in contact with the crankshaft counterweights and thrust bearing failure.

8. Verify that the #2 main bearing cap is properly centered over the inner bolt holes located in the block. Tighten main bearing cap inner bolts to 20 N.m (15 ft. lbs.).
9. Move crankshaft (1) forward to limit of travel so that crankshaft thrust face (2) is tight against thrust bearing.
10. Verify that a 0.25 mm (0.010 inch) shim or feeler gage will fit between the #2 main cap (rear face) and the crankshaft thrust face. Slide the gage side-to-side all of the way across the cap making sure that the clearance at all areas exceeds 0.25 mm (0.010 inch). The feeler gage should slide all the way down to the #2 main journal.

Fig. 316: Moving Crankshaft Rearward
Courtesy of CHRYSLER LLC

11. Move crankshaft (1) rearward to limit of travel so that crankshaft thrust face (2) is tight against thrust bearing.
12. Verify that a 0.25 mm (0.010 inch) shim or feeler gage will fit between the #2 main cap (front face) and the crankshaft thrust face. Slide the gage side-to-side all of the way across the cap making sure that the clearance at all areas exceeds 0.25 mm (0.010 inch). The feeler gage should slide all the way down to the #2 main journal.
13. A properly centered #2 main bearing cap has a minimum of 0.25 mm (0.010 inch) clearance in both the forward and rearward crankshaft positions. If measured clearance is less than 0.25 mm (0.010 inch), loosen and reposition #2 main bearing cap until this minimum clearance can be verified by repeating this procedure.
14. Following verification of proper #2 bearing cap centering, finish tightening the main bearing cap inner bolts an additional 90° turn.

Fig. 317: Measuring Crankshaft End Play
Courtesy of CHRYSLER LLC

15. Measure crankshaft end play. See **Engine/Engine Block/CRANKSHAFT - Standard Procedure**.

Fig. 318: Measuring Connecting Rod Side Clearance
Courtesy of CHRYSLER LLC

16. Install connecting rods and measure side clearance. See **Engine/Engine Block/BEARING(S), Connecting Rod - Standard Procedure**.

- 2 - BOLT (QTY. 8)
- 3 - BACKING PLATE

1. Position the flex plate (1) with backing plate (3) on the crankshaft.
2. Apply Mopar® Lock AND Seal Adhesive to the eight flex plate bolts (2).
3. Install the flex plate bolts (2). Tighten the bolts to 95 N.m (70 ft. lbs.).
4. Install the transmission. Refer to Transmission and Transfer Case/Automatic - 42RLE - Installation . Refer to Transmission and Transfer Case/Automatic - NAG1 - Installation .

NOTE: The Cam/Crank Variation Relearn procedure must be performed anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. Refer to DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure .

RING(S), PISTON

Description

DESCRIPTION

Fig. 331: PISTON RINGS
Courtesy of CHRYSLER LLC

- 1 - TOP PISTON RING

- 2 - CHROME INTERMEDIATE PISTON RING
- 3 - MICRO-NAPIER INTERMEDIATE PISTON RING
- 4 - OIL CONTROL RINGS
- 5 - SPACER

The piston rings include a moly-filled top ring with a symmetric barrel face. The intermediate piston ring is of the standard chrome design OR Micro-Napier design. The Micro-Napier design has a reduced "hook" on the running face, removes the need for chroming and improves oil economy. The oil control package consists of two steel rails and an expander spacer .

Standard Procedure

PISTON RING FITTING

Fig. 332: CHECK GAP ON PISTON RINGS
Courtesy of CHRYSLER LLC

- 1 - FEELER GAUGE

1. Wipe cylinder bore clean. Insert ring and push down with piston to ensure it is square in bore. The ring gap measurement must be made with the ring positioning at least 12 mm (0.50 in.) from bottom of cylinder bore. Check gap with feeler gauge . For clearance specifications. See **Engine - Specifications**.

Fig. 333: MEASURING PISTON RING SIDE CLEARANCE
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE

2. Check piston ring to groove clearance: . For clearance specifications, see **Engine - Specifications**.

Removal

REMOVAL

- 1 - TOP PISTON RING
- 2 - CHROME INTERMEDIATE PISTON RING
- 3 - MICRO-NAPIER INTERMEDIATE PISTON RING
- 4 - OIL CONTROL RINGS
- 5 - SPACER

1. Measure clearance of piston rings to the cylinder bore and piston. See **Engine/Engine Block/RING(S), Piston - Standard Procedure**.

The No. 1 and No. 2 piston rings have a different cross section . Insure that which ever design No. 2 ring is installed, it is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston. See **Engine/Engine Block/RING(S), Piston - Description** .

- Oil ring expander.
 - Lower oil control ring side rail.
 - Upper oil control ring side rail.
 - No. 2 Intermediate piston ring.
 - No. 1 Upper piston ring.
2. Install the side rail by placing one end between the piston ring groove and the spacer. Hold end firmly and press down the portion to be installed until side rail is in position. **Do not use a piston ring expander tool during this step .**

Fig. 337: Removing/Installing Upper And Intermediate Rings
 Courtesy of CHRYSLER LLC

3. Install lower side rail first and then the upper side rail.

The No. 1 and No. 2 piston rings have a different cross section . Insure that which ever design No. 2 ring is installed, it is installed with manufacturers I.D. mark (dot) facing up, towards top of the piston. See **Engine/Engine Block/RING(S), Piston - Description.**

4. Install No. 2 piston ring and then No. 1 piston ring .

RR09B48

4 - SIDE RAIL LOWER
5 - NO. 2 RING GAP AND SPACER EXPANDER GAP |
|--|

5. Position piston ring end gaps as shown in illustration.
6. Position oil control ring expander gap at least 45° from the side rail gaps but **not** on the piston pin center or on the thrust direction. Staggering ring gap is important for oil control.

ROD, PISTON AND CONNECTING

Description

DESCRIPTION

The pistons are made of a high strength aluminum alloy. Top land height has been decreased to reduce emissions. Piston skirts are coated with a solid lubricant for scuff resistance. Connecting rod is forged steel with a fractured connecting rod cap design. The connecting rod is also equipped with a squirt hole and attaches to the piston with a full floating pin retained by lock rings.

Operation

OPERATION

The piston and connecting rod assembly is the link between the combustion force and the crankshaft.

Standard Procedure

FITTING PISTONS

Fig. 339: Piston Measurements
Courtesy of CHRYSLER LLC

The pistons are machined to two different weight specifications and matched to rods based on weight. All piston and rod assemblies weigh the same to maintain engine balance.

Piston and cylinder wall must be clean and dry. Piston diameter should be measured 90° to piston pin at size location shown in illustration. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line. See **Engine - Specifications**. **Pistons and cylinder bores should be measured at normal room temperature, 70°F (21°C).**

Removal

REMOVAL

811318c8

Fig. 340: CONNECTING ROD TO CYLINDER IDENTIFICATION
Courtesy of CHRYSLER LLC

1 - PAINT MARK OR SCRIBE

1. Remove the cylinder heads. See **Engine/Cylinder Head - Removal**.
2. Remove the oil pan. See **Engine/Lubrication/PAN, Oil - Removal**.
3. Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation. Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies from the engine, rotate crankshaft so that each connecting rod is centered in cylinder bore.**

CAUTION: DO NOT stamp the connecting rods for cylinder identification

4. Inspect connecting rods and connecting rod caps for cylinder identification. Identify them with a paint mark or scribe, if necessary .

Fig. 341: Piston and Connecting Rod
Courtesy of CHRYSLER LLC

5. Remove connecting rod cap. Install protectors, tool 8189, on connecting rod . Guide each piston and rod assembly out of cylinder bore.

NOTE: **Be careful not to nick crankshaft journals.**

6. After removal, install bearing cap on the mating rod.

Installation

INSTALLATION

Fig. 342: Check for Stretched Bolts
Courtesy of CHRYSLER LLC

- 1 - STRETCHED BOLT
- 2 - THREADS ARE NOT STRAIGHT ON LINE
- 3 - THREADS ARE STRAIGHT ON LINE
- 4 - UNSTRETCHED BOLT

1. Install the piston rings. See Engine/Engine Block/RING(S), Piston - Installation.

NOTE: The connecting rod bearing cap bolts must be examined before reuse. If the threads are necked down, the bolts must be replaced.

2. Check connecting rod bolts for necking by holding a scale or straight edge against the threads. If all threads do not contact the scale, the bolt must be replaced .

RR09B48

- 1 - SIDE RAIL UPPER
- 2 - NO. 1 RING GAP
- 3 - PISTON PIN
- 4 - SIDE RAIL LOWER

5 - NO. 2 RING GAP AND SPACER EXPANDER GAP

3. Before installing pistons and connecting rod assemblies into the bore, ensure that compression ring gaps are staggered so that neither is in line with oil ring rail gap .

Fig. 344: Piston and Connecting Rod
Courtesy of CHRYSLER LLC

4. Immerse the piston head and rings in clean engine oil, slide the ring compressor over the piston and tighten with the special wrench . **Ensure position of rings does not change during this operation.**
5. Install connecting rod bolt protectors, special tool # 8189 .
6. Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Insert the rod and piston into cylinder bore and guide the rod over the crankshaft journal.

CAUTION: Do Not interchange piston assemblies cylinder-to-cylinder or bank-to-bank.

811326b3

Fig. 345: PISTON ORIENTATION
 Courtesy of CHRYSLER LLC

1 - ARROW FACES FRONT OF ENGINE

7. The arrow on top of piston must be pointing toward front of engine.

- | |
|--|
| 1 - MAJOR THRUST SIDE OF PISTON
2 - OIL SQUIRT HOLE |
|--|

CAUTION: View of connecting rod oil squirt hole is from the front of the engine.

8. The oil squirt hole on connecting rod faces the major thrust side of the cylinder bore .

NOTE: Make sure the rod bearings are seated with the oil squirt hole aligned.

9. Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on connecting rod journal.

NOTE: Connecting rod bolts must be lubricated with clean engine oil.

10. Install the rod caps. Install cleaned and inspected connecting rod bolts and tighten to 27 N.m (20 ft. lbs.) Plus 1/4 turn.
11. Install the cylinder head(s). See Engine/Cylinder Head - Installation.
12. Install the oil pan. See Engine/Lubrication/PAN, Oil - Installation.

- | |
|---|
| 1 - CRANKSHAFT
2 - REAR CRANKSHAFT OIL SEAL
3 - REAR CRANKSHAFT OIL SEAL RETAINER
4 - ENGINE BLOCK |
|---|

CAUTION: If a burr or scratch is present on the crankshaft edge (chamfer), clean surface using 400 grit sand paper to prevent seal damage during installation.

NOTE: The rear crankshaft oil seal and retainer are an assembly. **DO NOT** separate the seal protector from the rear crankshaft oil seal before installation on engine. Damage to the seal lip will occur if the seal protector is removed and installed prior to installation on engine.

1. Apply engine oil to crankshaft seal surface.
2. Carefully position the oil seal, retainer and seal protector on crankshaft and push firmly into place on engine block (the seal protector will be removed from the rear oil seal assembly as a result of installing the rear oil seal). Hand tighten the rear oil seal fasteners.

Fig. 354: REAR CRANKSHAFT SEAL RETAINER ALIGNMENT
Courtesy of CHRYSLER LLC

1 - SEAL RETAINER 2 - SPECIAL TOOLS 8225

NOTE: The following steps must be performed to prevent oil leaks at sealing joints.

3. Attach Special Tools 8225 (1) to pan rail using the oil pan fasteners.

NOTE: Special Tools 8225 (1), are use to assist with the fit of the flush mount rear

main seal retainer. The notch on tool should be located away the seal retainer.

4. While applying firm pressure to the seal retainer against Special Tools 8225 (1), tighten seal retainer screws to 12 N.m (105 in. lbs.).
5. Remove special tool #8225 (1).

NOTE: Make sure that the seal flange is flush with the block oil pan sealing surface.

6. Install oil pan. Tighten the 6 mm fasteners to 12 N.m (105 in. lbs.) and the 8 mm fasteners to 28 N.m (250 in. lbs.).
7. Install the flex plate and transmission.

ENGINE MOUNTING

DESCRIPTION

DESCRIPTION

The engine mounting system are of molded rubber material and consist of two mounts; right and a left side support the powertrain, and control powertrain torque.

INSULATOR, ENGINE MOUNT, LEFT

Removal

REMOVAL

813530c9

Fig. 355: REAR BELLY PAN
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.
3. Remove the fasteners (1) that secure the rear belly pan (2) to the underside of the vehicle.
4. Remove the rear belly pan from the underside of the vehicle.

1. Install mount to transmission bolts (2) and tighten to 47 N.m (35 ft. lbs.).

Fig. 370: REMOVE/INSTALL TRANSMISSION CROSS MEMBER BOLTS
Courtesy of CHRYSLER LLC

2. Install cross member (1) and attaching bolts. Tighten bolts to 68 N.m (50 ft. lbs.).
3. Lower transmission so cross member to mount bolts (2) can be started tightened by hand.
4. Lower transmission and remove jack.
5. Tighten mount bolts (2) to 47 N.m (39 ft. lbs.).

LUBRICATION

DESCRIPTION

DESCRIPTION

80a53b64

Fig. 371: Oil Lubrication System
Courtesy of CHRYSLER LLC

- | | |
|---|-----------------------------------|
| 1 - CRANKSHAFT | 9 - PEDESTAL DRILLED PASSAGE |
| 2 - OUTER ROTOR | 10 - EXHAUST ROCKER SHAFT |
| 3 - INNER ROTOR | 11 - SHAFT/PEDESTAL DOWEL PASSAGE |
| 4 - RELIEF VALVE | 12 - CAMSHAFT BEARING BORE |
| 5 - OIL PAN | 13 - CYLINDER BLOCK OIL GALLERY |
| 6 - OIL SCREEN | 14 - CYLINDER HEAD GASKET |
| 7 - OIL PUMP CASE | 15 - HEAD BOLT HOLE |
| 8 - OIL FLOWS TO ONLY ONE PEDESTAL ON EACH HEAD - SECOND FROM REAR ON RIGHT HEAD - SECOND FROM FRONT ON LEFT HEAD | 16 - INTAKE ROCKER SHAFT |

The oil lubrication system is a full-flow filtration, pressure feed type. The oil pump body is mounted to the engine block. The pump inner rotor is driven by the crankshaft. A windage tray, increases power by minimizing oil windage at high engine RPM. For increased oil cooling, an oil pan mounted, oil-to-coolant oil cooler is used.

OPERATION

OPERATION

80a53b64

Fig. 372: Oil Lubrication System
Courtesy of CHRYSLER LLC

1 - CRANKSHAFT	9 - PEDESTAL DRILLED PASSAGE
2 - OUTER ROTOR	10 - EXHAUST ROCKER SHAFT
3 - INNER ROTOR	11 - SHAFT/PEDESTAL DOWEL PASSAGE
4 - RELIEF VALVE	12 - CAMSHAFT BEARING BORE
5 - OIL PAN	13 - CYLINDER BLOCK OIL GALLERY
6 - OIL SCREEN	14 - CYLINDER HEAD GASKET
7 - OIL PUMP CASE	15 - HEAD BOLT HOLE
8 - OIL FLOWS TO ONLY ONE PEDESTAL ON EACH HEAD - SECOND FROM REAR ON RIGHT HEAD - SECOND FROM FRONT ON LEFT HEAD	16 - INTAKE ROCKER SHAFT

Engine oil stored in the oil pan (5) is drawn in and discharged by a gear rotor type oil pump (2, 3). The oil pump is directly coupled to the crankshaft (1). Oil pressure is regulated by a relief valve (4). The oil is fed through an oil filter and to the crankshaft journals from the oil gallery (8) in the cylinder block. This gallery also feeds oil under pressure to the cylinder heads. Oil flows through each cylinder heads oil passage to the rocker shafts (10, 16). Oil then feeds the camshaft journals (12), rocker arms, and hydraulic lash adjusters.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

Fig. 373: OIL PRESSURE SWITCH
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OIL PRESSURE SWITCH
2 - ENGINE OIL COOLER
3 - ENGINE OIL FILTER |
|---|

Check oil pressure using a gauge at oil pressure switch (1) location.

1. Remove the oil pressure switch (1). See **Engine/Lubrication/SWITCH, Oil Pressure - Removal**.
2. Install oil pressure test gauge, C-3292A with Adapter 8406. For Special Tool identification, see **Engine - Special Tools**.

CAUTION: If oil pressure is 0 at idle, Do Not Run engine at 3000 RPM.

3. Warm engine to normal operating temperature.
4. Monitor gauge readings at idle and 3000 RPM. For specifications, see **Engine - Specifications**.

COOLER, OIL

Description

DESCRIPTION

813707d2

Fig. 374: ENGINE OIL COOLER
Courtesy of CHRYSLER LLC

The engine oil cooler is a oil-to-coolant type and is mounted between the oil filter and the oil pan.

Operation

OPERATION

Engine oil travels from the oil cooler and into the oil filter. Engine oil then exits the filter into the main gallery. Engine coolant flows into the cooler from the heater return tube and exits into the water inlet tube.

Removal

REMOVAL

Fig. 375: Oil Cooler & Hoses
Courtesy of CHRYSLER LLC

1 - OIL COOLER 2 - COOLANT HOSES 3 - OIL FILTER

1. Drain cooling system.
2. Raise vehicle on hoist.
3. Disconnect coolant hoses (2) from oil cooler (1) .
4. Remove oil filter (3).
5. Remove oil cooler attaching fastener from center of oil cooler (1).
6. Remove oil cooler (1) .

Installation

INSTALLATION

Fig. 376: Oil Cooler & Hoses
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OIL COOLER
2 - COOLANT HOSES
3 - OIL FILTER |
|---|

1. Position oil cooler to fitting on oil pan.

NOTE: Remove all oil and debris from the seal retainer surface. The cut out section of the oil cooler seal retainer flange (top), must be aligned with the tab on the oil pan. The oil cooler must be prevented from turning during the tightening sequence.

2. Install oil cooler (1) attaching fastener and tighten to 61 N.m (45 ft. lbs.).
3. Install oil filter (3) and tighten to 12 N.m (106 in. lbs.).
4. Connect coolant hoses to oil cooler (2).
5. Fill cooling system.

FILTER, ENGINE OIL

Removal

REMOVAL

Fig. 377: Oil Cooler & Hoses
Courtesy of CHRYSLER LLC

NOTE: When servicing the oil filter, avoid deforming the filter can. Install the remove/install tool band strap against the base lock seam. The lock seam joining the can to the base is reinforced by the base plate.

1. Using a suitable oil filter wrench, unscrew filter (3) from base and discard.

Installation

INSTALLATION

Fig. 378: Oil Cooler & Hoses
Courtesy of CHRYSLER LLC

1. Wipe base clean, then inspect gasket contact surface.
2. Lubricate gasket of new filter (2) with clean engine oil.
3. Install and tighten filter to 12 N.m (106 in. lbs.) of torque after gasket contacts base. Use filter wrench if necessary.
4. Start engine and check for leaks.

OIL

Description

DESCRIPTION

For engine oil type and capacity, refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Description** .

Standard Procedure

ENGINE OIL LEVEL CHECK

81385286

Fig. 379: OIL FILL AND INDICATOR
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - OIL FILL CAP
2 - OIL FILL INDICATOR
3 - PCV HOSE |
|--|

The best time to check engine oil level (2) is after the engine has sat overnight, or if the engine has been running, allow the engine to be shut off for at least 5 minutes before checking oil level.

Checking the oil (2) while the vehicle is on level ground will improve the accuracy of the oil level reading. Add oil (1) only when the level is at, or below, the ADD mark on the indicator (2).

ENGINE OIL AND FILTER CHANGE

Change engine oil at mileage and time intervals described in the Maintenance Schedule. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description** .

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE, DISPOSE OF USED ENGINE OIL PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA.

TO CHANGE ENGINE OIL

Courtesy of CHRYSLER LLC

- | |
|--|
| <ul style="list-style-type: none">1 - OIL FILL CAP2 - OIL FILL INDICATOR3 - PCV HOSE |
|--|

1. Run engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn engine off.
3. Open hood, remove engine oil fill cap (1) .

Fig. 381: Oil Cooler & Hoses
Courtesy of CHRYSLER LLC

4. Raise vehicle on hoist.
5. Place a suitable drain pan under crankcase drain.
6. Remove oil pan drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug and gasket if damaged.
7. Remove oil filter (3) .
8. Install drain plug in crankcase. Torque oil pan drain plug to 27 N.m (20 ft. lbs.).
9. Install new oil filter (3) .

81385286

Fig. 382: OIL FILL AND INDICATOR
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - OIL FILL CAP
2 - OIL FILL INDICATOR
3 - PCV HOSE |
|--|

10. Lower vehicle.
11. Fill crankcase (1) with specified amount and type of engine oil. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Description** . Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** .
12. Install oil fill cap (1) .
13. Start engine and inspect for leaks.
14. Stop engine and inspect oil level (2).

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the WARNING above.

PAN, OIL

Removal

RWD

Remove the oil pressure switch (1). See [Engine/Lubrication/SWITCH, Oil Pressure - Removal](#).

11. Remove the oil pump fasteners. Remove the oil pump (1) and gasket (2) from the engine.

Disassembly

DISASSEMBLY

Fig. 408: OIL PUMP
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OIL PUMP BODY
2 - OIL PUMP OUTER ROTOR
3 - SCREWS
4 - OIL PUMP COVER
5 - OIL PUMP INNER ROTOR |
|---|

1. Remove oil pump cover screws (3) and lift off cover (4).
2. Remove pump rotors (2, 5).
3. Wash all parts in a suitable solvent and inspect carefully for damage or wear.

Cleaning

CLEANING

1. Clean all parts thoroughly in a suitable solvent.

Inspection

INSPECTION

NOTE: DO NOT inspect the oil relief valve assembly. If the oil relief valve is suspect, replace the oil pump.

Fig. 409: Checking Oil Pump Cover Flatness
Courtesy of CHRYSLER LLC

1 - STRAIGHT EDGE
2 - FEELER GAUGE
3 - OIL PUMP COVER

1. Disassemble oil pump. See **Engine/Lubrication/PUMP, Engine Oil - Disassembly.**
2. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. Replace pump cover if scratched or grooved.
3. Lay a straightedge (1) across the pump cover (3) surface. If a 0.025 mm (0.001 in.) feeler gauge can be inserted between cover and straight edge, cover should be replaced.

Fig. 410: Measuring Outer Rotor Thickness
Courtesy of CHRYSLER LLC

4. Measure thickness and diameter of outer rotor. If outer rotor thickness measures 14.299 mm (0.563 in.) or less , or if the diameter is 79.78 mm (3.141 inches.) or less, replace outer rotor.

9309-70

Fig. 411: Measuring Inner Rotor Thickness
Courtesy of CHRYSLER LLC

5. If inner rotor measures 14.299 mm (0.563 in.) or less replace inner rotor.

9309-187

Fig. 412: Measuring Outer Rotor Clearance in Housing
Courtesy of CHRYSLER LLC

1 - FEELER GAUGE 2 - OUTER ROTOR

6. Slide outer rotor (2) into body, press to one side with fingers and measure clearance between rotor and body. If measurement is 0.39 mm (0.015 inch.) or more, replace body only if outer rotor is in specifications.

9309-188

Fig. 413: Measuring Clearance Between Rotors
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - FEELER GAUGE
2 - OUTER ROTOR
3 - INNER ROTOR |
|--|

7. Install inner rotor into body. If clearance between inner (3) and outer rotors (2) is 0.20 mm (0.008 inch.) or more, replace both rotors.

9309-189

Fig. 414: Measuring Clearance Over Rotors
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - STRAIGHT EDGE
2 - FEELER GAUGES |
|--|

8. Place a straightedge (1) across the face of the body, between bolt holes. If a feeler gauge of 0.077 mm (0.003 in.) or more can be inserted between rotors and the straightedge, replace pump assembly **ONLY** if rotors are in specs.

9. Assemble oil pump. See **Engine/Lubrication/PUMP, Engine Oil - Assembly**.

Assembly

ASSEMBLY

Fig. 415: OIL PUMP

|--|
| <p>1 - OIL PUMP BODY
2 - OIL PUMP OUTER ROTOR
3 - SCREWS
4 - OIL PUMP COVER
5 - OIL PUMP INNER ROTOR</p> |
|--|

1. Assemble oil pump using new parts as required.
2. Tighten cover screws (3) to 12 N.m (105 in. lbs.).
3. Prime oil pump before installation by filling rotor cavity with engine oil.
4. If oil pressure is low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

Installation

INSTALLATION

Fig. 416: OIL PUMP
Courtesy of CHRYSLER LLC

- | |
|----------------------------|
| 1 - OIL PUMP
2 - GASKET |
|----------------------------|

1. Prime the oil pump (1) before installation by filling the rotor cavity with clean engine oil.
2. Install the oil pump (1) and gasket (2) carefully over the crankshaft. Position the pump onto the block and tighten the bolts to 28 N.m (250 in. lbs.).

Fig. 417: OIL PRESSURE SWITCH
Courtesy of CHRYSLER LLC

| 1 - OIL PRESSURE SWITCH
2 - ENGINE OIL COOLER
3 - ENGINE OIL FILTER |
|---|

3. Install the oil pressure switch (1). See **Engine/Lubrication/SWITCH, Oil Pressure - Installation**.

Fig. 418: COMPRESSOR REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

CAUTION: When equipped, use care not to deform or damage the automatic transmission cooler lines and retaining bracket when repositioning the A/C compressor.

NOTE: The bolt (3) that secures the A/C compressor and transmission cooler line bracket (4) (when equipped) must be installed through the bracket and the lower front mounting hole of the compressor prior to final positioning of the compressor to the cylinder block.

4. Loosely install the bolt (3) that secures the A/C compressor and automatic transmission cooler line bracket (4) (when equipped) to the compressor and position the compressor, bracket and bolt to the cylinder block (6).
5. Loosely install the bolts (1) and (2) that secure the A/C compressor to the cylinder block.
6. Tighten all three bolts that secure the A/C compressor to the engine in the following order to 26 N.m (19 ft. lbs.):
 - Upper front bolt (2).
 - Lower front bolt (3).
 - Rear bolt (1).

Fig. 419: WINDAGE TRAY AND OIL PICK UP TUBE

14. Install the crankshaft vibration damper (4). See **Engine/Engine Block/DAMPER, Vibration - Installation**.
15. Install the accessory drive belt (6). Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation**.
16. Fill the cooling system to the proper level using the appropriate coolant. Refer to **Cooling - Standard Procedure**.
17. Fill the engine crankcase with the proper oil to the correct level. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications**.
18. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SWITCH, OIL PRESSURE

Removal

REMOVAL

Fig. 425: OIL PRESSURE SWITCH
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OIL PRESSURE SWITCH
2 - ENGINE OIL COOLER
3 - ENGINE OIL FILTER |
|---|

1. Raise vehicle on hoist.
2. Position an oil collecting container under switch location.
3. Disconnect electrical connector.
4. Unscrew oil pressure switch (1) .

Installation

INSTALLATION

Fig. 426: OIL PRESSURE SWITCH
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OIL PRESSURE SWITCH
2 - ENGINE OIL COOLER
3 - ENGINE OIL FILTER |
|---|

1. Apply Mopar® Thread Sealant to the switch (1) threads.
2. Install oil pressure switch (1) to fitting.
3. Connect electrical connector.
4. Lower vehicle.
5. Start engine and check for leaks.

6. Check engine oil level and adjust as necessary.

MANIFOLDS

MANIFOLD, EXHAUST, LEFT

Removal

LEFT EXHAUST MANIFOLD

Fig. 427: LEFT EXHAUST MANIFOLD
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the upstream oxygen sensor electrical connector.
3. Remove the upper two nuts (3) from the exhaust manifold heat shields.
4. Raise and secure the vehicle on a hoist. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.
5. Use a socket such as Snap-On YA8875 or a crow foot wrench to remove the upstream oxygen sensor from the exhaust manifold.
6. Support the engine and remove the engine mount. See **Engine/Engine Mounting/INSULATOR, Engine Mount - Removal**.

2453061

9. Remove two bolts (4) and the upper (5) and lower (6) exhaust manifold heatshields.
10. Remove the exhaust manifold (7) and gasket (1).

Inspection

INSPECTION

1. Inspect exhaust manifolds for damage or cracks.
2. Check manifold flatness.
3. Inspect the exhaust manifold gasket for obvious discoloration or distortion.
4. Check distortion of the cylinder head mounting surface with a straightedge and thickness gauge.

Installation

LEFT EXHAUST MANIFOLD

Fig. 431: LEFT EXHAUST MANIFOLD
Courtesy of CHRYSLER LLC

1. Clean the gasket surfaces.

NOTE: If replacing the exhaust manifold, tighten the exhaust outlet studs to 39 N.m (29 ft. lbs.).

2. Position the exhaust manifold (7) and gasket (1). Install the retaining bolts (2). Tighten the bolts starting at the center working outward to 23 N.m (17 ft. lbs.).

Fig. 432: Oxygen Sensor & Catalytic Converter

10. Connect the upper radiator hose (2) to the thermostat housing.
11. Fill the cooling system. Refer to **Cooling - Standard Procedure** .
12. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

VALVE TIMING

DESCRIPTION

DESCRIPTION

81128fa6

Fig. 466: TIMING DRIVE SYSTEM
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - FRONT TIMING COVER
2 - WATER PUMP
3 - TIMING BELT
4 - CRANKSHAFT SPROCKET
5 - CRANKSHAFT DAMPER |
|---|

The timing drive system has been designed to provide quiet performance and reliability to support a **NON** free-wheeling engine.

The timing drive components include a crankshaft sprocket (4) , camshaft sprockets, tensioner pulley, hydraulic tensioner and a timing belt (3). The water pump (2) is driven by the back side of the timing belt (3). The right and left camshaft sprockets are keyed and not interchangeable because of the cam sensor pick-up wheel on the left sprocket.

BELT AND SPROCKETS, TIMING

Removal

TIMING BELT

8136#76

Fig. 467: Identifying Timing Gear Components
Courtesy of CHRYSLER LLC

1 - RIGHT CAMSHAFT GEAR ALIGNMENT MARK	7 - LEFT CAMSHAFT GEAR
2 - RIGHT CAMSHAFT GEAR	8 - LEFT CAMSHAFT GEAR ALIGNMENT MARK
3 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - RIGHT	9 - CRANKSHAFT GEAR ALIGNMENT MARK
4 - TIMING BELT	10 - CRANKSHAFT GEAR
5 - WATER PUMP PULLEY	11 - TIMING BELT TENSIONER PULLEY
6 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - LEFT	12 - TIMING BELT TENSIONER

CAUTION: The 3.5L is NOT a freewheeling engine. Therefore, the valve train rocker assemblies must be removed before attempting to rotate either crankshaft or camshafts independently of each other.

1. Disconnect and isolate the negative battery cable.
2. Remove the front timing belt cover. See Engine/Valve Timing/COVER(S), Engine Timing - Removal.
3. Mark belt running direction, if timing belt is to be reused.

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

4. Rotate engine clockwise until crankshaft (10) mark aligns with the TDC mark on oil pump housing (9) and the camshaft sprocket (2, 7) timing marks (1, 8) are aligned with the marks on the rear cover.
5. Remove the timing belt tensioner (12).
6. Remove the timing belt (4).
7. Inspect the tensioner for fluid leakage.
8. Inspect the pivot and bolt for free movement, bearing grease leakage, and smooth rotation. If not rotating freely, replace the arm and pulley assembly.

Fig. 468: Compressing Timing Belt Tensioner
Courtesy of CHRYSLER LLC

1 - VISE
2 - LOCKING PIN

9. When tensioner is removed from the engine it is necessary to compress the plunger into the tensioner body.

CAUTION: Index the tensioner in the vise the same way it is installed on the engine. This ensures proper pin orientation when tensioner is installed on the engine.

- a. Place the tensioner into a vise (1) and SLOWLY compress the plunger. Total bleed down of tensioner should take approximately two minutes.
- b. When plunger is compressed into the tensioner body install a pin (2) through the body and plunger to retain plunger in place until tensioner is installed.

CAMSHAFT SPROCKETS

Fig. 469: RIGHT CAMSHAFT SPROCKET
Courtesy of CHRYSLER LLC

1 - LOOSENED ROCKER ASSEMBLY 2 - RIGHT CAMSHAFT TDC
--

CAUTION: The 3.5L engine is NOT a free-wheeling design. Therefore, care should be taken not to rotate the camshafts or crankshaft with the timing belt removed.

NOTE: The camshaft timing gears are keyed to the camshaft.

1. Remove timing belt. See Engine/Valve Timing/BELT and SPROCKETS, Timing - Removal.
2. Hold the right camshaft sprocket with a 36 mm (1 7/16 in.) box end wrench so that the timing mark (2) does not move while removing the retaining bolt.
3. Loosen and remove the camshaft gear retaining bolt and washer. The right bolt is 213 mm (8 3/8 in.) long.

NOTE: The camshaft timing gears are keyed to the camshaft.

4. Remove the right camshaft sprocket.

Fig. 470: Left Camshaft Sprocket
Courtesy of CHRYSLER LLC

1 - LEFT CAMSHAFT TDC 2 - LOOSENED ROCKER ASSEMBLY

5. Hold the left camshaft sprocket with a 36 mm (1 7/16 in.) box end wrench so that the timing mark (1) does not move while removing the retaining bolt.
6. Loosen the left camshaft gear retaining bolt.

Fig. 471: Radiator Fan Assembly
 Courtesy of CHRYSLER LLC

7. Remove the grill closure panels (1).

Fig. 472: Upper Radiator Mounting Bolts
 Courtesy of CHRYSLER LLC

8. Loosen the upper radiator mounting bolts (1) and (2).
9. Reposition the radiator/condenser forward and remove the left camshaft gear retaining bolt and washer. The left bolt is 255 mm (10.0 in.) long.

NOTE: The camshaft timing gears are keyed to the camshaft.

10. Remove the left camshaft sprocket.

CRANKSHAFT SPROCKET

Fig. 473: Crankshaft Sprocket - Removal
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL L-4407A

1. Remove the timing belt. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Removal**.
2. Remove crankshaft sprocket using Special Tool L-4407A (1) .

Inspection

TIMING BELT

Fig. 474: Timing Belt Inspection
 Courtesy of CHRYSLER LLC

- 1 - PEELING
- 2 - TOOTH MISSING AND CANVAS FIBER EXPOSED
- 3 - RUBBER EXPOSED
- 4 - CRACKS
- 5 - PEELING
- 6 - ROUNDED EDGE
- 7 - ABNORMAL WEAR (FLUFFY STRAND)

1. Remove front timing belt cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Removal**.
2. Inspect both sides of the timing belt. Replace belt if any of the following conditions exist :
 - a. Hardening of back rubber back side is glossy without resilience and leaves no indent when pressed with fingernail.
 - b. Cracks (4) on rubber back.
 - c. Cracks or peeling (1) of canvas.
 - d. Cracks on rib root.
 - e. Cracks on belt sides.
 - f. Missing teeth (2).
 - g. Abnormal wear (7) of belt sides. The sides are normal if they are sharp as if cut by a knife.
 - h. Vehicle mileage or time at component maintenance requirement. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description** .

3. If none of the above conditions are seen on the belt, the front timing belt cover can be installed.
See Engine/Valve Timing/COVER(S), Engine Timing - Installation.

TIMING VERIFICATION

8136#76

Fig. 475: Identifying Timing Gear Components
Courtesy of CHRYSLER LLC

1 - RIGHT CAMSHAFT GEAR ALIGNMENT MARK	7 - LEFT CAMSHAFT GEAR
2 - RIGHT CAMSHAFT GEAR	8 - LEFT CAMSHAFT GEAR ALIGNMENT MARK
3 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - RIGHT	9 - CRANKSHAFT GEAR ALIGNMENT MARK
4 - TIMING BELT	10 - CRANKSHAFT GEAR
5 - WATER PUMP PULLEY	11 - TIMING BELT TENSIONER PULLEY
6 - CYLINDER HEAD TO INNER TIMING BELT COVER BOLTS - LEFT	12 - TIMING BELT TENSIONER

Remove the outer timing covers. Rotate the crankshaft until the pointer on the crankshaft sprocket (10) aligns the TDC mark on the oil pump (9). Check to determine if the camshaft sprocket (2, 7) timing marks (1, 8) are aligned with the marks on the inner timing cover. It may take an additional full revolution of the crankshaft before the camshaft sprocket marks are aligned.

Installation

TIMING BELT

CAUTION: The 3.5L is NOT a freewheeling engine. Therefore, the valve train rocker

assemblies must be removed before attempting to rotate either crankshaft or camshafts independently of each other.

CAUTION: If camshafts have moved from the timing marks, always rotate camshaft towards the direction nearest to the timing marks (**DO NOT TURN CAMSHAFTS A FULL REVOLUTION OR DAMAGE** to valves and/or pistons could result).

Fig. 476: Identifying Timing Gear Components
Courtesy of CHRYSLER LLC

1. Align the crankshaft sprocket (10) with the TDC mark (9) on the oil pump cover.
2. Align the camshaft sprockets (2, 7) timing reference marks (1, 8) with the marks on the rear cover.
3. Install the timing belt (4) starting at the crankshaft sprocket (10) going in a counterclockwise direction. Install the belt around the last sprocket and maintain tension on the belt as it is positioned around the tensioner pulley (11).

NOTE: It is necessary to compress the plunger into the tensioner body and install a locking pin prior to reinstalling the tensioner. See **Timing Belt Removal** for tensioner compression procedure. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Removal**.

4. Hold the tensioner pulley (11) against the belt and install the reset (pinned) timing belt tensioner (2) into the housing. Tighten attaching bolts to 28 N.m (250 in. lbs.).
5. When tensioner (12) is in place, pull the retaining pin to allow the tensioner to extend to the pulley bracket.
6. Rotate the crankshaft sprocket (10) two revolutions and check the timing marks on the

camshafts and crankshaft. The marks should line up within their respective locations. If the marks do not line up, repeat the procedure.

7. Install the front timing belt cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation**.
8. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
9. Fill the cooling system. Refer to **Cooling - Standard Procedure**.
10. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **Cooling - Standard Procedure**.

NOTE: The Cam/Crank Variation Relearn procedure must be performed anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure**.

Fig. 477: RIGHT CAMSHAFT SPROCKET
Courtesy of CHRYSLER LLC

CAUTION: The 3.5L engine is NOT a free-wheeling design. Therefore, care should be taken not to rotate the camshafts or crankshaft with the timing belt removed.

CAUTION: The camshaft sprockets are keyed and not interchangeable from side to side because of the camshaft position sensor pick-up.

1. Install the right camshaft sprocket onto the camshaft.
2. Install a **NEW** sprocket attaching bolt into place. The 213 mm (8 3/8 in.) bolt is to be installed into the right camshaft and the 255 mm (10 in.) bolt is to be installed into the left camshaft.
3. Hold the right camshaft sprocket with a 36 mm (1 7/16 in.) box end wrench so that the timing mark (2) does not move while tightening the retaining bolt. Tighten the bolt to 102 N.m (75 ft. lbs.) +90° turn.

Fig. 478: Left Camshaft Sprocket
Courtesy of CHRYSLER LLC

4. Install the left camshaft sprocket onto the camshaft.
5. Install a **NEW** sprocket attaching bolt into place. The 255 mm (10 in.) bolt is to be installed into the left camshaft and the 213 mm (8 3/8 in.) bolt is to be installed into the right camshaft.
6. Hold the left camshaft sprocket with a 36 mm (1 7/16 in.) box end wrench so that the timing mark (1) does not move while tightening the retaining bolt. Tighten the bolt to 102 N.m (75 ft. lbs.) +90° turn.

Fig. 479: Upper Radiator Mounting Bolts
 Courtesy of CHRYSLER LLC

7. Tighten the upper radiator mounting bolts (1) and (2) to 12 N.m (106 in. lbs.).

Fig. 480: Radiator Fan Assembly
 Courtesy of CHRYSLER LLC

8. Install the grill closure panels (1).
9. Install the timing belt and tensioner. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Installation.**
10. Install the front timing belt cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation.**
11. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

12. Fill cooling system. Refer to **Cooling - Standard Procedure** .
13. Operate engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **Cooling - Standard Procedure** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure** .

CRANKSHAFT SPROCKET

Fig. 481: Crankshaft Sprocket - Installation
Courtesy of CHRYSLER LLC

1 - INSTALL WITH SPECIAL TOOL 6641 WITH 12 mm SCREW C-4685-C1 AND THRUST BEARING AND WASHER

CAUTION: To ensure proper installation depth of crankshaft sprocket, Sprocket Installer 6641 must be used.

1. Install crankshaft sprocket using Special Tools 6641 (1) and C-4685-C1.
2. Install timing belt. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Installation**.

COVER(S), ENGINE TIMING, FRONT

Removal

REMOVAL

Fig. 482: Air Cleaner Housing

16. Fill the cooling system. Refer to **Cooling - Standard Procedure** .
17. Operate the engine until it reaches normal operating temperature. Check the cooling system for correct fluid level. Refer to **Cooling - Standard Procedure** .

COVER(S), ENGINE TIMING, REAR

Removal

REMOVAL

8136#76

Fig. 495: Identifying Timing Gear Components
Courtesy of CHRYSLER LLC

NOTE: The rear timing belt cover has O-rings to seal the water pump passages to cylinder block. Do not reuse the O-rings.

1. Disconnect and isolate the negative battery cable.
2. Drain the cooling system. Refer to **Cooling - Standard Procedure**.
3. Remove timing belt (4). See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Removal**.
4. Remove the right (2) and left (7) camshaft sprockets. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Removal**.

Fig. 496: POWER STEERING PUMP - 2.7L/3.5L
 Courtesy of CHRYSLER LLC

5. Remove three power steering pump mounting bolts (1) through access holes in pulley and reposition the power steering pump (3).

Fig. 497: GENERATOR 3.5L
 Courtesy of CHRYSLER LLC

6. Raise and support the vehicle.
7. Remove the front belly pan. Refer to **Body/Exterior/BELLY PAN - Removal**.
8. Remove upper most mounting bolt (2) from generator (1).
9. Remove generator bracket bolt (3) and remove bracket (4).

10. Remove lower mounting bolts (2) and reposition the generator (1).

Fig. 498: COMPRESSOR REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: Bolt 3 securing the A/C compressor to the engine cannot be fully removed until the compressor is positioned away from the cylinder block.

11. Fully loosen the bolt (3) that secures the A/C compressor (5) and automatic transmission cooler line bracket (4) to the cylinder block (6).

CAUTION: Use care not to deform or damage the automatic transmission cooler lines and retaining bracket when repositioning the A/C compressor.

12. Remove bolts (1 and 2) and reposition the A/C compressor.

- 1 - M8 FASTENERS (APPLY THREAD SEALANT)
- 2 - M10 FASTENERS
- 3 - M6 FASTENERS
- 4 - M10 FASTENERS (STUD/NUT)

3. Install rear timing belt cover. Tighten nuts (4) and bolts (1, 2) to the following specified torque:
 - M10 (2, 4) - 54 N.m (40 ft. lbs.)
 - M8 (1) - 28 N.m (20 ft. lbs.)
4. Position water pump and new gasket.
5. Install water pump mounting bolts (3). Tighten to 12 N.m (105 in. lbs.).

Fig. 502: COMPRESSOR REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

CAUTION: When equipped, use care not to deform or damage the automatic transmission cooler lines and retaining bracket when repositioning the A/C compressor.

NOTE: Bolt 3 that secures the A/C compressor and transmission cooler line bracket (when equipped) must be installed through the bracket and the lower front mounting hole of the compressor prior to final positioning of the compressor to the cylinder block.

6. Loosely install the bolt (3) that secures the A/C compressor and automatic transmission cooler line bracket (4) (when equipped) to the compressor and position the compressor, bracket and bolt to the cylinder block (6).
7. Loosely install the bolts (1 and 2) that secure the A/C compressor to the cylinder block.
8. Tighten all three bolts that secure the A/C compressor to the engine in the following order to 26 N.m (19 ft. lbs.):
 1. Upper front bolt (2).
 2. Lower front bolt (3).
 3. Rear bolt (1).

Fig. 503: GENERATOR 3.5L
Courtesy of CHRYSLER LLC

NOTE: Position generator, bracket and all bolts to engine compartment. Hand tightening all fasteners. Then torque all fasteners to specifications.

9. Position generator (1) to engine and loosely install lower mounting bolts (2).
10. Position generator bracket (4) and loosely install bracket bolt (3) and upper generator mounting bolt (2).
11. Tighten generator mounting bolts (2) to 65 N.m (48 ft. lbs.). Tighten generator bracket bolt (3) to 54 N.m (40 ft. lbs.).

Fig. 504: POWER STEERING PUMP - 2.7L/3.5L

Courtesy of CHRYSLER LLC

12. Align pump (3) with mounting holes on engine bracket (2).
13. Install three pump mounting bolts (1) through access holes in pulley and engine bracket. Tighten bolts to 28 N.m (21 ft. lbs.) torque.

Fig. 505: Identifying Timing Gear Components
Courtesy of CHRYSLER LLC

14. Install camshaft sprockets (2 and 7). See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Installation.**
15. Install timing belt (4). See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Installation.**
16. Install the front timing belt cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation.**
17. Install the front belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .
18. Connect negative battery cable. Tighten nut to 5 N.m (45 in. lbs.).
19. Fill cooling system. Refer to **Cooling - Standard Procedure** .
20. Operate engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **Cooling - Standard Procedure** .

TENSIONER, ENGINE TIMING

Removal

TENSIONER

1. The timing belt tensioner removal is part of the timing belt removal procedure. See

Engine/Valve Timing/BELT and SPROCKETS, Timing - Removal.

TENSIONER PULLEY ASSEMBLY

Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - TENSIONER PULLEY
2 - PIVOT BOLT
3 - TENSIONER BRACKET |
|---|

1. Remove the timing belt. See Engine/Valve Timing/BELT and SPROCKETS, Timing - Removal.
2. Remove the timing belt tensioner pulley (1) and bracket (3) assembly by unscrewing the pivot bolt (2) from the oil pump housing.

Inspection

TENSIONER

Fig. 507: TIMING BELT TENSIONER
Courtesy of CHRYSLER LLC

1 - PLUNGER (EXTENDED POSITION) 2 - TENSIONER HOUSING
--

1. Inspect hydraulic tensioner (2) for fluid loss around the plunger (1) seal. Replace tensioner if leaking.

TENSIONER PULLEY ASSEMBLY

Fig. 508: TENSIONER PULLEY
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - TENSIONER PULLEY
2 - PIVOT BOLT
3 - TENSIONER BRACKET |
|---|

NOTE: **The tensioner pulley (1), bracket (3), and pivot bolt (2) is serviced as an assembly.**

1. Inspect pulley (1) for free movement. Replace if pulley is loose, seized, or rough turning.
2. Inspect pulley bearing and seal. Replace if damaged.
3. Inspect pivot bolt (2) for free movement in assembly housing. Replace assembly if seized or excessive looseness.

Installation

TENSIONER PULLEY ASSEMBLY

Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - TENSIONER PULLEY
2 - PIVOT BOLT
3 - TENSIONER BRACKET |
|---|

1. Install the timing belt tensioner pulley (1) assembly. Tighten the pivot bolt (2) to 61 N.m (45 ft. lbs.).
2. Install the timing belt. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Installation**.

TENSIONER

1. The timing belt tensioner installation is part of the timing belt installation procedure. See **Engine/Valve Timing/BELT and SPROCKETS, Timing - Installation**.

ENGINE

3.6L - Service Information - Challenger

DESCRIPTION

DESCRIPTION

CAUTION: If the engine has experienced a catastrophic failure, THE INTAKE MANIFOLD MUST BE REPLACED!

2778955

Fig. 1: 3.6L (219.7 CID) Flexible Fuel V-6 Engine
Courtesy of CHRYSLER GROUP, LLC

The 3.6 liter (219.7 CID) flexible fuel V-6 engine features Variable Valve Timing (VVT), Dual Overhead Camshafts (DOHC) and a high-pressure die-cast aluminum cylinder block with steel liners in a 60° configuration. The 3.6 liter engine has a chain driven variable discharge oil pump with a two-stage pressure regulator for improved fuel economy. The exhaust manifolds are integrated into the cylinder heads for reduced weight. The cylinders are numbered from front to rear. The right bank is numbered 1, 3, 5 and the left bank is numbered 2, 4, 6. The firing order is 1-2-3-4-5-6. The engine serial number is located on the left side of the cylinder block at the transmission flange.

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

Refer to **ENGINE PERFORMANCE DIAGNOSTIC TABLE** and **ENGINE MECHANICAL DIAGNOSTIC TABLE** for possible causes and corrections of malfunctions. Refer to **FUEL SYSTEM** for the fuel system diagnosis.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
- Cylinder Combustion Pressure Leakage Test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.
- Engine Cylinder Head Gasket Failure Diagnosis. Refer to **DIAGNOSIS AND TESTING**.
- Intake Manifold Leakage Diagnosis. Refer to **DIAGNOSIS AND TESTING**.

ENGINE PERFORMANCE DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery	1. Charge or replace as necessary. Refer to <u>BATTERY, DIAGNOSIS AND TESTING</u> .
	2. Corroded or loose battery connections.	2. Clean and tighten battery connections. Refer to <u>CLEANING</u> .
	3. Faulty engine starting system.	3. Diagnose engine starting system. Refer to <u>DIAGNOSIS AND TESTING</u> .
	4. Faulty coil or control unit.	4. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .
	5. Incorrect spark plug gap.	5. Correct as necessary.
	6. Incorrect cam timing.	6. Verify cam timing. Refer to <u>VALVE TIMING, STANDARD PROCEDURE</u> .
	7. Dirt or water in fuel system.	7. Clean fuel system.
	8. Faulty fuel pump or wiring.	8. Repair or replace as necessary.

	<p>9. Faulty Camshaft Position (CMP) sensor.</p> <p>10. Faulty Crankshaft Position (CKP) sensor.</p>	<p>9. Replace sensor. Refer to <u>SENSOR, CAMSHAFT POSITION, REMOVAL</u> .</p> <p>10. Replace sensor. Refer to <u>SENSOR, CRANKSHAFT POSITION, REMOVAL</u> .</p>
ENGINE STALLS OR ROUGH IDLE	<p>1. Vacuum leak.</p> <p>2. Faulty Crankshaft Position (CKP) sensor.</p> <p>3. Faulty ignition coil.</p> <p>4. Incorrect cam timing.</p>	<p>1. Inspect intake manifold and vacuum hoses, repair or replace as necessary.</p> <p>2. Replace sensor. Refer to <u>SENSOR, CRANKSHAFT POSITION, REMOVAL</u> .</p> <p>3. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .</p> <p>4. Verify cam timing. Refer to <u>VALVE TIMING, STANDARD PROCEDURE</u> .</p>
ENGINE LOSS OF POWER	<p>1. Dirty or incorrectly gapped spark plugs.</p> <p>2. Dirt or water in fuel system.</p> <p>3. Faulty fuel pump.</p> <p>4. Leaking cylinder head gasket.</p> <p>5. Low compression.</p> <p>6. Burned, warped or pitted valves.</p> <p>7. Plugged or restricted exhaust system.</p> <p>8. Faulty ignition coil.</p> <p>9. Incorrect cam timing.</p>	<p>1. Correct as necessary. Refer to <u>SPARK PLUG, REMOVAL</u> .</p> <p>2. Clean fuel system.</p> <p>3. Replace fuel pump. Refer to <u>MODULE, FUEL PUMP, REMOVAL</u> .</p> <p>4. Replace cylinder head gasket. Refer to <u>CYLINDER HEAD , REMOVAL</u> .</p> <p>5. Determine the cause and repair as necessary. Refer to <u>CYLINDER COMBUSTION PRESSURE LEAKAGE</u> .</p> <p>6. Replace as necessary. Refer to <u>VALVES, INTAKE AND EXHAUST, REMOVAL</u> .</p> <p>7. Inspect and replace as necessary.</p> <p>8. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .</p> <p>9. Verify cam timing. Refer to <u>VALVE TIMING, STANDARD PROCEDURE</u> .</p>
ENGINE MISSES ON ACCELERATION	<p>1. Dirty or incorrectly gapped spark plugs.</p>	<p>1. Correct as necessary. Refer to <u>SPARK PLUG, REMOVAL</u> .</p>

	2. Dirt in fuel system.	2. Clean fuel system.
	3. Burned, warped or pitted valves.	3. Replace as necessary. Refer to <u>VALVES, INTAKE AND EXHAUST, REMOVAL</u> .
	4. Faulty ignition coil.	4. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .
ENGINE MISSES AT HIGH SPEED	1. Dirty or incorrectly gapped spark plugs.	1. Correct as necessary. Refer to <u>SPARK PLUG, REMOVAL</u> .
	4. Faulty ignition coil.	2. Replace ignition coil. Refer to <u>COIL, IGNITION, REMOVAL</u> .
	3. Dirt or water in fuel system.	3. Clean fuel system.

ENGINE MECHANICAL DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase.	1. Refer to <u>STANDARD PROCEDURE</u> .
	2. Thin or diluted oil.	2. Change oil and filter.
	3. Low oil pressure.	3. Check oil pump, if Ok, check rod and main bearings for excessive wear.
	4. Dirt in lash adjusters.	4. Replace as necessary.
	5. Worn rocker arms.	5. Replace as necessary.
	6. Worn lash adjusters	6. Replace as necessary.
	7. Worn valve guides.	7. Inspect the valve guides for wear, cracks or looseness. If either condition exists, replace the cylinder head. Refer to <u>CYLINDER HEAD , REMOVAL</u> .
	8. Excessive runout of valve seats on valve faces.	8. Refer to <u>STANDARD PROCEDURE</u> .
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Refer to <u>STANDARD PROCEDURE</u> .
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Connecting rod journal out-of-round.	5. Service or replace crankshaft.

	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Refer to <u>STANDARD PROCEDURE</u> .
	2. Low oil pressure.	2. Check oil pump, if OK, check rod and main bearings for excessive wear.
	3. Thin or diluted oil.	3. Change oil and filter.
	4. Excessive bearing clearance.	4. Replace as necessary.
	5. Excessive end play.	5. Check thrust washers for wear.
	6. Crankshaft journal out-of-round.	6. Service or replace crankshaft.
	7. Loose flywheel or torque converter.	7. Tighten to correct torque

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system and perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression

test.

NOTE: If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
 - Leaks between adjacent cylinders or into water jacket.
 - Any causes for combustion/compression pressure loss.
1. Check the coolant level and fill as required. DO NOT install the radiator cap.
 2. Start and operate the engine until it attains normal operating temperature.
 3. Turn the engine OFF.
 4. Remove the spark plugs.
 5. Remove the oil filler cap.
 6. Remove the air cleaner hose.
 7. **Calibrate the tester according to the manufacturer's instructions.** The shop air source for testing should maintain a regulated air pressure at 552 kPa (80 psi).
 8. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set the piston of the cylinder to be tested at TDC compression.
 9. During the testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with **no more** than 25% leakage.

FOR EXAMPLE: Input air at 552 kPa (80 psi), the primary gauge factory set at 207 kPa (30 psi) input pressure. The secondary gauge should have no more than 176 kPa (25.5 psi) loss, when connected to the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART**.

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH	Intake valve bent, burnt, or not	Inspect valve and valve seat.

THROTTLE BODY	seated properly	Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary

OIL CONSUMPTION TEST AND DIAGNOSIS

The following diagnostic procedures are used to determine the source of excessive internal oil Consumption, these procedures and tests apply to vehicles with 50, 000 miles or less.

NOTE: Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7, 500 miles.

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the Owner's Manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, ensure no external engine oil leaks are present.

- Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.
- Verify that the engine has the correct oil level dipstick and dipstick tube installed.

- **Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.**

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.
2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles, Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with **OIL CONSUMPTION DIAGNOSIS**.

OIL CONSUMPTION DIAGNOSIS

1. Check the positive crankcase ventilation (PCV) system. Make sure the system is not restricted and the PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).
2. Perform a cylinder compression test and cylinder leak down test using the standard leak down gauge following manufacturers suggested best practices.

NOTE: **Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.**

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. Tapered and Out-of-Round Cylinders

The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. Distorted Cylinders

This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts.

This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. Improper operation of "PCV "system

The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

4. Worn Piston Ring Grooves

For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will pass around behind the rings into the combustion chamber.

5. Worn, Broken or Stuck Piston Rings

When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. Cracked or Broken Ring Lands

Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. Worn Valve Stems and Guides

When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. Bent or Misaligned Connecting Rods

Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. Fuel Dilution

If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

- Excess fuel can enter and mix with the oil via a leaking fuel injector
- Gasoline contaminated with diesel fuel
- Restricted air intake
- Excessive idling

10. Contaminated Cooling Systems

Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus leading to higher oil consumption.

11. Oil Viscosity

The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle Owner's Manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. Dirty Engine Oil

Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. Crankcase Overfull

Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. Excessively High Oil Pressure

A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. **Aftermarket Performance Chips and Modification**

Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. **Lugging Engine**

Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. **Turbocharged Engines**

There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated plumbing to and from the charge air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. **Restricted Air Intake**

Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

19. **Intake Manifold port seals**

Engines that have a "V" configuration and a "wet valley" (3.3/3.8L) could draw oil into the intake ports due to improper sealing between the intake manifold ports and cylinder head. Causes may include improper torque of intake manifold bolts, corrosion (aluminum intake manifold) and or warped sealing surface.

ENGINE LUBRICATION DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-rings. Misaligned or damaged.	1. Replace as necessary.
	(a) Loose fasteners, broken or porous metal parts.	(a) Tighten fasteners, Repair or replace metal parts.
	2. Crankshaft rear oil seal.	2. Replace rear crankshaft oil

		seal. Refer to <u>SEAL, CRANKSHAFT OIL, REAR, REMOVAL</u> .
	3. Crankshaft seal flange. Scratched, nicked or grooved.	3. Polish or replace crankshaft.
	4. Oil pan flange cracked.	4. Replace oil pan. Refer to <u>PAN, OIL, REMOVAL</u> .
	5. Engine timing cover seal, damaged or misaligned.	5. Replace seal. Refer to <u>SEAL, CRANKSHAFT OIL, FRONT, REMOVAL</u> .
	6. Scratched or damaged vibration damper hub.	6. Polish or replace damper.
OIL PRESSURE DROP	1. Low oil level.	1. Check and correct oil level.
	2. Faulty oil pressure sensor.	2. Replace sensor. Refer to <u>SENSOR, OIL PRESSURE, REMOVAL</u> .
	3. Low oil pressure.	3. Check main bearing clearance. Refer to <u>STANDARD PROCEDURE</u> . 3. Check rod bearing clearance. Refer to <u>BEARING(S), CONNECTING ROD, STANDARD PROCEDURE</u> .
	4. Clogged oil filter.	4. Replace oil filter. Refer to <u>FILTER, ENGINE OIL, REMOVAL</u> .
	5. Worn oil pump.	5. Replace oil pump. Refer to <u>PUMP, ENGINE OIL, REMOVAL</u> .
	6. Thin or diluted oil.	6. Change oil and filter. Refer to <u>STANDARD PROCEDURE</u> .
	7. Excessive bearing clearance.	7. Replace crankshaft bearings. Refer to . 7. Replace rod bearings. Refer to <u>BEARING(S), CONNECTING ROD, STANDARD PROCEDURE</u> .
	8. Oil pump relief valve stuck.	8. Replace oil pump. Refer to <u>PUMP, ENGINE OIL, REMOVAL</u> .
	9. Oil pump pick-up tube loose, damaged or clogged.	9. Replace oil pump pick-up. Refer to <u>PICK-UP, OIL PUMP, REMOVAL</u> .
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings.	1. Hone cylinder bores and replace rings. Refer to <u>STANDARD PROCEDURE</u> .
	2. Carbon in oil ring slots.	2. Replace rings. Refer to <u>ROD,</u>

		<u>PISTON AND CONNECTING, REMOVAL.</u>
	3. Worn valve guides.	3. Replace cylinder heads. Refer to <u>CYLINDER HEAD , REMOVAL.</u>
	4. Leaking valve guide seals.	4. Replace valve guide seals. Refer to <u>SEAL(S), VALVE GUIDE, REMOVAL.</u>

STANDARD PROCEDURE

DUST COVERS AND CAPS

Fig. 2: Covers/Caps
Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures caused by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

3547950

Fig. 3: Opening Cover
Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

ENGINE GASKET SURFACE PREPARATION

94323

Fig. 4: Proper Tool Usage For Surface Preparation
Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (2).

Fig. 5: Proper Tool Usage For Surface Preparation
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (4).
- High speed power tool with a plastic bristle brush style disc (3).

Sealing surfaces must be free of grease or oil residue. Clean surfaces with Mopar® brake parts cleaner (or equivalent).

Fig. 6: Proper Tool Usage For Surface Preparation

| 1 - ABRASIVE PAD
2 - 3M ROLOC™ BRISTLE DISC
3 - PLASTIC/WOOD SCRAPER |
|--|

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper.
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (1).

NOTE: **Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (3).
- Drill motor with 3M Roloc™ Bristle Disc (white or yellow) (2).

CAUTION: Excessive pressure or high RPM (beyond the recommended speed), can damage the sealing surfaces. The mild (white, 120 grit) bristle disc is recommended. If necessary, the medium (yellow, 80 grit) bristle disc may be used on cast iron surfaces with care.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap, or equivalent.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

FORM-IN-PLACE GASKETS AND SEALERS

NOTE: All of the sealants mentioned below are not used on every engine, they are listed as a general reference guide. See appropriate Service Information for specific sealer usage.

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket. All sealing surfaces that use form-in-place gaskets and sealers **must** be free of grease or oil. Surfaces should be cleaned with Mopar® brake parts cleaner prior to sealer application. After the sealer is applied, the parts should be assembled within 10 minutes.

There are numerous types of form-in-place gasket materials that are used in the engine area. Mopar® Engine RTV GEN II, Mopar® ATF-RTV, and Mopar® Gasket Maker gasket materials, each have different properties and can not be used in place of the other.

MOPAR® ENGINE RTV GEN II is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF RTV is a specifically designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® BED PLATE SEALANT is a unique (green-in-color) anaerobic type gasket material that is specially made to seal the area between the bed plate and cylinder block without disturbing the bearing clearance or alignment of these components. The material cures slowly in the absence of air when torqued between two metallic surfaces, and will rapidly cure when heat is applied.

MOPAR® THREEBOND ENGINE RTV SEALANT is a unique gasket material that is specially made to retain adhesion and sealing properties when used to seal components exposed to engine oil.

SEALER APPLICATION

Mopar® Gasket Maker material should be applied sparingly 1 mm (0.040 in.) diameter or less of sealant to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Components should be torqued in place within 15 minutes. The use of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Engine RTV GEN II or ATF RTV gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. All mounting holes must be circled. For corner sealing and "T" joint locations, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be torqued in place while the sealant is still wet to the touch (within 10 minutes). The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Mopar® Threebond Engine RTV Sealant gasket material should be applied in a continuous bead approximately 3 mm (0.120 in.) in diameter. The gasket surfaces should be cleaned with isopropyl alcohol wipes in preparation for sealant application. All mounting holes must be circled. For corner sealing and "T" joint locations, a 3.17 or 6.35 mm (1/8 or 1/4 in.) drop is placed in the center of the gasket contact area. Uncured sealant may be removed with a shop towel. Components should be assembled within 20 minutes and torqued in place within 45 minutes. The usage of a locating dowel is recommended during assembly to prevent smearing material off the location.

Spring Force - Exhaust (Valve Open)	676 ± 30 N @ 10.0 mm	152 ± 6 lbs. @ 0.3937 in.
Number of Coils - Intake AND Exhaust	9.35	
Wire Diameter - Intake AND Exhaust	3.18 x 3.99 mm (ovate)	0.125 x 0.157 in. (ovate)
Installed Height - Intake AND Exhaust (Spring seat top to bottom of retainer)	40.0 mm	1.575 in.

OIL PRESSURE

Description	Specification	
	Metric	Standard
(Note: At Normal Operating Temperatures)		
Pressure @ Curb Idle Speed*	34.7 kPa Min.	5 psi Min.
Pressure @ 600 - 1200 RPM	34.7 (warm) - 958.0 (cold) kPa	5 (warm) - 139 (cold) psi
Pressure @ 1201 - 3500 RPM	206.8 (warm) - 958.0 (cold) kPa	30 (warm) - 139 (cold) psi
Pressure @ 3501 - 6400 RPM	427.0 (warm) - 958.0 (cold) kPa	62 (warm) - 139 (cold) psi
*CAUTION: If oil pressure is zero at idle, DO NOT run engine at 3000 RPM.		

TORQUE

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.

Air Inlet Hose - Band Clamps	4	-	35
A/C Compressor to Engine - M8 Bolts	25	18	-
Camshaft Chain Tensioner (Primary) - M6 T30	12	-	106
Camshaft Chain Guide (Primary) - M6 T30	12	-	106
Camshaft Chain Idler Sprocket - M8 T45	25	18	-
Camshaft Chain LH Tensioner (Secondary) - M6 T30	12	-	106
Camshaft Chain LH Guide (Secondary) - M6 T30	12	-	106
Camshaft Chain RH Tensioner (Secondary) - M6 T30	12	-	106
Camshaft Chain RH Guide (Secondary) - M6 T30	12	-	106
Camshaft Position (CMP) Sensor to Cylinder Head - 6M T30	9	-	80
Camshaft Bearing Cap - M6 T30	9.5	-	84
Connecting Rod Cap - M9 Bolts	20 + 90° Turn	15 + 90° Turn	-
Coolant Pump to Engine Timing Cover - M6 Bolts	12	-	106
Coolant Crossover Housing to Engine Timing Cover - M6 Bolts	12	-	106
Coolant Pump to Engine Timing Cover - M10 Bolt	55	40	-
Crankshaft Target Wheel to Counterweight - M6 T30	10	-	89
Crankshaft Outer Main Bearing Cap and Windage Tray - M8 Bolts	21 + 90° Turn	16 + 90° Turn	-
Crankshaft Inner Main Bearing Cap - M11 Bolts	20 + 90° Turn	15 + 90° Turn	-
Crankshaft Side Main Bearing Cap (Tie Bolt) - M8 Bolts	28	-	250
Crankshaft Vibration Damper - M16 Bolt	40 + 105° Turn	30 + 105° Turn	-
Crankshaft Position (CKP) Sensor to Engine Block - M6 Bolt	12	-	106
Crankshaft Rear Oil Seal Retainer - M6 T30	12	-	106
Cylinder Head Oil Restrictor - M8 Plug	15	-	133
Cylinder Head to Engine Block - M12 Bolts in Sequence	See <u>INSTALLATION</u>		
Cylinder Head Cover - M6 Bolts	12	-	106
Catalytic Converter to Cylinder Head - M8 Bolts	23	17	-
Engine Coolant Temperature (ECT) Sensor	11	-	97

Engine Block Heater - M6 Bolt	12	-	106
Left/Right Engine Mount Bracket to Engine Block - M10 Bolts	61	45	-
Left/Right Engine Mount Isolator to Engine Mount Bracket - M10 Nuts	61	45	-
Left/Right Engine Mount Heatshield to Engine Mount Bracket - M6 Bolts	12	-	106
Left/Right Engine Mount Isolator to Frame - M10 Bolts	61	45	-
Flexplate to Crankshaft - M10 Bolts	95	70	-
Fuel Rail to Lower Intake Manifold - M6 Bolts	7	-	62
Generator - M8 Bolts	25	18	-
Heater Core Supply Tube to Cylinder Head - M8 Bolt	12	-	106
Idle Pulley to Engine Timing Cover - Accessory Drive M8 Bolt	25	18	-
Ignition Capacitor to Cylinder Head - M6 Bolts	10	-	89
Ignition Coil to Cylinder Head Cover - M6 Bolts	8	-	71
Intake Manifold (Upper) - M6 Bolts	8	-	71
Intake Manifold (Lower) - M6 Bolts	8	-	71
Knock Sensor to Engine Block - M8 T40	22	16	-
Negative Battery Cable to Battery	5	-	45
Oil Control Valve - Cam Phaser M18	150	111	-
Upper Oil Pan to Engine Block - M8 Bolts	25	18	-
Transmission to Upper Oil Pan - M10 Bolts	55	41	-
Transmission to Starter - M10 Bolts	55	41	-
Torque Converter Dust Shield - M8 Bolt	12	-	106
Oil Cooler to Oil Filter Housing Screws	4	-	35
Upper Oil Pan to Rear Seal Retainer - M6 Bolts	10	-	89
Oil Pan Drain - Plug M14	27	20	-
Oil Pressure Sensor to Oil Filter Housing	20	-	177
Oil Temperature Sensor to Oil Filter Housing	20	-	177
Lower Oil Pan to Upper Oil Pan - M6 Bolts	10.5	-	93
Piston Oil Cooler Jet to Engine Block - M5	6	-	53
Oil Filter Housing/Oil Cooler to Engine Block - M6 Bolts	12	-	106
Oil Filter Housing Cap	25	18	-
Oil Pump to Block - M6 Bolts	12	-	106
Oil Level Indicator to Engine Block - M10 Bolt	35	26	-
Oil Level Indicator to Cylinder Head - M6 Bolt	12	-	106

Oil Pump Sprocket - M8 T45	25	18	-
Oil Pump Pick Up Tube Bracket to Windage Tray - M6 Bolt	12	-	106
Oil Pump Pick Up Tube to Oil Pump - M6 Bolt	12	-	106
Oxygen Sensor to Exhaust Pipe - M18	50	37	-
PCV Valve - M5 T25	4	-	35
Power Steering Pump to Bracket - M8 Bolts	25	18	-
Power Steering Pump Bracket to Engine - M8 Bolts	25	18	-
Spark Plug to Cylinder Head - M12	17.5	13	-
Starter Mounting - M10 Bolts	55	41	-
Tensioner to Engine Timing Cover - Accessory Drive M10 Bolt	55	41	-
Thermostat Housing to Coolant Crossover - M6 Bolts	12	-	106
Throttle Body - M6 Bolts	7	-	62
Engine Timing Cover - M6 Bolts	12	-	106
Engine Timing Cover - M8 Bolt	25	18	-
Engine Timing Cover - M10 Bolts	55	41	-
Transmission to Engine Block - M10 Bolts	55	41	-
Transmission Fluid Indicator to Transmission - M6 Bolt	12	-	106
Torque Converter - M8 Bolts	42	31	-
Upper Intake Manifold Support Bracket to Cylinder Head - M8 Bolt	20	-	177
Upper Intake Manifold Support Bracket to Upper Intake Manifold - M6 Nuts	10	-	89
Variable Valve Timing Solenoid to Cylinder Head Cover - M5 T25	4	-	35
Wire Harness Retainer Bracket to LH Cylinder Head - M6 T30	12	-	106
Rear Engine Mount Bracket to Transmission - M8 Bolts	33	24	-
Rear Engine Mount Isolator to Rear Engine Mount Bracket - M10 Bolts	61	45	-
Rear Engine Mount Crossmember to Frame - M10 Bolts	55	41	-
Rear Engine Mount Isolator to Crossmember - M10 Bolts	61	45	-
Left/Right Crossmember Brace to Crossmember - M8 Bolts	55	41	-
Left/Right Crossmember Brace to Frame - M8 Bolts	55	41	-

REMOVAL

REMOVAL

CAUTION: If the original engine has experienced a catastrophic failure or an individual failure with the piston, cylinder bore, engine block, valve or valve seat, the intake manifold **MUST** be replaced with a new manifold.

Fig. 7: Removing/Installing Cowl Panel
Courtesy of CHRYSLER GROUP, LLC

1. Remove the hood. Refer to **HOOD, REMOVAL** .
2. Remove the cowl panel cover (2). Refer to **COVER, COWL PANEL, REMOVAL** .
3. Remove the strut tower support (6).

Fig. 8: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

4. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE** .
5. Disconnect and isolate the negative battery cable (1).
6. Perform the Refrigerant System Recovery procedure. Refer to **PLUMBING, STANDARD PROCEDURE** .

Fig. 9: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

7. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

Fig. 10: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners

Courtesy of CHRYSLER GROUP, LLC

8. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
9. Loosen the clamp (2) at the throttle body.
10. Loosen the clamp (3) at the air cleaner housing.
11. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
12. Remove the air inlet hose assembly (5).

Fig. 11: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt

Courtesy of CHRYSLER GROUP, LLC

13. Disconnect the fresh air makeup hose (1) from the air cleaner housing.
14. Remove the air cleaner housing retaining bolt (2).

15. Remove the air cleaner housing (3).

Fig. 12: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

16. Raise and support the vehicle. Refer to HOISTING, STANDARD PROCEDURE .
17. Remove the belly pan retainers (1) and remove the belly pan.
18. Drain the cooling system. Refer to STANDARD PROCEDURE .
19. Drain the engine oil. Refer to STANDARD PROCEDURE .
20. Remove the starter motor. Refer to STARTER, REMOVAL .

Fig. 13: Upstream Oxygen Sensor & Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

21. Disconnect both left and right upstream oxygen sensor (2) electrical connectors (1).

Fig. 14: Exhaust Down Pipe & Retaining Nuts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

22. Remove the exhaust down pipe (1) to catalytic converter retaining nuts (2) from both left and right down pipes.

Fig. 15: Torque Converter Bolt
Courtesy of CHRYSLER GROUP, LLC

23. Rotate the crankshaft in a clockwise direction until the torque converter bolts (1) are accessible through the starter mounting hole and remove the six torque converter bolts (1).

24. Lower the vehicle.

Fig. 16: Coolant Bottle Return Hose
Courtesy of CHRYSLER GROUP, LLC

25. Remove the coolant bottle return hose (1).

Fig. 17: Heater Core Purge Hose, Coolant Bottle Retaining Bolts & Coolant Bottle
Courtesy of CHRYSLER GROUP, LLC

26. Remove the heater core purge hose (1) from the coolant bottle.
27. Remove the coolant bottle retaining bolts (2).
28. Remove the coolant bottle (3).

Fig. 18: EVAP Purge Solenoid, Electrical Connector & Vacuum Lines
 Courtesy of CHRYSLER GROUP, LLC

29. Disconnect the vacuum line (3) at the EVAP purge solenoid (1).
30. Disconnect the EVAP purge solenoid vacuum line (4) at the intake manifold and remove the vacuum line.

Fig. 19: PCV Valve, Intake Manifold, Brake Booster Vacuum Hose, MAP Sensor, ETC & CMP Sensor Electrical Connectors
 Courtesy of CHRYSLER GROUP, LLC

31. Disconnect the PCV hose from the PCV valve (1) and the intake manifold (2) and remove hose.
32. Disconnect the brake booster vacuum hose (3) and position aside.
33. Disconnect the electrical connector at the Manifold Absolute Pressure (MAP) Sensor (4).
34. Disconnect the electrical connector at the Electronic Throttle Control (ETC) (5).

35. Disconnect the electrical connector at the Camshaft Position Sensor (CMP) (6) and position harness aside.

Fig. 20: Fresh Air Makeup Hose At Rear Of Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

36. Remove the fresh air makeup hose (2) from the rear of the intake manifold (1).

Fig. 21: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

37. Remove the upper intake manifold (2) and insulator. Refer to **MANIFOLD, INTAKE, REMOVAL**.

Fig. 22: Fuel Supply Hose At Underbody Fuel Supply Tube
 Courtesy of CHRYSLER GROUP, LLC

38. Disconnect the fuel supply hose (1) from the underbody fuel supply tube (2). Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE** .

Fig. 23: Cooling Fan Module Components
 Courtesy of CHRYSLER GROUP, LLC

39. Remove the cooling fan module. Refer to **FAN, COOLING, REMOVAL** .

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

2807819

Fig. 24: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
 Courtesy of CHRYSLER GROUP, LLC

40. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and remove the accessory drive belt (3), then slowly rotate the tensioner into the freearm position.
41. Remove the generator (1). Refer to **GENERATOR, REMOVAL** .

2858821

Fig. 25: Variable Valve Timing Solenoid Connectors & Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

42. Disconnect the electrical connectors (2) from the variable valve timing solenoids on the right cylinder head.

43. Unfasten the starter harness to main harness retainer (3).
44. Unfasten the two starter wire harness retainers (1) from the right cylinder head cover.

Fig. 26: Main Wire Harness Retainer & Connector
Courtesy of CHRYSLER GROUP, LLC

45. Unfasten the main wire harness retainer (2) from the right cylinder head cover mounting stud.

Fig. 27: Main Wire Harness Retainers At Right Cylinder Head Cover
Courtesy of CHRYSLER GROUP, LLC

46. Unfasten the four main wire harness retainers (1) from the right cylinder head cover.

Fig. 28: Wire Harness Retainers, Oil Pump Solenoid Electrical Connector & Ground Strap
 Courtesy of CHRYSLER GROUP, LLC

47. Disconnect the oil pump solenoid electrical connector (2).
48. Unfasten the four wire harness retainers (1).
49. Remove the ground strap (3) from the right engine mount bracket.

Fig. 29: Variable Valve Timing Solenoid Connectors & Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

50. Disconnect the electrical connectors (2) from the left variable valve timing solenoids.
51. Unfasten the two starter wire harness retainers (1) from the left cylinder head cover.

Fig. 30: A/C Compressor Electrical Connector & Wire Harness Retainer
 Courtesy of CHRYSLER GROUP, LLC

52. Disconnect the A/C compressor electrical connector (1) and unfasten the wire harness retainer (2) from the A/C compressor discharge line.

Fig. 31: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
 Courtesy of CHRYSLER GROUP, LLC

53. Unfasten the two starter wire harness retainers (1) from the upper intake manifold support brackets.
54. Unfasten the main wire harness retainer (3) from the left cylinder head cover and two retainers (2) from the upper intake manifold support brackets.

Fig. 32: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

55. Disconnect the Engine Coolant Temperature (ECT) sensor connector (3).
56. Disconnect the left Camshaft Position (CMP) sensor (5).
57. Unfasten the main wire harness retainer (2) from the cylinder head cover and one main wire harness retainer (4) from the cylinder head cover mounting stud.
58. Unfasten the main wire harness retainer (1) from the rear of the lower intake manifold.

Fig. 33: Upper Radiator Hose
 Courtesy of CHRYSLER GROUP, LLC

59. Remove the upper radiator hose (1) from the engine thermostat housing.

Fig. 34: Lower Heater Core Return Hose & Lower Radiator Hose
 Courtesy of CHRYSLER GROUP, LLC

60. Remove the lower heater core return hose (1) from the engine coolant pump housing.
61. Remove the lower radiator hose (2) from the engine coolant pump housing.

Fig. 35: Heater Core Return Tube Lower Support Bracket Retaining Nut
 Courtesy of CHRYSLER GROUP, LLC

62. Remove the heater core return tube lower support bracket retaining nut (1).

Fig. 36: Heater Core Return Hose
 Courtesy of CHRYSLER GROUP, LLC

63. Disconnect the heater core return hose (1).

Fig. 37: Heater Core Return Tube Upper Support Bracket Retaining Nut & Tube
 Courtesy of CHRYSLER GROUP, LLC

64. Remove the heater core return tube upper support bracket retaining nut (2) and remove tube (1).

Fig. 38: A/C Compressor, Nut, Stud & Three Bolts
 Courtesy of CHRYSLER GROUP, LLC

65. Remove the A/C compressor (2). Refer to **COMPRESSOR, A/C, REMOVAL** .
66. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 39: Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

67. Remove the starter. Refer to **STARTER, REMOVAL** .
68. Unfasten the starter wire harness retainer (2) and the main wire harness retainer (1) from the engine block.

Fig. 40: Bolt & Transmission Cooling Lines
 Courtesy of CHRYSLER GROUP, LLC

69. Remove the bolt (1) and reposition the transmission cooling lines (2).

Fig. 41: Heat Shield
 Courtesy of CHRYSLER GROUP, LLC

70. Push back the heat shield (1) from the crankshaft position (CKP) sensor.

2858935

Fig. 42: Main Wire Harness Retainers & CKP Sensor
 Courtesy of CHRYSLER GROUP, LLC

71. Disconnect the main wire harness from the Crankshaft Position (CKP) sensor (3).
72. Unfasten the main wire harness retainer (1) from the engine block and one main wire harness retainer (2) from the right engine mount bracket.
73. Disconnect and reposition the power cord from the engine block heater (if equipped).

3079614

Fig. 43: Upper Side Transmission-To-Engine Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

74. Remove the two upper side transmission to engine retaining bolts (1).

Fig. 44: Engine Injection/Ignition Harness & Engine Oil Pressure/Temperature Harness
 Courtesy of CHRYSLER GROUP, LLC

75. Disconnect the main harness from the engine injection/ignition harness (1) at the rear of the left cylinder head.
76. Disconnect the main harness from the engine oil pressure/temperature harness (2) at the rear of the left cylinder head.

Fig. 45: Side Engine-To-Transmission Bolt, Transmission Dust Shield Retaining Bolt & Dust Shield
 Courtesy of CHRYSLER GROUP, LLC

77. Remove the side engine to transmission bolt (1).

Remove the transmission dust shield retaining bolt (2) and remove the dust shield (3)

Fig. 46: Rubber Plugs
Courtesy of CHRYSLER GROUP, LLC

78. Remove the two rubber plugs (1) covering the rear oil seal retainer flange bolts.

Fig. 47: Transmission-To-Engine Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

79. Remove four transmission to the engine oil pan bolts (1).

Fig. 48: Heater Core Inlet Tube, Oil Level Indicator & Bolts
 Courtesy of CHRYSLER GROUP, LLC

80. Lower the vehicle.
81. Remove two bolts (3) and remove the heater core inlet tube (4).
82. Remove the bolt (1) and remove the oil level indicator (2).

Fig. 49: Left Intake Manifold Support Brackets & Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

83. Remove the left intake manifold support bracket retaining bolts (2) and remove the support brackets (1).

Fig. 50: Driver Side Engine Lifting Bracket & Bolts
 Courtesy of CHRYSLER GROUP, LLC

84. Install the Driver Side Engine Lifting Bracket (special tool #10242-1, Brackets, Engine Lifting, Left Side) (1) on the left cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

Fig. 51: Passenger Side Engine Lifting Bracket & Bolts
 Courtesy of CHRYSLER GROUP, LLC

85. Install the Passenger Side Engine Lifting Bracket (special tool #10242-2, Brackets, Engine Lifting, Right Side) (1) on the right cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

2801362

Fig. 52: Lifting Sling, Engine Lifting Brackets & Engine Hoist
Courtesy of CHRYSLER GROUP, LLC

86. Reposition the starter wire harness and the main wire harness to the rear of the engine compartment.
87. Position a load-leveling lifting sling (2), such as OTC® 4305 Engine Load Leveler or equivalent, between the engine lifting brackets (3) and an engine hoist (1).
88. Support the transmission with a suitable jack.

2985363

Fig. 53: Electrical Connector, Harness Connector, Hose & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

89. Unfasten the harness retainer (4) from the electric vacuum pump mounting bracket.
90. Disconnect the electrical connector (1) from the electric vacuum pump (3).
91. Remove the quick connect vacuum hose (2) from the electric vacuum pump (3).

Fig. 54: Electric Vacuum Pump, Bolts & Studs
 Courtesy of CHRYSLER GROUP, LLC

92. Remove the two upper transmission to engine retaining bolts (2) and remove the electric vacuum pump (3).

Fig. 55: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Left engine mount shown in illustration, right engine mount similar.

93. Remove both left and right engine mount heat shield retaining nuts (3) and remove the heat shields (4).
94. Remove both left and right engine mount lower retaining bolts (2).

CAUTION: While slowly separating the engine from the vehicle, constant checks must be made to assure proper positioning and that no damage to other components or wiring harnesses occur during separation.

95. Carefully remove the engine from the engine compartment.
96. If required, remove the following components for installation on the replacement engine:
 - Left exhaust down pipe
 - Right exhaust down pipe
 - Left engine mount bracket
 - Left engine mount
 - Right engine mount bracket
 - Right engine mount
 - Accessory drive belt tensioner
 - Upper intake manifold support bracket
 - Block heater (if equipped)

INSTALLATION

INSTALLATION

CAUTION: If the original engine has experienced a catastrophic failure or an individual failure with the piston, cylinder bore, engine block, valve or valve seat, the intake manifold **MUST** be replaced with a new manifold.

2712055

Fig. 56: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: If installing a replacement engine, transfer components such as engine mount brackets, block heater, accessories, heater hoses and tubes to the replacement engine.

1. If required, transfer the following components onto the replacement engine:
 - Left exhaust down pipe
 - Right exhaust down pipe
 - Left engine mount bracket
 - Left engine mount
 - Right engine mount bracket
 - Right engine mount
 - Accessory drive belt tensioner
 - Upper intake manifold support bracket
 - Block heater (if equipped)
2. If required, remove the upper intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

Fig. 57: Left Intake Manifold Support Brackets & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the left intake manifold support bracket retaining bolts (2) and remove the support brackets (1).

Fig. 58: Driver Side Engine Lifting Bracket & Bolts
 Courtesy of CHRYSLER GROUP, LLC

4. Install the Driver Side Engine Lifting Bracket (special tool #10242-1, Brackets, Engine Lifting, Left Side) (1) on the left cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

Fig. 59: Passenger Side Engine Lifting Bracket & Bolts
 Courtesy of CHRYSLER GROUP, LLC

5. Install the Passenger Side Engine Lifting Bracket (special tool #10242-2, Brackets, Engine Lifting, Right Side) (1) on the right cylinder head with bolts (2) provided with the Engine Lifting Bracket and tighten bolts to 21 N.m (15 ft. lbs.).

2801352

Fig. 60: Lifting Sling, Engine Lifting Brackets & Engine Hoist
 Courtesy of CHRYSLER GROUP, LLC

6. Position a load-leveling lifting sling (2), such as OTC® 4305 Engine Load Leveler or equivalent, between the engine lifting brackets (3) and an engine hoist (1).
7. Reposition the starter wire harness and the main wire harness to the rear of the engine compartment.

2990543

Fig. 61: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Left engine mount shown in illustration, right engine mount similar.

8. Carefully lower the engine into the engine compartment while aligning the two locator dowels into the transmission housing.

9. Align the engine mounts, install both left and right engine mount lower retaining bolts (2) and tighten to 68 N.m (50 ft. lbs.).
10. Position both left and right engine mount heat shields (4), install the retaining nuts (3) and tighten to 12 N.m (9 ft. lbs.).

Fig. 62: Electric Vacuum Pump, Bolts & Studs
Courtesy of CHRYSLER GROUP, LLC

11. Position the electric vacuum pump (3), install the two transmission to engine retaining bolts (2) and tighten to 55 N.m (41 ft. lbs.).

Fig. 63: Electrical Connector, Harness Connector, Hose & Vacuum Pump
Courtesy of CHRYSLER GROUP, LLC

12. Install the quick connect vacuum hose (2) to the electric vacuum pump (3).
13. Connect the electrical connector (1) to the electric vacuum pump (3).

14. Secure the harness retainer (4) to the mounting bracket.

Fig. 64: Left Intake Manifold Support Brackets & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Remove the engine lifting brackets and position the left upper intake manifold support brackets (1) and install the retaining studs (2) finger tight.

Fig. 65: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
Courtesy of CHRYSLER GROUP, LLC

16. Route the main wire harness and starter wire harness on the engine.
17. Secure the two starter wire harness retainers (1) to the upper intake manifold support brackets.
18. Secure the main wire harness retainer (3) to the left cylinder head cover and two retainers (2) to the upper intake manifold support brackets.

Fig. 66: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

19. Connect the Engine Coolant Temperature (ECT) sensor connector (3).
20. Connect the left Camshaft Position (CMP) sensor (5).
21. Secure the main wire harness retainer (2) to the cylinder head cover and one main wire harness retainer (4) to the cylinder head cover mounting stud.
22. Secure the main wire harness retainer (1) to the rear of the lower intake manifold.

Fig. 67: Main Wire Harness Retainers At Right Cylinder Head Cover
 Courtesy of CHRYSLER GROUP, LLC

23. Secure the four main wire harness retainers (1) to the right cylinder head cover.

2858821

Fig. 68: Variable Valve Timing Solenoid Connectors & Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

24. Connect the electrical connectors (2) to the variable valve timing solenoids on the right cylinder head.
25. Secure the two starter wire harness retainers (1) to the right cylinder head cover.
26. Secure the starter harness to main harness retainer (3).

2858849

Fig. 69: Wire Harness Retainers, Oil Pump Solenoid Electrical Connector & Ground Strap
 Courtesy of CHRYSLER GROUP, LLC

27. Connect the oil pump solenoid electrical connector (2).
28. Secure the four wire harness retainers (1).
29. Install the ground strap (3) to the right engine mount bracket.

Fig. 70: Transmission-To-Engine Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

30. Remove the jack supporting the transmission.
31. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
32. Install the four transmission to the engine oil pan retaining bolts (1) and tighten to 55 N.m (41 ft. lbs.).

Fig. 71: Rubber Plugs
Courtesy of CHRYSLER GROUP, LLC

33. Install the two rubber plugs (1) covering the rear oil seal retainer flange bolts.

Fig. 72: Side Engine-To-Transmission Bolt, Transmission Dust Shield Retaining Bolt & Dust Shield

Courtesy of CHRYSLER GROUP, LLC

34. Install the side engine to transmission retaining bolt (1) and tighten to 55 N.m (41 ft. lbs.).
35. Position the torque converter dust shield (3), install the retaining bolt (2) and tighten to 12 N.m (9 ft. lbs.).

Fig. 73: Upper Side Transmission-To-Engine Retaining Bolts

Courtesy of CHRYSLER GROUP, LLC

36. Install the two upper side transmission to engine retaining bolts (1) and tighten to 55 N.m (41 ft. lbs.).

Fig. 74: Engine Injection/Ignition Harness & Engine Oil Pressure/Temperature Harness
 Courtesy of CHRYSLER GROUP, LLC

37. Connect the main harness to the engine injection/ignition harness (1) at the rear of the left cylinder head.
38. Connect the main harness to the engine oil pressure/temperature harness (2) at the rear of the left cylinder head.

75. Position the EVAP purge solenoid (1) vacuum line (4) and connect the vacuum line to the intake manifold.
76. Connect the other end of the vacuum line (3) to the EVAP purge solenoid (1).

Fig. 99: Heater Core Purge Hose, Coolant Bottle Retaining Bolts & Coolant Bottle
 Courtesy of CHRYSLER GROUP, LLC

77. Position the coolant bottle (3) into the engine compartment.
78. Install the coolant bottle retaining bolts (2) and tighten to 12 N.m (9 ft. lbs.).
79. Connect the heater core purge hose (1) to the coolant bottle.

Fig. 100: Coolant Bottle Return Hose
 Courtesy of CHRYSLER GROUP, LLC

80. Connect the coolant bottle return hose (1).

Fig. 101: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
 Courtesy of CHRYSLER GROUP, LLC

81. Position the air cleaner housing (3) into the vehicle.
82. Install the air cleaner housing retaining bolt (2) and tighten to 12 N.m (9 ft. lbs.).
83. Connect the fresh air makeup hose (1) to the air cleaner housing.

Fig. 102: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners

Courtesy of CHRYSLER GROUP, LLC

84. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
85. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
86. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
87. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
88. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

Fig. 103: Removing/Installing Cowl Panel

Courtesy of CHRYSLER GROUP, LLC

89. Install the strut tower support (6).

90. Install the cowl panel cover (2). Refer to **COVER, COWL PANEL, INSTALLATION** .
91. Install the hood. Refer to **HOOD, INSTALLATION** .

Fig. 104: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

92. If removed, install the oil filter and fill the engine crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
93. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .
94. Perform the Refrigerant System Charge procedure. Refer to **PLUMBING, STANDARD PROCEDURE** .
95. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

Fig. 105: Negative Battery Cable

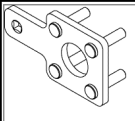

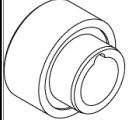

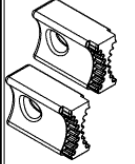

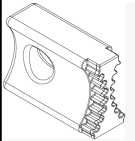

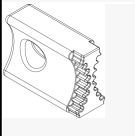

Courtesy of CHRYSLER GROUP, LLC

96. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
97. Run the engine until it reaches normal operating temperature and check for leaks.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

SPECIAL TOOLS

SPECIAL TOOLS

	10198 - Holder, Vibration Damper (Originally Shipped In Kit Number(s) 10223.)
	10199 - Installer, Crankshaft Front Oil Seal (Originally Shipped In Kit Number(s) 10223.)

AIR INTAKE SYSTEM

AIR CLEANER

REMOVAL

REMOVAL

Fig. 106: Fresh Air Makeup Hose, Air Cleaner Housing & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Remove the fresh air makeup hose (1) at the air cleaner housing (3).
2. Remove the air cleaner housing cover retaining bolts (2).

CAUTION: Do not use compressed air to clean out the air cleaner housing without first covering the air inlet to the throttle body. Dirt or foreign objects could enter the intake manifold causing engine damage.

Fig. 107: Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

3. Lift the air cleaner housing cover off the housing and position aside.
4. Remove the air cleaner element (1).
5. Remove any dirt or debris from the bottom of the air cleaner housing.

INSTALLATION

INSTALLATION

Fig. 108: Air Cleaner Element

Courtesy of CHRYSLER GROUP, LLC

1. Install a new air cleaner element (1) into the air cleaner housing.
2. Position the air cleaner housing cover so that the alignment tabs insert into the lower housing.

Fig. 109: Fresh Air Makeup Hose, Air Cleaner Housing & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Seat the cover (3) onto the housing and install the retaining bolts (2) and tighten to 4 N.m (35 in. lbs.).
4. Connect the fresh air makeup hose (1) onto the air cleaner housing.

BODY, AIR CLEANER

REMOVAL

REMOVAL

10. Connect the negative battery cable and tighten nut (1) to 5 N.m (45 in. lbs.).

CYLINDER HEAD

DESCRIPTION

DESCRIPTION

2793404

Fig. 118: Aluminum Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

The 3.6L aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. The cylinder head features four valves per cylinder with pressed in powdered metal valve guides. The valve guides are not serviceable. The DOHC valvetrain uses roller rocker arms with hydraulic lifters. The cylinder head's camshaft bearing caps are made of powdered metal and the location and direction of each cap is marked on the side of the caps. The spark plug tubes are pressed into the cylinder heads and sealed in place. The tubes are a thin wall design and caution must be taken when working in the spark plug tube area.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

Possible indications of the cylinder head gasket leaking between adjacent cylinders are:

- Loss of engine power
- Engine misfiring
- Poor fuel economy

Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:

- Engine overheating
- Loss of coolant
- Excessive steam (white smoke) emitting from exhaust
- Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE**. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING WITH COOLANT PRESSURE CAP REMOVED.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

Fig. 119: Cooling System Pressure Tester - 7700-A
Courtesy of CHRYSLER GROUP, LLC

WARNING: WITH THE COOLING SYSTEM TESTER IN PLACE, PRESSURE WILL BUILD UP FAST. EXCESSIVE PRESSURE BUILT UP BY CONTINUOUS ENGINE OPERATION MUST BE RELEASED TO A SAFE PRESSURE POINT. NEVER PERMIT THE PRESSURE TO EXCEED 138 kPa (20 psi).

Install Cooling System Tester (special tool #7700-A, Tester, Cooling System) or equivalent to

pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Fig. 120: Bloc-Chek Kit C-3685-A
Courtesy of CHRYSLER GROUP, LLC

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform test following the procedures supplied with the tool kit.

HYDRAULIC LASH ADJUSTER

A tappet-like noise may be produced from several items. Check the following items.

1. Engine oil level too high or too low. This may cause aerated oil to enter the adjusters and cause them to be spongy.
2. Insufficient running time after rebuilding cylinder head. Low speed running up to 1 hour may be required.
3. Turn engine off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
4. Low oil pressure.
5. The oil restrictor in cylinder head gasket or the oil passage to the cylinder head is plugged with debris.
6. Air ingested into oil due to broken or cracked oil pump pick up.
7. Worn valve guides.
8. Rocker arm ears contacting valve spring retainer.
9. Rocker arm loose, adjuster stuck or at maximum extension and still leaves lash in the system.
10. Oil leak or excessive cam bore wear in cylinder head.
11. Faulty lash adjuster.
 - Check lash adjusters for "sponginess" while installed in cylinder head and cam on camshaft at base circle. Depress part of rocker arm over adjuster. Normal adjusters should feel firm when pressed quickly. When pressed very slowly, lash adjusters should collapse.
 - Remove suspected lash adjusters, and replace.
 - Before installation, make sure adjusters are full of oil. This can be verified by little plunger travel when lash adjuster is depressed quickly.

REMOVAL

LEFT

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2715130

Fig. 121: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

2969729

Fig. 122: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable (1).

Fig. 123: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

Fig. 124: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).

34. Disconnect the Engine Coolant Temperature (ECT) sensor electrical connector (3).

Fig. 140: Injection/Ignition Electrical Connector & Engine Oil Pressure/Temperature Sensor Electrical Connector
 Courtesy of CHRYSLER GROUP, LLC

35. Disconnect the ignition coil capacitor electrical connector.
36. Disconnect the injection/ignition electrical connector (1).
37. Disconnect the engine oil pressure/temperature sensor electrical connector (3).
38. Unfasten the injection/ignition wire harness and the oil pressure/temperature sensor wire harness from the retainer bracket (2) on the rear of the left cylinder head.

Fig. 141: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers

Courtesy of CHRYSLER GROUP, LLC

39. Unfasten two starter wire harness retainers (1) from the upper intake manifold support brackets.
40. Unfasten one main wire harness retainer (3) from the left cylinder head cover and two retainers (2) from the upper intake manifold support brackets.

Fig. 142: Left Intake Manifold Support Brackets & Retaining Bolts

Courtesy of CHRYSLER GROUP, LLC

41. Remove the bolts (2) and remove the left upper intake manifold support brackets (1).

2726572

Fig. 143: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

42. Remove the ignition coils (2). Refer to **COIL, IGNITION, REMOVAL**.
43. Remove the cylinder head covers, lower and upper oil pans, crankshaft vibration damper and engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

NOTE: Take this opportunity to measure timing chain wear. Refer to **VALVE TIMING, STANDARD PROCEDURE**.

2661245

Fig. 144: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke

Courtesy of CHRYSLER GROUP, LLC

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

44. Rotate the crankshaft clockwise to place the number one piston at TDC on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5). The left side cam phaser arrows (2) should point toward each other and be parallel to the valve cover sealing surface (3). The right side cam phaser arrows (7) should point away from each other and the scribe lines (9) should be parallel to the valve cover sealing surface (8).

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

45. Mark the direction of rotation on the timing chain using a paint pen or equivalent to aid in reassembly.

CAUTION: When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

Fig. 145: Resetting Left Cam Chain Tensioner

Courtesy of CHRYSLER GROUP, LLC

46. Reset the left cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and

installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Refer to **VALVE TIMING, STANDARD PROCEDURE**.

Fig. 146: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.

47. Install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4).
48. Loosen both the intake oil control valve (6) and exhaust oil control valve (2).
49. Remove the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4).
50. Remove the oil control valve (2) from the left side exhaust cam phaser and pull the phaser off of the camshaft.
51. Remove the oil control valve (6) from the left side intake cam phaser and pull the phaser off of the camshaft.

2659731

Fig. 147: Left Cam Chain Tensioner, Arm, Guide & Bolts

52. Remove the left cam chain tensioner arm (1).
53. Remove two T30 bolts (6) and the left cam chain tensioner (5).
54. Remove two T30 bolts (4) and the left cam chain guide (2).

2692295

Fig. 148: Cylinder Head Retaining Bolt Removal Sequence - Left
 Courtesy of CHRYSLER GROUP, LLC

55. Remove the left camshafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

56. Remove the rocker arms. Refer to **ROCKER ARM, VALVE, REMOVAL** .

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

57. If required, remove the hydraulic lifters. Refer to **LIFTER(S), HYDRAULIC, REMOVAL**.

58. Using the sequence shown in illustration, remove the cylinder head retaining bolts.

2800384

Fig. 149: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right head gasket shown in illustration, left head gasket similar.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.

59. Remove the cylinder head and gasket (1) and discard the gasket.

Fig. 150: ECT Sensor, Ignition Coil Capacitor, Engine Wire Harness Retainer Bracket & Bolts

Courtesy of CHRYSLER GROUP, LLC

- 60. If required, remove the Engine Coolant Temperature (ECT) sensor (4).
- 61. If required, remove the bolt (2) and the ignition coil capacitor (1).
- 62. If required, remove the bolt (3) and the engine wire harness retainer bracket (5).

RIGHT

2715130

Fig. 151: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 152: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable (1).

Fig. 153: Engine Cover
 Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

Fig. 154: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners

Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
8. Remove the air inlet hose assembly (5).

Fig. 155: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt

Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the fresh air makeup hose (1) from the air cleaner housing.
10. Remove the air cleaner housing retaining bolt (2).

11. Remove the air cleaner housing (3).

Fig. 156: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

12. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and remove the accessory drive belt (3), then slowly rotate the tensioner into the freearm position.
13. Remove the generator (1). Refer to **GENERATOR, REMOVAL** .

Fig. 157: EVAP Purge Solenoid, Electrical Connector & Vacuum Lines
Courtesy of CHRYSLER GROUP, LLC

14. Disconnect the vacuum line (3) at the EVAP purge solenoid (1).
15. Disconnect the EVAP purge solenoid vacuum line (4) at the intake manifold and remove the vacuum line.

Fig. 158: PCV Valve, Intake Manifold, Brake Booster Vacuum Hose, MAP Sensor, ETC & CMP Sensor Electrical Connectors
Courtesy of CHRYSLER GROUP, LLC

16. Disconnect the PCV hose from the PCV valve (1) and the intake manifold (2) and remove hose.
17. Disconnect the brake booster vacuum hose (3) and position aside.
18. Disconnect the electrical connector at the Manifold Absolute Pressure (MAP) Sensor (4).
19. Disconnect the electrical connector at the Electronic Throttle Control (ETC) (5).
20. Disconnect the electrical connector at the Camshaft Position Sensor (CMP) (6) and position harness aside.

Fig. 159: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

21. Remove the upper and lower intake manifolds (2) and insulator. Refer to **MANIFOLD, INTAKE,**

REMOVAL .

Fig. 160: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

22. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
23. Remove the belly pan retainers (1) and remove the belly pan.
24. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
25. Drain the engine oil. Refer to **STANDARD PROCEDURE**.

Fig. 161: Right Upstream Oxygen Electrical Sensor Connector, Down Pipe Flanges & Bolts
Courtesy of CHRYSLER GROUP, LLC

26. Disconnect the right upstream oxygen electrical sensor connector (4) from the main wire harness.

27. Loosen the lower down pipe flange bolts (3).
28. Remove the upper down pipe flange bolts (1) and position the down pipe and catalytic converter aside.

Fig. 162: Oil Level Indicator & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

29. Remove the oil level indicator (2) retaining bolt (1) and remove the oil level indicator.

Fig. 163: Heater Core Supply Tube Support Bracket & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

30. Remove the heater core supply tube (1) support bracket retaining bolt (2) and remove the heater core supply tube (1).

Fig. 164: Upper Intake Manifold Support Bracket, Stud & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

31. Disconnect the ignition coil capacitor electrical connector.
32. Remove the stud (3) and remove the upper intake manifold support bracket (2).
33. Remove the cylinder head covers, lower and upper oil pans, crankshaft vibration damper and engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL** .

NOTE: Take this opportunity to measure timing chain wear. Refer to **VALVE TIMING, STANDARD PROCEDURE**.

34. Lower the vehicle.

Fig. 165: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

35. Remove the ignition coils (2). Refer to **COIL, IGNITION, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

2661245

Fig. 166: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke

Courtesy of CHRYSLER GROUP, LLC

36. Rotate the crankshaft clockwise to place the number one piston at TDC on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5). The left side cam phaser arrows (2) should point toward each other and be parallel to the valve cover sealing surface (3). The right side cam phaser arrows (7) should point away from each other and the scribe lines (9) should be parallel to the valve cover sealing surface (8).
37. Mark the direction of rotation on the timing chain using a paint pen or equivalent to aid in reassembly.

CAUTION: When the timing chains are removed and the cylinder heads are still installed, **DO NOT** rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

Fig. 167: Resetting Right Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

38. Reset the right cam chain tensioner by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (1).

Fig. 168: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser lock.

39. Install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5).
40. Loosen both the intake oil control valve (2) and exhaust oil control valve (7).
41. Remove the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5).
42. Remove the oil control valve (2) from the right side intake cam phaser and pull the phaser off of the camshaft.
43. Remove the oil control valve (7) from the right side exhaust cam phaser and pull the phaser off of the camshaft.

Fig. 169: Right Cam Chain Tensioner, Arm, Guide & Bolts
 Courtesy of CHRYSLER GROUP, LLC

44. Remove the right cam chain tensioner arm (6).
45. Remove two T30 bolts (4) and the right cam chain tensioner (3).
46. Remove three T30 bolts (2) and the right cam chain guide (1).

Fig. 170: Cylinder Head Retaining Bolt Removal Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

47. Remove the right camshafts. Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

48. Remove the rocker arms. Refer to **ROCKER ARM, VALVE, REMOVAL**.

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

49. If required, remove the hydraulic lifters. Refer to **LIFTER(S), HYDRAULIC, REMOVAL**.

50. Using the sequence shown in illustration, remove the cylinder head retaining bolts.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: Do not lay the cylinder head on its gasket sealing surface, due to the design of the cylinder head gasket, any distortion to the cylinder head sealing surface may prevent the gasket from properly sealing resulting in leaks.

2800384

Fig. 171: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

NOTE: The head gasket (1) crimps the locating dowels (2) and the dowels may pull out of the engine block when the head gasket is removed.

51. Remove the cylinder head and gasket. Discard the gasket.

Fig. 172: Ignition Coil Capacitor & Bolt
Courtesy of CHRYSLER GROUP, LLC

52. If required, remove the bolt (2) and the ignition coil capacitor (1).

CLEANING

CLEANING

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

NOTE: **Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.**

1. Remove all gasket material from cylinder head and block. Refer to **STANDARD PROCEDURE**. Be careful not to gouge or scratch the aluminum head sealing surface.
2. Clean all engine oil passages.

CAUTION: Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.

3. Clean out the cylinder head bolt holes in the engine block.

DO NOT USE any adhesives when installing the MLS head gaskets. The use of adhesives may cause the gasket not to seal properly and may leak. MLS gaskets are to be installed on a surface free of debris and oils.

INSPECTION

INSPECTION

Fig. 173: Checking Cylinder Head Flatness
Courtesy of CHRYSLER GROUP, LLC

1. Check cylinder head warpage with a straight edge (2) and feeler gauge (1).
2. Cylinder head must be flat within specification. Refer to **SPECIFICATIONS**.
3. Verify that the valve tappets move freely in their bores and that they have been rotating.
4. Inspect camshaft bearing journals for scoring.
5. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
6. Inspect the following components and verify that they are within specification. Refer to **SPECIFICATIONS**.
 - Camshafts
 - Valve Tappets
 - Springs
 - Valve Seats
 - Valve Guides
 - Valves

INSTALLATION

LEFT

Fig. 174: Magnetic Timing Wheels
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 175: ECT Sensor, Ignition Coil Capacitor, Engine Wire Harness Retainer Bracket & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the Engine Coolant Temperature (ECT) sensor (4) and tighten to 11 N.m (97 in. lbs.).
2. If removed, install the ignition coil capacitor (1) with a M6 bolt (2) and tightened to 10 N.m (89 in. lbs.).
3. If removed, install the engine wire harness retainer bracket (5) with a T30 bolt (3) and tightened to 12 N.m (106 in. lbs.).

Fig. 176: Checking Cylinder Head Bolts For Stretching (Necking)
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

NOTE: Typical cylinder head bolt shown in illustration.

4. Check cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 177: Head Gasket & Locating Dowels
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Right head gasket shown in illustration, left head gasket similar.

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

5. Clean and prepare the gasket sealing surfaces of the cylinder head and block. Refer to **STANDARD PROCEDURE**.

CAUTION: Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.

6. Clean out the cylinder head bolt holes in the engine block.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: The installation of the cylinder head gaskets are not interchangeable between the left and right cylinder heads. They are clearly marked (3) with "R" for right and "L" for left. They must be applied on a dry surface, without the use of any adhesives.

7. Position the new cylinder head gasket (1) onto the locating dowels (2).

2692178

Fig. 178: Cylinder Head Retaining Bolt Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

8. Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: Do not apply any additional oil to the bolt threads.

9. Install the eight cylinder head bolts finger tight.
10. Tighten the cylinder head bolts in the sequence shown in illustration, following this 9 step torque

plus angle method. Tighten according to the following torque values:

- Step 1: All to 30 N.m (22 ft. lbs.)
- Step 2: All to 45 N.m (33 ft. lbs.)
- Step 3: All + 75° Turn **Do not use a torque wrench for this step.**
- Step 4: All + 50° Turn **Do not use a torque wrench for this step.**
- Step 5: Loosen all fasteners in reverse of sequence shown in illustration
- Step 6: All to 30 N.m (22 ft. lbs.)
- Step 7: All to 45 N.m (33 ft. lbs.)
- Step 8: All + 70° Turn **Do not use a torque wrench for this step.**
- Step 9: All + 70° Turn **Do not use a torque wrench for this step.**

Fig. 179: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

NOTE: If the hydraulic lifters are being reused, reassemble them into their original locations.

11. If removed, install the hydraulic lifters. Refer to LIFTER(S), HYDRAULIC, INSTALLATION.

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

12. Install the rocker arms and camshafts. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
13. Rotate the camshafts clockwise to TDC by positioning the alignment holes (1) vertically.

Fig. 180: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

14. Install the left cam chain guide (2) with two bolts (4) and tighten the T30 bolts (4) to 12 N.m (9 ft. lbs.).
15. Install the left cam chain tensioner (5) to the cylinder head with two bolts (6) and tighten the T30 bolts (6) to 12 N.m (9 ft. lbs.).
16. Reset the left cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (7). Refer to **VALVE TIMING, STANDARD PROCEDURE**.
17. Install the left tensioner arm (1).

Fig. 181: Idler Sprocket, Plated Link & Arrow
 Courtesy of CHRYSLER GROUP, LLC

18. Press the left intake cam phaser onto the intake camshaft, install and hand tighten the oil control valve.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

19. Drape the left side cam chain over the left intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

Fig. 182: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
 Courtesy of CHRYSLER GROUP, LLC

20. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the left side cam phasers so that the arrows (3) point toward each other and are parallel to the valve cover sealing surface (5). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

21. Install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (4) and tighten the oil control valves (2) and (6) to 150 N.m (110 ft. lbs.).

2661245

Fig. 183: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke

Courtesy of CHRYSLER GROUP, LLC

22. Remove the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser).
23. Remove the Tensioner Pin (special tool #8514, Pins, Tensioner) (1) from the left cam chain tensioner.
24. Rotate the crankshaft clockwise two complete revolutions stopping when the dimple (4) on the crankshaft is aligned with the block/bearing cap junction (5).
25. While maintaining this alignment, verify that the arrows on the left side cam phasers (2) point toward each other and are parallel to the valve cover sealing surface (3) and that the right side cam phaser arrows (7) point away from each other and the scribe lines (9) are parallel to the valve cover sealing surface (8).

2714685

Fig. 184: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
 Courtesy of CHRYSLER GROUP, LLC

26. There should be 12 chain pins (2) between the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
27. If the engine timing is not correct, repeat this procedure.
28. Install the engine timing cover, crankshaft vibration damper, upper and lower oil pans and cylinder head covers. Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .

2857538

Fig. 185: Left Intake Manifold Support Brackets & Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

29. Install the left upper intake manifold support brackets (1) and tighten the stud (2) finger tight.

Fig. 186: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
 Courtesy of CHRYSLER GROUP, LLC

30. Fasten two starter wire harness retainers (1) to the upper intake manifold support brackets.
31. Fasten one main wire harness retainer (3) to the left cylinder head cover and two retainers (2) to the upper intake manifold support brackets.

Fig. 187: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

32. Install the spark plugs and tighten to 18 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION** .
33. Install the ignition coils (2). Refer to **COIL, IGNITION, INSTALLATION** .

Fig. 188: Injection/Ignition Electrical Connector & Engine Oil Pressure/Temperature Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

34. Connect the ignition coil capacitor electrical connector.
35. Connect the injection/ignition electrical connector (1).
36. Connect the engine oil pressure/temperature sensor electrical connector (3).
37. Fasten the injection/ignition wire harness and the oil pressure/temperature sensor wire harness from the retainer bracket (2) on the rear of the left cylinder head.

Fig. 189: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

38. Connect the Engine Coolant Temperature (ECT) sensor electrical connector (3).

Fig. 190: Upper Intake Manifold Bolt Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

39. Install the upper and lower intake manifolds. Refer to **MANIFOLD, INTAKE, INSTALLATION** .

Fig. 191: Heater Core Return Tube Upper Support Bracket Retaining Nut & Tube
 Courtesy of CHRYSLER GROUP, LLC

40. Position the heater core return tube (1) onto the upper support bracket, install the retaining nut (2) and tighten to 12 N.m (9 ft. lbs.).

Fig. 192: Heater Core Return Hose
 Courtesy of CHRYSLER GROUP, LLC

41. Connect the heater core return hose (1).

Fig. 193: A/C Compressor, Nut, Stud & Three Bolts
 Courtesy of CHRYSLER GROUP, LLC

42. Position the A/C compressor (2), install the upper bolts (1) finger tight.
43. Install the lower A/C compressor retaining studs (3) finger tight
44. Tightened the A/C compressor upper bolts (1) to 25 N.m (18 ft. lbs.).
45. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 194: Heater Core Return Tube Lower Support Bracket Retaining Nut
Courtesy of CHRYSLER GROUP, LLC

46. Position the heater core return tube lower support bracket onto the A/C compressor lower retaining stud, install the nut (1) and tighten both A/C compressor lower retaining nuts to 25 N.m (18 ft. lbs.).

Fig. 195: A/C Compressor Electrical Connector & Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

47. Connect the A/C compressor electrical connector (1) and fasten the wire harness retainer (2) to the A/C compressor discharge line.

Fig. 196: Lower Heater Core Return Hose & Lower Radiator Hose
 Courtesy of CHRYSLER GROUP, LLC

48. Connect the lower heater core return hose (1) to the engine coolant pump housing.

Fig. 197: Left Upstream Oxygen Sensor Electrical Connector & Down Pipe Flange Bolts
 Courtesy of CHRYSLER GROUP, LLC

49. Position the left down pipe onto the partially installed lower flange bolts (2).
50. Install the upper down pipe flange bolts (1) and tighten to 23 N.m (17 ft. lbs.).
51. Tighten the lower down pipe flange bolts (2) to 23 N.m (17 ft. lbs.).
52. Connect the left upstream oxygen sensor electrical connector (4) to the main wire harness.

Fig. 198: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

53. If removed, install the oil filter.
54. Position the belly pan and install the retainers (1).
55. Lower the vehicle.

Fig. 199: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
 Courtesy of CHRYSLER GROUP, LLC

56. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and install the accessory drive belt (3), then slowly rotate the tensioner into position.

Fig. 200: Fresh Air Makeup Hose At Rear Of Intake Manifold
 Courtesy of CHRYSLER GROUP, LLC

57. Connect the fresh air makeup hose (2) to the rear of the intake manifold (1).

Fig. 201: Heater Core Purge Hose, Coolant Bottle Retaining Bolts & Coolant Bottle
 Courtesy of CHRYSLER GROUP, LLC

58. Position the coolant bottle (3) into the engine compartment.
59. Install the coolant bottle retaining bolts (2) and tighten to 12 N.m (9 ft. lbs.).
60. Connect the heater core purge hose (1) to the coolant bottle.

Fig. 202: Coolant Bottle Return Hose
 Courtesy of CHRYSLER GROUP, LLC

61. Connect the coolant bottle return hose (1).

Fig. 203: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
 Courtesy of CHRYSLER GROUP, LLC

62. Position the air cleaner housing (3) into the vehicle.
63. Install the air cleaner housing retaining bolt (2) and tighten to 12 N.m (9 ft. lbs.).
64. Connect the fresh air makeup hose (1) to the air cleaner housing.

Fig. 204: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners

Courtesy of CHRYSLER GROUP, LLC

65. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
66. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
67. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
68. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
69. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

Fig. 205: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

70. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

71. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE**.
72. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

Fig. 206: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

73. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
74. Run the engine until it reaches normal operating temperature and check for leaks.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

RIGHT

Fig. 207: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 208: Ignition Coil Capacitor & Bolt
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the ignition coil capacitor (1) with an M6 bolt (2) tightened to 10 N.m (89 in. lbs.).

Fig. 209: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

NOTE: Typical cylinder head bolt shown in illustration.

2. Check the cylinder head bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

2800384

Fig. 210: Head Gasket & Locating Dowels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When cleaning cylinder head and cylinder block surfaces, **DO NOT** use a metal scraper because the surfaces could be cut or ground. Use **ONLY** a wooden or plastic scraper.

3. Clean and prepare the gasket sealing surfaces of the cylinder head and block. Refer to **STANDARD PROCEDURE**.

CAUTION: Non-compressible debris such as oil, coolant or RTV sealants that are not removed from bolt holes can cause the aluminum casting to crack when tightening the bolts.

4. Clean out the cylinder head bolt holes in the engine block.

WARNING: The multi-layered steel head gaskets have very sharp edges that could cause personal injury if not handled carefully.

CAUTION: The installation of the cylinder head gaskets are not interchangeable between the left and right cylinder heads. They are clearly marked (3) with "R" for right and "L" for left. They must be applied on a dry surface, without the use of any adhesives.

5. Position the new cylinder head gasket (1) on the locating dowels (2).

2719043

Fig. 211: Cylinder Head Retaining Bolt Tightening Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

6. Position the cylinder head onto the cylinder block. Make sure the cylinder head seats fully over the locating dowels.

NOTE: Do not apply any additional oil to the bolt threads.

7. Install the eight cylinder head bolts finger tight.
8. Tighten the cylinder head bolts in the sequence shown in illustration, following this 9 step torque plus angle method. Tighten according to the following torque values:
 - Step 1: All to 30 N.m (22 ft. lbs.)
 - Step 2: All to 45 N.m (33 ft. lbs.)
 - Step 3: All + 75° Turn **Do not use a torque wrench for this step.**
 - Step 4: All + 50° Turn **Do not use a torque wrench for this step.**
 - Step 5: Loosen all fasteners in reverse of sequence shown in illustration
 - Step 6: All to 30 N.m (22 ft. lbs.)
 - Step 7: All to 45 N.m (33 ft. lbs.)
 - Step 8: All + 70° Turn **Do not use a torque wrench for this step.**
 - Step 9: All + 70° Turn **Do not use a torque wrench for this step.**

Fig. 212: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the hydraulic lifters are being reused, reassemble them into their original locations.

9. If removed, install the hydraulic lifters. Refer to LIFTER(S), HYDRAULIC, INSTALLATION.

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

10. Install the rocker arms and camshafts. Refer to CAMSHAFT, ENGINE, INSTALLATION.

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

11. Verify that the camshafts are set at TDC by positioning the alignment holes (1) vertically.

Fig. 213: Right Cam Chain Tensioner, Arm, Guide & Bolts
 Courtesy of CHRYSLER GROUP, LLC

12. Install the right cam chain guide (1) with three bolts (2). Tighten the T30 bolts (2) to 12 N.m (106 in. lbs.).
13. Install the right cam chain tensioner (3) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N.m (106 in. lbs.).
14. Reset the right cam chain tensioner (3) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (5).
15. Install the right tensioner arm (6).

Fig. 214: Idler Sprocket, Dimple & Plated Link
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same

direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

16. Press the right exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve.
17. Drape the right side cam chain over the right exhaust cam phaser and onto the idler sprocket (1) so that the dimple (2) is aligned with the plated link (3) on the cam chain.

Fig. 215: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

18. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the right side cam phasers so that the arrows (3) point away from each other and the scribe lines (4) are parallel to the valve cover sealing surface (6). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

19. Install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser) (5) and tighten the oil control valves (2) and (7) to 150 N.m (110 ft. lbs.).

2661245

Fig. 216: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke

Courtesy of CHRYSLER GROUP, LLC

20. Remove the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser).
21. Remove the Tensioner Pin (special tool #8514, Pins, Tensioner) (6) from the RH cam chain tensioner.
22. Rotate the crankshaft clockwise two complete revolutions stopping when the dimple (4) on the crankshaft is aligned with the block/bearing cap junction (5).
23. While maintaining this alignment, verify that the arrows on the left side cam phasers (2) point toward each other and are parallel to the valve cover sealing surface (3) and that the right side cam phaser arrows (7) point away from each other and the scribe lines (9) are parallel to the valve cover sealing surface (8).

2714685

Fig. 217: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

24. There should be 12 chain pins (2) between the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
25. If the engine timing is not correct, repeat this procedure.
26. Install the engine timing cover, crankshaft vibration damper, upper and lower oil pans and cylinder head covers. Refer to **COVER(S), ENGINE TIMING, INSTALLATION**.

2726572

Fig. 218: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side ignition coils are shown in illustration, the right side ignition coils are similar.

27. Install the spark plugs and tighten to 18 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION**.
28. Install the ignition coils (2). Refer to **COIL, IGNITION, INSTALLATION**.

Fig. 219: Upper Intake Manifold Support Bracket, Stud & Fasteners
Courtesy of CHRYSLER GROUP, LLC

29. Position the upper intake manifold support bracket (2) and install the retaining stud (3) finger tight.

Fig. 220: Heater Core Supply Tube Support Bracket & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

30. Install the heater core supply tube (1) with one bolt (2) tightened to 12 N.m (106 in. lbs.).

Fig. 221: Oil Level Indicator & Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

31. Position the oil level indicator (2), install the retaining bolt (1) and tighten to 12 N.m (106 in. lbs.).

Fig. 222: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
 Courtesy of CHRYSLER GROUP, LLC

32. Install the generator (1). Refer to **GENERATOR, INSTALLATION** .
33. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts the stop and install the accessory drive belt (3), then slowly rotate the tensioner into position.

Fig. 223: Right Upstream Oxygen Electrical Sensor Connector, Down Pipe Flanges & Bolts

Courtesy of CHRYSLER GROUP, LLC

34. Install the right down pipe (2) onto the partially installed lower flange bolts (3).
35. Install the upper down pipe flange bolts (1) and tighten all M8 bolts to 23 N.m (17 ft. lbs.).
36. Connect the right upstream oxygen sensor connectors (4) to the main wire harness.

Fig. 224: Upper Intake Manifold Bolt Tightening Sequence

38. Connect the electrical connector at the Camshaft Position Sensor (CMP) (6).
39. Connect the electrical connector at the Electronic Throttle Control (ETC) (5).
40. Connect the electrical connector at the Manifold Absolute Pressure (MAP) Sensor (4).
41. Connect the brake booster vacuum hose (3).
42. Connect the PCV hose to the PCV valve (1) and to the intake manifold (2).

Fig. 226: EVAP Purge Solenoid, Electrical Connector & Vacuum Lines
 Courtesy of CHRYSLER GROUP, LLC

43. Connect the EVAP purge solenoid vacuum line (4) to the intake manifold.
44. Connect the vacuum line (3) to the EVAP purge solenoid (1).

Fig. 227: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

45. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
46. If removed, install the oil filter.
47. Position the belly pan and install the retainers (1).
48. Lower the vehicle.

Fig. 228: Fresh Air Makeup Hose, Air Cleaner Housing & Bolt
 Courtesy of CHRYSLER GROUP, LLC

49. Position the air cleaner housing (3) into the vehicle.
50. Install the air cleaner housing retaining bolt (2) and tighten to 12 N.m (9 ft. lbs.).
51. Connect the fresh air makeup hose (1) to the air cleaner housing.

Fig. 229: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners

Courtesy of CHRYSLER GROUP, LLC

52. Position the air inlet hose assembly (5) onto the throttle body and the air cleaner housing.
53. Secure the air inlet hose assembly retaining grommet onto the ball stud (4).
54. Tighten the clamp at the air cleaner housing (3) to 5 N.m (44 in. lbs.).
55. Tighten the clamp (2) at the throttle body to 5 N.m (44 in. lbs.).
56. Connect the Inlet Air Temperature (IAT) sensor electrical connector (1).

Fig. 230: Engine Cover

Courtesy of CHRYSLER GROUP, LLC

57. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .

58. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .
59. Position the engine cover (1) and secure the retaining grommets onto the ball studs.

Fig. 231: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

60. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
61. Run the engine until it reaches normal operating temperature and check for leaks.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE

DESCRIPTION

DESCRIPTION

2812619

Fig. 232: Exhaust Phaser Assembly
Courtesy of CHRYSLER GROUP, LLC

The 3.6L engine is equipped with Variable Valve Timing (VVT). This system adjusts the timing of all four camshafts independently using solenoids and oil control valves to direct oil pressure into the camshaft phaser assemblies. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The four phasers are located on the front of the camshafts, behind the VVT solenoids, inside of the engine timing cover. The exhaust phasers are identified with EXH and the intake phasers are identified with INT. The exhaust phaser has a clockspring, the intake phaser does not. The camshaft sprockets are integrated with the camshaft phaser and are serviced as an assembly. Do not attempt to disassemble the phasers, they are not serviceable. Phasers are interchangeable between the right and left cylinder heads but should be installed in the same location as removed.

The 3.6L engine has an Oil Control Valve (OCV) for each phaser. The OCV also acts as a bolt for mounting the Phaser to the camshaft. The OCVs spool valve is spring loaded and should move freely within the OCV body. The four OCVs are identical but should be installed in the same location as removed.

OPERATION

OPERATION

2811799

Fig. 233: Oil Control Valve (OCV), VVT Solenoid, Solenoid Pintle & Internal Spool Valve
Courtesy of CHRYSLER GROUP, LLC

Each phaser position is adjusted using regulated oil pressure through the Oil Control Valve (OCV) (3). To begin phaser movement, a voltage signal is applied to the VVT solenoid (1) to extend or retract the solenoid pintle (4). The pintle pushes against an internal spool valve (2) within the OCV moving the valve forwards and backwards to direct oil flow.

2813724

Fig. 234: Phasers In Lock-Pin Position
Courtesy of CHRYSLER GROUP, LLC

At engine startup, system oil pressure overcomes spring pressure and unlocks the phaser lock-pin (1) in preparation for phasing. The phasers remain in this position until a PCM signal is given to pulse-width modulate the VVT solenoid. At engine shutdown, as oil pressure is reduced, both Phasers return to their lock-pin position (1). However, because the exhaust Phaser needs to travel to a position above and beyond the standard camshaft clockwise rotation, the assistance of a clock spring is required. The intake Phaser on the other hand, simply relies on the torsional resistance from the valvetrain to push it back towards lock-pin position.

2813615

Fig. 235: Spool Valve, Vanes, OCV & Advance, Hold Or Retard Position
Courtesy of CHRYSLER GROUP, LLC

The position of the spool valve (1) inside the OCV (2) determines which ports and chambers inside the phaser are being fed, either to advance (3), hold (4) or retard (5) the timing of the phaser sprocket relative to the camshaft. The spool valve also returns oil from the chambers to the sump (6). The Camshaft Position (CMP) sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM. As oil pressure pushes against the vanes (6) of the phaser rotor, the rotor begins to move. Since this rotor is physically attached to the camshaft, rotor rotation causes the camshaft position to rotate relative to the standard sprocket (7) position.

REMOVAL

LEFT

Fig. 236: Magnetic Timing Wheels
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 237: Mount Dial Indicator Set To Stationary Point On Engine
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper intake manifold, left ignition coils and left cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
2. Remove the right ignition coils and all spark plugs. Refer to **SPARK PLUG, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the number three cylinder ignition coil mount. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

Fig. 238: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

4. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2) when the number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

3821049

Fig. 239: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows
Courtesy of CHRYSLER GROUP, LLC

NOTE: The cam phaser timing markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins (2) between the markings.

NOTE: Using a paint pen or equivalent. Mark the timing chain links to the corresponding timing marks located on the cam phasers.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1) as viewed from either the front or rear of the cam phasers.
6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

Fig. 240: Wrench, Oil Control Valves & Special Tool
 Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).
9. Remove the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1).

Fig. 241: Pin, Rack & Timing Chain Holder
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shows engine timing cover removed for clarity.

10. Using (special tool #10200-3, Pin) (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push (special tool #10200-1, Holder, Timing Chain, Left Side) (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder remains in place while the phasers are removed. Refer to **VALVE TIMING, STANDARD PROCEDURE**.

Fig. 242: Pin, Rack, Timing Chain Holder & Oil Control Valves
Courtesy of CHRYSLER GROUP, LLC

11. Remove the oil control valve (4) and pull the left side exhaust cam phaser off of the camshaft.
12. Remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

RIGHT

Fig. 243: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 244: Mount Dial Indicator Set To Stationary Point On Engine
Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper intake manifold, right ignition coils and right cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
2. Remove the left ignition coils and all spark plugs. Refer to **SPARK PLUG, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the cylinder head cover mounting surface. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one piston at top-dead-center on the exhaust stroke and set the indicator dial to zero.

Fig. 245: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

4. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

Fig. 246: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows
Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins (2) between the markings.

NOTE: Using a paint pen or equivalent. Mark the timing chain links to the corresponding timing marks located on the cam phasers.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
6. Mark both sides of the cam chain at the phaser timing marks (1 and 3) using a paint pen or equivalent to aid in reassembly.

Fig. 247: Wrench, Oil Control Valves & Special Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

7. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
8. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).
9. Remove the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).

Fig. 248: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not insert the Timing Chain Holder into position without first compressing the tensioner. The Timing Chain Holder is not designed to compress the tensioner and excessive force can damage the timing chain tensioner arm.

10. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert (special tool #10369, Holder, Timing Chain) (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The Timing Chain Holder remains in place while the phasers are removed.

Fig. 249: Timing Chain Holder, Trim Stick & Tensioner Arm
 Courtesy of CHRYSLER GROUP, LLC

NOTE: If the Timing Chain Holder (1) does not engage or slips from position, wedge a trim stick (2) or equivalent between the front cover and the tensioner arm (3) to push the tensioner arm towards the rear of the engine and then repeat the previous step.

Fig. 250: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
Courtesy of CHRYSLER GROUP, LLC

11. Remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.
12. Remove the oil control valve (2) and pull the right side intake cam phaser off of the camshaft.

INSTALLATION

LEFT

Fig. 251: Magnetic Timing Wheels

Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 252: Mount Dial Indicator Set To Stationary Point On Engine
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts.

1. Verify that the indicator dial (1) is set to zero when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.

Fig. 253: Positioning Camshaft Alignment Holes Vertically
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage.

Fig. 254: Timing Chain Holder
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The Timing Chain Holder (1) should still be in place as inserted during the Removal procedure. If required, the Timing Chain Holder can be reinserted by repeating Step 10 of the Removal procedure. Refer to ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, REMOVAL.

3821049

Fig. 255: Phaser Timing Mark, Chain Pins, Exhaust Cam Phaser Triangle Marking, Oil Control Valve, Scribe Lines & Arrows
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser.

2. Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.
3. Route the cam chain around the left intake cam phaser while aligning the paint mark with the phaser timing mark (1). Press the left intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (7).
4. While maintaining this alignment, route the cam chain around the exhaust cam phaser so that the paint mark is aligned with the phaser timing mark (3). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (4).
5. The **SCRIBE LINES** (5) on the cam phasers should face away from each other and the **ARROWS** (6) should point toward each other and be parallel to the cylinder head cover mounting surface. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (3) and the intake cam phaser circle marking (1).

Fig. 256: Wrench, Oil Control Valves & Special Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

6. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) against the cylinder head cover mounting surface with the tool number facing up.
7. Tighten the oil control valves (2) and (3) to 150 N.m (110 ft. lbs.).
8. Remove the Camshaft Phaser Lock (1) and the Timing Chain Holder.

Fig. 257: Chain Pins, Arrows, Scribe Lines, Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

9. Rotate the crankshaft clockwise two complete revolutions stopping when the right side number one cylinder piston is again positioned at top-dead-center on the exhaust stroke. To assure correct engine timing, verify the following;
 - The indicator dial is set to **ZERO** when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
 - The **SCRIBE LINES** (3) on the left side cam phasers face away from each other.
 - The **ARROWS** (4) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface.
 - There are twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3).
10. If the engine timing is not correct, repeat this procedure.
11. Install the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
12. Install the right ignition coils. Refer to **COIL, IGNITION, INSTALLATION** .
13. Install the left cylinder head cover and left ignition coils. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
14. Install the upper intake manifold and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
15. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
16. Start the engine and perform the following Powertrain Verification Tests. Refer to appropriate Electrical Diagnostics article.
 - Cam/Crank Variation Relearn
 - Target Coefficient Relearn

NOTE: **Following the first restart after a DTC driven phaser replacement, clear all DTCs and verify that subsequent restarts do not set any additional codes. for any DTCs that reset. Refer to appropriate Electrical Diagnostics article.**

CAMSHAFT, ENGINE

DESCRIPTION

DESCRIPTION

2820031

Fig. 265: Dual Over Head Camshaft (DOHC) Configuration
Courtesy of CHRYSLER GROUP, LLC

The Pentastar engine uses a Dual Over Head Camshaft (DOHC) configuration. The camshafts are a nodular cast iron design and have a pressed on magnetic timing wheel that is magnetic encoded. The two Camshaft Position (CMP) sensors are located between the timing wheels. Attached to the rear of the right exhaust camshaft is a centrifuge which is part of the crankcase ventilation system. The centrifuge is used to separate oil droplets from the crankcase gases before they enter the PCV valve. Four bearing journals are machined into the camshaft. Camshaft end play is controlled by two thrust walls that border the nose piece journal.

OPERATION

OPERATION

2820145

Fig. 266: Right Hand Camshafts
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH camshafts shown in illustration, LH camshafts similar.

The camshaft has precisely machined (egg shaped) lobes to provide accurate valve timing and duration. The camshaft is driven by the crankshaft via drive sprockets and chains.

STANDARD PROCEDURE

CAMSHAFT END PLAY

NOTE: Right intake camshaft shown in illustration, other camshafts similar.

1. Remove the cylinder head cover. Refer to COVER(S), CYLINDER HEAD, REMOVAL .

NOTE: Cylinder #1 or #4 must be used when checking for Top Dead Center (TDC).

Fig. 267: Mount Dial Indicator Set To A Stationary Point At Front Of Engine
 Courtesy of CHRYSLER GROUP, LLC

2. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the camshaft.
3. Move the camshaft all the way to the rear of its travel.
4. Zero the dial indicator.
5. Move the camshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification. Refer to **SPECIFICATIONS**.

REMOVAL

LEFT

Fig. 268: Magnetic Timing Wheels
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

CAUTION: When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

1. Remove the upper intake manifold, all ignition coils, all spark plugs and left cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .

Fig. 269: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

2. The left side cam phaser **SCRIBE LINES** (3) should face away from each other and the **ARROWS** (1) should point toward each other and be parallel to the cylinder head cover mounting surface (2). The number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.

NOTE: Illustration shows engine timing cover removed for clarity.

Fig. 270: Pin, Rack & Timing Chain Holder
Courtesy of CHRYSLER GROUP, LLC

4. Using the
 (special tool #10200-3, Pin)
 (2), lift the pawl off of the rack (3). While holding the pawl off of the rack, push
 (special tool #10200-1, Holder, Timing Chain, Left Side)
 (1) into place between the cylinder head and the cam chain guide to force the rack and piston
 back into the tensioner body.

NOTE: The holder remains in place while the phasers are removed.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the LH Camshaft/Phaser Lock.

Fig. 271: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
 Courtesy of CHRYSLER GROUP, LLC

5. Install the (special tool #10202, Locks, Camshaft/Phaser) (4).
6. Remove the exhaust oil control valve (2) and the intake oil control valve (6).

091074341

Fig. 272: Alignment Marks
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The alignment marks located on the camshaft specifies the location of the drive pin in reference to the phaser alignment mark.

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.

NOTE: **DO NOT REMOVE THE PHASER LOCK.**

NOTE: **Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked "1E->". The caps should be installed with the notch forward.**

2676491

Fig. 273: Camshaft Bearing Cap Bolts Removal Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

8. Rotate the camshafts counterclockwise to position the alignment holes (1) **approximately 30° before top-dead-center** . This places the camshafts in the neutral position (no valve load).
9. Loosen the camshaft bearing cap bolts in the sequence shown in illustration.

NOTE: **When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.**

10. Remove the camshaft bearing caps and the camshafts.

RIGHT

2691700

Fig. 274: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

CAUTION: When the timing chain is removed and the cylinder heads are still installed, Do not forcefully rotate the camshafts or crankshaft independently of each other. Severe valve and/or piston damage can occur.

CAUTION: DO NOT STAMP OR STRIKE THE CAMSHAFT BEARING CAPS. SEVERE DAMAGE WILL OCCUR TO THE BEARING CAPS.

Fig. 275: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the upper intake manifold, all ignition coils, all spark plugs, right cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
2. The right side cam phaser **ARROWS** (2) should point away from each other and the **SCRIBE LINES** (1) should be parallel to the cylinder head cover mounting surface (3) when the right side number one cylinder piston is positioned at top-dead-center on the exhaust stroke.
3. Mark the camshaft phasers to the timing chain with a paint pen or equivalent.

Fig. 276: Compressing Tensioner By Slightly Rotating Exhaust Camshaft Clockwise
 Courtesy of CHRYSLER GROUP, LLC

4. Use the timing chain to compress the tensioner by slightly rotating the exhaust camshaft clockwise (4). Insert the (special tool #10369, Holder, Timing Chain) (1) into place between the cylinder head boss and the tensioner arm to hold the tensioner in the compressed position. The

Timing Chain Holder remains in place while the phasers are removed.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RH Camshaft/Phaser Lock.

Fig. 277: Wrench, Oil Control Valves & Special Tool
Courtesy of CHRYSLER GROUP, LLC

5. Install (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).
6. Remove both the intake (2) and exhaust (3) oil control valves.

NOTE: Left side shown in illustration. Right side similar.

091074341

Fig. 278: Alignment Marks
Courtesy of CHRYSLER GROUP, LLC

7. Using care. Remove both the intake and exhaust oil control valves simultaneously.

NOTE: DO NOT REMOVE THE PHASER LOCK

2688694

Fig. 279: Camshaft Bearing Cap Bolts Removal Sequence - Right
Courtesy of CHRYSLER GROUP, LLC

8. Camshaft bearing caps should have been marked during engine manufacturing. For example, the number one exhaust camshaft bearing cap is marked "1E->". The caps should be installed

with the notch forward.

NOTE: Loosen the camshaft bearing cap bolts in the sequence shown in illustration.

NOTE: When the camshaft is removed the rocker arms may slide downward, mark the rocker arms before removing the camshaft.

9. Remove the camshaft bearing caps and the camshafts.

INSPECTION

INSPECTION

2819808

Fig. 280: Inspecting Camshaft Bearing Journals & Cam Lobes
Courtesy of CHRYSLER GROUP, LLC

NOTE: RH intake camshaft shown in illustration, other camshafts similar.

1. Inspect camshaft bearing journals (4) for damage and binding. If journals are binding, check the cylinder head for damage. Also check cylinder head oil holes for clogging.
2. Check the surface of the cam lobes (5) for abnormal wear (3). Measure and compare the unworn area (1) to the worn area (2). Replace camshafts that are not within specification. Refer to **SPECIFICATIONS**.

INSTALLATION

LEFT

Fig. 281: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 282: Bearing Cap Retaining Bolts Tightening Sequence - Left
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the camshaft journals with clean engine oil.

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than

a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

2. Install the left side camshaft(s) with the alignment holes (1) positioned approximately 30° before top-dead-center. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.

Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

3. Verify the rocker arms are aligned to the cam lobe. Refer to **ROCKER ARM, VALVE, INSTALLATION**.

4. Install the camshaft bearing caps and hand tighten the retaining bolts to 2 N.m (18 in. lbs.).
5. Tighten the bearing cap retaining bolts in the sequence shown in illustration to 9.5 N.m (84 in. lbs.).

Fig. 283: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

6. Rotate the camshafts clockwise to top-dead-center by positioning the alignment holes (1) vertically.
7. Install the timing chain tensioner holder.

Fig. 284: Marks On Timing Chain
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the LT Camshaft/Phasers to the camshaft alignment pins.

8. Verify the cam phasers are aligned with the marks (2) made on the timing chain.
9. Install the camshaft phasers onto the camshafts.

Fig. 285: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
 Courtesy of CHRYSLER GROUP, LLC

10. Using care, slowly rotate the engine four revolutions to verify the valve to piston clearance and camshaft phaser timing mark alignment (1).
11. Install the cylinder head cover, spark plugs, ignition coils and the upper intake manifold. Refer to

ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, INSTALLATION.

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

RIGHT

2691700

Fig. 286: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2668733

Fig. 287: Bearing Cap Retaining Bolts Tightening Sequence - Right
 Courtesy of CHRYSLER GROUP, LLC

1. Lubricate camshaft journals with clean engine oil.

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

2. Install the right side camshaft(s) at top-dead-center by positioning the alignment holes (1) vertically. This will place the camshafts at the neutral position (no valve load) easing the installation of the camshaft bearing caps.

NOTE: Caps are identified numerically (1 through 4), intake or exhaust (I or E) and should be installed from the front to the rear of the engine. All caps should be installed with the notch forward so that the stamped arrows (<) on the caps point toward the front of the engine.

3. Install the camshaft bearing caps and hand tighten the retaining bolts to 2 N.m (18 in. lbs.).
4. Verify the rocker arms are aligned to the cam lobe

Refer to **ROCKER ARM, VALVE, INSTALLATION** .

5. Tighten the bearing cap retaining bolts in the sequence shown in illustration to 9.5 N.m (84 in. lbs.).

Fig. 288: Positioning Camshaft Alignment Holes Vertically
 Courtesy of CHRYSLER GROUP, LLC

6. Verify the alignment holes are vertical to the cylinder head surface.

NOTE: Minor rotation of a camshaft (a few degrees) may be required when installing the RT Camshaft/Phasers to the camshaft alignment pins.

Fig. 289: Marks On Timing Chain
 Courtesy of CHRYSLER GROUP, LLC

7. Verify the cam phasers (3 and 4) are aligned to the marks (2) made on the timing chain.
8. Install the phasers (3 and 4) onto the camshafts.
9. Install the oil control valves. Tighten to 150 N.m (110 ft. lbs.).

Fig. 290: Arrows, Scribe Lines & Cylinder Head Cover Mounting Surface
Courtesy of CHRYSLER GROUP, LLC

10. Using care, slowly rotate the engine four revolutions to verify the valve to piston clearance and camshaft phaser timing mark alignment (1).
11. Install the cylinder head cover, spark plugs, ignition coils and the upper intake manifold. Refer to **ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, INSTALLATION.**

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

COVER(S), CYLINDER HEAD

DESCRIPTION

DESCRIPTION

2819308

Fig. 291: Cylinder Head Covers
Courtesy of CHRYSLER GROUP, LLC

The cylinder head covers are made of a carbon and fiberglass composite. The cylinder head covers are not interchangeable from side-to-side. The cylinder head covers are sealed with a press-in-place gasket that is designed to isolate the cover from the cylinder head for improved NVH. There are two dowel pins on the outboard side of the cover flange to locate the cover to holes in the cylinder head. RTV is used to seal the T-joint at the timing cover, cylinder head and cylinder head cover.

REMOVAL

LEFT

Fig. 292: Magnetic Timing Wheels
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 293: Upper Intake Manifold & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air inlet hose and upper intake manifold (2). Refer to **MANIFOLD, INTAKE, REMOVAL** .

Fig. 294: Intake Ports, Insulator & Alignment Posts
 Courtesy of CHRYSLER GROUP, LLC

3. Cover the open intake ports (1) to prevent debris from entering the engine.
4. Remove the insulator (2) from the LH cylinder head cover.

Fig. 295: Transmission Breather Hose, Make-Up Air Tube & Clips
 Courtesy of CHRYSLER GROUP, LLC

5. Disengage the clips (1), remove the make-up air tube (3) from the left cylinder head cover and reposition the transmission breather hose (2).

Fig. 296: Variable Valve Timing Solenoid Connectors & Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

6. Disconnect the electrical connectors (2) from the left variable valve timing solenoids.
7. Disengage two starter wire harness retainers (1) from the left cylinder head cover.

Fig. 297: Variable Valve Timing Solenoids, Connectors & Bolts
 Courtesy of CHRYSLER GROUP, LLC

8. Mark the variable valve timing solenoids (2 and 4) with a paint pen or equivalent so that they may be reinstalled in their original locations.
9. Remove the variable valve timing solenoids. Refer to **SOLENOID, VARIABLE VALVE TIMING**.

REMOVAL .

Fig. 298: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
Courtesy of CHRYSLER GROUP, LLC

10. Disengage one main wire harness retainer (3) from the left cylinder head cover.

Fig. 299: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
Courtesy of CHRYSLER GROUP, LLC

11. Disconnect the left Camshaft Position (CMP) sensor (5).
12. Disengage one main wire harness retainer (2) from the cylinder head cover and one main wire harness retainer (4) from the cylinder head cover mounting stud.

Fig. 300: CMP Sensor & Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The RH CMP sensor is shown in illustration, the LH CMP sensor is similar. If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.

13. Remove the camshaft position sensor. Refer to **SENSOR, CAMSHAFT POSITION, REMOVAL**.

Fig. 301: Injection/Ignition Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

14. Disengage two injection/ignition harness retainers (1) from the left cylinder head cover.

2726572

Fig. 302: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Remove the ignition coils (2). Refer to **COIL, IGNITION, REMOVAL** .

2719912

Fig. 303: Cylinder Head Cover Mounting Bolts & Studbolts

16. Loosen ten cylinder head cover mounting bolts (1) and two studbolts (2) and remove the cylinder head cover.

2776066

Fig. 304: Cylinder Head Cover Gasket & Spark Plug Tube Seals
 Courtesy of CHRYSLER GROUP, LLC

17. Remove and discard the cylinder head cover gasket (1).
18. The spark plug tube seals (2) can be reused if not damaged.

2776075

Fig. 305: RTV Sealant Locations
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

19. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover mating surfaces. Refer to **STANDARD PROCEDURE**.

RIGHT

2691700

Fig. 306: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2712055

Fig. 307: Upper Intake Manifold & Bolts

 Courtesy of CHRYSLER GROUP, LLC

3. Cover the open intake ports (1) to prevent debris from entering the engine.

Fig. 309: Variable Valve Timing Solenoid Connectors & Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Mark the variable valve timing solenoid connectors (2) with a paint pen or equivalent so that they may be reinstalled in their original locations.

4. Disconnect the electrical connectors (2) from the variable valve timing solenoids on the right cylinder head.
5. Disengage the starter harness to main harness retainer (3).
6. Disengage two starter wire harness retainers from the right cylinder head cover (1).

Fig. 310: Variable Valve Timing Solenoids, Connectors & Bolts
 Courtesy of CHRYSLER GROUP, LLC

7. Mark the variable valve timing solenoids (2 and 4) with a paint pen or equivalent so that they may be reinstalled in their original locations.
8. Remove the variable valve timing solenoids. Refer to **SOLENOID, VARIABLE VALVE TIMING, REMOVAL**.

Fig. 311: Main Wire Harness Retainers At Right Cylinder Head Cover
 Courtesy of CHRYSLER GROUP, LLC

9. Disengage four main wire harness retainers (1) from the right cylinder head cover.

Fig. 312: Main Wire Harness Retainer & Connector
 Courtesy of CHRYSLER GROUP, LLC

10. Disconnect the electrical connector (1) from the right Camshaft Position (CMP) sensor.
11. Disengage the main wire harness retainer (2) from the right cylinder head cover mounting stud.

Fig. 313: CMP Sensor & Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: If removing both RH and LH CMP sensors, mark the sensors so they can be installed in their original locations.

12. Remove the camshaft position sensor. Refer to **SENSOR, CAMSHAFT POSITION, REMOVAL**.

Fig. 314: Injection/Ignition Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

13. Disengage three injection/ignition harness retainers (1) from the right cylinder head cover.

Fig. 315: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH ignition coils are shown in illustration, the RH ignition coils are similar.

14. Remove the ignition coils (2). Refer to **COIL, IGNITION, REMOVAL** .

Fig. 316: Transmission Fluid Level Indicator Tube & Bolt
 Courtesy of CHRYSLER GROUP, LLC

15. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
16. Loosen the bolt (1) securing the transmission fluid level indicator tube (2) to the transmission housing.

Fig. 317: Upper Transmission-To-Engine Bolt & Transmission Oil Level Indicator Tube
 Courtesy of CHRYSLER GROUP, LLC

17. Remove the upper transmission to engine bolt (1) and reposition the transmission oil level indicator tube (2).

Fig. 318: PCV Valve & Screws

18. Lower the vehicle.
19. Remove the PCV valve (1). Refer to **VALVE, POSITIVE CRANKCASE VENTILATION (PCV), REMOVAL**.

Fig. 319: Cylinder Head Cover Mounting Bolts & Studbolts
 Courtesy of CHRYSLER GROUP, LLC

20. Loosen nine cylinder head cover mounting bolts (1) and three studbolts (2) and remove the cylinder head cover.

2776066

Fig. 320: Cylinder Head Cover Gasket & Spark Plug Tube Seals
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover is shown in illustration, the RH cylinder head cover is similar.

21. Remove and discard the cylinder head cover gasket (1).
22. The spark plug tube seals (2) can be reused if not damaged.

2776075

Fig. 321: RTV Sealant Locations
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover T-joints are shown in illustration, the RH cylinder head cover T-joints are similar.

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

23. Remove all residual sealant (1) from the cylinder head, timing chain cover and cylinder head cover mating surfaces. Refer to **STANDARD PROCEDURE**.

INSTALLATION

LEFT

2668076

Fig. 322: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2776066

Fig. 323: Cylinder Head Cover Gasket & Spark Plug Tube Seals
 Courtesy of CHRYSLER GROUP, LLC

1. Install the cylinder head cover gasket (1).
2. The spark plug tube seals (2) can be reused if not damaged.

2932247

Fig. 324: Spark Plug Tube Seal & Installer
 Courtesy of CHRYSLER GROUP, LLC

3. If required, install new spark plug tube seals (2) in the cylinder head cover:
 - Lubricate the spark plug tube seal inner and outer diameters with clean engine oil.
 - Place the spark plug tube seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/Spark Plug Tube Seal) (1).
 - Push the seal into the cylinder head cover until the base of the seal is seated.
 - Remove the tool.

2776075

Fig. 325: RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

4. Clean the timing engine timing cover, cylinder head and cylinder head cover mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the two engine timing cover to cylinder head T-joints as shown in illustration.

2719729

Fig. 326: Cylinder Head Cover Bolts & Double Ended Studs Tightening Sequence - Left
 Courtesy of CHRYSLER GROUP, LLC

6. Align the locator pins (1) to the cylinder head and install the cylinder head cover.
7. Tighten the cylinder head cover bolts and double ended studs in the sequence shown in illustration to 12 N.m (106 in. lbs.).

2726572

Fig. 327: Electrical Connector, Ignition Coils & Ignition Coil Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

8. If removed, install the spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
9. Install the ignition coils. Refer to **COIL, IGNITION, INSTALLATION** .

Fig. 328: Injection/Ignition Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

10. Engage two injection/ignition harness retainers (1) to the left cylinder head cover.

Fig. 329: Variable Valve Timing Solenoids, Connectors & Bolts
 Courtesy of CHRYSLER GROUP, LLC

11. Refer to the markings made at disassembly and install the variable valve timing solenoids (2 and 4) in their original locations. Refer to **SOLENOID, VARIABLE VALVE TIMING , INSTALLATION** .

Fig. 330: Variable Valve Timing Solenoid Connectors & Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

12. Connect the electrical connectors (2) to the left variable valve timing solenoids.
13. Engage two starter wire harness retainers (1) to the left cylinder head cover.

Fig. 331: Starter Wire Harness Retainers, Main Wire Harness Retainer & Manifold Support Bracket Retainers
 Courtesy of CHRYSLER GROUP, LLC

14. Engage one main wire harness retainer (3) to the left cylinder head cover.

Fig. 332: CMP Sensor & Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The RH CMP sensor is shown in illustration, the LH CMP sensor is similar. If both RH and LH CMP sensors were removed, install them into their original locations.

15. Install the camshaft position sensor. Refer to **SENSOR, CAMSHAFT POSITION, INSTALLATION**.

Fig. 333: ECT Sensor Connector, CMP Sensor & Main Wire Harness Retainers
 Courtesy of CHRYSLER GROUP, LLC

16. Connect the electrical connector (5) to the left Camshaft Position (CMP) sensor.
17. Engage one main wire harness retainer (2) to the cylinder head cover and one main wire harness retainer (4) to the cylinder head cover mounting stud.

Fig. 334: Transmission Breather Hose, Make-Up Air Tube & Clips
 Courtesy of CHRYSLER GROUP, LLC

18. Install the make-up air tube (3) to the left cylinder head cover and engage the clips (1) to the transmission breather hose (2).

Fig. 335: Intake Ports, Insulator & Alignment Posts
 Courtesy of CHRYSLER GROUP, LLC

19. Install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.

2712764

Fig. 336: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

20. Install the upper intake manifold (1), support brackets and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
21. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

RIGHT

2691700

Fig. 337: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 338: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover is shown in illustration, the RH cylinder head cover is similar.

1. Install the cylinder head cover gasket (1).
2. The spark plug tube seals (2) can be reused if not damaged.

Fig. 339: Spark Plug Tube Seal & Installer

Courtesy of CHRYSLER GROUP, LLC

3. If required, install new spark plug tube seals (2) in the cylinder head cover:
 - Lubricate the spark plug tube seal inner and outer diameters with clean engine oil.
 - Place the spark plug tube seal (2) on the Cam Sensor/Spark Plug Tube Seal Installer (special tool #10256, Installer, Cam Installer, Cam Sensor/Spark Plug Tube Seal) (1).
 - Push the seal into the cylinder head cover until the base of the seal is seated.
 - Remove the tool.

2776075

Fig. 340: RTV Sealant Locations
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head cover T-joint is shown in illustration, the RH cylinder head cover T-joint is similar.

4. Clean the timing engine timing cover, cylinder head and cylinder head cover mating surfaces with isopropyl alcohol in preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the two engine timing cover to cylinder head T-joints as shown in illustration.

2719834

15. Engage four main wire harness retainers (1) to the right cylinder head cover.

Fig. 347: CMP Sensor & Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: If both RH and LH CMP sensors were removed, install them into their original locations.

16. Install the camshaft position sensor. Refer to **SENSOR, CAMSHAFT POSITION, INSTALLATION**.

Fig. 348: Main Wire Harness Retainer & Connector
 Courtesy of CHRYSLER GROUP, LLC

17. Connect the electrical connector (1) to the right Camshaft Position (CMP) sensor.
18. Engage the main wire harness retainer (2) to the right cylinder head cover mounting stud.

Fig. 349: PCV Valve & Screws
 Courtesy of CHRYSLER GROUP, LLC

19. Install the PCV valve (1). Refer to **VALVE, POSITIVE CRANKCASE VENTILATION (PCV), REMOVAL** .

Fig. 350: Upper Transmission-To-Engine Bolt & Transmission Oil Level Indicator Tube
 Courtesy of CHRYSLER GROUP, LLC

20. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
21. Install the transmission oil level indicator tube (2) with the upper transmission to engine bolt (1) tightened to 55 N.m (41 ft. lbs.).

Fig. 351: Transmission Fluid Level Indicator Tube & Bolt
 Courtesy of CHRYSLER GROUP, LLC

22. Install the bolt (1) securing the transmission fluid level indicator tube (2) to the transmission housing and tighten to 12 N.m (106 in. lbs.).

Fig. 352: Intake Ports, Insulator & Alignment Posts
 Courtesy of CHRYSLER GROUP, LLC

23. Lower the vehicle.
24. If removed, install the insulator (2) to the two alignment posts (3) on top of the LH cylinder head cover.

Fig. 353: Upper Intake Manifold & Bolts
 Courtesy of CHRYSLER GROUP, LLC

25. Install the upper intake manifold (1), support brackets and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
26. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

LIFTER(S), HYDRAULIC

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC LIFTER(S) NOISE DIAGNOSIS

Proper noise diagnosis is essential in locating the source of an NVH complaint. Locating a lash adjuster (tappet) type noise can sometimes be difficult. As a result, an initial misdiagnosis may occur.

Refer to the following chart for possible causes and correction of a lash adjuster (tappet) type noise.

LASH ADJUSTER (TAPPET) NOISE CHART

POSSIBLE CAUSES	CORRECTION
1. Engine oil level-too high or too low. This may allow aerated oil to enter the adjusters and cause them to be spongy.	1. Check and correct the engine oil level.
2. Insufficient running time after rebuilding a cylinder head.	2. Low speed running of up to 1 hour may be required to fully evacuate trapped air from the valve train system. During this time, turn engine

	off and let set for a few minutes before restarting. Repeat this several times after engine has reached normal operating temperature.
3. Air trapped in the lash adjuster (after 1 hour of run time).	3. See below: (a) Check lash adjusters for sponginess while installed in the cylinder head. Depress the rocker arm over the adjuster. Normal adjusters should feel very firm. Very spongy adjusters can be bottomed out easily. (b) If the lash adjuster(s) are still spongy, replace the lash adjuster(s). Refer to <u>LIFTER(S), HYDRAULIC, REMOVAL</u> .
4. Low oil pressure.	4. See below: (a) Check and correct the engine oil level. (b) Check the engine oil pressure. Refer to <u>CHECKING ENGINE OIL PRESSURE</u> . (c) Check for excessive main bearing clearance and correct. Refer to <u>STANDARD PROCEDURE</u> . (d) Check for a worn oil pump. Refer to <u>INSPECTION</u> .
5. Oil passage to the cylinder head(s) plugged with debris.	5. Check cylinder head oil passages for blockage. Clean or replace as necessary.
6. Worn valve guide(s).	6. Measure valve stem-to-guide clearance. Refer to <u>VALVES, INTAKE AND EXHAUST, INSPECTION</u> .
7. Air ingested into oil due to broken or cracked oil pump pickup tube.	7. Inspect pickup tube and replace as necessary. Refer to <u>PICK-UP, OIL PUMP, REMOVAL</u> .
8. Collapsed lash adjuster due to debris ingestion.	8. Clean debris from engine and replace lash adjuster(s). Refer to <u>LIFTER(S), HYDRAULIC, REMOVAL</u> .

REMOVAL

REMOVAL

2742108

Fig. 354: Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head hydraulic lifters are shown in illustration, the RH cylinder head hydraulic lifters are similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s). Refer to CAMSHAFT, ENGINE, REMOVAL.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

3. Remove the rocker arm(s). Refer to ROCKER ARM, VALVE, REMOVAL.

NOTE: If the hydraulic lifters are to be reused, identify their positions so that they can be reassembled into their original locations.

4. Remove the hydraulic lifter(s) (1).

INSTALLATION

INSTALLATION

2742108

Fig. 355: Hydraulic Lifters
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head hydraulic lifters are shown in illustration, the RH cylinder head hydraulic lifters are similar. If the hydraulic lifters are being reused, reassemble them into their original locations.

1. Verify that the hydraulic lifters are at least partially full of oil. There should be little or no plunger travel when the hydraulic lifter is depressed.
2. Install the hydraulic lifter(s) (1).

NOTE: If the rocker arms are being reused, reassemble them into their original locations.

3. Install the rocker arm(s). Refer to **ROCKER ARM, VALVE, INSTALLATION**.
4. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

ROCKER ARM, VALVE

DESCRIPTION

DESCRIPTION

2804799

Fig. 356: Rocker Arm
Courtesy of CHRYSLER GROUP, LLC

The rocker arms are steel stampings with an integral roller bearing. The rocker arms incorporate a 0.5 mm oil hole in the lash adjuster socket for roller and camshaft lubrication.

REMOVAL

REMOVAL

2741091

Fig. 357: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the camshaft(s). Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can

be reassembled into their original locations.

3. Remove the rocker arm(s) (1).

INSPECTION

INSPECTION

Fig. 358: Rocker Arm
Courtesy of CHRYSLER GROUP, LLC

Inspect the cam follower assembly for wear or damage. Replace as necessary.

INSTALLATION

INSTALLATION

CAUTION: Proper inspection of the rocker arms is required to ensure proper installation. Inspection from the top and also side view is critical to verify the proper seated position of each and every rocker arm. Failure to install the rocker arms correctly may cause severe engine damage.

2741091

Fig. 359: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.

1. Lubricate the rocker arms with clean engine oil before installation.

NOTE: When placing the rocker arms. The valve stem should fit securely into the rocker arm guides.

2. Position the rocker arm(s) (1) onto the lifter(s) and valve stem(s).

210171394

Fig. 360: Rocker Arm & Lifter
Courtesy of CHRYSLER GROUP, LLC

3. Position the camshaft(s) onto the mounts and install the camshaft caps. Hand tighten the cap retaining bolts to 2 N.m (18 in. lbs.).

NOTE: **If any of the rocker arms are not installed properly. Loosen the camshaft caps and reposition the rocker arms.**

4. Verify that the rocker arm (3) is positioned over the lifter (4).
5. Verify that the rocker arm roller (2) is seated to the camshaft lobe (1).

091673879

Fig. 361: Camshaft Lobe, Rocker Arm Roller, Rocker Arm Guide & Valve Stem
Courtesy of CHRYSLER GROUP, LLC

6. Use a mirror to verify the valve stem (4) is centered between the rocker arm guides (3).
7. Verify the camshaft lobe (1) is centered over the rocker arm roller (2).
8. Tighten the camshaft caps. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.

SEAL(S), VALVE GUIDE

DESCRIPTION

DESCRIPTION

2706565

Fig. 362: Valve Stem Oil Seal, Valve Spring & Valve Guide
 Courtesy of CHRYSLER GROUP, LLC

The valve stem oil seals (1) are made of elastomer over-molded steel in a non-integrated type guide mounted configuration. The seal is not held in place by the valve spring (2). The valve stem seals are not reusable if removed from the valve guides (3), they must be replaced. Always coat the valve seals with clean engine oil before installing the valves.

REMOVAL

REMOVAL

2754292

Fig. 363: Valve Spring & Valve Spring Retainer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be

reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

1. Remove the valve spring(s) (2). Refer to **SPRING(S), VALVE, REMOVAL** .

Fig. 364: Valve Guide Seal & Valve Seal Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 5 cylinder exhaust valve guide seal shown in illustration, all other valve guide seals similar.

2. Remove the valve guide seal (1) using a valve seal tool (2). Discard the removed seal.

Fig. 365: Valve Spring Seat
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 5 cylinder exhaust valve spring seat shown in illustration, all other valve spring seats similar.

3. If required, remove the valve spring seat (1).
4. If required, remove the valve(s). Refer to VALVES, INTAKE AND EXHAUST, REMOVAL .

INSTALLATION

INSTALLATION

Fig. 366: Valve Spring Seat
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the valve(s). Refer to VALVES, INTAKE AND EXHAUST, INSTALLATION .

NOTE: Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification. Refer to SPECIFICATIONS. Number 5 cylinder exhaust valve shown in illustration, all other valves similar.

2. If removed, install the spring seat (1) over the valve guide.

Fig. 367: Installing Valve Guide Seal
 Courtesy of CHRYSLER GROUP, LLC

3. Apply engine oil to the lip of the valve guide seal (3). Install the valve guide seal (3) over the valve stem. Using an appropriate driver (1), push the seal firmly and squarely over the valve guide. **Do Not Force** the seal against the top of guide.

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (3). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

Fig. 368: Valve Spring & Valve Spring Retainer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all

other valves similar.

4. Install the valve spring(s) (2). Refer to **SPRING(S), VALVE, INSTALLATION** .

SPRING(S), VALVE

DESCRIPTION

DESCRIPTION

2814925

Fig. 369: Valve Spring Components
Courtesy of CHRYSLER GROUP, LLC

The valve springs are a beehive design and made from high strength chrome silicon steel. The springs are common for intake and exhaust applications. Valve guide seals are rubber overmolded on a steel support cylinder with a garter spring at the seal lip. The seals are not integrated with the valve spring seat. The valve spring seat is a flat steel washer. The steel valve spring retainers are designed for use with beehive springs and the valve spring retainer locks are a three bead Butt type design.

REMOVAL

IN VEHICLE

2715130

Fig. 370: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2741556

Fig. 371: A/C Suction & Liquid Line Assembly
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. If removing the LH exhaust valve springs, recover the refrigerant from the refrigerant system and remove the A/C suction and liquid line assembly (1). Refer to **LINE, A/C SUCTION, REMOVAL** .

Fig. 372: Heater Core Return Tube, Nut & Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Power steering pump not shown in illustration.

3. If removing the LH exhaust valve springs, remove the nut (1) and bolt (4) from the support brackets of the heater core return tube (3) and reposition the tube.

Fig. 373: Transmission Fluid Level Indicator Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

4. If removing the RH valve springs, remove the transmission fluid level indicator tube (2). Refer to

SEAL, FILL TUBE, REMOVAL

5. Remove both cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**

2741081

Fig. 374: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar.

NOTE: Only remove the camshafts from one head at a time. The opposite head must remain assembled in order to lock the crankshaft against rotation.

6. Remove the camshaft(s). Refer to **CAMSHAFT, ENGINE, REMOVAL**.

NOTE: If the rocker arms are to be reused, identify their positions so that they can be reassembled into their original locations.

7. Remove the rocker arm(s) (1). Refer to **ROCKER ARM, VALVE, REMOVAL**

Fig. 375: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
 Courtesy of CHRYSLER GROUP, LLC

NOTE: RH camshaft phaser lock shown in illustration, LH camshaft phaser lock similar.

CAUTION: Air pressure applied to the cylinder holds the valves in place. This air pressure also has a tendency to force the piston down and rotate the crankshaft. Do not allow the crankshaft to rotate. Crankshaft rotation may damage the timing chain or front timing cover and affect camshaft timing.

8. If removing the LH camshafts, install the RH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser)-1 (5) to lock the crankshaft against rotation. If removing the RH camshafts, install the LH Camshaft Phaser Lock (special tool #10202, Locks, Camshaft/Phaser)-2 to lock the crankshaft against rotation.

Fig. 376: Shop Air Supply & Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 4 cylinder intake valve spring compression shown in illustration, all other valves similar.

9. Remove the spark plug. Refer to **SPARK PLUG, REMOVAL** .
10. Install Valve Spring Compressor (special tool #MD998772A, Compressor, Valve Spring) (2) onto the cylinder head.
11. Install a spark plug adapter attached to a regulated shop air supply (1). Pressurize the cylinder being serviced to 620.5 - 689 kPa (90 - 100 psi) to hold the valves in place.

CAUTION: Air pressure must be maintained as long as the valve springs are removed to prevent the valves from dropping into the cylinders.

12. Using Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (3), compress valve spring (4) and remove valve retaining locks (5).

2754292

Fig. 377: Valve Spring & Valve Spring Retainer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

13. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).
14. If required, remove the valve guide seal and spring seat. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

OFF VEHICLE

2739009

Fig. 378: Valve Spring Compressor Components

1. Remove the cylinder head(s). Refer to **CYLINDER HEAD , REMOVAL** .
2. Position the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1).

Fig. 379: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.

3. Compress the valve spring (3) and remove the valve retaining locks (4).

Fig. 380: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

4. Release the valve spring compression and remove the valve spring retainer (1) and valve spring (2).
5. If required, remove the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, REMOVAL**
6. If required, remove the valve guide seal and spring seat. Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

INSPECTION

INSPECTION

Fig. 381: Testing Valve Spring
Courtesy of CHRYSLER GROUP, LLC

When valves have been removed for inspection, reconditioning or replacement, valve springs should be checked against specifications for free-length, spring force and spring installed height. Refer to **SPECIFICATIONS**.

Spring force can be measured with a test fixture (2). Follow the tool manufactures instructions. Replace any springs that do not meet specifications.

2756024

Fig. 382: Checking Valve Spring Installed Height
 Courtesy of CHRYSLER GROUP, LLC

Installed height of the valve spring must be checked with the valve assembled into the cylinder head. Refer to **SPRING(S), VALVE, INSTALLATION** .

If the valves or valve seats have been refinished and the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install an additional spring seat (8) in the head counterbore under the original valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

INSTALLATION

IN VEHICLE

2754328

Fig. 383: Spring Seat, Valve Guide Seal & Garter Spring
 Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

2754292

Fig. 384: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

2. Install the valve spring (2) and valve spring retainer (1).

2741103

Fig. 385: Shop Air Supply & Valve Spring Compressor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 4 cylinder intake valve spring compression shown in illustration, all other valves similar.

3. Using Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (3) with Valve Spring Compressor (special tool #MD998772A, Compressor, Valve Spring) (2), compress the valve spring (4) **only enough** to install the valve retaining locks (5).
4. Relieve the air pressure and remove the spark plug adapter.
5. Install the spark plug and tighten to 17.5 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION**.

2741081

Fig. 386: Locating Rocker Arms
Courtesy of CHRYSLER GROUP, LLC

NOTE: The LH cylinder head rocker arms are shown in illustration, the RH cylinder head rocker arms are similar. If the rocker arms are being reused, reassemble them into their original locations.

6. Install the rocker arm(s) (1). Refer to **ROCKER ARM, VALVE, INSTALLATION**.
7. Install the camshaft(s), phasers, cylinder head cover(s) and upper intake manifold. Refer to **CAMSHAFT, ENGINE, INSTALLATION**.

Fig. 387: Transmission Fluid Level Indicator Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

8. If removed, install the transmission fluid level indicator tube (2). Refer to **SEAL, FILL TUBE, INSTALLATION** .

Fig. 388: Heater Core Return Tube, Nut & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Power steering pump not shown in illustration.

9. If removed, install the nut (1) and bolt (4) to the support brackets of the heater core return tube

(3). Tighten the fasteners to 12 N.m (106 in. lbs.).

Fig. 389: A/C Suction & Liquid Line Assembly
Courtesy of CHRYSLER GROUP, LLC

10. If removed, install the A/C suction and liquid line assembly (1). Refer to **LINE, A/C SUCTION, INSTALLATION**.
11. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

OFF VEHICLE

Fig. 390: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the valve(s). Refer to **VALVES, INTAKE AND EXHAUST, INSTALLATION**.

NOTE: Reassemble the valves into their original locations. If the valves or valve seats have been refinished, verify that the valve stem tip height is within specification. Refer to SPECIFICATIONS. Number 5 cylinder exhaust valve shown in illustration, all other valves similar.

2. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to SEAL(S), VALVE GUIDE, INSTALLATION.

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

Fig. 391: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

3. Install the valve spring (2) and valve spring retainer (1).

Fig. 392: Compressing Valve Spring & Locating Valve Retaining Locks
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.

4. Compress valve springs (3) with the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) mounted in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1). Install the retaining locks (4) and release the valve spring compression.

Fig. 393: Checking Valve Spring Installed Height
 Courtesy of CHRYSLER GROUP, LLC

5. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). If the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install an

additional spring seat (8) in the head counterbore under the original valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

6. Install the cylinder head(s). Refer to **CYLINDER HEAD , INSTALLATION** .

TUBE, SPARK PLUG

REMOVAL

REMOVAL

2715130

Fig. 394: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

3309195

Fig. 395: Spark Plug Tube Installer & Spark Plug Tube
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the ignition coils. Refer to **COIL, IGNITION, REMOVAL** .
3. Using compressed air, blow out any dirt or contaminates from around the top of the spark plugs.
4. Remove the cylinder head cover(s). Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
5. Install the top half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (1) into the spark plug tube to be removed (2).

Fig. 396: Locking Pliers & Spark Plug Tube
Courtesy of CHRYSLER GROUP, LLC

6. Using suitable locking pliers (1), remove the spark plug tube (2) from the cylinder head and discard the tube.
7. Clean the area around the spark plug tube mounting with Mopar® Parts Cleaner or equivalent.

INSTALLATION

INSTALLATION

2715130

Fig. 397: Magnetic Timing Wheels
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

3309416

Fig. 398: Spark Plug Tube Installer
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the spark plug. Refer to **SPARK PLUG, REMOVAL** .
2. Install the lower half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (1) into the cylinder head and tighten to 17.5 N.m (13 ft. lbs.).

3309595

Fig. 399: Applying Stud & Bearing Mount Bead To Spark Plug Tube
Courtesy of CHRYSLER GROUP, LLC

3. Apply Mopar® Stud and Bearing Mount to the new spark plug tube approximately 3 mm (0.118 in.) from the end of the tube, in a 2 mm (0.078 in.) wide bead (1).

3309874

Fig. 400: Spark Plug Tube, Thrust Washers, Spark Plug Tube Installer & Bolt
Courtesy of CHRYSLER GROUP, LLC

4. Position the spark plug tube (3) on the top half of Spark Plug Tube Installer (special tool #10255, Installer, Spark Plug Tube) (2) and assemble the tool on the cylinder head. Make sure there are two thrust washers (4) installed.

CAUTION: Do not overtighten the bolt (1). Overtightening can damage the cylinder head spark plug threads.

5. Tighten the bolt (1) to draw the spark plug tube into position. When the top half of the tool contacts the bottom half of the tool, the tube is installed.

2776066

Fig. 401: Cylinder Head Cover Gasket & Spark Plug Tube Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: LH cylinder head cover shown in illustration, RH cylinder head cover similar.

CAUTION: Spark plug torque is critical and must not exceed the specified value. Overtightening stretches the spark plug shell reducing its heat transfer capability resulting in possible catastrophic engine failure.

6. Install the spark plug and tighten to 17.5 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION**.
7. If required, install a new spark plug tube seal (2). Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.
8. Install the cylinder head cover(s). Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

VALVES, INTAKE AND EXHAUST

DESCRIPTION

DESCRIPTION

2819692

Fig. 402: Intake Valve & Exhaust Valve Component Configuration
Courtesy of CHRYSLER GROUP, LLC

The intake valve (6) is made from a one piece forged heat resistant (martensitic) steel. The exhaust valve (7) is a two piece construction with a forged (austenitic) head welded to the (martensitic) stem. Both valves have a nitrided surface treatment to prevent scuffing except at the tip and lock grooves. The four valves per cylinder are actuated by roller rocker arms, which pivot on stationary lash adjusters. All valves use three bead lock keepers (1) to retain springs (3) and to promote valve rotation.

STANDARD PROCEDURE

Inspect the remaining margin (5) after the valves are refaced. Refer to **SPECIFICATIONS**.

VALVE SEATS

809c3e98

Fig. 405: Valve Face & Seat
Courtesy of CHRYSLER GROUP, LLC

- | |
|---|
| 1 - SEAT WIDTH
2 - FACE ANGLE
3 - SEAT ANGLE
4 - SEAT CONTACT AREA |
|---|

NOTE: When refacing the valve seats, it is important that the correct size valve guide pilot be used for the reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of the valve seat using a dial indicator. Total runout should not exceed 0.050 mm (0.002 inch.) total indicator reading.
2. Inspect the valve seat (3) with Prussian blue to determine where the valve contacts the seat. To do this, coat the valve seat (3) **LIGHTLY** with Prussian blue then set the valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of the valve face (4), contact is satisfactory. If the blue is transferred to the top edge of the valve face, then lower the valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, then raise the valve seat with a 65 degree stone.

NOTE: Valve seats which are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

3. When the seat is properly positioned the width of the intake seat should be 1.0 - 1.2 mm (0.04 - 0.05 in.) and the exhaust seats should be 1.41 - 1.61 mm (0.055 - 0.063 in.).

VALVE AND SPRING INSTALLED HEIGHT

Fig. 406: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to **SPECIFICATIONS**. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).

Fig. 407: Spring Seat, Valve Guide Seal & Garter Spring
 Courtesy of CHRYSLER GROUP, LLC

3. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION**.

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

Fig. 408: Valve Spring & Valve Spring Retainer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: If the valve springs are being reused, reassemble them into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valves similar.

4. Install the valve spring (2) and valve spring retainer (1).

Fig. 409: Compressing Valve Spring & Locating Valve Retaining Locks
Courtesy of CHRYSLER GROUP, LLC

NOTE: Number 3 cylinder intake valve spring compression shown in illustration, all other valves similar.

5. Compress valve springs (3) with the Valve Spring Compressor Adapter (special tool #10224, Adapter, Valve Spring) (2) mounted in the Valve Spring Compressor (special tool #C-3422-D, Compressor, Valve Spring) (1). Install the retaining locks (4) and release the valve spring compression.

Fig. 410: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

6. If the valves or valve seats have been refinished, check the installed height of the valve springs (4). If the installed valve spring height (4) is greater than 40.0 mm (1.575 in.), install a second spring seat (8) in the head counterbore under the valve spring seat (8) to bring the spring height back within specification. Make sure the measurement is taken from the top of spring seat (6) to the bottom surface of spring retainer (1).

REMOVAL

REMOVAL

Fig. 411: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head(s). Refer to CYLINDER HEAD , REMOVAL .

NOTE: If the springs are to be reused, identify their positions so that they can be reassembled into their original locations. Number 5 cylinder exhaust valve spring shown in illustration, all other valve springs similar.

2. Remove the valve spring(s) (2). Refer to SPRING(S), VALVE, REMOVAL .

2755802

Fig. 412: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before removing the valves, remove any burrs from the valve stem retainer lock grooves (2) and stem tip (1) to prevent damage to the valve guides.

3. Remove the valve(s) (3). Identify each valve to ensure installation in the original location.

2754328

Fig. 413: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

4. If required, remove the valve guide seal (1) and spring seat (3). Refer to **SEAL(S), VALVE GUIDE, REMOVAL**.

INSPECTION

INSPECTION

VALVES

Fig. 414: Inspecting Valve Margin
Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the valves thoroughly. Replace burned, warped and cracked valves.
2. Inspect the retainer lock grooves for wear or damage (2).
3. Inspect the valve face (4) for wear and pitting.
4. Measure the valve stems (3) and margins (5) for wear. Refer to **SPECIFICATIONS**.

VALVE GUIDES

Fig. 415: Measuring Valve Guide Wear

Courtesy of CHRYSLER GROUP, LLC

1. Remove carbon and varnish deposits from inside of the valve guides with a reliable guide cleaner.
2. Measure valve stem-to-guide clearance as follows:
3. Install the valve (2) into the cylinder head so that it is 15 mm (0.590 inch.) off of the valve seat. A small piece of hose may be used to hold the valve in place.
4. Attach the Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to the cylinder head and set it at a right angle to the valve stem being measured.
5. Move the valve to and from the indicator. Compare this reading to the specification. Refer to **SPECIFICATIONS**.

NOTE: If stem-to-guide clearance exceeds specifications, you must measure the valve stem. If the valve stem is within specification or if the valve guide is loose in the cylinder head, replace the cylinder head.

INSTALLATION

INSTALLATION

Fig. 416: Checking Valve Spring Installed Height
Courtesy of CHRYSLER GROUP, LLC

1. Coat the valve stems (2) with clean engine oil and install the valves into the cylinder head.

NOTE: If the valves are being reused, reassemble them into their original locations.

2. If the valves or valve seats have been refinished, check the valve tip height (5). If the valve tip height (5) exceeds the specification, grind the valve tip until it is within specification. Refer to

SPECIFICATIONS. Make sure the measurement is taken from the cylinder head surface (7) to the top of the valve stem (2).

Fig. 417: Spring Seat, Valve Guide Seal & Garter Spring
Courtesy of CHRYSLER GROUP, LLC

3. If removed, install the spring seat (3) and valve guide seal (1) over the valve guide. Refer to **SEAL(S), VALVE GUIDE, INSTALLATION.**

NOTE: Ensure that the garter spring (2) is intact around the top of the valve guide seal (1). Number 5 cylinder exhaust valve guide seal shown in illustration, all other valves similar.

Fig. 418: Valve Spring & Valve Spring Retainer
Courtesy of CHRYSLER GROUP, LLC

4. Install the valve spring(s) (2). Refer to **SPRING(S), VALVE, INSTALLATION** .

NOTE: Reassemble the valves springs into their original locations. If the valves or valve seats have been refinished, verify that the valve spring installed height is within specification. Refer to **SPECIFICATIONS**. Number 5 cylinder exhaust valve spring shown in illustration, all other valves springs similar.

5. Install the cylinder head(s). Refer to **CYLINDER HEAD , INSTALLATION** .

ENGINE BLOCK

DESCRIPTION

DESCRIPTION

2824104

Fig. 419: Cylinder Block & Main Bearing Caps
Courtesy of CHRYSLER GROUP, LLC

The cylinder block is a 60 degree high-pressure die cast aluminum design with cast steel cylinder liners. The leading side of the block is on the right side and houses cylinders 1, 3 and 5. The cylinder block is an open deck design with cut slots between each cylinder. Two knock sensors are located in the block valley. The cylinder block has three sets of piston cooling jets which are attached to the main oil gallery. The four powdered metal main bearing caps are a cross-bolted design and have directional arrows molded into the caps. The number 2 main bearing is the location for the two piece

upper half thrust bearings. The thrust bearings are installed with the oil grooves facing outward. The main bearing caps are a 6-bolt design and cross-bolted for improved lower end strength. There are three oil drain back drillings located on each of the cylinder banks.

STANDARD PROCEDURE

MEASURING BEARING CLEARANCE USING PLASTIGAGE

Fig. 420: Plastigage Placed In Lower Shell
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical crankshaft journal shown in illustration.

Engine crankshaft and connecting rod bearing clearances can be determined by the use of Plastigage or equivalent. The following is the recommended procedure for the use of Plastigage:

1. Remove the oil film from surface to be checked. Plastigage is soluble in oil.
2. Place a piece of Plastigage (1) across the entire width of the journal (In addition, suspected areas can be checked by placing the Plastigage in the suspected area). Plastigage must not crumble in use. If brittle, obtain fresh stock.
3. Torque the bearing cap bolts of the bearing being checked to the proper specifications. Refer to **SPECIFICATIONS**.

NOTE: **DO NOT** rotate the crankshaft. Plastigage will smear, causing inaccurate results.

801777cc

Fig. 421: Measuring Bearing Clearance With Plastigage
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical connecting rod cap shown in illustration.

4. Remove the bearing cap and compare the width of the flattened Plastigage (2) with the scale provided on the package (1). Locate the band closest to the same width. This band shows the amount of clearance. Differences in readings between the ends indicate the amount of taper present or the possibility of foreign material trapped under the bearing insert.
5. Record all readings taken. Compare clearance measurements to engine specifications. Refer to **SPECIFICATIONS**.

Fig. 422: Checking Connecting Rod Bearing Clearance With Plastigage
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical connecting rod journal shown in illustration.

NOTE: Plastigage is available in a variety of clearance ranges. Use the most appropriate range for the specifications you are checking. Plastigage generally is accompanied by two scales. One scale is in inches, the other is a metric scale.

6. Install the proper bearings to achieve the specified bearing clearances.
7. Repeat the Plastigage measurement to verify your bearing selection prior to final assembly.

CYLINDER BORE HONING

80861d41

Fig. 423: Identifying Cylinder Bore Crosshatch Pattern
Courtesy of CHRYSLER GROUP, LLC

Before honing, stuff plenty of clean shop towels under the bores and over the crankshaft to keep abrasive materials from entering the crankshaft area.

1. Used carefully, a cylinder bore sizing hone equipped with 220 grit stones, is the best tool for this job. In addition to deglazing, it will reduce taper and out-of-round, as well as removing light scuffing, scoring and scratches. Usually, a few strokes will clean up a bore and maintain the required limits.

CAUTION: DO NOT use rigid type hones to remove cylinder wall glaze.

2. Deglazing of the cylinder walls may be done if the cylinder bore is straight and round. Use of a cylinder surfacing hone equipped with 280 grit stones, about 20-60 strokes, depending on the bore condition, will be sufficient to provide a satisfactory surface. Use a light honing oil, available from major oil distributors.

CAUTION: DO NOT use engine or transmission oil, mineral spirits, or kerosene.

3. Honing should be done by moving the hone up and down fast enough to get a crosshatch pattern. The hone marks should INTERSECT at 50° to 60° for proper seating of rings.
4. A controlled hone motor speed between 200 and 300 RPM is necessary to obtain the proper crosshatch angle (1). The number of up and down strokes per minute can be regulated to get

the desired 50° to 60° angle (2). Faster up and down strokes increase the crosshatch angle.

5. After honing, it is necessary that the block be cleaned to remove all traces of abrasive. Use a brush to wash parts with a solution of hot water and detergent. Dry parts thoroughly. Use a clean, white, lint-free cloth to check that the bore is clean. Oil the bores after cleaning to prevent rusting.

INSPECTION

INSPECTION

2767936

Fig. 424: Main Bearing Inserts

Courtesy of CHRYSLER GROUP, LLC

1. Wipe the main bearing inserts (1 and 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear. Refer to **STANDARD PROCEDURE**.
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the cylinder block main bearing bores show damage the engine block must be replaced.

115574

Fig. 425: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

9. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
10. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A (1).
11. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
12. Determine taper by subtracting the smaller diameter from the larger diameter.
13. Rotate measuring device 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specifications. Refer to **SPECIFICATIONS**.
14. Determine out-of-roundness by comparing the difference between A and B at each of the three levels. Verify that the maximum out of round is within specifications. Refer to **SPECIFICATIONS**.
15. If cylinder bore taper and out-of-roundness are within specification, the cylinder bore can be honed. Refer to **ENGINE BLOCK, STANDARD PROCEDURE**. If the cylinder bore taper or out-of-round condition exceeds the maximum limits, the cylinder block must be replaced.

NOTE: **A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.**

BEARING(S), CONNECTING ROD

STANDARD PROCEDURE

CONNECTING ROD BEARING FITTING

Bearing oil clearance can also be determined by using Plastigage or equivalent. Refer to **ENGINE BLOCK, STANDARD PROCEDURE**.

2767957

Fig. 426: Crankshaft Main Bearing Journal Diameter Grade Markings & Connecting Rod Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

The connecting rod bearings are "select fit" to achieve proper oil clearance. Connecting rod bearing journal diameter grade markings (2) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4, 5, 6. Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal.

Connecting rod bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the three crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	58.9910 - 58.9969 mm (2.3225 - 2.3227 in.)
2	58.9970 - 59.0029 mm (2.3227 - 2.3229 in.)
3	59.0030 - 59.0090 mm (2.3229 - 2.3232 in.)

2769568

Fig. 427: Connecting Rod Bearing Shells & Bearing Size
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

The connecting rod bearing shells (1) are marked with the bearing size (2) on the bearing lining surface. The bearings are available in three different sizes in order to achieve the desired oil clearance.

Rod bearing shells are available in three sizes. The chart below identifies the three bearing sizes.

Bearing Marking	Size mm (in.)
1	1.583 - 1.580 mm (0.0623 - 0.0622 in.)
2	1.580 - 1.577 mm (0.0622 - 0.0621 in.)
3	1.577 - 1.574 mm (0.0621 - 0.0620 in.)

CONNECTING ROD BEARING REPLACEMENT

2769568

Fig. 428: Connecting Rod Bearing Shells & Bearing Size
 Courtesy of CHRYSLER GROUP, LLC

The connecting rod bearings (1) are serviced in-vehicle. They must be replaced one-at-a-time in order to prevent the pistons from contacting the valves. The connecting rod bearings are "select fit" to achieve proper oil clearances. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.

2778047

Fig. 429: Main Bearing Cap Bolts From Windage Tray Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
3. Remove the oil pan, oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL** .
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in

illustration and remove the windage tray (1).

811318c8

Fig. 430: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

5. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

2778313

Fig. 431: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Replace only one connecting rod bearing at a time while all other connecting rod bearing caps remain properly tightened. If all connecting rod bearing caps are removed, crankshaft rotation will result in valve and/or piston damage.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

6. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.
7. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Rotate the crankshaft away from the connecting rod and remove the bearing shell.
9. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
10. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
11. Rotate the crankshaft while guiding the connecting rod into position over the rod journal.

CAUTION: The connecting rod bolts must not be reused. Always replace the

connecting rod bolts whenever they are loosened or removed.

12. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

13. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
14. If required, check the connecting rod side clearance. Refer to **STANDARD PROCEDURE**.
15. Repeat the previous steps for each connecting rod bearing being replaced.

Fig. 432: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined BEFORE reuse. If the threads are necked down the bolts must be replaced.

16. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 433: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

17. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.
18. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
19. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION**.
20. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.
21. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
22. Operate the engine until it reaches normal operating temperature.

BEARING(S), CRANKSHAFT, MAIN

STANDARD PROCEDURE

MAIN BEARING FITTING

NOTE: Crankshaft thrust washers are not selectable and are only available in a single thickness.

Bearing oil clearance can also be determined by using Plastigage or equivalent. Refer to **ENGINE BLOCK, STANDARD PROCEDURE**.

2767957

Fig. 434: Crankshaft Main Bearing Journal Diameter Grade Markings & Connecting Rod Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

The upper and lower main bearings are "select fit" to achieve proper oil clearances. Crankshaft main bearing journal diameter grade markings (1) are stamped into the front crankshaft counterweight. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.

Crankshaft main bearing journal diameter grade markings correspond to specific journal diameters. The chart below identifies the five crankshaft grade markings and their associated journal diameters.

Crankshaft Marking	Journal Size mm (in.)
1	71.9870 - 71.9905 mm (2.8341 - 2.8343 in.)
2	71.9906 - 71.9941 mm (2.8343 - 2.8344 in.)
3	71.9942 - 71.9977 mm (2.8344 - 2.8345 in.)
4	71.9978 - 72.0013 mm (2.8346 - 2.8347 in.)
5	72.0014 - 72.0050 mm (2.8347 - 2.8348 in.)

Fig. 435: Engine Block Cylinder Bore Diameter Grade Markings & Engine Block Main Bearing Journal Diameter Grade Markings
 Courtesy of CHRYSLER GROUP, LLC

Engine block main bearing journal diameter grade markings (2) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4.

Engine block main bearing journal grade markings correspond to specific journal diameters. The chart below identifies the five engine block grade markings and their associated journal diameters.

Engine Block Marking	Journal Size mm (in.)
1	77.0055 - 77.0090 mm (3.0317 - 3.0318 in.)
2	77.0019 - 77.0054 mm (3.0316 - 3.0317 in.)
3	76.9983 - 77.0018 mm (3.0314 - 3.0316 in.)
4	76.9947 - 76.9982 mm (3.0313 - 3.0314 in.)
5	76.9910 - 76.9946 mm (3.0311 - 3.0313 in.)

For upper and lower main bearing selection, obtain the grade identification marks from the crankshaft and engine block. Main bearings are available in five sizes. Upper and lower sizes can be mixed on a journal in order to achieve the desired oil clearance. The chart below identifies the five sizes available and how they should be selected based on crankshaft and engine block grade markings.

Engine Block Marking	Crankshaft Marking				
	1	2	3	4	5
1	1/1	1/2	2/2	2/3	3/3
2	1/2	2/2	2/3	3/3	3/4
3	2/2	2/3	3/3	3/4	4/4
4	2/3	3/3	3/4	4/4	4/5
5	3/3	3/4	4/4	4/5	5/5

UPPER/LOWER Main Bearings to Achieve 0.024 - 0.050 mm (0.0009 - 0.0020 in.) Oil Clearance

2767936

Fig. 436: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

The upper main bearing shell (2) and lower main bearing shell (1) are marked with the bearing size (3) on the bearing lining surface. The upper and lower bearings are available in five different sizes and can be mixed on a journal in order to achieve the proper oil clearance.

Upper and lower main bearing shells are available in five sizes. The chart below identifies the five bearing sizes.

Bearing Marking	Size mm (in.)
1	2.4951 - 2.4987 mm (0.0982 - 0.0984 in.)
2	2.4915 - 2.4951 mm (0.0981 - 0.0982 in.)
3	2.4879 - 2.4915 mm (0.0979 - 0.0981 in.)
4	2.4843 - 2.4879 mm (0.0978 - 0.0979 in.)
5	2.4807 - 2.4843 mm (0.0977 - 0.0978 in.)

MAIN BEARING REPLACEMENT

Fig. 437: Main Bearing Identification
 Courtesy of CHRYSLER GROUP, LLC

The main bearings are serviced in-vehicle. They must be replaced one-at-a-time in order to properly support the crankshaft. The upper and lower main bearing shells are NOT interchangeable. The upper and lower main bearings are "select fit" to achieve proper oil clearances. Refer to **STANDARD PROCEDURE**.

Fig. 438: Power Steering Pump, Hoses & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Late production vehicles are equipped with Electro-Hydraulic Power Steering (EHPS) and do not have an engine mounted power steering pump.

1. Disconnect and isolate the negative battery cable.

2. If equipped with an engine mounted power steering pump, remove the serpentine drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

NOTE: Only two power steering pump mounting bolts are shown in illustration. Another bolt is on the lower end of the pump near the pulley.

3. Remove the three power steering pump mounting bolts (1) and reposition the power steering pump, if equipped.

Fig. 439: Main Bearing Cap Bolts From Windage Tray Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Remove the oil pan, oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL** .
5. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

Fig. 440: Main Bearing Tie Bolts Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

6. Remove the eight main bearing tie bolts in the sequence shown in illustration.

CAUTION: DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.

NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.

7. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

Fig. 441: Main Bearing Caps, Bolts, Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Replace only one main bearing at a time while all other main bearing caps remain properly tightened. If all main bearing caps are removed, the weight of the unsupported crankshaft will damage the crankshaft oil seals.

NOTE: Replace the main bearings in the following order; 2, 3, 1, 4.

8. Remove the two cap bolts (2) and remove the main bearing cap (1).
9. When removing the No. 2 bearing cap, also remove the thrust washers (5).
10. Slide the upper main bearing half (6) out from between the crankshaft and the engine block.
11. If required, select fit new main bearings to the engine block. Refer to **STANDARD PROCEDURE**.
12. Lubricate the upper main bearing half (6) with clean engine oil and slide the bearing into position.

Fig. 442: Thrust Washer Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

13. When installing thrust washers (1) at the No. 2 main bearing location, use the following procedure:
 - a. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

- b. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

Fig. 443: Checking Cylinder Head Bolts For Stretching (Necking)
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

14. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 444: Main Bearing Caps, Bolts, Crankshaft & Engine Block
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

15. Lubricate and install the lower bearing half (3) onto the main cap (1).
16. Install the main bearing cap (1) with two inner main bearing cap bolts (2) tightened to 20 N.m

(15 ft. lbs.) plus 90°.

17. Repeat the previous steps for main bearings 3, 1 and 4.
18. Measure crankshaft end play. Refer to **CRANKSHAFT, STANDARD PROCEDURE**.

Fig. 445: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

19. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.

Fig. 446: Main Bearing Tie Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

20. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown in illustration to 28 N.m (21 ft. lbs.).
21. Install the engine oil pump, oil pump pick-up and oil pan. Refer to **PUMP, ENGINE OIL, INSTALLATION** .

Fig. 447: Power Steering Pump, Hoses & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Only two power steering pump mounting bolts are shown in illustration. Another bolt is on the lower end of the pump near the pulley.

22. If removed, position the power steering pump (4) to the engine block. Install the three pump mounting bolts (1) and tighten to 25 N.m (18 ft. lbs.).
23. If removed, install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
24. Install the spark plugs and ignition coils. Refer to **SPARK PLUG, INSTALLATION** .
25. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.
26. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
27. Operate the engine until it reaches normal operating temperature.

CRANKSHAFT

DESCRIPTION

DESCRIPTION

2824124

Fig. 448: Crankshaft
Courtesy of CHRYSLER GROUP, LLC

The crankshaft is a cast design and is constructed using ductile iron. The crankshaft is a three throw split pin design with counterweights for balancing purposes. The main journals are cross drilled for rod bearing lubrication. The crankshaft is supported by four select fit main bearings with number 2 serving as the thrust washer location. The rear counterweight has provisions for crankshaft position sensor target wheel mounting. Both the front and rear seals are a single piece design and are mounted to the timing cover and cylinder block.

STANDARD PROCEDURE

STANDARD PROCEDURE - END PLAY

Fig. 449: Checking Crankshaft End Play
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical V6 engine shown in illustration.**

1. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to a stationary point at the front of the engine. Locate the probe perpendicular against the nose of the crankshaft.
2. Move the crankshaft all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the crankshaft forward to the limit of travel and read the dial indicator. Compare the measured end play to the specification. Refer to **SPECIFICATIONS**.

NOTE: **Crankshaft thrust washers are not selectable and are only available in a single thickness.**

REMOVAL

REMOVAL

2801352

Fig. 450: Lifting Sling, Engine Lifting Brackets & Engine Hoist
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove the crankshaft from the engine, the engine must be removed from the vehicle.

1. Remove the engine. Refer to **REMOVAL** .

2778047

Fig. 451: Main Bearing Cap Bolts From Windage Tray Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Remove the cylinder head covers, spark plugs, upper oil pan, engine timing cover, timing chain and sprockets. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL** .
3. Remove the flexplate and the rear crankshaft oil seal. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL**.

4. Remove the oil pump pick-up and engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL** .
5. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

811318c8

Fig. 452: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

Fig. 453: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

7. Remove the connecting rod cap bolts (5) and the connecting rod caps (4). Discard the cap bolts.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

9. Push the connecting rod and piston into the cylinder until the connecting rod is clear of the crankshaft journal. Remove the guide pins. Repeat this procedure at each cylinder until all of the connecting rods are clear of the crankshaft.

Fig. 454: Main Bearing Tie Bolts Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

Remove the main bearing cross bolts in the sequence shown in illustration.

CAUTION: DO NOT use a number stamp or a punch to mark main bearing caps, as damage to main bearings could occur.

NOTE: Main bearing caps are not interchangeable and are marked to insure correct assembly.

10. Mark the main bearing cap positions using a permanent ink marker or a scribe tool.

Fig. 455: Main Bearing Cap Bolts Removal Sequence
Courtesy of CHRYSLER GROUP, LLC

11. Remove the eight main bearing cap bolts in the sequence shown in illustration and remove the main bearing caps.

Fig. 456: Target Wheel & Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rest the crankshaft on the target wheel (1). Damaged or bent target wheel teeth will destroy the target wheels ability to correctly relay crankshaft position to the crankshaft position sensor.

12. Remove the crankshaft from the engine block.
13. If required, remove the four bolts (2) and the target wheel (1). Discard the four bolts.

INSPECTION

INSPECTION

Fig. 457: Measuring Crankshaft Journal
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical crankshaft journal measurements shown in illustration.

1. Clean the oil off the bearing journals.
2. Determine the maximum diameter of the journals with a micrometer. Measure at two locations 90° apart at each end of the journals.
3. Compare the measured rod journal diameter to the crankshaft connecting rod bearing journal diameter grade marking chart. Select the bearing size that corresponds to the crankshaft markings for each rod bearing journal that will provide the proper oil clearance. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
4. Compare the measured main bearing journal diameter to the crankshaft main bearing journal diameter grade marking chart. Obtain the main bearing journal grade identification marks from the engine block and select the upper and lower main bearing sizes that will provide the proper oil clearance. Refer to **STANDARD PROCEDURE**.
5. For connecting rod journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **SPECIFICATIONS**.
6. For main bearing journals, verify that the maximum taper and maximum out of round are within specifications. Refer to **SPECIFICATIONS**.

INSTALLATION

INSTALLATION

2792895

Fig. 458: Target Wheel & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. If required, select and fit new crankshaft main bearings to the engine block. Refer to **STANDARD PROCEDURE**.
2. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
3. If removed, install the target wheel (1) to the crankshaft with four new bolts (2). Ensure the threaded holes in the crankshaft are free of residual thread lock adhesive. Tighten the bolts to 10 N.m (89 in. lbs.).

2792286

Fig. 459: Main Bearing Caps, Bolts, Crankshaft & Engine Block
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

4. If removed, lubricate and install the upper main bearing halves (6) into the engine block (7).

CAUTION: When installing the crankshaft, use care not to damage bearing surfaces on the crankshaft.

5. Install the crankshaft (4) into the engine block (7).

Fig. 460: Thrust Washer Installation
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

6. Installing thrust washers (1) at the No. 2 main bearing location, using the following procedure:
 - a. Move the crankshaft forward to the limit of travel. Lubricate and install the front thrust washer (1) by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.
 - b. Move the crankshaft rearward to the limit of travel. Lubricate and install the rear thrust washer by rolling the washer onto the machined shelf between the No. 2 upper main bulk head and crankshaft thrust surface.

Fig. 461: Checking Cylinder Head Bolts For Stretching (Necking)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

7. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

2792286

Fig. 462: Main Bearing Caps, Bolts, Crankshaft & Engine Block
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

8. If removed, lubricate and install the lower main bearing halves (3) onto the main caps (1).
9. Install the main bearing caps (1) with two inner main bearing cap bolts (2).

2793140

Fig. 463: Inner Main Bearing Cap Bolts Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

10. Tighten the inner main bearing cap bolts in the sequence shown in illustration to 20 N.m (15 ft. lbs.) plus 90°.
11. Measure crankshaft end play. Refer to **CRANKSHAFT, STANDARD PROCEDURE**.

Fig. 464: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

12. If removed, install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

13. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

14. Pull the connecting rod and piston toward the crankshaft until the connecting rod is seated on the crankshaft journal. Remove the guide pins.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

15. If removed, install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

16. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
17. If required, check the connecting rod side clearance. Refer to **STANDARD PROCEDURE**.
18. Repeat the previous steps for the remaining connecting rods.

Fig. 465: Windage Tray With Main Bearing Cap Bolts Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

19. Install the windage tray (1) with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.

Fig. 466: Main Bearing Tie Bolts Installation Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

20. Install the eight main bearing tie bolts. Tighten the bolts in the sequence shown in illustration to 28 N.m (21 ft. lbs.).
21. Install the engine oil pump and oil pump pick-up. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
22. Install the rear crankshaft oil seal and flexplate. Refer to **SEAL, CRANKSHAFT OIL, REAR, INSTALLATION**.
23. Install the timing chain and sprockets, engine timing cover, oil pans, spark plugs and cylinder head covers. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.

Fig. 467: Lifting Sling, Engine Lifting Brackets & Engine Hoist

Courtesy of CHRYSLER GROUP, LLC

24. Install the engine. Refer to **INSTALLATION** .
25. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.
26. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
27. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
28. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.

DAMPER, VIBRATION

REMOVAL

REMOVAL

2739171

Fig. 468: Crankshaft Vibration Damper & Vibration Damper Holder
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

NOTE: A force greater than 350 N.m (260 ft. lbs.) may be required to remove the crankshaft vibration damper bolt.

2. Hold the crankshaft vibration damper (1) with Vibration Damper Holder (special tool #10198,

Holder, Vibration Damper) (2) and remove the crankshaft vibration damper bolt.

3. Pull the crankshaft vibration damper (1) off of the crankshaft.

INSTALLATION

INSTALLATION

2741078

Fig. 469: Front Crankshaft Seal Surface
Courtesy of CHRYSLER GROUP, LLC

1. Apply a light coating of engine oil to the front crankshaft seal surface (1).

2739215

Fig. 470: Crankshaft Vibration Damper & Bolt
Courtesy of CHRYSLER GROUP, LLC

2. Align the crankshaft vibration damper (1) to the flywheel key on the crankshaft and install the

damper. Seat the damper on the crankshaft sprocket.

3. Install and hand tighten the crankshaft vibration damper bolt (2).

Fig. 471: Crankshaft Vibration Damper & Vibration Damper Holder
Courtesy of CHRYSLER GROUP, LLC

4. Hold the crankshaft vibration damper (1) with Vibration Damper Holder (special tool #10198, Holder, Vibration Damper) (2) and tighten the crankshaft vibration damper bolt to 260 N.m + 105° (192 ft. lbs. + 105°).
5. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

FLEXPLATE

REMOVAL

REMOVAL

Fig. 472: Flexplate, Spacer Plate & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission.
2. Remove the bolts (1) and the spacer plate (2).
3. Remove the flexplate (3).

INSTALLATION

INSTALLATION

Fig. 473: Flexplate, Spacer Plate & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Position the flexplate (3) onto the crankshaft.
2. Install the spacer (2) and the bolts (1) hand tight.

3. Tighten the flexplate retaining bolts (1) to 95 N.m (70 ft. lbs.) in a criss-cross pattern.
4. Install the transmission.

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON RING FITTING

Fig. 474: Measuring Piston Ring End Gap
 Courtesy of CHRYSLER GROUP, LLC

1. Wipe the cylinder bore clean.
2. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder to a position 12 mm (0.50 in.) from the bottom of the cylinder bore.
3. Using a feeler gauge (1), check the ring end gap. Replace any rings not within specification.

Ring Position	Ring End Gap
No. 1 (top) Ring	0.25 - 0.40 mm (0.010 - 0.016 in.)
No. 2 (center) Ring	0.30 - 0.45 mm (0.012 - 0.018 in.)
Oil Control Ring (Steel Rail)	0.15 - 0.66 mm (0.006- 0.26 in.)

Fig. 475: Checking Piston Ring Grooves Clearances
Courtesy of CHRYSLER GROUP, LLC

4. Clean the piston ring grooves. Remove any nicks or burrs.
5. Measure the ring side clearance as shown in illustration. Make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.

Ring Position	Ring Side Clearance
No. 1 (top) Ring	0.025 - 0.033 mm (0.0010 - 0.0013 in.)
No. 2 (center) Ring	0.030 - 0.078 mm (0.0012 - 0.0031 in.)
Oil Control Ring (Steel Rails)	0.007 - 0.173 mm (.0003 - 0.0068 in.)

REMOVAL

REMOVAL

Fig. 476: Piston Ring Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. Remove the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, REMOVAL**.

CAUTION: To avoid damage to the piston rings, they must be removed in the following order:

- No. 1 (upper) piston ring (1)
- No. 2 (intermediate) piston ring (2)
- Oil ring upper side rail (3)
- Oil ring lower side rail (4)
- Oil ring expander (5)

Fig. 477: Removing/Installing Upper & Intermediate Rings
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

2. Remove the No. 1 (upper) piston ring using a ring expander tool.
3. Remove the No. 2 (intermediate) piston ring using a ring expander tool.

Fig. 478: Removing/Installing Piston Ring Side Rail
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to remove the oil ring side rails.

4. Remove the oil ring upper side rail.
5. Remove the oil ring lower side rail.
6. Remove the oil ring expander (1).

INSTALLATION

INSTALLATION

Fig. 479: Piston Ring Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

1. If required, fit new rings to the piston. Refer to **STANDARD PROCEDURE**.

CAUTION: To avoid damage to the piston rings, they must be installed in the following order:

- Oil ring expander (5)
- Oil ring lower side rail (4)
- Oil ring upper side rail (3)
- No. 2 (intermediate) piston ring (2)
- No. 1 (upper) piston ring (1)

80ae8450

Fig. 480: Removing/Installing Piston Ring Side Rail
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration. Do not use a piston ring expander to install the oil ring side rails.

2. Install the oil ring expander (1).
3. Install the oil ring lower side rail by placing one end between the piston ring groove and the oil ring expander. Hold this end firmly and press down the portion to be installed until the side rail is in position.
4. Install the oil ring upper side rail in the same manner as the lower side rail.

2791400

Fig. 481: Dot Marks On Piston Rings
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The No. 1 (upper) piston ring (1) and No. 2 (intermediate) piston ring (3) have a different cross section. Install the rings with manufacturers I.D.

mark (dot) (2) facing up, towards the top of the piston.

Fig. 482: Removing/Installing Upper & Intermediate Rings
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical piston shown in illustration.

5. Install the No. 2 (intermediate) piston ring using a ring expander tool.
6. Install the No. 1 (upper) piston ring using a ring expander tool.
7. Rotate the rings around the piston, the rings must rotate in the grooves with out binding.

Fig. 483: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

8. Position the piston ring end gaps as follows:
 - Oil ring expander gap (5)
 - Oil ring lower side rail end gap (4)
 - Oil ring upper side rail end gap (1)

- No. 2 (intermediate) ring end gap (5)
 - No. 1 (upper) ring end gap (2)
9. Install the piston and connecting rod(s). Refer to **ROD, PISTON AND CONNECTING, INSTALLATION** .

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

2824195

Fig. 484: Piston & Connecting Rod
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are a lightweight design with ultra low tension piston rings for improved fuel economy. The pistons are made of a high strength aluminum alloy and the piston skirt has a Moly® coating. The top piston ring land has an anodized coating for improved wear. The piston is connected to the rod using a full floating pin with two locking clips. The connecting rod is forged steel with a bolted cracked cap design. The connecting rod bolts are not reusable. Pistons are available in two different diameters with grade markings for each bore indicated on the side of the cylinder block. The upper compression ring is a 1.2 mm steel ring with a spray coating. The intermediate compression ring is 1.2 mm micro Napier design. Both compression rings have a dot or a mark on the piston ring. The

marked side of the ring must face the top of the piston. The 2 mm three piece oil control ring is very thin. These are chrome plated rings and have a stainless steel expander.

STANDARD PROCEDURE

PISTON FITTING

Fig. 485: Engine Block Cylinder Bore Diameter Grade Markings & Engine Block Main Bearing Journal Diameter Grade Markings
Courtesy of CHRYSLER GROUP, LLC

The pistons are "select fit" to achieve proper oil clearance. Engine block cylinder bore diameter grade markings (1) are stamped into the left side of the engine block. These marks are read from left to right, corresponding with cylinder number 1, 2, 3, 4, 5, 6.

Engine block cylinder bore diameter grade markings correspond to specific cylinder bore diameters. The chart below identifies the two engine block grade markings and their associated cylinder bore diameters.

Engine Block Marking	Cylinder Bore Size mm (in.)
1	95.995 \pm 0.005 mm (3.7793 \pm 0.0002 in.)
2	96.005 \pm 0.005 mm (3.7797 \pm 0.0002 in.)

2790134

Fig. 486: Piston Size Located On Piston Crown
 Courtesy of CHRYSLER GROUP, LLC

The piston is marked with the piston size (1 and 2) on the piston crown. The pistons are available in two different sizes in order to achieve the desired oil clearance. Select the piston size that corresponds to the engine block cylinder bore diameter grade markings for each cylinder.

Pistons are available in two sizes. The chart below identifies the two piston sizes.

Piston Marking	Size mm (in.)	
	Metal to Metal	Metal to Coating
1	95.995 ± 0.005 mm (3.7793 ± 0.0002 in.)	95.970 - 96.000 mm (3.7783 - 3.7795 in.)
2	95.965 ± 0.005 mm (3.7781 ± 0.0002 in.)	95.980 - 96.010 mm (3.7787 - 3.7835 in.)

808ac2ao

Fig. 487: Coating Material On Piston
 Courtesy of CHRYSLER GROUP, LLC

NOTE: **Typical coated piston shown in illustration.**

The coated pistons are serviced with the piston pin and connecting rod pre-assembled. The coating material (1 and 2) is applied to the piston after the final piston machining process. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

CONNECTING ROD SIDE CLEARANCE

DIAL INDICATOR

Fig. 488: Measuring Connecting Rod Side Clearance
Courtesy of CHRYSLER GROUP, LLC

1. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) to a stationary point on the engine. Locate the probe perpendicular to and resting against the connecting rod cap being checked.
2. Move the connecting rod all the way to the rear of its travel.
3. Zero the dial indicator.
4. Move the connecting rod forward to the limit of travel and read the dial indicator. Compare the measured side clearance to the specification. Refer to **SPECIFICATIONS**.
5. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

FEELER GAUGE

Fig. 489: Measuring Gap Between Connecting Rod & Crankshaft Journal Flange
 Courtesy of CHRYSLER GROUP, LLC

1. Slide a snug-fitting feeler gauge between the connecting rod and crankshaft journal flange. Compare the measured side clearance to the specification. Refer to **SPECIFICATIONS**.
2. Repeat this procedure for each connecting rod. Rotate the crankshaft for connecting rod accessibility.

REMOVAL

REMOVAL

Fig. 490: Main Bearing Cap Bolts From Windage Tray Removal Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pans, engine timing cover and cylinder heads. Refer to **CYLINDER HEAD, REMOVAL**.

3. Remove the engine oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL** .
4. Remove the eight main bearing cap bolts from the windage tray in the sequence shown in illustration and remove the windage tray (1).

811318c8

Fig. 491: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

5. If necessary, remove the top ridge of the cylinder bores with a reliable ridge reamer before removing the pistons from the engine block. **Be sure to keep the tops of pistons covered during this operation.** Pistons and connecting rods must be removed from the top of the engine block. When removing piston and connecting rod assemblies from the engine, rotate the crankshaft CW so that each connecting rod is centered in the cylinder bore.

CAUTION: DO NOT use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

6. Mark connecting rod and bearing cap positions (1) using a permanent ink marker or scribe tool.

2778313

Fig. 492: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

7. Remove the connecting rod cap bolts (5) and the connecting rod cap (4). Discard the cap bolts.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being removed.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

9. Remove the piston and connecting rod (1) from cylinder bore.
10. Repeat the previous steps for each piston being removed.
11. Immediately after piston and connecting rod removal, reinstall the bearing cap (4) on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
12. If required, remove the piston rings. Refer to **RING(S), PISTON, REMOVAL**.
13. Repeat the previous steps for each piston being removed.

CLEANING

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a Moly® coating, this coating must not be damaged.

CAUTION: Do not remove the piston pin from the piston and connecting rod assembly.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

INSPECTION

INSPECTION

2769568

Fig. 493: Connecting Rod Bearing Shells & Bearing Size
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the inserts (1) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes, or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Replace any bearing that shows abnormal wear. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.

811318c8

Fig. 494: Connecting Rod To Cylinder Identification
Courtesy of CHRYSLER GROUP, LLC

6. Inspect the connecting rod bearing bores for signs of scoring, nicks and burrs.

NOTE: Misaligned or bent connecting rods can cause abnormal wear on pistons, piston rings, cylinder walls, connecting rod bearings and crankshaft connecting rod journals. If wear patterns or damage to any of these components indicate the probability of a misaligned connecting rod, inspect it for correct rod alignment.

7. Replace misaligned, bent or twisted connecting rods.

NOTE: Connecting rods are serviced with the piston pre-assembled. The pistons are "select fit" to achieve proper oil clearance. Refer to **STANDARD PROCEDURE**.

80sac2ao

Fig. 495: Coating Material On Piston
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical coated piston shown in illustration.

8. Inspect the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.
9. Check the piston for taper and out of round shape.

NOTE: The coating material (1 and 2) is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY** . Refer to **INSPECTION**.

10. Compare the measured cylinder bore diameter to the engine block cylinder bore grade marking chart. Select the piston size that corresponds to the engine block markings for each cylinder to provide the proper oil clearance. Refer to **STANDARD PROCEDURE**.

NOTE: Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

NOTE: The coated pistons will be serviced with the piston pin and connecting rod pre-assembled.

INSTALLATION

INSTALLATION

RR09B48

Fig. 496: Piston Ring End Gap Position
 Courtesy of CHRYSLER GROUP, LLC

1. If required, select and fit new piston and connecting rod assemblies to the engine block. Refer to **STANDARD PROCEDURE**.
2. If required, select and fit new bearings to the connecting rod. Refer to **BEARING(S), CONNECTING ROD, STANDARD PROCEDURE**.
3. If required, hone the cylinder bores. Refer to **ENGINE BLOCK, STANDARD PROCEDURE**.
4. If removed, install the piston rings. Refer to **RING(S), PISTON, INSTALLATION**.
5. Position the piston ring end gaps as follows:
 - Oil ring expander gap (5)
 - Oil ring lower side rail end gap (4)
 - Oil ring upper side rail end gap (1)
 - No. 2 (intermediate) ring end gap (5)
 - No. 1 (upper) ring end gap (2)

2778313

Fig. 497: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

NOTE: Ensure the position of the ring end gaps does not change when installing the ring compressor.

6. Lubricate the piston rings with clean engine oil. Position Piston Compressor (special tool #C-385, Compressor, Piston) (2) over the piston and rings. Tighten the compressor (2).

NOTE: Install the rod bearings in pairs. Do not mix sizes or use a new bearing half with an old bearing half.

7. Install the bearing shell (8) on the connecting rod with the tang inserted into the machined groove in the rod. Lubricate the bearing surface with clean engine oil.
8. Remove the plastic guide plates (3) from the Guide Pins (special tool #8189, Guide Pins) (7) and install the Guide Pins to the connecting rod being installed.

Fig. 498: Piston Installation Position
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right cylinder bank shown in illustration, left cylinder bank similar.

9. The pistons crowns are stamped with a mark (1) indicating installation position. This mark must be positioned toward the front of engine on both cylinder banks.
10. Wipe the cylinder bore clean and lubricate with clean engine oil.
11. Rotate the crankshaft until the connecting rod journal is on the center of cylinder bore.

CAUTION: Avoid contact with the piston oil cooler jet(s). Positioning of the oil cooler jet(s) is critical for proper engine operation.

12. Insert the piston and connecting rod into the cylinder bore and carefully position the guide pins over the crankshaft journal.
13. Tap the piston down in the cylinder bore using a hammer handle while guiding the connecting rod into position over the rod journal.

Fig. 499: Piston, Connecting Rod Cap, Bolts, Plastic Guide Plates & Guide Pins
Courtesy of CHRYSLER GROUP, LLC

NOTE: Typical V6 engine configuration shown in illustration.

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

14. Install the bearing shell (6) on the connecting rod cap (4) with the tang inserted into the machined groove in the cap. Lubricate the bearing surface with clean engine oil.

NOTE: Do not lubricate the threads of the connecting rod cap bolts (5).

15. Install the connecting rod cap and bearing with the tang on the same side as the rod. Tighten the **NEW** connecting rod cap bolts (5) to 20 N.m (15 ft. lbs.) plus 90°.
16. If required, check the connecting rod side clearance. Refer to **STANDARD PROCEDURE**.
17. Repeat the previous steps for each piston being installed.

Fig. 500: Checking Cylinder Head Bolts For Stretching (Necking)
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The main bearing cap bolts are tightened using a torque plus angle procedure. The bolts must be examined **BEFORE** reuse. If the threads are necked down the bolts must be replaced.

18. Check the main bearing cap bolts for necking by holding a scale or straight edge against the threads. If all the threads do not contact the scale (2) the bolt must be replaced.

Fig. 501: Windage Tray With Main Bearing Cap Bolts Installation Sequence
 Courtesy of CHRYSLER GROUP, LLC

19. Install the windage tray with eight main bearing cap bolts. Tighten the bolts in the sequence shown in illustration to 21 N.m (16 ft. lbs.) plus 90°.
20. Install the engine oil pump and oil pump pick-up. Refer to **PUMP, ENGINE OIL, INSTALLATION**.
21. Install the cylinder heads, engine timing cover and oil pans. Refer to **CYLINDER HEAD, INSTALLATION**.
22. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.

23. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
24. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
25. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

SEAL, CRANKSHAFT OIL, FRONT

REMOVAL

REMOVAL

Fig. 502: Sleeve & Flywheel Key
Courtesy of CHRYSLER GROUP, LLC

1. Remove the accessory drive belt and the crankshaft vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL** .
2. Install the sleeve (2) from Seal Remover (special tool #8511, Remover, Seal) around the flywheel key (1) and onto the nose of the crankshaft.

Fig. 503: Seal Remover & Front Crankshaft Oil Seal
Courtesy of CHRYSLER GROUP, LLC

3. Screw Seal Remover (special tool #8511, Remover, Seal) (1) into the front crankshaft oil seal (2).

Fig. 504: Extractor Screw, Seal Remover & Front Crankshaft Oil Seal
Courtesy of CHRYSLER GROUP, LLC

4. Install the extractor screw (2) into the Seal Remover (special tool #8511, Remover, Seal) (1). Hold the seal remover stationary and tighten the extractor screw against the sleeve until the front crankshaft oil seal (3) is removed from the engine timing cover.

INSTALLATION

INSTALLATION

Fig. 505: Front Crankshaft Seal Installer & Oil Seal
Courtesy of CHRYSLER GROUP, LLC

1. Position the front crankshaft oil seal (3) into place on the engine timing cover.
2. Align the Front Crankshaft Seal Installer (special tool #10199, Installer, Crankshaft Front Oil Seal) (1) to the flywheel key on the crankshaft and against the front crankshaft oil seal (3).

CAUTION: Only tighten the crankshaft vibration damper bolt until the oil seal is seated in the cover. Overtightening of the bolt can crack the front timing cover.

3. Install and tighten the crankshaft vibration damper bolt (2) until the Crankshaft oil seal is seated in the engine timing cover.
4. Install the crankshaft vibration damper and accessory drive belt. Refer to **DAMPER, VIBRATION, INSTALLATION** .

SEAL, CRANKSHAFT OIL, REAR

REMOVAL

REMOVAL

2711679

Fig. 506: Seal Retainer & Attaching Screws
Courtesy of CHRYSLER GROUP, LLC

The rear crankshaft oil seal is incorporated into the seal retainer (2) and can not be removed from the retainer. The rear crankshaft oil seal and seal retainer (2) are serviced as an assembly.

1. Remove the transmission. Refer to **REMOVAL** .
2. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL** .
3. Remove the upper oil pan. Refer to **PAN, OIL, REMOVAL** .
4. Remove the eight seal retainer attaching screws (1).
5. Remove and discard the seal retainer (2).

INSTALLATION

INSTALLATION

2754463

Fig. 507: Rear Crankshaft Oil Seal, Retainer & Seal Protector
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rear crankshaft oil seal (2) and retainer (1) are an assembly. To avoid damage to the seal lip, DO NOT remove the seal protector (3) from the rear crankshaft oil seal before installation onto the engine.

CAUTION: Whenever the crankshaft is replaced, the rear crankshaft oil seal must also be replaced. Failure to do so may result in engine fluid leakage.

Fig. 508: Oil Seal Retainer Assembly & Seal Protector
Courtesy of CHRYSLER GROUP, LLC

1. Inspect the crankshaft to make sure there are no nicks or burrs on the seal surface.
2. Clean the engine block sealing surfaces thoroughly.

NOTE: It is not necessary to lubricate the seal or the crankshaft when installing the seal retainer. Residual oil following installation can be mistaken for seal leakage.

3. Carefully position the oil seal retainer assembly (2), and seal protector (1) on the crankshaft and push firmly into place on the engine block (during this step, the seal protector will be pushed from the rear oil seal assembly as a result of installing the rear oil seal).

Fig. 509: Rear Seal Installed
Courtesy of CHRYSLER GROUP, LLC

4. Verify that the seal lip (2) on the retainer is uniformly curled inward toward the engine on the crankshaft (1).

Fig. 510: Seal Retainer & Attaching Screws
Courtesy of CHRYSLER GROUP, LLC

5. Install the eight seal retainer bolts (1) and tighten to 12 N.m (106 in. lbs.).

NOTE: Make sure that the seal retainer flange is flush with the engine block oil pan sealing surface.

6. Install the upper oil pan. Refer to **PAN, OIL, INSTALLATION** .

7. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION** .
8. Install the transmission. Refer to **INSTALLATION** .
9. Fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.

3. Install the crossmember (1) with four bolts (3) tightened to 65 N.m (48 ft. lbs.).
4. Lower the transmission so the weight is resting on the isolator.
5. Install two bolts (2) to the rear engine mount isolator and tighten to 65 N.m (48 ft. lbs.).
6. Lower the vehicle.

LUBRICATION

DESCRIPTION

DESCRIPTION

2825865

Fig. 547: 3.6L Engine
Courtesy of CHRYSLER GROUP, LLC

The lubrication system is a full flow filtration, pressure feed type lubrication system. The oil pump is mounted to the bottom of the cylinder block and chain driven by the crankshaft sprocket. The oil pump pick-up tube is attached to the oil pump and supported at the windage tray. There are three oil gallery plugs installed in the engine block. A system oil pressure sensor allows oil pressure to be monitored with a diagnostic scan tool. The oil pressure and oil temperature sensors are located on the oil filter housing assembly which is mounted to the top of the engine block between the cylinder heads. The oil cooler is mounted to the oil filter housing. There is a pressure relief valve in the oil pump that is only activated on a cold start or for emergency relief since the oil pump output is self-regulating. There are three piston oil cooler jets mounted to the engine block. Each jet cools two pistons.

OPERATION

OPERATION

Fig. 548: Engine Lubrication Flow
Courtesy of CHRYSLER GROUP, LLC

The oil from the oil pan is pumped by a vane type oil pump mounted to the bottom of the cylinder block that is chain driven by the crankshaft sprocket. The oil from the pump travels to the oil filter element and then to the oil cooler assembly. After the oil has been filtered and cooled, the oil enters the main oil gallery. The pressurized oil travels through the main gallery to the four main journals to lubricate the crankshaft main bearings. The pressurized oil travels through the crankshaft main journals to cross-drilling supplying oil to the connecting rod journals. From the number one main bearing gallery, oil travels to the right secondary chain tensioner and to the primary chain idler shaft. The main oil gallery also supplies oil to three sets of piston oil cooling jets. From the cylinder block the oil flows through drillings into the left and right cylinder heads. Left cylinder head oil is supplied to the left secondary timing chain tensioner, camshaft journals and hydraulic lash adjusters. Right cylinder head oil is supplied to the right camshaft journals and hydraulic lash adjusters. The camshaft valve lobes and rocker arms are lubricated through a small hole in the rocker arm; oil flows through the lash adjuster then through the rocker arm and onto the camshaft lobe. Oil also flows through each of the four forward camshaft bearings into the camshafts and phasers.

Right Cylinder Head	1. Hydraulic Lash Adjusters 2. Camshaft Journals 3. Phaser Oil Control Valves
Hydraulic Lash Adjusters	1. Rocker Arms 2. Cam Lobes

DIAGNOSIS AND TESTING

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or de-grease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of the oil leak. If the oil leak is found and identified, repair per service manual instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat the inspection.

If the oil leak source is not positively identified at this time, proceed with the **AIR LEAK DETECTION TEST METHOD**.

AIR LEAK DETECTION TEST METHOD

1. Disconnect the make-up air hose from the cylinder head cover. Cap or plug the make-up air hose nipple.
2. Remove the PCV hose from the PCV valve. Cap or plug the PCV valve nipple.
3. Attach an air hose with a pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

4. Gradually increase air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected leak source. Adjust the regulator to a suitable test pressure within this range that provides the best bubble generation which will pinpoint the leak source. If the oil leak is detected and identified, repair per Service Information procedures.
5. If the leakage occurs at the rear oil seal area, follow the procedures for rear seal area leaks. Refer to **REAR SEAL AREA LEAKS**.
6. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve and make-up air hoses.
7. Clean the oil off of the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

CHECKING ENGINE OIL PRESSURE

2710795

Fig. 549: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the oil pressure sensor (2) from the oil filter housing (3). Refer to **SENSOR, OIL PRESSURE, REMOVAL**.

Fig. 550: Pressure Gauge Installed To Oil Pressure Port
Courtesy of CHRYSLER GROUP, LLC

3. Install Pressure Gauge (special tool #C-3292A, Gauge, Pressure) (1) to the oil pressure port. Tighten to 20 N.m (177 in. lbs.).
4. Install the upper and lower intake manifolds and air inlet hose. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
5. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
6. Start and idle the engine. If oil pressure is 0 at idle, shut off the engine and consult the Engine Lubrication and Diagnostic Table. Refer to **ENGINE LUBRICATION DIAGNOSTIC TABLE**.
7. Run the engine until it reaches normal operating temperature.
8. Verify that the engine has acceptable oil pressure. Refer to **SPECIFICATIONS**.

REAR SEAL AREA LEAKS

Fig. 551: Side Engine-To-Transmission Bolt, Transmission Dust Shield Retaining Bolt & Dust Shield

Courtesy of CHRYSLER GROUP, LLC

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
3. Remove the bolt (2) and the torque converter dust shield (3).

Fig. 552: Rubber Plugs

Courtesy of CHRYSLER GROUP, LLC

4. Remove two rubber plugs (1) covering the rear oil seal retainer flange bolts.
5. Inspect the flexplate and rear of the block for evidence of oil. Use a black light to check for the oil leak:
 - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - b. Where leakage tends to run straight down, possible causes are a porous block, rear oil seal retainer, oil galley pipe plug and rear seal retainer to oil pan mating surfaces.
6. If no leaks are detected, use the Air Leak Detection Method as outlined in Engine Oil Leak. Refer to **AIR LEAK DETECTION TEST METHOD**.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

7. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is

detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

8. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled. Refer to **SEAL, CRANKSHAFT OIL, REAR, REMOVAL**.

COOLER, OIL

DESCRIPTION

DESCRIPTION

2826514

Fig. 553: Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil cooler is attached to the top of the oil filter housing which is located in the V of the cylinder block. The oil cooler is a plate style coolant-to-oil heat exchanger.

OPERATION

OPERATION

2826564

Fig. 554: Oil Flow & Coolant Flow Locations
Courtesy of CHRYSLER GROUP, LLC

Oil flows from the engine oil pump to the oil filter housing inlet (1) and to the oil filter element located within the oil filter housing. After the oil is filtered it travels internally through the engine oil cooler and then to the main oil gallery (5).

Coolant flows from the right cylinder block water jacket (3) and from the left cylinder block water jacket (4) into the housing. The coolant flows through the oil cooler and exits the housing from the rear hose nipple (6) where it is returned to the water pump. A coolant by-pass in the housing is designed to direct excessive coolant flow around the oil cooler for continuous circulation.

REMOVAL

REMOVAL

2707169

Fig. 555: Oil Cooler & Screws
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The oil cooler can not be cleaned out. In the event that the engine requires rebuilding or replacement, replace the oil cooler.

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
4. Remove the air cleaner housing assembly, upper and lower intake manifolds. Refer to **MANIFOLD, INTAKE, REMOVAL** .
5. Remove four bolts (2) and two screws (1) and (3).
6. Remove the oil cooler (4).

2710718

NOTE: Always use new dry seals (1) when installing the oil cooler. Do not lubricate the seals.

1. Install the new oil cooler seals (1) onto the oil filter housing (2).

2707169

Fig. 558: Oil Cooler & Screws
Courtesy of CHRYSLER GROUP, LLC

2. Position the oil cooler (4) on the oil filter housing.
3. Install two screws (1) and (3). Tighten the screws to 4 N.m (35 in. lbs.).
4. Install four bolts (2) and tighten to 12 N.m (106 in. lbs.).
5. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
6. Fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE** .
7. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
8. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
9. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

FILTER, ENGINE OIL

REMOVAL

REMOVAL

Fig. 559: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

All engines are equipped with a high quality full-flow, disposable type oil filter. Chrysler Corporation recommends a Mopar® or equivalent oil filter be used.

CAUTION: When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.

1. Place an oil absorbent cloth around the oil filter housing at the base of the oil filter cap.

NOTE: The oil filter (3) is attached to the oil filter cap (2).

2. Rotate the oil filter cap (1) counterclockwise and remove the cap (1) and filter (3) from the oil filter housing.

2725399

Fig. 560: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil filter (3) from the oil filter cap (2).
4. Remove and discard the O-ring seal (1).

INSTALLATION

INSTALLATION

2725399

Fig. 561: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

1. Lightly lubricate the new O-ring seal (1) with clean engine oil.

2. Install the O-ring seal (1) on the filter cap (2).
3. Install the new oil filter (3) into the oil filter cap (2).

Fig. 562: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

4. Thread the oil filter cap (1) into the oil filter housing and tighten to 25 N.m (18 ft. lbs.).
5. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks. Refer to **STANDARD PROCEDURE**.

HOUSING, OIL FILTER

DESCRIPTION

DESCRIPTION

2826514

Fig. 563: Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil filter housing is located in the V of the cylinder block. The oil filter element is located within the housing and the engine oil cooler is attached to the top of the housing. Both the oil pressure and oil temperature sensors are located at the rear of the housing.

OPERATION

OPERATION

2826564

Fig. 564: Oil Flow & Coolant Flow Locations
Courtesy of CHRYSLER GROUP, LLC

Oil flows from the engine oil pump to the oil filter housing inlet (1) and to the oil filter element located within the oil filter housing. After the oil is filtered and then cooled it travels to the main oil gallery (5). An oil filter by-pass is built into the housing and is not serviceable. Removing the oil filter cap from the housing allows oil to drain from the oil filter cavity into to the crankcase (2).

Coolant flows from the right cylinder block water jacket (3) and from the left cylinder block water jacket (4) into the housing. The coolant flows through the oil cooler and exits the housing from the rear hose nipple (6) where it is returned to the water pump. A coolant by-pass in the housing is designed to direct excessive coolant flow around the oil cooler for continuous circulation.

REMOVAL

REMOVAL

2707704

Fig. 565: Oil Temperature Sensor Electrical Connector, Oil Pressure Sensor Electrical Connector, Oil Filter Housing, Heater Hose & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
4. Remove the air cleaner housing assembly, upper and lower intake manifolds. Refer to **MANIFOLD, INTAKE, REMOVAL** .
5. Disconnect the oil temperature sensor electrical connector (5).
6. Disconnect the oil pressure sensor electrical connector (4).
7. Remove five bolts (2) and remove the oil filter housing (1).
8. Lift the oil filter housing (1) and remove the heater hose (3).

2707844

4. If removed, position the oil cooler (4) on the oil filter housing.

2707844

Fig. 573: Oil Filter Housing Seals & O-Ring Seal
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Always use new dry seals (2) when installing the oil filter housing. Lubricate the O-ring seal with clean engine oil prior to installation.

5. Install new oil filter housing seals (2) onto the oil filter housing.

2710852

Fig. 574: Heater Hose, Electrical Connectors, Oil Filter Housing & Bolt Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

6. Install the heater hose (2) to the oil filter housing (1).
7. Position the oil filter housing (1) on the engine block.
8. Install five bolts and tighten in the sequence shown in illustration to 12 N.m (106 in. lbs.).

9. Connect the oil pressure sensor electrical connector (3).
10. Connect the oil temperature sensor electrical connector (4).
11. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
12. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.
13. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
14. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
15. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

JET, PISTON OIL COOLER

DESCRIPTION

DESCRIPTION

2867027

Fig. 575: Engine Blocked-Mounted Oil Jets
Courtesy of CHRYSLER GROUP, LLC

The 3.6 liter engine has three engine blocked-mounted oil jets (1) installed to cool the underside of each piston. The oil jets are fed by the main oil gallery, and spray upward on the bottom of the pistons and cylinder walls. Each set of jets has a check valve which closes below 2.5 bar (35 psi) to maintain ample oil pressure at idle. All three sets of oil jets are identical and seal to the engine block using an

o-ring and fastener.

REMOVAL

REMOVAL

Fig. 576: Piston Oil Cooler Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Piston oil cooler jet for cylinders one/two shown in illustration. Piston oil cooler jets for cylinders three/four and five/six are similar.

1. Remove the crankshaft. Refer to **CRANKSHAFT, REMOVAL** .
2. Remove the bolt (1) and the piston oil cooler jet(s) (2) from the engine block.

Fig. 577: Piston Oil Cooler Jet O-Ring Seal

Courtesy of CHRYSLER GROUP, LLC

3. Remove and discard the O-ring seal (1) from the piston oil cooler jet(s).

INSTALLATION

INSTALLATION

2793527

Fig. 578: Piston Oil Cooler Jet O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate a new O-ring seal (1) with engine oil and install on the piston oil cooler jet(s).

2793540

Fig. 579: Piston Oil Cooler Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Piston oil cooler jet for cylinders one/two shown in illustration. Piston oil cooler jets for cylinders three/four and five/six are similar.

2. Install the piston oil cooler jet(s) (2) into the engine block and tighten the retaining bolt (1) to 6 N.m (53 in. lbs.).
3. Install the crankshaft. Refer to **CRANKSHAFT, INSTALLATION** .
4. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.
5. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
6. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
7. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL AND FILTER CHANGE

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

Change the engine oil and filter at mileage and time intervals described in the Maintenance Schedule. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

Fig. 580: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shows engine cover removed for clarity.

CAUTION: When performing an engine oil change, the oil filter cap must be removed. Removing the oil filter cap releases oil held within the oil filter cavity and allows it to drain into the sump. Failure to remove the cap prior to reinstallation of the drain plug will not allow complete draining of the used engine oil.

1. Run the engine until achieving normal operating temperature.
2. Position the vehicle on a level surface and turn the engine off.
3. Place an oil absorbent cloth around the oil filter housing at the base of the oil filter cap.

NOTE: The oil filter (3) is attached to the oil filter cap (2).

4. Rotate the oil filter cap (1) counterclockwise and remove the cap (1) and filter (3) from the oil filter housing.

Fig. 581: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

5. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
6. Remove the belly pan retainers (1) and remove the belly pan.

Fig. 582: Oil Pan Drain Plug
 Courtesy of CHRYSLER GROUP, LLC

7. Place a suitable drain pan under the crankcase drain plug (1).
8. Remove the drain plug (1) from oil pan and allow the oil to drain into the pan. Inspect the drain plug threads for stretching or other damage. Replace the drain plug and gasket if damaged.
9. Install the drain plug (1) in the oil pan and tighten to 27 N.m (20 ft. lbs.).

Fig. 583: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

10. Position the belly pan and install the retainers (1).

2725399

Fig. 584: O-Ring Seal, Oil Filter Cap & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

11. Lower the vehicle.
12. Remove the oil filter (3) from the oil filter cap (2).
13. Remove and discard the O-ring seal (1).

NOTE: It is not necessary to pre-oil the oil filter or fill the oil filter housing.

14. Lightly lubricate the new O-ring seal (1) with clean engine oil.
15. Install the O-ring seal (1) on the filter cap (2).
16. Install the new oil filter (3) into the oil filter cap (2).

2725425

Fig. 585: Oil Filter Cap, O-Ring Seal & Oil Filter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shows engine cover removed for clarity.

17. Thread the oil filter cap (1) into the oil filter housing and tighten to 25 N.m (18 ft. lbs.).

Fig. 586: Oil Fill Cap & Oil Level Gauge
Courtesy of CHRYSLER GROUP, LLC

18. Remove the oil fill cap (2). Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**.
19. Install the oil fill cap (2).
20. Start the engine and inspect for leaks.
21. Stop the engine and check the oil level (1).

Fig. 587: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

22. Install the engine cover (1), if removed.

OIL FILTER SPECIFICATION

All engines are equipped with a high quality full-flow, disposable type oil filter. When replacing oil filter, use a Mopar® filter or equivalent.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing of used engine oil after it has been drained from a vehicle engine. Refer to the WARNING listed above.

PAN, OIL

DESCRIPTION

DESCRIPTION

3515588

Fig. 588: Upper & Lower Oil Pan
Courtesy of CHRYSLER GROUP, LLC

There is an upper and lower oil pan. The upper oil pan is cast aluminum and also serves as the lower end structural support. The lower pan is a stamped steel design. Both upper and lower oil pans are sealed using Mopar® Threebond Engine RTV Sealant. The lower oil pan must be removed in order to access all of the upper oil pan attaching bolts.

2830423

Fig. 589: Windage Tray
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not attempt to support the weight of the engine on the windage tray. The windage tray is a thin cast aluminum construction and can be easily damaged.

The high pressure die cast aluminum windage tray is mounted to the main bearing caps and is designed to keep oil off of the connecting rods as the crankshaft rotates. When the oil is kept off the connecting rods, the engine rotates easier and oil foaming decreases. Like the oil pan, the windage tray is designed to stiffen the lower end of the engine. The tray is directional and the main bearing cap bolts hold it in place.

REMOVAL

LOWER

Fig. 590: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE**.
2. Remove the belly pan retainers (1) and remove the belly pan.
3. Drain the engine oil. Refer to **STANDARD PROCEDURE**.

Fig. 591: Bolts, Studs, Nuts & Lower Oil Pan
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The lower oil pan must be removed to access all of the upper oil pan retaining bolts.

4. Remove twelve bolts (4), two studs (2) and two nuts (3) from the flange of the lower oil pan (1).

3515868

Fig. 592: Using Pry Bar To Remove Oil Pan
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not pry on the lower oil pan flange. There are no designated pry points for lower oil pan removal. Prying on only one or a few locations could bend the flange and damage the pan.

5. Using a pry bar (1), apply side force to the lower oil pan (2) in order to sever the sealant bond and remove the pan.
6. Remove all residual sealant from the upper and lower oil pans. Refer to **PAN, OIL, CLEANING**.

UPPER

3071685

20. Remove the two rubber plugs (1) covering the rear oil seal retainer flange bolts.

Fig. 604: Rear Oil Seal Retainer Flange Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: shown in illustration with transmission removed for clarity.

CAUTION: There are two hidden M6 bolts that must be removed from the rear of the upper oil pan flange. If these bolts are not removed, the rear oil seal retainer flange will be severely damaged.

21. Remove two M6 bolts (1) from the rear oil seal retainer flange.

Fig. 605: Oil Pan Mounting Bolts (M8)
 Courtesy of CHRYSLER GROUP, LLC

22. Remove nineteen M8 oil pan mounting bolts (1).

Fig. 606: Locating Pry Points To Remove Oil Pan
Courtesy of CHRYSLER GROUP, LLC

23. Using the four pry points indicated in illustration, carefully remove the upper oil pan.
24. Remove all residual sealant from the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces. Refer to **PAN, OIL, CLEANING**.

CLEANING

CLEANING

CAUTION: Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces thoroughly with isopropyl alcohol in preparation for sealant application. All surfaces that seal with RTV must be oil and contamination free to ensure proper adhesion of the RTV to the mating surface to prevent leaks.

3515756

Fig. 607: Locating Sealant On Upper Oil Pan
 Courtesy of CHRYSLER GROUP, LLC

3515720

Fig. 608: Locating Sealant On Lower Oil Pan
 Courtesy of CHRYSLER GROUP, LLC

1. Clean the oil pan in solvent and wipe dry with a clean cloth.

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl

(rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

2. Remove all residual sealant (1) from the upper and lower oil pans. Refer to **CLEANING**.

INSTALLATION

LOWER

3515720

Fig. 609: Locating Sealant On Lower Oil Pan
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

1. Clean the upper and lower oil pan mating surfaces with isopropyl alcohol in preparation for sealant application.
2. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant (1) to the lower oil pan as shown in illustration.

Fig. 610: Bolts, Studs, Nuts & Lower Oil Pan
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Following assembly, the Mopar® Threebond Engine RTV Sealant must be allowed to dry for 45 minutes prior to adding oil and engine operation. Premature exposure to oil prior to drying may result in engine fluid leakage.

3. Install two studs (2) into the upper oil pan flange.
4. Install the lower oil pan (1) to the upper oil pan with twelve bolts (4) and two nuts (3) tightened to 11 N.m (8 ft. lbs.).

Fig. 611: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

5. Position the belly pan and install the retainers (1).

6. Lower the vehicle.
7. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS**.
8. Start and run the engine until it reaches normal operating temperature and check for leaks.

UPPER

3515756

Fig. 612: Locating Sealant On Upper Oil Pan
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces thoroughly with isopropyl alcohol in preparation for sealant application. All surfaces that seal with RTV must be oil and contamination free to ensure proper adhesion of the RTV to the mating surface to prevent leaks.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in

engine fluid leakage.

1. Clean the upper and lower oil pans, timing chain cover, rear seal retainer and engine block mating surfaces with isopropyl alcohol in preparation for sealant application.
2. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the upper oil pan as shown in illustration in the following locations:
 - Oil pan to engine block flange (1)
 - Two timing cover to engine block T-joints (2)
 - Two rear seal retainer to engine block T-joints (3)

Fig. 613: Oil Pan Mounting Bolts (M8)
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Make sure that the rear face of the oil pan is flush to the transmission bell housing before tightening any of the oil pan mounting bolts. A gap between the oil pan and the transmission could crack the oil pan or transmission casting.

3. Install the oil pan to the engine block making sure the oil pan is flush to the transmission bell housing. Secure the oil pan to the engine block with nineteen M8 oil pan mounting bolts (1) finger tight.

Fig. 614: Transmission-To-Engine Oil Pan Bolts
 Courtesy of CHRYSLER GROUP, LLC

4. Install the four transmission to the engine oil pan bolts (1) and tighten to 55 N.m (41 ft. lbs.).

Fig. 615: Oil Pan Mounting Bolts (M8)

1. Lubricate the new O-ring seal (1) with clean engine oil and install the O-ring onto the oil pump pick-up tube.

3690202

Fig. 631: Oil Pump Pick-Up Tube & Support Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

2. Position the oil pump pick-up tube (1) onto the oil pump and install the retaining bolt (2) finger

tight.

3. Install the oil pump pick-up tube support bracket retaining bolt (3) and tighten to 12 N.m (9 ft. lbs.).
4. Tighten the oil pump pick-up tube retaining bolt (2) to 12 N.m (9 ft. lbs.).
5. Install the oil pan. Refer to **PAN, OIL, INSTALLATION** .
6. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.

Fig. 632: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

7. Connect the negative battery cable (1) and tighten nut to 5 N.m (45 in. lbs.).
8. Run the engine until it reaches normal operating temperature and check for leaks.

PUMP, ENGINE OIL

DESCRIPTION

DESCRIPTION

2831052

Fig. 633: Oil Pump Chain
Courtesy of CHRYSLER GROUP, LLC

The vane type engine oil pump is mounted to the underside of the cylinder block and is driven by the oil pump chain off the crankshaft at a 1:1 drive ratio. This pump location improves efficiency compared to an on-crankshaft location. The pump is driven with a silent chain which is tensioned using a spring loaded tensioner. The pump is not timed to the engine.

An internal mechanical ball and spring type relief valve prevents excess pressure in the engine by dumping oil into the sump and provides emergency protection at conditions such as a cold start with high engine speed.

The pump has a moving slide mechanism for variable displacement capability and an on-off solenoid for two-stage pressure regulation. The pump and the solenoid are not to be disassembled. Both are non-serviceable components and are to be replaced as a complete assembly.

OPERATION

OPERATION

2832737

Fig. 634: Moving Element, On/Off Solenoid & Relief Valve
Courtesy of CHRYSLER GROUP, LLC

The engine oil pump features seven vanes and a moving element (1) that continuously adjusts to maintain a regulated oil pressure supply by varying the displacement of the pump. The pump has two regulated pressure stages of operation controlled by an on/off solenoid (2). Low pressure mode regulation (solenoid on) is approximately 200 kPa (29 psi) and high pressure mode regulation (solenoid off) is approximately 450 kPa (65 psi). The Powertrain Control Module (PCM) switches the pump between stages based on engine operating conditions, oil and coolant temperatures, speed and load. Under most typical conditions, the pump will run in low mode from idle up to around 3000 RPM, and switch from low to high mode between 3000 and 4000 RPM.

The maximum oil pressure in the engine is limited to 1000 kPa (145 psi) by the relief valve (3). Pressure in the main oil gallery of the engine can be monitored with diagnostic equipment through the oil pressure sensor mounted on the rear of the oil filter module. The minimum pressure for the engine is 41 kPa (6 psi) at any operating condition. Anything under this pressure could result in damage to critical moving parts.

2832771

Fig. 635: Moving Element, Main Gallery Oil Pressure, Spring Pressure & Pump Driveshaft
Courtesy of CHRYSLER GROUP, LLC

In high pressure mode regulation (solenoid off) main gallery oil pressure (2) is applied to the moving element (1). The main gallery oil pressure works against spring pressure (3) to move the element to a more concentric location about the pump driveshaft (4) thus reducing displacement and pump output.

2832798

Fig. 636: Chamber & Spring
Courtesy of CHRYSLER GROUP, LLC

In low pressure mode regulation (solenoid on) the energized solenoid opens an additional chamber (1) to main gallery oil pressure increasing the force on the spring (2) to further reduce displacement and output pressure.

REMOVAL

REMOVAL

Fig. 637: Oil Pump Pick-Up Tube & Support Bracket Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the upper oil pan. Refer to **PAN, OIL, REMOVAL** .
3. Remove the oil pump pick-up (1). Refer to **PICK-UP, OIL PUMP, REMOVAL**.

Fig. 638: Oil Pump Solenoid Electrical Connector
 Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the engine wire harness from the oil pump solenoid electrical connector (1).

Fig. 639: Oil Pump Solenoid Electrical Connector Retention Lock Tab
 Courtesy of CHRYSLER GROUP, LLC

5. Depress the connector retention lock tab (1) to disengage the oil pump solenoid electrical connector from the engine block.

Fig. 640: Timing Gear Splash Shield & Bolts
 Courtesy of CHRYSLER GROUP, LLC

6. Remove bolts (2) and the timing gear splash shield (1).

Fig. 641: Oil Pump Solenoid Electrical Connector & Primary Chain Tensioner Mounting Bolt

Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shows the engine timing cover removed for clarity.

7. Push the oil pump solenoid electrical connector into the engine block, rotate the connector slightly CW, push it past the primary chain tensioner mounting bolt (1) and into the engine.

Fig. 642: Oil Pump Chain Tensioner & Retaining Pin

Courtesy of CHRYSLER GROUP, LLC

8. Push back the oil pump chain tensioner (2) and insert a suitable retaining pin (1) such as a 3 mm Allen wrench.

Fig. 643: Retaining Pin, Retaining Bolt, Oil Pump Chain & Sprocket
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

9. Mark the direction of rotation on the oil pump chain (3) and sprocket (4) using a paint pen or equivalent to aid in reassembly.

NOTE: There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.

10. Remove the oil pump sprocket T45 retaining bolt (2) and remove the oil pump sprocket (4).

Fig. 644: Retaining Pin, Oil Pump Chain Tensioner Spring & Dowel Pin
Courtesy of CHRYSLER GROUP, LLC

11. Remove the retaining pin (3) and disengage the oil pump chain tensioner spring (1) from the dowel pin (2).
12. Remove the oil pump chain tensioner from the oil pump.

Fig. 645: Oil Pump, Locator Pins & Bolts
Courtesy of CHRYSLER GROUP, LLC

13. Remove the four oil pump bolts (1) and remove the oil pump (3).

INSPECTION

INSPECTION

2833271

Fig. 646: Solenoid Wires, Connector Retention Lock Tab & O-Ring Seal
Courtesy of CHRYSLER GROUP, LLC

NOTE: The 3.6L Oil pump is released as an assembly. The assembly includes both the pump and the solenoid. There are no serviceable sub-assembly components. In the event the oil pump or solenoid are not functioning or out of specification they must be replaced as an assembly.

1. Inspect the solenoid wires (1) for cuts or chaffing.
2. Inspect the condition of the connector O-ring seal (3).
3. Inspect the connector retention lock tab (2) for fatigue or damage.

INSTALLATION

INSTALLATION

Fig. 647: Oil Pump, Locator Pins & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Align the locator pins (2) to the engine block and install the oil pump (3) with four bolts (1). Tighten the bolts to 12 N.m (106 in. lbs.).

Fig. 648: Retaining Pin, Oil Pump Chain Tensioner Spring & Dowel Pin
 Courtesy of CHRYSLER GROUP, LLC

2. Install the oil pump chain tensioner on the oil pump.
3. Position the oil pump chain tensioner spring (1) above the dowel pin (2).
4. Push back the oil pump chain tensioner and insert a suitable retaining pin (3) such as a 3 mm Allen wrench.

Fig. 649: Retaining Pin, Retaining Bolt, Oil Pump Chain & Sprocket
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are no timing marks on the oil pump gear or chain. Timing of the oil pump is not required.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

5. Place the oil pump sprocket (4) into the oil pump chain (3). Align the oil pump sprocket with the oil pump shaft and install the sprocket. Install the T45 retaining bolt (2) and tighten to 25 N.m (18 ft. lbs.).
6. Remove the retaining pin (1). Verify that the oil pump chain is centered on the tensioner and crankshaft sprocket.
7. Rotate the crankshaft CW one complete revolution to verify proper oil pump chain installation.

Fig. 650: Oil Pump Solenoid Electrical Connector & Primary Chain Tensioner Mounting Bolt

Courtesy of CHRYSLER GROUP, LLC

NOTE: Illustration shows the engine timing cover removed for clarity.

8. Position the oil pump solenoid electrical connector (2) into the engine block. Rotate the connector so that it can be pushed past the primary chain tensioner mounting bolt (1). Then rotate the connector slightly CCW and push it into the engine block until it locks in place.

Fig. 651: Timing Gear Splash Shield & Bolts

Courtesy of CHRYSLER GROUP, LLC

9. Install the timing gear splash shield (1). Tighten bolts (2) to 5 N.m (35 in. lbs.).

Fig. 652: Oil Pump Solenoid Electrical Connector Retention Lock Tab
Courtesy of CHRYSLER GROUP, LLC

10. Verify that the oil pump solenoid electrical connector retention lock tab (1) is engaged to the engine block.

Fig. 653: Oil Pump Solenoid Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

11. Connect the engine wire harness to the oil pump solenoid electrical connector (1).

Fig. 654: Oil Pump Pick-Up Tube & Support Bracket Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

12. Install the oil pump pick-up (1). Refer to **PICK-UP, OIL PUMP, INSTALLATION**.
13. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.
14. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.
15. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

CAUTION: A MIL or low oil pressure indicator that remains illuminated for more than 2 seconds may indicate low or no engine oil pressure. Stop the engine and investigate the cause of the indication.

16. Start and run the engine until it reaches normal operating temperature.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

2710795

Fig. 655: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

The oil pressure sensor (2) is located on the oil filter housing (3). The oil pressure sensor is a three wire sensor with a tapered threaded sensor port. The sensor port is mounted to the oil filter housing through an access hole. A thread lock patch seals the oil pressure sensor to the oil filter housing.

OPERATION

OPERATION

2867304

Fig. 656: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

The oil pressure sensor is a silicon based sensing unit that measures the pressure of the engine oil. The Powertrain Control Module (PCM) supplies a 5 volt reference and a ground to the sensor. The input to the PCM occurs on the signal return circuit. The oil pressure sensor is a linear sensor; as

pressure changes, voltage changes proportionately and returns a voltage signal to the PCM that reflects oil pressure. The zero pressure reading is 0.5 volt and full scale is 4.5 volt.

REMOVAL

REMOVAL

Fig. 657: Lower Intake Manifold & Attaching Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Release fuel system pressure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the air inlet hose, upper intake manifold and lower intake manifold with the fuel injectors and fuel rail (2). Refer to **MANIFOLD, INTAKE, REMOVAL** .

5. Remove the oil pressure sensor (2) from the oil filter housing (3).

INSTALLATION

INSTALLATION

2710795

Fig. 660: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
Courtesy of CHRYSLER GROUP, LLC

1. Install the oil pressure sensor (2) and tighten to 23 N.m (17 ft. lbs.).

2710852

Fig. 661: Heater Hose, Electrical Connectors, Oil Filter Housing & Bolt Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil pressure sensor electrical connector (3).
3. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SENSOR, OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

2710795

Fig. 662: Oil Temperature Sensor, Oil Pressure Sensor & Oil Filter Housing
 Courtesy of CHRYSLER GROUP, LLC

The oil temperature sensor (1) is located on the oil filter housing (3). The oil temperature sensor is a two wire sensor with a tapered threaded sensor probe. The sensor probe is mounted to the oil filter housing through an access hole. A thread lock patch seals the oil temperature sensor to the oil filter housing.

OPERATION

OPERATION

2867292

Fig. 663: Oil Temperature Sensor
 Courtesy of CHRYSLER GROUP, LLC

The oil temperature sensor is a variable resistor that measures the temperature of the engine oil. The Powertrain Control Module (PCM) supplies a 5 volt reference and a ground to the sensors low

reference signal circuit. When the oil temperature is low, the sensor resistance is high. When the oil temperature is high, the sensor resistance is low.

REMOVAL

REMOVAL

Fig. 664: Lower Intake Manifold & Attaching Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Release fuel system pressure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE** .
2. Disconnect and isolate the negative battery cable.
3. Remove the air inlet hose, upper intake manifold and lower intake manifold with the fuel injectors and fuel rail (2). Refer to **MANIFOLD, INTAKE, REMOVAL** .

Courtesy of CHRYSLER GROUP, LLC

Install the oil temperature sensor (1) and tighten to 30 N.m (22 ft. lbs.).

2710852

Fig. 668: Heater Hose, Electrical Connectors, Oil Filter Housing & Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Connect the oil temperature sensor electrical connector (4).
2. Install the upper and lower intake manifolds and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
3. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

MANIFOLDS

MANIFOLD, EXHAUST

DESCRIPTION

DESCRIPTION

2793404

Fig. 669: Aluminum Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

The 3.6L aluminum cylinder heads are a unique design with left and right castings. The exhaust manifolds are integrated into the cylinder heads. If any damaged is found to the exhaust manifold portion, the cylinder head must be removed for repair or replacement. Refer to **CYLINDER HEAD, REMOVAL** .

MANIFOLD, INTAKE

DESCRIPTION

DESCRIPTION

UPPER INTAKE MANIFOLD

CAUTION: If the engine has experienced a catastrophic failure, THE INTAKE MANIFOLD MUST BE REPLACED!

2809323

Fig. 670: Upper Intake Manifold Design
Courtesy of CHRYSLER GROUP, LLC

The upper intake manifold is an injection molded nylon composite design. The upper intake manifold is sealed to the lower intake manifold using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the upper intake manifold is removed from the engine. There is a silencer pad positioned between the upper and lower intake manifolds for improved noise, vibration and harshness (NVH). The left cylinder head cover has two alignment posts to aid proper installation of the silencer pad. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design. If the upper intake manifold is damaged or cracked, it must be replaced.

The Electronic Throttle Control (ETC) and Manifold Air Pressure (MAP) sensor are attached directly to the upper intake manifold. The upper intake manifold also provides vacuum ports for brake booster, positive crankcase ventilation (PCV) and emissions control.

LOWER INTAKE MANIFOLD

CAUTION: If the engine has experienced a catastrophic failure, THE INTAKE MANIFOLD MUST BE REPLACED!

2809336

Fig. 671: Lower Intake Manifold Design
Courtesy of CHRYSLER GROUP, LLC

The lower intake manifold is an injection molded nylon composite design. The lower intake manifold is sealed to the cylinder heads using six individual press-in-place port silicone gaskets. Replace the gaskets whenever the lower intake manifold is removed from the engine. The seven upper intake manifold fasteners thread directly into the composite lower intake manifold and are a self-taping design.

The fuel injection fuel rail is also a composite design. The four fuel rail fasteners thread directly into the composite lower intake manifold and are a self-taping design. The lower intake manifold can be serviced without removing the fuel injector rail. The fuel rail and fuel injectors must be installed into the lower intake manifold as an assembly. Do not attempt to install the fuel rail when the injectors are in the manifold. Always install new O-rings on the fuel injectors.

If the lower intake manifold is damaged or cracked, it must be replaced.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKS

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or

the fan. Do not wear loose clothing.

1. Start the engine.
2. Spray a small stream of water (spray bottle) at the suspected leak area.
3. If engine RPM'S change, the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

UPPER

Fig. 672: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

Fig. 673: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

Fig. 674: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
4. Loosen the clamp (2) at the throttle body.
5. Loosen the clamp (3) at the air cleaner housing.
6. Lift the air inlet hose assembly retaining grommet off the ball stud (4).
7. Remove the air inlet hose assembly (5).

Fig. 675: Brake Booster Hose Retainer
Courtesy of CHRYSLER GROUP, LLC

8. Disengage the brake booster hose retainer (1) from the upper intake manifold.

Fig. 676: MAP Sensor, ETC, PCV Hose, Brake Booster Vacuum Hose, EVAP Vapor Purge Line, Clip & Wire Harness Retainer
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the electrical connectors from the Manifold Absolute Pressure (MAP) sensor (2) and the Electronic Throttle Control (ETC) (4).
10. Disengage the ETC harness from the clip (5) on the throttle body and unfasten the wire harness retainer (1) from the upper intake manifold near the MAP sensor and reposition the wire harness.
11. Disconnect the following hoses from the upper intake manifold:
 - Positive Crankcase Ventilation (PCV) (7)
 - Brake booster vacuum hose (6)
 - EVAP vapor purge line (3)

Fig. 677: Upper Intake Manifold Support Bracket, Stud & Fasteners

15. Remove the two nuts (1), loosen two stud retainers (3) and reposition the two upper intake manifold support brackets (2).

Fig. 680: Upper Intake Manifold & Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The upper intake manifold attaching bolts are captured in the upper intake manifold. Once loosened, the bolts will have to be lifted out of the lower intake manifold and held while removing the upper intake manifold.

NOTE: Exercise care not to inadvertently loosen the two fuel rail attachment bolts that are in close proximity of the upper intake manifold attaching bolts.

16. Remove the seven manifold attaching bolts (1) and remove the upper intake manifold (2).

Fig. 681: Intake Ports, Insulator & Alignment Posts
Courtesy of CHRYSLER GROUP, LLC

17. Remove and discard the six upper to lower intake manifold seals (1).
18. Cover the open intake ports to prevent debris from entering the engine.
19. If required, remove the insulator (2) from the left cylinder head cover.

LOWER

Fig. 682: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE** .

2. Disconnect and isolate the negative battery cable (1).

Fig. 683: Engine Cover
Courtesy of CHRYSLER GROUP, LLC

3. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (1).

Fig. 684: Inlet Air Temperature (IAT) Sensor Electrical Connector, Air Inlet Hose Assembly & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Disconnect the electrical connector (1) from the Inlet Air Temperature (IAT) sensor.
5. Loosen the clamp (2) at the throttle body.
6. Loosen the clamp (3) at the air cleaner housing.
7. Lift the air inlet hose assembly retaining grommet off the ball stud (4).

8. Remove the air inlet hose assembly (5).

Fig. 685: Upper Intake Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

WARNING: The fuel system is under constant pressure even with engine off.
Before servicing the fuel rail, fuel system pressure must be released.

9. Remove the upper intake manifold (2) and support brackets. Refer to **MANIFOLD, INTAKE, REMOVAL**.

Fig. 686: Intake Ports, Insulator & Alignment Posts

18. If required, remove the fuel rail (2) and fuel injectors from the lower intake manifold. Refer to **RAIL, FUEL, REMOVAL** .

INSPECTION

INSPECTION

2869717

Fig. 692: Non-Repairable Damage To Lower Intake Manifold Due To Cross Threading Of An Upper Intake Manifold Attaching Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: When the upper intake manifold (3) and lower intake manifold (1) are not aligned properly, cross threading of the upper intake manifold attaching bolts can

occur. The illustration shows non-repairable damage to the lower intake manifold (1) due to cross threading of an upper intake manifold attaching bolt (2).

Check both the upper and lower intake manifolds for:

- Damage and cracks
- Gasket surface damage or warping

Check the lower intake manifold for:

- Damaged fuel injector ports

If either the upper or lower manifold exhibits any damaged or warped conditions, replace the manifold.

INSTALLATION

UPPER

2756534

Fig. 693: Fuel Rail Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to installing the upper intake manifold, verify that the four fuel rail bolts were not inadvertently loosened. The bolts must be tightened in the sequence shown in illustration to 7 N.m (62 in. lbs.). Refer to RAIL, FUEL, INSTALLATION.

Fig. 694: Intake Ports, Insulator & Alignment Posts
 Courtesy of CHRYSLER GROUP, LLC

1. Clean and inspect the sealing surfaces. Install new upper to lower intake manifold seals (1).

NOTE: Make sure the fuel injectors and wiring harnesses are in the correct position so that they don't interfere with the upper intake manifold installation.

2. If removed, position the insulator (2) onto the two alignment posts (3) on top of the left cylinder head cover.

Fig. 695: Upper Intake Attaching Bolts, Locating Posts & Holes
 Courtesy of CHRYSLER GROUP, LLC

3. Lift and hold the seven upper intake attaching bolts (1) clear of the mating surface. Back the

bolts out slightly or if required, use an elastic band to hold the bolts clear of the mating surface.

4. Position the upper intake manifold (1) onto the lower intake manifold so that the two locating posts (2) on the upper intake manifold align with corresponding holes (3) in the lower intake manifold.

Fig. 696: Upper Intake Manifold Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

5. Install the seven upper intake manifold attaching bolts. Tighten the bolts in the sequence shown in illustration to 8 N.m (71 in. lbs.).

18. Start the engine and check for leaks.

VALVE TIMING

DESCRIPTION

DESCRIPTION

2809852

Fig. 715: Valve Timing System Components
Courtesy of CHRYSLER GROUP, LLC

The timing drive uses four silent chains. The silent chain link design improves sprocket engagement and reduces noise, vibration and harshness (NVH). One chain (5) drives the oil pump (4) and three chains drive the camshafts in a two stage design. The left secondary camshaft chain (1) uses an oil pressure controlled chain tensioner (9) with a ratcheting device. The right secondary camshaft chain (8) uses an oil pressure controlled tensioner (7) without a ratchet. The primary chain (2) also uses an oil pressure controlled tensioner (6) without a ratchet. A spring loaded tensioner (3) takes up the slack in the oil pump chain (5). The chain guides and tensioner arms are made of glass filled nylon with nylon wear faces.

OPERATION

OPERATION

2873481

Fig. 716: Primary Chain, Idler Sprocket & Crankshaft Sprocket
Courtesy of CHRYSLER GROUP, LLC

The primary timing chain is a silent type. The primary chain drives the 28 tooth idler sprocket directly from a 21 tooth crankshaft sprocket. This results in a 75% speed reduction to the idler sprocket. The idler sprocket assembly connects the primary chain drive and the secondary chain drive. The idler sprocket assembly consists of two integral 22 tooth sprockets a 28 tooth sprocket. The idler sprocket assembly spins on a stationary idler shaft. The idler shaft is a light press-fit into the cylinder block. A large washer on the idler shaft bolt and the rear flange of the idler shaft are used to control sprocket thrust movement. Pressurized oil is routed through the center of the idler shaft to provide lubrication for the bushings used in the idler sprocket assembly. Primary chain motion is controlled by a hydraulic oil damped tensioner and a fixed guide. The tensioner and the guide both use nylon plastic wear faces for low friction and long wear. The primary chain receives oil splash lubrication.

Fig. 717: Secondary Drive Chains
Courtesy of CHRYSLER GROUP, LLC

There are two identical secondary drive chains, both are silent type, one to drive the camshafts in each double overhead cam (DOHC) cylinder head. The secondary chains drive the 33 tooth camshaft sprockets directly from the 22 tooth idler sprockets. This speed reduction combined with the crankshaft to idler sprocket speed reduction produces the required 2:1 camshaft drive ratio. A fixed chain guide and a hydraulic oil damped tensioner are used to maintain tension in each secondary chain system. The left hydraulic secondary chain tensioner is fed from the main oil gallery through the cylinder head. The right hydraulic secondary chain tensioner is fed from the number one main bearing journal. Each tensioner incorporates a controlled leak path through a device known as a vent disc located in the nose of the piston to manage chain loads. Only the left tensioner has a mechanical ratchet system that limits chain slack if the tensioner piston bleeds down after engine shut down. The tensioner arms and guides also utilize nylon wear faces for low friction and long wear. The two secondary timing chains are lubricated by holes in the oil controlled tensioners that spray oil through an opening in the tensioner arms. The holes are protected from clogging by a fine mesh screen which is located on the back of the hydraulic tensioners.

STANDARD PROCEDURE

RESETTING LEFT CAM CHAIN TENSIONER

2661778

Fig. 718: Left Side Cam Chain Tensioner Ratchet Components
 Courtesy of CHRYSLER GROUP, LLC

The left side cam chain tensioner used on the 3.6L engine is equipped with a ratchet. The ratchet consists of a rack (2) and a pawl (1). In use, the rack (2) extends with the piston (3) from the tensioner body. The pawl (1) will not allow the rack (2) to retract back into the tensioner body. In order to reset the tensioner, the pawl (1) must be disengaged from the rack (2) so that the piston (3) and rack (2) can be pushed back (4) into the tensioner body.

2661831

Fig. 719: Locating Slot In Rack & Allen Wrench
 Courtesy of CHRYSLER GROUP, LLC

WITH ENGINE TIMING COVER REMOVED

NOTE: The slot (2) in the rack provides an anchor point for a pin that holds the rack in the retracted position.

1. Using a suitable tool, such as an Allen wrench (1), lift the pawl off of the rack.
2. While holding the pawl off of the rack, push the rack and the piston into the tensioner body.

2661934

Fig. 720: Inserting Tensioner Pin To Hold Rack & Piston In Retracted Position
Courtesy of CHRYSLER GROUP, LLC

3. When the slot is aligned with the hole in the tensioner body, insert Tensioner Pin (special tool #8514, Pins, Tensioner) (1) to hold the rack and piston in the retracted position.

2665529

WITH ENGINE TIMING COVER INSTALLED

NOTE: Illustration shows timing cover removed for clarity.

1. Using (special tool #10200-3, Pin) (2), lift the pawl off of the rack (3).

Fig. 722: Positioning Timing Chain Holder To Force Rack & Piston Back Into Tensioner Body

Courtesy of CHRYSLER GROUP, LLC

2. While holding the pawl off of the rack, push (special tool #10200-1, Holder, Timing Chain, Left Side) (1) into place between the cylinder head and the cam chain guide to force the rack and piston back into the tensioner body. The holder must remain in place during service to keep the rack and piston in the retracted position.

MEASURING TIMING CHAIN WEAR

Fig. 723: Piston Extension & Right Hand Cam Chain Tensioner

Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine timing chain cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL** .
2. To determine if the timing chains are worn, rotate the crankshaft clockwise until maximum tensioner piston extension (1) is obtained on the RH cam chain tensioner (2). Measure the distance between the secondary timing chain tensioner housing and the step ledge on the tensioner piston (1). Piston extension (1) must be less than 16 mm (0.630 in.).
3. Piston extension greater than 16 mm (0.630 in.) indicates that all timing chains are worn and require replacement. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL** .

ENGINE TIMING VERIFICATION

Fig. 724: Magnetic Timing Wheels
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 725: Mount Dial Indicator Set To Stationary Point On Engine
Courtesy of CHRYSLER GROUP, LLC

Correct timing is critical for the NON free-wheeling designed, 3.6L engine. Engine timing can be verified by using the following procedures:

1. Remove the upper intake manifold and both cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
2. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

3. Mount Dial Indicator Set (special tool #C-3339A, Set, Dial Indicator) (1) to a stationary point on the engine, such as the cylinder head cover mounting surface. Position the indicator probe into the number one cylinder, rotate the crankshaft clockwise (as viewed from the front) to place the number one piston at top-dead-center on the exhaust stroke and set the indicator dial to **ZERO** .

Fig. 726: Arrows, Scribe Lines, & Cam Phasers
Courtesy of CHRYSLER GROUP, LLC

4. While maintaining this alignment, verify that the **ARROWS** (1) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (2) and that the right side cam phaser **ARROWS** (3) point away from each other and the **SCRIBE LINES** (5) are parallel to the cylinder head cover mounting surface (4).

2714685

Fig. 727: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

5. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
6. If the engine timing is not correct, proceed to Timing Chain and Sprockets for service procedures. Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL** .

CHAIN AND SPROCKETS, TIMING

REMOVAL

REMOVAL

2715130

Fig. 728: Magnetic Timing Wheels
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

Fig. 729: Piston Extension & Right Hand Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When the timing chains are removed and the cylinder heads are still installed, DO NOT rotate the camshafts or crankshaft without first locating the proper crankshaft position. Failure to do so will result in valve and/or piston damage.

NOTE: The Variable Valve Timing (VVT) assemblies (Phasers) and Oil Control Valves (OCVs) can be serviced without removing the engine timing cover. Refer to ASSEMBLY, VARIABLE VALVE TIMING, PHASER/OIL CONTROL VALVE, REMOVAL.

1. Disconnect and isolate the negative battery cable.
2. Remove the air cleaner housing assembly and upper intake manifold. Refer to MANIFOLD, INTAKE, REMOVAL.
3. Remove both cylinder head covers. Refer to COVER(S), CYLINDER HEAD, REMOVAL.
4. Remove the spark plugs. Refer to SPARK PLUG, REMOVAL.
5. Raise and support the vehicle. Refer to HOISTING, STANDARD PROCEDURE.
6. Drain the cooling system. Refer to STANDARD PROCEDURE.
7. Remove the oil pan, accessory drive belts, crankshaft vibration damper and engine timing cover. Refer to COVER(S), ENGINE TIMING, REMOVAL.

NOTE: Take this opportunity to measure timing chain wear. Refer to VALVE

TIMING, STANDARD PROCEDURE.

2661245

Fig. 730: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke

Courtesy of CHRYSLER GROUP, LLC

CAUTION: When aligning timing marks, always rotate engine by turning the crankshaft. Failure to do so will result in valve and/or piston damage.

8. Rotate the crankshaft clockwise (as viewed from the front) to place the number one cylinder piston at top-dead-center on the exhaust stroke by aligning the dimple (4) on the crankshaft with the block/bearing cap junction (5).
9. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).

2714685

Fig. 731: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

NOTE: The phaser markings (1 and 3) could align with either an external or internal chain link. Either alignment is acceptable as long as there are twelve chain pins between the markings.

10. There should be twelve chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

11. Mark the direction of rotation on the following timing chains using a paint pen or equivalent to aid in reassembly:
 - Left side cam chain
 - Right side cam chain
 - Oil pump chain
 - Primary chain

Fig. 732: Resetting Right Cam Chain Tensioner
 Courtesy of CHRYSLER GROUP, LLC

12. Reset the right side cam chain tensioner by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (1).

Fig. 733: Resetting Left Cam Chain Tensioner
 Courtesy of CHRYSLER GROUP, LLC

13. Reset the left side cam chain tensioner by lifting the pawl (1), pushing back the piston (2) and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Refer to **VALVE TIMING, STANDARD PROCEDURE**.

2682471

Fig. 734: Oil Pump Chain Tensioner, Spring, Retaining Bolt, Dowel Pin, Oil Pump Sprocket & Oil Pump Chain
 Courtesy of CHRYSLER GROUP, LLC

14. Disengage the oil pump chain tensioner spring (3) from the dowel pin (2) and remove the oil pump chain tensioner (1).
15. Remove the oil pump sprocket T45 retaining bolt (4) and remove the oil pump sprocket (5) and oil pump chain (6).

3817977

Fig. 735: Wrench, Oil Control Valves & Special Tool
 Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

16. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1) with the tool number

facing up.

17. Loosen, but do not remove, the exhaust oil control valve (3) and the intake oil control valve (2).
18. Remove the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (1).
19. Remove the oil control valve (2) from the right side intake cam phaser.
20. Pull the right side intake cam phaser off of the camshaft and remove the right side cam chain.
21. If required, remove the oil control valve (3) and pull the right side exhaust cam phaser off of the camshaft.

Fig. 736: Wrench, Oil Control Valves & Special Tool
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rock the camshaft slightly (a few degrees) with a wrench (4) when installing the camshaft phaser lock.

22. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1) with the tool number facing up.
23. Loosen, but do not remove, the exhaust oil control valve (2) and the intake oil control valve (3).
24. Remove the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (1).
25. Remove the oil control valve (2) from the left side exhaust cam phaser.
26. Pull the left side exhaust cam phaser off of the camshaft and remove the left side cam chain.
27. If required, remove the oil control valve (3) and pull the left side intake cam phaser off of the camshaft.

Fig. 737: Primary Chain Tensioner, Tensioner Pin, Primary Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

28. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3). Remove two T30 bolts (4) and remove the primary chain tensioner.
29. Remove the T30 bolt (1) and the primary chain guide (2).

30. Remove the idler sprocket T45 retaining bolt (2) and washer (3).
31. Remove the primary chain, idler sprocket and crankshaft sprocket as an assembly.

2659731

Fig. 739: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

32. If required, remove two T30 bolts (6) and the left side cam chain tensioner (5).
33. If required, remove two T30 bolts (4) and the left side cam chain guide (2) and tensioner arm (1).

2659678

Fig. 740: Right Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

34. If required, remove two T30 bolts (4) and the right side cam chain tensioner (3).
35. If required, remove three T30 bolts (2) and the right side cam chain guide (1) and tensioner arm (6).
36. Inspect all sprockets and chain guides. Replace if damaged.

INSPECTION

INSPECTION

Fig. 741: Piston Extension & Right Hand Cam Chain Tensioner
Courtesy of CHRYSLER GROUP, LLC

Prior to disassembly of the timing chains and sprockets, measure the timing chain wear (1). Refer to **VALVE TIMING, STANDARD PROCEDURE**.

Inspect the following valve timing components:

- Sprockets for excessive tooth wear. Some tooth markings are normal and not a cause for sprocket replacement.
- Idler sprocket assembly bushing and shaft for excessive wear.
- Chain guides and tensioner arms. Replace these parts if grooving in plastic face is more than 1 mm (0.039 in.) deep.
- Secondary chain tensioner piston and ratcheting device. Inspect for evidence of heavy contact between tensioner piston and tensioner arm. If this condition exist the tensioner arm and chain should be replaced.
- Primary chain tensioner plastic faces. Replace as required.

INSTALLATION

INSTALLATION

2715130

Fig. 742: Magnetic Timing Wheels
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The magnetic timing wheels (1) must not come in contact with magnets (pickup tools, trays, etc.) or any other strong magnetic field. This will destroy the timing wheels ability to correctly relay camshaft position to the camshaft position sensor.

2659678

Fig. 743: Right Cam Chain Tensioner, Arm, Guide & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. Inspect all sprockets and chain guides. Replace if damaged.
2. If removed, install the right side cam chain guide (1) and tensioner arm (6). Tighten attaching T30 bolts (2) to 12 N.m (106 in. lbs.).
3. If removed, install the right side cam chain tensioner (3) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N.m (106 in. lbs.).
4. Reset the right side cam chain tensioner (3) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (5).

2659731

Fig. 744: Left Cam Chain Tensioner, Arm, Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. If removed, install the left side cam chain guide (2) and tensioner arm (1). Tighten attaching T30 bolts (4) to 12 N.m (106 in. lbs.).
6. If removed, install the left side cam chain tensioner (5) to the cylinder head with two bolts (6). Tighten the T30 bolts (6) to 12 N.m (106 in. lbs.).
7. Reset the left side cam chain tensioner (5) by lifting the pawl (3), pushing back the piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (7). Refer to **VALVE TIMING, STANDARD PROCEDURE**.

2605347

Fig. 745: Crankshaft Key, Dimple & Block/Bearing Cap Junction
Courtesy of CHRYSLER GROUP, LLC

8. Verify that the key (3) is installed in the crankshaft.

CAUTION: Do not rotate the crankshaft more than a few degrees independently of the camshafts. Piston to valve contact could occur resulting in possible valve damage. If the crankshaft needs to be rotated more than a few degrees, first remove the camshafts.

9. Verify that the number one cylinder piston is positioned at top-dead-center by aligning the dimple (2) on the crankshaft with the block/bearing cap junction (1).

Fig. 746: Positioning Camshaft Alignment Holes Vertically
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate the camshafts more than a few degrees independently of the crankshaft. Valve to piston contact could occur resulting in possible valve damage. If the camshafts need to be rotated more than a few degrees, first move the pistons away from the cylinder heads by rotating the crankshaft counterclockwise to a position 30° before-top-dead-center. Once the camshafts are returned to their top-dead-center position, rotate the crankshaft clockwise to return the crankshaft to top-dead-center.

10. Verify that the camshafts are set at top-dead-center by positioning the alignment holes (1) vertically.

2568864

Fig. 747: Aligning Arrow With Plated Link On Primary Chain
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

11. Place the primary chain onto the crankshaft sprocket (3) so that the arrow (2) is aligned with the plated link (1) on the timing chain.

2569142

Fig. 748: Placing Idler Sprocket Into Timing Chain So That Dimple Is Aligned With Plated Link On Timing Chain
 Courtesy of CHRYSLER GROUP, LLC

12. While maintaining this alignment, invert the crankshaft sprocket and timing chain and place the

idler sprocket (4) into the timing chain so that the dimple (2) is aligned with the plated link (1) on the timing chain.

Fig. 749: Timing Chain Plated Link At 12 O'Clock, Washer, Retaining Bolt, Block/Bearing Cap Junction & Dimple
Courtesy of CHRYSLER GROUP, LLC

13. While maintaining this alignment, lubricate the idler sprocket bushing with clean engine oil and install the sprockets and timing chain on the engine. To verify that the timing is still correct, the timing chain plated link (6) should be located at 12:00 (1) when the dimple (5) on the crankshaft is aligned with the block/bearing cap junction (4).
14. Install the idler sprocket retaining bolt (2) and washer (3). Tighten the T45 bolt (2) to 25 N.m (18 ft. lbs.).

Fig. 750: Primary Chain Tensioner, Tensioner Pin, Primary Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

15. Install the primary chain guide (2). Tighten attaching T30 bolt (1) to 12 N.m (106 in. lbs.).
16. Reset the primary chain tensioner (5) by pushing back the tensioner piston and installing Tensioner Pin (special tool #8514, Pins, Tensioner) (3).
17. Install the primary chain tensioner (5) to the engine block with two bolts (4). Tighten the T30 bolts (4) to 12 N.m (106 in. lbs.) and remove the Tensioner Pin (special tool #8514, Pins, Tensioner) (3).

Fig. 751: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
 Courtesy of CHRYSLER GROUP, LLC

18. Press the left side intake cam phaser onto the intake camshaft. Install and hand tighten the oil control valve (6).

Fig. 752: Idler Sprocket, Plated Link & Arrow
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side and right side cam chains are identical.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

19. Drape the left side cam chain over the left side intake cam phaser and onto the idler sprocket (1) so that the arrow (3) is aligned with the plated link (2) on the cam chain.

Fig. 753: Phaser Timing Marks, Oil Control Valves & LH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

20. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the left side cam phasers so that the arrows (3) point toward each other and are parallel to the cylinder head cover mounting surface (5). Press the exhaust cam phaser onto the exhaust cam, install and hand tighten the oil control valve (2).

NOTE: Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.

21. Install the (special tool #10202-2, Lock, Camshaft/Phaser, Left Side) (4) with the tool number facing up.
22. Tighten the oil control valves (2) and (6) to 150 N.m (110 ft. lbs.).
23. Remove the Camshaft Phaser Lock (4).

Fig. 754: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
 Courtesy of CHRYSLER GROUP, LLC

24. Press the right side exhaust cam phaser onto the exhaust camshaft. Install and hand tighten the oil control valve (7).

Fig. 755: Idler Sprocket, Dimple & Plated Link
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

25. Drape the right side cam chain over the right side exhaust cam phaser and onto the idler sprocket (1) so that the dimple (2) is aligned with the plated link (3) on the cam chain.

Fig. 756: Phaser Timing Marks, Oil Control Valves & RH Camshaft Phaser Lock
Courtesy of CHRYSLER GROUP, LLC

26. While maintaining this alignment, route the cam chain around the exhaust and intake cam phasers so that the plated links are aligned with the phaser timing marks (1). Position the right side cam phasers so that the arrows (3) point away from each other and the scribe lines (4) are parallel to the cylinder head cover mounting surface (6). Press the intake cam phaser onto the intake cam, install and hand tighten the oil control valve (2).

NOTE: **Minor rotation of a camshaft (a few degrees) may be required to install the camshaft phaser or phaser lock.**

27. Install the (special tool #10202-1, Lock, Camshaft/Phaser, Right Side) (5) with the tool number facing up.
28. Tighten the oil control valves (2) and (7) to 150 N.m (110 ft. lbs.).
29. Remove the Camshaft Phaser Lock (5).

2682471

Fig. 757: Oil Pump Chain Tensioner, Spring, Retaining Bolt, Dowel Pin, Oil Pump Sprocket & Oil Pump Chain
Courtesy of CHRYSLER GROUP, LLC

NOTE: There are no timing marks on the oil pump gear or chain.

CAUTION: Always reinstall timing chains so that they maintain the same direction of rotation. Inverting a previously run chain on a previously run sprocket will result in excessive wear to both the chain and sprocket.

30. Place the oil pump sprocket (5) into the oil pump chain (6). Place the oil pump chain onto the crankshaft sprocket while aligning the oil pump sprocket with the oil pump shaft. Install the oil pump sprocket T45 retaining bolt (4) and tighten to 25 N.m (18 ft. lbs.).
31. Install the oil pump chain tensioner (1). Make sure that the spring (3) is positioned above the dowel pin (2).

2661245

Fig. 758: Rotating Crankshaft Clockwise To Position No. 1 Piston At TDC On Exhaust Stroke

Courtesy of CHRYSLER GROUP, LLC

32. Remove the Tensioner Pins (special tool #8514, Pins, Tensioner) (1) and (6) from the right side and left side cam chain tensioners.
33. Rotate the crankshaft clockwise (as viewed from the front) two complete revolutions stopping when the dimple (4) on the crankshaft is aligned with the block/bearing cap junction (5).
34. While maintaining this alignment, verify that the **ARROWS** (2) on the left side cam phasers point toward each other and are parallel to the cylinder head cover mounting surface (3) and that the right side cam phaser **ARROWS** (7) point away from each other and the **SCRIBE LINES** (9) are parallel to the cylinder head cover mounting surface (8).

2714685

Fig. 759: Chain Pins, Exhaust Cam Phaser Triangle Marking & Circle Marking
Courtesy of CHRYSLER GROUP, LLC

35. There should be 12 chain pins (2) **BETWEEN** the exhaust cam phaser triangle marking (1) and the intake cam phaser circle marking (3) as viewed from either the front or rear of the cam phasers.
36. If the engine timing is not correct, repeat this procedure.
37. Install the engine timing cover, crankshaft vibration damper, accessory drive belts and oil pan. Refer to **COVER(S), ENGINE TIMING, INSTALLATION** .
38. Install the spark plugs. Tighten to 17.5 N.m (13 ft. lbs.). Refer to **SPARK PLUG, INSTALLATION** .
39. Install the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
40. Install the upper intake manifold and air cleaner housing assembly. Refer to **MANIFOLD, INTAKE, INSTALLATION** .
41. Fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE** .
42. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
43. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
44. Operate the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

NOTE: **The Cam/Crank Variation Relearn procedure must be performed using the scan tool anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components.**

COVER(S), ENGINE TIMING

REMOVAL

REMOVAL

7. Remove the bolt (2) and reposition the heater core supply tube (1).

Fig. 764: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

8. Remove the accessory drive belt (3). Refer to **BELT, SERPENTINE, REMOVAL** .
9. Remove the accessory drive belt tensioner (7). Refer to **TENSIONER, BELT, REMOVAL** .
10. Remove the accessory idler pulley (2). Refer to **PULLEY, IDLER, REMOVAL** .
11. Remove the crankshaft vibration damper (6). Refer to **DAMPER, VIBRATION, REMOVAL** .
12. Remove the right and left cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL** .
13. Remove the upper and lower oil pans. Refer to **PAN, OIL, REMOVAL** .

3696116

Fig. 765: Timing Cover Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the water pump or the coolant outlet housing for engine timing cover removal.

14. Remove the following timing cover attaching bolts:
- Three M10 bolts (1)
 - Two M8 bolts (2)
 - Twenty-two M6 bolts (3)

Fig. 766: Timing Cover Removal Pry Points
 Courtesy of CHRYSLER GROUP, LLC

15. Using the seven pry points indicated in illustration, carefully remove the timing cover.

Fig. 767: Coolant Outlet Housing, Water Pump & Bolts
 Courtesy of CHRYSLER GROUP, LLC

16. If required, remove the remaining four M6 bolts (2) and the coolant outlet housing (1) from the engine timing cover.
17. If required, remove the remaining four M6 bolts (4) and the water pump (3) from the engine timing cover.

2769376

Fig. 768: Sealant At Cylinder Head Bosses, Right & Left Flanges, Cylinder Head-To-Engine Block T-Joints & Cover To Right Cam Chain Tensioner Gap
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use oil based liquids, wire brushes, abrasive wheels or metal scrapers to clean the engine gasket surfaces. Use only isopropyl (rubbing) alcohol, along with plastic or wooden scrapers. Improper gasket surface preparation may result in engine fluid leakage.

18. Remove all residual sealant from the timing chain cover, cylinder head and engine block mating surfaces. Refer to **CLEANING**.

Fig. 769: Coolant Outlet Housing Gasket & Water Pump Gasket
 Courtesy of CHRYSLER GROUP, LLC

19. Remove and discard the coolant outlet housing gasket (1) and the water pump gasket (2).

INSTALLATION

INSTALLATION

Fig. 770: Coolant Outlet Housing, Water Pump & Bolts
 Courtesy of CHRYSLER GROUP, LLC

1. If removed, install the coolant outlet housing (1) to the timing cover with a new gasket using only the four bolts (2) shown in illustration tightened to 12 N.m (106 in. lbs.).
2. If removed, install the water pump (3) to the timing cover using only the four bolts (4) shown in illustration tightened to 12 N.m (106 in. lbs.). Refer to **PUMP, WATER, INSTALLATION**.

Fig. 771: Coolant Outlet Housing Gasket & Water Pump Gasket
 Courtesy of CHRYSLER GROUP, LLC

3. Install the coolant outlet housing gasket (1) and the water pump gasket (2).

Fig. 772: Sealant At Cylinder Head Bosses, Right & Left Flanges, Cylinder Head-To-Engine Block T-Joints & Cover To Right Cam Chain Tensioner Gap
 Courtesy of CHRYSLER GROUP, LLC

4. Clean the engine timing cover, cylinder head and block mating surfaces with isopropyl alcohol in

preparation for sealant application.

CAUTION: Engine assembly requires the use of a unique sealant that is compatible with engine oil. Using a sealant other than Mopar® Threebond Engine RTV Sealant may result in engine fluid leakage.

CAUTION: Following the application of Mopar® Threebond Engine RTV Sealant to the gasket surfaces, the components must be assembled within 20 minutes and the attaching fasteners must be tightened to specification within 45 minutes. Prolonged exposure to the air prior to assembly may result in engine fluid leakage.

5. Apply a 2 to 3 mm wide bead of Mopar® Threebond Engine RTV Sealant to the front cover as shown in illustration in the following locations:
- Three cylinder head bosses (1)
 - Right and left flanges (2)
 - Four cylinder head to engine block T-joints (3)
 - Cover to right cam chain tensioner gap (4)

3696116

Fig. 773: Timing Cover Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Align the locator pins (4) on the engine block to the engine timing cover and install the cover.
7. Install and tighten the timing cover attaching bolts:

- Twenty-two M6 bolts (3) to 12 N.m (106 in. lbs.).
- Two M8 bolts (2) to 25 N.m (18 ft. lbs.).
- Three M10 bolts (1) to 55 N.m (41 ft. lbs.).

2807819

Fig. 774: Idler Pulley, Tensioner Arm, Belt, Idler, Tensioner & Belt Routing
Courtesy of CHRYSLER GROUP, LLC

8. Install the upper and lower oil pans. Refer to **PAN, OIL, INSTALLATION** .
9. Install the right and left cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION** .
10. Install the crankshaft vibration damper (6). Refer to **DAMPER, VIBRATION, INSTALLATION** .
11. Install the accessory idler pulley (2). Refer to **PULLEY, IDLER, INSTALLATION** .
12. Install accessory drive belt tensioner (7). Refer to **TENSIONER, BELT, INSTALLATION** .
13. Install the accessory drive belt (3). Refer to **BELT, SERPENTINE, REMOVAL** .

Fig. 775: Heater Core Supply Tube Support Bracket & Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

14. Install the heater core supply tube (1) with one bolt (2) tightened to 12 N.m (106 in. lbs.).

Fig. 776: Heater Core Supply Hose & Coolant Outlet Housing
 Courtesy of CHRYSLER GROUP, LLC

15. Install the heater core supply hose (1) to the coolant outlet housing (2).

Fig. 777: Radiator Hose & Heater Hose
 Courtesy of CHRYSLER GROUP, LLC

16. Install the lower radiator hose (2) to the water pump housing.
17. Install the heater core return hose (1) to the water pump housing.

Fig. 778: Upper Radiator Hose & Thermostat Housing
 Courtesy of CHRYSLER GROUP, LLC

18. Install the thermostat housing (1) and upper radiator hose (2). Refer to **THERMOSTAT, REMOVAL** .
19. If removed, install the oil filter and fill the engine crankcase with the proper oil to the correct level. Refer to **STANDARD PROCEDURE**.
20. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
21. Fill the cooling system. Refer to **STANDARD PROCEDURE** .

22. Run the engine until it reaches normal operating temperature. Check cooling system for correct fluid level. Refer to **STANDARD PROCEDURE** .

ENGINE

5.7L - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The 5.7L engine (348 CID) eight-cylinder engine is a 90° V-Type lightweight, deep skirt cast iron block, aluminum heads, single cam, overhead valve engine with hydraulic roller tappets. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2.

DIAGNOSIS AND TESTING

INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

See **PERFORMANCE** and **MECHANICAL** for possible causes and corrections of malfunctions.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. See **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
- Cylinder Combustion Pressure Leakage Test. See **CYLINDER COMBUSTION PRESSURE LEAKAGE**.
- Engine Cylinder Head Gasket Failure Diagnosis. See **Engine/Cylinder Head - Diagnosis and Testing**.
- Intake Manifold Leakage Diagnosis. See **Engine/Manifolds/MANIFOLD, Intake - Diagnosis and Testing**.

PERFORMANCE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery. 2. Corroded or loose battery	1. Charge or replace as necessary. 2. Clean and tighten battery

	connections. 3. Faulty starter. 4. Incorrect spark plug gap. 5. Dirt or water in fuel system. 6. Faulty fuel pump, relay or wiring.	connections. Apply a coat of light mineral grease to the terminals. 3. Refer to <u>Electrical/Starting - Diagnosis and Testing</u> . 4. Refer to <u>Electrical/Ignition Control - Specifications</u> . 5. Clean system and replace fuel filter. 6. See <u>Engine - Diagnosis and Testing</u> .
ENGINE STALLS OR ROUGH IDLE	1. Idle speed set to low. 2. Vacuum leak.	1. See <u>Engine - Diagnosis and Testing</u> . 2. Inspect intake manifold and vacuum hoses, repair or replace as necessary.
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs. 2. Dirt or water in fuel system. 3. Blown cylinder head gasket. 4. Low compression. 5. Burned, warped or pitted valves. 6. Plugged or restricted exhaust system.	1. Replace spark plugs. 2. Clean system and replace fuel filter. 3. Replace cylinder head gasket. 4. See <u>CYLINDER COMPRESSION PRESSURE LEAKAGE</u> . 5. Replace as necessary. 6. Inspect and replace as necessary.

MECHANICAL

CONDITION	POSSIBLE CAUSES	CORRECTIONS
NOISY VALVES	1. High or low oil level in crankcase. 2. Thin or diluted oil. 3. Low oil pressure. 4. Dirt in lash adjusters. 5. Worn rocker arms. 6. Worn lash adjusters 7. Worn valve guides.	1. Refer to <u>Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications</u> . 2. Change oil and filter. 3. Check oil pump, if Ok, check rod and main bearings for excessive wear. 4. Replace as necessary. 5. Replace as necessary. 6. Replace as necessary. 7. Replace cylinder head.

	8. Excessive runout of valve seats on valve faces.	8. See <u>Engine/Cylinder Head/SEAL(S), Valve Guide - Description</u> .
CONNECTING ROD NOISE	1. Insufficient oil supply. 2. Low oil pressure. 3. Thin or diluted oil. 4. Excessive bearing clearance. 5. Connecting rod journal out-of-round. 6. Misaligned connecting rods.	1. Refer to <u>Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications</u> . 2. Check oil pump, if Ok, check rod and main bearings for excessive wear. 3. Change oil and filter. 4. Replace as necessary. 5. Replace crankshaft. 6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply. 2. Low oil pressure. 3. Thin or diluted oil. 4. Excessive bearing clearance. 5. Excessive end play. 6. Crankshaft journal out-of round. 7. Loose flywheel or torque converter.	1. Refer to <u>Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications</u> . 2. Check oil pump, if Ok, check rod and main bearings for excessive wear. 3. Change oil and filter. 4. Replace as necessary. 5. Check thrust washers for wear. 6. Replace crankshaft. 7. Tighten to correct torque

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.

3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system. Refer to **Fuel System/Fuel Delivery - Standard Procedure** and perform the fuel system pressure release procedure.
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: **The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.**

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

NOTE: **If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.**

9. If one or more cylinders continue to have abnormally low compression pressures, perform the CYLINDER COMBUSTION PRESSURE LEAKAGE test.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating).
 - Leaks between adjacent cylinders or into water jacket.
 - Any causes for combustion/compression pressure loss.
1. Check the coolant level and fill as required. DO NOT install the radiator cap.
 2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
 3. Remove the spark plugs.
 4. Remove the oil filler cap.
 5. Remove the air cleaner hose.
 6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi)

recommended.

7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set piston of cylinder to be tested at TDC compression, While testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.**

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block	Remove cylinder head and inspect. Replace defective part.
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders	Remove cylinder head and inspect. Replace gasket, head, or block as necessary.
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary.

LUBRICATION

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	<ol style="list-style-type: none">1. Gaskets and O-Rings.<ol style="list-style-type: none">a. Misaligned or damaged.b. Loose fasteners, broken or porous metal parts.2. Crankshaft rear seal.3. Crankshaft seal flange.	<ol style="list-style-type: none">1. Replace as necessary.<ol style="list-style-type: none">a. Replace as necessary.b. Tighten fasteners, Repair or replace metal parts.2. Replace as necessary.3. Polish or replace crankshaft.

-	Scratched, nicked or grooved. 4. Oil pan flange cracked. 5. Front cover seal, damaged or misaligned. 6. Scratched or damaged vibration damper hub. 7. Crankshaft Rear Flange Microporosity.	4. Replace oil pan. 5. Replace seal. 6. Polish or replace damper. 7. Replace Crankshaft.
OIL PRESSURE DROP	1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn oil pump. 6. Thin or diluted oil. 7. Excessive bearing clearance. 8. Oil pump relief valve stuck. 9. Oil pickup tube loose or damaged.	1. Check and correct oil level. 2. Replace sending unit. 3. Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Replace oil pump. 9. Replace as necessary.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket(s). 6. Leaking valve guide seals.	1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gasket(s). 6. Replace valve guide seals.

MECHANICAL

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase. 2. Thin or diluted oil. 3. Low oil pressure.	1. Check for correct oil level. Adjust the oil level by draining or adding as needed. See <u>Engine/Lubrication/OIL - Standard Procedure.</u> 2. Change the engine oil. See <u>Engine/Lubrication/OIL - Standard Procedure.</u> 3. Check the engine oil level. If OK, Perform oil pressure test. See <u>Engine/Lubrication -</u>

	<p>4. Dirt in tappets/lash adjusters.</p> <p>5. Bent push rod(s).</p> <p>6. Worn rocker arms</p> <p>7. Worn tappets/lash adjusters.</p> <p>8. Worn valve guides.</p> <p>9. Excessive runout of valve seats or valve faces.</p>	<p><u>Diagnosis and Testing.</u></p> <p>4. Clean and/or replace the hydraulic tappets/lash adjusters. See <u>Engine/Engine Block/LIFTER(S), Hydraulic - Diagnosis and Testing.</u></p> <p>5. Install new push rods. See <u>Engine/Cylinder Head/SPRING(S), Valve - Removal.</u></p> <p>6. Inspect the oil supply to the rocker arms and replace worn rocker arms as needed. See <u>Engine/Cylinder Head/ROCKER ARM, Valve - Removal.</u></p> <p>7. Install new hydraulic tappets/lash adjusters. See <u>Engine/Engine Block/LIFTER(S), Hydraulic - Removal.</u></p> <p>8. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.</p> <p>9. Grind the valves and seats. See <u>Engine/Cylinder Head/VALVES, Intake and Exhaust - Standard Procedure.</u></p>
CONNECTING ROD NOISE	<p>1. Insufficient oil supply.</p> <p>2. Low oil pressure.</p> <p>3. Thin or diluted oil.</p> <p>4. Excessive connecting rod bearing clearance.</p> <p>5. Connecting rod journal out of round.</p>	<p>1. Check the engine oil level.</p> <p>2. Check the engine oil level. If OK, Perform the engine oil pressure test. See <u>Engine/Lubrication - Diagnosis and Testing.</u></p> <p>3. Change the engine oil to correct the viscosity. See <u>Engine/Lubrication/OIL - Standard Procedure.</u></p> <p>4. Measure the bearings for correct clearance with plastigage. Repair as necessary.</p> <p>5. Replace the crankshaft. See <u>Engine/Engine Block/CRANKSHAFT - Removal.</u></p>

	6. Misaligned connecting rods.	6. Replace the bent connecting rods. See <u>Engine/Cylinder Head/SPRING(S), Valve - Removal</u> .
MAIN BEARING NOISE	<p>1. Insufficient oil supply. 2. Low oil pressure.</p> <p>3. Thin or diluted oil.</p> <p>4. Excessive main bearing clearance.</p> <p>5. Excessive end play.</p> <p>6. Crankshaft main journal out of round or worn.</p> <p>7. Loose flywheel or torque converter.</p>	<p>1. Check the engine oil level. 2. Check the engine oil level. If OK, Perform the engine oil pressure test. See <u>Engine/Lubrication - Diagnosis and Testing</u>.</p> <p>3. Change the engine oil to correct viscosity. See <u>Engine/Lubrication/OIL - Standard Procedure</u>.</p> <p>4. Measure the bearings for correct clearance with plasti-gage. Repair as necessary.</p> <p>5. Check the crankshaft thrust bearing for excessive wear on flanges. See <u>Engine/Engine Block/CAMSHAFT, Engine - Inspection</u>.</p> <p>6. Replace the crankshaft. See <u>Engine/Engine Block/CRANKSHAFT - Removal</u>.</p> <p>7. Inspect the crankshaft, flexplate/flywheel and bolts for damage. Tighten to correct torque.</p>
LOW OIL PRESSURE	<p>1. Low oil level.</p> <p>2. Faulty oil pressure sending unit.</p> <p>3. Clogged oil filter.</p> <p>4. Worn oil pump.</p> <p>5. Thin or diluted oil.</p> <p>6. Excessive bearing</p>	<p>1. Check the oil level and fill if necessary.</p> <p>2. Install a new sending unit.</p> <p>3. Install a new oil filter. See <u>Engine/Lubrication/FILTER, Engine Oil - Removal</u>.</p> <p>4. Replace the oil pump assembly. See <u>Engine/Lubrication/PUMP, Engine Oil - Removal</u>.</p> <p>5. Change the engine oil to correct viscosity. See <u>Engine/Lubrication/OIL - Standard Procedure</u>.</p> <p>6. Measure the bearings for</p>

	<p>clearance.</p> <p>7. Oil pump relief valve stuck.</p> <p>8. Oil pickup tube loose, broken, bent or clogged.</p> <p>9. Oil pump cover warped or cracked.</p>	<p>correct clearance with plasti-gage. Repair as necessary.</p> <p>7. The oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced. See <u>Engine/Lubrication/PUMP, Engine Oil - Removal.</u></p> <p>8. Inspect the oil pickup tube and pump, and clean or replace as necessary. See <u>Engine/Lubrication/PAN, Oil - Removal.</u></p> <p>9. Install a new oil pump. See <u>Engine/Lubrication/PUMP, Engine Oil - Removal.</u></p>
OIL LEAKS	<p>1. Misaligned or deteriorated gaskets.</p> <p>2. Loose fastener, broken or porous metal part.</p> <p>3. Front or rear crankshaft oil seal leaking.</p> <p>4. Leaking oil gallery plug or cup plug.</p>	<p>1. Replace gasket.</p> <p>2. Tighten, repair or replace the part.</p> <p>3. Replace the front seal or rear seal. See <u>Engine/Engine Block/SEAL, Crankshaft Oil - Removal.</u> Refer to <u>Engine/Engine Block/SEAL, Crankshaft Oil - Removal .</u></p> <p>4. Remove and reseal threaded plug. Replace the cup style plug.</p>
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	<p>1. CCV System malfunction.</p> <p>2. Defective valve stem seal (s).</p> <p>3. Worn or broken piston rings.</p> <p>4. Scuffed pistons/cylinder</p>	<p>1. Check for correct operation. Refer to <u>Emissions Control - Description .</u></p> <p>2. Repair or replace the seal(s). See <u>Engine/Cylinder Head/SPRING(S), Valve - Removal.</u></p> <p>3. Hone the cylinder bores and Install new rings. See <u>Engine/Engine Block/ROD, Piston and Connecting - Removal.</u></p> <p>4. Hone the cylinder bores and</p>

	walls.	replace pistons as required. See <u>Engine/Engine Block/ROD, Piston and Connecting - Removal</u> .
	5. Carbon in oil control ring groove.	5. Remove the rings and de-carbon the piston. See <u>Engine/Engine Block/RING(S), Piston - Standard Procedure</u> .
	6. Worn valve guides.	6. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.
	7. Piston rings fitted too tightly in grooves.	7. Remove the rings and check the ring end gap and side clearance. Replace if necessary. See <u>Engine/Engine Block/RING(S), Piston - Standard Procedure</u> .

STANDARD PROCEDURE

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads.
- Tapping the hole with a special Heli-Coil Tap.
- Installing an insert into the tapped hole to bring the hole back to its original thread size.

HYDROSTATIC LOCK

CAUTION: Do not attempt to run engine. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

1. Perform the Fuel Pressure Release Procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .
2. Disconnect the negative battery cable(s) from the battery.

3. Inspect air cleaner, induction system, and intake manifold to make sure the system is dry and clear of foreign material.
4. Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.
5. With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.
6. Identify the fluid in the cylinders (coolant, fuel, oil).
7. Make sure all fluid has been removed from the cylinders.
8. Repair engine or components as necessary to prevent this problem from occurring again.
9. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This prevents damage on restart.
10. Install new spark plugs. Tighten the spark plugs to 41 N.m (30 ft. lbs.).
11. Drain engine oil. Remove and discard the oil filter.
12. Install the drain plug. Tighten the plug to 34 N.m (25 ft. lbs.).
13. Install a new oil filter.
14. Fill the engine crankcase with the specified amount and grade of oil. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** .
15. Connect the negative battery cable(s).
16. Start the engine and check for any leaks.

FORM-IN-PLACE GASKETS AND SEALERS

NOTE: **All sealants mentioned below are not used on every engine, they are listed as general reference guide. See service information for specific sealer usage.**

There are numerous places where form-in-place gaskets are used on the engine. Care must be taken when applying form-in-place gaskets to assure obtaining the desired results. **Do not use form-in-place gasket material unless specified.** Bead size, continuity, and location are of great importance. Too thin of a bead can result in leakage while too much can result in spill-over which can break off and obstruct fluid feed lines. A continuous bead of the proper width is essential to obtain a leak-free gasket. All sealing surfaces that use form-in-place gaskets and sealers must be free of grease or oil. Clean surfaces with Mopar® brake parts cleaner prior to sealer application. After the sealer is applied, assemble the parts within 10 minutes.

Numerous types of form-in-place gasket materials are used in the engine area. Mopar® Sealant RTV Silicone Rubber Adhesive, MOPAR® Silicone Rubber RTV, Mopar® ATF-RTV and Mopar® Gasket Maker gasket materials, each have different properties and cannot be used in place of the other.

MOPAR® SEALANT RTV SILICONE RUBBER ADHESIVE is used to seal components exposed to engine oil. This material is a specially designed black silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil. Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® SILICONE RUBBER RTV is used to seal components exposed to engine oil, gear lubricant, and coolant. This material is a specially designed gray silicone rubber RTV that retains adhesion and sealing properties when exposed to engine oil, gear lubricant and coolant. Excellent adhesion even on oily surfaces, withstands temperatures to 330° C (626° F). Moisture in the air causes the material to cure. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® ATF-RTV is a specially designed black silicone rubber RTV that retains adhesion and sealing properties to seal components exposed to automatic transmission fluid, engine coolants, and moisture. This material is available in three ounce tubes and has a shelf life of one year. After one year this material will not properly cure. Always inspect the package for the expiration date before use.

MOPAR® GASKET MAKER is an anaerobic type gasket material. The material cures in the absence of air when squeezed between two metallic surfaces. It will not cure if left in the uncovered tube. The anaerobic material is for use between two machined surfaces. Do not use on flexible metal flanges.

MOPAR® GASKET SEALANT is a slow drying, permanently soft sealer. This material is recommended for sealing threaded fittings and gaskets against leakage of oil and coolant. It can be used on threaded and machined parts under all temperatures. This material also prevents corrosion. Mopar® Gasket Sealant is available in a 13 oz. aerosol can or in a 4 oz. or 6 oz. can with applicator.

SEALER APPLICATION

Apply 1 mm (0.040 in.) diameter or less of Mopar® Gasket Maker material to one gasket surface. Be certain the material surrounds each mounting hole. Excess material can easily be wiped off. Tighten the components in place within 15 minutes. Use a locating dowel during assembly to prevent smearing material off the location.

Apply Mopar® RTV or ATF-RTV gasket material in a continuous bead approximately 3 mm (0.120 in.) in diameter. For corner sealing and "T-Joint" locations and waffle pad area, a 0.635 mm (0.025 in.) drop is placed in the center of the gasket contact area. Remove uncured sealant with a shop towel. Tighten the components in place while the sealant is still wet to the touch (within 10 minutes). Use a locating dowel during assembly to prevent smearing material off the location.

REMOVAL

REMOVAL

Fig. 1: Removing/Installing Cowl Panel
 Courtesy of CHRYSLER LLC

1. Remove the hood. Refer to **Body/Hood/HOOD - Removal** .
2. Remove the cowl top panel (2). Refer to **Body/Exterior/COVER, Cowl Panel - Removal** .
3. Remove the strut tower support (6).

Fig. 2: Engine Covers
 Courtesy of CHRYSLER LLC

4. Remove the engine covers (1).

5. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .

Fig. 3: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

6. Disconnect and isolate the negative battery cable (3).

Fig. 4: Air Cleaner Duct
Courtesy of CHRYSLER LLC

7. Disconnect the make up air hose.
8. Disconnect the intake air temperature (IAT) sensor electrical connector.
9. Remove the air cleaner housing (1) and clean air tube (2).

Fig. 5: Identifying Accessory Drive Belt Routing - 5.7L
Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

10. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop and remove the accessory drive belt (4), then slowly rotate the tensioner into the freearm position.
11. Remove the cooling fan. Refer to Cooling/Engine/FAN, Cooling - Removal .

Fig. 6: Removing/Installing A/C Compressor
 Courtesy of CHRYSLER LLC

12. Remove the A/C compressor (3). Refer to **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal**.

Fig. 7: Removing/Installing Front Liquid A/C Line
 Courtesy of CHRYSLER LLC

13. Remove the nut (1) from the front section of the A/C liquid line (2) to the rear section of the liquid line (3), separate the lines, remove and discard the dual plane seal.
14. Install plugs or tape over the opened liquid line fittings.
15. Remove the front section of the A/C liquid line from the engine compartment.

Fig. 8: Removing/Installing Front Suction A/C Line
 Courtesy of CHRYSLER LLC

16. Remove the nut (1) from the front section of the A/C suction line (2) to the rear section of the suction line (3), separate the lines, remove and discard the dual plane seal.
17. Install plugs or tape over the opened suction line fittings.
18. Remove the front section of the A/C suction line from the engine compartment.

Fig. 9: Engine Mount Heat Shield
 Courtesy of CHRYSLER LLC

19. Remove the engine mount heat shield retaining bolt (2) and heat shield (1).

Fig. 10: GENERATOR SUPPORT BRACKET
 Courtesy of CHRYSLER LLC

20. Remove the generator (2) and support bracket (1). Refer to **Electrical/Charging/GENERATOR - Removal** .

Fig. 11: POWER STEERING PUMP - 5.7L
 Courtesy of CHRYSLER LLC

NOTE: It is not necessary to disconnect power steering pump hoses from power steering pump for power steering pump removal.

21. Remove the three power steering pump (1) mounting bolts (2) through the access holes in the

pulley and position the pump aside.

Fig. 12: FRONT BELLY PAN
Courtesy of CHRYSLER LLC

22. Raise and support the vehicle.
23. Remove the belly pan (2).
24. Drain the engine oil.
25. Drain the cooling system. Refer to **Cooling - Standard Procedure** .

Fig. 13: LOWER RADIATOR HOSE
Courtesy of CHRYSLER LLC

- 1 - LOWER RADIATOR HOSE
- 2 - RADIATOR FAN ASSEMBLY

26. Remove lower radiator hose (1).

Fig. 14: Knock Sensor 5.7L
Courtesy of CHRYSLER LLC

NOTE: Two knock sensors are used. Each sensor is bolted to the outside of cylinder block below the exhaust manifold.

27. Remove the right and left knock sensor electrical connectors.

Fig. 15: Crankshaft Position Sensor Electrical Connector
 Courtesy of CHRYSLER LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block.

28. Remove the CKP sensor electrical connector (1).
29. Remove the oil temperature sensor electrical connector.
30. Remove the oil pressure sensor electrical connector.
31. Lower the vehicle.

Fig. 16: RADIATOR FAN ASSEMBLY
 Courtesy of CHRYSLER LLC

- 1 - UPPER RADIATOR CLOSURE PANELS
- 2 - UPPER RADIATOR HOSE
- 3 - RADIATOR FAN ELECTRICAL CONNECTOR
- 4 - RADIATOR FAN ASSEMBLY

32. Remove upper radiator hose (2).

Fig. 17: CAMSHAFT POSITION SENSOR-5.7L
Courtesy of CHRYSLER LLC

33. Disconnect the camshaft position (CMP) sensor electrical connector (4).

Fig. 18: HEATER HOSE SUPPLY

Courtesy of CHRYSLER LLC

34. Remove the heater hoses (1,2).

Fig. 19: Ignition Coil Mounting Bolts
Courtesy of CHRYSLER LLC

35. Remove all ignition coil electrical connectors (1).
36. Remove all fuel injector electrical connectors.

Fig. 20: Removing/Installing MAP Sensor

Courtesy of CHRYSLER LLC

NOTE: The Manifold Absolute Pressure (MAP) sensor (3) is mounted into the top rear of the intake manifold near the cowl hood seal (1).

37. Disconnect the MAP sensor electrical connector by sliding release lock out (1) and pressing down on the lock tab (2).

Fig. 21: Removing/Installing ECT
Courtesy of CHRYSLER LLC

38. Remove the coolant temperature sensor (3) electrical connector (2).

Fig. 22: Ignition Capacitor
 Courtesy of CHRYSLER LLC

NOTE: The ignition capacitor (2) is attached to the left rear corner of the intake manifold (3).

39. Remove the ignition capacitor (2) electrical connector (1).

Fig. 23: Intake Manifold Removal & Tightening Sequence
 Courtesy of CHRYSLER LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

40. Remove the intake manifold. See [Engine/Manifolds/MANIFOLD, Intake - Removal](#).

41. Remove the ground wires from the rear of each cylinder head.
42. Remove the right and left side engine wiring harness and position aside.

Fig. 24: Engine Mount Nuts
Courtesy of CHRYSLER LLC

43. Raise and support the vehicle.
44. Remove the front engine mount nuts (1,2).
45. Disconnect the transmission oil cooler lines from their retainers at the oil pan.

Fig. 25: LH CATALYTIC CONVERTER
Courtesy of CHRYSLER LLC

CAUTION: When separating the exhaust pipes from the manifolds, disconnect

the oxygen sensor connector(s). Allowing the exhaust pipes hanging from the oxygen sensor wires damages the harness and/or sensor.

46. Disconnect the oxygen sensor electrical connectors (2).
47. Saturate all exhaust bolts and nuts with Mopar® Rust Penetrant and allow five minutes for penetration.
48. Remove the exhaust pipe to manifold bolts (3) and separate the exhaust pipes (4) from the exhaust manifolds.

815caa71

Fig. 26: Removing/Installing Starter
Courtesy of CHRYSLER LLC

49. Remove the starter motor (1) heat shield (4).
50. Disconnect the starter wires, remove the starter motor retaining bolts (2) and remove the starter (1). Refer to **Electrical/Starting/STARTER - Removal** .

Fig. 27: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER LLC

51. Remove the inspection cover (1).

Fig. 28: Removing/Installing Transmission
Courtesy of CHRYSLER LLC

52. Manual transmission equipped vehicles, remove the transmission. Refer to **Transmission and Transfer Case/Manual - Removal** .

813878a5

Fig. 29: TORQUE CONVERTER BOLTS
 Courtesy of CHRYSLER LLC

53. Automatic transmission equipped vehicles, rotate the crankshaft in clockwise direction until converter bolts (1) are accessible and remove the flexplate to converter bolts (1).

8131d387

Fig. 30: Remove/Install Transmission To Oil Pan Bolts
 Courtesy of CHRYSLER LLC

54. Remove the oil pan to transmission bolts (1).

Fig. 31: Remove/Install Transmission To Engine Bolts
Courtesy of CHRYSLER LLC

55. Remove the transmission bell housing to engine block bolts (2).

Fig. 32: ENGINE LIFT FIXTURE and ADAPTER
Courtesy of CHRYSLER LLC

56. Lower the vehicle.
57. Remove the left coolant tube.

NOTE: Do not use air tools to install engine lift fixture.

58. Install the engine lift fixture 8984A (2) and adapter 8984-UPD (4).
59. Using a suitable engine hoist, separate the engine from the transmission and remove the engine from the vehicle.
60. Install the engine assembly on a suitable repair stand.

INSTALLATION

INSTALLATION

Fig. 33: ENGINE LIFT FIXTURE and ADAPTER
Courtesy of CHRYSLER LLC

NOTE: Do not use air tools to install Engine Lift Fixture and Adapter 8984A (2,3).

1. Install the engine lift fixture 8984A (2) and adapter 8984-UPD (4).
2. Using a suitable engine hoist, lower the engine into in the engine compartment.
3. Automatic transmission equipped vehicles, align the engine with the transmission.
4. Install two transmission to engine block mounting bolts finger tight.
5. Lower the engine assembly until the engine mount studs rest in the frame brackets and remove the engine hoist.

1435449

Fig. 34: Removing/Installing Transmission
Courtesy of CHRYSLER LLC

6. Manual transmission equipped vehicles, install the transmission. Refer to **Transmission and Transfer Case/Manual - Installation** .
7. Raise and support the vehicle.

8131d397

Fig. 35: Remove/Install Transmission To Oil Pan Bolts
Courtesy of CHRYSLER LLC

8. Install the transmission (3) to oil pan (2) bolts (1) and tighten to 39 N.m (29 ft. lbs.).

8131d398

Fig. 36: Removing/Installing Transmission To Engine Bolts
Courtesy of CHRYSLER LLC

9. Install the remaining transmission (3) to engine block (1) mounting bolts (2) and tighten to 68 N.m (50 ft. lbs.).

157012

Fig. 37: Engine Mount Nuts
Courtesy of CHRYSLER LLC

10. Install and tighten the front engine mount retaining nuts to 95 N.m (70 ft. lbs.).

813878a5

Fig. 38: TORQUE CONVERTER BOLTS
Courtesy of CHRYSLER LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the flexplate. Bolts that are too long will damage the clutch surface inside the torque converter.

11. Automatic transmission equipped vehicles, rotate the crankshaft in clockwise direction and install all torque converter to flexplate bolts (1) finger tight.
12. Verify that the torque converter is pulled flush to the flexplate and tighten bolts to 88 N.m (65 ft. lbs.).

Fig. 39: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER LLC

13. Install the inspection cover (1) and tighten bolt (2) to 11 N.m (8 ft. lbs.).

Fig. 40: Removing/Installing Starter
Courtesy of CHRYSLER LLC

14. Position the starter motor into the transmission.
15. Connect the solenoid wire to the starter motor (snaps on).
16. Position the battery cable to the solenoid stud, install the battery cable eyelet nut and tighten to

11 N.m (8 ft. lbs.).

17. Install the three starter motor retaining bolts (2) and tighten to 54 N.m (40 ft. lbs.).
18. Install the starter (1) heat shield (4) and securely tighten nuts (3).

Fig. 41: LH CATALYTIC CONVERTER
Courtesy of CHRYSLER LLC

19. Install the exhaust pipes (4) to the manifolds and connect the oxygen sensor electrical connectors (2). Refer to **Exhaust System/CONVERTER, Catalytic - Installation** .

Fig. 42: Knock Sensor 5.7L

Courtesy of CHRYSLER LLC

20. Connect the right and left knock sensor (1) electrical connectors (5).

Fig. 43: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER LLC

NOTE: **The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block.**

21. Connect the CKP sensor electrical connector (1).
22. Connect the oil temperature sensor electrical connector.
23. Connect the oil pressure sensor electrical connector.
24. Connect the transmission oil cooler lines to their retainers at the oil pan.

8138a0a2

Fig. 44: LOWER RADIATOR HOSE
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - LOWER RADIATOR HOSE
2 - RADIATOR FAN ASSEMBLY |
|--|

25. Install the lower radiator hose (1).

813530ba

Fig. 45: FRONT BELLY PAN
 Courtesy of CHRYSLER LLC

26. Install the belly pan (2).
27. Lower the vehicle.

Fig. 46: ENGINE LIFT FIXTURE and ADAPTER
 Courtesy of CHRYSLER LLC

28. Remove the engine lift fixture 8984A (2) and adapter 8984-UPD (4).
29. Install the left coolant tube.
30. Install the left and right side wiring harness.

Fig. 47: CAMSHAFT POSITION SENSOR-5.7L
 Courtesy of CHRYSLER LLC

31. Connect the camshaft position sensor electrical connector (4).

Fig. 48: HEATER HOSE SUPPLY
 Courtesy of CHRYSLER LLC

32. Connect the heater hoses (1,2).
33. Connect the ground wires to the rear of each cylinder head.

Fig. 49: POWER STEERING PUMP - 5.7L
 Courtesy of CHRYSLER LLC

34. Install the three power steering pump (1) retaining bolts (2) through the access holes in the pulley and tighten the bolts to 28 N.m (21 ft. lbs.).

1248247

Fig. 50: Intake Manifold Removal & Tightening Sequence
 Courtesy of CHRYSLER LLC

35. Install the intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Installation**.

815bbae3

Fig. 51: Fuel Line At Fuel Rail
 Courtesy of CHRYSLER LLC

36. Connect the fuel line (1) to the fuel rail. Refer to **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure** .

Fig. 52: GENERATOR
 Courtesy of CHRYSLER LLC

37. Install the generator (2) and connect the electrical connectors. Refer to **Electrical/Charging/GENERATOR - Installation** .

Fig. 53: Removing/Installing A/C Compressor
 Courtesy of CHRYSLER LLC

38. Install the A/C compressor (3). Refer to **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal** .

Fig. 54: Engine Mount Heat Shield
Courtesy of CHRYSLER LLC

39. Install the engine mount heat shield (1) and tighten fastener (2).

Fig. 55: Removing/Installing Front Suction A/C Line
Courtesy of CHRYSLER LLC

40. Position the front section of the A/C suction line (2) into the engine compartment.
41. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line to the rear section of the A/C suction line (3).
42. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use

only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

43. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
44. Install the nut (1) that secures the front section of the A/C suction line to the rear section of the A/C suction line and tighten the nut to 22 N.m (16 ft. lbs.).

Fig. 56: Removing/Installing Front Liquid A/C Line
Courtesy of CHRYSLER LLC

45. Position the front section of the A/C liquid line into the engine compartment.
46. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).
47. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
48. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
49. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line and tighten the nut to 22 N.m (16 ft. lbs.).

8012597c

Fig. 57: Removing/Installing MAP Sensor
Courtesy of CHRYSLER LLC

NOTE: The Manifold Absolute Pressure (MAP) sensor (3) is mounted into the top rear of the intake manifold near the cowl hood seal (1).

50. Connect the MAP sensor electrical connector and slide the release lock into position.

8013234a

Fig. 58: Removing/Installing ECT
Courtesy of CHRYSLER LLC

51. Connect the coolant temperature sensor (3) electrical connector (2).

Fig. 59: Ignition Coil Mounting Bolts
Courtesy of CHRYSLER LLC

52. Connect all ignition coil electrical connectors (1).
53. Connect all fuel injector electrical connectors.

Fig. 60: Ignition Capacitor
Courtesy of CHRYSLER LLC

NOTE: The ignition capacitor (2) is attached to the left rear corner of the intake manifold (3).

54. Connect the ignition capacitor (2) electrical connector (1).

Fig. 61: Identifying Accessory Drive Belt Routing - 5.7L
Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

55. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts its stop and install the accessory drive belt (4) onto the pulleys, then slowly release the tensioner.
56. Install the cooling fan. Refer to **Cooling/Engine/FAN, Cooling - Installation** .

Fig. 62: RADIATOR FAN ASSEMBLY
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - UPPER RADIATOR CLOSURE PANELS
2 - UPPER RADIATOR HOSE
3 - RADIATOR FAN ELECTRICAL CONNECTOR
4 - RADIATOR FAN ASSEMBLY |
|--|

57. Install the upper radiator hose (2).

Fig. 63: Removing/Installing Cowl Panel
 Courtesy of CHRYSLER LLC

58. Install the strut tower support (6) and tighten bolts to 38 N.m (28 ft. lbs.).
59. Install the cowl top panel. Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .

815d014c

Fig. 64: Air Cleaner Duct
Courtesy of CHRYSLER LLC

60. Install the air cleaner housing (1) and clean air tube (2). See **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
61. Install the make up air hose.
62. Connect the intake air temperature (IAT) sensor connector.
63. Fill the engine with oil. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** .
64. Fill the cooling system. Refer to **Cooling - Standard Procedure** .

815caa1a

Fig. 65: Engine Covers
 Courtesy of CHRYSLER LLC

65. Snap the engine covers (1) onto the fuel rails.

813422cd

Fig. 66: Battery System Components And PDC Cover
 Courtesy of CHRYSLER LLC

66. Connect the negative battery cable (3).
67. Charge the A/C system. Refer to Heating and Air Conditioning/Plumbing - Standard Procedure.

68. Start the engine and check for leaks.

69. Road test the vehicle.

SPECIFICATIONS

MDS SYSTEM

DESCRIPTION

DESCRIPTION

81d715d8

Fig. 88: MDS CYLINDER VIEW
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - DEACTIVATING LIFTERS
2 - SOLENOIDS
3 - LIFTER OIL GALLERY
4 - MAIN OIL GALLERY |
|---|

The Multiple Displacement System (MDS) provides cylinder deactivation during steady-speed, low-acceleration and shallow grade climbing conditions to increase fuel economy.

MDS can provide a 5-20 percent fuel economy benefit when operating in four-cylinder mode, depending on driving habits and vehicle usage. For EPA rating purposes, fuel economy is 8-15 percent higher than if the engine was operating on eight cylinders at all times.

MDS is integrated into the basic engine architecture, requiring a minimum of additional parts - four additional solenoids, an oil temperature sensor and a wire harness. Eight unique valve lifters and a modified camshaft are also required.

OPERATION

OPERATION

Fig. 89: MDS LIFTER CROSS-SECTION
Courtesy of CHRYSLER LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals provide smooth operation. Two cylinders on each bank are active when the engine is in four-cylinder mode - every other cylinder in the firing order. All of the cylinders that are deactivated have unique hydraulic valve lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. It is delivered through special oil passages drilled into the cylinder block. Solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each valve lifter, which then becomes a "lost motion" link. Its base follows the camshaft, but its top remains stationary, held in place against the pushrod by light spring pressure but unable to move because of the much higher force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in 5.7L engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition then occurs, but the combustion products remain trapped in the cylinder under high pressure, because the valves no longer open. No air enters or leaves. During subsequent piston strokes, this high-pressure gas is repeatedly compressed and expanded like an air spring, but fuel is not injected.

AIR INTAKE SYSTEM

AIR CLEANER

Removal

REMOVAL

Fig. 90: View of Retaining Clamps
 Courtesy of CHRYSLER LLC

1. Disengage the two retaining clamps (1) and lift the cover upwards.
2. Remove the air cleaner element from the inside of the air cleaner housing.

Installation

INSTALLATION

Fig. 91: View of Retaining Clamps
 Courtesy of CHRYSLER LLC

1. Clean any dirt or foreign matter from the inside of the air cleaner housing.

NOTE: **The air cleaner element must be properly seated for the air cleaner housing cover to fit correctly.**

2. Install the air cleaner element into the air cleaner housing.
3. Position the air cleaner housing cover in place and secure the two retainer clips (1).

BODY, AIR CLEANER

Removal

REMOVAL

1375411

Fig. 92: Air Filter Assembly
Courtesy of CHRYSLER LLC

1. Remove the engine cover (1).
2. Disconnect the intake air temperature (IAT) sensor (5) connector.
3. Loosen the clamps at the throttle body and the air filter assembly and remove the air tube (4).
4. Disconnect the make up air hose (MUA) (2).
5. Remove the air filter assembly retaining bolt (3).
6. Remove the air filter assembly from the vehicle.

Installation

INSTALLATION

1375411

Fig. 93: Air Filter Assembly
Courtesy of CHRYSLER LLC

1. Position the air filter assembly into the engine compartment.
2. Install the air filter assembly retaining bolt (3) and tighten.
3. Connect the clean air tube to the throttle body and the air filter assembly and tighten clamps.
4. Connect the make up air hose (MUA) (2).
5. Connect the intake air temperature (IAT) sensor (5) connector.
6. Install the engine cover (1).

CYLINDER HEAD

OPERATION

CYLINDER HEAD

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:
 - Loss of engine power
 - Engine misfiring
 - Poor fuel economy
- Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:
 - Engine overheating
 - Loss of coolant
 - Excessive steam (white smoke) emitting from exhaust
 - Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in the **CYLINDER COMPRESSION PRESSURE LEAKAGE**. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50 - 70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: Use extreme care when the engine is operating with the coolant pressure cap removed. Failure to follow these instructions may result in possible serious or fatal injury.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

CAUTION: With the cooling system tester in place, pressure builds up fast. Excessive pressure built up by continuous engine operation must be released to a safe pressure point. Never permit pressure to exceed 138 kPa (20 psi).

Install the Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If the gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using the Bloc-Chek Kit C-3685-A or equivalent. Perform the test following the procedures supplied with the tool kit.

REMOVAL

REMOVAL

WARNING: The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released.

1. Perform the Fuel System Pressure Release procedure. Refer to Fuel System/Fuel Delivery - Standard Procedure .

CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used by referring to Quick-Connect Fitting Removal. This will prevent unnecessary fitting or fitting latch breakage.

2. Disconnect the fuel supply line. Refer to Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure .
3. Disconnect the negative battery cable.

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

4. Drain the cooling system. Refer to Cooling - Standard Procedure .

Fig. 94: IAT Sensor Electrical Connector
Courtesy of CHRYSLER LLC

5. Disconnect the Intake Air Temperature (IAT) sensor electrical connector (2).
6. Remove the air cleaner resonator and duct work as an assembly (1). See **Engine/Air Intake System/BODY, Air Cleaner - Removal**.

Fig. 95: LH CATALYTIC CONVERTER
Courtesy of CHRYSLER LLC

CAUTION: When servicing or replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor.

7. Saturate all exhaust bolts and nuts with Mopar® Rust Penetrant. Allow 5 minutes for penetration.
8. Remove exhaust pipe to manifold bolts (3).
9. Disconnect the evaporation control system.

Fig. 96: HEATER HOSE SUPPLY
 Courtesy of CHRYSLER LLC

10. Disconnect the heater hoses (1,2).

Fig. 97: Identifying Accessory Drive Belt Routing - 5.7L
 Courtesy of CHRYSLER LLC

11. Insert a suitable square drive ratchet into the square hole on the belt tensioner arm (7).
12. Release the belt tension by rotating the tensioner (7) **clockwise** . Rotate the belt tensioner and remove the accessory drive belt (4) from the pulleys.

81378561

Fig. 98: POWER STEERING PUMP - 5.7L
 Courtesy of CHRYSLER LLC

NOTE: It is not necessary to disconnect the P/S hoses from the pump, for P/S pump removal.

13. Remove three power steering pump (1) mounting bolts (2) through access holes in pulley. Refer to Steering/Pump - Removal .

815cfa8f

Fig. 99: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

14. Remove the cylinder head covers and gaskets, using the sequence shown in illustration. See **Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.**

Fig. 100: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

15. Remove intake manifold retaining fasteners in the sequence shown in illustration. See **Engine/Manifolds/MANIFOLD, Intake - Removal.**

Fig. 101: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

NOTE: Make sure to identify the original location of the rocker arms and push

rods for correct assembly.

16. Remove the rocker arm assemblies using the sequence shown in illustration. See **Engine/Cylinder Head/ROCKER ARM, Valve - Removal**.
17. Remove the push rods.

88745

Fig. 102: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

18. Remove the head bolts from each cylinder head using the sequence shown in illustration.
19. Remove the cylinder head and discard the cylinder head gasket(s).

CLEANING

CLEANING

Clean all sealing surfaces of the cylinder block and cylinder heads using Mopar® Brake Parts Cleaner (or equivalent).

INSPECTION

INSPECTION

1. Inspect the cylinder head for out-of-flatness using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.
3. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.
4. Inspect the pushrods. Replace worn or bent pushrods.

INSTALLATION

INSTALLATION

CAUTION: The cylinder head gaskets are not interchangeable between the left and right sides. They are marked with an "L" and "R" to indicate the left or right side and they are marked "TOP" to indicate which side goes up.

CAUTION: The head gaskets are marked "TOP" to indicate which side goes up.

983987

Fig. 103: Identifying Cylinder Head Gasket Marking
Courtesy of CHRYSLER LLC

1. Clean all surfaces of the cylinder block and cylinder heads.
2. Clean the cylinder block front and the rear gasket surfaces using a suitable solvent.

4591

Fig. 104: Cylinder Head Components
Courtesy of CHRYSLER LLC

3. Position the new cylinder head gaskets (5) onto the cylinder block.
4. Position the cylinder heads (4) onto the head gaskets (5) and the cylinder block.

88745

15. Connect the heater hoses (1,2).

16. Connect the fuel supply line.

81378561

Fig. 110: POWER STEERING PUMP - 5.7L
Courtesy of CHRYSLER LLC

17. Install three power steering pump mounting bolts (2) through access holes in pulley. Tighten bolts to 28 N.m (21 ft. lbs.). Refer to **Steering/Pump - Installation**.

212564

Fig. 111: Identifying Accessory Drive Belt Routing - 5.7L
Courtesy of CHRYSLER LLC

18. Position the accessory drive belt (4) over all pulleys except for the water pump pulley (8).
19. Insert a suitable square drive ratchet into the square hole on the belt tensioner arm (7).

20. Rotate the tensioner (7) **clockwise** and slip the accessory drive belt over the water pump pulley (8).

Fig. 112: Cylinder Head Cover Torque Sequence
Courtesy of CHRYSLER LLC

21. Install the cylinder head covers (1) and tighten retainers in the sequence shown in illustration. See **Engine/Cylinder Head/COVER(S), Cylinder Head - Installation**.
22. Connect the evaporation control system.

Fig. 113: IAT Sensor Electrical Connector
Courtesy of CHRYSLER LLC

23. Install the air cleaner resonator and duct work as an assembly (1). See **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
24. Connect the Intake Air Temperature (IAT) sensor electrical connector (2).
25. Fill the cooling system. Refer to **Cooling - Standard Procedure**.
26. Change the engine oil and engine oil filter. See **Engine/Lubrication/OIL - Standard Procedure**.
27. Connect the negative battery cable.
28. Start the engine and check for leaks.

COVER(S), CYLINDER HEAD

Removal

REMOVAL

Fig. 114: Ignition Coil Mounting Bolts
 Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Disconnect ignition coil connector (1).
3. Remove ignition coil retaining bolts (3).

Fig. 115: Removing/Installing Ignition Coil

5. Remove cylinder head cover retaining bolts.

Fig. 117: Cylinder Head Components
 Courtesy of CHRYSLER LLC

6. Remove cylinder head cover (1).

NOTE: The gasket (2) may be used again, provided no cuts, tears, or deformation have occurred.

Installation

INSTALLATION

4591

Fig. 118: Cylinder Head Components
Courtesy of CHRYSLER LLC

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: Do not allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

1. Clean cylinder head cover (1) and both sealing surface (4). Inspect and replace gasket (2) as necessary.
2. Install cylinder head cover and hand start all fasteners. Verify that all double ended studs (3) are in the correct location.

Fig. 119: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

3. Tighten cylinder head cover bolts and double ended studs to 8 N.m (70 lbs. in.) in the sequence shown in illustration.

Fig. 120: Removing/Installing Ignition Coil
 Courtesy of CHRYSLER LLC

4. Before installing coil(s), apply dielectric grease to inside of spark plug boots (1).
5. Install ignition coils.

Fig. 121: Ignition Coil Mounting Bolts
 Courtesy of CHRYSLER LLC

6. Tighten fasteners (3) to 7 N.m (62 in. lbs.).
7. Connect ignition coil electrical connectors (1).
8. Install PCV hose.
9. Connect battery negative cable.

ROCKER ARM, VALVE

Removal

REMOVAL

Fig. 122: Battery

Courtesy of CHRYSLER LLC

1. Disconnect the negative battery cable (1).
2. Remove the engine cover.

Fig. 123: Removing/Installing Ignition Coil
Courtesy of CHRYSLER LLC

3. Remove the ignition coils (1). Refer to Electrical/Ignition Control/COIL, Ignition - Removal .

Fig. 124: Cylinder Head Cover Torque Sequence

Courtesy of CHRYSLER LLC

4. Using the sequence shown in illustration, remove the cylinder head cover. See Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.

Fig. 125: PUSH ROD RETAINER 9070
Courtesy of CHRYSLER LLC

5. Install the pushrod retainer 9070 (1).

Fig. 126: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

6. Using the sequence shown in illustration, loosen the rocker shafts retaining bolts.

Fig. 127: Intake Rocker Arm Marking
Courtesy of CHRYSLER LLC

CAUTION: The rocker shaft assemblies are not interchangeable between the intake and the exhaust, failure to install them in the correct location could result in engine damage. The intake rocker arms (1) are marked with the letter "I" (2).

Fig. 128: Rocker Shaft Retainers
Courtesy of CHRYSLER LLC

CAUTION: Do not remove the retainers (1) from the rocker shaft (3).

7. Remove the rocker shaft (3). Note the rocker shaft location during removal.

CAUTION: The longer pushrods are for the exhaust side and the shorter pushrods are for the intake side.

8. Remove the pushrods. Note the pushrod location during removal.

Installation

INSTALLATION

Fig. 129: PUSH ROD RETAINER 9070
Courtesy of CHRYSLER LLC

CAUTION: The longer pushrods are for the exhaust side and the shorter pushrods are for the intake side.

1. Install the pushrods in the same order as removed.
2. Install the pushrod retainer 9070 (1).

921965

Fig. 130: Rocker Shaft Retainers
Courtesy of CHRYSLER LLC

CAUTION: Make sure that the retainers (1) and the rocker arms (2) are not overlapped when tightening bolts or engine damage could result.

CAUTION: Due to the changes in the pushrod clearance holes in the Eagle 5.7L cylinder heads, close attention must be given when installing the pushrod(s) into the tappet(s). Once the pushrod(s) have been installed, use a suitable light to look down through the pushrod hole(s). This will allow you to verify the pushrod(s) are centered properly in the tappet(s) and avoid engine damage. Recheck after the rocker shaft assembly has been installed and tightened to specification.

922845

Fig. 131: Intake Rocker Arm Marking

8. Using the sequence shown in illustration, remove the exhaust/intake rocker arm shaft retaining bolts.

44571

Fig. 142: ROCKER SHAFT
 Courtesy of CHRYSLER LLC

NOTE: Tap the top of the valve spring retainer to loosen the spring retainers locks.

9. Install the rocker arm valve spring compressor shaft 9065A (1).

10. Install the spring compressor adapter arm 9065A if needed.
11. Insert an air hose (2) into the spark plug hole and charge the cylinder with air.

Fig. 143: Remove/Install Valve Spring Intake
Courtesy of CHRYSLER LLC

NOTE: Tap the top of the valve spring retainer to loosen the spring retainers locks.

12. Compress the valve spring with valve spring compressor (1) and remove the valve retainer locks.
13. Release the spring compressor and remove valve spring.

NOTE: The valve springs are interchangeable between intake and exhaust.

14. Remove the valve seal.

NOTE: All valve springs and seals are removed in the same manner.

Installation

INSTALLATION

Fig. 144: Remove/Install Valve Spring Intake
Courtesy of CHRYSLER LLC

1. Install the valve seal.
2. Install the valve spring.
3. Using the valve spring compressor 9065A (1), compress the valve spring and install the valve spring retainer and locks.
4. Remove the spring compressor.
5. Remove the air hose from the spark plug hole.

NOTE: **All valve springs and seals are installed in the same manner.**

Fig. 145: Intake Rocker Arm Marking
 Courtesy of CHRYSLER LLC

CAUTION: The rocker shaft assemblies are not interchangeable between the intake and the exhaust, failure to install them in the correct location could result in engine damage. The intake rocker arms (1) are marked with the letter "I" (2).

CAUTION: Due to the changes in the pushrod clearance holes in the Eagle 5.7L cylinder heads, close attention must be given when installing the pushrod(s) into the tappet(s). Once the pushrod(s) have been installed, use a suitable light to look down through the pushrod hole(s). This will allow you to verify the pushrod(s) are centered properly in the tappet(s) and avoid engine damage. Recheck after the rocker shaft assembly has been installed and tightened to specification.

CAUTION: The longer pushrods are for the exhaust side and the shorter pushrods are for the intake side.

NOTE: Pushrods must be installed in the same order as removed.

6. Install the rocker arm shaft and pushrods. See Engine/Cylinder Head/ROCKER ARM, Valve - Installation.
7. Using the sequence shown in illustration, tighten the rocker shaft bolts to 22 N.m (16 ft. lbs.).

Fig. 148: PUSH ROD RETAINER 9070
 Courtesy of CHRYSLER LLC

8. If used, remove the pushrod retainer 9070 (1).

Fig. 149: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: Do not allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

9. Clean the cylinder head cover and both sealing surfaces, inspect and replace the gasket as necessary.
10. Install the cylinder head cover and hand start all fasteners. Verify that all double ended studs are in the correct location.
11. Using the sequence shown in illustration, tighten the cylinder head cover retaining bolts to 8 N.m (71 in. lbs.).
12. Install the spark plugs.

Fig. 150: Removing/Installing Ignition Coil
Courtesy of CHRYSLER LLC

13. Before installing the ignition coils, apply dielectric grease to the inside of the spark plug boots.

Fig. 151: Ignition Coil Mounting Bolts
Courtesy of CHRYSLER LLC

14. Install the ignition coil (2) on the plugs and tighten the fasteners (3) to 7 N.m (62 in. lbs).
15. Connect the ignition coil electrical connectors (1).
16. Install the air cleaner assembly. See **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
17. Install the air intake resonator. Refer to **AIR CLEANER**.
18. Connect the negative battery cable.

VALVES, INTAKE AND EXHAUST

Description

VALVE GUIDES

The valve guides are made of powdered metal and pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

VALVES

Both the intake and the exhaust valves are made of steel. The intake valve is 50.93 mm (2.00 inches) in diameter and the exhaust valve is 39.53 mm (1.55 inches) in diameter. All valves use three-bead lock keepers to retain the springs and promote valve rotation.

Standard Procedure

REFACING

VALVE FACE AND VALVE SEAT ANGLE CHART

DESCRIPTION	SPECIFICATION	
	Metric	Standard
-		
Seat Width	-	
Intake	1.18 - 1.62 mm	0.0464 - 0.0637 in.
Exhaust	1.48 - 1.92 mm	0.058 - 0.075 in.
Face Angle	45° - 45 1/2°	
Seat Angle	44 1/2° - 45°	

NOTE: Valve seats that are worn or burned can be reworked, provided that correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Using a suitable dial indicator, measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in).
2. Apply a small amount of Prussian Blue to the valve seat. Insert the valve into the cylinder head. Rotate valve while applying light pressure on the valve seat. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
3. When the seat is properly positioned the width of the intake seat must be 1.18 - 1.62 mm (0.0464 - 0.0637 in.) and the exhaust seat must be 1.48 - 1.92 mm (0.058 - 0.075 in.).
4. Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 46.0 mm (1.81 in.).
5. The valve seat must maintain a seat angle of 44 1/2° - 45°.
6. The valve face must maintain a face angle of 45° - 45 1/2°.

Removal

REMOVAL

1. Remove the cylinder head. See **Engine/Cylinder Head - Removal**.
2. Compress valve springs using Valve Spring Compressor Tool C-3422-D and Adapter 8464.
3. Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.
4. Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

Installation

INSTALLATION

1. Clean valves thoroughly. Discard burned, warped and cracked valves.
2. Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
3. Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
4. Coat valve stems with lubrication oil and insert them in cylinder head.
5. If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.
6. Install new seals on all valve guides. Install valve springs and valve retainers.
7. Compress valve springs with Valve Spring Compressor Tool special tool # C- 3422 and adapter 8464, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer.
8. Install cylinder head. See **Engine/Cylinder Head - Installation**.

ENGINE BLOCK

CLEANING

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- The galley at the oil filter adaptor hole.
- The front and rear oil galley holes.
- The MDS oil galley holes in the valley.
- The feed holes for the crankshaft main bearings.

Drill and tapped holes should be free of debris upon assembly.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs, and coolant drain plugs. Tighten the oil galley 1/4 inch x 18 NPT plugs to 20 N.m (177 in. lbs.). Tighten the coolant drain 1/4 inch x 18 NPT plugs to 34 N.m (300 in. lbs.). Tighten the 3/8 inch x 18 NPT plugs to 27 N.m (240 in. lbs.).

INSPECTION

INSPECTION

Fig. 152: Bore Gauge - Typical
Courtesy of CHRYSLER LLC

1. It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) increments is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90 degrees) to the axis of the crankshaft and then take two additional reading.
3. Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
4. Determine taper by subtracting the smaller diameter from the larger diameter.
5. Rotate measuring device 90° and repeat steps above.
6. Determine out-of-roundness by comparing the difference between each measurement.
7. If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.015 mm (0.0006 inch), the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

ASSEMBLY, VARIABLE VALVE TIMING

Description

DESCRIPTION

1225995

Fig. 153: Variable Cam Timing (VCT) Assembly
Courtesy of CHRYSLER LLC

The 5.7L Eagle engine is equipped with Variable Cam Timing (VCT). This system advances and/or retards the camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The VCT assembly is sometimes referred to as a camshaft phaser.

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

The VCT assembly consists of the camshaft sprocket and a timing phaser. The VCT phaser assembly bolts to the camshaft and is serviced as an assembly.

Operation

OPERATION

The Variable Cam Timing (VCT) assembly is actuated with engine oil pressure. The oil flow to the VCT assemblies are controlled by an Oil Control Valve (OCV). The OCV consist of a Pulse Width Modulated (PWM) solenoid and a spool valve. The PCM actuates the OCV to control oil flow through the spool valve into the VCT assemblies. The VCT assembly consists of a rotor, stator, and sprocket. The stator is connected to the timing chain through the sprocket. The rotor is connected to the camshaft. Oil flow in to the VCT assembly rotates the rotor with respect to the stator, thus rotating the exhaust camshaft with respect to the timing chain and intake camshaft. An infinitely variable cam timing position can be achieved within the limits of the hardware. The CMP monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

Removal

REMOVAL

Fig. 154: Camshaft Phaser & Bolt
Courtesy of CHRYSLER LLC

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

1. Remove the timing chain and sprockets. See Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Removal.
2. Remove the camshaft phaser bolt (1).
3. Remove camshaft phaser (2).

Installation

INSTALLATION

Fig. 155: Phaser Alignment Slot
 Courtesy of CHRYSLER LLC

1. Align the slot (2) in the phaser (1) with the dowel on the camshaft.

Fig. 156: Camshaft Phaser & Bolt
 Courtesy of CHRYSLER LLC

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

2. Position the phaser (2) in place and install phaser retaining bolt (1) and tighten to 122 N.m (90 ft. lbs.).
3. Install the timing chain and sprockets. See **Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Installation.**

BEARING(S), CRANKSHAFT, MAIN

Standard Procedure

CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Fig. 157: Crankshaft Journal Measurements - Typical
Courtesy of CHRYSLER LLC

With the crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008 mm (0.0004 inch.) and maximum out of round is 0.005 mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (MAIN BEARING FITTING CHART). Select the inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

Fig. 158: Crankshaft Counterweight Stamped Grade Identification Marks
Courtesy of CHRYSLER LLC

The main bearings are "select fit" to achieve proper oil clearances. For main bearing selection, the crankshaft counterweight has grade identification marks stamped into it. These marks are read from left to right. The left letter (1) refers to the number one main journal and the right letter (2) refers to the number 5 journal.

NOTE: Service main bearings are coded. These codes identify what size or grade of the bearing.

MAIN BEARING SELECTION CHART - 5.7L

GRADE MARKING	BEARING SIZE		FOR USE WITH JOURNAL SIZE	
	METRIC	STANDARD	METRIC	STANDARD
A	0.008 mm U/S	0.0004 in. U/S	64.988 - 64.995 mm	2.5585 - 2.5588 in.
B	NOMINAL		64.996 - 65.004 mm	2.5588 - 2.5592 in.
C	0.008 mm O/S	0.0004 in. O/S	65.005 - 65.012 mm	2.5592 - 2.5595 in.

Inspection

INSPECTION

Fig. 159: Main Bearing Wear Patterns
Courtesy of CHRYSLER LLC

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

NOTE: If any crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scrapping or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CAMSHAFT, ENGINE

Removal

CAMSHAFT CORE HOLE PLUG

Fig. 160: Camshaft Core Hole Plug
Courtesy of CHRYSLER LLC

1. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .
2. Remove the engine from the vehicle. See **Engine - Removal**.
3. Remove the flexplate. See **Engine/Engine Block/FLEXPLATE - Removal**.

CAUTION: Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

4. Using a suitable sharp punch, punch a small hole in the camshaft core hole plug (1).
5. Insert a short sheet metal screw into the small hole in the camshaft core hole plug.
6. Using a suitable slide hammer puller, remove the rear camshaft core hole plug.

CAMSHAFT

Fig. 161: Accessory Drive Belt Routing
Courtesy of CHRYSLER LLC

1. Remove the battery negative cable.
2. Remove the air cleaner assembly. See **Engine/Air Intake System/BODY, Air Cleaner - Removal.**
3. Drain coolant. Refer to **Cooling - Standard Procedure .**
4. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal .**
5. Remove the left and right cylinder heads. See **Engine/Cylinder Head - Removal.**
6. Remove the radiator. Refer to **Cooling/Engine/RADIATOR, Engine Cooling - Removal .**
7. Remove the oil pan. See **Engine/Lubrication/PAN, Oil - Removal.**
8. Remove timing case cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Removal.**

Fig. 162: Removing/Installing Hydraulic Roller Tappet
 Courtesy of CHRYSLER LLC

NOTE: Identify lifters to ensure installation in original location.

9. Remove the tappets (2) and retainer (1) assembly.

Fig. 163: Oil Pick Up Tube
 Courtesy of CHRYSLER LLC

10. Remove the oil pick up tube (1).

474847

Fig. 164: Oil Pump Retaining Bolts
 Courtesy of CHRYSLER LLC

11. Remove the oil pump retaining bolts (2) and remove the oil pump (1).

474928

Fig. 165: Timing Chain
 Courtesy of CHRYSLER LLC

12. Remove timing chain (5). Refer to **CHAIN and SPROCKETS, Timing** .

Fig. 166: Camshaft Thrust Plate
Courtesy of CHRYSLER LLC

13. Remove camshaft thrust plate (1).

Fig. 167: Removing/Installing Camshaft
Courtesy of CHRYSLER LLC

NOTE: **Slowly rotate the camshaft while pulling camshaft out.**

14. Install a long bolt (2) into front of camshaft (1) to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

Inspection

INSPECTION

The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason. If the cam bearings are damaged, the cylinder block must be replaced.

Installation

CAMSHAFT CORE HOLE PLUG

Fig. 168: Camshaft Core Hole Plug
Courtesy of CHRYSLER LLC

1. Clean the core hole in the cylinder block.

NOTE: Do not apply adhesive to the new camshaft core hole plug. A new plug has adhesive pre-applied.

2. Install a new camshaft core hole plug (1) located at the rear of cylinder block, using a suitable flat faced tool. The plug must be fully seated on the cylinder block shoulder.
3. Install the flexplate. See **Engine/Engine Block/FLEXPLATE - Installation**.
4. Install the engine. See **Engine - Installation**.

CAMSHAFT

Fig. 169: Removing/Installing Camshaft
 Courtesy of CHRYSLER LLC

1. Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft (1).

Fig. 170: Camshaft Thrust Plate
 Courtesy of CHRYSLER LLC

2. Install camshaft thrust plate (1).

Fig. 171: Camshaft Thrust Plate Bolt Tightening Sequence
 Courtesy of CHRYSLER LLC

3. Tighten the bolts to 28 N.m (250 in. lbs.) in the sequence shown in illustration.
4. Measure camshaft end play. See **Engine - Specifications**. If not within limits install a new thrust plate.

Fig. 172: Timing Chain
 Courtesy of CHRYSLER LLC

5. Install timing chain (5) and sprockets (1,3). See **Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Installation**.
6. Install timing chain tensioner (4) and guide (2).

474847

Fig. 173: Oil Pump Retaining Bolts
Courtesy of CHRYSLER LLC

7. Install the oil pump (1) and tighten bolts to 28 N.m (248 in. lbs.). See **Engine/Lubrication/PUMP, Engine Oil - Installation.**

474797

Fig. 174: Oil Pick Up Tube
Courtesy of CHRYSLER LLC

8. Inspect oil pick up tube O-rings and replace as necessary.
9. Install the oil pick up tube (1) and tighten fasteners (2) to 28 N.m (248 in. lbs.).
10. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation.**
11. Install the oil pan. See **Engine/Lubrication/PAN, Oil - Installation.**

CAUTION: Engines equipped with MDS use both standard roller tappets (2) and deactivating roller tappets (1). The deactivating roller tappets must be used in cylinders 1,4,6,7. The deactivating tappets can be identified by the two holes in the side of the tappet body (3), for the latching pins.

NOTE: Each tappet reused must be installed in the same position from which it was removed. When camshaft is replaced, all of the tappets must be replaced.

Fig. 175: Rear MDS Lifter Assembly
Courtesy of CHRYSLER LLC

12. Install the rear MDS lifter assembly (2) and tighten bolt (1) to 12 N.m (106 in. lbs.).

Fig. 176: Front MDS Lifter Assembly

Courtesy of CHRYSLER LLC

13. Install the front MDS lifter assembly (2) and tighten bolt (1) to 12 N.m (106 in. lbs.).

Fig. 177: Cylinder Head Components
Courtesy of CHRYSLER LLC

14. Install both left and right cylinder heads (4). See Engine/Cylinder Head - Installation.
15. Install pushrods.
16. Install rocker arms. See Engine/Cylinder Head/ROCKER ARM, Valve - Installation.

Fig. 178: Cylinder Head Cover Torque Sequence
Courtesy of CHRYSLER LLC

17. Install cylinder head covers. See **Engine/Cylinder Head/COVER(S), Cylinder Head - Installation.**

Fig. 179: Generator & Power Steering Pump
Courtesy of CHRYSLER LLC

18. Install intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Installation.**
19. Install the generator (2).
20. Install the power steering pump (3).
21. Install the accessory drive belt (1). Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .

22. Install the radiator. Refer to Cooling/Engine/RADIATOR, Engine Cooling - Installation .
23. Install the air cleaner assembly. See Engine/Air Intake System/BODY, Air Cleaner - Installation.
24. Install the battery negative cable.
25. Refill coolant. Refer to Cooling - Standard Procedure .
26. Refill engine oil.
27. Start engine and check for leaks.

COVER, STRUCTURAL DUST

Description

DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine.

Operation

OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration.

Removal

REMOVAL

1. Raise and support the vehicle.

2301773

Fig. 180: Steering Rack To Frame Mounting Bolts
Courtesy of CHRYSLER LLC

2. Remove the steering rack to frame mounting bolts (1) and lower the steering rack enough to gain clearance for the structural dust cover removal.

Fig. 181: Transmission Mount To Crossmember Retaining Nuts
Courtesy of CHRYSLER LLC

3. Remove the transmission mount to crossmember retaining nuts (1).
4. Using a suitable jack, lift the transmission enough to gain clearance for the structural dust cover removal.

Fig. 182: Structural Cover
Courtesy of CHRYSLER LLC

5. Remove the structural dust cover retaining bolts (1,3 & 4).
6. Remove the structural dust cover (2).

Installation

INSTALLATION

CAUTION: The structural dust cover must be installed as described in the following steps. Failure to do so may cause severe damage to the cover.

Fig. 183: Structural Cover
Courtesy of CHRYSLER LLC

1. Position the structural dust cover in the vehicle
2. Install all four bolts retaining the structural dust cover to the engine (3) hand tight.
3. Install the four cover to transmission bolts (1, 2 & 4) hand tight.

CAUTION: The structural dust cover must be held tightly against both the engine and the transmission bell housing during the tightening sequence. Failure to do so may cause severe damage to the cover.

4. Tighten the structural dust cover-to-transmission bolts (1, 2 & 4) to 9 N.m (80 in. lbs.).
5. Tighten the structural dust cover-to-engine block bolts (3) to 9 N.m (80 in. lbs.).
6. Retighten the structural dust cover-to-transmission bolts to 54 N.m (40 ft. lbs.).
7. Retighten the structural dust cover-to-engine block bolts to 54 N.m (40 ft. lbs.).

Fig. 184: Transmission Mount To Crossmember Retaining Nuts
Courtesy of CHRYSLER LLC

8. Lower the transmission onto the crossmember and remove the jack.
9. Install the transmission mount to crossmember retaining nuts (1) and tighten to 54 N.m (40 ft. lbs.).

Fig. 185: Steering Rack To Frame Mounting Bolts
Courtesy of CHRYSLER LLC

10. Position the steering rack to the frame, install the bolts (1) and tighten bolts/nuts to 258 N.m (190 ft. lbs.).
11. Lower the vehicle.

CRANKSHAFT

Removal

REMOVAL

Fig. 186: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER LLC

1. Remove engine. See **Engine - Removal**.
2. Remove the vibration damper (1) using a bolt grip puller (2). See **Engine/Engine Block/DAMPER, Vibration - Removal**.

Fig. 187: REAR SEAL RETAINER TORQUE SEQUENCE

Courtesy of CHRYSLER LLC

3. Remove the rear oil seal retainer. See Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Removal.
4. Remove the oil pan. See Engine/Lubrication/PAN, Oil - Removal.

Fig. 188: Oil Pick Up Tube
Courtesy of CHRYSLER LLC

5. Remove the oil pump pickup (1).
6. Remove the windage tray/oil pan gasket.
7. Remove the timing chain cover. See Engine/Valve Timing/COVER(S), Engine Timing - Removal.

Fig. 189: Oil Pump Retaining Bolts

Courtesy of CHRYSLER LLC

8. Remove the oil pump (1). See Engine/Lubrication/PUMP, Engine Oil - Removal.

Fig. 190: Timing Chain
Courtesy of CHRYSLER LLC

9. Remove the timing chain (5) and sprockets (1,3). See Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Removal.

Fig. 191: Identifying Mark On Connecting Rod And Bearing Cap
Courtesy of CHRYSLER LLC

10. Identify rod bearing caps before removal. Remove rod bearing caps with bearings.

44625

Fig. 192: MAIN BEARING CAPS
Courtesy of CHRYSLER LLC

11. Identify main bearing caps (1) before removal.

8142ec54

Fig. 193: MAIN CAP REMOVAL

Courtesy of CHRYSLER LLC

6. Lubricate and install the thrust bearings (1).

44625

Fig. 199: MAIN BEARING CAPS
Courtesy of CHRYSLER LLC

NOTE: The main cap crossbolts are torqued after final torque of the main cap bolts. Always use a new washer/seal on crossbolts.

7. Clean and oil all cap bolts. Install all main bearing caps (1) making sure the arrow (2) faces forward.

4715

Fig. 200: Main Bearing Cap Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

8. Tighten main bearing cap bolts to 13 N.m (10 ft. lbs.) in the sequence shown in illustration.
9. Tighten main bearing cap bolts to 27 N.m (20 ft. lbs.) in the sequence shown in illustration.
10. Rotate main cap bolts an additional 90° in the sequence shown in illustration.

161728

Fig. 201: Crossbolt Tightening Sequence
Courtesy of CHRYSLER LLC

11. Install the crossbolts with new seal washer. Starting with crossbolt A,
12. Tighten crossbolt to 28 N.m (21 ft. lbs.).
13. Repeat crossbolt tightening procedure.
14. Measure crankshaft end play. See **Engine/Engine Block/BEARING(S), Crankshaft - Standard Procedure**.
15. Position the connecting rods onto the crankshaft and install the rod bearing caps. See **Engine/Engine Block/ROD, Piston and Connecting - Installation**.

474928

Fig. 202: Timing Chain
Courtesy of CHRYSLER LLC

16. Install timing chain (5) and sprockets (1,3). See **Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Installation**.
17. Install the timing chain tensioner (4) and guide (2).

Fig. 203: Oil Pump Retaining Bolts
Courtesy of CHRYSLER LLC

18. Install the oil pump (1). See **Engine/Lubrication/PUMP, Engine Oil - Installation**.
19. Install the timing chain case cover (1). See **Engine/Valve Timing/COVER(S), Engine Timing - Installation**.

Fig. 204: REAR SEAL RETAINER TORQUE SEQUENCE
 Courtesy of CHRYSLER LLC

20. Install the rear main seal and retainer. See Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Installation.

Fig. 205: Oil Pick Up Tube
 Courtesy of CHRYSLER LLC

21. Install the windage tray/oil pan gasket.
22. Inspect oil pick up tube O-rings, replace as necessary.
23. Install the oil pick up tube (1) and tighten fasteners (2) to 28 Nm (248 in. lbs.).

24. Install the oil pan. See Engine/Lubrication/PAN, Oil - Installation.
25. Install the vibration damper. See Engine/Engine Block/DAMPER, Vibration - Installation.
26. Install the engine. See Engine - Installation.

DAMPER, VIBRATION

Removal

REMOVAL

Fig. 206: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER LLC

1. Disconnect negative cable from battery.
2. Remove accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal.
3. Drain cooling system. Refer to Cooling - Standard Procedure.
4. Remove radiator upper hose.
5. Remove fan shroud. Refer to Cooling/Engine/FAN, Cooling - Removal.
6. Remove crankshaft damper bolt.
7. Install puller (2) and remove damper (1).

Installation

INSTALLATION

CAUTION: To prevent severe damage to the crankshaft, damper, and damper installer 8512A, thoroughly clean the damper bore and the crankshaft nose before installing damper.

Fig. 207: Removing/Installing Crankshaft Damper Bolt
 Courtesy of CHRYSLER LLC

1. Position damper onto crankshaft.
2. Assemble Damper Installer 8512A (2) , and the Pressing Cup (1) from A/C Hub Installer 6871.

Fig. 208: Pressing Damper Onto Crankshaft
 Courtesy of CHRYSLER LLC

3. Using Damper Installer 8512A (3), and the pressing cup (2) from A/C hub installer 6871 press damper (1) onto crankshaft.
4. Install and tighten crankshaft damper bolt to 176 N.m (129 ft. lbs.).
5. Install cooling fan.
6. Install radiator upper shroud and tighten fasteners to 11 N.m (95 in. lbs.).
7. Install radiator upper hose.

8. Install accessory drive belt (1). Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .
9. Refill cooling system. Refer to **Cooling - Standard Procedure** .
10. Connect negative cable to battery.

FLEXPLATE

Removal

REMOVAL

Fig. 209: Flexplate Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

1. Remove the transmission. Refer to **Transmission and Transfer Case/Manual - Removal** . Refer to **Transmission and Transfer Case/Automatic - NAG1 - Removal** .
2. Using the sequence shown in illustration, remove the flexplate retaining the bolts.
3. Remove the flexplate.

Installation

INSTALLATION

Fig. 210: Flexplate Retaining Bolt Removal & Tightening Sequence
 Courtesy of CHRYSLER LLC

1. Position the flexplate onto the crankshaft and install the retaining bolts hand tight.
2. Using the sequence shown in illustration, tighten the flexplate retaining bolts to 95 N.m (70 ft. lbs.).
3. Install the transmission. Refer to **Transmission and Transfer Case/Manual - Installation** .
 Refer to **Transmission and Transfer Case/Automatic - NAG1 - Removal** .

LIFTER(S), HYDRAULIC, ROLLER

Description

DESCRIPTION

Fig. 211: MDS Lifter

Courtesy of CHRYSLER LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

The MDS can provide a 5 to 20 percent fuel economy benefit when operating in four-cylinder mode. Depending on driving habits and vehicle usage. Fuel economy is 8 to 15 percent higher than if the engine was operating on eight-cylinders at all times.

MDS is integrated into the basic engine architecture, requiring a minimum of additional parts - four additional solenoids, an oil temperature sensor, a wire harness, eight unique valve lifters (1), and a modified camshaft.

The MDS lifter (1) can be identified by the disconnecting pin (3) on the side of the lifter.

Operation

OPERATION

Fig. 212: MDS LIFTER CROSS-SECTION
Courtesy of CHRYSLER LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals provide smooth operation. Two cylinders on each bank are active when the engine is in four-cylinder mode - every other cylinder in the firing order. All of the cylinders that are deactivated have unique hydraulic valve lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. It is delivered through special oil passages drilled into the cylinder block. Solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each valve lifter, which then becomes a "lost motion" link. Its base follows the camshaft, but its top remains stationary, held in place against the pushrod by light spring pressure but unable to move because of the much higher

force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in 5.7L engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition then occurs, but the combustion products remain trapped in the cylinder under high pressure, because the valves no longer open. No air enters or leaves. During subsequent piston strokes, this high-pressure gas is repeatedly compressed and expanded like an air spring, but fuel is not injected.

Diagnosis and Testing

HYDRAULIC TAPPETS

Check the oil pressure before disassembling any part of the engine to correct tappet noise. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-80 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow five minutes for the oil level to stabilize before checking the oil level. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on the dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL - HIGH

If the oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in the oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow the valves to seat noisily.

OIL LEVEL - LOW

Low oil level may allow the oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on the intake side of the oil pump through which air can be drawn creates the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When the oil level and leaks have been corrected, operate the engine at fast idle. Run the engine for a sufficient amount of time to allow all of the air inside the tappets to be bleed out.

TAPPET NOISE DIAGNOSIS

1. To determine the source of tappet noise, crank the engine over with the cylinder head covers removed.
2. Feel each valve spring or rocker arm to detect the noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: Worn valve guides or cocked springs are sometimes mistaken for noisy

tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm pushrod sockets and pushrod ends for wear.

3. Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.
4. The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it's probably not the tappets.

Removal

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the cylinder head. See **Engine/Cylinder Head - Removal**.

Fig. 213: Rear MDS Lifter Assembly
Courtesy of CHRYSLER LLC

3. Remove the tappet guide holder retaining bolt (1) from the tappet guide holder assembly (2).

Fig. 214: Tappet Guide Holder Assembly
Courtesy of CHRYSLER LLC

CAUTION: The tappets and guide holder assembly must be installed as an assembly and in their original locations or engine damage could result.

CAUTION: If the tappets and guide holder assembly are to be reused, identify tappets to ensure installation in their original location.

4. Remove the tappet guide holder (1) and tappets (2) as an assembly.
5. Check the camshaft lobes for abnormal wear.

Installation

INSTALLATION

479259

Fig. 215: MDS Lifter
Courtesy of CHRYSLER LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

CAUTION: Engines equipped with MDS use both standard roller tappets (2) and deactivating roller tappets (1). The deactivating roller tappets must be used in cylinders 1,4,6,7. The deactivating tappets can be identified by the two holes in the side of the tappet body (3), for the latching pins.

CAUTION: The tappets and guide holder assembly must be installed as an assembly and in their original locations or engine damage could result.

2558531

Fig. 216: Tappet Guide Holder Assembly

Courtesy of CHRYSLER LLC

1. Lubricate the tappet guide holder (1) and tappets (2).

Fig. 217: Rear MDS Lifter Assembly
Courtesy of CHRYSLER LLC

CAUTION: If the tappets and guide holder assembly are to be reused, they must be installed in their original location.

2. Install the tappet guide holder (2) and tappets.
3. Tighten the tappet retainer bolt (1) to 12 N.m (9 ft. lbs.).
4. Install the cylinder head. See Engine/Cylinder Head - Installation.
5. Connect the negative battery cable.

CAUTION: To prevent damage to valve assemblies, do not run the engine above fast idle until all hydraulic tappets have filled with oil and have become quiet.

6. Start the engine and check for leaks.
7. Road test the vehicle.

RETAINER, CRANKSHAFT REAR OIL SEAL

Diagnosis and Testing

REAR SEAL AREA LEAKS

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and cannot be serviced separately.

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Raise and support the vehicle.
2. Remove the structural dust cover. See **Engine/Engine Block/COVER, Structural Dust - Removal**.
3. Inspect the rear of the cylinder block for evidence of oil leakage, note the following:
 - Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces. See appropriate component repair procedures of these items.
4. If no leaks are detected, pressurize the crankcase as outlined in the **AIR LEAK DETECTION TEST METHOD**.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out using an emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done. See **Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Removal**.

Removal

REMOVAL

Fig. 218: REAR SEAL RETAINER TORQUE SEQUENCE
Courtesy of CHRYSLER LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

NOTE: This procedure can be performed in vehicle.

1. Disconnect the negative battery cable.
2. Remove the transmission (Refer to appropriate Transmission SERVICE INFORMATION article).
3. Remove the flexplate. See **Engine/Engine Block/FLEXPLATE - Removal**.
4. Remove the oil pan. See **Engine/Lubrication/PAN, Oil - Removal**.
5. Using the sequence shown in illustration, remove the rear oil seal retainer mounting bolts.
6. Carefully remove the retainer from the engine block.

Installation

INSTALLATION

Fig. 219: REAR SEAL RETAINER TORQUE SEQUENCE
Courtesy of CHRYSLER LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

1. Thoroughly clean all gasket residue from the engine block.
2. Position the gasket onto the new crankshaft rear oil seal retainer.
3. Position the crankshaft rear oil seal retainer onto the engine block.
4. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting bolts and tighten to 15 N.m (11 ft. lbs.).
5. Install the oil pan. See **Engine/Lubrication/PAN, Oil - Installation**.
6. Install the flexplate. See **Engine/Engine Block/FLEXPLATE - Installation**.
7. Install the transmission (Refer to appropriate Transmission SERVICE INFORMATION article).
8. Fill the engine with oil.
9. Start the engine and check for leaks.

RING(S), PISTON

Standard Procedure

PISTON RING FITTING

PISTON RING END GAP

Fig. 220: Checking Piston Ring End Gap Using Feeler Gauge
Courtesy of CHRYSLER LLC

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

1. Wipe the cylinder bore clean.
2. Insert the ring in the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12 mm (0.50 inch.) from bottom of cylinder bore.

3. Using a piston, to ensure that the ring is squared in the cylinder bore, slide the ring downward into the cylinder.
4. Using a feeler gauge check the ring end gap. Replace any rings not within specification.

PISTON RING SIDE CLEARANCE

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

805dd867

Fig. 221: Measuring Piston Ring Side Clearance
Courtesy of CHRYSLER LLC

1. Measure the ring side clearance as shown in illustration, make sure the feeler gauge (1) fits snugly between the ring land and the ring. Replace any ring not within specification.
2. Rotate the ring around the piston, the ring must rotate in the groove with out binding.

PISTON RING SPECIFICATION CHART

Piston Ring Position	Piston Ring Side Clearance	Maximum Clearance
Upper Ring	-	-
	Metric 0.04 - 0.09 mm	0.11 mm
	Standard 0.0015 - 0.0035 in.	0.004 in.
Intermediate Ring	-	-
	Metric 0.04 - 0.08 mm	0.10 mm
	Standard 0.0015 - 0.0031 in.	0.004 in.
Piston Ring Position	Piston Ring End Gap	Wear Limit
Upper Ring	-	-
	Metric 0.40 - 0.55 mm	0.43 mm
	Standard 0.0157 - 0.0216 in.	0.017 in.
Intermediate Ring	-	-
	Metric 0.24 - 0.51 mm	0.74 mm
	Standard 0.0094 - 0.0200 in.	0.029 in.
Oil Control Ring (Steel Rail)	-	-
	Metric 0.015 - 0.66 mm	0.76 mm
	Standard 0.0059 - 0.0259 in.	0.030 in.

PISTON RING INSTALLATION

Fig. 222: SIDE RAIL - INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: The No. 1 and No. 2 piston rings have a different cross section. Ensure No. 2 ring is installed with manufacturers I.D. mark (Dot) facing up, towards top of the piston.

NOTE: Piston rings are installed in the following order:

- Oil ring expander.
- Lower oil ring side rail.
- Upper oil ring side rail.
- No. 2 Intermediate piston ring.
- No. 1 Upper piston ring.

1. Install the oil ring expander.
2. Install upper side rail by placing one end between the piston ring groove and the expander ring. Hold end firmly and press down the portion to be installed until side rail is in position. Repeat this step for the lower side rail.

Fig. 223: UPPER AND INTERMEDIATE RINGS
Courtesy of CHRYSLER LLC

3. Install No. 2 intermediate piston ring using a piston ring installer.
4. Install No. 1 upper piston ring using a piston ring installer.

RR09B48

Fig. 224: PISTON RING END GAP POSITION
Courtesy of CHRYSLER LLC

NOTE: Install the piston rings so the gaps positioned as indicated with the piston viewed from the top.

NOTE: Staggering ring gap is important for oil control.

5. Install the oil expander so the ring gap is located in the (1) position.
6. Install the oil ring rails so the ring gap is located in the (2,4) position.
7. Install the second compression ring so the ring gap is located in the (3) position.
8. Install the top compression so the ring gap is located in the (1) position.

ROD, PISTON AND CONNECTING

Description

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote®) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal, with a fractured cap design.

Standard Procedure

PISTON FITTING

Fig. 225: Measuring Inside Diameter Of Cylinder Bore Using Dial Bore Gauge
Courtesy of CHRYSLER LLC

1. To correctly select the proper size piston, a cylinder bore gauge (2), capable of reading in 0.003 mm (0.0001 in.) INCREMENTS is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore (4). Start perpendicular (across or at 90 degrees) to the axis of the crankshaft at point A (1) and then take an additional bore reading 90 degrees to that at point B (1).
3. The coated pistons will be serviced with the piston pin and connecting rod pre-assembled. The

piston-rod assembly is specific for the left cylinder bank (odd numbered) and the right cylinder bank (even numbered) and must not be interchanged.

Fig. 226: Piston Diameter Measuring Points
Courtesy of CHRYSLER LLC

4. Measure the piston diameter with a micrometer at points (1,2).

Removal

REMOVAL

Fig. 227: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

1. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure**.
2. Disconnect and isolate the negative battery cable (3).

815caa1a

Fig. 228: Engine Covers
Courtesy of CHRYSLER LLC

3. Remove the engine covers (1).

163967

Fig. 229: Air Duct To Throttle Body
Courtesy of CHRYSLER LLC

4. Loosen clamp and disconnect the air duct at throttle body.
5. Disconnect the intake air temperature sensor (4) electrical connector.
6. Remove the makeup air hose (1).
7. Remove the air cleaner housing retaining bolt (3) and remove the air cleaner housing (2).

8. Remove the cylinder head(s). See **Engine/Cylinder Head - Removal**.
9. Raise and support the vehicle.

Fig. 230: Engine Mount Nuts
Courtesy of CHRYSLER LLC

10. Remove the engine mount nuts (1,2).

Fig. 231: GEAR MOUNTING BOLTS
Courtesy of CHRYSLER LLC

11. Remove the steering gear mounting bolts (1) and position the steering gear (2) aside.
12. Remove the engine oil dipstick and tube from the oil pan.
13. Lower the vehicle.

Fig. 232: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER LLC

NOTE: Do not use air tools to install engine lift fixture.

14. Install the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3).
15. Raise the engine to provide clearance to remove the oil pan.
16. Raise and support the vehicle.
17. Remove the oil pan. See **Engine/Lubrication/PAN, Oil - Removal.**
18. Lower the vehicle.
19. Remove the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Removal.**
20. If necessary, remove the ridge on top of the cylinder bores with a reliable ridge reamer before removing the pistons from the cylinder block. **Be sure to keep the tops of the pistons covered during this operation.**

Fig. 233: Identifying Mark On Connecting Rod And Bearing Cap
 Courtesy of CHRYSLER LLC

CAUTION: Do Not use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur.

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removal to ensure correct reassembly.

21. Raise and support the vehicle.
22. Mark the connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

Fig. 234: Connecting Rod Guides
Courtesy of CHRYSLER LLC

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

NOTE: Pistons and connecting rods assemblies must be removed from the top of cylinder block. When removing the piston and connecting rod assemblies from the engine, rotate the crankshaft so each connecting rod is centered in the cylinder bore.

23. Remove the connecting rod cap, install the Connecting Rod Guides 8507 (1) and carefully remove the piston from the cylinder bore, repeat this procedure for each piston being removed.
24. Immediately after removing the piston and connecting rod, install the bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
25. Carefully remove the piston rings from the piston(s), starting from the top ring down.

Cleaning

CLEANING

CAUTION: Do not use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a moly coating, this coating must not be damaged.

1. Using a suitable cleaning solvent, clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

CAUTION: Do not remove the piston pin from the piston and connecting rod assembly.

Inspection

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring. See **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore. See **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the piston for scoring or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

Installation

INSTALLATION

1218927

Fig. 235: Rod Bearing
Courtesy of CHRYSLER LLC

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Check piston ring clearance. See **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
2. Before installing piston and connecting rod assemblies into the bore, install the piston rings. See **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
3. Immerse the piston head and rings in clean engine oil and position a ring compressor over the piston and rings and tighten the ring compressor. **Ensure the position of rings do not change during this operation.**
4. Position the rod bearing (1) onto the connecting rod and lubricate bearing surface with clean engine oil.

Fig. 236: Connecting Rod Guides
Courtesy of CHRYSLER LLC

5. Install Connecting Rod Guides 8507 (1) into the connecting rod bolt threads.

Fig. 237: PISTON DIRECTION ARROW
Courtesy of CHRYSLER LLC

6. The pistons are marked on the piston pin bore surface with an raised "F" or arrow on top of piston indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks.
7. Wipe cylinder bore clean and lubricate with clean engine oil.

8. Rotate the crankshaft until the connecting rod journal is centered with the cylinder bore.
9. Insert the piston and rod assembly into the cylinder bore and carefully position the connecting rod over the crankshaft journal.
10. Tap the piston down into the cylinder bore using a hammer handle while guiding the connecting rod into position on the rod journal.

1219213

Fig. 238: Connecting Rod Cap
Courtesy of CHRYSLER LLC

11. Remove the Connecting Rod Guides 8507.
12. Wipe the connecting rod cap (1) clean and lubricate with clean engine oil and install the bearing (3).

NOTE: **The connecting rods and bearing caps are not interchangeable, line up the previously marked bearing caps and connecting rods to ensure assembly to their original location.**

13. Lubricate the bearing surfaces with clean engine oil and position the rod cap in place.

Fig. 239: Removing/Installing Connecting Rod
 Courtesy of CHRYSLER LLC

CAUTION: When installing connecting rods, make sure the wide side (1) is towards the crankshaft and narrow sides (2) face each other.

Fig. 240: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER LLC

CAUTION: Always replace the Rod Bolts whenever they are loosened or removed.

14. Lubricate the new rod cap bolts with clean engine oil, install and tighten to 21 N.m (15 ft. lbs.) plus 90°.
15. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation.**
16. Install the new oil pan gasket/windage tray and oil pan. See **Engine/Lubrication/PAN, Oil - Installation.**
17. Install the engine oil dipstick tube and dipstick.
18. Lower the vehicle.
19. Using the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3) lower the engine into position and remove.
20. Raise and support the vehicle.

Fig. 241: GEAR MOUNTING BOLTS
Courtesy of CHRYSLER LLC

21. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).

157012

Fig. 242: Engine Mount Nuts
 Courtesy of CHRYSLER LLC

22. Install the engine mount nuts (1,2) and tighten to 95 N.m (70 ft. lbs.).
23. Lower the vehicle.
24. Install the cylinder head(s). See **Engine/Cylinder Head - Installation**.

163967

Fig. 243: Air Duct To Throttle Body
 Courtesy of CHRYSLER LLC

25. Position the air cleaner housing (2), install the air cleaner housing retaining bolt (3) and securely tighten.
26. Connect the makeup air hose (1).
27. Connect the intake air temperature sensor (4) electrical connector.
28. Connect the air duct to the throttle body and tighten clamp to 3 N.m (30 in. lbs.).

29. Fill the engine with oil. See **Engine/Lubrication/OIL - Standard Procedure**.

815caa1a

Fig. 244: Engine Covers

SEAL, CRANKSHAFT OIL, FRONT

Removal

REMOVAL

Fig. 246: Vibration Damper & Bolt Grip Puller
Courtesy of CHRYSLER LLC

1. Disconnect negative cable from battery.
2. Remove accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
3. Drain cooling system. Refer to **Cooling - Standard Procedure** .
4. Remove upper radiator hose.
5. Remove radiator shroud attaching fasteners.
6. Remove radiator cooling fan and shroud. Refer to **Cooling/Engine/FAN, Cooling - Removal** .
7. Remove crankshaft damper bolt.
8. Remove damper (1) using bolt grip type puller (2). See **Engine/Engine Block/DAMPER, Vibration - Removal**.

Fig. 247: FRONT CRANKSHAFT SEAL REMOVAL
Courtesy of CHRYSLER LLC

9. Using Seal Remover 9071 (1), remove crankshaft front seal (2).

Installation

INSTALLATION

Fig. 248: FRONT SEAL INSTALLATION

Courtesy of CHRYSLER LLC

CAUTION: The front crankshaft seal must be installed dry. Do not apply lubricant to the sealing lip or the outer edge.

1. Using Crankshaft Front Oil Seal Installer 9072 (2) and Damper Installer 8512A (1), install crankshaft front seal.

CAUTION: To prevent severe damage to the crankshaft or damper, thoroughly clean the damper bore and the crankshaft nose before installing damper.

2. Install vibration damper. See Engine/Engine Block/DAMPER, Vibration - Installation.
3. Install radiator cooling fan and shroud. Refer to Cooling/Engine/FAN, Cooling - Installation.
4. Install upper radiator hose.
5. Install accessory drive belt refer. Refer to Cooling/Accessory Drive/BELT, Serpentine - Installation.
6. Refill cooling system. Refer to Cooling - Standard Procedure.
7. Connect negative cable to battery.

SEAL, CRANKSHAFT OIL, REAR

Description

DESCRIPTION

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer, for more information refer to the following;

- **Diagnosis and Testing** . See Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Diagnosis and Testing.
- **Removal** . See Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Removal.
- **Installation** . See Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Installation.

SOLENOID, MULTIPLE DISPLACEMENT

Description

DESCRIPTION

The Multi Displacement System selectively deactivates cylinders 1,4,6, and 7, to improve fuel economy. It has two modes of operation:

- 8 cylinders for acceleration and heavy loads.
- 4 cylinders for cruising and city traffic.

The main components of the Multi Displacement System are:

- Unique MDS camshaft.
- Deactivating roller tappets.
- 4 control valves/solenoids.
- control valve/solenoid wiring harness.
- oil temp sensor.

Operation

OPERATION

Cylinder Deactivation

- Trap an exhaust charge from a normal combustion event
- Normal combustion event
- Don't open the exhaust valve
- Don't open the intake valve
- Piston is an air spring
- Cylinders deactivated in firing sequence

Cylinder Reactivation

- Open the exhaust valve
- Empty the cylinder
- Open the intake valve
- Normal combustion event
- Cylinders reactivated in firing sequence

Diagnosis and Testing

MDS SOLENOID

The Multi-Displacement System (MDS) has the following detectable issues:

- solenoid circuit
- fail to deactivate a cylinder(s)
- fail to reactivate a cylinder(s)
- low oil pressure

CONDITION	POSSIBLE CAUSES	CORRECTION
MDS does not activate	1. Low oil pressure. 2. Bad oil temperature sensor.	1. Check for proper oil pressure. 2. Replace the oil temperature

-	3. Malfunctioning MDS solenoid.	sensor.
-	4. Malfunctioning MDS tappet.	3. Replace the solenoid.
MDS does not deactivate	1. Low oil pressure.	4. Replace tappet (s).
-	2. Bad oil temperature sensor.	1. Check or proper oil pressure.
-	3. Malfunctioning MDS solenoid.	2. Replace the oil temp sensor.
-	4. Malfunctioning MDS tappet.	3. Replace the solenoid.
		4. Replace tappet(s).

Removal

REMOVAL

Fig. 249: MDS SOLENOIDS
Courtesy of CHRYSLER LLC

1. Disconnect the negative battery cable.
2. Remove the intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Removal.**
3. Remove foam insulator pad (1).

Fig. 250: MDS SOLENOID CONNECTOR
Courtesy of CHRYSLER LLC

4. Remove wiring harness connectors (1) from the MDS solenoid(s) (2) that require removal.
5. Remove hold down bolt (3) from MDS solenoid(s) (2).

Fig. 251: MDS SOLENOID REMOVAL
Courtesy of CHRYSLER LLC

CAUTION: Do not try to pry the solenoid out. This could lead to breakage and contamination of the lubrication system.

6. Lightly tap on solenoid with a rubber mallet. Wiggle solenoid from side to side.
7. Remove MDS solenoid(s).

Installation

INSTALLATION

Fig. 252: MDS SOLENOIDS
Courtesy of CHRYSLER LLC

1. Verify that MDS bores are free of debris, before solenoid installation.
2. Install MDS solenoid(s) (3) fully into block.
3. Install hold down bolt (2) and tighten to 11 N.m (97 in. lbs.).
4. Reconnect the MDS wiring harness to the solenoid(s) (3).
5. Install foam insulator pad (1) if removed.
6. Install the intake manifold. See [Engine/Manifolds/MANIFOLD, Intake - Installation](#).

ENGINE MOUNTING

INSULATOR, ENGINE MOUNT, FRONT

Removal

REMOVAL

12. Connect the negative battery cable (2).

INSULATOR, ENGINE MOUNT, REAR

Removal

REMOVAL

Fig. 269: TRANSMISSION MOUNT
Courtesy of CHRYSLER LLC

1. Raise the vehicle on a hoist.
2. Using a suitable jack, support transmission.
3. Remove the nuts (3) from the transmission mount.
4. Remove the transmission to mount bolts (4).
5. Raise the transmission enough to remove the rear mount (1).
6. Remove the mount (1).

Installation

INSTALLATION

NOTE: Threadlocking compound must be applied to the bolts before installation.

1. Install the two bolts that attach the transmission mount to the transmission bracket.
2. Tighten the bolts to 61 N.m (45 ft. lbs.) torque.
3. Lower the transmission so the transmission mount rests on the crossmember, and the studs of the transmission mount are aligned in the slots in the crossmember.
4. Install the nuts onto the transmission mount studs through the crossmember access slot.
5. Tighten the nuts to 54 N.m (40 ft. lbs.).

LUBRICATION

DESCRIPTION

DESCRIPTION

2390268

Fig. 270: 5.7L MDS Lubrication System
Courtesy of CHRYSLER LLC

The 5.7L MDS lubrication system is a full flow filtration pressure feed type.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

1. Remove the oil pressure sending unit and install gauge assembly C-3292A.
2. Run the engine until thermostat opens.
3. Oil Pressure:
 - Curb Idle-25 kPa (4 psi) minimum
 - 3000 RPM-170 - 758 kPa (25 - 110 psi)
4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of the oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

If the oil leak source is not positively identified at this time , proceed with the AIR LEAK DETECTION TEST METHOD.

AIR LEAK DETECTION TEST METHOD

1. Remove the PCV valve from the IAFM. Cap or plug the PCV valve grommet.
2. Attach an air hose with a pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

3. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.
4. If the leakage occurs at the rear oil seal area, refer to INSPECTION FOR REAR SEAL AREA LEAKS.
5. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve.
6. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - b. Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in the **AIR LEAK DETECTION TEST METHOD**.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

CONTROL VALVE, OIL INTAKE

Operation

OPERATION

The Variable Valve Timing (VVT) assembly is actuated with engine oil pressure. The oil flow to the VVT assemblies are controlled by an Oil Control Valve (OCV). The OCV consist of a Pulse Width Modulated (PWM) solenoid and a spool valve. The PCM actuates the OCV to control oil flow through the spool valve into the VVT assemblies. The VVT assembly consists of a rotor, stator, and sprocket. The stator is connected to the timing chain through the sprocket. The rotor is connected to the camshaft. Oil flow in to the VVT assembly rotates the rotor with respect to the stator, thus rotating the exhaust camshaft with respect to the timing chain and intake camshaft. An infinitely variable valve timing position can be achieved within the limits of the hardware. The CMP monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

Description

DESCRIPTION

The 5.7L engine is equipped with Variable Valve Timing (VVT). This system uses an oil control valve to direct oil pressure into the camshaft phaser assembly. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy, and reduce emissions. The oil control valve is located under the intake manifold.

Installation

INSTALLATION

Fig. 271: Oil Control Valve
Courtesy of CHRYSLER LLC

1. Install oil control valve.
2. Tighten oil control valve fastener (1).
3. Connect oil control valve electrical connector (2).
4. Install intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Installation**.

Removal

REMOVAL

Fig. 272: Oil Control Valve
 Courtesy of CHRYSLER LLC

1. Remove intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Removal.**
2. Disconnect oil control valve electrical connector (2).
3. Remove oil control valve fastener (1).

Fig. 273: Oil Control Valve
 Courtesy of CHRYSLER LLC

NOTE: To remove the oil control valve, the engine must be at room temperature.

4. Rotate the oil control valve to break the seal. Pull the oil control valve out.

FILTER, ENGINE OIL

Removal

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. Chrysler Corporation recommends a Mopar® or equivalent oil filter be used.

1. Position a drain pan under the oil filter.
2. Using a suitable oil filter wrench loosen filter.
3. Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss.
4. When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: **Make sure filter gasket was removed with filter.**

5. With a wiping cloth, clean the gasket sealing surface of oil and grime.

Installation

INSTALLATION

Fig. 274: Oil Filter Sealing Surface - Typical
Courtesy of CHRYSLER LLC

1. Lightly lubricate oil filter gasket (2) with engine oil.
2. Thread filter (3) onto adapter nipple. When gasket makes contact with sealing surface (1), hand tighten filter one half turn, or 180°. Do not over tighten.
3. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.

OIL

Standard Procedure

ENGINE OIL SERVICE

The engine oil level indicator is located at the left hand of the engine on the 5.7L engines.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about ten minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

1. Position vehicle on level surface.
2. With engine OFF, allow approximately five minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
3. Wipe dipstick clean.
4. Install dipstick and verify it is seated in the tube.
5. Remove dipstick, with handle held above the tip, take oil level reading.
6. Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description** .

Run engine until achieving normal operating temperature.

1. Position the vehicle on a level surface and turn engine off.
2. Hoist and support vehicle on safety stands.
3. Remove oil fill cap.
4. Place a suitable drain pan under crankcase drain.
5. Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
6. Install drain plug in crankcase. Torque to 34 N.m (25 ft. lbs.).
7. Lower vehicle and fill crankcase with specified type and amount of engine oil described in this service information.
8. Install oil fill cap.
9. Start engine and inspect for leaks.
10. Stop engine and inspect oil level.

NOTE: Care should be exercised when disposing used engine oil after it has been

drained from a vehicle engine. Refer to the **WARNING** at beginning of this service information.

PAN, OIL

Removal

REMOVAL

Fig. 275: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable (3).
2. Remove the intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Removal**.
3. Raise and support the vehicle.

Fig. 276: FRONT BELLY PAN
Courtesy of CHRYSLER LLC

4. Remove the belly pan (2).
5. Drain the engine oil and remove the oil filter.

Fig. 277: GEAR MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: Do not remove P/S hoses, tie rod ends or disconnect steering column coupler.

6. Remove the steering gear mounting bolts (1) and position the steering gear (2) aside.

157012

Fig. 278: Engine Mount Nuts
 Courtesy of CHRYSLER LLC

7. Remove the engine mount nuts (1,2).
8. Remove the engine oil dipstick and tube from the oil pan.
9. Lower the vehicle.

2230616

Fig. 279: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER LLC

NOTE: Do not use air tools to install engine lift fixture.

10. Install the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3).
11. Raise the engine to provide clearance to remove the oil pan.

81387997

Fig. 280: OIL PAN TORQUE SEQUENCE

Courtesy of CHRYSLER LLC

NOTE: Do not pry on oil pan or oil pan gasket. The gasket is integral to engine windage tray and does not come out with oil pan.

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

12. Remove the M10 fasteners (vertical and horizontal) from the rear of the oil pan to the transmission.
13. Using the sequence shown in illustration, the oil pan mounting bolts and remove the oil pan.

NOTE: When the oil pan is removed a new oil pan gasket/windage tray assembly must be installed, the old gasket cannot be reused.

14. Remove and discard the integral windage tray and gasket.

Installation

INSTALLATION

Fig. 281: T-JOINT RTV APPLICATION
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - Front Cover T-Joints
2 - Rear Oil Retainer T-Joints |
|--|

1. Clean the oil pan gasket mating surface of the engine block and oil pan.

NOTE: Mopar® Engine RTV must be applied to the 4 T-joints, (area where the front cover, rear retainer and oil pan gasket meet). The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.

2. Apply Mopar® Engine RTV at the 4 T- joints (1,2).

NOTE: When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed, the old gasket cannot be reused.

3. Install a new oil pan gasket/windage tray assembly.
4. If removed, reinstall the oil pump pickup tube with a new O-ring and tighten the pickup tube retainers to 28 N.m (21 ft. lbs.).

81387997

Fig. 282: OIL PAN TORQUE SEQUENCE

Courtesy of CHRYSLER LLC

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

NOTE: New M6 fasteners must be used when reinstalling the oil pan. Do not reuse the old M6 fasteners.

5. Align the rear of the oil pan with the rear face of the engine block and install the M10 and M6 oil pan retainers finger tight.
6. Using the sequence shown in illustration, tighten the M6 bolts to 5 N.m (44 in. lbs.).
7. Using the sequence shown in illustration, tighten the M10 bolts to 54 N.m (39 ft. lbs.).
8. Using the sequence shown in illustration, tighten the M6 bolts to 12 N.m (9 ft. lbs.).
9. Lower the vehicle.

Fig. 283: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER LLC

10. Using the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3) lower the engine into position and remove.

Fig. 284: Engine Mount Nuts
 Courtesy of CHRYSLER LLC

11. Raise and support the vehicle.
12. Install the engine mount nuts (1,2) and tighten to 95 N.m (70 ft. lbs.).
13. Install the engine oil dipstick and tube.

Fig. 285: GEAR MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

14. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).
15. Lower the vehicle.
16. Install the intake manifold. See Engine/Manifolds/MANIFOLD, Intake - Installation.
17. Fill the engine oil.
18. Install the oil filter.

Fig. 286: FRONT BELLY PAN
 Courtesy of CHRYSLER LLC

19. Install the belly pan (2).

813422cd

Fig. 287: Battery System Components And PDC Cover

20. Connect the negative battery cable (3).
21. Start engine and check for leaks.

PUMP, ENGINE OIL

Removal

REMOVAL

474847

Fig. 288: Oil Pump Retaining Bolts
 Courtesy of CHRYSLER LLC

1. Remove the oil pan and pick-up tube. See Engine/Lubrication/PAN, Oil - Removal.
2. Remove the timing chain cover. See Engine/Valve Timing/COVER(S), Engine Timing - Removal.
3. Remove the four bolts (2) and the oil pump (1).

Cleaning

CLEANING

1. Wash all parts in a suitable solvent.

Inspection

INSPECTION

Fig. 289: Measuring Outer Rotor Clearance in Housing
 Courtesy of CHRYSLER LLC

CAUTION: The oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

1. Remove the pump cover.
2. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.
3. Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor (2) and the body. If the measurement is 0.235 mm (0.009 in.) or more the oil pump assembly must be replaced.

Fig. 290: Measuring Clearance Between Rotors
Courtesy of CHRYSLER LLC

4. Install the inner rotor into the oil pump body. Measure the clearance between the inner (3) and outer rotors (1). If the clearance between the rotors is 0.150 mm (0.006 in.) or more the oil pump assembly must be replaced.

Fig. 291: Measuring Clearance Over Rotors
Courtesy of CHRYSLER LLC

5. Place a straight edge (1) across the body of the oil pump (between the bolt holes), if a feeler gauge (2) of 0.095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced.
6. Reinstall the pump cover. Tighten fasteners to 15 N.m (132 in. lbs.).

NOTE: The 5.7 Oil pump is serviced as an assembly. In the event the oil pump is not functioning or out of specification, it must be replaced as an assembly.

Installation

INSTALLATION

439119

Fig. 292: Oil Pump Retaining Bolt Tightening Sequence
Courtesy of CHRYSLER LLC

1. Position the oil pump onto the crankshaft and install the 4 oil pump retaining bolts.
2. Tighten the oil pump retaining bolts to 28 N.m (250 in. lbs.) in the sequence shown in illustration.
3. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation.**
4. Install the pick-up tube and oil pan. See **Engine/Lubrication/PAN, Oil - Installation.**

SENSOR, OIL PRESSURE

Description

DESCRIPTION

The oil pressure sensor uses the following three circuits:

- Signal circuit to the PCM
- Sensor ground circuit through the PCM
- 5 volt reference circuit from the PCM

The oil pressure sensor returns a voltage signal back to the PCM with reference to oil pressure. Ground for the sensor is supplied by the PCM.

The oil pressure sensor is located on the right side of the engine block. The sensor screws into the engines main oil gallery.

Removal

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
3. Remove the upper generator mounting bolt.
4. Raise and support the vehicle.

Fig. 293: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

5. Remove the lower splash shield retaining bolts (1) and the splash shield.

2439251

Fig. 294: Identifying Lower Generator Retaining Bolts
Courtesy of CHRYSLER LLC

6. Remove the lower generator retaining bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil pressure sensor.

2439466

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil pressure sensor (1).

2439466

Fig. 298: Identifying Oil Pressure Sensor Electrical Connector
 Courtesy of CHRYSLER LLC

2. Connect the oil pressure sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

2439251

Fig. 299: Identifying Lower Generator Retaining Bolts
 Courtesy of CHRYSLER LLC

5. Install the lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs).

Fig. 300: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

6. Position the lower splash shield and install the retaining bolts (1).
7. Lower the vehicle
8. Tighten the upper generator mounting bolt to 55 N.m (41 ft. lbs).

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

9. Install the accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Installation .
10. Connect the negative battery cable.

SENSOR, OIL TEMPERATURE

Description

DESCRIPTION

The oil temperature sensor uses the following two circuits:

- Signal circuit to the PCM
- Ground circuit from the PCM

The oil temperature sensor is a Negative Thermal Coefficient sensor. The resistance of the sensor changes as oil temperature changes. This results in different output voltages back to the PCM.

The oil temperature sensor is located on the right side of the engine block.

Removal

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
3. Remove the generator upper mounting bolt.
4. Raise and support the vehicle.

Fig. 301: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

5. Remove the lower splash shield retaining bolts (1) and the splash shield.

Fig. 302: Identifying Lower Generator Retaining Bolts

Courtesy of CHRYSLER LLC

6. Remove the generator lower mounting bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil temperature sensor.

5. Install the generator lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs.).

Fig. 308: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

6. Position the lower splash shield and install the splash shield retaining bolts (1).
7. Lower the vehicle.
8. Tighten the generator upper mounting bolt to 55 N.m (41 ft. lbs.).

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

9. Install the accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal .
10. Connect the negative battery cable.

MANIFOLDS

MANIFOLD, EXHAUST

Description

DESCRIPTION

The exhaust manifolds are log style with a patented flow enhancing design to maximize performance. The exhaust manifolds are made of high silicon molybdenum cast iron. A multi-layer stainless steel exhaust manifold gasket is used to improve sealing to the cylinder head. The exhaust manifolds are covered by a three layer laminated heat shield for thermal protection and noise reduction. The heat shields are fastened with a torque prevailing nut that is backed off slightly to allow for the thermal expansion of the exhaust manifold, with the exception of the nut, which also secures the oil dipstick tube bracket. That nut should not be backed off.

Operation

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

Removal

REMOVAL

81465116

Fig. 309: Engine Support Tool
Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Raise vehicle.
3. Remove exhaust pipe to manifold bolts.
4. Remove engine mount through bolts.
5. Lower vehicle.
6. Install Engine Support Fixture 8534B (1).
7. Raise engine enough to remove manifolds.

CAUTION: Do not damage engine harness while raising the engine.

Fig. 310: Exhaust Manifold Bolt Tightening Sequence - Left
Courtesy of CHRYSLER LLC

8. Remove heat shield.
9. Remove manifold bolts.
10. Remove manifold and gasket.

Cleaning

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

Inspection

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

Installation

INSTALLATION

Fig. 311: Exhaust Manifold Bolt Tightening Sequence - Left
Courtesy of CHRYSLER LLC

1. Install manifold gasket and manifold.
2. Install manifold bolts and tighten to 25 N.m (18 ft. lbs.) in the sequence shown in illustration.
3. Install heat shield and tighten nuts to 8 N.m (70 in. lbs.).

Fig. 312: Engine Support Tool
Courtesy of CHRYSLER LLC

4. Lower engine.

CAUTION: Do not damage engine harness while lowering the engine.

5. Remove Engine Support Fixture 8534B from engine.
6. Raise vehicle.
7. Install and tighten right and left side engine mount through bolts.
8. Install exhaust flange to pipe bolts.
9. Lower vehicle.
10. Connect negative battery cable.

MANIFOLD, INTAKE

Description

DESCRIPTION

1248247

Fig. 313: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

The intake manifold is made of a composite material with the runners tuned to give the best balance of power and torque. The manifold uses a single plane sealing system and separate PCV port seals to prevent leaks. The screws connecting the manifold to the head use a thread lock patch, and must be replaced when the manifold is serviced.

Diagnosis and Testing

INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or the fan. Do not wear loose clothing. Failure to follow these instructions may result in possible serious or fatal injury.

1. Start the engine.
2. Spray a small stream of water at the suspected leak area.
3. If a change in RPM is observed the area of the suspected leak has been found.
4. Repair as required.

Removal

REMOVAL

Fig. 314: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

1. Disconnect negative cable from battery (4).
2. Remove air cleaner assembly. See **Engine/Air Intake System/BODY, Air Cleaner - Removal**.
3. Disconnect electrical connectors and reposition harness.
4. Disconnect vacuum lines.
5. Perform fuel pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure**.
6. Remove intake manifold retaining fasteners.
7. Remove intake manifold.

Cleaning

CLEANING

NOTE: There is **NO** approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

Inspection

INSPECTION

1. Inspect the intake sealing surface for cracks, nicks and distortion.
2. Inspect the intake manifold vacuum hose fittings for looseness or blockage.

Installation

INSTALLATION

Fig. 315: Intake Manifold & PCV Seals
Courtesy of CHRYSLER LLC

1. Install intake manifold seals (1,3).
2. Position intake manifold (2) in place.

1248247

Fig. 316: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

3. Install new intake manifold bolts (with thread lock patch) and tighten to 12 N.m (105 in. lbs.) in the sequence shown in illustration.
4. Position wiring harness in place and connect electrical connectors.
5. Connect fuel line.
6. Connect brake booster and vacuum hoses.
7. Install air cleaner assembly. See **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
8. Connect negative battery cable.

VALVE TIMING

CHAIN AND SPROCKETS, TIMING

Removal

REMOVAL

1. Disconnect the negative battery cable.
2. Drain the cooling system. Refer to **Cooling - Standard Procedure** .

Fig. 317: FRONT COVER SLIDE BUSHINGS
 Courtesy of CHRYSLER LLC

NOTE: It is not necessary to remove water pump for timing chain cover removal.

3. Remove the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Removal.**
4. Verify the slide bushings (1) remain installed in the timing chain cover during removal.

Fig. 318: Oil Pump Retaining Bolts
 Courtesy of CHRYSLER LLC

5. Remove the oil pump retaining bolts (2) and remove the oil pump (1).

Fig. 319: Aligning Timing Marks With Timing Chain Sprockets
Courtesy of CHRYSLER LLC

6. Install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align the timing marks with the timing chain sprockets (1, 2).

Fig. 320: Chain Tensioner Arm
Courtesy of CHRYSLER LLC

7. Retract the chain tensioner arm (1) until the hole in the arm lines up with the hole in the bracket.

Fig. 321: Timing Chain Tensioner Pin
Courtesy of CHRYSLER LLC

8. Install the Tensioner Pin 8514 (1) into the chain tensioner holes.

Fig. 322: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER LLC

CAUTION: Never attempt to disassemble the camshaft phaser, severe engine damage could result.

9. Remove the camshaft phaser retaining bolt (1) and remove the timing chain with the camshaft phaser and crankshaft sprocket.

Fig. 323: Timing Chain Tensioner Pin
Courtesy of CHRYSLER LLC

NOTE: **Inspect the timing chain tensioner and timing chain guide shoes for wear and replace as necessary.**

10. If the timing chain tensioner is being replaced, remove the retaining bolts (3) and remove the timing chain tensioner (2).

Fig. 324: Timing Chain Guide
Courtesy of CHRYSLER LLC

11. If the timing chain guide (1) is being replaced, remove the retaining bolts (2) and remove the timing chain guide.

Installation

INSTALLATION

475580

Fig. 325: Crankshaft Sprocket
Courtesy of CHRYSLER LLC

1. Install the crankshaft sprocket (1) and position halfway onto the crankshaft.

Fig. 326: Aligning Timing Chain & Camshaft Phaser Marks
Courtesy of CHRYSLER LLC

2. While holding the camshaft phaser in hand, position the timing chain on the camshaft phaser and align the timing marks as shown in illustration.

475628

Fig. 327: Aligning Timing Chain & Crankshaft Sprocket Marks
 Courtesy of CHRYSLER LLC

3. While holding the camshaft phaser and timing chain in hand, position the timing chain on the crankshaft sprocket and align the timing mark as shown in illustration.

1035416

Fig. 328: Camshaft Phaser Retaining Bolt
 Courtesy of CHRYSLER LLC

4. Align the slot in the camshaft phaser with the dowel on the camshaft and position the camshaft phaser on the camshaft while sliding the crankshaft sprocket into position.
5. Install the camshaft phaser retaining bolt (1) finger tight.

Fig. 329: Timing Chain Guide
Courtesy of CHRYSLER LLC

6. If removed, install the timing chain guide (1) and tighten the bolts (2) to 11 N.m (8 ft. lbs.).

Fig. 330: Timing Chain Tensioner Pin
Courtesy of CHRYSLER LLC

7. If removed, install the timing chain tensioner (2) and tighten the bolts (3) to 11 N.m (8 ft. lbs.).
8. Remove the tensioner pin 8514 (1).

487402

Fig. 331: Aligning Timing Marks With Timing Chain Sprockets
Courtesy of CHRYSLER LLC

9. Rotate the crankshaft two revolutions and verify the alignment of the timing marks (1, 2). If the timing marks do not line up, remove the camshaft sprocket and realign.

1035416

Fig. 332: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER LLC

10. Tighten the camshaft phaser bolt (1) to 85 N.m (63 ft. lbs.).

Fig. 333: Oil Pump Retaining Bolts
 Courtesy of CHRYSLER LLC

11. Position the oil pump (1) onto the crankshaft and install the oil pump retaining bolts (2) finger tight.

Fig. 334: Oil Pump Retaining Bolt Tightening Sequence
 Courtesy of CHRYSLER LLC

12. Using the sequence shown in illustration, tighten the oil pump retaining bolts to 28 N.m (21 ft. lbs.).

Fig. 335: FRONT COVER SLIDE BUSHINGS
Courtesy of CHRYSLER LLC

13. Verify the slide bushings (1) are installed in the timing chain cover.
14. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation**.
15. Fill the engine with oil.
16. Fill the cooling system. Refer to **Cooling - Standard Procedure** .
17. Connect the negative battery cable.
18. Start the engine and check for leaks.

COVER(S), ENGINE TIMING

Removal

REMOVAL

Fig. 336: Removing Battery Terminal Using Puller
 Courtesy of CHRYSLER LLC

NOTE: It may be necessary to use a battery terminal puller (2) if the battery cable terminal clamps are seized on to the battery posts.

1. Disconnect and isolate the negative battery cable.

Fig. 337: IAT Sensor Electrical Connector
 Courtesy of CHRYSLER LLC

2. Disconnect IAT sensor electrical connector (2).

3. Remove the air cleaner resonator and duct work as an assembly (1).

Fig. 338: Engine Cover
Courtesy of CHRYSLER LLC

4. Remove the engine cover (1).

Fig. 339: Drain Plug
Courtesy of CHRYSLER LLC

WARNING: Do not remove the radiator pressure cap, cylinder block drain plugs or loosen the radiator draincock with the system hot and under pressure. Serious burns from coolant can occur.

NOTE: Radiator draincock is located on the right/lower side of radiator facing to rear of vehicle.

5. With the engine cold, raise the vehicle on a hoist and locate the radiator draincock.
6. Attach one end of a hose to the draincock. Put the other end into a clean container. Open draincock and drain coolant from radiator.
7. Drain the engine oil.
8. Remove the lower radiator hose.

NOTE: The lower fan shroud mounting bolts can only be accessed from under the vehicle.

9. Remove the two lower mounting bolts from the fan shroud.

Fig. 340: 5.7L ENGINE ACCESSORY DRIVE BELT ROUTING
Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

10. Lower the vehicle and rotate the accessory drive belt tensioner (6) counterclockwise until it contacts its stop. Remove the accessory drive belt, then slowly rotate the tensioner into the freearm position. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal.

Fig. 341: FAN SHROUD MOUNTING BOLT LOCATIONS
 Courtesy of CHRYSLER LLC

11. Remove the two upper mounting bolts (1) and the wire harness retainer (2) from the shroud and remove the fan and fan drive assembly. Refer to Cooling/Engine/FAN, Cooling - Removal .

Fig. 342: Coolant Reservoir/Overflow Tank - Gas
 Courtesy of CHRYSLER LLC

12. Disconnect the coolant bottle overflow hose.
13. Remove the two mounting bolts (2).
14. Remove the coolant bottle reservoir/overflow tank (1).

Fig. 343: COMPRESSOR-A/C 5.7L REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: It is not necessary to disconnect the A/C lines or discharge refrigerant.

15. Remove the A/C compressor (3) with the lines attached and secure compressor out of the way.

Fig. 344: Removing / Installing Generator - 5.7L
 Courtesy of CHRYSLER LLC

WARNING: Disconnect the negative cable from the battery before removing the battery output wire (B+ wire) from the generator. Failure to do so can result in injury or damage to the electrical system.

16. Unsnap the plastic insulator cap from B+ output terminal.
17. Remove the B+ terminal mounting nut at rear of generator and disconnect the terminal from the generator.
18. Disconnect the field wire connector (3) at rear of the generator by pushing on the connector tab.
19. Remove the both generator mounting bolts (1).
20. Remove the generator (2) from vehicle.

Fig. 345: HEATER HOSE SUPPLY
Courtesy of CHRYSLER LLC

21. Remove the upper radiator hose.
22. Disconnect both heater hoses (1,2).

Fig. 346: Automatic Belt Tensioner
 Courtesy of CHRYSLER LLC

23. Remove the bolt (2) and accessory drive belt tensioner (1).
24. Remove both idler pulley bolts and remove the pulleys.

Fig. 347: CRANKSHAFT DAMPER REMOVAL
 Courtesy of CHRYSLER LLC

25. Remove the crankshaft damper using crankshaft insert 8513A and three jaw puller 1023. See **Engine/Engine Block/DAMPER, Vibration - Removal**.

81378561

Fig. 348: POWER STEERING PUMP - 5.7L
Courtesy of CHRYSLER LLC

NOTE: It is not necessary to disconnect the power steering pump hoses from the power steering pump for power steering pump removal.

26. Remove the three power steering pump retainer bolts (2) through the access holes in the pulley and secure power steering pump out of the way.
27. Remove the dipstick support bolt.
28. Remove the oil pan and pick up tube. See **Engine/Lubrication/PAN, Oil - Removal**.

Fig. 349: FRONT COVER SLIDE BUSHINGS
Courtesy of CHRYSLER LLC

NOTE: It is not necessary to remove water pump for timing cover removal.

29. Remove the timing cover bolts and remove cover.
30. Verify that the timing cover slide bushings (1) are located in timing cover.

Installation

INSTALLATION

Fig. 350: FRONT COVER SLIDE BUSHINGS
Courtesy of CHRYSLER LLC

1. Clean timing chain cover and block surface.

NOTE: Always install a new gasket on timing cover.

2. Verify that the slide bushings (1) are installed in timing cover.
3. Install cover and new gasket. Tighten fasteners to 28 N.m (250 in. lbs.).

NOTE: The large lifting stud is tightened to 55 N.m (40 ft. lbs.).

Fig. 351: OIL PAN TORQUE SEQUENCE
Courtesy of CHRYSLER LLC

4. Install the oil pan and pick up tube. See **Engine/Lubrication/PAN, Oil - Installation.**
5. Install the A/C compressor.
6. Install the generator.
7. Install power steering pump.
8. Install the dipstick support bolt.
9. Install the thermostat housing.
10. Install crankshaft damper. See **Engine/Engine Block/DAMPER, Vibration - Installation.**
11. Install accessory drive belt tensioner assembly and both idler pulleys.
12. Install radiator lower hose.
13. Install both heater hoses.
14. Install the cooling module.
15. Install the accessory drive belt.
16. Install the coolant bottle and washer bottle.
17. Install the upper radiator hose.
18. Install the air cleaner assembly.
19. Fill cooling system.
20. Refill engine oil.
21. Connect the battery negative cable.

TENSIONER, ENGINE TIMING

Standard Procedure

RESETTING TENSIONER

1376096

Fig. 352: Tensioner Body, Washer, Spring & Plunger
Courtesy of CHRYSLER LLC

NOTE: Verify that the tensioner is assembled correctly.

1. Install the washer (1), spring (2), and plunger (3) inside the tensioner body (4).

1376075

Fig. 353: Installing Tensioner Pin
Courtesy of CHRYSLER LLC

2. Squeeze the tensioner body (3) and movable guide shoe (2) together and install Tensioner Pin 8514 (1).

Description

DESCRIPTION

Fig. 354: Timing Chain Tensioner Arm
Courtesy of CHRYSLER LLC

The timing chain tensioner is a spring loaded design. It consists of two chain guide shoes. One shoe is fixed in place and the other is spring loaded to keep tension on the chain.

Operation

OPERATION

The timing chain tension is maintained by routing the timing chain through the tensioner assembly. A nylon shoe presses on the timing chain maintaining the correct chain tension.

ENGINE

6.1L - Service Information - Challenger

DESCRIPTION

DESCRIPTION

©15ca8cb

Fig. 1: 6.1L ENGINE
Courtesy of CHRYSLER LLC

The 6.1L (370 CID) eight-cylinder engine is a 90° V-Type, deep skirt, lightweight cast iron block with aluminum heads, single cam, overhead valves, and hydraulic roller tappets. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2.

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance (e.g., engine idles rough and stalls) or mechanical (e.g., a strange noise).

See **ENGINE PERFORMANCE DIAGNOSTIC TABLE** and **ENGINE DIAGNOSIS - MECHANICAL** for possible causes and corrections of malfunctions.

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. Information concerning additional tests and diagnosis is provided within the following diagnosis:

- Cylinder Compression Pressure Test. See **CYLINDER COMPRESSION PRESSURE LEAKAGE**.
- Cylinder Combustion Pressure Leakage Test. See **CYLINDER COMBUSTION PRESSURE LEAKAGE**.
- Engine Cylinder Head Gasket Failure Diagnosis. See **Engine/Cylinder Head - Diagnosis and Testing**.
- Intake Manifold Leakage Diagnosis. See **Engine/Manifolds/MANIFOLD, Intake - Diagnosis and Testing**.

ENGINE DIAGNOSIS - MECHANICAL

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase. 2. Thin or diluted oil. 3. Low oil pressure. 4. Dirt in tappets/lash adjusters. 5. Bent push rod(s). 6. Worn rocker arms.	1. Check for correct oil level. Adjust oil level by draining or adding as needed. 2. Change oil. See <u>Engine/Lubrication/OIL - Standard Procedure</u> . 3. Check engine oil level. If OK, Perform oil pressure test. See <u>Engine/Lubrication - Diagnosis and Testing</u> . 4. Clean/replace hydraulic tappets/lash adjusters. 5. Install new push rods. 6. Inspect oil supply to rocker arms and replace worn arms as needed.

	<ul style="list-style-type: none"> 7. Worn tappets/lash adjusters. 8. Worn valve guides. 9. Excessive runout of valve seats or valve faces. 	<ul style="list-style-type: none"> 7. Install new hydraulic tappets/lash adjusters. 8. Inspect all valve guides and replace as necessary. 9. Grind valves and seats.
CONNECTING ROD NOISE	<ul style="list-style-type: none"> 1. Insufficient oil supply. 2. Low oil pressure. 3. Thin or diluted oil. 4. Excessive connecting rod bearing clearance. 5. Connecting rod journal out of round. 6. Misaligned connecting rods. 	<ul style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If OK, Perform oil pressure test. See <u>Engine/Lubrication - Diagnosis and Testing</u>. 3. Change oil to correct viscosity. See <u>Engine/Lubrication/OIL - Standard Procedure</u>. 4. Measure bearings for correct clearance with plasti-gage. Repair as necessary. 5. Replace crankshaft or grind journals. 6. Replace bent connecting rods.
MAIN BEARING NOISE	<ul style="list-style-type: none"> 1. Insufficient oil supply. 2. Low oil pressure. 3. Thin or diluted oil. 4. Excessive main bearing clearance. 5. Excessive end play. 6. Crankshaft main journal out of round or worn. 7. Loose flywheel or torque converter. 	<ul style="list-style-type: none"> 1. Check engine oil level. 2. Check engine oil level. If OK, Perform oil pressure test. See <u>Engine/Lubrication - Diagnosis and Testing</u>. 3. Change oil to correct viscosity. 4. Measure bearings for correct clearance. Repair as necessary. 5. Check crankshaft thrust bearing for excessive wear on flanges. 6. Grind journals or replace crankshaft. 7. Inspect crankshaft, flexplate/flywheel and bolts for damage. Tighten to correct torque.
LOW OIL PRESSURE	<ul style="list-style-type: none"> 1. Low oil level. 2. Faulty oil pressure sending unit. 3. Clogged oil filter. 4. Worn oil pump. 5. Thin or diluted oil. 6. Excessive bearing clearance. 7. Oil pump relief valve 	<ul style="list-style-type: none"> 1. Check oil level and fill if necessary. 2. Install new sending unit. 3. Install new oil filter. 4. Replace oil pump assembly. 5. Change oil to correct viscosity. 6. Measure bearings for correct clearance. 7. Remove valve to inspect, clean

	stuck. 8. Oil pickup tube loose, broken, bent or clogged. 9. Oil pump cover warped or cracked. 10. Faulty or missing piston cooling jets.	and reinstall. 8. Inspect oil pickup tube and pump, and clean or replace if necessary. 9. Install new oil pump. 10. Replace piston cooling jets.
OIL LEAKS	1. Misaligned or deteriorated gaskets. 2. Loose fastener or broken or porous metal part. 3. Front or rear crankshaft oil seal leaking. 4. Leaking oil gallery plug or cup plug.	1. Replace gasket. 2. Tighten, repair or replace the part. 3. Replace seal. 4. Remove and reseal threaded plug. Replace cup style plug.
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	1. CCV System malfunction. 2. Defective valve stem seal (s). 3. Worn or broken piston rings. 4. Scuffed pistons/cylinder walls. 5. Carbon in oil control ring groove. 6. Worn valve guides. 7. Piston rings fitted too tightly in grooves.	1. Refer to <u>EVAPORATIVE EMISSIONS</u> . 2. Repair or replace seal(s). 3. Hone cylinder bores. Install new rings. 4. Hone cylinder bores and replace pistons as required. 5. Remove rings and de-carbon piston. 6. Inspect/replace valve guides as necessary. 7. Remove rings and check ring end gap and side clearance. Replace if necessary.

ENGINE LUBRICATION DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS	1. Gaskets and O-Rings. (a) Misaligned or damaged. (b) Loose fasteners, broken or porous metal parts. 2. Crankshaft rear seal. 3. Crankshaft seal flange scratched, nicked or grooved. 4. Oil pan flange cracked. 5. Front cover seal, damaged or misaligned. 6. Scratched or damaged vibration	1. (a) Replace as necessary. (b) Tighten fasteners, Repair or replace metal parts. 2. Replace as necessary. 3. Polish or replace crankshaft. 4. Replace oil pan. 5. Replace seal. 6. Polish or replace damper.

-	damper hub. 7. Crankshaft rear flange microporosity.	7. Replace crankshaft.
OIL PRESSURE DROP	1. Low oil level. 2. Faulty oil pressure sending unit. 3. Low oil pressure. 4. Clogged oil filter. 5. Worn oil pump. 6. Thin or diluted oil. 7. Excessive bearing clearance. 8. Oil pump relief valve stuck. 9. Oil pickup tube loose or damaged. 10. Faulty or missing piston cooling jets.	1. Check and correct oil level. 2. Replace sending unit. 3. Check pump and bearing clearance. 4. Replace oil filter. 5. Replace as necessary. 6. Change oil and filter. 7. Replace as necessary. 8. Replace oil pump. 9. Replace as necessary. 10. Replace piston cooling jets.
OIL PUMPING AT RINGS; SPARK PLUGS FOULING	1. Worn or damaged rings. 2. Carbon in oil ring slots. 3. Incorrect ring size installed. 4. Worn valve guides. 5. Leaking intake gasket. 6. Leaking valve guide seals.	1. Hone cylinder bores and replace rings. 2. Replace rings. 3. Replace rings. 4. Ream guides and replace valves. 5. Replace intake gaskets. 6. Replace valve guide seals.

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Disable the fuel system. Refer to **Fuel System/Fuel Delivery - Standard Procedure** and perform the fuel system pressure release procedure.
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

NOTE: If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. See CYLINDER COMBUSTION PRESSURE LEAKAGE.

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
 - Leaks between adjacent cylinders or into water jacket
 - Any causes for combustion/compression pressure loss
1. Check the coolant level and fill as required. DO NOT install the radiator cap.
 2. Start and operate the engine until it attains normal operating temperature, then turn the engine OFF.
 3. Remove the spark plugs.
 4. Remove the oil filler cap.
 5. Remove the air cleaner hose.
 6. Calibrate the tester according to the manufacturer's instructions. The shop air source for testing should maintain 483 kPa (70 psi) minimum, 1,379 kPa (200 psi) maximum and 552 kPa (80 psi) recommended.
 7. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Position the piston of cylinder to be tested at TDC compression. While testing, listen for pressurized air escaping through the throttle body, tailpipe, and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with no more than 25% leakage.

FOR EXAMPLE: At 552 kPa (80 psi) input pressure, a minimum of 414 kPa (60 psi) should be maintained in the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.**

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
AIR ESCAPES THROUGH THROTTLE BODY	Intake valve bent, burnt, or not seated properly.	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH TAILPIPE	Exhaust valve bent, burnt, or not seated properly.	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
AIR ESCAPES THROUGH RADIATOR	Head gasket leaking or cracked cylinder head or block.	Remove cylinder head and inspect. Replace defective part.
MORE THAN 50% LEAKAGE FROM ADJACENT CYLINDERS	Head gasket leaking or crack in cylinder head or block between adjacent cylinders.	Remove cylinder head and inspect. Replace gasket, head, or block as necessary.
MORE THAN 25% LEAKAGE AND AIR ESCAPES THROUGH OIL FILLER CAP OPENING ONLY	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall.	Inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary.

ENGINE PERFORMANCE DIAGNOSTIC TABLE

CONDITION	POSSIBLE CAUSE	CORRECTION
ENGINE WILL NOT START	1. Weak battery. 2. Corroded or loose battery connections. 3. Faulty starter. 4. Incorrect spark plug gap. 5. Dirt or water in fuel system. 6. Faulty fuel pump, relay or wiring.	1. Charge or replace as necessary. 2. Clean and tighten battery connections. Apply a coat of light mineral grease to the terminals. 3. Refer to <u>Electrical/Starting - Diagnosis and Testing</u> . 4. Refer to <u>Electrical/Ignition Control - Specifications</u> . 5. Clean system and replace fuel filter. 6. See <u>Engine - Diagnosis and Testing</u>
ENGINE STALLS OR ROUGH IDLE	1. Idle speed set to low.	1. See <u>Engine - Diagnosis and Testing</u>

	2. Vacuum leak.	2. Inspect intake manifold and vacuum hoses, repair or replace as necessary.
	3. Incorrect engine timing.	3. Correct engine timing.
ENGINE LOSS OF POWER	1. Dirty or incorrectly gapped spark plugs. 2. Dirt or water in fuel system. 3. Blown cylinder head gasket. 4. Low compression. 5. Burned, warped or pitted valves. 6. Plugged or restricted exhaust system.	1. Replace spark plugs. 2. Clean system and replace fuel filter. 3. Replace cylinder head gasket. 4. See <u>CYLINDER COMPRESSION PRESSURE LEAKAGE</u> . 5. Replace as necessary. 6. Inspect and replace as necessary.

STANDARD PROCEDURE

REPAIR DAMAGED OR WORN THREADS

CAUTION: Be sure that the tapped holes maintain the original center line.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads
- Tapping the hole with a special Heli-Coil Tap, or equivalent
- Installing an insert into the tapped hole to bring the hole back to its original thread size

HYDROSTATIC LOCK

CAUTION: DO NOT use the starter motor to rotate the crankshaft. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

1. Perform the Fuel Pressure Release Procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure**.
2. Disconnect the negative cable(s) from the battery.
3. Inspect air cleaner, induction system, and intake manifold to ensure system is dry and clear of

foreign material.

4. Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head. Remove the spark plugs.
5. With all spark plugs removed, rotate the crankshaft using a breaker bar and socket.
6. Identify the fluid in the cylinders (coolant, fuel, oil, etc.).
7. Be sure all fluid has been removed from the cylinders.
8. Repair engine or components as necessary to prevent this problem from occurring again.
9. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will prevent damage on restart.
10. Install new spark plugs. Tighten the spark plugs to 41 N.m (30 ft. lbs.).
11. Drain engine oil. Remove and discard the oil filter.
12. Install the drain plug. Tighten the plug to 34 N.m (25 ft. lbs.).
13. Install a new oil filter.
14. Fill engine crankcase with the specified amount and grade of oil. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** .
15. Connect the negative cable(s) to the battery.
16. Start the engine and check for any leaks.

REMOVAL

REMOVAL

Fig. 2: Removing/Installing Cowl Panel
Courtesy of CHRYSLER LLC

1. Remove the hood. Refer to **Body/Hood/HOOD - Removal** .
2. Remove the cowl top panel (2). Refer to **Body/Exterior/COVER, Cowl Panel - Removal** .

3. Remove the strut tower support (6).

815caa1a

Fig. 3: Engine Covers
Courtesy of CHRYSLER LLC

4. Remove the engine covers (1).
5. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .

813422cd

Courtesy of CHRYSLER LLC

6. Disconnect and isolate the negative battery cable (3).

815d014c

Fig. 5: Air Cleaner Duct
Courtesy of CHRYSLER LLC

7. Disconnect the make up air hose.
8. Disconnect the intake air temperature (IAT) sensor electrical connector.
9. Remove the air cleaner housing (1) and clean air tube (2).

212564

Fig. 6: Identifying Accessory Drive Belt Routing

Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

10. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop and remove the accessory drive belt (4), then slowly rotate the tensioner into the freearm position.
11. Remove the cooling fan. Refer to Cooling/Engine/FAN, Cooling - Removal .

Fig. 7: Removing/Installing A/C Compressor
Courtesy of CHRYSLER LLC

12. Remove the A/C compressor (3). Refer to Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal .

Fig. 8: Removing/Installing Front Liquid A/C Line
Courtesy of CHRYSLER LLC

13. Remove the nut (1) from the front section of the A/C liquid line (2) to the rear section of the liquid line (3), separate the lines, remove and discard the dual plane seal.
14. Install plugs or tape over the opened liquid line fittings.
15. Remove the front section of the A/C liquid line from the engine compartment.

Fig. 9: Removing/Installing Front Suction A/C Line
Courtesy of CHRYSLER LLC

16. Remove the nut (1) from the front section of the A/C suction line (2) to the rear section of the suction line (3), separate the lines, remove and discard the dual plane seal.

17. Install plugs or tape over the opened suction line fittings.
18. Remove the front section of the A/C suction line from the engine compartment.

Fig. 10: Engine Mount Heat Shield
Courtesy of CHRYSLER LLC

19. Remove the engine mount heat shield retaining bolt (2) and heat shield (1).

Fig. 11: GENERATOR SUPPORT BRACKET
Courtesy of CHRYSLER LLC

20. Remove the generator (2) and support bracket (1). Refer to **Electrical/Charging/GENERATOR - Removal** .

81378561

Fig. 12: Power Steering Pump
Courtesy of CHRYSLER LLC

NOTE: It is not necessary to disconnect power steering pump hoses from power steering pump for power steering pump removal.

21. Remove the three power steering pump (1) mounting bolts (2) through the access holes in the pulley and position the pump aside.

813530ba

Fig. 13: FRONT BELLY PAN
Courtesy of CHRYSLER LLC

22. Raise and support the vehicle.

23. Remove the belly pan (2).
24. Drain the engine oil.
25. Drain the cooling system. Refer to Cooling - Standard Procedure .

Fig. 14: Lower Radiator Hose
Courtesy of CHRYSLER LLC

1 - LOWER RADIATOR HOSE 2 - RADIATOR FAN ASSEMBLY
--

26. Remove lower radiator hose (1).

Fig. 15: 5.7L/6.1L KNOCK SENSOR
 Courtesy of CHRYSLER LLC

NOTE: Two knock sensors are used. Each sensor is bolted to the outside of cylinder block below the exhaust manifold.

27. Remove the right and left knock sensor electrical connectors.

Fig. 16: Crankshaft Position Sensor Electrical Connector
 Courtesy of CHRYSLER LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right-rear side of

the engine block.

28. Remove the CKP sensor electrical connector (1).
29. Remove the oil temperature sensor electrical connector.
30. Remove the oil pressure sensor electrical connector.
31. Lower the vehicle.

Fig. 17: Radiator Fan Assembly

| 1 - UPPER RADIATOR CLOSURE PANELS |
| 2 - UPPER RADIATOR HOSE |
| 3 - RADIATOR FAN ELECTRICAL CONNECTOR |
| 4 - RADIATOR FAN ASSEMBLY |

32. Remove upper radiator hose (2).

Fig. 18: Camshaft Position Sensor
Courtesy of CHRYSLER LLC

33. Disconnect the camshaft position (CMP) sensor electrical connector (4).

Fig. 19: Heater Hose Supply
Courtesy of CHRYSLER LLC

34. Remove the heater hoses (1,2).

Fig. 20: Ignition Coil Mounting Bolts
 Courtesy of CHRYSLER LLC

35. Remove all ignition coil electrical connectors (1).
36. Remove all fuel injector electrical connectors.

Fig. 21: Locating Manifold Air Pressure MAP Sensor - 6.1L
 Courtesy of CHRYSLER LLC

NOTE: The Manifold Absolute Pressure (MAP) sensor (2) is located at the rear of

the intake manifold (1).

37. Disconnect the MAP sensor electrical connector by sliding release lock out and pressing down on the lock tab.

Fig. 22: Removing/Installing ECT
Courtesy of CHRYSLER LLC

38. Remove the coolant temperature sensor (3) electrical connector (2).

Fig. 23: Ignition Capacitor
Courtesy of CHRYSLER LLC

NOTE: The ignition capacitor (2) is attached to the left rear corner of the intake manifold (3).

39. Remove the ignition capacitor (2) electrical connector (1).

1248247

Fig. 24: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

40. Remove the intake manifold. See Engine/Manifolds/MANIFOLD, Intake - Removal.
41. Remove the ground wires from the rear of each cylinder head.
42. Remove the right and left side engine wiring harness and position aside.

157012

Fig. 25: Engine Mount Nuts
 Courtesy of CHRYSLER LLC

43. Raise and support the vehicle.
44. Remove the front engine mount nuts (1,2).
45. Disconnect the transmission oil cooler lines from their retainers at the oil pan.

81338ecd

Fig. 26: Oxygen Sensor & Catalytic Converter
 Courtesy of CHRYSLER LLC

CAUTION: When separating the exhaust pipes from the manifolds, disconnect the oxygen sensor connector(s). Allowing the exhaust pipes hanging from the oxygen sensor wires damages the harness and/or sensor.

46. Disconnect the oxygen sensor electrical connectors (2).

47. Saturate all exhaust bolts and nuts with Mopar® Rust Penetrant. Allow five minutes for penetration.
48. Remove the exhaust pipe to the manifold bolts (3) and separate the exhaust pipes (4) from the exhaust manifolds.

815caa71

Fig. 27: Removing/Installing Starter
Courtesy of CHRYSLER LLC

49. Remove the starter motor (1) heat shield (4).
50. Disconnect the starter wires, remove the starter motor retaining bolts (2) and remove the starter (1). Refer to **Electrical/Starting/STARTER - Removal** .

Fig. 28: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER LLC

51. Remove the inspection cover (1).

Fig. 29: Removing/Installing Transmission
Courtesy of CHRYSLER LLC

52. Manual transmission equipped vehicles, remove the transmission (Refer to **REMOVAL** .

813878a5

Fig. 30: Torque Converter Bolts
Courtesy of CHRYSLER LLC

53. Automatic transmission equipped vehicles, rotate the crankshaft in clockwise direction until converter bolts (1) are accessible and remove the flexplate to converter bolts (1).

8131d387

Fig. 31: Remove/Install Transmission To Oil Pan Bolts
Courtesy of CHRYSLER LLC

54. Remove the oil pan to transmission bolts (1).

Fig. 32: Remove/Install Transmission to Engine Bolts
Courtesy of CHRYSLER LLC

55. Remove the transmission bell housing to engine block bolts (2).

Fig. 33: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER LLC

56. Lower the vehicle.
57. Remove the left coolant tube.

NOTE: Do not use air tools to install engine lift fixture.

58. Install the engine lift fixture 8984A (2) and adapter 8984-UPD (4).
59. Using a suitable engine hoist, separate the engine from the transmission and remove the engine from the vehicle.
60. Install the engine assembly on a suitable repair stand.

INSTALLATION

INSTALLATION

Fig. 34: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER LLC

1. Install the engine lift fixture (2) 8984A and adapter 8984-UPD (4).
2. Using a suitable engine hoist, lower the engine into in the engine compartment.
3. Automatic transmission equipped vehicles, align the engine with the transmission.
4. Install two transmission to engine block mounting bolts finger tight.
5. Lower the engine assembly until the engine mount studs rest in the frame brackets and remove the engine hoist.

1435449

Fig. 35: Removing/Installing Transmission
 Courtesy of CHRYSLER LLC

6. Manual transmission equipped vehicles, install the transmission (Refer to **INSTALLATION** .
7. Raise and support the vehicle.

8131d397

Fig. 36: Remove/Install Transmission To Oil Pan Bolts
 Courtesy of CHRYSLER LLC

8. Install the transmission (3) to oil pan (2) bolts (1) and tighten to 39 N.m (29 ft. lbs.).

Fig. 37: Remove/Install Transmission to Engine Bolts
Courtesy of CHRYSLER LLC

9. Install the remaining transmission (3) to engine block (1) mounting bolts (2) and tighten to 68 N.m (50 ft. lbs.).

Fig. 38: Engine Mount Nuts
Courtesy of CHRYSLER LLC

10. Install and tighten the front engine mount retaining nuts to 95 N.m (70 ft. lbs.).

813878a5

Fig. 39: TORQUE CONVERTER BOLTS
Courtesy of CHRYSLER LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the flexplate. Bolts that are too long will damage the clutch surface inside the torque converter.

11. Rotate the crankshaft in clockwise direction and install all torque converter to flexplate bolts (1) finger tight.
12. Verify that the torque converter is pulled flush to the flexplate and tighten bolts to 88 N.m (65 ft. lbs.).

Fig. 40: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER LLC

13. Install the inspection cover (1) and tighten bolt (2) to 11 N.m (8 ft. lbs.).

Fig. 41: Removing/Installing Starter
Courtesy of CHRYSLER LLC

14. Position the starter into the transmission.
15. Connect the solenoid wire to the starter motor (snaps on).
16. Position the battery cable to the solenoid stud, install the battery cable eyelet nut and tighten to

11 N.m (8 ft. lbs.).

17. Install the three starter mounting bolts (2) and tighten to 54 N.m (40 ft. lbs.).
18. Install the starter (1) heat shield (4) and securely tighten nuts (3).

Fig. 42: Oxygen Sensor & Catalytic Converter
Courtesy of CHRYSLER LLC

19. Install the exhaust pipes (4) to the manifolds and connect the oxygen sensor electrical connectors (2). Refer to **Exhaust System/CONVERTER, Catalytic - Installation**.

Fig. 43: 5.7L/6.1L KNOCK SENSOR

Courtesy of CHRYSLER LLC

20. Connect the right and left knock sensor (1) electrical connectors (5).

Fig. 44: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block.

21. Connect the CKP sensor electrical connector (1).
22. Connect the oil temperature sensor electrical connector.
23. Connect the oil pressure sensor electrical connector.
24. Connect the transmission oil cooler lines to their retainers at the oil pan.

Fig. 45: Lower Radiator Hose
 Courtesy of CHRYSLER LLC

1 - LOWER RADIATOR HOSE 2 - RADIATOR FAN ASSEMBLY
--

25. Install the lower radiator hose (1).

Fig. 46: Front Belly Pan
 Courtesy of CHRYSLER LLC

26. Install the belly pan (2).
27. Lower the vehicle.

Fig. 47: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER LLC

28. Remove the engine lift fixture 8984A (2) and adapter 8984-UPD (4).
29. Install the left coolant tube.
30. Install the left and right side wiring harness.

Fig. 48: Camshaft Position Sensor
Courtesy of CHRYSLER LLC

31. Connect the camshaft position sensor electrical connector (4).

Fig. 49: Heater Hose Supply
Courtesy of CHRYSLER LLC

32. Connect the heater hoses (1,2).
33. Connect the ground wires to the rear of each cylinder head.

Fig. 50: Power Steering Pump
Courtesy of CHRYSLER LLC

34. Install the three power steering pump (1) mounting bolts (2) through the access holes in the pulley and tighten the bolts to 28 N.m (21 ft. lbs.).

1248247

Fig. 51: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

35. Install the intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Installation**.

815bbae3

Fig. 52: Fuel Line At Fuel Rail Fitting- 6.1L
Courtesy of CHRYSLER LLC

36. Connect fuel line (1) to fuel rail. Refer to **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure** .

Fig. 53: Generator
Courtesy of CHRYSLER LLC

37. Install the generator (2) and connect the electrical connectors. Refer to **Electrical/Charging/GENERATOR - Installation** .

Fig. 54: Removing/Installing A/C Compressor
Courtesy of CHRYSLER LLC

38. Install the A/C compressor (3). Refer to **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal** .

Fig. 55: Engine Mount Heat Shield
Courtesy of CHRYSLER LLC

39. Install the engine mount heat shield (1) and tighten fastener (2).

Fig. 56: Removing/Installing Front Suction A/C Line
Courtesy of CHRYSLER LLC

40. Position the front section of the A/C suction line (2) into the engine compartment.
41. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line to the rear section of the A/C suction line (3).
42. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use

only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

43. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
44. Install the nut (1) that secures the front section of the A/C suction line to the rear section of the A/C suction line and tighten the nut to 22 N.m (16 ft. lbs.).

Fig. 57: Removing/Installing Front Liquid A/C Line
Courtesy of CHRYSLER LLC

45. Position the front section of the A/C liquid line into the engine compartment.
46. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).
47. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
48. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
49. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line and tighten the nut to 22 N.m (16 ft. lbs.).

Fig. 58: Locating Manifold Air Pressure MAP Sensor - 6.1L
 Courtesy of CHRYSLER LLC

NOTE: The Manifold Absolute Pressure (MAP) sensor (2) is located at the rear of the intake manifold (1).

50. Connect the MAP sensor (2) electrical connector.

Fig. 59: Removing/Installing ECT
Courtesy of CHRYSLER LLC

51. Connect the coolant temperature sensor (3) electrical connector (2).

Fig. 60: Ignition Coil Mounting Bolts
Courtesy of CHRYSLER LLC

52. Connect all ignition coil electrical connectors (1).
53. Connect all fuel injector electrical connectors.

Fig. 61: Ignition Capacitor
Courtesy of CHRYSLER LLC

NOTE: The ignition capacitor (2) is attached to the left rear corner of the intake manifold (3).

54. Connect the ignition capacitor (2) electrical connector (1).

Fig. 62: Identifying Accessory Drive Belt Routing
Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

55. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts its stop and install the accessory drive belt (4) onto the pulleys, then slowly release the tensioner.
56. Install the cooling fan. Refer to **Cooling/Engine/FAN, Cooling - Installation** .

Fig. 63: Radiator Fan Assembly
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - UPPER RADIATOR CLOSURE PANELS
2 - UPPER RADIATOR HOSE
3 - RADIATOR FAN ELECTRICAL CONNECTOR
4 - RADIATOR FAN ASSEMBLY |
|--|

57. Install the upper radiator hose (2).

Fig. 64: Removing/Installing Cowl Panel
 Courtesy of CHRYSLER LLC

58. Install the strut tower support (6) and tighten bolts to 38 N.m (28 ft. lbs.).
59. Install the cowl top panel. Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .

815d014c

Fig. 65: Air Cleaner Duct
Courtesy of CHRYSLER LLC

60. Install the air cleaner housing (1) and clean air tube (2). See **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
61. Install the make up air hose.
62. Connect the intake air temperature (IAT) sensor connector.
63. Fill the engine with oil. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** .
64. Fill the cooling system. Refer to **Cooling - Standard Procedure** .

815caa1a

Fig. 66: Engine Covers
Courtesy of CHRYSLER LLC

65. Snap the engine covers (1) onto the fuel rails.

813422cd

Fig. 67: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

66. Connect the negative battery cable (3).
67. Charge the A/C system. Refer to Heating and Air Conditioning/Plumbing - Standard Procedure .

68. Start the engine and inspect for leaks.

69. Road test the vehicle.

SPECIFICATIONS

SPECIFICATIONS

GENERAL DESCRIPTION

DESCRIPTION	SPECIFICATION
Engine Type	90° V-8 OHV
Displacement	6.1 Liters 370 (Cubic Inches)
Bore	103 mm (4.055 in.)
Stroke	90.9 mm (3.58 in.)
Compression Ratio	10.3:1
Firing Order	1-8-4-3-6-5-7-2
Lubrication	Pressure Feed - Full Flow Filtration
Cooling System	Liquid Cooled - Forced Circulation
Cylinder Block	Cast Iron
Cylinder Head	Aluminum
Crankshaft	Forged Steel
Camshaft	Cast Iron
Pistons	Aluminum Alloy
Connecting Rods	Powdered Metal

CYLINDER BLOCK

AIR INTAKE SYSTEM

AIR CLEANER

Removal

REMOVAL

Fig. 89: Tabs From Housing Cover
Courtesy of CHRYSLER LLC

1. Release tabs (1) from housing cover.

Fig. 90: Air Cleaner Element
Courtesy of CHRYSLER LLC

2. Reposition cover (1).
3. Remove air cleaner element (2) from housing.
4. Clean inside of housing before replacing element.

Installation

INSTALLATION

Fig. 91: Air Cleaner Element
Courtesy of CHRYSLER LLC

1. Install the filter element (2) into the housing.

Fig. 92: Tabs From Housing Cover
Courtesy of CHRYSLER LLC

2. Position the housing cover into the housing locating tabs.
3. Push the cover in place and verify that the retaining clips (1) are fully seated.

BODY, AIR CLEANER

Removal

REMOVAL

Fig. 93: Air Duct To Throttle Body
Courtesy of CHRYSLER LLC

1. Loosen clamp and disconnect air duct at throttle body.
2. Disconnect intake air temperature sensor (4) electrical connector.
3. Remove makeup air hose (1).
4. Remove air cleaner housing retaining bolt (3) and remove air cleaner housing (2).

Installation

INSTALLATION

815cad17

Fig. 94: Air Cleaner Housing
Courtesy of CHRYSLER LLC

1. Install the air filter housing (1) into locating pin (3).
2. Install the hold down bolt (2) into the air filter housing (1).

815d014c

Fig. 95: Air Cleaner Duct
Courtesy of CHRYSLER LLC

3. Install air duct (2) to air cleaner cover and tighten hose clamp to 3 N.m (30 in. lbs.).
4. If any other hose clamps were removed from air intake system, tighten them to 3.4 N.m (30 in. lbs.).

CYLINDER HEAD

OPERATION

OPERATION

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on the stroke of the engine.

DIAGNOSIS AND TESTING

CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:
 - Loss of engine power
 - Engine misfiring
 - Poor fuel economy
- Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:
 - Engine overheating
 - Loss of coolant
 - Excessive steam (white smoke) emitting from exhaust
 - Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in Cylinder Compression Pressure Test in this service information. An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50-70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: Use extreme caution when the engine is operating with coolant pressure cap removed. Failure to follow this warning may result in serious or fatal injury.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: With cooling system tester in place, pressure will build up fast. Excessive pressure built up, by continuous engine operation, must be released to a safe pressure level. Never permit pressure to exceed 138 kPa (20 psi). Failure to follow this warning may result in serious or fatal injury.

Install Cooling System Tester 7700 or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit C-3685-A or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

REMOVAL

815caa1a

Fig. 96: Engine Covers

Courtesy of CHRYSLER LLC

1. Remove the engine covers (1), they snap off of the fuel rail.
2. Disconnect the manifold absolute pressure (MAP) sensor harness connector, located at the back of the intake manifold.
3. Disconnect the short runner valve (SRV), located at the back of the intake manifold.
4. Disconnect the intake air temperature (IAT) sensor harness connector.

815d014c

Fig. 97: Air Cleaner Duct
Courtesy of CHRYSLER LLC

5. Remove the air cleaner housing (1) and clean air tube (2).
6. Disconnect the electronic throttle body harness connector.
7. Disconnect the brake booster vacuum hose (it may be easier to disconnect the vacuum hose at the booster).
8. Disconnect the evaporative purge vacuum hose, and the make-up air (MUA) hose from the intake manifold.
9. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure**.
10. Disconnect the fuel injector harness connectors.
11. Disconnect the fuel supply line. Refer to **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure**.

Fig. 98: Locating Battery
 Courtesy of CHRYSLER LLC

12. Disconnect the negative battery cable.
13. Drain the cooling system. Refer to **Cooling - Standard Procedure** .

Fig. 99: Heater Hose Supply
 Courtesy of CHRYSLER LLC

14. Disconnect the heater hoses (1,2).

Fig. 100: Oxygen Sensor & Catalytic Converter
 Courtesy of CHRYSLER LLC

CAUTION: When separating the exhaust pipes from the manifolds, disconnect the oxygen sensor connector(s). Allowing the exhaust pipes hanging from the oxygen sensor wires damages the harness and/or sensor.

15. Disconnect the oxygen sensor electrical connectors (2).
16. Saturate all exhaust bolts and nuts with Mopar® Rust Penetrant. Allow five minutes for penetration.
17. Remove the exhaust pipe to the manifold bolts (3) and separate the exhaust pipes (4) from the exhaust manifolds.

Fig. 101: Identifying Accessory Drive Belt Routing
Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

18. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop. Remove the accessory drive belt, then slowly rotate the tensioner into the freearm position. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .

Fig. 102: Power Steering Pump
Courtesy of CHRYSLER LLC

NOTE: It is not necessary to disconnect the power steering pump hoses from the pump, for power steering pump removal.

19. Remove the three power steering pump (1) mounting bolts (2) through the access holes in the pulley. Refer to **Steering/Pump - Removal** .
20. Remove the power steering pump (1) and secure out of the way.

Fig. 103: Ignition Coil Mounting Bolts
 Courtesy of CHRYSLER LLC

21. Disconnect the ignition coil electrical connectors (1).
22. Remove ignition coil mounting bolts (3).

Fig. 104: Removing/Installing Ignition Coil
 Courtesy of CHRYSLER LLC

23. Remove the ignition coils (1).

Fig. 105: Cylinder Head Components
 Courtesy of CHRYSLER LLC

24. Remove the cylinder head cover (1). See Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.

Fig. 106: Intake Manifold Removal & Tightening Sequence
 Courtesy of CHRYSLER LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

25. Using the sequence shown in illustration, remove the intake manifold retaining fasteners
26. Remove the intake manifold and throttle body as an assembly. See

Engine/Manifolds/MANIFOLD, Intake - Removal.

921225

Fig. 107: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

NOTE: Make sure to identify the original location of the rocker arms and push rods for correct assembly.

27. Using the sequence shown in illustration, remove the rocker arm assemblies. See **Engine/Cylinder Head/ROCKER ARM, Valve - Removal.**
28. Remove the push rods.

88745

Fig. 108: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

29. Using the sequence shown in illustration, remove the head bolts from each cylinder head and remove the cylinder heads. Discard the cylinder head gaskets.

CLEANING

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

INSPECTION

1. Inspect the cylinder head for out-of-flatness, using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.
3. Inspect the valve guides for wear, cracks or looseness. If either condition exist, replace the cylinder head.
4. Inspect push rods. Replace worn or bent push rods.

INSTALLATION

INSTALLATION

Fig. 109: HEAD GASKET INSTALLATION

Courtesy of CHRYSLER LLC

1. Clean all surfaces of cylinder block and cylinder heads.

2. Clean cylinder block front and rear gasket surfaces using a suitable solvent.

CAUTION: The head gaskets (1) are interchangeable between left and right sides. They are marked "UP" to indicate direction to face up.

Fig. 110: Cylinder Head Components
Courtesy of CHRYSLER LLC

NOTE: Rotate crankshaft 45°, so that all pistons are 1/2 the way down the cylinder bore to avoid piston to valve contact.

3. Position new cylinder head gaskets (5) onto the cylinder block.
4. Position cylinder heads (4) in place.

Fig. 111: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

5. Install head bolts.
6. Tighten the cylinder head bolts in four steps using the sequence shown in illustration:

Fig. 112: PUSHROD RETAINING PLATE
Courtesy of CHRYSLER LLC

CAUTION: Pushrods and rocker arm assemblies must be installed in their original locations or engine damage could result.

- Step 1 - Tighten bolts 1-10 to 34 N.m (25 ft. lbs.) and bolts 11-15 to 20 N.m (15 ft. lbs.) in the sequence shown in illustration.
 - Step 2 - Tighten bolts 1-10 to 54 N.m (40 ft. lbs.) and verify bolts 11-15 are 20 N.m (15 ft. lbs.) in the sequence shown in illustration.
 - Step 3 - Rotate bolts 1-10 an additional 90 degrees in the sequence shown in illustration.
 - Step 4 - Tighten bolts 11-15 to 34 N.m (25 ft. lbs.) in the sequence shown in illustration.
7. Install Pushrod retainer 9070 (1) on cylinder head.
 8. Install intake pushrods in their original position and snap push rods into Pushrod Retainer 9070 (1). See **Engine/Cylinder Head/ROCKER ARM, Valve - Installation**.
 9. Install intake rocker shaft and remove Pushrod Retainer 9070 (1).
 10. Install exhaust pushrods and rocker shaft.
 11. Install the intake manifold and throttle body assembly. See **Engine/Manifolds/MANIFOLD, Intake - Installation**.
 12. Install the spark plugs.
 13. Connect the heater hoses.

14. Install the fuel supply line.
15. Install the power steering pump.
16. Install the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .

Fig. 113: Cylinder Head Components
Courtesy of CHRYSLER LLC

17. Install cylinder head covers (1). See **Engine/Cylinder Head/COVER(S), Cylinder Head - Installation**.

Fig. 114: Removing/Installing Ignition Coil

Courtesy of CHRYSLER LLC

18. Install the ignition coils (1). Refer to Electrical/Ignition Control/COIL, Ignition - Installation .

Fig. 115: Ignition Coil Mounting Bolts
Courtesy of CHRYSLER LLC

19. Connect the ignition coil electrical connectors (1) and injector electrical connectors.

Fig. 116: Air Duct To Throttle Body
Courtesy of CHRYSLER LLC

20. Connect the evaporation control system.
21. Install the air cleaner housing and connect to throttle body.

22. Connect make-up air hose (1), and vacuum lines.
23. Connect intake air temperature sensor (4) electrical connector.

Fig. 117: Locating Battery
Courtesy of CHRYSLER LLC

24. Fill cooling system. Refer to **Cooling - Standard Procedure** .
25. Connect the negative cable to the battery (1).

Fig. 118: Engine Covers

Courtesy of CHRYSLER LLC

26. Install engine covers (1).
27. Start engine check for leaks.

COVER(S), CYLINDER HEAD

Removal

REMOVAL

Fig. 119: Ignition Coil Mounting Bolts
Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Disconnect ignition coil connector (1).
3. Remove ignition coil retaining bolts (3).

Fig. 120: Removing/Installing Ignition Coil
 Courtesy of CHRYSLER LLC

4. Remove ignition coil (1).

Fig. 121: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

5. Remove cylinder head cover retaining bolts.

Fig. 122: Cylinder Head Components
Courtesy of CHRYSLER LLC

6. Remove cylinder head cover (1).

NOTE: The gasket (2) may be used again, provided no cuts, tears, or deformation have occurred.

Installation

INSTALLATION

Fig. 123: Cylinder Head Components
Courtesy of CHRYSLER LLC

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: DO NOT allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

1. Clean the cylinder head cover (1) and both sealing surfaces (1,4,). Inspect and replace gasket (2) as necessary.
2. Install the cylinder head cover and hand start all fasteners. Verify that all double ended studs (3) are in the correct location.

Fig. 124: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

3. Using the sequence shown in illustration, tighten the cylinder head cover bolts and double ended studs to 8 N.m (70 lbs in.).

Fig. 125: Removing/Installing Ignition Coil
 Courtesy of CHRYSLER LLC

4. Before installing the coil(s), apply dielectric grease to the inside of the spark plug boots (1).
5. Install the ignition coils.

Fig. 126: Ignition Coil Mounting Bolts
Courtesy of CHRYSLER LLC

6. Tighten the fasteners (3) to 7 N.m (62 in. lbs.).
7. Connect the ignition coil electrical connectors (1).
8. Install the PCV hose.
9. Connect the negative battery cable.

ROCKER ARM, VALVE

Removal

REMOVAL

Fig. 127: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

1. Remove cylinder head cover. See Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.

Fig. 128: PUSHROD RETAINING PLATE
 Courtesy of CHRYSLER LLC

2. Install Pushrod Retainer 9070 (1).

Fig. 129: ROCKER SHAFT TORQUE SEQUENCE
Courtesy of CHRYSLER LLC

3. Loosen the rocker shafts using the sequence provided.

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with an "I".

4. Remove the rocker shafts. Note location for reassembly.

CAUTION: The longer pushrods are for the exhaust side, and the shorter pushrods are for intake side.

5. Remove the pushrods. Note pushrod location for reassembly.

4637

Fig. 130: ROCKER ARM RETAINER REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

CAUTION: Do not remove the retainers from the rocker shaft. The assembly tangs (1) at the bottom of the retainers can be damaged, causing the assembly tangs to break off, and get into the engine.

Installation

INSTALLATION

Fig. 131: PUSHROD RETAINING PLATE
 Courtesy of CHRYSLER LLC

CAUTION: The longer pushrods are for the exhaust side, and the shorter pushrods are for intake side.

1. Install the pushrods in the same order as removed.
2. Install the Pushrod Retainer 9070 (1).

45077

Fig. 132: ROCKER ARM RETAINER REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

CAUTION: Ensure that retainers (2) and rocker arms (4) are not overlapped when torquing bolts.

CAUTION: Verify that push rod is installed into rocker arm (4) and tappet correctly while installing rocker shaft assembly. Recheck after rocker shaft has been torqued to specification.

Fig. 133: ROCKER SHAFT TORQUE SEQUENCE
Courtesy of CHRYSLER LLC

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with the letter "I".

3. Install rocker shaft assemblies in the same order as removed.
4. Tighten the rocker shaft bolts to 22 N.m (195 in. lbs.) using the sequence shown in illustration.

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

Fig. 134: PUSHROD RETAINING PLATE
 Courtesy of CHRYSLER LLC

5. Remove Pushrod Retainer 9070 (1).

Fig. 135: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

6. Install cylinder head cover. See **Engine/Cylinder Head/COVER(S), Cylinder Head - Installation**.

SEAL(S), VALVE GUIDE

Description

DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems. The intake valve stem seal has a smaller valve spring seat compared to the exhaust valve stem seal. The intake and exhaust valve stem seals are identified by different colors.

SPRING(S), VALVE

Removal

REMOVAL

Fig. 136: Locating Battery

2. Remove the air cleaner housing (1) and clean air tube (2). See **Engine/Air Intake System/BODY, Air Cleaner - Installation.**

815bb677

Fig. 138: IGNITION COIL MOUNTING BOLTS - 6.1L
 Courtesy of CHRYSLER LLC

3. Remove the ignition coil electrical connectors (1).
4. Remove the ignition coils (2).

5. Remove the spark plugs.

Fig. 139: Cylinder Head Cover Torque Sequence
Courtesy of CHRYSLER LLC

6. Using the sequence shown in illustration, remove the cylinder head cover bolts and remove the cylinder head covers. See Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.

Fig. 140: PUSHROD RETAINING PLATE
Courtesy of CHRYSLER LLC

CAUTION: The piston must be at TDC, and both valves closed on the cylinder to be serviced.

NOTE: The intake push rods can fall into the engine and become lodged in the oil pan, if removing intake rocker arm shaft, install the pushrod retainer 9070 (1) to retain the intake push rods (2).

7. Install the pushrod retainer 9070 (1) onto the cylinder head.
8. Clip the pushrods (2) into pushrod retainer (1).

921225

Fig. 141: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

9. Using the sequence shown in illustration, remove the rocker arm shaft bolts and remove the rocker arm shaft.

4659

Fig. 142: ROCKER SHAFT
Courtesy of CHRYSLER LLC

10. Install the rocker arm shaft adapter 9065A (1).
11. Insert an air hose (2) into the spark plug hole and charge the cylinder with air.

45101

Fig. 143: VALVE SPRING REMOVAL/INSTALLATION INTAKE
Courtesy of CHRYSLER LLC

NOTE: All valve springs and seals are removed in the same manner.

NOTE: Tap the top of the valve spring retainer to loosen the spring retainers locks.

12. Install the valve spring compressor 9065A (1) and remove the intake valve retainer locks.
13. Release the valve spring compressor and remove the valve springs.

Fig. 144: VALVE SPRING TOOL ADAPTER
Courtesy of CHRYSLER LLC

14. Install the valve spring compressor 9065A (2) and the rocker arm adapter 9065A (1) and remove the exhaust valve retainer locks.
15. Release the valve spring compressor and remove valve spring.

NOTE: The valve springs are interchangeable between intake and exhaust.

16. Remove the valve seal.

Installation

INSTALLATION

Fig. 145: VALVE SPRING TOOL ADAPTER
Courtesy of CHRYSLER LLC

NOTE: The intake seal has a smaller spring seat diameter compared to the exhaust seal.

1. Install the valve seal.

NOTE: The intake spring damper has a longer free length compared to the exhaust spring damper.

2. Install the valve spring.
3. Using the valve spring compressor 9065A (1,3), compress the valve spring and install the valve spring retainer locks.

45107

Fig. 146: Valve Spring Removal Tools
Courtesy of CHRYSLER LLC

4. Release the air charge (1) in the cylinder.
5. Remove the valve spring compressor 9065A (3).

CAUTION: Verify that the pushrods are fully seated into the lifters and the rocker arms. Recheck after rocker arm shaft has been torqued to specification.

6. Install the rocker arm shaft and push rods. See Engine/Cylinder Head/ROCKER ARM, Valve - Installation.

921225

15. Connect the negative battery cable.

VALVES, INTAKE AND EXHAUST

Description

VALVES

80b8983f

Fig. 154: Valve Assembly Configuration

Courtesy of CHRYSLER LLC

Both the intake (4) and exhaust (5) valves are made of steel. The intake valve is 52.8 mm (2.08 inches) in diameter and the exhaust valve is 40.5 mm (1.59 inches) in diameter. All valves use three bead lock keepers (1) and retainers (2) to retain the springs (6) and promote valve rotation.

VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

Standard Procedure

REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Using a suitable dial indicator measure the center of the valve seat. Total run out must not exceed 0.051 mm (0.002 in).
2. Apply a small amount of Prussian blue to the valve seat, insert the valve into the cylinder head. While applying light pressure on the valve, rotate the valve. Remove the valve and examine the valve face. If the blue is transferred below the top edge of the valve face, lower the valve seat using a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat using a 65 degree stone.
3. When the seat is properly positioned the width of the intake seat must be 1.018 - 1.62 mm (0.0464 - 0.0637 in.) and the exhaust seat must be 1.48 - 1.92 mm (0.058 - 0.075 in.).
4. Check the valve spring installed height after refacing the valve and seat. The installed height for both intake and exhaust valve springs must not exceed 46.0 mm (1.81 in.).

VALVE FACE AND VALVE SEAT ANGLE CHART

DESCRIPTION	SPECIFICATION	
SEAT WIDTH	-	
INTAKE	1.018 - 1.62 mm	0.0464 - 0.0637 in.
EXHAUST	1.48 - 1.92 mm	0.058 - 0.075 in.
FACE ANGLE	-	
INTAKE	45 1/2° - 46°	
EXHAUST	45° - 45 1/2°	
SEAT ANGLE	-	

(INT. AND EXT.)

44 1/2° - 45°

5. The valve seat must maintain an angle of 44.5° - 45.0°.
6. The valve face must maintain a face angle of 45.5° - 46.0° degrees for the Intake, and 45° - 45.5° for the exhaust.

Removal

REMOVAL

88745

Fig. 155: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

1. Remove the cylinder head. See Engine/Cylinder Head - Removal.

80b8983f

Fig. 156: Valve Assembly Configuration
Courtesy of CHRYSLER LLC

2. Compress the valve springs using the valve spring compressor C-3422-D and adapter 8464.
3. Remove the valve retaining locks (1), valve spring retainers (2), valve stem seals (3) and valve springs (6).
4. Before removing the valves, remove any burrs from the valve stem lock grooves to prevent damage to the valve guides. Identify the valves to ensure installation in original location.

Installation

INSTALLATION

Fig. 157: Valve Assembly Configuration
 Courtesy of CHRYSLER LLC

1. Clean the valves thoroughly. Discard burned, warped, and cracked valves.
2. Remove carbon and varnish deposits from inside the valve guides with a reliable guide cleaner.
3. Measure the valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
4. Coat the valve stems with clean engine oil and insert them into the cylinder head.
5. If the valves or seats are reground, check valve stem height. If the valve is too long, replace the cylinder head.
6. Install new seals (3) on all valve guides. Install the valve springs (6) and valve retainers (2).

Fig. 158: VALVE SPRING REMOVAL/INSTALLATION EXHAUST
Courtesy of CHRYSLER LLC

7. Compress the valve springs with the valve spring compressor C-3422-D (1) and adapter 8464, install the locks and release the tool. If the valves and/or seats are ground, measure the installed height of the springs. Make sure the measurement is taken from the bottom of spring seat in the cylinder head to the bottom surface of spring retainer.

Fig. 159: Cylinder Head Components
Courtesy of CHRYSLER LLC

8. Install the cylinder head. See **Engine/Cylinder Head - Installation.**

ENGINE BLOCK

CLEANING

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean out:

- the galley at the oil filter adaptor hole.
- the front and rear oil galley holes.
- the feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil galley plugs. Tighten the 1/4 inch NPT plugs to 20 N.m (177 in. lbs.). Tighten the 3/8 inch NPT plugs to 27 N.m (240 in. lbs.).

INSPECTION

INSPECTION

ENGINE BLOCK

1. Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking. Repair as necessary.
2. Examine block and cylinder bores for cracks or fractures.
3. Check block deck surfaces for flatness.

CYLINDER BORE

Fig. 160: Using Bore Gauge To Measure Cylinder Bore Diameter
Courtesy of CHRYSLER LLC

1. It is mandatory to use a dial bore gauge to measure each cylinder bore diameter. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (.0001 in.) increments is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at three levels below top of bore. Start perpendicular (across or at 90°) to the axis of the crankshaft and then take two additional reading.
3. Measure the cylinder bore diameter crosswise to the cylinder block near the top of the bore. Repeat the measurement near the middle of the bore, then repeat the measurement near the bottom of the bore.
4. Determine taper by subtracting the smaller diameter from the larger diameter.
5. Rotate measuring device 90° and repeat steps above.
6. Determine out-of-roundness by comparing the difference between each measurement.
7. If cylinder bore taper does not exceed 0.025 mm (0.001 inch) and out-of-roundness does not exceed 0.025 mm (0.001 inch), the cylinder bore can be honed. If the cylinder bore taper or out-of-round condition exceeds these maximum limits, the cylinder block must be replaced. A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.

BEARING(S), CRANKSHAFT, MAIN

Standard Procedure

CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008 mm (0.0004 inch.) and maximum out-of-round is 0.005 mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

The main bearings are "select fit" to achieve proper oil clearances. For main bearing selection, the crankshaft counterweight has grade identification marks stamped into it. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4 and 5.

NOTE: Service main bearings are coded. These codes identify what size (color) the bearing is.

MAIN BEARING SELECTION CHART - 6.1L

GRADE	COLOR	mm	in	FOR USE WITH JOURNAL SIZE
-	LOWER	-	-	64.988-64.995 mm
A	ORANGE	0.008 mm U/S	(0.0004 in.) U/S	(2.5585- 2.5588 in.)
-	LOWER	-	-	64.996-65.004 mm
B	BLACK	NOMINAL	NOMINAL	(2.5588-2.5592 in.)
-	LOWER	-	-	65.005-65.012 mm
C	GREEN	0.008 mm O/S	(0.0004 in.) O/S	(2.5592-2.5595 in.)

Inspection

INSPECTION

Fig. 161: Main Bearing Wear Patterns
Courtesy of CHRYSLER LLC

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

NOTE: **If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.**

Inspect the back of the inserts for fractures, scrapings or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CAMSHAFT, ENGINE

Removal

CAMSHAFT CORE HOLE PLUG

Fig. 162: Camshaft Core Hole Plug
Courtesy of CHRYSLER LLC

1. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .
2. Remove the engine from the vehicle. See **Engine - Removal**.
3. Remove the flexplate. See **Engine/Engine Block/FLEXPLATE - Removal**.

CAUTION: Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

4. Using a suitable sharp punch, punch a small hole in the camshaft core hole plug (1).
5. Insert a short sheet metal screw into the small hole in the camshaft core hole plug.
6. Using a suitable slide hammer puller, remove the rear camshaft core hole plug.

CAMSHAFT

815caa1a

Fig. 163: Engine Covers
Courtesy of CHRYSLER LLC

1. Remove the engine covers (1), they snap off of the fuel rail.
2. Disconnect the manifold absolute pressure (MAP) sensor harness connector, located at the back of the Intake Manifold.
3. Disconnect the short runner valve (SRV), located at the back of the intake manifold.
4. Disconnect the intake air temperature (IAT) sensor harness connector.

815d014c

Fig. 164: Air Cleaner Duct
Courtesy of CHRYSLER LLC

5. Remove the air cleaner housing (1) and clean air tube (2).
6. Disconnect the electronic throttle body harness connector.
7. Disconnect the brake booster vacuum hose (it may be easier to disconnect the vacuum hose at the booster).
8. Disconnect the evaporative purge vacuum hose, and the make-up air (MUA) hose from the intake manifold.
9. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .
10. Disconnect the fuel injector harness connectors.
11. Disconnect the fuel supply line. Refer to **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure** .

Fig. 165: Locating Battery
 Courtesy of CHRYSLER LLC

12. Remove the negative battery cable.

WARNING: Do not remove the cylinder block drain plugs or loosen the radiator draincock with the system hot and under pressure. Serious burns from the coolant can occur.

13. Drain the cooling system. Refer to Cooling - Standard Procedure .

Fig. 166: Identifying Accessory Drive Belt Routing
 Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

14. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop. Remove the accessory drive belt, then slowly rotate the tensioner into the freearm position. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal .

81378561

Fig. 167: Power Steering Pump
Courtesy of CHRYSLER LLC

NOTE: It is not necessary to disconnect the power steering pump hoses from the pump, for power steering pump removal.

15. Remove the three power steering pump (1) mounting bolts (2) through the access holes in the pulley. Refer to Steering/Pump - Removal .
16. Remove the power steering pump (1) and secure out of the way.

Fig. 168: Ignition Coil Mounting Bolts
 Courtesy of CHRYSLER LLC

17. Disconnect the ignition coil electrical connectors (1).
18. Remove ignition coil mounting bolts (3).

Fig. 169: Removing/Installing Ignition Coil
 Courtesy of CHRYSLER LLC

19. Remove the ignition coils (1).

81369904

Fig. 170: Generator
Courtesy of CHRYSLER LLC

20. Remove the generator. Refer to **Electrical/Charging/GENERATOR - Removal** .
21. Remove the A/C compressor, and set aside. Refer to **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal** .
22. Remove the radiator. Refer to **Cooling/Engine/RADIATOR, Engine Cooling - Removal** .
23. Remove intake manifold. See **Engine/Manifolds/MANIFOLD, Intake - Removal**.

815cfe8f

Fig. 171: Cylinder Head Cover Torque Sequence

Courtesy of CHRYSLER LLC

24. Remove the cylinder head covers. See Engine/Cylinder Head/COVER(S), Cylinder Head - Removal.

Fig. 172: Cylinder Head Components
Courtesy of CHRYSLER LLC

25. Remove both left and right cylinder heads (4). See Engine/Cylinder Head - Removal.
26. Remove the oil pan. See Engine/Lubrication/PAN, Oil - Removal.
27. Remove the oil pick up tube.
28. Remove the windage tray/oil pan gasket.

Fig. 173: FRONT COVER SLIDE BUSHINGS
Courtesy of CHRYSLER LLC

29. Remove the timing case cover (1). See **Engine/Valve Timing/COVER(S), Engine Timing - Removal**.

45133

Fig. 174: OIL PUMP REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

30. Remove the oil pump. See **Engine/Lubrication/PUMP, Engine Oil - Removal**.

81015542

Fig. 175: TIMING MARK ALIGNMENT

Courtesy of CHRYSLER LLC

31. Remove the timing chain (1) and camshaft sprocket (2). See **Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Removal**.
32. Remove the camshaft tensioner/thrust plate assembly.

Fig. 176: HYDRAULIC ROLLER TAPPET REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: Identify lifters to ensure installation in original location.

33. Remove the tappets (2) and retainer (1) assembly.

Fig. 177: CAMSHAFT REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

34. Install a long bolt into the front of the camshaft to aid in removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

Inspection

INSPECTION

1. The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason.

Installation

CAMSHAFT CORE HOLE PLUG

Fig. 178: Camshaft Core Hole Plug
Courtesy of CHRYSLER LLC

1. Clean the core hole in the cylinder block.

NOTE: **Do not apply adhesive to the new camshaft core hole plug. A new plug has adhesive pre-applied.**

2. Install a new camshaft core hole plug (1) located at the rear of cylinder block, using a suitable flat faced tool. The plug must be fully seated on the cylinder block shoulder.
3. Install the flexplate. See **Engine/Engine Block/FLEXPLATE - Installation**.
4. Install the engine. See **Engine - Installation**.

CAMSHAFT

Fig. 179: CAMSHAFT REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

1. Lubricate the camshaft lobes and camshaft bearing journals and carefully insert the camshaft.

Fig. 180: TIMING MARK ALIGNMENT
 Courtesy of CHRYSLER LLC

2. Install the camshaft tensioner plate assembly and tighten the bolts to 28 N.m (250 in. lbs.).
3. Install the timing chain and sprockets. See **Engine/Valve Timing/CHAIN and SPROCKETS, Timing - Installation**.
4. Measure camshaft end play. See **Engine - Specifications**. If not within limits install a new thrust plate.

51449b63

Fig. 181: OIL PUMP REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

5. Install the oil pump. See **Engine/Lubrication/PUMP, Engine Oil - Installation**.

Fig. 182: HYDRAULIC ROLLER TAPPET REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: Each tappet must be installed in the same position from which it was removed.

NOTE: When the camshaft is replaced, all of the tappets must be replaced.

6. Install the tappets (2) and retainer assembly (1). See **Engine/Engine Block/LIFTER(S), Hydraulic - Installation.**

Fig. 183: Cylinder Head Components
Courtesy of CHRYSLER LLC

7. Install both left and right cylinder heads (4). See **Engine/Cylinder Head - Installation**.
8. Install the pushrods in the same position from which they were removed.

921225

Fig. 184: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

9. Install the rocker arms and shaft assembly. See **Engine/Cylinder Head/ROCKER ARM, Valve - Installation**.
10. Using the sequence shown in illustration, install the rocker arm shaft bolts and tighten to 22 N.m (16 ft. lbs.).

Fig. 185: FRONT COVER SLIDE BUSHINGS
 Courtesy of CHRYSLER LLC

11. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation.**
12. Install the oil pick up tube.
13. Install the oil pan. See **Engine/Lubrication/PAN, Oil - Installation.**

Fig. 186: Intake Manifold Removal & Tightening Sequence
 Courtesy of CHRYSLER LLC

14. Using the sequence shown in illustration, install the intake manifold and tighten the bolts to 12 N.m (9 ft. lbs.). See **Engine/Manifolds/MANIFOLD, Intake - Installation.**

Fig. 187: Cylinder Head Cover Torque Sequence
 Courtesy of CHRYSLER LLC

15. Install the cylinder head covers. See Engine/Cylinder Head/COVER(S), Cylinder Head - Installation.
16. Install the A/C compressor. See Engine/Lubrication/PAN, Oil - Installation.
17. Install the generator.

Fig. 188: Identifying Accessory Drive Belt Routing
 Courtesy of CHRYSLER LLC

18. Install the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .
19. Install the radiator. Refer to **Cooling/Engine/RADIATOR, Engine Cooling - Installation** .

23. Fill the engine with oil.
24. Install engine covers (1).
25. Start engine and check for leaks.

COVER, STRUCTURAL DUST

Description

DESCRIPTION

The structural dust cover is made of die cast aluminum and joins the lower half of the transmission bell housing to the engine. The structural cover is an integral one piece aluminum oil pan/structural cover.

Operation

OPERATION

The structural cover provides additional powertrain stiffness and reduces noise and vibration. The structural cover is integrated with the oil pan.

CRANKSHAFT

Removal

REMOVAL

Fig. 192: CRANKSHAFT DAMPER REMOVAL
Courtesy of CHRYSLER LLC

1. Remove engine.
2. Remove the vibration damper with a puller (1). See **Engine/Engine Block/DAMPER, Vibration - Removal.**

- | |
|--|
| <ul style="list-style-type: none">1 - BEARING2 - NUT3 - THREADED ROD4 - BEARING HARDENED SURFACE (FACING NUT)5 - HARDENED WASHER |
|--|

CAUTION: To prevent severe damage to the crankshaft, damper installer 8512A, thoroughly clean the damper bore and the crankshaft nose before installing damper.

1. Slide damper onto crankshaft slightly.

CAUTION: Damper installer 8512A, is assembled in a specific sequence. Failure to assemble this tool in this sequence may result in tool failure and severe damage to either the tool or the crankshaft.

2. Assemble damper installer 8512A as follows, The nut is threaded onto the shaft first (2). Then the roller bearing (1) is placed onto the threaded rod (3) The hardened bearing surface of the bearing (1) **MUST** face the nut (2). Then the hardened washer (5) slides onto the threaded rod (3). Once assembled coat the threaded rod's threads with MOPAR® Nickel Anti-Seize or

equivalent.

3. Using damper installer 8512A, press damper onto crankshaft.
4. Install vibration damper bolt and tighten to 176 N.m (129 ft. lbs.).
5. Install radiator upper hose.
6. Install accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .
7. Refill cooling system. Refer to **Cooling - Standard Procedure** .
8. Connect negative cable to battery.

FLEXPLATE

Removal

REMOVAL

Fig. 212: FLEX PLATE TIGHTENING SEQUENCE
Courtesy of CHRYSLER LLC

1. Remove the transmission. Refer to **Transmission and Transfer Case/Automatic - NAG1 - Removal** .
2. Remove the bolts and flexplate (1).

Installation

INSTALLATION

Fig. 213: FLEX PLATE TIGHTENING SEQUENCE
Courtesy of CHRYSLER LLC

1. Position the flexplate or flywheel onto the crankshaft and install the bolts hand tight.
2. Tighten the flexplate retaining bolts to 95 N.m (70 ft. lbs.).
3. Install the transmission. Refer to **Transmission and Transfer Case/Automatic - NAG1 - Installation** .

LIFTER(S), HYDRAULIC, ROLLER

Diagnosis and Testing

HYDRAULIC ROLLER TAPPETS

Before disassembling any part of the engine to correct tappet noise, check the oil pressure. If vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-70 psi) at 3,000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on dipstick. Either of these two conditions could be responsible for noisy tappets.

OIL LEVEL - HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic tappets by the oil pump causing them to lose length and allow valves to seat noisily.

OIL LEVEL - LOW

Low oil level may allow oil pump to take in air. When air is fed to the tappets, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same tappet action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When tappet noise is due to aeration, it may be intermittent or constant, and usually more than one tappet will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the tappets to be bled out.

TAPPET NOISE DIAGNOSIS

1. To determine source of tappet noise, crank over engine with cylinder head covers removed.
2. Feel each valve spring or rocker arm to detect noisy tappet. The noisy tappet will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: **Worn valve guides or cocked springs are sometimes mistaken for noisy tappets. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not appreciably reduced, it can be assumed the noise is in the tappet. Inspect the rocker arm push rod sockets and push rod ends for wear.**

3. Valve tappet noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger, or by the plunger partially sticking in the tappet body cylinder. The tappet should be replaced. A heavy click is caused by a tappet check valve not seating, or by foreign particles wedged between the plunger and the tappet body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as valve closes. In either case, tappet assembly should be removed for inspection and cleaning.
4. The valve train generates a noise very much like a light tappet noise during normal operation. Care must be taken to ensure that tappets are making the noise. If more than one tappet seems to be noisy, it is probably not the tappets.

Removal

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the cylinder head. See **Engine/Cylinder Head - Removal.**

Fig. 214: Identifying MDS Rear Lifter Assemblies
 Courtesy of CHRYSLER LLC

3. Remove the tappet guide holder retaining bolt (1) from the tappet guide holder assembly (2).

Fig. 215: Tappet Guide Holder Assembly
 Courtesy of CHRYSLER LLC

CAUTION: The tappets and guide holder assembly must be installed as an assembly and in their original locations or engine damage could result.

CAUTION: If the tappets and guide holder assembly are to be reused, identify tappets to ensure installation in their original location.

4. Remove the tappet guide holder (1) and tappets (2) as an assembly.
5. Check the camshaft lobes for abnormal wear.

Installation

INSTALLATION

CAUTION: The tappets and guide holder assembly must be installed as an assembly and in their original locations or engine damage could result.

Fig. 216: Tappet Guide Holder Assembly
Courtesy of CHRYSLER LLC

1. Lubricate the tappet guide holder (1) and tappets (2).

Fig. 217: Identifying MDS Rear Lifter Assemblies
Courtesy of CHRYSLER LLC

CAUTION: If the tappets and guide holder assembly are to be reused, they must be installed in their original location.

2. Install the tappet guide holder (2) and tappets.
3. Tighten the tappet retainer bolt (1) to 12 N.m (106 in. lbs.).
4. Install the cylinder head. See **Engine/Cylinder Head - Installation**.
5. Connect the negative battery.

CAUTION: To prevent damage to valve assemblies, do not run the engine above fast idle until all hydraulic tappets have filled with oil and have become quiet.

6. Start the engine and check for leaks.
7. Road test the vehicle.

RETAINER, CRANKSHAFT REAR OIL SEAL

Diagnosis and Testing

REAR SEAL AREA LEAKS

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and cannot be serviced separately.

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Raise and support the vehicle.
2. Remove the structural dust cover.
3. Inspect the rear of the cylinder block for evidence of oil leakage, note the following:
 - Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in **AIR LEAK DETECTION TEST METHOD**.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out using an emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done. See Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Removal.

Removal

REMOVAL

Fig. 218: Rear Seal Retainer Torque Sequence
Courtesy of CHRYSLER LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

NOTE: This procedure can be performed in vehicle.

1. Disconnect the negative battery cable.
2. Remove the transmission (Refer to **REMOVAL** .
3. Remove the flexplate. See **Engine/Engine Block/FLEXPLATE - Removal**.
4. Remove the oil pan. See **Engine/Lubrication/PAN, Oil - Removal**.
5. Using the sequence shown in illustration, remove the rear oil seal retainer mounting bolts.
6. Carefully remove the retainer from the engine block.

Installation

INSTALLATION

Fig. 219: Rear Seal Retainer Torque Sequence
Courtesy of CHRYSLER LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

1. Thoroughly clean all gasket residue from the engine block.
2. Position the gasket onto the new crankshaft rear oil seal retainer.
3. Position the crankshaft rear oil seal retainer onto the engine block.
4. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting

bolts and tighten to 15 N.m (11 ft. lbs.).

5. Install the oil pan. See Engine/Lubrication/PAN, Oil - Installation.
6. Install the flexplate. See Engine/Engine Block/FLEXPLATE - Installation.
7. Install the transmission (Refer to INSTALLATION .
8. Fill the engine with oil.
9. Start the engine and check for leaks.

RING(S), PISTON

Standard Procedure

PISTON RING FITTING

Fig. 220: Using Feeler Gauge To Check Ring End Gap
Courtesy of CHRYSLER LLC

CAUTION: Before reinstalling used rings or installing new rings, the ring clearances must be checked or engine damage may result.

1. Wipe the cylinder bore clean.
2. Insert the ring into the cylinder bore.

NOTE: The ring gap measurement must be made with the ring positioned at least 12 mm (0.50 inch) from bottom of cylinder bore.

3. Using a piston, make sure that the ring is squared in the cylinder bore. Slide the ring downward into the cylinder.
4. Using a feeler gauge (1), check the ring end gap. Replace any rings not within specification.

PISTON RING SIDE CLEARANCE

5. Measure the ring side clearance with a feeler gauge (1) as shown in illustration. Make sure the feeler gauge fits snugly between the ring land and the ring. Replace any ring not within specification.

NOTE: Make sure marks on compression rings face upward.

6. Rotate the ring around the piston. The ring must rotate in the groove with out binding.

Fig. 221: SIDE RAIL - INSTALLATION
Courtesy of CHRYSLER LLC

7. Install the oil ring expander.
8. Install lower side rail by placing one end between the piston ring groove and the expander ring (1). Hold end firmly and press down the portion to be installed until side rail is in position. Repeat step for upper side rail.

Fig. 222: UPPER AND INTERMEDIATE RINGS
Courtesy of CHRYSLER LLC

9. Install No. 2 intermediate piston ring using a piston ring installer.
10. Install No. 1 upper piston ring using a piston ring installer.

RR09B48

Fig. 223: PISTON RING END GAP POSITION
Courtesy of CHRYSLER LLC

11. Install the oil ring expander gap at the (5) position.
12. Install the oil ring lower side rail gap at the (4) position.
13. Install the oil ring upper side rail gap at the (1) position.
14. Install the second compression ring gap at the (5) position.
15. Install the top compression ring gap at the (2) position.

ROD, PISTON AND CONNECTING

Description

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high-strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal, with a "fractured cap" design. A floating piston pin is used to attach the piston and connecting rod.

Standard Procedure

PISTON FITTING

805dd884

Fig. 224: Using Bore Gauge To Measure Cylinder Bore Diameter
 Courtesy of CHRYSLER LLC

1. To correctly select the proper size piston, a cylinder bore gauge, capable of reading in 0.003 mm (0.0001 in.) increments is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore (4). Start perpendicular (across or at 90°) to the axis of the crankshaft at point A and then take an additional bore reading 90° to that at point B.

80aac2ao

Fig. 225: MOLY COATED PISTON
 Courtesy of CHRYSLER LLC

NOTE: Always install new retaining clips for the piston pin. Never reuse the old clips.

NOTE: Use care not to distort the clip while installing.

3. Once assembled, the piston-rod assembly is specific for the left cylinder bank (odd numbered) and the right cylinder bank (even numbered) and must not be interchanged.
4. The coating material (1,2) is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a Dial Bore Gauge is **MANDATORY**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) increments is required.
5. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

Removal

REMOVAL

Fig. 226: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

1. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure**.
2. Disconnect and isolate the negative battery cable (3).

815caa1a

Fig. 227: Engine Covers
Courtesy of CHRYSLER LLC

3. Remove the engine covers (1).

163967

Fig. 228: Air Duct To Throttle Body
Courtesy of CHRYSLER LLC

4. Loosen clamp and disconnect air duct at throttle body.
5. Disconnect intake air temperature sensor (4) electrical connector.
6. Remove makeup air hose (1).
7. Remove air cleaner housing retaining bolt (3) and remove air cleaner housing (2).

8. Remove the cylinder head(s). See **Engine/Cylinder Head - Removal**.
9. Raise and support the vehicle.

Fig. 229: Engine Mount Nuts
Courtesy of CHRYSLER LLC

10. Remove the engine mount nuts (1,2).

Fig. 230: Identifying Steering Gear & Mounting Bolts
Courtesy of CHRYSLER LLC

11. Remove the steering gear mounting bolts (1) and position the steering gear (2) aside.
12. Remove the engine oil dipstick and tube from the oil pan.
13. Lower the vehicle.

Fig. 231: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER LLC

NOTE: Do not use air tools to install engine lift fixture.

14. Install the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3).
15. Raise the engine to provide clearance to remove the oil pan.
16. Raise and support the vehicle.
17. Remove the oil pan. See **Engine/Lubrication/PAN, Oil - Removal.**
18. Lower the vehicle.
19. Remove the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Removal.**
20. If necessary, remove the ridge on top of the cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. **Be sure to keep tops of pistons covered during this operation.**

Fig. 232: IDENTIFY CONNECTION ROD TO CYLINDER
 Courtesy of CHRYSLER LLC

CAUTION: Do Not use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur.

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

21. Raise and support the vehicle.
22. Mark the connecting rod and bearing cap positions using a permanent ink marker or scribe tool.

Fig. 233: OIL JET REMOVE/INSTALL
Courtesy of CHRYSLER LLC

CAUTION: When removing and installing the piston and connecting rod assembly, Do Not damage the piston oil cooler jets (1). If the jets are bent, engine damage may occur.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces, as engine damage may occur.

CAUTION: Care must be taken not to nick crankshaft journals, as engine damage may occur.

NOTE: Pistons and connecting rods assemblies must be removed from the top of cylinder block. When removing the piston and connecting rod assemblies from the engine, rotate the crankshaft so each connecting rod is centered in the cylinder bore.

23. Remove the connecting rod cap and carefully remove the piston from the cylinder bore, repeat this procedure for each piston being removed.
24. Immediately after removing the piston and connecting rod, install the bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
25. Carefully remove the piston rings from the piston(s), starting from the top ring down.

Cleaning

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

Inspection

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring.

Check the connecting rod for signs of twist or bending.

Use the proper tool when removing the piston clip. If the clip is pried out, a burr may form on the groove that will inhibit pin removal and installation.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore. See **Engine/Engine Block/ROD, Piston and Connecting - Standard Procedure**.

Check the piston for scoring, or scraping marks in the piston skirts. Check the ring lands for cracks and/or deterioration.

Installation

INSTALLATION

1218927

Fig. 234: Rod Bearing
Courtesy of CHRYSLER LLC

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Check piston ring clearance. See **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
2. Before installing piston and connecting rod assemblies into the bore, install the piston rings. See **Engine/Engine Block/RING(S), Piston - Standard Procedure**.
3. Immerse the piston head and rings in clean engine oil and position a ring compressor over the piston and rings and tighten the ring compressor. **Ensure the position of rings do not change during this operation.**
4. Position the rod bearing (1) onto the connecting rod and lubricate bearing surface with clean engine oil.

Fig. 235: Identifying Piston In Cylinder Bore
Courtesy of CHRYSLER LLC

5. The pistons are marked on the piston pin bore surface with an raised "F" or arrow on top of piston indicating installation position. This mark must be pointing toward the front of engine on both cylinder banks.
6. Wipe cylinder bore clean and lubricate with clean engine oil.
7. Rotate the crankshaft until the connecting rod journal is centered with the cylinder bore.
8. Insert the piston and rod assembly into the cylinder bore and carefully position the connecting rod over the crankshaft journal.
9. Tap piston down in cylinder bore using a hammer handle. While at the same time, guide connecting rod into position on rod journal.

1219213

Fig. 236: Connecting Rod Cap
Courtesy of CHRYSLER LLC

10. Wipe the connecting rod cap (1) clean and lubricate with clean engine oil and install the bearing (3).

NOTE: **The connecting rods and bearing caps are not interchangeable, line up the previously marked bearing caps and connecting rods to ensure assembly to their original location.**

11. Lubricate the bearing surfaces with clean engine oil and position the rod cap in place.

Fig. 237: Removing/Installing Connecting Rod
 Courtesy of CHRYSLER LLC

CAUTION: When installing connecting rods, make sure the wide side (1) is towards the crankshaft and narrow sides (2) face each other.

Fig. 238: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER LLC

CAUTION: Always replace the Rod Bolts whenever they are loosened or removed.

12. Lubricate the new rod cap bolts with clean engine oil, install and tighten to 45 N.m (33 ft. lbs.) plus 60°.
13. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation.**
14. Install the new oil pan gasket/windage tray and oil pan. See **Engine/Lubrication/PAN, Oil - Installation.**
15. Install the engine oil dipstick tube and dipstick.
16. Lower the vehicle.
17. Using the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3) lower the engine into position and remove.
18. Raise and support the vehicle.

Fig. 239: Identifying Steering Gear & Mounting Bolts
Courtesy of CHRYSLER LLC

19. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).

157012

Fig. 240: Engine Mount Nuts
 Courtesy of CHRYSLER LLC

20. Install the engine mount nuts (1,2) and tighten to 95 N.m (70 ft. lbs.).
21. Lower the vehicle.
22. Install the cylinder head(s). See [Engine/Cylinder Head - Installation](#).
23. Install the intake manifold. See [Engine/Manifolds/MANIFOLD, Intake - Installation](#).

163967

Fig. 241: Air Duct To Throttle Body
 Courtesy of CHRYSLER LLC

24. Position the air cleaner housing (2), install the air cleaner housing retaining bolt (3) and securely tighten.
25. Connect the makeup air hose (1).
26. Connect the intake air temperature sensor (4) electrical connector.

27. Connect the air duct to the throttle body and tighten clamp to 3 N.m (30 in. lbs.).
28. Fill the engine with oil. See **Engine/Lubrication/OIL - Standard Procedure**.

815caa1a

Fig. 242: Engine Covers
Courtesy of CHRYSLER LLC

29. Install the engine covers (1).

813422cd

30. Connect the negative battery cable (3).

SEAL, CRANKSHAFT OIL, FRONT

Removal

REMOVAL

Fig. 244: Locating Battery
Courtesy of CHRYSLER LLC

1. Disconnect negative cable from battery (1).
2. Remove accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
3. Drain cooling system. Refer to **Cooling - Standard Procedure** .
4. Remove upper radiator hose.
5. Remove radiator shroud attaching fasteners.
6. Remove radiator cooling fan and shroud. Refer to **Cooling/Engine/FAN, Cooling - Removal** .

Fig. 245: CRANKSHAFT DAMPER REMOVAL
Courtesy of CHRYSLER LLC

7. Remove crankshaft damper bolt.
8. Remove damper using the Crankshaft Insert 8513A (2) and Three Jaw Puller 1023 (1). See **Engine/Engine Block/DAMPER, Vibration - Removal.**

Fig. 246: FRONT CRANKSHAFT SEAL REMOVAL

Courtesy of CHRYSLER LLC

9. Use Seal Remover 9071 (1) to remove the crankshaft front seal (2).

Installation

INSTALLATION

Fig. 247: FRONT SEAL INSTALLATION

Courtesy of CHRYSLER LLC

CAUTION: The front crankshaft seal must be installed dry. Do not apply lubricant to sealing lip or to outer edge.

1. Use Seal Installer 9072 and Damper Installer 8512A to install the crankshaft front oil seal.

CAUTION: To prevent severe damage to the Crankshaft or Damper, thoroughly clean the damper bore and the crankshaft nose before installing Damper.

2. Install vibration damper. See Engine/Engine Block/DAMPER, Vibration - Installation.
3. Install radiator cooling fan and shroud. Refer to Cooling/Engine/FAN, Cooling - Installation.
4. Install upper radiator hose.
5. Install accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Installation.

Fig. 248: Locating Battery
Courtesy of CHRYSLER LLC

6. Refill cooling system. Refer to **Cooling - Standard Procedure** .
7. Connect negative cable to battery (1).

SEAL, CRANKSHAFT OIL, REAR

Description

DESCRIPTION

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer, for more information refer to the following;

- **Diagnosis and Testing** . See **Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Diagnosis and Testing**.
- **Removal** . See **Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Removal**.
- **Installation** . See **Engine/Engine Block/RETAINER, Crankshaft Rear Oil Seal - Installation**.

ENGINE MOUNTING

INSULATOR, ENGINE MOUNT, REAR

Removal

REMOVAL

Fig. 249: Rear Cross Member Bolts
Courtesy of CHRYSLER LLC

1. Raise the vehicle on a hoist.
2. Using a suitable jack, support transmission.
3. Remove rear cross member bolts (1,3).
4. Remove rear mount bolts (2) and remove cross member (4).

Fig. 250: TRANSMISSION MOUNT
Courtesy of CHRYSLER LLC

5. Remove the fasteners (1) from the rear mount (3).

6. Remove the mount isolator (3).

4847

 Courtesy of CHRYSLER LLC

6. Lower vehicle.
7. Connect negative battery cable to battery (1).

LUBRICATION

DESCRIPTION

DESCRIPTION

810115ad

Fig. 267: Engine Oil Lubrication System
Courtesy of CHRYSLER LLC

The lubrication system is a full flow filtration pressure feed type.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

1. Remove oil pressure sending unit and install gauge assembly C-3292A.
2. Run engine until thermostat opens.
3. Oil Pressure:
 - Curb Idle - 25 kPa (4 psi) minimum
 - 3000 RPM - 170 - 758 kPa (25 - 110 psi)
4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell, temporarily stopping the leak.
2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

If the oil leak source is not positively identified at this time , proceed with the AIR LEAK DETECTION TEST METHOD.

AIR LEAK DETECTION TEST METHOD

1. Remove the PCV valve from the IAFM. Cap or plug the PCV valve grommet.
2. Attach an air hose with pressure gauge and regulator to the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

3. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per service information procedures.
4. If the leakage occurs at the rear oil seal area, refer to **INSPECTION FOR REAR SEAL AREA LEAKS**.
5. If no leaks are detected, turn off the air supply and remove the air hose and all plugs and caps. Install the PCV valve.
6. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise the vehicle.
3. Remove torque converter or clutch housing cover and inspect rear of block for evidence of oil. Use a black light to check for the oil leak:
 - a. Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - b. Where leakage tends to run straight down, possible causes are a porous block, distributor seal, camshaft bore cup plugs oil galley pipe plugs, oil filter runoff, and main bearing cap to cylinder block mating surfaces.
4. If no leaks are detected, pressurize the crankcase as outlined in **AIR LEAK DETECTION TEST METHOD**.

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is especially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

FILTER, ENGINE OIL

Removal

REMOVAL

All engines are equipped with a high quality full-flow, disposable type oil filter. Chrysler Corporation recommends a Mopar® or equivalent oil filter be used.

1. Remove belly pan. Refer to **Body/Exterior/BELLY PAN - Removal** .
2. Position a drain pan under the oil filter.
3. Using a suitable oil filter wrench loosen filter.
4. Rotate the oil filter counterclockwise to remove it from the cylinder block oil filter boss.
5. When filter separates from cylinder block oil filter boss, tip gasket end upward to minimize oil spill. Remove filter from vehicle.

NOTE: Make sure filter gasket was removed with filter.

6. With a wiping cloth, clean the gasket sealing surface of oil and grime.

Installation

INSTALLATION

Fig. 268: Oil Filter Sealing Surface - Typical
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - SEALING SURFACE
2 - RUBBER GASKET
3 - OIL FILTER |
|--|

1. Lightly lubricate oil filter gasket (2) with engine oil.
2. Thread filter onto adapter nipple. When gasket makes contact with sealing surface, hand tighten filter one half turn, or 180°, do not over tighten.
3. Add oil, verify crankcase oil level and start engine. Inspect for oil leaks.
4. Install belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .

JET, PISTON OIL COOLER

Description

DESCRIPTION

81d0111b

Fig. 269: ENGINE OIL JET DESCRIPTION
 Courtesy of CHRYSLER LLC

Four dual-nozzle oil jets are bolted to the cylinder block underneath the main oil gallery. The jets connect with an oil-tight fit to the main gallery through lubrication passages. Each oil jet helps cool the two opposing pistons.

Removal

REMOVAL

8150068b

Fig. 270: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER LLC

1. Remove the oil pan and oil pick-up tube. See Engine/Lubrication/PAN, Oil - Installation.

NOTE: When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed. The old gasket cannot be reused.

2. Discard the integral windage tray and gasket.

Fig. 271: OIL JET REMOVE/INSTALL
Courtesy of CHRYSLER LLC

NOTE: It may be necessary to rotate the engine crankshaft to access the Piston Oil Cooler Jet retaining bolts.

3. Remove the Piston Oil Cooler Jet retaining bolt (2).
4. Remove the Piston Oil Cooler Jet (1).

Installation

INSTALLATION

Fig. 272: OIL JET REMOVE/INSTALL
 Courtesy of CHRYSLER LLC

1. Install the Piston Oil Cooler Jet. (1)
2. Tighten the bolt to 13 Nm (115 lbs. in.) (2)

Fig. 273: T-JOINT RTV APPLICATION
 Courtesy of CHRYSLER LLC

NOTE: Mopar® Engine RTV must be applied to the 4 T-joints, (area where front cover, rear retainer, block, and oil pan gasket meet). The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.

3. Clean the oil pan mating surfaces of the engine block and oil pan.
4. Apply Mopar® Engine RTV at the 4 T- joints. (1,2)
5. Install a new oil pan gasket/windage tray assembly.

8150068b

Fig. 274: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER LLC

6. Install the engine oil pan. See Engine/Lubrication/PAN, Oil - Installation.

OIL

Standard Procedure

ENGINE OIL SERVICE

The engine oil level indicator is located at the right hand of the engine on the 6.1L engines.

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about ten minutes before checking oil level. Checking engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil dipstick.

1. Position vehicle on level surface.
2. With engine OFF, allow approximately five minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.
3. Wipe dipstick clean.
4. Install dipstick and verify it is seated in the tube.
5. Remove dipstick, with handle held above the tip, take oil level reading.
6. Add oil only if level is below the ADD mark on dipstick.

ENGINE OIL CHANGE

Change engine oil at mileage and time intervals described in Maintenance Schedules. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description** .

Run engine until achieving normal operating temperature.

1. Position the vehicle on a level surface and turn engine off.
2. Remove oil fill cap.
3. Hoist and support vehicle on safety stands.
4. Remove the belly pan. Refer to **Body/Exterior/BELLY PAN - Removal** .
5. Place a suitable drain pan under crankcase drain.
6. Remove drain plug from crankcase and allow oil to drain into pan. Inspect drain plug threads for stretching or other damage. Replace drain plug if damaged.
7. Install drain plug in crankcase. Torque to 27 N.m (20 ft. lbs.).
8. Lower vehicle and fill crankcase with specified type and amount of engine oil described in this service information.
9. Install oil fill cap.
10. Start engine and inspect for leaks.
11. Stop engine and inspect oil level.
12. Install the belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .

NOTE: Care should be exercised when disposing used engine oil after it has been drained from a vehicle engine. Refer to the **WARNING** at beginning of this service information.

PAN, OIL

Removal

REMOVAL

Fig. 275: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable (3).
2. Remove the intake manifold. See [Engine/Manifolds/MANIFOLD, Intake - Removal](#).
3. Raise and support the vehicle.

Fig. 276: Front Belly Pan
Courtesy of CHRYSLER LLC

4. Remove the belly pan (2).
5. Drain the engine oil and remove the oil filter.

Fig. 277: Identifying Steering Gear & Mounting Bolts
Courtesy of CHRYSLER LLC

NOTE: Do not remove P/S hoses, tie rod ends or disconnect steering column coupler.

6. Remove the steering gear mounting bolts (1) and position the steering gear (2) aside.

Fig. 278: Engine Mount Nuts
Courtesy of CHRYSLER LLC

7. Remove the engine mount nuts (1, 2).
8. Remove the engine oil dipstick and tube from the oil pan.
9. Lower the vehicle.

Fig. 279: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER LLC

NOTE: Do not use air tools to install engine lift fixture.

10. Install the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3).
11. Raise the engine to provide clearance to remove the oil pan.

81387997

Fig. 280: Oil Pan Bolt Removal/Installation Sequence
 Courtesy of CHRYSLER LLC

NOTE: Do not pry on oil pan or oil pan gasket. The gasket is integral to engine windage tray and does not come out with oil pan.

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

12. Remove the M10 fasteners (vertical and horizontal) from the rear of the oil pan to the transmission.
13. Using the sequence shown in illustration, the oil pan mounting bolts and remove the oil pan.

NOTE: When the oil pan is removed a new oil pan gasket/windage tray assembly must be installed, the old gasket cannot be reused.

14. Remove and discard the integral windage tray and gasket.

Installation

INSTALLATION

Fig. 281: T-Joint RTV Application
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - Front Cover T-Joints
2 - Rear Oil Retainer T-Joints |
|--|

1. Clean the oil pan gasket mating surface of the engine block and oil pan.

NOTE: Mopar® Engine RTV must be applied to the 4 T-joints, (area where the front cover, rear retainer and oil pan gasket meet). The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.

2. Apply Mopar® Engine RTV at the 4 T- joints (1,2).

NOTE: When the oil pan is removed, a new oil pan gasket/windage tray assembly must be installed, the old gasket cannot be reused.

3. Install a new oil pan gasket/windage tray assembly.
4. If removed, reinstall the oil pump pickup tube with a new O-ring and tighten the pickup tube retainers to 28 N.m (21 ft. lbs.).

81387997

Fig. 282: Oil Pan Bolt Removal/Installation Sequence
 Courtesy of CHRYSLER LLC

NOTE: The horizontal M10 fasteners are 5 mm longer in length, and must be reinstalled in original locations.

NOTE: New M6 fasteners must be used when reinstalling the oil pan. Do not reuse the old M6 fasteners.

5. Align the rear of the oil pan with the rear face of the engine block and install the M10 and M6 oil pan retainers finger tight.
6. Using the sequence shown in illustration, tighten the M6 bolts to 5 N.m (44 in. lbs.).
7. Using the sequence shown in illustration, tighten the M10 bolts to 54 N.m (39 ft. lbs.).
8. Using the sequence shown in illustration, tighten the M6 bolts to 12 N.m (9 ft. lbs.).
9. Lower the vehicle.

Fig. 283: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER LLC

10. Using the Engine Lift Fixture 8984A (1), Engine Lift Adapter 8984-UPD (2) and the Engine Support Fixture 8534B (3) lower the engine into position and remove.

Fig. 284: Engine Mount Nuts
Courtesy of CHRYSLER LLC

11. Raise and support the vehicle.
12. Install the engine mount nuts (1,2) and tighten to 95 N.m (70 ft. lbs.).
13. Install the engine oil dipstick and tube.

Fig. 285: Identifying Steering Gear & Mounting Bolts
Courtesy of CHRYSLER LLC

14. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).
15. Lower the vehicle.
16. Install the intake manifold. See Engine/Manifolds/MANIFOLD, Intake - Installation.
17. Fill the engine oil.
18. Install the oil filter.

Fig. 286: FRONT BELLY PAN
Courtesy of CHRYSLER LLC

19. Install the belly pan (2).

813422cd

20. Connect the negative battery cable (3).
21. Start engine and check for leaks.

PUMP, ENGINE OIL

Removal

REMOVAL

81448b63

Fig. 288: OIL PUMP REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

1. Remove the oil pan and pick-up tube. See **Engine/Lubrication/PAN, Oil - Removal**.
2. Remove the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Removal**.
3. Remove the four bolts, and the oil pump.

Cleaning

CLEANING

1. Wash all parts in a suitable solvent.

Inspection

INSPECTION

80b6b3b1

Fig. 289: Measuring Outer Rotor Clearance in Housing
Courtesy of CHRYSLER LLC

- | |
|------------------|
| 1 - FEELER GAUGE |
| 2 - OUTER ROTOR |

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

1. Remove the pump cover.
2. Clean all parts thoroughly. Mating surface of the oil pump housing should be smooth. If the pump cover is scratched or grooved the oil pump assembly should be replaced.
3. Slide outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil pump body and measure clearance between the outer rotor (2) and the body. If the measurement is 0.235 mm (0.009 in.) or more the oil pump assembly must be replaced.

Fig. 290: Measuring Clearance Between Rotors
Courtesy of CHRYSLER LLC

1 - OUTER ROTOR
2 - FEELER GAUGE
3 - INNER ROTOR

4. Install the inner rotor in the into the oil pump body. Measure the clearance between the inner (3) and outer rotors (1). If the clearance between the rotors is .150 mm (0.006 in.) or more the oil pump assembly must be replaced.

Fig. 291: Measuring Clearance Over Rotors
Courtesy of CHRYSLER LLC

1 - STRAIGHT EDGE
2 - FEELER GAUGE

5. Place a straight edge (1) across the body of the oil pump (between the bolt holes), if a feeler gauge (2) of .095 mm (0.0038 in.) or greater can be inserted between the straightedge and the rotors, the pump must be replaced .
6. Reinstall the pump cover. Tighten fasteners to 15 N.m (132 in. lbs.)

NOTE: **The 6.1L Oil pump is released as an assembly. There are no Chrysler part numbers for Sub-Assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.**

Installation

INSTALLATION

81448b63

Fig. 292: OIL PUMP REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

1. Position the oil pump onto the crankshaft and install the 4 oil pump retaining bolts.
2. Tighten the oil pump retaining bolts to 28 N.m (250 in. lbs.).
3. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation**.
4. Install the pick-up tube and oil pan. See **Engine/Lubrication/PAN, Oil - Installation**.

SENSOR, OIL PRESSURE

Description

DESCRIPTION

The oil pressure sensor uses the following three circuits:

- Signal circuit to the PCM
- Sensor ground circuit through the PCM
- 5 volt reference circuit from the PCM

The oil pressure sensor returns a voltage signal back to the PCM with reference to oil pressure. Ground for the sensor is supplied by the PCM.

The oil pressure sensor is located on the right side of the engine block. The sensor screws into the engines main oil gallery.

Removal

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
3. Remove the upper generator mounting bolt.
4. Raise and support the vehicle.

Fig. 293: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

5. Remove the lower splash shield retaining bolts (1) and the splash shield.

2439251

Fig. 294: Identifying Lower Generator Retaining Bolts
Courtesy of CHRYSLER LLC

6. Remove the lower generator retaining bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil pressure sensor.

2439466

Fig. 295: Identifying Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER LLC

9. Disconnect the oil pressure sensor electrical connector (1).

2439480

10. Remove the oil pressure sensor (1).

Installation

INSTALLATION

2439480

Fig. 297: Identifying Oil Pressure Sensor
Courtesy of CHRYSLER LLC

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil pressure sensor (1).

2439466

Fig. 298: Identifying Oil Pressure Sensor Electrical Connector
 Courtesy of CHRYSLER LLC

2. Connect the oil pressure sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

2439251

Fig. 299: Identifying Lower Generator Retaining Bolts
 Courtesy of CHRYSLER LLC

5. Install the lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs).

Fig. 300: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

6. Position the lower splash shield and install the retaining bolts (1).
7. Lower the vehicle
8. Tighten the upper generator mounting bolt to 55 N.m (41 ft. lbs).

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

9. Install the accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Installation .
10. Connect the negative battery cable.

SENSOR, OIL TEMPERATURE

Description

DESCRIPTION

The oil temperature sensor uses the following two circuits:

- Signal circuit to the PCM
- Ground circuit from the PCM

The oil temperature sensor is a Negative Thermal Coefficient sensor. The resistance of the sensor changes as oil temperature changes. This results in different output voltages back to the PCM.

The oil temperature sensor is located on the right side of the engine block.

Removal

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
3. Remove the generator upper mounting bolt.
4. Raise and support the vehicle.

Fig. 301: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

5. Remove the lower splash shield retaining bolts (1) and the splash shield.

Fig. 302: Identifying Lower Generator Retaining Bolts

Courtesy of CHRYSLER LLC

6. Remove the generator lower mounting bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil temperature sensor.

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil temperature sensor (1).

Fig. 306: Identifying Oil Temperature Sensor Electrical Connector
Courtesy of CHRYSLER LLC

2. Connect the oil temperature sensor electrical connector (1).

3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

Fig. 307: Identifying Lower Generator Retaining Bolts
Courtesy of CHRYSLER LLC

5. Install the generator lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs.).

Fig. 308: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER LLC

6. Position the lower splash shield and install the splash shield retaining bolts (1).
7. Lower the vehicle.
8. Tighten the generator upper mounting bolt to 55 N.m (41 ft. lbs.).

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

9. Install the accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal .
10. Connect the negative battery cable.

MANIFOLDS

MANIFOLD, EXHAUST

Description

DESCRIPTION

The exhaust manifolds are tube in shell air gap design to maximize durability and performance. The exhaust manifolds are made of stainless steel stamped shells and stainless steel tubes with a powdered metal outlet. A layered graphite over perforated steel manifold gasket is used to provide sealing to the cylinder head.

Operation

OPERATION

The exhaust manifolds collect the engine exhaust exiting the combustion chambers, then channels the exhaust gases to the exhaust pipes attached to the manifolds.

Removal

REMOVAL

EXHAUST MANIFOLD - LEFT SIDE

815cad17

Fig. 309: Air Cleaner Housing
Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Remove air cleaner housing (1).
3. Remove coolant bottle, and set aside without removing hoses. Refer to **Cooling/Engine/BOTTLE, Coolant Recovery - Removal**.
4. Remove the top row of bolts from manifold from under the hood.
5. Support and raise the vehicle on a hoist.
6. Remove the lower splash shield.
7. Remove the exhaust pipe as an assembly.
8. Remove the knock sensor.
9. Remove the bottom row of bolts from manifold from under vehicle.
10. Remove manifold from under vehicle.

2 - BOLT
3 - NUT
4 - HEAT SHIELD |
|---|

1. Disconnect negative battery cable.
2. Remove power distribution box.
3. Loosen the power distribution box mounting bracket.
4. Unfasten, and relocate the wire harness mounted on the right hand inner fender panel.
5. Remove the bottom row of bolts from manifold from under vehicle.
6. Support and raise the vehicle on a hoist.
7. Remove the exhaust pipe as an assembly.
8. Remove the lower splash shield.
9. Remove starter (1) and heat shield (4).
10. Remove knock sensor.
11. Remove the top row of bolts from manifold from under the hood.
12. Remove the manifold from under vehicle.

Cleaning

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

Inspection

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.375 mm (0.0147 in.) around each port opening, and 0.75 mm (0.0295 in.) overall.

Installation

INSTALLATION

EXHAUST MANIFOLD - LEFT SIDE

815d027c

Fig. 311: EXHAUST MANIFOLD TORQUE LEFT
Courtesy of CHRYSLER LLC

1. Install the exhaust manifold gasket and the exhaust manifold.
2. Using the sequence shown in illustration, install the exhaust manifold bolts and tighten to 31 N.m (23 ft. lbs.).
3. Install the coolant bottle.

815cad17

Fig. 312: Air Cleaner Housing
Courtesy of CHRYSLER LLC

4. Install the air cleaner housing (1).
5. Install the knock sensor.
6. Install the exhaust pipe to manifold bolts.
7. Connect negative battery cable.

EXHAUST MANIFOLD - RIGHT SIDE

815d0278

Fig. 313: 6.1L EXH MANIFOLD TORQUE RIGHT
Courtesy of CHRYSLER LLC

1. Install the exhaust manifold gasket and the exhaust manifold.
2. Using the sequence shown in illustration, install the exhaust manifold bolts and tighten to 31 N.m (23 ft. lbs.).
3. Connect the wire harness mounted on the right hand inner fender panel.
4. Install the power distribution box mounting bracket.
5. Install the power distribution box.

Fig. 314: Removing/Installing Starter
Courtesy of CHRYSLER LLC

6. Install the starter (1) and heat shield (4).
7. Install the knock sensor.
8. Install the exhaust pipe to manifold bolts.
9. Connect the negative battery cable.

MANIFOLD, INTAKE

Description

DESCRIPTION

The intake manifold is made of aluminum, and features runners to maximize power. The intake manifold uses single plane sealing which consist of two edge molded gaskets to prevent leaks.

Diagnosis and Testing

INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or the fan. Do not wear loose clothing. Failure to follow this warning may

result in serious or fatal injury.

1. Start the engine.
2. Spray a small stream of water at the suspected leak area.
3. If a change in RPM is observed the area of the suspected leak has been found.
4. Repair as required.

Removal

REMOVAL

815caa1a

Fig. 315: Engine Covers
Courtesy of CHRYSLER LLC

1. Remove the engine covers (1).
2. Perform the fuel system pressure release procedure. Refer to **Fuel System/Fuel Delivery - Standard Procedure** .
3. Disconnect the fuel supply line. Refer to **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure** .

Fig. 316: Locating Battery
 Courtesy of CHRYSLER LLC

4. Disconnect the negative battery cable.

Fig. 317: Air Cleaner Duct
 Courtesy of CHRYSLER LLC

5. Remove the air cleaner housing (1) and clean air tube (2).
6. Disconnect electrical connectors for the following components:
 - Manifold Absolute Pressure (MAP) Sensor

- Short runner valve (SRV)
 - Fuel Injectors
 - Electric Throttle Control (ETC)
7. Disconnect the brake booster hose, purge hose, and Make Up Air Hose (MUA).

Fig. 318: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

8. Using the sequence shown in illustration, remove the intake manifold retaining fasteners
9. Remove intake manifold as an assembly.

Cleaning

CLEANING

NOTE: There is NO approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

Inspection

INSPECTION

1. Inspect the intake sealing surface for cracks, nicks and distortion.
2. Inspect the intake manifold vacuum hose fittings for looseness or blockage.

Installation

INSTALLATION

1248247

Fig. 319: Intake Manifold Removal & Tightening Sequence
Courtesy of CHRYSLER LLC

1. Position the intake manifold.
2. Using the sequence shown in illustration, install the intake manifold retaining bolts and tighten the fasteners to 12 N.m (9 ft. lbs.).
3. Connect the electrical connectors for the following components:
 - Manifold Absolute Pressure (MAP) Sensor
 - Short runner valve (SRV)
 - Fuel Injector electrical connectors
 - ETC (Electronic Throttle Control)
4. Connect the brake booster hose, purge hose, and make-up air hose (MUA).

815d014c

Fig. 320: Air Cleaner Duct

VALVE TIMING

CHAIN AND SPROCKETS, TIMING

Removal

REMOVAL

Fig. 323: Front Cover Slide Bushings
 Courtesy of CHRYSLER LLC

1. Disconnect the negative battery cable.
2. Drain the cooling system.
3. Remove the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Removal.**
4. Verify the slide bushings (1) remain installed in the timing chain cover during removal.

Fig. 324: Timing Mark Alignment
Courtesy of CHRYSLER LLC

5. Install the vibration damper bolt finger tight. Using a suitable socket and breaker bar, rotate the crankshaft to align the timing chain plated links with the timing marks on the sprockets as shown in illustration.

CAUTION: The camshaft pin and the slot in the cam sprocket must be clocked at 12:00 (2). The crankshaft keyway must be clocked at 2:00 (3). The crankshaft sprocket must be installed so that the dots and or paint marking is at 6:00.

81449b63

Fig. 325: Removing/Installing Oil Pump
Courtesy of CHRYSLER LLC

6. Remove the oil pump. See Engine/Lubrication/PUMP, Engine Oil - Removal.

Fig. 326: RETRACTING TENSIONER
Courtesy of CHRYSLER LLC

7. Retract the chain tensioner arm (1) until the hole in the arm lines up with the hole in the bracket (2).

Fig. 327: TENSIONER PIN
Courtesy of CHRYSLER LLC

8. Install the Tensioner Pin 8514 (1) into the holes in the chain tensioner (2).

Fig. 328: Timing Mark Alignment
Courtesy of CHRYSLER LLC

9. Remove the camshaft sprocket retaining bolt and remove the timing chain with the camshaft and crankshaft sprockets (2, 3).

NOTE: **Inspect the timing chain tensioner and timing chain guide shoes for wear and replace as necessary.**

10. If the timing chain tensioner (1) is being replaced, remove the retaining bolts and remove the chain tensioner.
11. If the timing chain guide is being replaced, remove the retaining bolts and remove the timing chain guide.

Installation

INSTALLATION

Fig. 329: RETRACTING TENSIONER
Courtesy of CHRYSLER LLC

1. If removed, install the timing chain guide and tighten bolts to 28 N.m (21 ft. lbs.).
2. If removed, install the timing chain tensioner (1) and tighten bolts to 28 N.m (21 ft. lbs.).
3. If required, retract the chain tensioner arm and install the Tensioner Pin 8514 (2) into the holes of the chain tensioner.

Fig. 330: TIMING MARK ALIGNMENT

Courtesy of CHRYSLER LLC

CAUTION: The timing chain must be installed with the single plated link aligned with the dot and or paint marking on the camshaft sprocket. The crankshaft sprocket is aligned with the dot and or paint marking on the sprocket between two plated timing chain links.

CAUTION: The camshaft pin and the slot in the cam sprocket must be clocked at 12:00. The crankshaft keyway must be clocked at 2:00. The crankshaft sprocket must be installed so that the dots and or paint marking is at 6:00.

4. Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.
5. Place timing chain around both sprockets with timing marks aligned with the plated links.
6. Lift the sprockets and chain keeping sprockets tight against the chain in the position as shown in illustration).
7. Position both sprockets (2, 3) onto their respective shafts and verify alignment of timing marks.
8. Install the camshaft sprocket retaining bolt and tighten to 122 N.m (90 ft. lbs.).

Fig. 331: TENSIONER PIN
Courtesy of CHRYSLER LLC

9. Remove the Tensioner Pin 8514 (1).
10. Rotate the crankshaft two revolutions and verify the alignment of the timing marks. If the timing marks do not line up, remove the camshaft sprocket and realign.

81448b63

Fig. 332: Removing/Installing Oil Pump
 Courtesy of CHRYSLER LLC

11. Install the oil pump. See **Engine/Lubrication/PUMP, Engine Oil - Installation.**

81448b6ad

Fig. 333: Front Cover Slide Bushings
 Courtesy of CHRYSLER LLC

12. Verify the slide bushings (1) are installed in the timing chain cover.
13. Install the timing chain cover. See **Engine/Valve Timing/COVER(S), Engine Timing - Installation**.
14. Fill the engine with oil.
15. Fill the cooling system. Refer to **Cooling - Standard Procedure** .
16. Connect the negative battery cable.
17. Start the engine and check for leaks.

COVER(S), ENGINE TIMING

Removal

REMOVAL

815caa1a

Fig. 334: Engine Covers
Courtesy of CHRYSLER LLC

1. Remove engine covers (1).

Fig. 335: Locating Battery
 Courtesy of CHRYSLER LLC

2. Disconnect the battery negative cable from battery (1).

Fig. 336: Air Cleaner Housing
 Courtesy of CHRYSLER LLC

3. Remove clean air hose from throttle body.
4. Remove retaining bolt (2) and remove air cleaner housing (1).
5. Drain the cooling system.

6. Remove the accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal.
7. Remove the cooling fan.
8. Remove the fan shroud.

NOTE: It is not necessary to disconnect A/C lines or discharge freon.

9. Remove A/C compressor and set aside. Refer to Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal.

4701

Fig. 337: CRANKSHAFT DAMPER REMOVAL
Courtesy of CHRYSLER LLC

10. Remove the generator.
11. Remove the upper radiator hose.
12. Disconnect both heater hoses at the timing cover.
13. Disconnect the lower radiator hose at engine.
14. Remove accessory drive belt tensioner and both idler pulleys.
15. Remove the crankshaft damper. See Engine/Engine Block/DAMPER, Vibration - Removal.

NOTE: Do not remove the hoses from the power steering pump.

16. Remove power steering pump and set aside.

Fig. 338: FRONT COVER SLIDE BUSHINGS
Courtesy of CHRYSLER LLC

17. Remove the dipstick support bolt.
18. Drain the engine oil.
19. Remove the oil pan and pick up tube. See Engine/Lubrication/PAN, Oil - Removal.

NOTE: It is not necessary to remove water pump for timing cover removal.

20. Remove the timing cover bolts and remove cover.
21. Verify that the timing cover slide bushings (1) are located in timing cover.

Installation

INSTALLATION

Fig. 339: FRONT COVER SLIDE BUSHINGS
Courtesy of CHRYSLER LLC

1. Clean timing chain cover and block surface.

NOTE: Always install a new gasket on timing cover.

2. Verify that the slide bushings (1) are installed in timing cover.
3. Install cover and new gasket. Tighten fasteners to 28 N.m (250 in. lbs.).

NOTE: The large lifting stud is torqued to 55 N.m (40 ft. lbs.).

Fig. 341: Accessory Drive Belt Routing
 Courtesy of CHRYSLER LLC

11. Install accessory drive belt tensioner assembly and both idler pulleys.

Fig. 342: Engine Covers
 Courtesy of CHRYSLER LLC

12. Install the radiator lower hose.
13. Install both heater hoses at the timing cover.
14. Install radiator fan shroud.

15. Install the cooling fan.
16. Install the accessory drive belt.
17. Install the coolant bottle and washer bottle.
18. Install the upper radiator hose.
19. Install the air cleaner assembly.
20. Fill cooling system.
21. Refill engine oil.
22. Connect the battery negative cable.
23. Install the engine covers (1).

TENSIONER, ENGINE TIMING

Description

DESCRIPTION

The timing chain tensioner is a stamped steel constant tension mechanical design. It is mounted to the front of the engine, behind the timing chain drive.

Operation

OPERATION

The timing chain tension is maintained by routing the timing chain through the tensioner assembly. A nylon covered spring steel arm presses on the timing chain maintaining the correct chain tension.

ENGINE

6.4L - Service Information - Challenger

DESCRIPTION

DESCRIPTION

CAUTION: If the engine has experienced a catastrophic failure, THE INTAKE MANIFOLD MUST BE REPLACED!

3667207

Fig. 1: 6.4L HEMI V-8 Engine
Courtesy of CHRYSLER GROUP, LLC

The 6.4L HEMI eight-cylinder SRT high performance engine is a 90° V-Type, deep skirt, lightweight cast iron block with aluminum heads, single cam, overhead valves, and hydraulic roller lifters. The heads incorporate splayed valves with a hemispherical style combustion chamber and dual spark plugs. The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2. The 6.4L HEMI engine is a bored and stroked version of the 5.7L HEMI engine developed for SRT high performance vehicles. This engine shares the same architecture as the 2009 5.7L HEMI with the following Performance Upgrades:

- Increased Bore
- Increased Stroke

- Increased Valve Sizing

The 6.4L HEMI engine also has improved horsepower, torque and fuel economy as compared with the 6.1L HEMI engine. This is achieved with the larger displacement and the following Technical Improvements:

- Variable Cam Timing (VCT) Cam Phasing System
- Multi-Displacement System (MDS)
- High Flow Ports
- Increased Maximum RPM
- Combustion Chamber Shape
- Higher Compression Ratio

DIAGNOSIS AND TESTING

ENGINE DIAGNOSIS - INTRODUCTION

Engine diagnosis is helpful in determining the causes of malfunctions not detected and remedied by routine maintenance.

These malfunctions may be classified as either performance e.g., (engine idles rough and stalls) or mechanical e.g., (a strange noise). for possible causes and corrections of malfunctions. Refer to **ENGINE MECHANICAL DIAGNOSIS CHART** .

Additional tests and diagnostic procedures may be necessary for specific engine malfunctions that can not be isolated with the Service Diagnosis charts. For additional Information on diagnosis and testing. Refer to the following tests:

- Cylinder Compression Pressure Leakage. Refer to **CYLINDER COMPRESSION PRESSURE LEAKAGE** .
- Cylinder Combustion Pressure Leakage. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE** .
- Checking Engine Oil Pressure. Refer to **CHECKING ENGINE OIL PRESSURE** .
- Cylinder Head Gasket Failure. Refer to **DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE** .
- Intake Manifold Leakage. Refer to **DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE** .

CYLINDER COMBUSTION PRESSURE LEAKAGE

The combustion pressure leakage test provides an accurate means for determining engine condition.

Combustion pressure leakage testing will detect:

- Exhaust and intake valve leaks (improper seating)
- Leaks between adjacent cylinders or into water jacket
- Any causes for combustion and/or compression pressure loss

1. Check the coolant level and fill as required. DO NOT install the radiator cap.
2. Start and operate the engine until it attains normal operating temperature.
3. Turn the engine OFF.
4. Remove the spark plugs.
5. Remove the oil filler cap.
6. Remove the air cleaner hose.
7. **Calibrate the tester according to the manufacturer's instructions.** The shop air source for testing should maintain a regulated air pressure at 552 kPa (80 psi).
8. Perform the test procedures on each cylinder according to the tester manufacturer's instructions. Set the piston of the cylinder to be tested at TDC compression.
9. During the testing, listen for pressurized air escaping through the throttle body, tailpipe and oil filler cap opening. Check for bubbles in the radiator coolant.

All gauge pressure indications should be equal, with **no more** than 25% leakage.

FOR EXAMPLE: Input air at 552 kPa (80 psi), the primary gauge factory set at 207 kPa (30 psi) input pressure. The secondary gauge should have no more than 176 kPa (25.5 psi) loss, when connected to the cylinder.

Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART.**

CYLINDER COMBUSTION PRESSURE LEAKAGE DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
Air escapes through the throttle body	Intake valve bent, burnt, or not seated properly.	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
Air escapes through the tailpipe	Exhaust valve bent, burnt, or not seated properly.	Inspect valve and valve seat. Reface or replace, as necessary. Inspect valve springs. Replace as necessary.
Air escapes through the radiator	Cylinder head gasket leaking or cracked in cylinder head or engine block.	Remove cylinder head and inspect. Replace cylinder head gasket, cylinder head or engine block as necessary.
More than 50% leakage from adjacent cylinders	Cylinder head gasket leaking or crack in cylinder head or engine block between adjacent cylinders.	Remove cylinder head and inspect. Replace cylinder head gasket, cylinder head or engine block as necessary.

More than 25% leakage and air escapes through the oil filler cap opening only	Stuck or broken piston rings; cracked piston; worn rings and/or cylinder wall.	Remove cylinder head and inspect for broken rings or piston. Measure ring gap and cylinder diameter, taper and out-of-round. Replace defective part as necessary.
---	--	---

CYLINDER COMPRESSION PRESSURE LEAKAGE

NOTE: The results of a cylinder compression pressure test can be utilized to diagnose several engine malfunctions.

NOTE: Ensure the battery is completely charged and the engine starter motor is in good operating condition. Otherwise the indicated compression pressures may not be valid for diagnosis purposes.

1. Clean the spark plug recesses with compressed air.
2. Remove the spark plugs and record the cylinder number of each spark plug for future reference.
3. Inspect the spark plug electrodes for abnormal firing indicators such as fouled, hot, oily, etc.
4. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
5. Insert a compression pressure gauge and rotate the engine with the engine starter motor for three revolutions.
6. Record the compression pressure on the 3rd revolution. Continue the test for the remaining cylinders.

NOTE: The recommended compression pressures are to be used only as a guide to diagnosing engine problems. An engine should not be disassembled to determine the cause of low compression unless some malfunction is present.

7. Compression should not be less than 689 kPa (100 psi) and not vary more than 25 percent from cylinder to cylinder.
8. If one or more cylinders have abnormally low compression pressures, repeat the compression test.

NOTE: If the same cylinder or cylinders repeat an abnormally low reading on the second compression test, it could indicate the existence of a problem in the cylinder in question.

9. If one or more cylinders continue to have abnormally low compression pressures, perform the cylinder combustion pressure leakage test. Refer to **CYLINDER COMBUSTION PRESSURE LEAKAGE**.

ENGINE MECHANICAL DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
ENGINE NOISE	1. Worn accessory drive belt	1. Check for damage and/or alignment. Refer to BELT, SERPENTINE, DIAGNOSIS AND TESTING .
	2. Worn coolant pump	2. Check for possible coolant leak. If ok, check the pulley and input shaft for wear. Replace as necessary.
	3. Worn generator	3. Check the pulley for wear. Spin the armature. Replace as necessary.
	4. Idler/Tensioner pulley	4. Check pulleys. Verify bearing noise. Replace as necessary.
	5. Power steering pump	5. Check the pulley and input shaft for wear. Replace as necessary.
	6. Flywheel/Flexplate	6. Check for wear or possible cracking. Check bolts. repair as necessary.
NOISY VALVES/LIFTERS	1. High or low oil level in crankcase.	1. Check for correct oil level. Adjust oil level by draining or adding as needed.
	2. Thin or diluted oil.	2. Change oil. Refer to STANDARD PROCEDURE .
	3. Low oil pressure.	3. Check engine oil level. If OK, perform oil pressure test. Refer to DIAGNOSIS AND TESTING .
	4. Dirt in hydraulic lifters.	4. Clean/replace hydraulic lifters.
	5. Bent push rod(s).	5. Install new push rods.
	6. Worn rocker arms.	6. Inspect oil supply to rocker arms and replace worn arms as needed.
	7. Worn hydraulic lifters.	7. Install new hydraulic lifters.

	8. Worn valve guides.	8. Inspect all valve guides and replace as necessary.
	9. Excessive runout of valve seats or valve faces.	9. Grind valves and seats.
CONNECTING ROD NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. If OK, perform oil pressure test. Refer to <u>DIAGNOSIS AND TESTING</u> .
	3. Thin or diluted oil.	3. Change oil to correct viscosity. Refer to <u>STANDARD PROCEDURE</u> .
	4. Excessive connecting rod bearing clearance.	4. Measure bearings for correct clearance with plasti-gage. Repair as necessary.
	5. Connecting rod journal out of round.	5. Replace crankshaft or grind journals.
	6. Misaligned connecting rods.	6. Replace bent connecting rods.
MAIN BEARING NOISE	1. Insufficient oil supply.	1. Check engine oil level.
	2. Low oil pressure.	2. Check engine oil level. If OK, perform oil pressure test. Refer to <u>DIAGNOSIS AND TESTING</u> .
	3. Thin or diluted oil.	3. Change oil to correct viscosity. Refer to <u>STANDARD PROCEDURE</u> .
	4. Excessive main bearing clearance.	4. Measure bearings for correct clearance. Repair as necessary.
	5. Excessive end play.	5. Check crankshaft thrust bearing for excessive wear on flanges.
	6. Crankshaft main journal out of round or worn.	6. Grind journals or replace crankshaft.
	7. Loose flexplate, flywheel or torque converter.	7. Inspect crankshaft, flexplate, flywheel and bolts for damage. Tighten to correct torque.
LOW OIL PRESSURE	1. Low oil level.	1. Check oil level and fill if necessary.
	2. Faulty oil pressure sending	2. Install new sending unit.

	unit.	
	3. Clogged oil filter.	3. Install new oil filter.
	4. Worn oil pump.	4. Replace oil pump assembly.
	5. Thin or diluted oil.	5. Change oil to correct viscosity. Refer to <u>STANDARD PROCEDURE</u> .
	6. Excessive bearing clearance.	6. Measure bearings for correct clearance.
	7. Oil pump relief valve stuck.	7. Remove valve to inspect, clean and reinstall.
	8. Oil pickup tube loose, broken, bent or clogged.	8. Inspect oil pickup tube and pump, and clean or replace if necessary.
	9. Oil pump cover warped or cracked.	9. Install new oil pump.
	10. Faulty or missing piston cooling jets.	10. Replace piston cooling jets.
OIL LEAKS	1. Misaligned or deteriorated gaskets.	1. Replace gasket.
	2. Loose fastener or broken or porous metal part.	2. Tighten, repair or replace the part.
	3. Front or rear crankshaft oil seal leaking.	3. Replace seal.
	4. Leaking oil gallery plug or cup plug.	4. Remove and reseal threaded plug. Replace cup style plug.
EXCESSIVE OIL CONSUMPTION OR SPARK PLUGS OIL FOULED	1. PCV System malfunction.	1. Refer to <u>VALVE, POSITIVE CRANKCASE VENTILATION (PCV), REMOVAL</u> .
	2. Defective valve stem seal(s).	2. Repair or replace seal(s).
	3. Worn or broken piston rings.	3. Hone cylinder bores. Install new rings.
	4. Scuffed pistons/cylinder walls.	4. Hone cylinder bores and replace pistons as required.
	5. Carbon in oil control ring groove.	5. Remove rings and de-carbon piston.
	6. Worn valve guides.	6. Inspect/replace valve guides as necessary.
	7. Piston rings fitted too tightly in grooves.	7. Remove rings and check ring end gap and side clearance. Replace if

necessary.

Lifter Purge Guideline

1. Warm engine to standard idle conditions.

NOTE: Engine noise may be in the form of a clicking, chatter, or clattering noise.

2. Listen to the engine for 30 to 60 seconds with the hood up and the engine cover removed.
3. If noise is present, de-aeration of the lifters is required.
4. Run the engine between 2000 and 3000 RPM for three to five minutes.
5. Return the engine to standard idle speed for 30 to 60 seconds.
6. Evaluate noise. If noise is present, repeat the run an additional 4 cycles.

NOTE: The standard drive cycle will be about 10 - 15 miles of non- stop, combined highway and city driving.

7. If noise is present, take the vehicle on a standard drive cycle.

NOTE: Use a feeler gauge to verify clearance is present between the lifter and cam base circle.

8. Evaluate the noise. If noise is present, follow standard service procedure for lifter repairs or noise conditions. Refer to **DIAGNOSIS AND TESTING - HYDRAULIC ROLLER LIFTERS**.
9. Evaluate lifters for sponginess, check valve defects, and clearance.

OIL CONSUMPTION TEST AND DIAGNOSIS

DIAGNOSTIC PROCEDURES

The following diagnostic procedures are used to determine the source of excessive internal oil Consumption, these procedures and tests apply to vehicles with 50, 000 miles or less.

NOTE: Engine oil consumption may be greater than normal during engine break-in. Repairs should be delayed until vehicle has been driven at least 7, 500 miles.

Severe service (high ambient temperature, short trips, heavy loading, trailer towing, taxi, off-road, or law enforcement use) may result in greater oil consumption than normal.

Sustained high speed driving and high engine RPM operation may result in increased oil consumption.

Failure to comply with the recommended oil type and viscosity rating, as outlined in the Owner's Manual, may impact oil economy as well as fuel economy.

Oil consumption may increase with vehicle age and mileage due to normal engine wear.

NOTE: Because a few drops of external oil leakage per mile can quickly account for the loss of one quart of oil in a few hundred miles, ensure no external engine oil leaks are present.

- **Oil leakage is not the same as oil consumption and all external leakage must be eliminated before any action can be taken to verify and/or correct oil consumption complaints.**
- **Verify that the engine has the correct oil level dipstick and dipstick tube installed.**
- **Verify that the engine is not being run in an overfilled condition. Check the oil level 15 minutes after a hot shutdown with the vehicle parked on a level surface. In no case should the level be above MAX or the FULL mark on the dipstick.**

OIL CONSUMPTION TEST

1. Check the oil level at least 15 minutes after a hot shutdown.
2. If the oil level is low, top off with the proper viscosity and API service level engine oil. Add one bottle of MOPAR® 4-In-1 Leak Detection Dye into the engine oil.
3. Tamper proof the oil pan drain plug, oil filter, dipstick and oil fill cap.
4. Record the vehicle mileage.
5. Instruct the customer to drive the vehicle as usual.
6. Ask the customer to return to the servicing dealer after accumulating 500 miles, Check the oil level at least 15 minutes after a hot shutdown. If the oil level is half way between the "FULL" and "ADD" mark continue with the next step.
7. Using a black light, re-check for any external engine oil leaks, repair as necessary, if no external engine oil leaks are present, continue with **OIL CONSUMPTION DIAGNOSIS**.

OIL CONSUMPTION DIAGNOSIS

1. Check the Positive Crankcase Ventilation (PCV) system. Make sure the system is not restricted and the PCV valve has the correct part number and correct vacuum source (18-20 in. Hg at idle below 3000 ft. above sea level is considered normal).
2. Perform a cylinder compression test and cylinder leak down test using the standard leak down gauge following manufacturers suggested best practices.

NOTE: **Verify the spark plugs are not oil saturated. If the spark plugs are oil saturated and compression is good it can be assumed the valve seals or valve guides are at fault.**

3. If one or more cylinders have more than 15% leak down further engine tear down and inspection will be required.

TOP 19 REASONS THAT MAY LEAD TO ENGINE OIL CONSUMPTION

1. Tapered and Out-of-Round Cylinders

The increased piston clearances permit the pistons to rock in the worn cylinders. While tilted momentarily, an abnormally large volume of oil is permitted to enter on one side of the piston. The rings, also tilted in the cylinder, permit oil to enter on one side. Upon reversal of the piston on each stroke, some of this oil is passed into the combustion chamber.

2. Distorted Cylinders

This may be caused by unequal heat distribution or unequal tightening of cylinder head bolts. This condition presents a surface which the rings may not be able to follow completely. In this case, there may be areas where the rings will not remove all of the excess oil. When combustion takes place, this oil will be burned and cause high oil consumption.

3. Improper operation of "PCV "system

The main purpose of the Positive Crankcase Ventilation (PCV) valve is to recirculate blow-by gases back from the crankcase area through the engine to consume unburned hydrocarbons. The PCV system usually has a one way check valve and a make up air source. The system uses rubber hoses that route crankcase blow by gases to the intake manifold. Vacuum within the engine intake manifold pulls the blow by gases out of the crankcase into the combustion chamber along with the regular intake air and fuel mixture.

The PCV system can become clogged with sludge and varnish deposits and trap blow by gases in the crankcase. This degrades the oil, promoting additional formation of deposit material. If left uncorrected, the result is plugged oil rings, oil consumption, rapid ring wear due to sludge buildup, ruptured gaskets and seals due to crankcase pressurization.

4. Worn Piston Ring Grooves

For piston rings to form a good seal, the sides of the ring grooves must be true and flat - not flared or shouldered. Piston rings in tapered or irregular grooves will not seal properly and, consequently, oil will pass around behind the rings into the combustion chamber.

5. Worn, Broken or Stuck Piston Rings

When piston rings are broken, worn or stuck to such an extent that the correct tension and clearances are not maintained, this will allow oil to be drawn into the combustion chamber on the intake stroke and hot gases of combustion to be blown down the cylinder past the piston on the power stroke. All of these conditions will result in burning and carbon build up of the oil on the cylinders, pistons and rings.

6. Cracked or Broken Ring Lands

Cracked or broken ring lands prevent the rings from seating completely on their sides and cause oil pumping. This condition will lead to serious damage to the cylinders as well as complete destruction of the pistons and rings. Cracked or broken ring lands cannot be corrected by any means other than piston replacement.

7. Worn Valve Stems and Guides

When wear has taken place on valve stems and valve guides, the vacuum in the intake manifold will draw oil and oil vapor between the intake valve stems and guides into the intake manifold and then into the cylinder where it will be burned.

8. Bent or Misaligned Connecting Rods

Bent or misaligned connecting rods will not allow the pistons to ride straight in the cylinders. This will prevent the pistons and rings from forming a proper seal with the cylinder walls and promote oil consumption. In addition, it is possible that a bearing in a bent connect rod will not have uniform clearance on the connecting rod wrist pin. Under these conditions, the bearing will wear rapidly and throw off an excessive amount of oil into the cylinder.

9. Fuel Dilution

If raw fuel is allowed to enter the lubrication system, the oil will become thinner and more volatile and will result in higher oil consumption. The following conditions will lead to higher oil consumption;

- Excess fuel can enter and mix with the oil via a leaking fuel injector
- Gasoline contaminated with diesel fuel
- Restricted air intake
- Excessive idling

10. Contaminated Cooling Systems

Corrosion, rust, scale, sediment or other formations in the water jacket and radiator will prevent a cooling system from extracting heat efficiently. This is likely to cause cylinder distortion thus leading to higher oil consumption.

11. Oil Viscosity

The use of oil with a viscosity that is too light may result in high oil consumption. Refer to the vehicle Owner's Manual for the proper oil viscosity to be used under specific driving conditions and/or ambient temperatures.

12. Dirty Engine Oil

Failure to change the oil and filter at proper intervals may cause the oil to be so dirty that it will promote accumulation of sludge and varnish and restrict oil passages in the piston rings and pistons. This will increase oil consumption; dirty oil by nature is also consumed at a higher rate than clean oil.

13. Crankcase Overfull

Due to an error in inserting the oil dip stick so that it does not come to a seat on its shoulder, a low reading may be obtained. Additional oil may be added to make the reading appear normal with the stick in this incorrect position which will actually make the oil level too high. If the oil level is so high that the lower ends of the connecting rods touch the oil in the oil pan excessive quantities of oil will be thrown on the cylinder walls and some of it will work its way up into the combustion chamber.

14. Excessively High Oil Pressure

A faulty oil pressure relief valve may cause the oil pressure to be too high. The result will be that the engine will be flooded with an abnormally large amount of oil in a manner similar to that which occurs with worn bearings. This condition may also cause the oil filter to burst.

15. Aftermarket Performance Chips and Modification

Increasing performance through the use of performance/power enhancement products to a stock or factory engine will increase the chance of excessive oil consumption.

16. Lugging Engine

Lugging is running the engine at a lower RPM in a condition where a higher RPM (more power/torque) should be implemented. Especially susceptible on vehicles equipped with a manual transmission. This driving habit causes more stress loading on the piston and can lead to increases in engine oil consumption.

17. Turbocharged Engines

There is a possibility for PCV "push-over" due to higher crankcase pressure (as compared to naturally aspirated engines) which is normal for turbocharged engines. This condition causes varying amounts of engine oil to enter the intake manifold, charge air cooler and associated plumbing to and from the charge air cooler, also a leaking turbocharger seal will draw oil into the combustion chamber where it will burn (blue smoke from tail pipe may be present) and form carbon deposits which contribute to further oil consumption as they interfere with proper engine function.

18. Restricted Air Intake

Excessive restriction in the air intake system will increase engine vacuum and can increase oil consumption, an extremely dirty air filter would be one example of this situation.

STANDARD PROCEDURE

DUST COVERS AND CAPS

Fig. 2: Covers/Caps
 Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures caused by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

Fig. 3: Opening Cover
 Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

ENGINE GASKET SURFACE PREPARATION

Fig. 4: Proper Tool Usage For Surface Preparation
 Courtesy of CHRYSLER GROUP, LLC

To ensure engine gasket sealing, proper surface preparation must be performed, especially with the use of aluminum engine components and multi-layer steel cylinder head gaskets.

Never use the following to clean gasket surfaces:

- Metal scraper (1).
- Abrasive pad or paper to clean cylinder block and head.
- High speed power tool with an abrasive pad or a wire brush (2).

Fig. 5: Proper Tool Usage For Surface Preparation
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Multi-Layer Steel (MLS) head gaskets require a scratch free sealing surface.

Only use the following for cleaning gasket surfaces:

- Solvent or a commercially available gasket remover
- Plastic or wood scraper (4).
- High speed power tool with a plastic bristle brush style disc (3).

Sealing surfaces must be free of grease or oil residue. Clean surfaces with Mopar® brake parts cleaner (or equivalent).

DUST COVERS AND CAPS

Fig. 6: Covers/Caps
Courtesy of CHRYSLER GROUP, LLC

Due to the high amounts of failures caused by dust, dirt, moisture and other foreign debris being introduced to the engine during service. Covers or caps are needed to reduce the possible damage that can be caused or created.

Fig. 7: Opening Cover
Courtesy of CHRYSLER GROUP, LLC

Covers over openings will reduce any possibilities for foreign materials to enter the engine systems. Using miller tool (special tool #10368, Set, Universal Protective Cap), Select the appropriated cover needed to the procedure.

REPAIR DAMAGED OR WORN THREADS

CAUTION: Always maintain the original center line when drilling and/or tapping holes.

Damaged or worn threads can be repaired. Essentially, this repair consists of:

- Drilling out worn or damaged threads
- Tapping the hole with a special Heli-Coil Tap or equivalent
- Installing a Heli-Coil insert into the tapped hole to bring the hole back to its original thread size

HYDROSTATIC LOCK

CAUTION: Do not attempt to run engine. Severe damage could occur.

When an engine is suspected of hydrostatic lock (regardless of what caused the problem), follow the steps below.

Fig. 8: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

Fig. 9: Engine Covers
 Courtesy of CHRYSLER GROUP, LLC

2. Lift the engine cover retaining grommets off the ball studs and remove the engine cover (2).
3. Place a shop towel around the fuel supply line Quick Connect Fitting to catch any fuel that may be under pressure and disconnect the fuel supply line. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE** .

Fig. 10: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

4. Loosen the air duct retaining clamp (1) at the throttle body.
5. Disconnect the intake air temperature sensor electrical connector (2).
6. Remove the makeup air hose (3) at the air cleaner housing.
7. Remove the air cleaner housing retaining bolt (4).
8. While lifting up the air cleaner housing (5), slide the air duct off the throttle body and remove the air cleaner housing from the vehicle.
9. Inspect the air duct, air cleaner housing and the intake manifold to make sure the system is dry and clear of any foreign material.
10. Place a shop towel around the spark plugs to catch any fluid that may possibly be under pressure in the cylinder head.
11. Remove the spark plugs. Refer to **SPARK PLUG, REMOVAL** .
12. With the spark plugs removed, rotate the crankshaft using a breaker bar and socket.
13. Identify the fluid in the cylinders (coolant, fuel, oil, etc.).
14. Make sure all fluid has been removed from the cylinders.
15. Repair engine or components as necessary to prevent this problem from occurring again.
16. Squirt a small amount of engine oil into the cylinders to lubricate the walls. This will help prevent engine damage on restart.
17. Install new spark plugs. Refer to **SPARK PLUG, INSTALLATION** .
18. Perform the Engine Oil Service procedure. Refer to **STANDARD PROCEDURE** .
19. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).
20. Start the engine and check for leaks.

Generator to Engine Block - Bolts	54	40	-
Generator Support Bracket-to-Engine Mount Nut	25	18	-
Heater Tube - Bolt	18	13	-
Intake Manifold - Bolts	Specific torque and fastener pattern required; follow installation sequence. Refer to <u>MANIFOLD, INTAKE, INSTALLATION.</u>		
Lifter Guide Holder - Bolts	12	9	-
MDS Solenoid - Bolts	11	8	-
Oil Control Valve - Bolt	11	8	-
Piston Oil Cooler Jet - Bolts	13	10	-
Power Steering Pump to Engine Block - Bolts	28	21	-
Oil Dipstick Tube - Nut	31	23	-
Oil Pan - Drain Plug	27	20	-
Oil Pan - Bolts	Specific torque and fastener pattern required; follow installation sequence. Refer to <u>PAN, OIL, INSTALLATION.</u>		
Oil Pump - Bolts	28	21	-
Oil Pump Pickup Tube - Bolt and Nut	28	21	-
Rear Seal Retainer - Bolts	15	11	-
Rear Isolator Bracket to Transmission - Bolts (Automatic)	33	24	-
Rear Isolator to Bracket - Bolts (Automatic)	54	40	-
Rear Isolator to Crossmember - Bolts (Automatic)	61	45	-
Rear Isolator to Transmission - Bolts (Manual)	56	41	-

Rear Isolator to Crossmember - Bolts (Manual)	54	40	-
Rocker Arm - Bolts	22	16	-
Strut Tower Support - Bolts	32	28	-
Thermostat Housing - Bolts	28	21	-
Throttle Body - Bolts	12	9	-
Torque Converter to Flexplate - Bolts	68	50	-
Transmission to Engine Block - Bolts	68	50	-
Vibration Damper - Bolt	330	243	-
Water Pump to Engine Timing Cover - Bolts	28	21	-

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

CAUTION: If the original engine has experienced a catastrophic failure or an individual failure with the piston, cylinder bore, engine block, valve or valve seat, the intake manifold **MUST** be replaced with a new manifold.

Fig. 11: Cowl Panel, Push-Pins & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Remove the hood. Refer to **HOOD, REMOVAL** .
2. Remove the cowl panel cover (1). Refer to **COVER, COWL PANEL, REMOVAL** .

3. Remove the strut tower support (6).

Fig. 12: Engine Covers

Courtesy of CHRYSLER GROUP, LLC

4. Lift the engine cover retaining grommets off the ball studs and remove the engine covers (1).
5. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.

Fig. 13: Negative Battery Cable

Courtesy of CHRYSLER GROUP, LLC

6. Disconnect and isolate the negative battery cable (1).

2979852

Fig. 14: Intake Manifold Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Remove the intake manifold and throttle body as an assembly.

7. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

2857582

Fig. 15: Oil Control Valve, Electrical Connector & Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The engine must be at room temperature before removing the Oil Control Valve.

8. Disconnect the Oil Control Valve electrical connector (1).
9. Remove the Oil Control Valve retaining bolt (2).

10. Rotate the Oil Control Valve (3) to break the seal then pull the Oil Control Valve straight out.

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

Fig. 16: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

11. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position.

Fig. 17: Cooling Fan Module Components
Courtesy of CHRYSLER GROUP, LLC

12. Remove the cooling fan (1). Refer to **FAN, COOLING, REMOVAL** .

Fig. 18: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

13. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
14. Remove the belly pan retainers (1) and remove the belly pan.
15. Drain the cooling system. Refer to **STANDARD PROCEDURE** .
16. Drain the engine oil. Refer to **STANDARD PROCEDURE** .

Fig. 19: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

17. Remove the A/C compressor (3). Refer to **COMPRESSOR, A/C, REMOVAL** .

2990543

Fig. 20: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

18. Remove both left/right engine mount heat shield (4) retaining nuts (3) and remove the heat shields.
19. Remove both left/right engine mount to frame retaining bolts (2).
20. Disconnect the transmission oil cooler lines from their retainers at the oil pan.

8136a0a2

RADIATOR
FAN
ASSEMBLY

21. Remove the lower radiator hose (1).

Fig. 22: Knock Sensor, Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: Two knock sensors are used. Each sensor is bolted to the outside of the engine block below the exhaust manifold.

NOTE: Left side shown in illustration, right side similar.

22. Remove the heat shields from both knock sensors (shield snaps on/off sensor).
23. Disconnect the knock sensor electrical connectors (3).

CAUTION: When separating the catalytic converters from the manifolds, disconnect the oxygen sensor connectors. Allowing the catalytic converters hanging from the oxygen sensor wires damages the harness and/or sensors.

Fig. 23: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

24. Disconnect all oxygen sensor electrical connectors (2).
25. Saturate all exhaust bolts and nuts (3) with Mopar® Rust Penetrant. Allow five minutes for penetration.
26. Remove the both catalytic converter to manifold flange nuts (3) and separate the catalytic converters (4) from the exhaust manifolds.

815caa71

Fig. 24: Removing/Installing Starter
 Courtesy of CHRYSLER GROUP, LLC

27. Remove the starter motor (1) heat shield (4).
28. Disconnect the starter wires, remove the starter motor retaining bolts (2) and remove the starter (1). Refer to **STARTER, REMOVAL**.

2466012

Fig. 25: Crankshaft Position Sensor Electrical Connector
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block.

29. Remove the CKP sensor electrical connector (1).

3002113

Fig. 26: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

30. Remove the generator support bracket to engine mount retaining nut (1).
31. Remove the generator support bracket retaining bolt (2) and remove the support bracket (3).
32. Lower the vehicle.

81369904

Fig. 27: Generator & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

33. Unsnap the plastic insulator cap from the B+ output terminal.
34. Remove the B+ terminal mounting nut at the rear of the generator and remove the B+ terminal.

35. Depress the field wire connector tab at the rear of the generator and disconnect the field wire connector.
36. Remove the two generator retaining bolts (1) and remove the generator (2).

Fig. 28: Removing/Installing A/C Liquid Lines
Courtesy of CHRYSLER GROUP, LLC

37. Remove the nut (1) from the front section of the A/C liquid line (2) to the rear section of the liquid line (3), separate the lines, remove and discard the dual plane seal.
38. Install plugs or tape over the opened liquid line fittings.
39. Remove the front section of the A/C liquid line (2) from the engine compartment.

Fig. 29: Removing/Installing A/C Suction Lines

Courtesy of CHRYSLER GROUP, LLC

40. Remove the nut (1) from the front section of the A/C suction line (2) to the rear section of the suction line (3), separate the lines, remove and discard the dual plane seal.
41. Install plugs or tape over the opened suction line fittings.
42. Remove the front section of the A/C suction line (2) from the engine compartment.

Fig. 30: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

43. Remove the oil pressure sensor electrical connector (1).
44. Remove the oil temperature sensor electrical connector.

Fig. 31: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to disconnect power steering pump hoses from power steering pump for power steering pump removal.

45. Remove the three power steering pump (4) mounting bolts (2) through the access holes in the pulley (3) and position the pump aside.

2968475

Fig. 32: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

46. Remove the upper radiator hose clamp (1) and remove the upper radiator hose (2).
47. Remove the oil cooler hose clamp (3) and remove the oil cooler hose (4).

2968719

Fig. 33: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt

52. Remove the heater hoses (1, 2).

2912996

Fig. 36: Coolant Recovery Container Pressure Cap, Tube & Screws
 Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the hoses from the coolant bottle for coolant bottle removal.

53. Remove the coolant bottle retaining bolts (2) and position the coolant bottle (1) aside.

815bb677

Fig. 37: Ignition Coil Connector, Ignition Coil & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

54. Remove all ignition coil electrical connectors (1) and position the harness aside.

Fig. 38: TIPM/PDC Mounting Bracket
Courtesy of CHRYSLER GROUP, LLC

55. Remove the Totally Integrated Power Module (TIPM) and mounting bracket. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL**.
56. Unfasten the wire harness mounted on the right hand inner fender panel and position aside.

Fig. 39: Ignition Capacitor, Electrical Connector & Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

NOTE: The ignition capacitor (2) is located near the left rear corner of the intake manifold (3).

57. Remove the ignition capacitor (1) electrical connector (2).
58. Remove the ground wires from the rear of each cylinder head.

59. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 40: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER GROUP, LLC

60. Remove the transmission inspection cover retaining bolt (2) and remove the inspection cover (1).

Fig. 41: Removing/Installing Transmission
Courtesy of CHRYSLER GROUP, LLC

61. Manual transmission equipped vehicles, remove the transmission. Refer to **REMOVAL** .

813878a5

Fig. 42: Torque Converter Bolts
Courtesy of CHRYSLER GROUP, LLC

62. Automatic transmission equipped vehicles, rotate the crankshaft in clockwise direction until the torque converter bolts (1) are accessible and remove the flexplate to torque converter bolts (1).

8131d387

Fig. 43: Remove/Install Transmission To Oil Pan Bolts
Courtesy of CHRYSLER GROUP, LLC

63. Remove the oil pan to transmission bolts (1).

Fig. 44: Remove/Install Transmission To Engine Bolts
 Courtesy of CHRYSLER GROUP, LLC

64. Remove the transmission bell housing to engine block bolts (2).

CAUTION: While carefully separating the engine from the transmission and removing the engine from the vehicle, constant checks must be made to ensure no damage to other components or wiring harnesses occur throughout the removal procedure.

Fig. 45: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER GROUP, LLC

65. Lower the vehicle.
66. Using a suitable jack, support the transmission.

NOTE: Do not use air tools to install engine lift fixture.

67. Install the (special tool #8984B, Fixture, Engine Lifting) (2) and (special tool #8984-UPD, Adapter, Engine Lift) (4).
68. Using a suitable engine hoist, separate the engine from the transmission and remove the engine from the engine compartment.
69. Secure the engine onto a suitable engine stand.

INSTALLATION

INSTALLATION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

CAUTION: If the original engine has experienced a catastrophic failure or an individual failure with the piston, cylinder bore, engine block, valve or valve seat, the intake manifold **MUST** be replaced with a new manifold.

Fig. 46: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools to install (special tool #8984B, Fixture, Engine Lifting) (2, 3).

1. Install the engine lift fixture (2) (special tool #8984B, Fixture, Engine Lifting) and adapter (special tool #8984-UPD, Adapter, Engine Lift) (4).
2. Using a suitable engine hoist, lower the engine into the engine compartment.
3. Automatic transmission equipped vehicles, align the engine with the transmission.
4. Install two transmission bell housing to engine block bolts finger tight.
5. Lower the engine assembly until the engine mounts rest in the engine cradle crossmember.

Fig. 47: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

6. Align the engine mounts, install both left/right engine mount to frame retaining bolts (2) and tighten to 68 N.m (50 ft. lbs.).
7. Position both left and right engine mount heat shields (4), install the retaining nuts (3) and tighten to 27 N.m (20 ft. lbs.).
8. Remove the engine hoist and the jack supporting the transmission.
9. Raise and support the vehicle.

1435449

Fig. 48: Removing/Installing Transmission
 Courtesy of CHRYSLER GROUP, LLC

10. Manual transmission equipped vehicles, install the transmission. Refer to **INSTALLATION** .

8131d397

Fig. 49: Remove/Install Transmission To Oil Pan Bolts
 Courtesy of CHRYSLER GROUP, LLC

11. Automatic transmission equipped vehicles, install the oil pan to transmission bolts (1) and tighten to 54 N.m (40 ft. lbs.).

8131d398

Fig. 50: Remove/Install Transmission To Engine Bolts
 Courtesy of CHRYSLER GROUP, LLC

12. Install the remaining transmission bell housing to engine block bolts (2) and tighten to 68 N.m (50 ft. lbs.).

81387885

Fig. 51: Torque Converter Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the flexplate. Bolts that are too long will damage the clutch surface inside the torque converter.

13. Rotate the crankshaft in clockwise direction and install all torque converter to flexplate bolts (1) finger tight.
14. Verify that the torque converter is pulled flush to the flexplate and tighten bolts to 88 N.m (65 ft. lbs.).

Fig. 52: Remove/Install Torque Converter Access Cover
Courtesy of CHRYSLER GROUP, LLC

15. Install the inspection cover (1) and tighten the retaining bolt (2) to 11 N.m (8 ft. lbs.).

Fig. 53: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Crankshaft Position (CKP) sensor is located at the right rear side of

the engine block.

16. Connect the CKP sensor electrical connector (1).

815caa71

Fig. 54: Removing/Installing Starter
Courtesy of CHRYSLER GROUP, LLC

17. Position the starter motor (1) into the transmission.
18. Install the three starter motor retaining bolts (2) and tighten to 54 N.m (40 ft. lbs.).
19. Connect the solenoid wire to the starter motor (snaps in place).
20. Position the battery cable to the solenoid stud, install the battery cable eyelet nut and tighten to 11 N.m (8 ft. lbs.).
21. Position the starter heat shield (4) and install the retaining nuts (3).

Fig. 55: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
 Courtesy of CHRYSLER GROUP, LLC

22. Position the catalytic converters (4) onto the exhaust manifold flanges, install the flange nuts (3) and tighten to 41 N.m (30 ft. lbs.).
23. Connect the oxygen sensor electrical connectors (2).

Fig. 56: Knock Sensor, Electrical Connector & Bolt
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

24. Connect the right and left knock sensor (1) electrical connectors (5).
25. Install the heat shields onto both knock sensors (shield snaps on/off sensor).

26. Connect the transmission oil cooler lines to their retainers at the oil pan.

Fig. 57: Lower Radiator Hose & Radiator Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

1 - LOWER RADIATOR HOSE
2 - RADIATOR FAN ASSEMBLY

27. Install the lower radiator hose (1).

28. Lower the vehicle.

Fig. 58: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

29. Remove the engine lift fixture (special tool #8984B, Fixture, Engine Lifting) (2) and adapter (special tool #8984-UPD, Adapter, Engine Lift) (4).
30. Position the left and right side wiring harness.

Fig. 59: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

31. Lubricate the Oil Control Valve (OCV) rubber O-ring seal with clean engine oil.
32. Install the OCV (3) and rotate into position.

33. Install the OCV retaining bolt (2) and tighten to 11 N.m (8 ft. lbs.).
34. Connect the OCV electrical connector (1).

Fig. 60: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt

Courtesy of CHRYSLER GROUP, LLC

35. Position the heater core tube (3) into the water pump.
36. Install the heater core tube retaining bolt (1) and tighten to 11 N.m (8 ft. lbs.).
37. Connect the electrical connector to the coolant temperature (ECT) sensor (2).

Fig. 61: Camshaft Position Sensor Electrical Connector & Bolt

Courtesy of CHRYSLER GROUP, LLC

38. Connect the camshaft position sensor electrical connector (1).

2979852

Fig. 62: Intake Manifold Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Install the intake manifold and throttle body as an assembly.

39. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.

44987

Fig. 63: Heater Hose Supply
 Courtesy of CHRYSLER GROUP, LLC

40. Connect the heater hoses (1, 2).
41. Connect the ground wires to the rear of each cylinder head.

Fig. 64: Ignition Capacitor, Electrical Connector & Intake Manifold
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The ignition capacitor (2) is attached to the rear of the left cylinder head.

42. Connect the ignition capacitor (2) electrical connector (1).

Fig. 65: Power Steering Reservoir, Pump, Pulley & Bolts
 Courtesy of CHRYSLER GROUP, LLC

43. Position the power steering pump (4).
44. Install the three power steering pump (4) mounting bolts (2) through the access holes in the pulley and tighten the bolts to 28 N.m (21 ft. lbs.).

2439466

Fig. 66: Oil Pressure Sensor Electrical Connector
 Courtesy of CHRYSLER GROUP, LLC

45. Connect the oil pressure sensor electrical connector (1).
46. Connect the oil temperature sensor electrical connector.

81369904

Fig. 67: Generator & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

47. Position the generator (2) and install two generator mounting bolts (1) finger tight.
48. Raise and support the vehicle.

3002113

Fig. 68: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

49. Position the generator support bracket (3) to the engine mount, install the retaining nut (1) finger tight.
50. Position the generator support bracket (3) to the generator, install the retaining bolt (2) and tighten to 65 N.m (48 ft. lbs.).
51. Tighten the generator support bracket (3) to engine mount retaining nut (1) to 28 N.m (21 ft. lbs.).

812c1715

Fig. 69: Removing/Installing A/C Compressor

53. Position the belly pan and install the belly pan retainers (1).
54. Lower the vehicle.

Fig. 71: Generator & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

55. Tighten two generator mounting bolts (1) to 65 N.m (48 ft. lbs.).
56. Snap the field wire connector into the rear of the generator.
57. Position the generator B+ terminal eyelet to the generator output stud, install the retaining nut and tighten to 13 N.m (10 ft. lbs.).
58. Snap the plastic insulator cap onto the B+ output terminal.

Fig. 72: Removing/Installing A/C Suction Lines
Courtesy of CHRYSLER GROUP, LLC

59. Position the front section of the A/C suction line (2) into the engine compartment.
60. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line to the rear section of the A/C suction line (3).

NOTE: Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

61. Lubricate the new dual plane seal with clean refrigerant oil and position the seal onto the suction line fitting.
62. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
63. Install the nut (1) that secures the front section of the A/C suction line to the rear section of the A/C suction line and tighten the nut to 22 N.m (16 ft. lbs.).

Fig. 73: Removing/Installing A/C Liquid Lines
Courtesy of CHRYSLER GROUP, LLC

64. Position the front section of the A/C liquid line into the engine compartment.
65. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).

NOTE: Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

66. Lubricate the new dual plane seal with clean refrigerant oil and position the seal onto the liquid line fitting.
67. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
68. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line and tighten the nut to 22 N.m (16 ft. lbs.).

Fig. 74: Ignition Coil Connector, Ignition Coil & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

69. Position the ignition coil electrical harness and connect all ignition coil electrical connectors (1).

Fig. 75: Coolant Recovery Container Pressure Cap, Tube & Screws
 Courtesy of CHRYSLER GROUP, LLC

70. Position the coolant bottle (1) and install the coolant bottle retaining bolts (2).

Fig. 76: TIPM/PDC Mounting Bracket
 Courtesy of CHRYSLER GROUP, LLC

71. Install the Totally Integrated Power Module (TIPM) mounting bracket.
72. Install the TIPM. Refer to **MODULE, TOTALLY INTEGRATED POWER (TIPM), REMOVAL**.
73. Position the wire harness and secure to the right hand inner fender panel.

Fig. 77: Accessory Drive Belt Routing, Tensioner & Pulleys
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

74. Rotate the accessory drive belt tensioner (8) clockwise until it contacts the stop and install the accessory drive belt (2) onto the pulleys, then slowly release the tensioner.

2809449

Fig. 78: Cooling Fan Module Components
 Courtesy of CHRYSLER GROUP, LLC

75. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION** .

2968475

Fig. 79: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
 Courtesy of CHRYSLER GROUP, LLC

76. Position the oil cooler hose (4) and Install oil cooler hose clamp (3).
 77. Position the upper radiator hose (2) and Install the upper radiator hose clamp (1).

Fig. 80: Cowl Panel, Push-Pins & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

78. Install the strut tower support (6) and tighten bolts to 38 N.m (28 ft. lbs.).
79. Install the cowl panel cover (1). Refer to **COVER, COWL PANEL, INSTALLATION** .
80. Fill the crankcase with the specified type and amount of engine oil. Refer to **CAPACITIES AND RECOMMENDED FLUIDS, SPECIFICATIONS** .
81. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

Fig. 81: Engine Covers
 Courtesy of CHRYSLER GROUP, LLC

82. Install the engine covers (1) onto the ball studs.

Fig. 82: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

83. Connect the negative battery cable (3).
84. Perform the Refrigerant System Charge procedure. Refer to **PLUMBING, STANDARD PROCEDURE**.
85. Start the engine and inspect for leaks.

MDS SYSTEM

DESCRIPTION

DESCRIPTION

479259

Fig. 83: MDS Lifter

Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) selectively deactivates cylinders 1, 4, 6 and 7 during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy.

The MDS can provide a 5 to 20% fuel economy benefit when operating in four-cylinder mode. Depending on driving habits and vehicle usage. For EPA rating purposes the fuel economy is 8 to 15% higher than if the engine was operating on eight-cylinders at all times.

The MDS deactivating lifter (1) can be distinguished from the non-MDS lifter (2) by the disconnecting pin (3) on the side of the MDS lifter.

MDS is integrated into the basic engine architecture requiring these additional components:

- Unique MDS camshaft
- 8 deactivating roller lifters
- 4 MDS control valve solenoids
- MDS control valve solenoid wiring harness
- Oil temperature sensor

OPERATION

OPERATION

Fig. 84: MDS Lifter Cross-Section
Courtesy of CHRYSLER GROUP, LLC

The Multiple Displacement System (MDS) provides cylinder deactivation during steady speed, low acceleration and shallow grade climbing conditions to increase fuel economy. Both four and eight cylinder configurations have even firing intervals to provide smooth operation. The MDS selectively deactivates cylinders 1, 4, 6, and 7, to improve fuel economy. All deactivated cylinders have unique hydraulic lifters that collapse when deactivated to prevent the valves from opening. Engine oil pressure is used to activate and deactivate the valves. Oil is delivered through special oil passages drilled into the cylinder block. The MDS solenoid valves control the flow. When activated, pressurized oil pushes a latching pin on each MDS lifter which becomes a lost motion link. The base of the MDS lifter follows the camshaft while the top remains stationary. The MDS lifter is held in place against the pushrod by light spring pressure but unable to move because of the much higher force of the valve spring.

NOTE: It is critical to use the recommended oil viscosity in engines that use MDS.

Deactivation occurs during the compression stroke of each cylinder, after air and fuel enter the cylinder. Ignition occurs, but the combustion products remain trapped in the cylinder under high pressure, because the valves no longer open. No fuel/air enters or leaves during subsequent piston

strokes, this high pressure gas is repeatedly compressed and expanded like an air spring.

AIR INTAKE SYSTEM

AIR CLEANER

REMOVAL

REMOVAL

Fig. 85: Air Cleaner Housing Cover Retaining Screws
Courtesy of CHRYSLER GROUP, LLC

1. Remove the air cleaner housing cover retaining screws (1).

Fig. 86: Air Cleaner Housing Cover & Air Cleaner Element

Courtesy of CHRYSLER GROUP, LLC

2. Lift the air cleaner housing cover (1) while separating the locating tabs from the housing.
3. Remove air cleaner element (2) from the housing.
4. Clean the inside of air cleaner housing before replacing element.

INSTALLATION

INSTALLATION

Fig. 87: Air Cleaner Housing Cover & Air Cleaner Element
Courtesy of CHRYSLER GROUP, LLC

1. Install the air cleaner element (2) into the housing.
2. Align the air cleaner housing cover (1) locating tabs into the housing while lowering the cover into position.

Fig. 88: Air Cleaner Housing Cover Retaining Screws
 Courtesy of CHRYSLER GROUP, LLC

3. Install the air cleaner housing cover retaining screws (1) and tighten to 3 N.m (30 in. lbs.).

BODY, AIR CLEANER

REMOVAL

REMOVAL

Fig. 89: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
 Courtesy of CHRYSLER GROUP, LLC

1. Loosen the air duct retaining clamp (1) at the throttle body.

2. Disconnect the intake air temperature sensor electrical connector (2).
3. Remove the makeup air hose (3) at the air cleaner housing.
4. Remove the air cleaner housing retaining bolt (4).
5. While lifting up the air cleaner housing (5), slide the air duct off the throttle body and remove the air cleaner housing from the vehicle.

INSTALLATION

INSTALLATION

Fig. 90: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

1. While sliding the air duct onto the throttle body, lower the air cleaner housing (5) into position and align the locating pin on the bottom of the housing.
2. Install the air cleaner housing retaining bolt (4) and tighten to 5 N.m (44 in. lbs.).
3. Install the makeup air hose (3) at the air cleaner housing.
4. Connect the intake air temperature sensor electrical connector (2).
5. Position the air duct retaining clamp (1) at the throttle body and tighten to 3 N.m (30 in. lbs.).

CYLINDER HEAD

OPERATION

OPERATION

The cylinder head closes the combustion chamber allowing the pistons to compress the air fuel mixture to the correct ratio for ignition. The valves located in the cylinder head open and close to either allow clean air into the combustion chamber or to allow the exhaust gases out, depending on

the stroke of the engine.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - CYLINDER HEAD GASKET FAILURE

A cylinder head gasket leak can be located between adjacent cylinders or between a cylinder and the adjacent water jacket.

- Possible indications of the cylinder head gasket leaking between adjacent cylinders are:
 -
 - Loss of engine power
 - Engine misfiring
 - Poor fuel economy
- Possible indications of the cylinder head gasket leaking between a cylinder and an adjacent water jacket are:
 -
 - Engine overheating
 - Loss of coolant
 - Excessive steam (white smoke) emitting from exhaust
 - Coolant foaming

CYLINDER-TO-CYLINDER LEAKAGE TEST

To determine if an engine cylinder head gasket is leaking between adjacent cylinders, follow the procedures in **CYLINDER COMPRESSION PRESSURE LEAKAGE** . An engine cylinder head gasket leaking between adjacent cylinders will result in approximately a 50-70% reduction in compression pressure.

CYLINDER-TO-WATER JACKET LEAKAGE TEST

WARNING: Use extreme caution when the engine is operating with coolant pressure cap removed. Failure to follow this warning may result in serious or fatal injury.

VISUAL TEST METHOD

With the engine cool, remove the coolant pressure cap. Start the engine and allow it to warm up until thermostat opens.

If a large combustion/compression pressure leak exists, bubbles will be visible in the coolant.

COOLING SYSTEM TESTER METHOD

WARNING: With cooling system tester in place, pressure will build up fast. Excessive

pressure built up, by continuous engine operation, must be released to a safe pressure level. Never permit pressure to exceed 138 kPa (20 psi). Failure to follow this warning may result in serious or fatal injury.

Install Cooling System Tester (special tool #7700, Tester, Cooling System) or equivalent to pressure cap neck. Start the engine and observe the tester's pressure gauge. If gauge pulsates with every power stroke of a cylinder a combustion pressure leak is evident.

CHEMICAL TEST METHOD

Combustion leaks into the cooling system can also be checked by using Bloc-Chek Kit (special tool #C-3685-A, Bloc-Chek Kit) or equivalent. Perform test following the procedures supplied with the tool kit.

REMOVAL

REMOVAL

Fig. 91: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect the negative battery cable (1).

Fig. 92: Engine Covers
Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine covers (1).
4. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
5. Drain the cooling system. Refer to **STANDARD PROCEDURE**.

Fig. 93: Heater Hose Supply
Courtesy of CHRYSLER GROUP, LLC

6. Disconnect the heater hoses (1, 2).

Fig. 94: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic Converter
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

7. Remove the catalytic converters. Refer to **CONVERTER, CATALYTIC, REMOVAL** .
8. Lower the vehicle.

Fig. 95: Accessory Drive Belt Routing, Tensioner & Pulleys
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever

damage may occur to the tensioner.

9. Rotate the accessory drive belt tensioner (8) clockwise until it contacts its stop. Remove the accessory drive belt (2), then slowly rotate the tensioner into the freearm position. Refer to **BELT, SERPENTINE, REMOVAL**.

Fig. 96: Power Steering Reservoir, Pump, Pulley & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to disconnect the power steering pump hoses from the pump, for power steering pump removal.

10. Remove the three power steering pump (1) retaining bolts (2) through the access holes in the pulley (3).
11. Remove the power steering pump (1) and secure out of the way.

Fig. 97: Cylinder Head Cover Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

12. Using the sequence shown in illustration, remove the cylinder head cover retaining bolts and remove cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.
13. If removing the right cylinder head, remove the engine oil dip stick tube retaining nut at the exhaust manifold and remove the oil dip stick tube.

Fig. 98: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Pushrods and rocker arm assemblies must be installed in their

original locations or engine damage could result.

NOTE: Make sure to identify the original location of the rocker arms and push rods for correct assembly.

14. Remove the rocker arms and pushrods. Refer to ROCKER ARM, VALVE, REMOVAL.

68745

Fig. 99: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

NOTE: It is not necessary to remove the exhaust manifolds to remove the cylinder heads.

15. Using the sequence shown in illustration, remove the cylinder head bolts and remove the cylinder head(s).

2994432

Fig. 100: Cylinder Head Gasket & Cylinder Head

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

16. Discard the cylinder head gasket (1).
17. Inspect and clean the cylinder head (2) mating surface.

2997620

Fig. 101: Exhaust Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

18. If necessary, using the sequence shown in illustration, remove the exhaust manifold bolts and remove the manifold.

CLEANING

CLEANING

Clean all surfaces of the cylinder block and cylinder heads.

Clean the cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

INSPECTION

1. Inspect the cylinder head for flatness using a straightedge and a feeler gauge. If tolerances exceed 0.0508 mm (0.002 in.) replace the cylinder head.
2. Inspect the valve seats for damage. Service the valve seats as necessary.

3. Inspect the valve guides for wear, cracks or looseness. If any of these conditions exist, replace the cylinder head.
4. Inspect push rods. Replace worn or bent push rods.

INSTALLATION

INSTALLATION

2997620

Fig. 102: Exhaust Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

1. If removed, using a new exhaust manifold gasket, position the exhaust manifold and install the retaining bolts finger tight.
2. Using the sequence shown in illustration, tighten the retaining bolts to 31 N.m (23 ft. lbs.).

Fig. 103: Cylinder Head Gasket & Cylinder Head
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The cylinder head gaskets (1) are not interchangeable between left and right sides. They are marked "UP" to indicate direction to face up and "L" or "R" to indicate left side or right side of engine block.

NOTE: Left side shown in illustration, right side similar.

3. Clean all sealing surfaces of the engine block and the cylinder head(s) (2).

NOTE: Rotate crankshaft 45° so that all pistons are 1/2 the way down the cylinder bore to avoid piston to valve contact.

4. Position the new cylinder head gasket(s) (1) onto the engine block.
5. Position the cylinder head(s) (2) onto the engine block.
6. Install the cylinder head bolts finger tight.

CAUTION: The 6.4L engine uses a unique 4 layer steel head gasket that must be compressed evenly and completely across the deck surface for proper sealing. The tightening sequence shown in the following illustration must be followed to ensure all layers are compressed before applying the additional 90 degree turn.

88745

Fig. 104: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Using the sequence below, tighten the retaining bolts.
 - a. Using the sequence shown in illustration, tighten bolts 1-10 to 34 N.m (25 ft. lbs.).
 - b. Using the sequence shown in illustration, tighten bolts 11-15 to 20 N.m (15 ft. lbs.).
 - c. Using the sequence shown in illustration, tighten bolts 1-10 to 54 N.m (40 ft. lbs.).
 - d. Using the sequence shown in illustration, verify bolts 11-15 are 20 N.m (15 ft. lbs.).
 - e. Using the sequence shown in illustration, tighten bolts 1-10 to 61 N.m (45 ft. lbs.).
 - f. Using the sequence shown in illustration, rotate bolts 1-10 an additional 90 degrees.
 - g. Using the sequence shown in illustration, tighten bolts 11-15 to 34 N.m (25 ft. lbs.).

921225

Fig. 105: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Pushrods and rocker arm assemblies must be installed in their original locations or engine damage could result.

8. Install the pushrods and rocker arms. Refer to **ROCKER ARM, VALVE, INSTALLATION**.
9. If removed, install the oil dip stick tube and tighten the retaining nut at the exhaust manifold.

Fig. 106: Cylinder Head Cover Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

10. Position the cylinder head covers, using the sequence shown in illustration, tighten the cylinder head cover bolts to 8 N.m (70 lbs in.). Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

Fig. 107: Power Steering Reservoir, Pump, Pulley & Bolts
 Courtesy of CHRYSLER GROUP, LLC

11. Install the power steering pump. Refer to **PUMP, INSTALLATION** .

Fig. 108: Accessory Drive Belt Routing, Tensioner & Pulleys
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

12. Rotate the accessory drive belt tensioner (8) clockwise until it contacts its stop, install the accessory drive belt (2), then slowly release the tensioner into position. Refer to **BELT, SERPENTINE, INSTALLATION** .

Fig. 109: Oxygen Sensor, Oxygen Sensor Connector, Ball Flange Nut & LH Catalytic

Converter

6. Remove the ignition coils (1).

Fig. 117: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Using the sequence shown in illustration, remove the cylinder head cover retaining bolts.

Fig. 118: Cylinder Head & Cover
Courtesy of CHRYSLER GROUP, LLC

8. Remove the cylinder head cover (1).
9. Clean the sealing surface of the cylinder head (2).

NOTE: The cylinder head cover gasket may be used again, provided no cuts, tears, or

deformation have occurred.

INSTALLATION

INSTALLATION

Fig. 119: Cylinder Head & Cover
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not use harsh cleaners to clean the cylinder head covers. Severe damage to covers may occur.

CAUTION: Do not allow other components including the wire harness to rest on or against the engine cylinder head cover. Prolonged contact with other objects may wear a hole in the cylinder head cover.

NOTE: The cylinder head cover gasket may be used again, provided no cuts, tears, or deformation have occurred.

1. Clean the cylinder head cover (1) and the sealing surface of the cylinder head (2). Inspect and replace gasket if necessary.
2. Install the cylinder head cover and hand start all fasteners.

Fig. 120: Cylinder Head Cover Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

3. Using the sequence shown in illustration, tighten the cylinder head cover bolts to 8 N.m (70 lbs in.).

Fig. 121: Removing/Installing Ignition Coil
 Courtesy of CHRYSLER GROUP, LLC

4. Before installing the ignition coils, apply dielectric grease to the inside of the spark plug boots (1).

5. Install the ignition coils.

Fig. 122: Ignition Coil Electrical Connectors, Harness & Bolts

ROCKER ARM, VALVE

REMOVAL

REMOVAL

Fig. 125: Cylinder Head Cover Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, REMOVAL**.

Fig. 126: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

2. Install Push Rod Retainer (special tool #9070, Retainer, Push Rod) (1).

Fig. 127: Rocker Shaft Removal/Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

3. Using the sequence shown in illustration, loosen the rocker shaft assemblies.

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with an "I".

4. Remove the rocker shaft assemblies. Note the location for reassembly.

CAUTION: The longer pushrods are for the exhaust side, and the shorter pushrods are for intake side.

5. Remove the pushrods. Note the pushrod location for reassembly.

4637

Fig. 128: Rocker Arm Retainers
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not remove the retainers from the rocker shaft assemblies. The assembly tangs (1) at the bottom of the retainers can be damaged, causing the assembly tangs to break off and get into the engine.

INSTALLATION

INSTALLATION

Fig. 129: Pushrod Retaining Plate
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The longer pushrods are for the exhaust side, and the shorter pushrods are for intake side.

1. Install the pushrods in the same order as removed.
2. Install the Push Rod Retainer (special tool #9070, Retainer, Push Rod) (1).

Fig. 130: Rocker Arm Retainers
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Ensure the retainers (1) and rocker arms (3) are not overlapped when torquing bolts.

CAUTION: Verify the push rods are installed into the rocker arms (3) and lifters correctly while installing the rocker shaft assembly. Recheck after the rocker shaft assembly has been torqued to specification.

3. Install the rocker shaft assemblies in the same order as removed.

Fig. 131: Rocker Shaft Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with the letter "I".

4. Verify the rocker arms are installed in the correct location.

NOTE: Repeat torque sequence several times to ensure rocker shaft assembly is firmly seated.

5. Using the sequence shown in illustration, tighten the rocker shaft bolts to 22 N.m (16 ft. lbs.).

Fig. 132: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Do not rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller lifters adequate time to bleed down (about 5 minutes).

6. Remove the Push Rod Retainer (special tool #9070, Retainer, Push Rod) (1).

Fig. 133: Cylinder Head Cover Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

7. Install the cylinder head cover. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION.**

SEAL(S), VALVE GUIDE

DESCRIPTION

DESCRIPTION

The valve guide seals are made of rubber and incorporate an integral steel valve spring seat. The integral garter spring maintains consistent lubrication control to the valve stems. The intake valve stem seal has a smaller valve spring seat compared to the exhaust valve stem seal. The intake and exhaust valve stem seals are identified by different colors.

3. Remove the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, REMOVAL.**

Fig. 137: Pushrod Retaining Plate
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: The piston must be at TDC, and both valves closed on the cylinder to be serviced.

NOTE: The intake push rods can fall into the engine and become lodged in the oil pan, if removing intake rocker arm shaft, install the pushrod retainer (special tool #9070, Retainer, Push Rod) (1) to retain the intake push rods (2).

4. Install the pushrod retainer (special tool #9070, Retainer, Push Rod) (1) onto the cylinder head.
5. Clip the pushrods (2) into the pushrod retainer (1).

921225

Fig. 138: Rocker Shafts Retaining Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The rocker shaft assemblies are not interchangeable between intake and exhaust. The intake rocker arms are marked with an "I".

6. Using the sequence shown in illustration, remove the rocker arm shaft bolts and remove the rocker arm shaft.

4659

Fig. 139: Rocker Arm Shaft Adapter & Air Hose
 Courtesy of CHRYSLER GROUP, LLC

7. Install the rocker arm shaft adapter (special tool #9065C, Compressor, Valve Spring) (1).
8. Insert an air hose (2) into the spark plug hole and charge the cylinder with air.

3693536

Fig. 140: Intake Valve Spring Removal/Installation
 Courtesy of CHRYSLER GROUP, LLC

NOTE: A fulcrum assembly (1) must be rotated to the appropriate setting as marked on the tool for proper valve spring alignment.

NOTE: All valve springs and seals are removed in the same manner.

NOTE: Tap the top of the valve spring retainer to loosen the spring retainer locks.

9. Install the valve spring compressor (special tool #9065C, Compressor, Valve Spring) (1) and remove the intake valve retainer locks.
10. Release the valve spring compressor and remove the valve springs.

Fig. 141: Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

11. Install the valve spring compressor (special tool #9065C, Compressor, Valve Spring) (2) and the rocker arm adapter (special tool #9065-3, Adapter, Valve Spring Compressor) (1) and remove the exhaust valve retainer locks.
12. Release the valve spring compressor and remove the valve spring.

NOTE: The valve springs are interchangeable between intake and exhaust.

13. Remove and discard the valve guide seal.

INSTALLATION

INSTALLATION

Fig. 142: Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

NOTE: All valve springs and seals are installed in the same manner.

NOTE: The intake seal has a smaller spring seat diameter compared to the exhaust seal.

1. Install a new valve guide seal.

NOTE: The intake spring retainer has a longer free length compared to the exhaust spring retainer.

2. Install the valve spring.
3. Install the valve spring retainer.
4. Using the valve spring compressor (special tool #9065C, Compressor, Valve Spring) (3) and the rocker arm adapter (special tool #9065-3, Adapter, Valve Spring Compressor) (1), compress the valve spring and install the valve spring retainer locks.

45107

Fig. 143: Air Charge, Valve Spring Compressor & Adapter
Courtesy of CHRYSLER GROUP, LLC

5. Remove the valve spring compressor (special tool #9065C, Compressor, Valve Spring) (3) and the rocker arm adapter (special tool #9065-3, Adapter, Valve Spring Compressor).
6. Release the air charge (1) in the cylinder.

CAUTION: Verify that the pushrods are fully seated into the lifters and the rocker arms. Recheck after rocker arm shaft has been torqued to specification.

7. Install the rocker arm shaft and push rods. Refer to **ROCKER ARM, VALVE, INSTALLATION**.

921225

Fig. 144: Rocker Shafts Retaining Bolt Removal & Tightening Sequence

Courtesy of CHRYSLER GROUP, LLC

NOTE: Repeat torque sequence several times to ensure rocker shaft assembly is firmly seated.

8. Using the sequence shown in illustration, tighten the rocker arm shaft bolts to 22 N.m (16 ft. lbs.).

Fig. 145: Pushrod Retaining Plate
Courtesy of CHRYSLER GROUP, LLC

9. Remove the pushrod retainer (special tool #9070, Retainer, Push Rod) (1).

Fig. 146: Cylinder Head Cover Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

10. Position the cylinder head cover onto the cylinder head.
11. Using the sequence shown in illustration, tighten the cylinder head cover bolts to 8 N.m (6 ft. lbs.). Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

Fig. 147: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
 Courtesy of CHRYSLER GROUP, LLC

12. Install the air cleaner housing (5) and clean air tube (1). Refer to **BODY, AIR CLEANER**.

INSTALLATION.

Fig. 148: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

13. Connect the negative battery cable.
14. Road test the vehicle.

VALVES, INTAKE AND EXHAUST

DESCRIPTION

VALVES

Fig. 149: Valve Assembly Configuration
 Courtesy of CHRYSLER GROUP, LLC

Both the intake (4) and exhaust (5) valves are made of steel with full chrome plate on valve stems. The intake valve is 54.3 mm (2.14 in.) diameter and the exhaust valve is 42.0 mm (1.65 in.) diameter. All valves use three bead lock keepers (1) and retainers (2) to retain the springs (6) and promote valve rotation.

VALVE GUIDES

The valve guides are made of powdered metal and are pressed into the cylinder head. The guides are not replaceable or serviceable, and valve guide reaming is not recommended. If the guides are worn beyond acceptable limits, replace the cylinder heads.

STANDARD PROCEDURE

STANDARD PROCEDURE - REFACING

NOTE: Valve seats that are worn or burned can be reworked, provided that the correct angle and seat width are maintained. Otherwise the cylinder head must be replaced.

NOTE: When refacing valves and valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

1. Measure the concentricity of the valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 inch.) total indicator reading.

- Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat the valve seat with Prussian blue then set the valve in place. Rotate the valve using light pressure. If the blue is transferred to the center of the valve face, contact is satisfactory. If the blue is transferred to the top edge of the valve face, lower the valve seat with a 15 degree stone. If the blue is transferred to the bottom edge of the valve face, raise the valve seat with a 65 degree stone.
- Refer to the chart below for the proper valve seat width, valve seat angle, valve face angle and valve spring height.

VALVE SEAT, VALVE FACE AND SPRING HEIGHT CHART

DESCRIPTION	SPECIFICATION	
SEAT WIDTH		
INTAKE	0.94 - 1.04 mm	0.037 - 0.041 in.
EXHAUST	1.16 - 1.26 mm	0.046 - 0.050 in.
SEAT ANGLE		
(INT. AND EXT.)	44.5° - 45°	
FACE ANGLE		
INTAKE	45.5° - 46°	
EXHAUST	45° - 45.5°	
SPRING HEIGHT		
INTAKE	52.1 mm	2.051 in.
EXHAUST	51.2 mm	2.016 in.

Fig. 150: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

4. The valve seat must maintain an angle of 44.5° - 45.0° .
5. The valve face must maintain an angle of 45.5° - 46.0° for the Intake and 45° - 45.5° for the exhaust.

REMOVAL

REMOVAL

Fig. 151: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

Fig. 152: Cylinder Head Bolt Removal & Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL**.

80b8983f

Fig. 153: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

3. Compress the valve springs using the valve spring compressor (special tool #C-3422-D, Compressor, Valve Spring) and adapter (special tool #8464, Adapter, Valve Spring).
4. Remove the valve spring retainer locks (1), valve spring retainers (2), valve stem seals (3) and valve springs (6).
5. Before removing the valves, remove any burrs from the valve spring retainer lock grooves in the valve stems (4) to prevent damage to the valve guides. Identify the valves to ensure installation in their original location.
6. Remove the valves (4, 5).

INSTALLATION

INSTALLATION

80b8983f

Fig. 154: Valve Assembly Configuration
Courtesy of CHRYSLER GROUP, LLC

1. Clean the valves thoroughly. Discard burned, warped, and cracked valves.
2. Remove carbon and varnish deposits from inside the valve guides with a reliable guide cleaner.
3. Measure the valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
4. Coat the valve stems (4, 5) with clean engine oil and insert them into the cylinder head.
5. If the valves or seats have been reground, check valve stem height. If the valve is too long, replace the cylinder head.
6. Install new seals (3) on all valve guides. Install the valve springs (6) and valve spring retainers (2).

Fig. 155: Exhaust Valve Spring Removal/Installation
 Courtesy of CHRYSLER GROUP, LLC

7. Compress the valve springs with the valve spring compressor (special tool #C-3422-D, Compressor, Valve Spring) (1) and adapter (special tool #8464, Adapter, Valve Spring), install the valve spring retainer locks and release the tool. If the valves and/or seats have been ground, measure the installed height of the springs. Make sure the measurement is taken from the bottom of spring seat in the cylinder head to the bottom surface of valve spring retainer.

Fig. 156: Cylinder Head Bolt Removal & Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

8. Install the cylinder head (2). Refer to **CYLINDER HEAD, INSTALLATION**.

Fig. 157: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

9. Connect the negative battery cable (1).

ENGINE BLOCK

CLEANING

CLEANING

Thoroughly clean the oil pan and engine block gasket surfaces.

Use compressed air to clean the following:

- Gallery at the oil filter adaptor hole.
- Front and rear oil gallery holes.
- Feed holes for the crankshaft main bearings.

Once the block has been completely cleaned, apply Loctite PST pipe sealant with Teflon 592 to the threads of the front and rear oil gallery plugs. Tighten the 1/4 inch NPT plugs to 20 N.m (15 ft. lbs.). Tighten the 3/8 inch NPT plugs to 27 N.m (20 ft. lbs.) and the coolant drain plugs to 34 N.m (25 ft. lbs.).

INSPECTION

INSPECTION

ENGINE BLOCK

Fig. 158: Checking Engine Block Deck Surface With Precision Straightedge & Feeler Gauge
Courtesy of CHRYSLER GROUP, LLC

1. Clean the engine block thoroughly and check all core hole plugs for evidence of leaking and repair if necessary.
2. Examine the engine block and cylinder bores for cracks or fractures.

NOTE: Check the engine block deck surface with a precision straightedge and feeler gauge. The surface irregularities should not exceed 0.09 mm (0.0035 in.). Check the deck surface from one end to the other with the precision straightedge positioned across corners and parallel to the block centerline up and down the deck.

3. Check the engine block deck (1) surfaces for flatness using a precision straightedge (2) and feeler gauge (3).

CYLINDER BORE

115574

Fig. 159: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

1. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder bore gauge capable of reading in 0.003 mm (0.0001 in.) increments is required. If a bore gauge is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at three levels below the top of the bore (4). Start at the top of the bore, perpendicular (across or at 90°) to the axis of the crankshaft at point A (1).
3. Repeat the measurement near the middle of the bore then repeat the measurement near the bottom of the bore.
4. Determine the taper by subtracting the smaller diameter from the larger diameter.
5. Rotate the measuring device 90° to point B (1) and repeat the three measurements. Verify that the maximum taper is within specifications.
6. Determine out-of-roundness by comparing the difference between each measurement.
7. If the cylinder bore taper does not exceed 0.0127 mm (0.0005 inch) and out-of-roundness does not exceed 0.008 mm (0.0003 inch) then the cylinder bore can be honed. If the cylinder bore taper or out- of-round condition exceeds the maximum limits, replace the engine block.

NOTE: **A slight amount of taper always exists in the cylinder bore after the engine has been in use for a period of time.**

MAIN BEARINGS

2767936

Fig. 160: Main Bearing Inserts
Courtesy of CHRYSLER GROUP, LLC

1. Wipe the main bearing inserts (1, 2) clean.
2. Inspect the inserts for abnormal wear patterns, scoring, grooving, fatigue, pitting and for metal or other foreign material imbedded in the lining.
3. Inspect the back of the inserts for fractures, scrapes or irregular wear patterns.
4. Inspect the insert locking tabs for damage.
5. Inspect the crankshaft thrust washers for scoring, scratches, wear or blueing.
6. Replace any bearing that shows abnormal wear.
7. Inspect the main bearing bores for signs of scoring, nicks and burrs.
8. If the engine block main bearing bores show damage, replace the engine block.

BEARING(S), CRANKSHAFT, MAIN

STANDARD PROCEDURE

STANDARD PROCEDURE - CRANKSHAFT MAIN BEARING - FITTING

MAIN BEARING JOURNAL DIAMETER (CRANKSHAFT REMOVED)

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

Crankshaft removed from the cylinder block.

Clean the oil off the main bearing journal.

Determine the maximum diameter of the journal with a micrometer. Measure at two locations 90° apart at each end of the journal.

The maximum allowable taper is 0.008 mm (0.0004 inch). The maximum out-of-round is 0.005 mm (0.0002 inch). Compare the measured diameter with the journal diameter specification (Main Bearing Fitting Chart). Select inserts required to obtain the specified bearing-to-journal clearance.

CRANKSHAFT MAIN BEARING SELECTION

The main bearings are "select fit" to achieve proper oil clearances. For main bearing selection, the crankshaft counterweight has grade identification marks stamped into it. These marks are read from left to right, corresponding with journal number 1, 2, 3, 4 and 5.

NOTE: Service main bearings are coded. These codes identify what size (color) the bearing is.

MAIN BEARING SELECTION CHART - 6.4L

GRADE	COLOR	mm	In	FOR USE WITH JOURNAL SIZE
	LOWER			64.988-64.995 mm
A	ORANGE	0.008 mm U/S	(0.0004 in.) U/S	(2.5585- 2.5588 in.)
	LOWER			64.996-65.004 mm
B	BLACK	NOMINAL	NOMINAL	(2.5588-2.5592 in.)
	LOWER			65.005-65.012 mm
C	GREEN	0.008 mm O/S	(0.0004 in.) O/S	(2.5592-2.5595 in.)

INSPECTION

INSPECTION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

Fig. 161: Main Bearing Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Wipe the inserts clean and inspect for abnormal wear patterns and for metal or other foreign material imbedded in the lining. Normal main bearing insert wear patterns are illustrated.

NOTE: If any of the crankshaft journals are scored, the crankshaft must be repaired or replaced.

Inspect the back of the inserts for fractures, scoring or irregular wear patterns.

Inspect the upper insert locking tabs for damage.

Replace all damaged or worn bearing inserts.

CAMSHAFT, ENGINE

REMOVAL

5.7L/6.4L - CAMSHAFT CORE HOLE PLUG

Fig. 162: Camshaft Core Hole Plug
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Remove the engine from the vehicle. Refer to **REMOVAL**.
3. Remove the flexplate. Refer to **FLEXPLATE, REMOVAL**.

CAUTION: Do not damage the rear surface of the camshaft or the core plug sealing surface, when removing the core plug.

4. Using a suitable sharp punch, punch a small hole in the camshaft core hole plug (1).

5. Insert a short sheet metal screw into the small hole in the camshaft core hole plug.
6. Using a suitable slide hammer puller, remove the rear camshaft core hole plug.

CAMSHAFT

Fig. 163: Cylinder Head & Gasket
Courtesy of CHRYSLER GROUP, LLC

1. Remove both cylinder heads (2). Refer to CYLINDER HEAD, REMOVAL.

CAUTION: The 6.4L Multi Displacement System (MDS) engine uses both standard roller lifters and deactivating roller lifters. The deactivating roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: Whenever the camshaft is replaced, all lifters must be replaced. If the lifter and retainer assemblies are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

Fig. 164: Hydraulic Lifters/Tappets & Retainer/Guide Holder
 Courtesy of CHRYSLER GROUP, LLC

2. Remove the lifters (2) and retainer (1) as an assembly. Refer to **LIFTER(S), HYDRAULIC, ROLLER, REMOVAL**.

Fig. 165: Generator & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

3. Remove the generator. Refer to **GENERATOR, REMOVAL** .

Fig. 166: A/C Condenser & Radiator
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the A/C compressor. Refer to **COMPRESSOR, A/C, REMOVAL** .
5. Remove the radiator (12). Refer to **RADIATOR, ENGINE COOLING, REMOVAL** .
6. Remove the A/C condenser (7). Refer to **CONDENSER, A/C, REMOVAL** .
7. Raise and support vehicle.

Fig. 167: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
 Courtesy of CHRYSLER GROUP, LLC

8. Remove the oil pan and oil pump pickup tube (2). Refer to **PAN, OIL, REMOVAL** .

45131

Fig. 168: Front Cover Slide Bushings
 Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the water pump for timing cover removal.

9. Remove the engine timing cover. Refer to **COVER(S), ENGINE TIMING, REMOVAL**.

45133

Fig. 169: Remove/Install Oil Pump
 Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil pump. Refer to **PUMP, ENGINE OIL, REMOVAL**.

Fig. 170: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
 Courtesy of CHRYSLER GROUP, LLC

11. Remove the timing chain (5) and camshaft phaser (1). Refer to **CHAIN AND SPROCKETS, TIMING, REMOVAL.**

Fig. 171: Camshaft Thrust Plate
 Courtesy of CHRYSLER GROUP, LLC

12. Remove the camshaft thrust plate (1).

CAUTION: Use care when removing the camshaft, do not damage the camshaft bearings with the camshaft lobes.

Fig. 172: Removing/Installing Camshaft
Courtesy of CHRYSLER GROUP, LLC

13. Install a long bolt (2) into the front of the camshaft to aid in removal.
14. Remove the camshaft using care not to damage the camshaft bearings with the camshaft lobes (1).

INSPECTION

INSPECTION

1. The cam bearings are not serviceable. Do not attempt to replace cam bearings for any reason.

INSTALLATION

5.7L/6.4L - CAMSHAFT CORE HOLE PLUG

Fig. 173: Camshaft Core Hole Plug
Courtesy of CHRYSLER GROUP, LLC

1. Clean the core hole in the cylinder block.

NOTE: Do not apply adhesive to the new camshaft core hole plug. A new plug has adhesive pre-applied.

2. Install a new camshaft core hole plug (1) located at the rear of cylinder block, using a suitable flat faced tool. The plug must be fully seated on the cylinder block shoulder.
3. Install the flexplate. Refer to **FLEXPLATE, INSTALLATION**.
4. Install the engine. Refer to **INSTALLATION**.

CAMSHAFT

CAUTION: The 6.4L engine uses a unique camshaft for use with the Multi Displacement System (MDS). When installing a new camshaft, the replacement camshaft must be compatible with MDS.

CAUTION: Use care when installing the camshaft into the engine block, do not damage the camshaft bearings with the camshaft lobes.

Fig. 174: Removing/Installing Camshaft
 Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the camshaft lobes (1) and the camshaft bearing journals with clean engine oil.
2. Install a long bolt (2) into the front of the camshaft to aid in the installation, carefully install the camshaft into the engine block.

Fig. 175: Camshaft Thrust Plate
 Courtesy of CHRYSLER GROUP, LLC

3. Install the camshaft thrust plate (1) and tighten retaining bolts to 12 N.m (106 in. lbs.).

474928

Fig. 176: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
 Courtesy of CHRYSLER GROUP, LLC

4. Install the timing chain and camshaft phaser. Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.
5. Using a suitable dial indicator, measure the camshaft end play. Refer to **SPECIFICATIONS** . If not within specification, install a new thrust plate.

45133

Fig. 177: Remove/Install Oil Pump
 Courtesy of CHRYSLER GROUP, LLC

6. Install the oil pump. Refer to **PUMP, ENGINE OIL, INSTALLATION**.

45131

Fig. 178: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

7. Install the engine timing cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION.**
8. Raise and support vehicle.

2970744

Fig. 179: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Install the oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION.**

Fig. 180: A/C Condenser & Radiator
 Courtesy of CHRYSLER GROUP, LLC

10. Install the A/C condenser (7). Refer to CONDENSER, A/C, INSTALLATION .
11. Install the radiator (12). Refer to RADIATOR, ENGINE COOLING, INSTALLATION .
12. Install the A/C compressor. Refer to COMPRESSOR, A/C, INSTALLATION .

Fig. 181: Generator & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

13. Install the generator. Refer to GENERATOR, INSTALLATION .

CAUTION: The 6.4L Multi Displacement System (MDS) engine uses both standard roller lifters and deactivating roller lifters. The deactivating

roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: Whenever the camshaft is replaced, all lifters must be replaced. If the lifter and retainer assemblies are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

Fig. 182: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

14. Install the lifters (2) and retainer (1) as an assembly into their original location. Refer to **LIFTER (S), HYDRAULIC, ROLLER, INSTALLATION.**

Fig. 183: Cylinder Head & Gasket
 Courtesy of CHRYSLER GROUP, LLC

15. Install both cylinder heads (2). Refer to L **CYLINDER HEAD, INSTALLATION**.
16. Install the pushrods in the same location as removed.
17. Install the rocker arms. Refer to **ROCKER ARM, VALVE, INSTALLATION**.

Fig. 184: Cylinder Head Cover Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

18. Install the cylinder head covers. Refer to **COVER(S), CYLINDER HEAD, INSTALLATION**.

Fig. 185: Identifying Accessory Drive Belt Routing - 5.7L
Courtesy of CHRYSLER GROUP, LLC

19. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

Fig. 186: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
Courtesy of CHRYSLER GROUP, LLC

20. Install the air cleaner housing (5) and clean air tube (1).

Fig. 187: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

21. Install the negative battery cable.
22. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE** .

Fig. 188: Engine Covers
 Courtesy of CHRYSLER GROUP, LLC

23. Fill the crankcase with the specified type and amount of engine oil. Refer to **STANDARD PROCEDURE** .
24. Install engine covers (1).
25. Start the engine and check for leaks.

CRANKSHAFT

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

2981007

Fig. 189: 6.4L HEMI® V-8 Engine
Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine. Refer to **REMOVAL**.
2. Secure the engine onto a suitable engine stand.

1184557

Fig. 190: Vibration Damper & Bolt Grip Puller
 Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.

3. Remove the crankshaft damper retaining bolt.
4. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper.
5. Remove the crankshaft damper (1).

81388432

7. Install all main bearing caps (1) in the location as noted during removal making sure the arrow (2) faces forward.

4715

Fig. 207: Main Bearing Cap Bolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

8. Clean and oil all main cap bolts and install finger tight.
9. Using the sequence shown in illustration, tighten the main bearing cap bolts to 13 N.m (10 ft.

lbs.).

10. Again, using the sequence shown in illustration, tighten the main bearing cap bolts to 28 N.m (21 ft. lbs.).
11. Using the sequence shown in illustration, rotate the main bearing cap bolts an additional 90°.

Fig. 208: Crossbolt Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The main bearing cap crossbolts are torqued after the final torque of the main cap bolts. Always use a new seal washers on crossbolts.

12. Install the crossbolts with new seal washers finger tight.
13. Using the sequence shown in illustration, tighten the crossbolts to 31 N.m (23 ft. lbs.).
14. Again, using the sequence shown in illustration, repeat the crossbolt tightening procedure.
15. Measure the crankshaft end play. Refer to **STANDARD PROCEDURE** .

CAUTION: The connecting rod bolts must not be reused. Always replace the connecting rod bolts whenever they are loosened or removed.

Fig. 209: Mark On Connecting Rod & Bearing Cap

Courtesy of CHRYSLER GROUP, LLC

16. Wipe the connecting rod caps clean and install the rod bearings.
17. Lubricate the bearing surfaces with clean engine oil and install the bearings and connecting rod caps onto the connecting rod journals in the same location as noted during removal.
18. Lubricate the new connecting rod bolts with clean engine oil and install the bolts finger tight.
19. Tighten the connecting rod bolts to 21 N.m (15 ft. lbs.) plus an additional 90° turn.

Fig. 210: Identifying Connecting Rod Proper Installation
Courtesy of CHRYSLER GROUP, LLC

20. If required, measure the connecting rod side clearance (1, 2). Refer to **SPECIFICATIONS** .

Fig. 211: Timing Chain, Sprockets, Timing Chain Tensioner & Guide
 Courtesy of CHRYSLER GROUP, LLC

21. Install the timing chain (5), camshaft phaser (1) and crankshaft sprocket (3). Refer to **CHAIN AND SPROCKETS, TIMING, INSTALLATION**.

Fig. 212: Oil Pump Retaining Bolt Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

22. Position the oil pump on the crankshaft and install the oil pump retaining bolts finger tight.
23. Using the sequence shown in illustration, tighten the oil pump retaining bolts to 28 N.m (21 ft. lbs.).

Fig. 213: Engine Timing Cover
 Courtesy of CHRYSLER GROUP, LLC

24. Install the engine timing cover (1). Refer to **COVER(S), ENGINE TIMING, INSTALLATION.**

Fig. 214: Rear Seal Retainer Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

25. Thoroughly clean all gasket residue from the engine block.
26. Position the gasket onto the new crankshaft rear oil seal retainer.
27. Position the crankshaft rear oil seal retainer onto the engine block.
28. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting bolts and tighten to 15 N.m (11 ft. lbs.).

2970744

Fig. 215: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

29. Install the oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION**.

933170

Fig. 216: Pressing Cup & Damper Installer
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To prevent severe damage to the crankshaft Damper Installer,

thoroughly clean the damper bore and the crankshaft nose before installing damper.

30. Position the damper on the crankshaft.

CAUTION: The Damper Installer is assembled in a specific sequence. Failure to assemble this tool in this sequence may result in tool failure and severe damage to either the tool or the crankshaft.

31. Assemble the Damper Installer (special tool #8512A, Installer, Damper) (2) as follows:
1. Install the nut onto the threaded shaft.
 2. Install the roller bearing onto the threaded shaft making sure the hardened bearing surface is facing the nut.
 3. Install the pressing cup (2) from the A/C Hub Installer (special tool #6871, Installer, A/C Hub) onto the threaded shaft.
 4. Coat the threaded shaft with MOPAR® Nickel Anti-Seize or equivalent.

Fig. 217: Pressing Damper Onto Crankshaft
Courtesy of CHRYSLER GROUP, LLC

32. Using the Damper Installer (special tool #8512A, Installer, Damper) (3) and the pressing cup (2) from A/C Hub Installer (special tool #6871, Installer, A/C Hub), press the crankshaft damper (1) onto the crankshaft.
33. Install the crankshaft damper bolt and tighten to 176 N.m (129 ft. lbs.).

Fig. 218: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

34. Install the flexplate (1) or flywheel. Refer to **FLEXPLATE, INSTALLATION.**

35. Install the engine. Refer to **INSTALLATION**.
36. Start the engine and check for leaks.

DAMPER, VIBRATION

DESCRIPTION

DESCRIPTION

The crankshaft damper is used to control the resonance that is produced by the engine. The Noise, Vibration, and Harshness (NVH) created from the crankshaft can be controlled by dissipating the torque energy through the damper.

3548067

Fig. 220: Crankshaft Damper & Harden Steel Bolt
Courtesy of CHRYSLER GROUP, LLC

The crankshaft damper on the engines is held to the crankshaft by means of a harden steel bolt. The damper is pressed onto a specific machined surface of the crankshaft.

3548080

Fig. 221: HEMI® Engine Crankshaft Damper
Courtesy of CHRYSLER GROUP, LLC

The HEMI® Engines incorporate various crankshaft vibration dampers depending on the engine application. And can be removed depending on the application used.

3548099

Fig. 222: Removing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

Finding the proper puller for the application will ensure no damage will come to the damper. The flange puller is used by installing 3 bolts into the pre-tapped holes in the damper.

475917

Fig. 223: Removing Vibration Damper
 Courtesy of CHRYSLER GROUP, LLC

Some pulleys that do not have bolt holes can be removed with a three jaw style (special tool #1023, Puller).

REMOVAL

REMOVAL

2969729

Fig. 224: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

2968475

Fig. 225: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
 Courtesy of CHRYSLER GROUP, LLC

3. Remove the upper radiator hose clamps (1) and remove the upper radiator hose (2).
4. Remove the oil cooler hose clamp (3) and remove oil cooler hose (4) and position aside.

81866F19

Fig. 226: Accessory Drive Belt Routing, Tensioner & Pulleys
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .

2960677

Fig. 227: Cooling Fan Electrical Connector, Cooling Fan Mounting Bolts & Radiator Cooling Fan Assembly

6. Remove the cooling fan assembly. Refer to **FAN, COOLING, REMOVAL** .

1184557

Fig. 228: Vibration Damper & Bolt Grip Puller
 Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.

7. Remove the vibration damper bolt.
8. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper.

9. Remove the crankshaft damper (1).

INSTALLATION

INSTALLATION

Fig. 229: Installing Vibration Damper Onto Crankshaft Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

1. Using (special tool #10387, Installer, Vibration Damper), install the threaded rod (1) onto the crankshaft (2).
2. Tighten the threaded rod (4) until it is seated to the face (3) of the crankshaft.

Fig. 230: Installing Vibration Damper
Courtesy of CHRYSLER GROUP, LLC

3. Position the damper (2) on the crankshaft.
4. Install the press washer, bearing, washer, and the press nut onto the threaded rod.
5. Using Damper Installer (1) and a deep well socket, press the damper onto the crankshaft till seated.

Fig. 231: Installing Vibration Damper
 Courtesy of CHRYSLER GROUP, LLC

6. Install the vibration damper bolt.
7. Position the (special tool #10386, Holder, Vibration Damper) (2), onto the vibration pulley (3).
8. Tighten the bolt to 250 N.m (184 ft. lbs.).

Fig. 232: Accessory Drive Belt Routing, Tensioner & Pulleys
 Courtesy of CHRYSLER GROUP, LLC

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .

Fig. 233: Cooling Fan Electrical Connector, Cooling Fan Mounting Bolts & Radiator Cooling Fan Assembly

10. Install the cooling fan. Refer to **FAN, COOLING, INSTALLATION** .

Fig. 234: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

11. Install the oil cooler hose (4) and clamp (3).
12. Install the upper radiator hose (2) and clamp (1).
13. Refill the cooling system. Refer to **STANDARD PROCEDURE** .

Fig. 235: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

14. Connect the negative battery cable (1).

FLEXPLATE

REMOVAL

REMOVAL

Fig. 236: Flex Plate Bolt Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the transmission. Refer to **REMOVAL** .
2. Using the sequence shown in illustration, remove the flexplate (1) retaining bolts.
3. Remove the flexplate.

INSTALLATION

INSTALLATION

Fig. 237: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Position the flexplate (1) onto the crankshaft and install the bolts finger tight.
2. Using the sequence shown in illustration, tighten the flexplate retaining bolts to 95 N.m (70 ft. lbs.).
3. Install the transmission. Refer to **INSTALLATION** .

LIFTER(S), HYDRAULIC, ROLLER

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HYDRAULIC ROLLER LIFTERS

Before disassembling any part of the engine to correct lifter noise, check the oil pressure. If the vehicle has no oil pressure gauge, install a reliable gauge at the pressure sending-unit. The pressure should be between 207-552 kPa (30-70 psi) at 3, 000 RPM.

Check the oil level after the engine reaches normal operating temperature. Allow 5 minutes to

stabilize oil level, check dipstick. The oil level in the pan should never be above the FULL mark or below the ADD OIL mark on the dipstick. Either of these two conditions could be responsible for noisy lifters.

HIGH

If oil level is above the FULL mark, it is possible for the connecting rods to dip into the oil. With the engine running, this condition could create foam in the oil pan. Foam in oil pan would be fed to the hydraulic lifters by the oil pump causing them to lose length and allow valves to seat noisily.

LOW

Low oil level may allow oil pump to take in air. When air is fed to the lifters, they lose length, which allows valves to seat noisily. Any leaks on intake side of oil pump through which air can be drawn will create the same lifter action. Check the lubrication system from the intake strainer to the pump cover, including the relief valve retainer cap. When lifter noise is due to aeration, it may be intermittent or constant, and usually more than one lifter will be noisy. When oil level and leaks have been corrected, operate the engine at fast idle. Run engine for a sufficient time to allow all of the air inside the lifters to be bled out.

LIFTER NOISE DIAGNOSIS

1. To determine source of lifter noise, crank the engine with cylinder head covers removed.
2. Feel each valve spring or rocker arm to detect noisy lifter. The noisy lifter will cause the affected spring and/or rocker arm to vibrate or feel rough in operation.

NOTE: **Worn valve guides or cocked springs are sometimes mistaken for noisy lifters. If such is the case, noise may be dampened by applying side thrust on the valve spring. If noise is not noticeably reduced, it can be assumed the noise is in the lifter. Inspect the rocker arm push rod sockets and push rod ends for wear.**

3. Valve lifter noise ranges from light noise to a heavy click. A light noise is usually caused by excessive leak-down around the unit plunger or by the plunger partially sticking in the lifter body cylinder. The lifter should be replaced. A heavy click is caused by a lifter check valve not seating or by foreign particles wedged between the plunger and the lifter body. This will cause the plunger to stick in the down position. This heavy click will be accompanied by excessive clearance between the valve stem and rocker arm as the valve closes. In either case, lifter assembly should be removed for inspection and cleaning.
4. The valve train generates a noise very much like a light lifter noise during normal operation. Care must be taken to ensure that lifters are making the noise. If more than one lifter seems to be noisy, it's probably not the lifters.

REMOVAL

REMOVAL

Fig. 238: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the cylinder head. Refer to **CYLINDER HEAD, REMOVAL**.

Fig. 239: Hydraulic Lifters/Tappets & Retainer/Guide Holder
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: If the lifter and retainer assembly are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer assembly must be installed as a unit.

3. Remove the lifters (2) and retainer (1) as an assembly.
4. Check the camshaft lobes for abnormal wear.

INSTALLATION

INSTALLATION

Fig. 240: Hydraulic Lifters/Tappets & Retainer/Guide Holder
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the lifters (2) and retainer (1) assembly with clean engine oil.

Fig. 241: Rear MDS Lifter Assembly
Courtesy of CHRYSLER GROUP, LLC

CAUTION: The 6.4L Multi Displacement System (MDS) engine uses both

standard roller lifters and deactivating roller lifters. The deactivating roller lifters must be used in cylinders 1, 4, 6, 7. The deactivating lifters can be identified by the two holes in the side of the lifter body, for the latching pins.

CAUTION: If the lifter and retainer assembly are to be reused, identify the lifters to ensure installation in their original location or engine damage could result.

CAUTION: The lifter and retainer must be installed as an assembly.

2. Install the lifters (2) and retainer (1) as an assembly into their original location.
3. Tighten the lifter retainer bolt (1) to 12 N.m (9 ft. lbs.).
4. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.

Fig. 242: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

5. Connect the negative battery cable.

CAUTION: To prevent damage to valve assemblies, do not run the engine above fast idle until all hydraulic lifters have filled with oil and have become quiet.

6. Start the engine and check for leaks.
7. Road test the vehicle.

RETAINER, CRANKSHAFT REAR OIL SEAL

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - REAR SEAL AREA LEAKS

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and is serviced as an assembly.

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Raise and support the vehicle.
2. Remove the transmission inspection/torque converter access cover.
3. Inspect the rear of the cylinder block for evidence of oil leakage and note the following:
 - Circular spray pattern generally indicates seal leakage or crankshaft damage.
 - Where leakage tends to run straight down, possible causes are a porous block, camshaft bore cup plugs, oil gallery pipe plugs, oil filter runoff and main bearing cap to cylinder block mating surfaces. See appropriate Engine information, for proper repair procedures of these items.
4. If no leaks are detected, pressurize the crankcase. Refer to **DIAGNOSIS AND TESTING** .

CAUTION: Do not exceed 20.6 kPa (3 psi).

5. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out using an emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks or scratches. The crankshaft seal flange is specially machined to complement the function of the rear oil seal.

6. For bubbles that remain steady with shaft rotation, no further inspection can be done. Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL**.

REMOVAL

REMOVAL

Fig. 243: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

NOTE: This procedure can be performed in vehicle.

1. Disconnect the negative battery cable (1).
2. Remove the automatic transmission. Refer to **REMOVAL** . If equipped, remove the manual transmission. Refer to **REMOVAL** .

Fig. 244: Flex Plate Bolt Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

3. Remove the flexplate (1) or flywheel. Refer to **FLEXPLATE, REMOVAL**.
4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.

Fig. 245: Rear Seal Retainer Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

5. Using the sequence shown in illustration, remove the rear oil seal retainer mounting bolts.
6. Remove and discard the rear oil seal retainer.

INSTALLATION

INSTALLATION

Fig. 246: Rear Seal Retainer Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer and must be replaced as an assembly.

NOTE: The crankshaft rear oil seal retainer can not be reused after removal.

1. Thoroughly clean all gasket residue from the engine block.
2. Position the gasket onto the new crankshaft rear oil seal retainer.
3. Position the crankshaft rear oil seal retainer onto the engine block.
4. Using the sequence shown in illustration, install the crankshaft rear oil seal retainer mounting bolts and tighten to 15 N.m (11 ft. lbs.).
5. Install the oil pan. Refer to **PAN, OIL, INSTALLATION**.

Fig. 247: Flex Plate Bolt Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

6. Install the flexplate (1) or flywheel. Refer to **FLEXPLATE, INSTALLATION**.
7. Install the transmission (Refer to **NAG1 AUTOMATIC TRANSMISSION - SERVICE INFORMATION** or **TR6060 MANUAL TRANSMISSION - SERVICE INFORMATION**).
8. Fill the crankcase with the specified type and amount of engine oil. Refer to **STANDARD PROCEDURE** .

Fig. 248: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

9. Connect the negative battery cable (1).
10. Start the engine and check for leaks.

RING(S), PISTON

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON RING FITTING

Fig. 249: Using Feeler Gauge To Check Ring End Gap
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Before reinstalling used piston rings or installing new piston rings, the piston ring clearances must be checked or engine damage may result.

1. Wipe the cylinder bore clean.
2. Insert the piston ring into the cylinder bore.

NOTE: The piston ring gap measurement must be made with the piston ring positioned at least 12 mm (0.50 inch) from bottom of cylinder bore.

3. Using a piston, make sure that the piston ring is squared in the cylinder bore. Slide the piston ring downward into the cylinder.
4. Using a feeler gauge (1), check the piston ring end gap, replace any rings not within specification.

PISTON RING SIDE CLEARANCE

Fig. 250: Measuring Piston Ring Side Clearance
Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Measure the piston ring side clearance with a feeler gauge (1) as shown in illustration. Make sure the feeler gauge fits snugly between the piston ring land and the piston ring, replace any ring not within specification.

NOTE: Make sure the marks on the compression rings face upward.

2. Rotate the ring around the piston. The ring must rotate in the groove with out binding.

PISTON RING INSTALLATION

Fig. 251: Installing Piston Ring Side Rail
 Courtesy of CHRYSLER GROUP, LLC

1. Install the oil ring expander.
2. Install the lower side rail by placing one end between the piston ring groove and the expander ring (1). Hold the lower side rail end firmly and press down the portion to be installed until the side rail is in position. Repeat this step for the upper side rail.

Fig. 252: Installing Upper & Intermediate Rings
 Courtesy of CHRYSLER GROUP, LLC

3. Using a piston ring installer, install the No. 2 intermediate piston ring.
4. Using a piston ring installer, install the No. 1 upper piston ring.

RR09B48

Fig. 253: Piston Ring End Gap Position
Courtesy of CHRYSLER GROUP, LLC

5. Install the oil ring expander gap at the (5) position.
6. Install the oil ring lower side rail gap at the (4) position.
7. Install the oil ring upper side rail gap at the (1) position.
8. Install the second compression ring gap at the (5) position.
9. Install the top compression ring gap at the (2) position.

ROD, PISTON AND CONNECTING

DESCRIPTION

DESCRIPTION

CAUTION: Do not use a metal stamp to mark connecting rods as damage may result, instead use ink or a scratch awl.

The pistons are made of a high-strength aluminum alloy. Piston skirts are coated with a solid lubricant (Molykote) to reduce friction and provide scuff resistance. The piston top ring groove and land is anodized. The connecting rods are made of forged powdered metal with a "fractured cap" design. A floating piston pin is used to attach the piston and connecting rod.

STANDARD PROCEDURE

STANDARD PROCEDURE - PISTON FITTING

115574

Fig. 254: Measuring Cylinder Bore Diameter
Courtesy of CHRYSLER GROUP, LLC

1. Use Cylinder Indicator (special tool #C-119, Cylinder Indicator) (2) to correctly measure the inside diameter of the cylinder bore (3). A cylinder indicator capable of reading in 0.003 mm (0.0001 in.) increments is required. If a cylinder indicator is not available, do not use an inside micrometer.
2. Measure the inside diameter of the cylinder bore at a point 38.0 mm (1.5 inches) below top of bore (4). Start perpendicular (across or at 90°) to the axis of the crankshaft at point A and then take an additional bore reading 90° to that at point B.

80aac2ao

Fig. 255: Moly Coated Piston
Courtesy of CHRYSLER GROUP, LLC

NOTE: The coated pistons, piston pins and connecting rods are pre-assembled

and serviced as an assembly.

3. The piston and rod assembly is specific for the left cylinder bank (odd numbered) and the right cylinder bank (even numbered) and must not be interchanged.
4. The coating material (1, 2) is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a cylinder indicator is **MANDATORY**. To correctly select the proper size piston, a cylinder indicator capable of reading in 0.003 mm (0.0001 in.) increments is required.
5. Piston installation into the cylinder bore requires slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

Fig. 256: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect and isolate the negative battery cable (1).

3501715

Fig. 257: Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

3. Remove the cylinder head(s). Refer to **CYLINDER HEAD, REMOVAL**.

2970744

Fig. 258: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.
5. Remove and discard the oil pan gasket/windage tray (3).
6. If necessary, remove the ridge on top of the cylinder bores with a reliable ridge reamer before removing pistons from engine block. **Be sure to keep the tops of the pistons covered during this operation.**

CAUTION: When removing and installing the pistons and connecting rods, do not damage the piston oil cooler jets. If the jets are bent, engine damage may occur.

Fig. 259: Piston Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

7. Remove the piston oil cooler jet(s) retaining bolt(s) (2) and remove the piston oil cooler jet(s) (1).

CAUTION: Do not use a number stamp or a punch to mark connecting rods or caps, as damage to connecting rods could occur.

CAUTION: Care must be taken not to damage the fractured rod and cap joint face surfaces as engine damage may occur.

CAUTION: Care must be taken not to nick crankshaft journals as engine damage may occur.

Fig. 260: Mark On Connecting Rod & Bearing Cap
Courtesy of CHRYSLER GROUP, LLC

NOTE: Connecting rods and bearing caps are not interchangeable and should be marked before removing to ensure correct reassembly.

8. Mark the connecting rod and bearing cap position using a permanent ink marker or scribe tool.

NOTE: Pistons and connecting rod assemblies must be removed from the top of the engine block. When removing the piston and connecting rod assemblies from the engine, rotate the crankshaft so each connecting rod is centered in the cylinder bore.

9. Remove the connecting rod cap and carefully remove the piston from the cylinder bore, repeat this procedure for each piston being removed.
10. Immediately after removing the piston and connecting rod, install the bearing cap on the mating connecting rod to prevent damage to the fractured cap and rod surfaces.
11. Carefully remove the piston rings from the piston(s), starting from the top ring down.

CLEANING

CLEANING

CAUTION: DO NOT use a wire wheel or other abrasive cleaning device to clean the pistons or connecting rods. The pistons have a Moly coating, this coating must not be damaged.

1. Using a suitable cleaning solvent clean the pistons in warm water and towel dry.
2. Use a wood or plastic scraper to clean the ring land grooves.

INSPECTION

INSPECTION

Check the connecting rod journal for excessive wear, taper and scoring.

Check the connecting rod for signs of twist or bending.

Check the piston for taper and elliptical shape before it is fitted into the cylinder bore. Refer to **STANDARD PROCEDURE** .

Check the piston for scoring, or scraping marks on the piston skirts. Check the ring lands for cracks and/or deterioration.

INSTALLATION

INSTALLATION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

NOTE: Before reinstalling used rings or installing new rings, the ring clearances must be checked.

NOTE: Make sure the piston ring grooves are clean and free of nicks and burrs.

1. Check piston ring clearance. Refer to **STANDARD PROCEDURE** .
2. Before installing piston and connecting rod assemblies into the bore, install the piston rings. Refer to **STANDARD PROCEDURE** .
3. Immerse the piston head and rings in clean engine oil and position a ring compressor over the piston and rings and tighten the ring compressor. **Make sure the position of rings do not change during this operation.**

Fig. 261: Piston Direction Arrow
Courtesy of CHRYSLER GROUP, LLC

4. The pistons are marked on the piston pin bore surface with an raised "F" or arrow on top of piston indicating installation position. This mark must be pointing toward the front of the engine on both cylinder banks.
5. Wipe the cylinder bore clean and lubricate with clean engine oil.
6. Rotate the crankshaft until the connecting rod journal is centered with the cylinder bore.

7. Insert the piston and rod assembly into the cylinder bore and carefully position the connecting rod over the crankshaft journal.
8. Tap the piston down in cylinder bore using a hammer handle. While at the same time, guide the connecting rod into position on crankshaft rod journal.
9. Perform the measure bearing clearance procedure. Refer to **ENGINE BLOCK, STANDARD PROCEDURE** .

Fig. 262: Connecting Rod Cap & Bearing
Courtesy of CHRYSLER GROUP, LLC

10. Wipe the connecting rod cap (1) clean and lubricate with clean engine oil and install the bearing (3).

NOTE: The connecting rods and bearing caps are not interchangeable, line up the previously marked bearing caps and connecting rods to ensure assembly to their original location.

11. Lubricate the bearing surfaces with clean engine oil and position the rod cap onto the connecting rod.

CAUTION: When installing the connecting rods, make sure the wide side of the connecting rod faces the crankshaft and the narrow sides face each other.

CAUTION: Always replace the connecting rod bolts whenever they are loosened or removed.

Fig. 263: Connecting Rod Proper Installation
Courtesy of CHRYSLER GROUP, LLC

12. Verify the connecting rods are properly installed, the wide side (1) of the connecting rod is facing towards the crankshaft and the narrow sides (2) of the connecting rods face each other.
13. Lubricate the new rod cap bolts with clean engine oil, install and tighten to 45 N.m (33 ft. lbs.) plus an additional 60° turn.

CAUTION: When removing and installing the pistons and connecting rods, do not damage the piston oil cooler jets. If the jets are bent, engine damage may occur.

Fig. 264: Piston Oil Jet & Bolt
 Courtesy of CHRYSLER GROUP, LLC

14. Position the piston oil cooler jet(s) (1).
15. Install the piston oil cooler jet retaining bolt(s) (2) and tighten to 13 N.m (10 ft. lbs.).

Fig. 265: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
 Courtesy of CHRYSLER GROUP, LLC

16. Install the new oil pan gasket/windage tray (3), oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION**.
17. Install the engine oil dipstick tube and dipstick.
18. Lower the vehicle.

3501715

Fig. 266: Cylinder Head
Courtesy of CHRYSLER GROUP, LLC

19. Install the cylinder head(s). Refer to **CYLINDER HEAD, INSTALLATION**.

2969729

Fig. 267: Negative Battery Cable

SEAL, CRANKSHAFT OIL, REAR

DESCRIPTION

DESCRIPTION

The crankshaft rear oil seal is integral to the crankshaft rear oil seal retainer, for more information. Refer to the following;

- **Diagnosis and Testing** . Refer to **DIAGNOSIS AND TESTING** .
- **Removal** . Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, REMOVAL**.
- **Installation** . Refer to **RETAINER, CRANKSHAFT REAR OIL SEAL, INSTALLATION**.

SOLENOID, MULTIPLE DISPLACEMENT

DESCRIPTION

DESCRIPTION

The Multi Displacement System (MDS) selectively deactivates cylinders 1, 4, 6, and 7 to improve fuel economy. It has two modes of operation:

- 8 cylinders for acceleration and heavy loads
- 4 cylinders for cruising and city traffic

The main components of the Multi Displacement System are:

- Unique MDS camshaft
- Deactivating roller lifters
- 4 control valve solenoids
- Control valve solenoid wiring harness
- Oil temperature sensor

OPERATION

OPERATION

Cylinder Deactivation

- Trap an exhaust charge from a normal combustion event
- Normal combustion event
- Deactivate the exhaust valve
- Deactivate the intake valve
- Piston is an air spring
- Cylinders deactivated in firing sequence

Cylinder Reactivation

- Normal combustion event
- Activate the exhaust valve

- Activate the intake valve
- Empty the cylinder
- Cylinders reactivated in firing sequence

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - 6.4L - MDS SOLENOID

The Multi-Displacement System (MDS) has the following detectable issues:

- Solenoid circuit
- Fail to deactivate a cylinder(s)
- Fail to reactivate a cylinder(s)
- Low oil pressure

CONDITION	POSSIBLE CAUSES	CORRECTION
MDS does not activate	1. Low oil pressure	1. Check for proper oil pressure
	2. Bad oil temperature sensor	2. Replace the oil temperature sensor
	3. Malfunctioning MDS solenoid	3. Replace the MDS solenoid
	4. Malfunctioning MDS lifter	4. Replace lifter(s)
MDS does not deactivate	1. Low oil pressure	1. Check or proper oil pressure
	2. Bad oil temperature sensor	2. Replace the oil temp sensor
	3. Malfunctioning MDS solenoid	3. Replace the MDS solenoid
	4. Malfunctioning MDS lifter(s)	4. Replace lifter(s)

REMOVAL

REMOVAL

Fig. 281: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate the negative battery cable (1).

Fig. 282: Intake Manifold Foam Insulator Pad, MDS Solenoids & Bolts
 Courtesy of CHRYSLER GROUP, LLC

2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Remove foam insulator pad (1).

Fig. 283: MDS Solenoids, Electrical Connectors & Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the Multiple Displacement Solenoid (MDS) (2) electrical connector(s) (1).
5. Remove the MDS solenoid (2) retaining bolt(s) (3).

CAUTION: Do not try to pry the solenoid out. This could lead to breakage and contamination of the lubrication system.

Fig. 284: Removing/Installing MDS Solenoid
 Courtesy of CHRYSLER GROUP, LLC

6. Lightly tap on the MDS solenoid(s) with a rubber mallet. Rotate the MDS solenoid(s) from side to side to break the seal.
7. Remove the MDS solenoid(s).

INSTALLATION

INSTALLATION

Fig. 285: Removing/Installing MDS Solenoid
Courtesy of CHRYSLER GROUP, LLC

1. Verify the MDS solenoid bores are free of debris before installing the MDS solenoid into the engine block.
2. Install the MDS solenoid(s) (3), ensure the seal is fully seated into the engine block.

Fig. 286: MDS Solenoids, Electrical Connectors & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the retaining bolt(s) (3) and tighten to 11 N.m (8 ft. lbs.).
4. Connect the MDS electrical connector to the solenoid(s) (1).

Fig. 287: Intake Manifold Foam Insulator Pad, MDS Solenoids & Bolts
 Courtesy of CHRYSLER GROUP, LLC

5. Install the foam insulator pad (1).
6. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION.**

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

2. Position the engine mounts (2), Install the retainers (1) and tighten to 61 N.m (45 ft. lbs.).

3002113

Fig. 310: Support Bracket, Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

3. Position the generator support bracket (3) to the engine mount, install the retaining nut (1) and tighten finger tight.
4. Position the generator support bracket (3) to the generator, install the retaining bolt (2) and

tighten to 65 N.m (48 ft. lbs.).

5. Tighten the generator support bracket (3) to engine mount retaining nut (1) to 28 N.m (21 ft. lbs.).
6. Lower the vehicle.

Fig. 311: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

7. Lower the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3) until the engine mounts are seated in the engine cradle.
8. Remove the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3).

Fig. 312: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Install the VVCS (3). Refer to **SOLENOID, VARIABLE VALVE TIMING (VVTs), EXHAUST, INSTALLATION**.
10. Raise and support the vehicle.

Fig. 313: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

11. Install both left/right engine mount lower retaining bolts (2) and tighten to 61 N.m (45 ft. lbs.).
12. Position both left/right engine mount heat shields (4), install the retaining nuts (3) and tighten to 27 N.m (20 ft. lbs.).

Fig. 314: Lower Splash Shield & Fasteners

Courtesy of CHRYSLER GROUP, LLC

13. Position the belly pan and install the belly pan retainers (1).
14. Lower the vehicle.

Fig. 315: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

15. Position the engine oil dipstick tube, install the retaining nut at the right exhaust manifold.
16. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
17. Connect the negative battery cable (1).

LUBRICATION

DESCRIPTION

DESCRIPTION

3128800

Fig. 316: 6.4L Lubrication System
Courtesy of CHRYSLER GROUP, LLC

The lubrication system is a full flow filtration pressure feed type system.

DIAGNOSIS AND TESTING

CHECKING ENGINE OIL PRESSURE

1. Remove oil pressure sending unit and install gauge assembly (special tool #C-3292A, Gauge, Pressure).
2. Run engine until thermostat opens.
3. Check oil pressure gauge:
 - Curb Idle - 25 kPa (4 psi) minimum
 - 3000 RPM - 170 - 758 kPa (25 - 110 psi)
4. If oil pressure is 0 at idle, shut off engine. Check for a clogged oil pick-up screen or a pressure relief valve stuck open.

ENGINE OIL LEAK

Begin with a thorough visual inspection of the engine, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Do not clean or degrease the engine at this time because some solvents may cause rubber to swell thus temporarily stopping the leak.

2. Add an oil soluble dye (use as recommended by manufacturer). Start the engine and let idle for approximately 15 minutes. Check the oil dipstick to make sure the dye is thoroughly mixed as indicated with a bright yellow color under a black light.
3. Using a black light, inspect the entire engine for fluorescent dye, particularly at the suspected area of oil leak. If the oil leak is found and identified, repair per Service Information procedures.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles), and repeat inspection.

If the oil leak source is not positively identified at this time, proceed with the **AIR LEAK DETECTION TEST METHOD**.

AIR LEAK DETECTION TEST METHOD

1. Remove the PCV valve, cap or plug the PCV valve port at the intake manifold.
2. Attach an air hose with a pressure gauge and regulator onto the dipstick tube.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

3. Gradually apply air pressure from 1 psi to 2.5 psi maximum while applying soapy water at the suspected source. Adjust the regulator to the suitable test pressure that provide the best bubbles which will pinpoint the leak source. If the oil leak is detected and identified, repair per Service Information procedures.
4. If the leakage occurs at the rear oil seal area, proceed with the **INSPECTION FOR REAR SEAL AREA LEAKS**.
5. If no leaks are detected, turn off the air supply and remove the air hose from the dipstick tube.
6. Remove the PCV port plug or cap at the intake manifold and install the PCV valve.
7. Clean the oil off the suspect oil leak area using a suitable solvent. Drive the vehicle at various speeds approximately 24 km (15 miles). Inspect the engine for signs of an oil leak by using a black light. If the oil leak is found and identified, repair per Service Information procedures.

INSPECTION FOR REAR SEAL AREA LEAKS

Since it is sometimes difficult to determine the source of an oil leak in the rear seal area of the engine, a more involved inspection is necessary. The following steps should be followed to help pinpoint the source of the leak.

If the leakage occurs at the crankshaft rear oil seal area:

1. Disconnect the battery.
2. Raise and support the vehicle.
3. Remove torque converter or clutch housing inspection cover.
4. Using a black light and inspect the rear of the engine block for evidence of oil.

Circular spray pattern on the rear of the engine block generally indicates:

- Rear crankshaft oil seal
- Damaged crankshaft

Oil running straight down the back of the engine block generally indicates:

- Porous engine block
- Camshaft core hole plug
- Oil gallery pipe plug
- Oil pan gasket

5. If no leaks are detected, pressurize the crankcase as outlined in the **AIR LEAK DETECTION TEST METHOD**.

CAUTION: Do not subject the engine assembly to more than 20.6 kPa (3 PSI) of test pressure.

6. If the leak is not detected, very slowly turn the crankshaft and watch for leakage. If a leak is detected between the crankshaft and crankshaft oil seal while slowly turning the crankshaft, it is possible the crankshaft seal surface is damaged. The seal area on the crankshaft could have minor nicks or scratches that can be polished out with emery cloth.

CAUTION: Use extreme caution when crankshaft polishing is necessary to remove minor nicks and scratches. The crankshaft seal flange is machined specifically to complement the function of the rear oil seal.

7. For bubbles that remain steady with shaft rotation, no further inspection can be done until disassembled.

SOLENOID, VARIABLE VALVE TIMING (VVTS), EXHAUST

DESCRIPTION

DESCRIPTION

Fig. 317: Oil Control Valve, Electrical Connector & Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

The 6.4L engine is equipped with Variable Valve Timing (VVT). This system uses a Variable Valve Timing Solenoid (VVTs) to control the oil pressure to direct oil pressure to the camshaft phaser assembly. The camshaft phaser assembly advances and/or retards camshaft timing to improve engine performance, mid-range torque, idle quality, fuel economy and reduce emissions. The VVTS (3) is located under the intake manifold.

OPERATION

OPERATION

Fig. 318: Camshaft Phaser & Bolt
 Courtesy of CHRYSLER GROUP, LLC

The Variable Cam Timing (VCT) assembly is actuated with engine oil pressure. The oil flow to the

VCT assembly is controlled by an Variable Valve Timing Solenoid (VVTS). The VVTS consists of a Pulse Width Modulated (PWM) solenoid and a spool valve. The PCM actuates the VVTS to control oil flow through the spool valve into the VCT assembly. The VCT assembly consists of a rotor and a stator/sprocket. The stator/sprocket is connected to the timing chain. The rotor is connected to the camshaft. Oil flow into the VCT assembly rotates the rotor with respect to the stator, thus rotating the camshaft with respect to the stator/sprocket. This will rotate both the intake and exhaust lobes on the camshaft by the same amount. The intake and exhaust lobes can not be individually controlled with this VCT system. An infinitely variable valve timing position can be achieved within the limits of the hardware. The camshaft position sensor monitors the position of the camshaft with respect to the crankshaft and provides feedback to the PCM.

REMOVAL

REMOVAL

Fig. 319: Oil Control Valve, Electrical Connector & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: The Variable Valve Timing Solenoid (VVTS) (3) is located under the intake manifold.

1. Remove intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
2. Disconnect VVTS electrical connector (1).
3. Remove VVTS retaining bolt (2).

Fig. 320: Removing/Installing OCV
Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove the VVTS, the engine must be at room temperature.

4. Rotate the VVTS to break the seal and remove.

INSTALLATION

INSTALLATION

Fig. 321: Removing/Installing OCV
Courtesy of CHRYSLER GROUP, LLC

1. Lubricate the Variable Valve Timing Solenoid (VVT) rubber O-ring seal with clean engine oil.
2. Install the VVTS and rotate into position.

Fig. 322: Oil Control Valve, Electrical Connector & Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

3. Install the VVTS (3) retaining bolt (2) and tighten to 11 N.m (8 ft. lbs.).
4. Connect VVTS electrical connector (1).
5. Install intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.

COOLER, OIL

DESCRIPTION

DESCRIPTION

Fig. 323: Oil Filter, Oil Cooler & Hoses
 Courtesy of CHRYSLER GROUP, LLC

The engine oil cooler (2) is engineered for maximum cooling efficiency with no restriction in oil flow. The oil cooler is a stack plate design coolant-to-oil heat exchanger.

The oil cooler (2) is mounted between the oil filter (1) and the engine block. The oil cooler uses the radiator coolant system; coolant is circulated through two coolant hoses to maintain a consistent engine oil temperature.

REMOVAL

REMOVAL

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

Fig. 324: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support the vehicle.
2. Remove the belly pan retainers (1) and remove the belly pan.
3. Drain the cooling system. Refer to **STANDARD PROCEDURE** .

Fig. 325: Oil Filter, Oil Cooler & Hoses
 Courtesy of CHRYSLER GROUP, LLC

4. Remove the oil filter (1) from the oil cooler (2).

Fig. 326: Clamps, Allen Wrench Socket & Oil Cooler Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the clamps (1) from the cooling hoses at the oil cooler and remove hoses.
6. Using a 12 mm Allen Wrench socket (2), remove the oil cooler retaining bolt (3).

2968394

Fig. 327: O-Ring Seal & Oil Cooler
Courtesy of CHRYSLER GROUP, LLC

NOTE: Whenever the oil cooler is serviced, the rubber O-ring seal must be replaced.

7. Remove and discard the oil cooler (2) rubber O-ring seal (1).

INSTALLATION

INSTALLATION

CAUTION: If the engine encounters a catastrophic failure, the engine oil cooler must be replaced or damage to the new engine and/or components could result.

2968394

Fig. 328: O-Ring Seal & Oil Cooler

Courtesy of CHRYSLER GROUP, LLC

NOTE: Whenever the oil cooler is serviced, the rubber O-ring seal must be replaced.

1. Clean the sealing surface of the oil cooler (2) and install a new rubber O-ring seal (1).
2. Lightly lubricate the oil cooler rubber O-ring seal (1) with clean engine oil.

Fig. 329: Clamps, Allen Wrench Socket & Oil Cooler Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

3. Using a 12 mm Allen Wrench socket (2), install the oil cooler retaining bolt (3) and tighten to 28 N.m (21 ft. lbs.).
4. Position the cooling hoses and install the clamps (1).

Fig. 330: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

5. Lightly lubricate the oil filter gasket with clean engine oil.

NOTE: **Do not over tighten the oil filter.**

6. Thread the oil filter (1) onto the oil cooler (2) oil filter boss.
7. When the oil filter gasket makes contact with the oil cooler sealing surface, hand tighten the oil filter one half turn, or 180°.

Fig. 331: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

8. Position the belly pan to the under side of the vehicle and install the retainers (1).
9. Lower the vehicle.
10. Fill the cooling system. Refer to **STANDARD PROCEDURE** .
11. Start the engine and check for leaks.
12. Turn the engine off and check the oil level.

FILTER, ENGINE OIL

REMOVAL

REMOVAL

Fig. 332: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

All engines are equipped with a high quality full-flow, disposable type oil filter.

1. Raise and support the vehicle.
2. Remove the belly pan retainers (1) and remove the belly pan.

Fig. 333: Oil Filter, Oil Cooler & Hoses
 Courtesy of CHRYSLER GROUP, LLC

3. Position a drain pan under the oil filter.
4. Using a suitable oil filter wrench, rotate the oil filter (1) counterclockwise to remove it from the oil cooler (2).
5. When the oil filter separates from the oil cooler, keep the gasket end upward to minimize oil spill and remove the oil filter from vehicle.

NOTE: Make sure the oil filter gasket was removed with the oil filter.

6. Using a wiping cloth, clean the oil cooler gasket sealing surface of oil and grime.

INSTALLATION

INSTALLATION

Fig. 334: Oil Filter, Oil Cooler & Hoses
Courtesy of CHRYSLER GROUP, LLC

1. Lightly lubricate the oil filter gasket with clean engine oil.

NOTE: Do not over tighten the oil filter.

2. Thread the oil filter (1) onto the oil cooler (2) oil filter boss.
3. When the oil filter gasket makes contact with the oil cooler sealing surface, hand tighten the oil filter one half turn, or 180°.

Fig. 335: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

4. Position the belly pan to the under side of the vehicle and install the retainers (1).
5. Lower the vehicle.
6. Fill the crankcase with the specified type and amount of engine oil as described in **STANDARD PROCEDURE**.
7. Install the oil fill cap.
8. Start the engine and check for leaks.
9. Turn the engine off and check the oil level.

JET, PISTON OIL COOLER

DESCRIPTION

DESCRIPTION

81d0111b

Fig. 336: Engine Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

Four dual-nozzle oil jets are bolted to the cylinder block underneath the main oil gallery. The jets connect with an oil-tight fit to the main gallery through lubrication passages. Each oil jet helps cool the two opposing pistons.

REMOVAL

REMOVAL

81387997

Fig. 337: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

1. Remove the oil pan and oil pump pickup tube. Refer to **PAN, OIL, REMOVAL**.

Fig. 338: Piston Oil Jet & Bolt
Courtesy of CHRYSLER GROUP, LLC

NOTE: It may be necessary to rotate the engine crankshaft to access the piston oil cooler jet retaining bolts.

2. Remove the piston oil cooler jet retaining bolt (2).
3. Remove the piston oil cooler jet (1).

INSTALLATION

INSTALLATION

Fig. 339: Piston Oil Jet & Bolt
 Courtesy of CHRYSLER GROUP, LLC

1. Position the piston oil cooler jet (1).
2. Install the piston oil cooler jet retaining bolt and tighten to 13 N.m (10 ft. lbs.) (2).

Fig. 340: Oil Pan Bolt Removal/Installation Sequence

3. Install the engine oil pump pickup tube and oil pan. Refer to PAN, OIL, INSTALLATION.

OIL

STANDARD PROCEDURE

STANDARD PROCEDURE - ENGINE OIL SERVICE

CRANKCASE OIL LEVEL INSPECTION

On the 6.4L engine, the oil level indicator is located on the right side of the engine.

CAUTION: Do not overfill crankcase with engine oil, pressure loss or oil foaming can result.

Inspect the engine oil level approximately every 800 kilometers (500 miles). Unless the engine has exhibited loss of oil pressure, run the engine for about ten minutes before checking the oil level. Checking the engine oil level on a cold engine is not accurate.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable levels are indicated between the ADD and SAFE marks on the engine oil level indicator.

1. Position the vehicle on the level surface.
2. With the engine off, allow approximately five minutes for the oil to settle to the bottom of the crankcase and then remove the engine oil level indicator.
3. Wipe the oil level indicator clean.
4. Install the oil level indicator and verify it is seated in the tube.
5. Remove the oil level indicator, with the handle held above the tip, observe the oil level reading.
6. Add oil only if the level is below the ADD mark on the oil level indicator.

ENGINE OIL CHANGE

Change the engine oil at the mileage and time intervals described in the Maintenance Schedules. Refer to **MAINTENANCE SCHEDULES, DESCRIPTION** .

Run the engine until it reaches normal operating temperature.

1. Remove the oil fill cap.
2. Raise and support the vehicle.
3. Remove the belly pan. Refer to **BELLY PAN, REMOVAL** .
4. Place a suitable drain pan under the oil pan drain.
5. Remove the drain plug from the oil pan and allow the oil to drain.
6. Inspect the drain plug threads for stretching or other damage and replace if necessary.
7. Install the drain plug and tighten to 27 N.m (20 ft. lbs.).
8. Install the belly pan. Refer to **BELLY PAN, INSTALLATION** .

9. Lower the vehicle and fill the crankcase with the specified type and amount of engine oil described in **STANDARD PROCEDURE**.
10. Install the oil fill cap.
11. Start the engine and check for leaks.
12. Stop the engine and check the oil level.

NOTE: Care should be exercised when disposing of used engine oil.

PAN, OIL

REMOVAL

REMOVAL

Fig. 341: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect the negative battery cable (1).
2. Remove the intake manifold. Refer to **MANIFOLD, INTAKE, REMOVAL**.
3. Remove the engine oil dipstick and tube from the oil pan.
4. Raise and support the vehicle.

Fig. 342: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the belly pan retainers (1) and remove the belly pan.
6. Drain the engine oil and remove the oil filter.

Fig. 343: Gear Mounting Bolts & Steering Gear
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not remove P/S hoses, tie rod ends or disconnect the steering column coupler.

7. Remove the steering gear mounting bolts (1) and lower the steering gear (2) to provide clearance to remove the oil pan.

Fig. 344: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

8. Remove both left/right front engine mount heat shield retaining nuts (3) and remove the heat shields (4).
9. Remove both left/right front engine mount lower retaining bolts (2).
10. Lower the vehicle.

Fig. 345: Engine Lift Fixture & Adapter
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not use air tools to install engine lift fixture.

11. Install the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3).
12. Raise the engine to provide clearance to remove the oil pan.

Fig. 346: Oil Pan Bolt Removal/Installation Sequence
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not pry on the oil pan or oil pan gasket. The oil pan gasket is integral to the engine windage tray and does not come out with the oil pan.

NOTE: The horizontal M10 retaining bolts (11, 12, 15, 18) are 5 mm longer in length than the vertical M10 retaining bolts (20, 21, 22, 23) and must be reinstalled in their original locations.

13. Raise and support the vehicle.
14. Remove the M10 retaining bolts (horizontal 11, 12, 15, 18 and vertical 20, 21, 22, 23) from the rear of the oil pan to the transmission.
15. Remove the M6 retaining bolts and remove the oil pan.

2970744

Fig. 347: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

16. Remove the oil pump pickup tube retaining bolt and nut (1).
17. Remove the oil pump pickup tube (2).
18. Remove and discard the oil pan gasket/windage tray (3).

INSTALLATION

INSTALLATION

Fig. 348: T-Joint RTV Sealant Application Locations
Courtesy of CHRYSLER GROUP, LLC

- | |
|--|
| 1 - Front Cover T-Joints
2 - Rear Oil Retainer T-Joints |
|--|

NOTE: Mopar® Engine RTV must be applied to the 4 T-joints, the area where the front cover, rear retainer and oil pan gasket meet. The bead of RTV should cover the bottom of the gasket. This area is approximately 4.5 mm x 25 mm in each of the 4 T-joint locations.

1. Clean the oil pan gasket mating surface of the engine block and oil pan.
2. Apply Mopar® Engine RTV at the 4 T- joints (1, 2).

2970744

Fig. 349: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

3. Install a new oil pan gasket/windage tray (3).
4. Using a new O-ring, position the oil pump pickup tube (2) into the oil pump.
5. Install the oil pump pickup tube retaining bolt and nut (1) and tighten to 28 N.m (21 ft. lbs.).

81387997

Fig. 350: Oil Pan Bolt Removal/Installation Sequence
 Courtesy of CHRYSLER GROUP, LLC

NOTE: The horizontal M10 retaining bolts (11, 12, 15, 18) are 5 mm longer in length than the vertical M10 retaining bolts (20, 21, 22, 23) and must be reinstalled in their original locations.

NOTE: New M6 retaining bolts must be used when reinstalling the oil pan. Do not reuse the old M6 retaining bolts.

6. Align the rear of the oil pan with the rear face of the engine block and install the M10 and M6 retaining bolts finger tight.
7. Using the sequence shown in illustration, tighten the M6 retaining bolts to 5 N.m (44 in. lbs.).
8. Using the sequence shown in illustration, tighten the M10 retaining bolts to 54 N.m (40 ft. lbs.).
9. Using the sequence shown in illustration, tighten the M6 retaining bolts to 12 N.m (9 ft. lbs.).
10. Lower the vehicle.

Fig. 351: Engine Lift Fixture & Adapter
Courtesy of CHRYSLER GROUP, LLC

11. Using the Engine Lift Fixture (special tool #8984B, Fixture, Engine Lifting) (1), Engine Lift Adapter (special tool #8984-UPD, Adapter, Engine Lift) (2) and the Engine Support Fixture (special tool #8534B, Fixture, Driveline Support) (3) lower the engine into position and remove.
12. Install the engine oil dipstick tube and dipstick.
13. Raise and support the vehicle.

Fig. 352: Engine Mount Heat Shield Retaining Nuts, Lower Mount Retaining Bolts & Heat Shields

Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown in illustration, right side similar.

14. Install both engine mount lower retaining bolts (2) and tighten to 61 N.m (45 ft. lbs.).
15. Position both engine mount heat shields (4) and install retaining nuts (3).

Fig. 353: Gear Mounting Bolts & Steering Gear

Courtesy of CHRYSLER GROUP, LLC

16. Position the steering gear (2), install mounting bolts (1) and tighten to 95 N.m (70 ft. lbs.).

Fig. 354: Oil Filter, Oil Cooler & Hoses
 Courtesy of CHRYSLER GROUP, LLC

17. Lightly lubricate the oil filter gasket with clean engine oil.

NOTE: Do not over tighten the oil filter.

18. Thread the oil filter (1) onto the oil cooler (2) oil filter boss.
19. When the oil filter gasket makes contact with the oil cooler sealing surface, hand tighten the oil filter one half turn, or 180°.

Fig. 355: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

20. Position the belly pan to the under side of vehicle and install belly pan retainers (1).

21. Lower the vehicle.
22. Install the intake manifold. Refer to **MANIFOLD, INTAKE, INSTALLATION**.
23. Fill the engine with oil. Refer to **STANDARD PROCEDURE** .

Fig. 356: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

24. Connect the negative battery cable (1).
25. Start the engine and check for leaks.

PUMP, ENGINE OIL

REMOVAL

REMOVAL

Fig. 357: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove water pump for timing cover removal.

1. Remove the engine timing cover. Refer to COVER(S), ENGINE TIMING, REMOVAL.

2970744

Fig. 358: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray (3) assembly must be installed, the old gasket cannot be reused.

2. Remove the oil pan and oil pump pickup tube (2). Refer to PAN, OIL, REMOVAL.

474847

Fig. 359: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the oil pump retaining bolts (2) and remove the oil pump (1).

CLEANING

CLEANING

1. Wash all parts in a suitable solvent.
2. Using compressed air, carefully dry parts.

INSPECTION

INSPECTION

Fig. 360: Measuring Outer Rotor Clearance In Housing
Courtesy of CHRYSLER GROUP, LLC

- | |
|-------------------------------------|
| 1 - FEELER GAUGE
2 - OUTER ROTOR |
|-------------------------------------|

CAUTION: Oil pump pressure relief valve and spring should not be removed from the oil pump. If these components are disassembled and or removed from the pump the entire oil pump assembly must be replaced.

1. Remove the pump cover.
2. Clean all parts thoroughly. The mating surface of the oil pump housing should be smooth. If the oil pump cover is scratched or grooved the oil pump assembly should be replaced.
3. Slide the outer rotor into the body of the oil pump. Press the outer rotor to one side of the oil

pump body and measure the clearance between the outer rotor (2) and the body. If the measurement is 0.235 mm (0.009 in.) or greater the oil pump assembly must be replaced.

Fig. 361: Measuring Clearance Between Inner & Outer Rotors
Courtesy of CHRYSLER GROUP, LLC

1 - OUTER ROTOR 2 - FEELER GAUGE 3 - INNER ROTOR

4. Install the inner rotor into the oil pump body. Measure the clearance between the inner (3) and outer (1) rotors. If the clearance between the rotors is .150 mm (0.006 in.) or greater the oil pump assembly must be replaced.

Fig. 362: Measuring Clearance Over Rotors
Courtesy of CHRYSLER GROUP, LLC

1 - STRAIGHT EDGE 2 - FEELER GAUGE
--

5. Place a straight edge (1) across the body of the oil pump (between the bolt holes), using a feeler gauge (2), measure the clearance between the straightedge and the rotors. If the clearance is .095 mm (0.0038 in.) or greater the oil pump must be replaced.
6. Install the pump cover and tighten retainers to 15 N.m (11 ft. lbs.)

NOTE: The 6.4L oil pump is serviced as an assembly. There are no Chrysler part numbers for sub-assembly components. In the event the oil pump is not functioning or out of specification it must be replaced as an assembly.

INSTALLATION

INSTALLATION

Fig. 363: Oil Pump & Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Position the oil pump (1) onto the crankshaft, install the retaining bolts (2) and tighten to 28 N.m (21 ft. lbs.).

Fig. 364: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

2. Install the timing chain cover. Refer to **COVER(S), ENGINE TIMING, INSTALLATION.**

2970744

Fig. 365: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Install the oil pump pickup tube (2) and oil pan. Refer to **PAN, OIL, INSTALLATION**.

SENSOR, OIL PRESSURE

DESCRIPTION

DESCRIPTION

The oil pressure sensor uses the following three circuits:

- Signal circuit to the PCM
- Sensor ground circuit through the PCM
- 5 volt reference circuit from the PCM

The oil pressure sensor returns a voltage signal back to the PCM with reference to oil pressure. Ground for the sensor is supplied by the PCM.

The oil pressure sensor is located on the right side of the engine block. The sensor screws into the engines main oil gallery.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Remove the upper generator mounting bolt.
4. Raise and support the vehicle.

Fig. 366: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the belly pan retainers (1) and remove the belly pan.

Fig. 367: Lower Generator Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

6. Remove the lower generator retaining bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil pressure sensor.

2439466

Fig. 368: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

9. Disconnect the oil pressure sensor electrical connector (1).

2439480

Fig. 369: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

10. Remove the oil pressure sensor (1).

INSTALLATION

INSTALLATION

2439480

Fig. 370: Oil Pressure Sensor
Courtesy of CHRYSLER GROUP, LLC

NOTE: Apply Mopar® Thread Sealant with PTFE to the sensor threads before installing into the engine block.

1. Install the oil pressure sensor (1).

2439486

Fig. 371: Oil Pressure Sensor Electrical Connector
Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil pressure sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

Fig. 372: Lower Generator Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

5. Install the lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs).

Fig. 373: Lower Splash Shield & Fasteners
 Courtesy of CHRYSLER GROUP, LLC

6. Position the lower splash shield and install the retainers (1).
7. Lower the vehicle
8. Tighten the upper generator mounting bolt to 55 N.m (41 ft. lbs).

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to

overheat.

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, INSTALLATION** .
10. Connect the negative battery cable.

SENSOR, OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

The oil temperature sensor uses the following two circuits:

- Signal circuit to the PCM
- Ground circuit from the PCM

The oil temperature sensor is a Negative Thermal Coefficient sensor. The resistance of the sensor changes as oil temperature changes. This results in different output voltages back to the PCM.

The oil temperature sensor is located on the right side of the engine block.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
3. Remove the generator upper mounting bolt.
4. Raise and support the vehicle.

Fig. 374: Lower Splash Shield & Fasteners

Courtesy of CHRYSLER GROUP, LLC

5. Remove the belly pan retainers (1) and remove the belly pan.

Fig. 375: Lower Generator Retaining Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Remove the generator lower mounting bolts (1).
7. Lower the vehicle.
8. Position the generator aside to gain access to the oil temperature sensor.

 Courtesy of CHRYSLER GROUP, LLC

2. Connect the oil temperature sensor electrical connector (1).
3. Position the generator and install the upper mounting bolt finger tight.
4. Raise and support the vehicle.

2439251

Fig. 380: Lower Generator Retaining Bolts
 Courtesy of CHRYSLER GROUP, LLC

5. Install the generator lower mounting bolts (1) and tighten to 55 N.m (41 ft. lbs.).

Fig. 381: Lower Splash Shield & Fasteners
Courtesy of CHRYSLER GROUP, LLC

6. Position the belly pan to the under side of the vehicle and install the retainers (1).
7. Lower the vehicle.
8. Tighten the generator upper mounting bolt to 55 N.m (41 ft. lbs.).

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

9. Install the accessory drive belt. Refer to **BELT, SERPENTINE, REMOVAL** .
10. Connect the negative battery cable.

MANIFOLDS

MANIFOLD, EXHAUST

DESCRIPTION

DESCRIPTION

The exhaust manifolds are tube in shell air gap design to maximize durability and performance. The exhaust manifolds are made of stainless steel stamped shells and stainless steel tubes with a powdered metal outlet. A layered graphite over perforated steel manifold gasket is used to provide sealing to the cylinder head.

OPERATION

OPERATION

The exhaust manifolds collect the engine exhaust gases exiting the combustion chambers and then channels the exhaust gases to the exhaust pipes/catalytic converters.

REMOVAL

REMOVAL

EXHAUST MANIFOLDS

Fig. 382: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

NOTE: The left side shown in illustration. Right side similar.

1. Disconnect the negative battery cable (1).

Fig. 383: Cylinder Head

Courtesy of CHRYSLER GROUP, LLC

2. Remove cylinder head. Refer to CYLINDER HEAD, REMOVAL.

3005118

Fig. 384: Exhaust Manifold & Bolts
Courtesy of CHRYSLER GROUP, LLC

3. Remove the exhaust manifold (2) top row of bolts (1).

3004712

Fig. 385: Exhaust Manifold Heat Shield & Bolts
Courtesy of CHRYSLER GROUP, LLC

4. Remove the exhaust manifold heat shield.
5. Remove the exhaust manifold bottom row of bolts (1).

CLEANING

CLEANING

Clean the mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

INSPECTION

INSPECTION

Inspect the exhaust manifold for cracks.

Inspect the mating surface of the exhaust manifold for flatness with a straight edge. The exhaust manifold gasket surface must be flat and within 0.67 mm (0.0264 in.) overall.

INSTALLATION

INSTALLATION

9. Install the cylinder head. Refer to **CYLINDER HEAD, INSTALLATION**.

2969729

Fig. 390: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

10. Connect the negative battery cable (1).
11. Start the engine and check for leaks.

MANIFOLD, INTAKE

DESCRIPTION

DESCRIPTION

CAUTION: If the engine has experienced a catastrophic failure, THE INTAKE MANIFOLD MUST BE REPLACED!

3060720

Fig. 391: Intake Manifold
Courtesy of CHRYSLER GROUP, LLC

The intake manifold is made of a composite material and features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold. The manifold uses a single plane sealing system with individual port seals and a separate PCV port seal to prevent leaks.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - INTAKE MANIFOLD LEAKAGE

An intake manifold air leak is characterized by lower than normal manifold vacuum. Also, one or more cylinders may not be functioning.

WARNING: Use extreme caution when the engine is operating. Do not stand in a direct line with the fan. Do not put your hands near the pulleys, belts or the fan. Do not wear loose clothing. Failure to follow this warning may result in serious or fatal injury.

1. Start the engine.
2. Spray a small stream of water at the suspected leak area.
3. If a change in RPM is observed the area of the suspected leak has been found.
4. Repair as required.

REMOVAL

REMOVAL

Fig. 392: Negative Battery Cable
 Courtesy of CHRYSLER GROUP, LLC

1. Perform the fuel system pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.
2. Disconnect the negative battery cable (1).

Fig. 393: Engine Covers
 Courtesy of CHRYSLER GROUP, LLC

3. Remove the engine covers (1).
4. Disconnect the fuel supply line. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.

Fig. 394: Air Duct Retaining Clamp, Intake Air Temperature Sensor Electrical Connector, Makeup Air Hose, Bolt & Air Cleaner Housing
 Courtesy of CHRYSLER GROUP, LLC

5. Remove the air cleaner housing (5). Refer to **BODY, AIR CLEANER, REMOVAL**.
6. Disconnect the brake booster hose and the EVAP purge hose.

Fig. 395: Intake Manifold Removal/Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

7. Disconnect the electrical connectors from the following components:
 - Manifold Absolute Pressure (MAP) Sensor
 - Short Runner Valve (SRV)
 - Fuel Injectors
 - Electronic Throttle Control (ETC)

NOTE: Remove the intake manifold and throttle body as an assembly.

8. Using the sequence shown in illustration, remove the intake manifold retaining bolts.
9. Remove the intake manifold and throttle body as an assembly from the vehicle.

CLEANING

CLEANING

NOTE: There is **NO** approved repair procedure for the intake manifold. If severe damage is found during inspection, the intake manifold must be replaced.

Before installing the intake manifold thoroughly clean the mating surfaces. Use a suitable cleaning solvent, then air dry.

INSPECTION

INSPECTION

1. Inspect the intake manifold sealing surface for cracks, nicks and distortion.
2. Inspect the intake manifold vacuum hose fittings for looseness or blockage.

INSTALLATION

INSTALLATION

Fig. 396: Intake Manifold & PCV Seals
Courtesy of CHRYSLER GROUP, LLC

NOTE: The intake manifold seals (1, 3) may be used again, provided no cuts, tears, or deformation have occurred.

1. Inspect the intake manifold seals and replace if necessary.

NOTE: If reinstalling the original manifold, apply Mopar® Lock & Seal Adhesive to the intake manifold bolts. Not required when installing a new manifold.

2. If required, apply Mopar® Lock & Seal Adhesive to the intake manifold bolts.
3. Position the intake manifold (2).

2979852

Fig. 397: Intake Manifold Removal/Tightening Sequence
Courtesy of CHRYSLER GROUP, LLC

4. Using the sequence shown in illustration, install the intake manifold retaining bolts and tighten to 12 N.m (9 ft. lbs.).
5. Connect the fuel supply line. Refer to **FITTING, QUICK CONNECT, STANDARD PROCEDURE**.
6. Connect the brake booster hose and the EVAP purge hose.
7. Connect the electrical connectors to the following components:
 - Manifold Absolute Pressure (MAP) Sensor
 - Short Runner Valve (SRV)
 - Fuel Injectors
 - Electronic Throttle Control (ETC)

Fig. 414: Camshaft Phaser Retaining Bolt
 Courtesy of CHRYSLER GROUP, LLC

4. Align the slot in the camshaft phaser with the dowel on the camshaft and position the camshaft phaser on the camshaft while sliding the crankshaft sprocket into position.
5. Install the camshaft phaser retaining bolt (1) finger tight.

Fig. 415: Timing Chain Guide & Bolts
Courtesy of CHRYSLER GROUP, LLC

6. If removed, install the timing chain guide (1) and tighten the bolts (2) to 11 N.m (8 ft. lbs.).

Fig. 416: Timing Chain Tensioner, Pin & Bolts
Courtesy of CHRYSLER GROUP, LLC

7. If removed, install the timing chain tensioner (2) and tighten the bolts (3) to 11 N.m (8 ft. lbs.).
8. If required, retract the chain tensioner arm and install the Tensioner Pin (special tool #8514, Pins, Tensioner) (1) into the holes of the chain tensioner arm.

487402

Fig. 417: Aligning Timing Marks With Timing Chain Sprockets
Courtesy of CHRYSLER GROUP, LLC

9. Using care, rotate the crankshaft to verify the alignment of the timing marks (1, 2). If the timing marks do not line up, remove the camshaft sprocket and realign.

1035416

Fig. 418: Camshaft Phaser Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

10. Tighten the camshaft phaser bolt (1) to 85 N.m (63 ft. lbs.).

45133

Fig. 419: Remove/Install Oil Pump
 Courtesy of CHRYSLER GROUP, LLC

11. Position the oil pump onto the crankshaft and install the oil pump retaining bolts finger tight.

439119

Fig. 420: Oil Pump Retaining Bolt Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

12. Using the sequence shown in illustration, tighten the oil pump retaining bolts to 28 N.m (21 ft. lbs.).

45131

Fig. 421: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

13. Verify the slide bushings (1) remain located in the engine timing cover.

2966762

Fig. 422: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

14. Using a new gasket, install the engine timing cover and tighten the retaining bolts to 28 N.m (21 ft. lbs.).

NOTE: The large lifting stud is torqued to 55 N.m (40 ft. lbs.).

15. Tighten the large lifting stud to 55 N.m (40 ft. lbs.).

2970744

Fig. 423: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

16. Raise and support the vehicle.
17. Install the oil pump pickup tube (2) and the oil pan. Refer to **PAN, OIL, INSTALLATION**.

2969729

Fig. 424: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

18. Install the negative battery cable.
19. Fill the cooling system with the specified type and amount of engine coolant. Refer to **STANDARD PROCEDURE**.

Fig. 425: Engine Covers
 Courtesy of CHRYSLER GROUP, LLC

20. Fill the crankcase with the specified type and amount of engine oil. Refer to **STANDARD PROCEDURE** .
21. Install the engine covers (1).
22. Start the engine and check for leaks.

COVER(S), ENGINE TIMING

REMOVAL

REMOVAL

Fig. 426: Engine Covers
 Courtesy of CHRYSLER GROUP, LLC

1. Remove the engine covers (1).
2. Perform the fuel pressure release procedure. Refer to **FUEL DELIVERY, GAS, STANDARD PROCEDURE**.

Fig. 427: Negative Battery Cable
Courtesy of CHRYSLER GROUP, LLC

3. Disconnect the negative battery cable (1).

Fig. 428: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: When the oil pan is removed, a new oil pan gasket and the integral windage tray assembly must be installed, the old gasket cannot be reused.

4. Remove the oil pan. Refer to **PAN, OIL, REMOVAL**.

5. Remove the oil pump pickup tube retaining bolt and nut (1).
6. Remove the oil pump pickup tube (2).
7. Remove and discard the oil pan gasket/windage tray (3).
8. Lower the vehicle.

Fig. 429: Upper Radiator Hose, Clamp, Oil Cooler Return Line Hose & Clamp
Courtesy of CHRYSLER GROUP, LLC

9. Remove the upper radiator hose clamp (1) and remove the upper radiator hose (2).
10. Remove the oil cooler hose clamp (3) and remove oil cooler hose (4).

Fig. 430: Coolant Temperature (ECT) Sensor Electrical Connector, Heater Tube & Retaining Bolt
Courtesy of CHRYSLER GROUP, LLC

11. Remove the coolant temperature sensor electrical connector (2).
12. Remove the heater tube retaining bolt (1).
13. Lift the heater tube (3) out of the water pump.

Fig. 431: Camshaft Position Sensor Electrical Connector & Bolt
Courtesy of CHRYSLER GROUP, LLC

14. Disconnect the camshaft position sensor electrical connector (1).

Fig. 432: Cooling Fan Electrical Connector, Cooling Fan Mounting Bolts & Radiator
Cooling Fan Assembly
Courtesy of CHRYSLER GROUP, LLC

15. Remove the cooling fan. Refer to **FAN, COOLING, REMOVAL** .

Fig. 433: Accessory Drive Belt Routing, Tensioner & Pulleys
 Courtesy of CHRYSLER GROUP, LLC

16. Remove the accessory drive belt (2). Refer to **BELT, SERPENTINE, REMOVAL** .
17. Remove the lower radiator hose clamp and remove the lower radiator hose.
18. Remove the idler pulley (6).
19. Remove the belt tensioner (8).

Fig. 434: Power Steering Reservoir, Pump, Pulley & Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: It is not necessary to remove the power steering pump hoses for power steering pump removal.

20. Remove the three power steering pump mounting bolts (2) through the access holes in the pulley (3).
21. Remove the power steering pump (1) from the engine and position aside.

Fig. 435: Removing/Installing A/C Compressor
Courtesy of CHRYSLER GROUP, LLC

22. Remove A/C compressor from the front timing chain cover and position aside. Refer to **COMPRESSOR, A/C, REMOVAL**.

Fig. 436: Generator & Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

23. Remove the generator from the front timing chain cover and position aside. Refer to **GENERATOR, REMOVAL**.

1184557

Fig. 437: Vibration Damper & Bolt Grip Puller
 Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing the puller tool, ensure the bolts are fully threaded through the entire crankshaft damper.

24. Remove the vibration damper. Refer to **DAMPER, VIBRATION, REMOVAL**.
25. Install the puller tool (2) making sure the bolts are fully threaded through the entire crankshaft damper and remove the crankshaft damper (1).

2986762

Fig. 438: Engine Timing Cover

NOTE: It is not necessary to remove water pump for timing cover removal.

26. Remove the engine timing cover retaining bolts and remove the engine timing cover.

45131

Fig. 439: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

27. Verify that the engine timing cover slide bushings (1) remain located in the engine timing cover.

INSTALLATION

INSTALLATION

45131

Fig. 440: Front Cover Slide Bushings
Courtesy of CHRYSLER GROUP, LLC

1. Clean the engine timing cover and engine block surface.

NOTE: Always install a new gasket when servicing the engine timing cover.

2. Verify that the engine timing cover slide bushings (1) remain located in the engine timing cover.

2966762

Fig. 441: Engine Timing Cover
Courtesy of CHRYSLER GROUP, LLC

3. Using a new gasket, install the engine timing cover and tighten the retaining bolts to 28 N.m (21 ft. lbs.).

NOTE: The large lifting stud is torqued to 55 N.m (40 ft. lbs.).

4. Tighten the large lifting stud to 55 N.m (40 ft. lbs.).

2970744

Fig. 442: Integral Windage Tray, Oil Pump Pickup Tube & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Raise and support the vehicle.
6. Install the oil pump pickup tube (2) and the oil pan. Refer to **PAN, OIL, INSTALLATION**.
7. Install the lower radiator hose and clamp.

Fig. 443: Installing Vibration Damper Onto Crankshaft Using Special Tool
Courtesy of CHRYSLER GROUP, LLC

8. Assemble the (special tool #10387, Installer, Vibration Damper) as follows:
 1. Install the threaded shaft (1) onto the crankshaft (3) till its seated.
 2. Position the crankshaft damper onto the crankshaft.
 3. Install the thrust washer.
 4. Install the roller bearing onto the threaded shaft making sure the hardened bearing surface is facing away from the crankshaft.
 5. Install the washer.
 6. Install the nut onto the threaded shaft.

Fig. 444: Installing Vibration Damper
 Courtesy of CHRYSLER GROUP, LLC

9. Using the crankshaft Damper Installer (1) press the vibration damper (2) onto the crankshaft. Refer to **DAMPER, VIBRATION, INSTALLATION**.
10. Install the crankshaft damper bolt and tighten to 176 N.m (129 ft. lbs.).

Fig. 445: Generator & Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

11. Install the generator. Refer to **GENERATOR, INSTALLATION**.

Fig. 446: Removing/Installing A/C Compressor

29. Install the engine covers (1).
30. Perform the Refrigerant System Charge procedure. Refer to **PLUMBING, STANDARD PROCEDURE**.
31. Start the engine and check for leaks.

TENSIONER, ENGINE TIMING

DESCRIPTION

DESCRIPTION

Fig. 456: Timing Chain Tensioner Arm
Courtesy of CHRYSLER GROUP, LLC

The timing chain tensioner is a spring loaded design. It consists of two chain guide shoes. One shoe is fixed in place and the other is spring loaded to keep tension on the chain.

OPERATION

OPERATION

Fig. 457: Timing Chain Tensioner Arm
Courtesy of CHRYSLER GROUP, LLC

The timing chain tension is maintained by routing the timing chain through the tensioner assembly. The tensioner assembly consists of two chain guide shoes. One shoe is fixed in place and the other is spring loaded to maintain the correct timing chain tension.

ABS - Service Information - Challenger

DESCRIPTION

DESCRIPTION

Fig. 1: Integrated Control Unit
Courtesy of CHRYSLER LLC

This vehicle uses an electronic brake control system designated MK25e. This system includes ABS (Antilock Brake System), TCS (Traction Control System), BAS (Brake Assist System), EVBP (Electronic Variable Brake Proportioning) and ESP® (Electronic Stability Program). All of these systems work together to enhance vehicle stability and control in various driving conditions and are commonly referred to as ESP.

This system uses components of the base brake system, but also features the following components:

- Integrated Control Unit (ICU) - Includes Hydraulic Control Unit (HCU) (2) and Antilock Brake Module (ABM) (1)
- Wheel Speed Sensors (WSS) - Four sensors (one at each wheel)
- Dynamics Sensor - Includes a yaw rate sensor and a lateral accelerometer.
- Steering Angle Sensor (SA) - The SAS is part of the Steering Column Control Module (SCCM).
- Brake Pressure Sensor - The brake pressure sensor is located in the HCU and is not serviceable separate from the HCU.

ABS

The purpose of the Antilock Brake System (ABS) is to prevent wheel lockup under braking conditions on virtually any type of road surface. Antilock braking is desirable because a vehicle that is stopped without locking the wheels retains directional stability and some steering capability. This allows the driver to retain greater control of the vehicle during braking.

ALL-SPEED TRACTION CONTROL

The traction control system (TCS) is an all-speed traction control. All-Speed Traction Control enhances mobility and prevents wheel slip when accelerating on slippery surfaces. It also provides a measure of directional stability control. Using the wheel-speed sensors, it can detect excessive yaw and help keep the car on the intended course, as for instance, when accelerating around a curve.

With rear-wheel drive, All-Speed Traction Control is effective up to 85 mph (137 km/h); with AWD, All-Speed Traction Control is effective up to 45 mph (72 km/h), which is common among competitive AWD vehicles with traction control.

ELECTRONIC STABILITY PROGRAM

The Electronic Stability Program (ESP) enhances control and stability of the vehicle under various driving conditions. ESP corrects for over/under steering of the vehicle by applying the brake of the appropriate wheel to assist in counteracting the over/under steer condition. Engine power may also be reduced to help the vehicle maintain the desired path. ESP uses sensors in the vehicle to determine the vehicle path intended by the driver and compares it to the actual path of the vehicle. When the actual path does not match the intended path, ESP applies the brake of the appropriate wheel to assist in counteracting the oversteer or understeer condition.

- Oversteer - When the vehicle is turning more than appropriate for the steering wheel position.
- Understeer - When the vehicle is turning less than appropriate for the steering wheel position.

The "ESP/TCS" indicator light located in the instrument cluster starts to flash as soon as the tires lose traction and the ESP system becomes active. The "ESP/TCS" indicator light also flashes when TCS is active.

The ESP can be turned off by using the ESP Off switch. When the ESP Off switch is depressed, it does not completely turn the system off. The ESP system shuts off engine management but retains brake activations for yaw control.

The SRT8 equipped vehicles have three-mode ESP functionality. When the ESP Off switch is depressed and quickly released, the system enters "partial" mode which has no engine management but retains brake activations for yaw control. If the switch is held down for a period of five seconds or longer before releasing, a chime will sound and the ESP system enters "full-off" mode which disables engine management as well as brake activations. The system can be returned to "normal" by briefly pressing and releasing the ESP Off switch. The system will default to full-on mode at the beginning of each ignition cycle.

BRAKE ASSIST SYSTEM

The Brake Assist System (BAS) is designed to optimize the vehicle's braking capability during emergency braking maneuvers. The system detects an emergency braking situation by sensing the rate and amount of brake application and then applies optimum pressure to the brakes. This can help reduce braking distances. The BAS complements the antilock brake system (ABS). Applying the brakes very quickly results in the best BAS assistance.

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Electronic Variable Brake Proportioning (EVBP) is used to balance front-to-rear braking in place of a traditional rear proportioning valve. The EVBP system uses the ABS system to control the slip of the rear wheels in partial braking range. The braking force of the rear wheels is controlled electronically by using the inlet and outlet valves located in the integrated control unit (ICU).

EVBP activation is invisible to the customer since there is no pump motor noise or brake pedal feedback.

OPERATION

OPERATION

ABS

There are a few performance characteristics of the Antilock Brake System (ABS) that may at first seem abnormal, but in fact are normal. These characteristics are described below.

NORMAL BRAKING

Under normal braking conditions, the ABS functions the same as a standard base brake system with a front/rear split master cylinder and conventional vacuum assist.

ABS BRAKING

ABS operation is available at all vehicle speeds above 3-5 mph. If a wheel locking tendency is detected during a brake application, the brake system enters the ABS mode. During ABS braking, hydraulic pressure in the four wheel circuits is modulated to prevent any wheel from locking. Each wheel circuit is designed with a set of electric solenoids to allow modulation. Wheel lockup may be perceived at the very end of an ABS stop and is considered normal.

During an ABS event, the integrated control unit (ICU) regulates hydraulic pressure at all four of the vehicle's wheels.

The hydraulic pressure at each front wheel is controlled independently (relative to the amount of slip at each wheel) in order to maximize the braking force generated by the front brakes. The rear wheels are controlled such that the hydraulic pressure at either rear wheel does not exceed that of the highest slip rear wheel in order to maintain vehicle stability.

The system can build and release pressure at each wheel, depending on signals generated by the wheel speed sensors (WSS) at each wheel and received at the Antilock Brake Module (ABM).

NOISE AND BRAKE PEDAL FEEL

During ABS braking, some brake pedal movement may be felt. In addition, ABS braking will create ticking, popping, or groaning noises heard by the driver. This is normal and is due to pressurized fluid being transferred between the master cylinder and the brakes. If ABS operation occurs during hard braking, some pulsation may be felt in the vehicle body due to fore and aft movement of the suspension as brake pressures are modulated.

At the end of an ABS stop, ABS is turned off when the vehicle is slowed to a speed of 3-4 mph. There may be a slight brake pedal drop anytime that the ABS is deactivated, such as at the end of the stop when the vehicle speed is less than 3 mph or during an ABS stop where ABS is no longer required. These conditions exist when a vehicle is being stopped on a road surface with patches of ice, loose gravel, or sand on it. Also, stopping a vehicle on a bumpy road surface activates ABS because of the wheel hop caused by the bumps.

TIRE NOISE AND MARKS

Although the ABS system prevents complete wheel lockup, some wheel slip is desired in order to achieve optimum braking performance. Wheel slip is defined as follows: 0 percent slip means the wheel is rolling freely and 100 percent slip means the wheel is fully locked. During brake pressure modulation, wheel slip is allowed to reach up to 25-30 percent. This means that the wheel rolling velocity is 25-30 percent less than that of a free rolling wheel at a given vehicle speed. This slip may result in some tire chirping, depending on the road surface. This sound should not be interpreted as total wheel lockup.

Complete wheel lockup normally leaves black tire marks on dry pavement. The ABS will not leave dark black tire marks since the wheel never reaches a fully locked condition. However, tire marks may be noticeable as light patched marks.

START-UP AND DRIVE-OFF CYCLES

When the ignition is turned on, a popping sound and a slight brake pedal movement may be noticed. The ABS warning lamp will also be on for up to 5 seconds after the ignition is turned on.

When the vehicle is first driven off, a humming may be heard or felt by the driver at approximately 12-25 mph (20-40 km/h). All of these conditions are a normal function of ABS as the system is performing a diagnosis check.

PREMATURE ABS CYCLING

Symptoms of premature ABS cycling include: clicking sounds from the solenoid valves; pump/motor running; and pulsations in the brake pedal. Premature ABS cycling can occur at any braking rate of the vehicle and on any type of road surface. Neither the red BRAKE indicator lamp, nor the amber ABS indicator lamp, illuminate and no faults are stored in the ABM.

Premature ABS cycling is a condition that needs to be correctly assessed when diagnosing problems with the antilock brake system. It may be necessary to use a scan tool to detect and verify premature ABS cycling.

Check the following common causes when diagnosing premature ABS cycling: damaged wheel bearings (causing tone wheel issues); damaged wheel bearing housings where wheel speed sensors mount; and loose wheel speed sensor mounting bolts.

After diagnosing the defective component, repair or replace it as required. When the component repair or replacement is completed, test drive the vehicle to verify that premature ABS cycling has been corrected.

ALL-SPEED TRACTION CONTROL

Traction control systems sense impending wheel spin based on a model of the rate of change of wheel speed under normal traction conditions. The All-Speed Traction Control uses signals from the same wheel speed sensors as ABS to determine when to apply the brakes to one or more wheels and when to reduce engine torque output using the electronic throttle control (ETC) to prevent wheel slip during acceleration. Throttle control makes the vehicle less reliant on brake application alone to maintain traction, increasing the operating speed range and more closely modulates speed, resulting in smoother operation. With All-Speed Traction Control reducing engine torque as well as applying the brakes, it is possible to achieve almost seamless torque application at the wheels.

If the wheel slip is severe enough to require throttle intervention, All-Speed Traction Control will reduce engine torque and sometimes upshift the transmission to avoid the condition. In milliseconds, All-Speed Traction Control interrogates the engine control system to determine the current torque output, determines how much the torque output the current conditions will allow, and signals this requirement to the engine control system, which reduces the torque by partially closing the throttle. With execution of the torque reduction, the brake system reduces brake pressure to make the transition smooth, while maintaining forward progress. By reducing engine power, braking effectiveness is maintained and the system can operate throughout the normal vehicle speed range. That is why the system is identified as providing "all-speed" traction control.

With AWD, where front-wheel slip can occur, the degree of throttle intervention is relatively less than with rear-wheel drive. The difference in speed capability and the degree of throttle intervention between rear-wheel drive and all-wheel drive is due to the fact that non-driven front wheels on a rear-wheel drive vehicle give the system an accurate vehicle speed reference on which to base responses. With AWD, the possibility that the front wheels may also be slipping makes appropriate corrective action more difficult to determine, thus limiting the effective speed range. Offsetting this is the fact that loss of traction is less likely with AWD because torque is transmitted through all four wheels to begin with. In actual driving situations on snow or ice, the rear-wheel drive and AWD systems respond in essentially the same way up to the 45 mph (72 km/h) limit of the AWD system.

ELECTRONIC STABILITY PROGRAM

To determine whether the car is responding properly to cornering commands, ESP uses steering wheel angle, yaw (turning) rate and lateral acceleration sensors (combined into Dynamics Sensor). Using signals from these sensors, in addition to individual wheel speed sensor signals, the system determines appropriate brake and throttle actions. Once initiated, ESP operates much like All-Speed Traction Control, except that the goal is directional stability. If the vehicle yaw response, or rate of turning, is inconsistent with the steering angle and vehicle speed indications, the ESP system applies the brakes and, if necessary closes the throttle, to restore control. This occurs whether the vehicle is

turning too rapidly (oversteering) or not rapidly enough (understeering).

ELECTRONIC VARIABLE BRAKE PROPORTIONING

Upon entry into EVBP the inlet valve for the rear brake circuit is switched ON so that the fluid supply from the master cylinder is shut off. In order to decrease the rear brake pressure, the outlet valve for the rear brake circuit is pulsed. This allows fluid to enter the low pressure accumulator (LPA) in the Hydraulic Control Unit (HCU) resulting in a drop in fluid pressure to the rear brakes. In order to increase the rear brake pressure, the outlet valve is switched off and the inlet valve is pulsed. This increases the pressure to the rear brakes. This back-and-forth process will continue until the required slip difference is obtained. At the end of EVBP braking (brakes released) the fluid in the LPA drains back to the master cylinder by switching on the electronic shuttle valve.

The EVBP will remain functional during many ABS fault modes. If both the red BRAKE and amber ABS warning indicators are illuminated, the EVBP may not be functioning.

STANDARD PROCEDURE

ANTILOCK BRAKE SYSTEM BLEEDING

The base brake's hydraulic system must be bled anytime air enters the hydraulic system. The ABS must always be bled anytime it is suspected that the HCU has ingested air.

Brake systems with ABS must be bled as two independent braking systems. The non-ABS portion of the brake system with ABS is to be bled the same as any non-ABS system.

The ABS portion of the brake system must be bled separately. Use the following procedure to properly bleed the brake hydraulic system including the ABS.

NOTE: **During the brake bleeding procedure, be sure the brake fluid level remains close to the FULL level in the master cylinder fluid reservoir. Check the fluid level periodically during the bleeding procedure and add Mopar® DOT 3 brake fluid as required.**

BLEEDING

When bleeding the ABS system, the following bleeding sequence must be followed to insure complete and adequate bleeding.

1. Make sure all hydraulic fluid lines are installed and properly torqued.
2. Connect the scan tool to the diagnostics connector. The diagnostic connector is located under the lower steering column cover to the left of the steering column.
3. Using the scan tool, check to make sure the ABM does not have any fault codes stored. If it does, clear them.

Fig. 2: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

WARNING: When bleeding the brake system wear safety glasses. A clear bleed tube (1) must be attached to the bleeder screws and submerged in a clear container filled part way with clean brake fluid (2). Direct the flow of brake fluid away from yourself and the painted surfaces of the vehicle. Brake fluid at high pressure may come out of the bleeder screws when opened.

NOTE: Pressure bleeding is recommended to bleed the base brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

4. Bleed the base brake system. See **STANDARD PROCEDURE** .
5. Using the scan tool, select ECU VIEW, followed by ABS MISCELLANEOUS FUNCTIONS to access bleeding. Follow the instructions displayed. When finished, disconnect the scan tool and proceed.
6. Bleed the base brake system a second time. See **STANDARD PROCEDURE** . Check brake fluid level in the reservoir periodically to prevent emptying, causing air to enter the hydraulic system.

Fig. 3: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

7. Fill the master cylinder fluid reservoir (1) to the MAX level.
8. Test drive the vehicle to be sure the brakes are operating correctly and that the brake pedal does not feel spongy.

ELECTRICAL

SENSOR, DYNAMICS

Description

DESCRIPTION

305789

Fig. 4: DYNAMICS SENSOR MOUNTING
 Courtesy of CHRYSLER LLC

The Yaw Rate and Lateral Acceleration Sensors are housed into one unit known as the Dynamics Sensor. The sensor is used to measure side-to-side (lateral) motion and vehicle rotational sensing (how fast the vehicle is turning - yaw).

Yaw and Lateral Acceleration Sensors cannot be serviced separately. The entire Dynamics Sensor must be replaced when necessary.

Removal

REMOVAL

8133b050

Fig. 5: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable (2) from battery post.
2. Remove floor console. Refer to **Body/Interior/CONSOLE, Floor - Removal**

Fig. 6: DYNAMICS SENSOR MOUNTING
Courtesy of CHRYSLER LLC

3. Disconnect wiring harness (1) connector at sensor (3).
4. Remove nuts (2) mounting sensor (3) to floor pan tunnel (4).
5. Remove dynamics sensor (3) from vehicle.

Installation

INSTALLATION

Fig. 7: DYNAMICS SENSOR MOUNTING
Courtesy of CHRYSLER LLC

1. Install dynamics sensor (3) over studs mounted to floor pan tunnel (4).
2. Install mounting nuts (2). Tighten nuts to 12 N.m (110 in. lbs.).
3. Connect wiring harness (1) connector to module (3).
4. Install floor console. Refer to **Body/Interior/CONSOLE, Floor - Installation**

8133bb50

Fig. 8: BATTERY AND CABLES

5. Connect negative battery cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure**
6. Perform Verification Test and clear any faults. See **Brakes - Standard Procedure**.

SENSOR, STEERING WHEEL ANGLE

Removal

REMOVAL

To service the steering angle sensor, the steering column control module (SCCM) must be removed and disassembled. Refer to **Steering/Column/MODULE, Steering Column Control - Removal**

Installation

INSTALLATION

To service the steering angle sensor, the steering column control module (SCCM) must be assembled and installed on the column. Refer to **Steering/Column/MODULE, Steering Column**

Control - Assembly

SENSOR, WHEEL SPEED, FRONT

Description

DESCRIPTION

Fig. 9: WHEEL SPEED SENSOR AT FRONT KNUCKLE

Courtesy of CHRYSLER LLC

One wheel speed sensor is mounted to each knuckle. The wheel speed sensor, using a tone wheel attached to the hub and bearing as a trigger mechanism, communicates with the Antilock Brake Module, informing it of that wheel's speed.

The head of the front wheel speed sensor mounts to the inside of the knuckle.

Removal

REMOVAL

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 10: WHEEL SPEED SENSOR AT BODY CONNECTOR
 Courtesy of CHRYSLER LLC

2. Remove the sensor cable routing clip (2) from the brake hose bracket (3).

Fig. 11: RELEASE WHEEL SPEED SENSOR CONNECTOR
 Courtesy of CHRYSLER LLC

NOTE: In the following step, to release the sensor connector (3) from the body wiring harness (1), move the retaining clip (2) as shown in illustration, then pull the sensor connector outward.

Fig. 12: WHEEL SPEED SENSOR AT BODY CONNECTOR
 Courtesy of CHRYSLER LLC

3. Remove the sensor connector (1) from the body wiring harness connector (4).

Fig. 13: WHEEL SPEED SENSOR AT FRONT KNUCKLE

4. Remove the screw (3) fastening the wheel speed sensor to knuckle (1).
5. Pull the sensor head (4) out of the knuckle.
6. Remove the wheel speed sensor cable routing clip (2) from the brake hose routing bracket (5).

Installation

INSTALLATION

Fig. 14: WHEEL SPEED SENSOR AT FRONT KNUCKLE
Courtesy of CHRYSLER LLC

1. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N.m (97 in. lbs.).
2. Attach wheel speed sensor cable and routing clip (2) to brake hose routing bracket (5).

Fig. 15: WHEEL SPEED SENSOR AT BODY CONNECTOR
Courtesy of CHRYSLER LLC

3. Attach sensor cable routing clip (2) to brake hose bracket (3).

4. Connect sensor connector (1) to body wiring harness connector (4). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.
5. Lower vehicle.
6. Perform Verification Test and clear any faults. See **Brakes - Standard Procedure**.

SENSOR, WHEEL SPEED, REAR

Description

DESCRIPTION

Fig. 16: WHEEL SPEED SENSOR AT REAR KNUCKLE
Courtesy of CHRYSLER LLC

One wheel speed sensor (3) is mounted to the rear of each rear knuckle. The wheel speed sensor, using a tone wheel attached to the rear axle half shaft as a trigger mechanism, communicates with the Antilock Brake Module, informing it of that wheel's speed.

Removal

REMOVAL

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

Fig. 17: RELEASE WHEEL SPEED SENSOR CONNECTOR
 Courtesy of CHRYSLER LLC

NOTE: To release sensor connector from body wiring harness connector (1) in following step, move retaining clip (2) as indicated here, then pull sensor connector (3) outward.

Fig. 18: SENSOR CONNECTION TO BODY CONNECTOR
 Courtesy of CHRYSLER LLC

2. Remove sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).
3. Separate left sensor connector (4) from right sensor connector (3).

Fig. 19: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
 Courtesy of CHRYSLER LLC

4. If removing left sensor, unclip sensor cable (3) from routing clip near body connector (1).

7. If installing left sensor, clip sensor cable (3) to routing clip near body connector (1).

Fig. 27: SENSOR CONNECTION TO BODY CONNECTOR
Courtesy of CHRYSLER LLC

8. Match left sensor connector (4) to right sensor connector (3) to make one connector.
9. Insert sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.
10. Lower vehicle.
11. Perform Verification Test and clear any faults. See **Brakes - Standard Procedure**.

SWITCH, ELECTRONIC STABILITY PROGRAM (ESP)

Description

DESCRIPTION

281506

Fig. 28: Instrument Panel Switch Pod
Courtesy of CHRYSLER LLC

The ESP Off Switch is located in the Instrument Panel Switch Pod in the center of the instrument panel. The ESP Off switch turns the Electronic Stability Program off whenever the switch is depressed. Depressing the switch a second time turns the ESP back on. The switch resets itself each time the ignition is cycled.

When the ESP Off switch is depressed and released, turning ESP off, it does not completely turn the system off. The ESP system reduces torque management to a lesser amount, but ESP function can still occur if the system perceives the need.

This vehicle has what is known as three-mode ESP. When the ESP Off switch is depressed and quickly released, the system turns off ESP like any other model, but if the switch is held down for a period of five seconds or longer before releasing, the ESP system further reduces the amount of torque management provided. The system can be returned to "normal" by briefly pressing and releasing the ESP Off switch.

The ESP Off switch is serviced as part of the Instrument Panel Switch Pod.

Removal

REMOVAL

1. Using trim stick or equivalent remove the center bezel.
2. Disconnect the electrical connectors.
3. Remove the two mounting fasteners.
4. Remove the switch pod.

Installation

INSTALLATION

1. Install the switch pod to the center bezel.

2. Install the two mounting fasteners.
3. Connect the electrical connectors
4. Install the center bezel.

HYDRAULIC/MECHANICAL

HYDRAULIC CONTROL UNIT (HCU)

Removal

REMOVAL

To remove the HCU, the ICU must be removed and disassembled. See **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Removal**. See **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Disassembly**.

Installation

INSTALLATION

To install the HCU, assemble and install the ICU. See **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Assembly**. See **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation**

INTEGRATED CONTROL UNIT (ICU)

Description

DESCRIPTION

Fig. 29: Integrated Control Unit
Courtesy of CHRYSLER LLC

The Hydraulic Control Unit (HCU) (2) and the Antilock Brake Module (ABM) (1) used with this antilock brake system are combined (integrated) into one unit, which is called the Integrated Control Unit (ICU).

Fig. 30: ICU MOUNTING
Courtesy of CHRYSLER LLC

The ICU (1) is located in the engine compartment, mounted to a bracket that is attached to the right side rail through the use of isolation grommets (2).

The ABS with traction control ICU consists of the following components: the ABM, eight (build/decay) solenoid valves (four inlet valves and four outlet valves), two traction control solenoid valves, two hydraulic shuttle valves, valve block, fluid accumulators, a pump, and an electric pump/motor.

The replaceable components of the ICU are the HCU and the ABM. No attempt should be made to service any components of the HCU or ABM. For replacement of the ABM. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Anti-Lock Brake System - Removal** .

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

For additional information on the ABM. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Anti-Lock Brake System - Description** .

Removal

REMOVAL

NOTE: Before proceeding. Refer to Brakes - Warning . Refer to Brakes - Caution .

8133b050

Fig. 31: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.

816b0a54

Fig. 32: Brake Tubes At ICU
Courtesy of CHRYSLER LLC

3. Remove primary (4) and secondary (1) brake tubes (from master cylinder) at hydraulic control unit (7).
4. Remove remaining brake tubes (2, 3, 5, 6) at hydraulic control unit (7).

Fig. 33: ABM Connector Release Tabs
Courtesy of CHRYSLER LLC

NOTE: Use this figure in the following step to release the ABM harness connector cover. It shows the location of the release tabs.

Fig. 34: Wiring Harness Connector At ABM
Courtesy of CHRYSLER LLC

5. Disconnect ABM harness connector from antilock brake module (ABM). To do so:
 - a. Depress tabs on each side of connector cover, then
 - b. Pull outward and upward on lower half of cover until it locks into position pointing straight outward (2). Connector can then be pulled straight outward off ABM (1).

Fig. 35: ICU MOUNTING
Courtesy of CHRYSLER LLC

6. Pull up on unit (1) and remove from mounting grommets (2) in body side rail.

Disassembly

DISASSEMBLY

1. Remove two screws attaching the mounting bracket to the HCU. Remove the bracket.

8140fbf5

Fig. 36: ABM Mounting Screws - With Traction Control
 Courtesy of CHRYSLER LLC

2. Remove four screws (1) attaching ABM (2) to HCU.

8140fd05

Fig. 37: ABM Assembly To HCU
 Courtesy of CHRYSLER LLC

3. Separate ABM (1) from HCU (2).

Assembly

ASSEMBLY

1. Clean any debris off the mating surfaces of the HCU and ABM.

CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.

Fig. 38: Solenoid Valve Seal
Courtesy of CHRYSLER LLC

2. If the seals (1) on the solenoid valve stems (2) are not new, replace them all. Each of the solenoid valve stem seals must be new to keep out moisture and debris; **do not reuse solenoid valve stem seals**.

Fig. 39: Internal Pump Connector O-Ring

Courtesy of CHRYSLER LLC

3. Replace the pump/motor connector O-ring (1) if it is not new. Be sure the O-ring is properly seated in the mounting groove (2).

Fig. 40: ABM Assembly To HCU
Courtesy of CHRYSLER LLC

4. Align components and install the ABM (1) on the HCU (2).

Fig. 41: ABM Mounting Screws - With Traction Control
Courtesy of CHRYSLER LLC

5. Install the four screws (1) attaching the ABM (2) to the HCU. Tighten the mounting screws to 2

N.m (17 in. lbs.).

6. Attach the mounting bracket to the HCU. Install two mounting bracket attaching screws and tighten to 11 N.m (97 in. lbs.).
7. Install the ICU in the vehicle. See **Brakes/Hydraulic/Mechanical/INTEGRATED CONTROL UNIT (ICU) - Installation**

Installation

INSTALLATION

Fig. 42: ICU MOUNTING
Courtesy of CHRYSLER LLC

1. Install unit (1), pushing mounting bracket down into mounting grommets (2) located in body side rail.

Fig. 43: Wiring Harness Connector At ABM
 Courtesy of CHRYSLER LLC

CAUTION: Before installing the ABM harness connector (2) on the ABM (1), be sure the seal is properly installed in the connector.

2. Insert ABM harness connector (2) into socket of ABM (1) and close cover, locking connector in place.

Fig. 44: LEFT REAR AND RIGHT REAR BRAKE TUBES AT ICU
 Courtesy of CHRYSLER LLC

3. Install left (2) and right (1) rear brake tubes at hydraulic control unit (4). Tighten tube nuts to 20

N.m (177 in. lbs.) torque.

Fig. 45: LEFT FRONT AND RIGHT FRONT BRAKE TUBES AT ICU
Courtesy of CHRYSLER LLC

4. Install left (2) and right (3) brake tubes at hydraulic control unit (4). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.

Fig. 46: Brake Tubes At ICU
Courtesy of CHRYSLER LLC

5. Install primary (4) and secondary (1) brake tubes at hydraulic control unit (7). Tighten tube nuts to 20 N.m (177 in. lbs.) torque.

6. Remove brake pedal holding tool.

8133bb50

Fig. 47: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

7. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure**

Fig. 48: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

8. Fill and bleed (1) base brake hydraulic system and ABS. See **STANDARD PROCEDURE** and **Brakes - Standard Procedure**.
9. Perform Diagnostic Verification Test and clear any faults. See **Brakes - Standard Procedure**.

ACCESSORIES AND EQUIPMENT

Audio & Video - Service Information - Challenger

DESCRIPTION

DESCRIPTION

Several radios are offered. The audio system uses a CAN B bus Ignition ON message so that the system will only operate when the ignition switch is in the RUN or ACCESSORY/ACCESSORY DELAY positions.

The audio system includes the following components:

- Amplifier
- Antenna (Radio, Navigation, Satellite)
- Radio noise suppression components
- Radio
- Speakers

Certain functions and features of the audio/video system rely upon resources shared with other electronic modules in the vehicle over the CAN bus network. For diagnosis of the CAN bus network, the use of a scan tool and the proper Diagnostic Procedures information is recommended.

For complete circuit diagrams, refer to the appropriate wiring information.

DIAGNOSIS AND TESTING

AUDIO

Any diagnosis of the Audio system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

WARNING: On vehicles equipped with airbags, refer to electrical, restraints before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

AUDIO SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
NO AUDIO	1. Fuse inoperative.	1. Check radio fuses in integrated power module (IPM). Replace fuses, if required.

	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Exchange or replace radio, if required.
	6. Amplifier inoperative.	6. Perform diagnosis on amplifier. Replace as necessary.
NO DISPLAY	1. Fuse inoperative.	1. Check radio fuses. Replace fuses, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Exchange or replace radio, if required.
NO MEMORY	1. Fuse inoperative.	1. Check ignition-off draw fuse. Replace fuse, if required.
	2. Radio connector damaged.	2. Check for loose or corroded radio connector. Repair, if required.
	3. Wiring damaged.	3. Check for battery voltage at radio connector. Repair wiring, if required.
	4. Ground damaged.	4. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	5. Radio inoperative.	5. Exchange or replace radio, if required.
POOR RADIO RECEPTION	1. Antenna or cable damaged or inoperative.	1. Refer to antenna diagnosis. Repair or replace antenna, if required.
	2. Ground damaged.	2. Check for continuity between radio chassis and a known good ground. There should be continuity. Repair ground, if required.
	3. Radio inoperative.	3. Exchange or replace radio, if required.

-	4. Poor antenna connection at radio or in line.	4. Verify proper connection.
-	5. Faulty rear window defogger.	5. Verify that the rear defogger grid is functioning properly, repair as necessary. Refer to <u>Electrical - Heated/Cooled Systems/Heated Glass - Diagnosis and Testing</u> .
SOUND DISTORTION (VIBRATION FROM SPEAKER AREA, BUZZING - HUMMING	1. Door trim panel loose or missing fasteners.	1. Inspect door trim panel and correct as necessary. Replace any missing fasteners.
	2. Water shield loose or misaligned.	2. Inspect water shield and adjust as required.
	3. Items placed in door trim panel map pockets vibrating or moving from side to side.	3. Remove items from door trim panel. Ensure that vibration is no longer present.
NO COMPACT DISC OPERATION	1. CD damaged.	1. Insert known good CD and test operation. Avoid the use of "home maid" CD's with adhesive labels. The labels may cause disc to become jammed in the radio.
	2. Foreign material on CD.	2. Clean CD and test operation.
	3. Condensation on CD or optics.	3. Allow temperature of vehicle interior to stabilize and test operation.
	4. Radio inoperative.	4. Exchange or replace radio, if required.

AMPLIFIER

DESCRIPTION

DESCRIPTION

Fig. 1: Amplifier
Courtesy of CHRYSLER LLC

The amplifier (2) is available in three ratings: 276 watt, 322 watt, and 368 watt. The amplifier is mounted to the left of the steering column under the instrument panel.

OPERATION

OPERATION

The amplifier receives fused battery current from a fuse in the rear Power Distribution Center (PDC) at all times. The internal circuitry of the amplifier switches the amplifier ON based upon a CAN bus message that is received from the radio receiver whenever the radio is turned on. The amplifier receives the sound signal inputs from the left and right rear outputs of the radio, then sends the amplified speaker outputs for each of those channels to the speakers.

DIAGNOSIS AND TESTING

AMPLIFIER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

The amplifier unit should be checked if there is no sound output noted from the speakers. For diagnosis of the power amplifier. See **Electrical - Audio and Video/Audio and Video/SPEAKER - Diagnosis and Testing**.

REMOVAL

REMOVAL

INSTRUMENT PANEL AMPLIFIER	Refer to the INSTRUMENT PANEL AMPLIFIER removal procedure.
REAR SHELF AMPLIFIER (SRT ONLY)	Refer to the REAR SHELF AMPLIFIER (RC7 sales code) removal procedure.

INSTRUMENT PANEL AMPLIFIER

Fig. 2: Electrical Harness Connectors
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure any time the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

1. Disconnect and isolate battery negative cable.
2. Remove the steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Removal**
3. Disconnect electrical connectors.

Fig. 3: Amplifier
Courtesy of CHRYSLER LLC

4. Remove the mounting fasteners (1).
5. Remove the amplifier (2).

REAR SHELF AMPLIFIER (RC7 sales code)

Fig. 4: Rear Shelf Amplifier
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the rear shelf trim. Refer to **Body/Interior/PANEL, Rear Shelf - Removal** .
3. Remove the four mounting fasteners (2).
4. Disconnect the electrical connector.

5. Remove the amplifier from the mounting plate (1).

INSTALLATION

INSTALLATION

INSTRUMENT PANEL AMPLIFIER	Refer to the INSTRUMENT PANEL AMPLIFIER installation procedure.
REAR SHELF AMPLIFIER (RC7 sales code)	Refer to the REAR SHELF AMPLIFIER (RC7 sales code) installation procedure.

INSTRUMENT PANEL AMPLIFIER

Fig. 5: Amplifier
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position the amplifier (2) and secure with the fasteners (1).

Fig. 6: Electrical Harness Connectors
 Courtesy of CHRYSLER LLC

2. Connect the electrical connectors.
3. Install the steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .
4. Connect the negative battery cable

REAR SHELF AMPLIFIER (RC7 sales code)

Fig. 7: Rear Shelf Amplifier
 Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

1. Install the amplifier to the mounting plate (1).
2. Connect the electrical connector.
3. Install the four mounting fasteners (2).
4. Install the rear shelf trim. Refer to **Body/Interior/PANEL, Rear Shelf - Installation** .
5. Connect the negative battery cable.

ANTENNA, SATELLITE

REMOVAL

REMOVAL

Fig. 8: Wire Harness Connectors
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

1. Disconnect and isolate the battery negative cable.
2. Lower the rear portion of the headliner as necessary to access underside of antenna
3. Disconnect the wire harness connectors from the antenna.

Fig. 9: Satellite Radio Antenna
Courtesy of CHRYSLER LLC

4. Remove the mounting fastener.
5. From inside the vehicle, and using a flat bladed tool, depress one of the retaining tabs on the antenna. Push up the one side of the antenna connector through the roof panel. Depress the other side of the connector and remove the antenna.

INSTALLATION

INSTALLATION

Fig. 10: Satellite Radio Antenna
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Insert wire harness through hole in roof panel. Press antenna into position until both retainers engage into position.
2. Install and tighten mounting fastener.

Fig. 11: Wire Harness Connectors
Courtesy of CHRYSLER LLC

3. Connect wire harness connectors to antenna.
4. Install headliner.
5. Connect battery negative cable.

BODY AND CABLE, ANTENNA

REMOVAL

REMOVAL

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the right side cowl trim panel. Refer to Body/Interior/PANEL, Cowl Trim - Removal
3. Disconnect the antenna cable from the instrument panel antenna cable.
4. Remove the right side quarter trim panel. Refer to Body/Interior/PANEL, Quarter Trim - Removal .
5. Disconnect the antenna cable from the antenna module.
6. Position the floor carpet aside.
7. Remove the antenna cable.

INSTALLATION

INSTALLATION

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position the antenna cable and secure it to the wire harness.
2. Connect the antenna cable to the antenna module.
3. Connect the antenna cable to the instrument panel antenna cable.
4. Install the right side quarter trim panel. Refer to Body/Interior/PANEL, Quarter Trim - Installation .
5. Install the right side cowl trim panel. Refer to Body/Interior/PANEL, Cowl Trim - Installation .
6. Connect the battery negative cable.

BODY AND CABLE, ANTENNA, NAVIGATION

REMOVAL

REMOVAL

Fig. 12: Locating Navigation Antenna & Fasteners
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the radio. See Electrical - Audio and Video/Audio and Video/RADIO - Removal.
3. Disconnect the navigation antenna from the back of the radio.

4. Remove the instrument cluster. Refer to **Body/Instrument Panel/BEZEL, Instrument Cluster - Removal** .
5. Install the navigation antenna fasteners (1).
6. Remove the navigation antenna.

INSTALLATION

INSTALLATION

Fig. 13: Locating Navigation Antenna & Fasteners
Courtesy of CHRYSLER LLC

1. Install the navigation antenna (2) into the vehicle.
2. Install the navigation antenna fasteners (1).
3. Install the instrument cluster. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Installation** .
4. Install the radio. See **Electrical - Audio and Video/Audio and Video/RADIO - Installation**.
5. Connect the negative battery cable.

CABLE, ANTENNA, INSTRUMENT PANEL

REMOVAL

REMOVAL

Fig. 14: Cable At Instrument Panel
Courtesy of CHRYSLER LLC

NOTE: **A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .**

1. Disconnect and isolate the battery negative cable.
2. Remove the radio. See **Electrical - Audio and Video/Audio and Video/RADIO - Removal**.
3. Remove the glove box. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
4. Remove the right side cowl trim. Refer to **Body/Interior/PANEL, Cowl Trim - Removal** .
5. Disconnect antenna cable at right side cowl area.
6. Remove cable from instrument panel.

INSTALLATION

INSTALLATION

Fig. 15: Cable At Instrument Panel
Courtesy of CHRYSLER LLC

NOTE: **A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .**

1. Install cable to instrument panel.
2. Connect antenna cable at right side cowl area.
3. Install the right side cowl trim. Refer to **Body/Interior/PANEL, Cowl Trim - Installation** .
4. Install the glove box. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
5. Install the radio. See **Electrical - Audio and Video/Audio and Video/RADIO - Installation**.
6. Connect the battery negative cable.

COMPONENTS, RADIO NOISE SUPPRESSION

DESCRIPTION

DESCRIPTION

Radio noise suppression devices are installed on this vehicle. Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) can be produced by any on-board or external source of electromagnetic energy. These electromagnetic energy sources can radiate electromagnetic signals through the air, or conduct them through the vehicle electrical system.

When the audio system converts RFI or EMI to an audible acoustic wave form, it is referred to as radio noise. This undesirable radio noise is generally manifested in the form of "buzzing," "hissing," "popping," "clicking," "crackling," and/or "whirring" sounds. In most cases, RFI and EMI radio noise can be suppressed using a combination of vehicle and component grounding, filtering and shielding techniques. This vehicle is equipped with radio noise suppression devices that were designed to minimize exposure to typical sources of RFI and EMI; thereby, minimizing radio noise complaints.

Radio noise suppression is accomplished primarily through circuitry or devices that are integral to the radios, audio power amplifiers and other on-board electrical components such as generators, wiper motors, blower motors, and fuel pumps that have been found to be potential sources of RFI or EMI. External radio noise suppression devices that are used on this vehicle to control RFI or EMI, and can be serviced, include the following:

- **Engine-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the engine cylinder heads. The other is secured to the frame.
- **Resistor-type spark plugs** - This type of spark plug has an internal resistor connected in series between the spark plug terminal and the center electrode to help reduce the production of electromagnetic radiation that can result in radio noise.
- **Exhaust-to-frame ground strap** - This length of braided ground strap has an eyelet terminal connector crimped to each end. One end is secured to the exhaust pipe. The other is secured to the frame.

OPERATION

OPERATION

There are two common strategies that can be used to suppress Radio Frequency Interference (RFI) and ElectroMagnetic Interference (EMI) radio noise. The first suppression strategy involves preventing the production of RFI and EMI electromagnetic signals at their sources. The second suppression strategy involves preventing the reception of RFI and EMI electromagnetic signals by the audio system components.

The use of braided ground straps in key locations is part of the RFI and EMI prevention strategy. These ground straps ensure adequate ground paths, particularly for high current components such as many of those found in the starting, charging, ignition, engine control and transmission control systems. An insufficient ground path for any of these high current components may result in radio noise caused by induced voltages created as the high current seeks alternative ground paths through components or circuits intended for use by, or in close proximity to the audio system components or circuits.

Preventing the reception of RFI and EMI is accomplished by ensuring that the audio system components are correctly installed in the vehicle. Loose, corroded or improperly soldered wire harness connections, improperly routed wiring and inadequate audio system component grounding can all contribute to the reception of RFI and EMI. A properly grounded antenna body and radio chassis, as well as a shielded antenna coaxial cable with clean and tight connections will each help reduce the potential for reception of RFI and EMI.

MAST, ANTENNA, QUARTER GLASS

DESCRIPTION

DESCRIPTION

The integral antenna element is bonded to the rear glass and is replaced with the glass assembly only.

OPERATION

OPERATION

The integral antenna receives radio frequencies and sends them to the antenna module for amplification.

DIAGNOSIS AND TESTING

REAR GLASS INTEGRAL ANTENNA

The antenna grid pattern is located above the EBL grid.

For circuit descriptions and diagrams, refer to the appropriate wiring information. To detect breaks in the integral antenna elements, the following procedure is required:

1. Disconnect the antenna module connector from the antenna terminals on the glass.
2. Using an ohmmeter, place a lead on one of the terminals and check each end of the grid pattern connected to this terminal for continuity. If continuity is present, move one lead through the grid in progression starting at the terminal with the other lead on the terminal until continuity is lost. Repeat procedure for the other terminal. A break in the antenna grid can be repaired using a Mopar Rear Window Defogger Repair Kit or equivalent.

MODULE, RADIO ANTENNA

DESCRIPTION

DESCRIPTION

The antenna module is an electronic circuit component designed to capture and enhance RF (Radio Frequency) signals in both the AM and FM broadcast bands. The antenna module is mounted to the right quarter trim. The module is grounded through the mounting bracket and fastener. The module has a two wire electrical connector that connects to the integral radio antenna and EBL grid, located on the rear window. There is also an electrical connector for battery voltage and a coax cable connector.

OPERATION

OPERATION

The antenna module receives both AM and FM radio signals supplied by the rear window integral radio antenna and selectively amplifies them. The amplified signal is then sent through the body length coax cable to the radio input.

DIAGNOSIS AND TESTING

ANTENNA MODULE

CONDITION	POSSIBLE CAUSES	CORRECTION
NO AM RECEPTION, WEAK FM RECEPTION	1. Antenna module to antenna connector open or disconnected. 2. Cable open or disconnected. 3. No battery power at antenna module. 4. Antenna module disconnected from glass.	1. Repair open or reconnect antenna module connector to glass mounted antenna. 2. Replace antenna cable or, reconnect cable. 3. Check fuse. If okay, repair open in battery voltage circuit. 4. Connect module connector to glass.
NO AM OR FM RECEPTION	1. Coax disconnected at radio. 2. Coax shorted to ground.	1. Reconnect coax. 2. Repair or Replace coax
WEAK OR NO AM/FM RECEPTION	1. Antenna Module inoperative.	1. Replace antenna module.

REMOVAL

REMOVAL

Fig. 16: Wire Harness Connectors & Antenna Cable
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
3. Disconnect the wire harness connectors and th antenna cable.
4. Remove the mounting fasteners and the antenna module.

INSTALLATION

INSTALLATION

Fig. 17: Wire Harness Connectors & Antenna Cable
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position the module into place.
2. Install and tighten the mounting fasteners.
3. Connect the wire connectors and the antenna cable to the antenna module.
4. Install the right quarter trim panel. Refer to Body/Interior/PANEL, Quarter Trim - Installation .
5. Connect the battery negative cable.

RADIO

DESCRIPTION

DESCRIPTION

Fig. 18: Radio
Courtesy of CHRYSLER LLC

Available radios include:

- AM/FM Stereo Radio, Single Disc CD/DVD Player(CD/DVD/MP3/WMA Audio JEP DVD Video/Audio) with Full Map Navigation with GPS Antenna and Real Time Traffic (RER)
- AM/FM Stereo Radio with CD/MP3/WMA and AUX jack (RES)
- AM/FM Stereo Radio, with 6-disc CD/MP3/WMA Changer (REQ)

NOTE: **USB devices (e.g., camera memory USB adaptors, etc.) must comply with the MSD (Mass Storage Device) standard. This USB terminal can provide power to the inserted device. The device's current limitation must be less or equal to 500mA.**

STANDARD PROCEDURE

STANDARD PROCEDURE - RADIO BACKUP

The radio hard drive (HDD) can be backed up to save customer data in the event that a radio replacement is required. This procedure can only be done with all radios with a hard disk drive. All other radios do not have a HDD.

1. Turn the ignition to RUN, engine OFF.
2. Power on the external HDD.
3. Connect the external HDD to the radio using the USB (Universal Serial Bus) cable. The radio

display will change to the "Manage My Files" screen.

4. Connect the scan tool and perform the following steps to place the radio into "Dealership Mode":
 - ECU View
 - Radio
 - Misc. Functions
 - Service Mode
 - Start
 - Next
5. Follow the on screen instructions on the radio to back up the radio HDD.

REMOVAL

REMOVAL

Fig. 19: Radio

Courtesy of CHRYSLER LLC

NOTE: REQ radios only must be put into "Transportation Mode" before removal. With Ignition in RUN or ACCESSORY, press SET and DISK simultaneously until the radio displays "TRANSPORTATION" on the display or for 5 seconds.

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the instrument panel center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .
3. Remove the mounting fasteners.

Fig. 20: Radio Electrical Harness Connectors - Typical
Courtesy of CHRYSLER LLC

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

4. Disconnect the antenna cables by pulling the locking antenna connector away from the radio.
5. Disconnect the electrical connectors and remove the radio.

INSTALLATION

INSTALLATION

Fig. 21: Radio Electrical Harness Connectors - Typical
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

NOTE: **REQ RADIO** , After installation of the radio, remove the radio from "Transportation Mode" by pulling the IOD fuse or using the scan tool and perform a battery reset.

1. Connect the electrical connectors and antenna cables to the radio.

Fig. 22: Radio
Courtesy of CHRYSLER LLC

2. Position the radio and install the mounting fasteners.
3. Install the instrument panel center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .
4. Connect the negative battery cable.

RECEIVER, SATELLITE

REMOVAL

REMOVAL

NOTE: If the owner's satellite service was active before the satellite receiver was replaced the new satellite receiver will have to be activated. The existing satellite receiver will have to be deactivated before the replacement satellite receiver can be activated.

To activate Sirius satellite radio service, call Sirius at their toll-free number.

Please have the following information available when activating a system:

- Electronic Serial Number / Sirius Identification Number (ESN/SID) of the unit to be replaced
- ESN/SID of the replacement receiver
- Vehicle Owner's name and address
- VIN

The ESN/SID number can be obtained through the radio display by following the steps in the satellite radio owners manual.

The vehicle must be outside with the audio system powered on, in the satellite radio mode, to receive the activation signal.

Fig. 23: Fasteners & Electrical Harness Connector
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and the isolate the battery negative cable.
2. Remove the left side trunk trim.
3. Disconnect the electrical connector (3).
4. Disconnect the antenna connectors.
5. Remove the mounting bracket fasteners (1).
6. Remove the module to the mounting bracket fasteners (2).

INSTALLATION

INSTALLATION

NOTE: If the owner's satellite service was active before the satellite receiver was replaced the new satellite receiver will have to be activated. The existing satellite receiver will have to be deactivated before the replacement satellite receiver can be activated.

To activate Sirius satellite radio service, call Sirius at their toll-free number. Please have the following information available when activating a system:

- Electronic Serial Number / Sirius Identification Number (ESN/SID) of the unit to be replaced
- ESN/SID of the replacement receiver
- Vehicle Owner's name and address
- VIN

The ESN/SID number can be obtained through the radio display by following the steps in the satellite radio owners manual.

The vehicle must be outside with the audio system powered on, in the satellite radio mode, to receive the activation signal.

Fig. 24: Fasteners & Electrical Harness Connector
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Install and tighten the module to the mounting bracket fasteners (2).
2. Position the module into place.
3. Install and tighten the mounting bracket fasteners (1).
4. Connect the antenna connectors.

5. Connect the electrical connectors (3).
6. Install the left side trunk trim.
7. Connect the battery negative cable.

SPEAKER

DESCRIPTION

DESCRIPTION

Four Speakers (RCD sales code)

This system includes four speakers in four locations.

- One 15.2 x 22.9 cm. (6 x 9 in.) diameter speaker is located in each front door
- One 16.5 cm (6.5 in) diameter speaker located on each side of the rear shelf.

Boston Acoustics Six-Speaker System with 276 watts total (RC6 sales code)

This system features six speakers in six locations.

- One 15.2 x 22.9 cm. (6 x 9 in.) diameter speaker is located in each front door.
- One 16.5 cm. (6.5 in.) diameter speaker located on each side of the rear shelf.
- Two 8.9 cm. (3.5 in.) instrument panel tweeters are located on the outboard in the instrument panel top cover.

Boston Acoustics Six-Speaker System with 368 watts total (RC7 sales code)

This system features eight speakers in eight locations.

- One 15.2 x 22.9 cm. (6 x 9 in.) diameter speaker is located in each front door.
- One 16.5 centimeter (6.5 inch) diameter speaker located on each side of the rear package shelf.
- A 20.3 cm. (8 in.) diameter subwoofer is located in the rear package shelf.
- Three 8.9 cm. (3.5 in.) speakers located on the top portion of the instrument panel.
- 368 watts amplifier.

SRT High Performance Audio 8-Speaker System (RC5 sales code)

This system features eight speakers in eight locations.

- One 15.2 x 22.9 cm. (6 x 9 in.) diameter speaker is located in each front door.
- One 16.5 cm. (6.5 in.) diameter speaker located on each side of the rear package shelf.
- A 25.4 cm (10 in.) square subwoofer mounted in the trunk.

- Three 8.9 cm. (3.5 in.) speakers located on the top portion of the instrument panel.
- A 322 watt amplifier.

DIAGNOSIS AND TESTING

SPEAKER

Any diagnosis of the Audio system should begin with the use of a scan tool and the appropriate Diagnostic Service information.

Refer to the appropriate wiring information.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

CAUTION: The speaker output of the radio is a "floating ground" system. Do not allow any speaker lead to short to ground, as damage to the radio may result.

1. If all speakers are inoperative, check the radio fuses in the junction block. If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Check the amplifier fuse (if equipped) in the junction block. If OK, go to Step 3. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
3. Turn the ignition switch to the ON position. Turn the radio receiver ON. Adjust the balance and fader control controls to check the performance of each individual speaker. Note the speaker locations that are not performing correctly. Go to Step 4.
4. Turn the radio OFF. Turn the ignition OFF. Disconnect and isolate the battery negative cable. If vehicle is **not** equipped with a amplifier, remove the radio receiver. If the vehicle is equipped with an amplifier, disconnect the wire harness connectors. There are two connectors. The one on the body harness has body speakers only. The other on the instrument panel harness has the instrument panel speakers, battery, ground, and CAN. Go to Step 5.
5. Check both the speaker feed (+) circuit and return (-) circuit cavities for the inoperative speaker at the wire harness connector for continuity to ground. There should be no continuity. If OK, go to Step 6. If not OK, repair the shorted speaker feed (+) and/or return (-) circuit(s) to the speaker as required.
6. Disconnect wire harness connector at the inoperative speaker. Check for continuity between the speaker feed (+) circuit cavities of the radio receiver wire harness connector or if equipped, the amplifier wire harness connector and the speaker wire harness connector. Repeat the check between the speaker return (-) circuit cavities of the radio receiver wire harness connector and

the speaker wire harness connector. In each case, there should be continuity. If OK, replace the faulty speaker. If not OK, repair the open speaker feed (+) and/or return (-) circuit(s) as required.

REMOVAL

REMOVAL

Front Door Speaker	Refer to the <u>FRONT DOOR SPEAKER</u> removal procedure.
Instrument Panel Side Speaker	Refer to the <u>INSTRUMENT PANEL SIDE SPEAKER</u> removal procedure.
Instrument Panel Center Speaker	Refer to the <u>INSTRUMENT PANEL CENTER SPEAKER</u> removal procedure.
Rear Speaker	Refer to the <u>REAR SPEAKER</u> removal procedure.
Subwoofer - Rear Shelf	Refer to the <u>SUBWOOFER - REAR SHELF</u> removal procedure.
Subwoofer - Trunk Mount	Refer to the <u>SUBWOOFER - TRUNK MOUNT</u> removal procedure.

FRONT DOOR SPEAKER

Fig. 25: Front Door Speaker
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

1. Disconnect and isolate the battery negative cable.
2. Remove the front door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Removal** .
3. Remove the mounting fasteners.
4. Disconnect the electrical connector and remove the speaker.

INSTRUMENT PANEL SIDE SPEAKER

Fig. 26: Instrument Panel Side Speaker
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the speaker cover from the instrument panel.
3. Remove the mounting fasteners.
4. Disconnect the electrical connector and remove the speaker.

INSTRUMENT PANEL CENTER SPEAKER

Fig. 27: Instrument Panel Center Speaker
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the speaker cover from the instrument panel.
3. Remove the mounting fasteners.
4. Disconnect the electrical connector and remove the speaker.

REAR SPEAKER

Fig. 28: Rear Speakers
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the quarter trim panels. Refer to Body/Interior/PANEL, Quarter Trim - Removal .
3. Remove the rear shelf trim. Refer to Body/Interior/PANEL, Rear Shelf - Removal .
4. Remove the mounting fasteners.
5. Disconnect the electrical connector and remove speaker.

SUBWOOFER - REAR SHELF

Fig. 29: Subwoofer
 Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the quarter trim panels. Refer to Body/Interior/PANEL, Quarter Trim - Removal .
3. Remove the rear shelf trim. Refer to Body/Interior/PANEL, Rear Shelf - Removal .
4. Remove the mounting fasteners.
5. Disconnect the electrical connector and remove the subwoofer.

SUBWOOFER - TRUNK MOUNT

Fig. 30: Subwoofer - Sedan
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

- 1. Open the decklid.
- 2. Disconnect and isolate the battery negative cable.
- 3. Remove the top mounting fastener (2).
- 4. Disconnect the electrical connector (3).
- 5. Remove the subwoofer (1) from the vehicle.

INSTALLATION

INSTALLATION

Front Door Speaker	Refer to the FRONT DOOR SPEAKER installation procedure.
Instrument Panel Side Speaker	Refer to the INSTRUMENT PANEL SIDE SPEAKER installation procedure.
Instrument Panel Center Speaker	Refer to the INSTRUMENT PANEL CENTER SPEAKER installation procedure.
Rear Speaker	Refer to the REAR SPEAKER installation procedure.
Subwoofer - Rear Shelf	Refer to the SUBWOOFER - REAR SHELF installation procedure.
Subwoofer - Trunk Mount	Refer to the SUBWOOFER - TRUNK MOUNT installation procedure.

FRONT DOOR SPEAKER

Fig. 31: Front Door Speaker

Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position the speaker and connect the electrical connector.
2. Install and tighten the mounting fasteners.
3. Install the front door trim panel. Refer to Body/Door - Front/PANEL, Door Trim - Installation .
4. Connect the negative battery cable.

INSTRUMENT PANEL SIDE SPEAKER

Fig. 32: Instrument Panel Side Speaker
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position the speaker and connect the electrical connector.
2. Install and tighten the mounting fasteners.
3. Install the speaker cover to instrument panel.
4. Connect the negative battery cable.

INSTRUMENT PANEL CENTER SPEAKER

Fig. 33: Instrument Panel Center Speaker
 Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position the speaker and connect the electrical connector.
2. Install and tighten the mounting fasteners.
3. Install the speaker cover to the instrument panel.
4. Connect the negative battery cable

REAR SPEAKER

Fig. 34: Rear Speakers
 Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been

disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position the speaker and connect the electrical connector.
2. Install and tighten the mounting fasteners.
3. Install the rear shelf trim. Refer to **Body/Interior/PANEL, Rear Shelf - Installation** .
4. Install the quarter trim panels. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
5. Connect the negative battery cable.

SUBWOOFER - REAR SHELF

Fig. 35: Subwoofer
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

1. Position the subwoofer and connect the electrical connector.
2. Install and tighten the mounting fasteners.
3. Install the rear shelf trim. Refer to **Body/Interior/PANEL, Rear Shelf - Installation** .
4. Install the quarter trim panels. Refer to **Body/Interior/PANEL, Quarter Trim - Removal** .
5. Connect the negative battery cable.

SUBWOOFER - TRUNK MOUNT

Fig. 36: Subwoofer - Sedan
Courtesy of CHRYSLER LLC

NOTE: Perform a battery reconnect procedure anytime the battery has been disconnected.

1. Install the subwoofer (1) to the vehicle.
2. Connect the electrical connector (3).
3. Install the top mounting fastener (2).
4. Connect the negative battery cable.
5. Close the decklid.

SWITCH, REMOTE RADIO

DESCRIPTION

DESCRIPTION

Fig. 37: Remote Radio Switches
Courtesy of CHRYSLER LLC

Four rocker-type switches are mounted on the front of the steering wheel spokes.

The left switches control the following functions:

- **SCROLL** - Controls the radio station seek up/down, CD change track, tape change side, satellite radio change channel, trip functions, navigation, system status messages, and personal settings
- **FUNCTION SELECT** - Controls the radio preset advance or disc change (in audio mode), reset or trip functions and scroll through warning messages, and personal feature selection (only when vehicle is in Park).
- **AUDIO SYSTEM HOT KEY** - Controls mode selection: AM, FM, Tape, CD, Satellite Radio

The right switches control the following:

- **MENU** - Controls trip functions, navigation, system status, personal settings, and telephone
- **C/T** - Compass/Temperature hot key
- **AUDIO SYSTEM VOLUME** - Controls the system volume level

REMOVAL

REMOVAL

Fig. 38: Locating Remote Radio Switch Tabs
 Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the driver airbag. Refer to Restraints/AIR BAG, Driver - Removal .
3. Using a trim stick, gently pry the switch from the steering wheel at locations shown in illustration.
4. Disconnect the electrical connector.
5. Remove the switch from the steering wheel.

INSTALLATION

INSTALLATION

Fig. 39: Locating Remote Radio Switch Tabs

Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Connect the electrical connector to the switch.
2. Position the switch and press it into place.
3. Install the driver airbag. Refer to Restraints/AIR BAG, Driver - Installation .
4. Connect the battery negative cable.

AUTOMATIC TRANSMISSION 42RLE -

Service Information - Challenger

DESCRIPTION

DESCRIPTION

8680141

Fig. 1: 42RLE Automatic Transmission
Courtesy of CHRYSLER LLC

1 - DRIVEPLATE	6 - REVERSE CLUTCH	11 - STUB SHAFT
2 - TORQUE CONVERTER	7 - FRONT PLANET CARRIER	12 - LOW/REVERSE CLUTCH
3 - INPUT SHAFT	8 - REAR PLANET CARRIER	13 - 2/4 CLUTCH
4 - UNDERDRIVE CLUTCH	9 - OUTPUT SHAFT	14 - OIL PUMP
5 - OVERDRIVE CLUTCH	10 - SNAP RING	-

The 42RLE is a four-speed transmission that is a conventional hydraulic/mechanical assembly controlled with adaptive electronic controls and monitors. The hydraulic system of the transmission consists of the transmission fluid, fluid passages, hydraulic valves, and various line pressure control components. An input clutch assembly which houses the underdrive, overdrive, and reverse clutches is used. It also utilizes separate holding clutches: 2nd/4th gear and Low/Reverse. The primary

mechanical components of the transmission consist of the following:

- Three multiple disc input clutches
- Two multiple disc holding clutches
- Four hydraulic accumulators
- Two planetary gear sets
- Hydraulic oil pump
- Valve body
- Solenoid/Pressure switch assembly

Control of the transmission is accomplished by fully adaptive electronics. Optimum shift scheduling is accomplished through continuous real-time sensor feedback information provided to the Transmission Control Module (TCM) portion of the Powertrain Control Module (PCM).

The TCM is the heart of the electronic control system and relies on information from various direct and indirect inputs (sensors, switches, etc.) to determine driver demand and vehicle operating conditions. With this information, the TCM can calculate and perform timely and quality shifts through various output or control devices (solenoid pack, transmission control relay, etc.).

The TCM also performs certain self-diagnostic functions and provides comprehensive information (sensor data, DTC's, etc.) which is helpful in proper diagnosis and repair. This information can be viewed with the scan tool.

TRANSMISSION IDENTIFICATION

Fig. 2: Identification Label Breakdown
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - T=TRACEABILITY |
| 2 - SUPPLIER CODE (PK=KOKOMO) |
| 3 - COMPONENT CODE (TK=KOKOMO TRANSMISSION) |

4 - BUILD DAY (350=DEC. 15)
5 - BUILD YEAR (1=2001)
6 - ASSEMBLY LINE CODE
7 - BUILD SEQUENCE NUMBER
8 - LAST THREE OF P/N
9 - CHANGE LEVEL
10 - TRANSMISSION PART NUMBER
11 - P=PART NUMBER

The 42RLE transmission can be identified by a barcode label that is affixed to the upper left area of the bellhousing.

The label contains a series of digits that can be translated into useful information such as transmission part number (10), date of manufacture (4, 5), manufacturing origin (2), assembly line identifier (6), build sequence number (7), etc. .

If the tag is not legible or is missing, the "PK" number, which is stamped into the left rear flange of the transmission case, can be referred to for identification. The entire part number, build code, and sequence number are stamped into the flange.

OPERATION

OPERATION

The 42RLE transmission ratios are:

GEAR	RATIO
First	2.84 : 1
Second	1.57 : 1
Third	1.00 : 1
Overdrive	0.69 : 1
Reverse	2.21 : 1

FIRST GEAR POWERFLOW

80/79c31

Fig. 3: First Gear Powerflow
Courtesy of CHRYSLER LLC

- 1 - UNDERDRIVE CLUTCH APPLIED (Turns Rear Sun)
 2 - LOW-REVERSE CLUTCH APPLIED (Holds Rear Annulus/Front Carrier)

In first gear range, torque input is through the underdrive clutch (1) to the underdrive hub assembly. The underdrive hub is splined to the rear sun gear. When the underdrive clutch is applied, it rotates the underdrive hub and rear sun gear. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly. The rear sun gear drives the rear planetary pinion gears. The rear planetary pinion gears are forced to walk around the inside of the stationary rear annulus gear. The pinions are pinned to the rear carrier and cause the rear carrier assembly to rotate as they walk around the annulus gear. This provides the torque output for first gear. The other planetary gearset components are freewheeling. The first gear ratio is 2.84:1.

SECOND GEAR POWERFLOW

80f79edd

Fig. 4: Second Gear Powerflow
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - UNDERDRIVE CLUTCH APPLIED (Turns Rear Sun)
2 - 2-4 CLUTCH APPLIED (Holds Front Sun) |
|--|

Second gear is achieved by having both planetary gear sets contribute to torque multiplication. As in first gear, torque input is through the underdrive clutch (1) to the rear sun gear. The 2/4 clutch (2) is applied to hold the front sun gear stationary. The rotating rear sun gear turns the rear planetary pinions. The rear pinions rotate the rear annulus/front carrier assembly. The pinions of the front carrier walk around the stationary front sun gear. This transmits torque to the front annulus/rear carrier assembly, which provides output torque and a gear ratio of 1.57:1.

THIRD GEAR POWERFLOW

807a041

Fig. 5: Third Gear Powerflow
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - UNDERDRIVE CLUTCH APPLIED (Turns Rear Sun)
2 - OVERDRIVE CLUTCH APPLIED (Turns Front Carrier/Rear Annulus) |
|---|

In third gear, two input clutches are applied to provide torque input: the underdrive clutch (1) and overdrive clutch (2). The underdrive clutch rotates the rear sun gear, while the overdrive clutch rotates the front carrier/rear annulus assembly. The result is two components (rear sun gear and rear annulus gear) rotating at the same speed and in the same direction. This effectively locks the entire planetary gearset together and is rotated as one unit. The gear ratio in third is 1:1.

FOURTH GEAR POWERFLOW

80f7a049

Fig. 6: Fourth Gear Powerflow
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OVERDRIVE CLUTCH APPLIED (Turns Rear Sun)
2 - 2-4 CLUTCH APPLIED (Holds Front Sun) |
|---|

In fourth gear input torque is through the overdrive clutch (1) which drives the front carrier. The 2/4 clutch (2) is applied to hold the front sun gear. As the overdrive clutch rotates the front carrier, it causes the pinions of the front carrier to walk around the stationary front sun gear. This causes the front carrier pinions to turn the front annulus/rear carrier assembly which provides output torque. In fourth gear, transmission output speed is more than engine input speed. This situation is called overdrive and the gear ratio is 0.69:1.

REVERSE GEAR POWERFLOW

807a053

Fig. 7: Reverse Gear Powerflow
Courtesy of CHRYSLER LLC

- 1 - LOW-REVERSE CLUTCH APPLIED (Holds Rear Annulus Front Carrier)
 2 - REVERSE CLUTCH APPLIED (Turns Front Sun)

In reverse, input power is through the reverse clutch (1). When applied, the reverse clutch drives the front sun gear through the overdrive hub and shaft. The L/R clutch (2) is applied to hold the front carrier/rear annulus assembly stationary. The front carrier is being held by the L/R clutch so the pinions are forced to rotate the front annulus/rear carrier assembly in the reverse direction. Output torque is provided, in reverse, with a gear ratio of 2.21:1.

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION

CAUTION: Before attempting any repair on the 42RLE Four Speed Automatic Transmission, always check for proper shift cable adjustment. Also check for diagnostic trouble codes with the scan tool and the 42RLE Transmission Diagnostic information.

42RLE automatic transmission malfunctions may be caused by these general conditions:

- Poor engine performance
- Improper adjustments
- Hydraulic malfunctions

- Mechanical malfunctions
- Electronic malfunctions

When diagnosing a problem always begin with recording the complaint. The complaint should be defined as specific as possible. Include the following checks:

- Temperature at occurrence (cold, hot, both)
- Dynamic conditions (acceleration, deceleration, upshift, cornering)
- Elements in use when condition occurs (what gear is transmission in during condition)
- Road and weather conditions
- Any other useful diagnostic information.

After noting all conditions, check the easily accessible variables:

- Fluid level and condition
- Shift cable adjustment
- Diagnostic trouble code inspection

Then perform a road test to determine if the problem has been corrected or that more diagnosis is necessary. If the problem exists after the preliminary tests and corrections are completed, hydraulic pressure checks should be performed.

ROAD TEST

Prior to performing a road test, verify that the fluid level, fluid condition, and linkage adjustment have been approved.

During the road test, the transmission should be operated in each position to check for slipping and any variation in shifting.

If the vehicle operates properly at highway speeds, but has poor acceleration, the converter stator overrunning clutch may be slipping. If acceleration is normal, but high throttle opening is needed to maintain highway speeds, the converter stator clutch may have seized. Both of these stator defects require replacement of the torque converter and thorough transmission cleaning.

Slipping clutches can be isolated by comparing the "Elements in Use" chart with clutch operation encountered on a road test. This chart identifies which clutches are applied at each position of the selector lever.

A slipping clutch may also set a DTC and can be determined by operating the transmission in all selector positions.

ELEMENTS IN USE AT EACH POSITION OF SELECTOR LEVER

Shift Lever Position	INPUT CLUTCHES			HOLDING CLUTCHES	
	Underdrive	Overdrive	Reverse	2/4	Low/Reverse

P - PARK	-	-	-	-	X
R - REVERSE	-	-	X	-	X
N - NEUTRAL	-	-	-	-	X
OD - OVERDRIVE	-	-	-	-	-
First	X	-	-	-	X
Second	X	-	-	X	-
Direct	X	X	-	-	-
Overdrive	-	X	-	X	-
D - DRIVE*	-	-	-	-	-
First	X	-	-	-	X
Second	X	-	-	X	-
Direct	X	X	-	-	-
L - LOW*	-	-	-	-	-
First	X	-	-	-	X
Second	X	-	-	X	-
Direct	X	X	-	-	-
* Vehicle upshift and downshift speeds are increased when in these selector positions.					

The process of elimination can be used to detect any unit which slips and to confirm proper operation of good units. Road test analysis can diagnose slipping units, but the cause of the malfunction cannot be determined. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

PRELIMINARY

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVABLE

1. Record all DTCs and the accompanying DTC Event Data.
2. Check for an appropriate Technical Service Bulletin that applies to the customer complaint.
3. Check fluid level and condition.
4. Road test and note how transmission upshifts, downshifts, and engages.
5. If the complaint was related to shift quality, perform the Quick Learn procedure. Refer to **Electrical/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure** , and the Drive Learn Procedure. Refer to **Electrical/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure** .
6. If the shift complaint still exists, compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off.
7. Perform air-pressure test to check clutch operation. See **Transmission and Transfer**

Case/Automatic - 42RLE - Diagnosis and Testing.

8. Replace the Transmission Solenoid/TRS Assembly and perform the Quick Learn and Drive Learn procedures again.
9. If the complaint still exists, remove, inspect, and repair the transmission as necessary.

VEHICLE IS DISABLED

1. Record all DTCs and the accompanying DTC Event Data.
2. With engine running, place transmission in gear and verify correct PRNDL reading. Observe the Input and Output speeds using the scan tool. If output RPM is greater than zero but vehicle does not move, check for transfer case in Neutral (or failed internally), failed propshaft, or failed / disconnected drive axle. If output RPM is zero and input RPM is greater than zero, internal transmission slippage is indicated. Run clutch slip tests using the scan tool, check oil pan for debris, and air check the various clutch circuits.
3. Shift the transmission into neutral, if both input and output speeds are zero, check flexplate bolts, torque converter, and transmission input shaft.
4. Compare actual line pressure (sensor reading, using the scan tool) to the Desired Line Pressure reading, in Park, Drive, and Reverse at 1500 RPM. Check that the LP sensor reads 30 psi (the minimum it should ever display) with key on / engine off. If line pressure is incorrect, check fluid level and condition.
5. Remove, inspect, and repair the transmission as necessary.

HYDRAULIC PRESSURE TESTS

NOTE: Before performing the hydraulic pressure tests be certain to disconnect the Variable Line Pressure (VLP) electrical connector at the transmission. Check for and clear any codes that may have been set after performing any hydraulic pressure test and connecting the Variable Line Pressure (VLP) electrical connector.

Fig. 8: Pressure Taps
Courtesy of CHRYSLER LLC

- 1 - TORQUE CONVERTER CLUTCH OFF
- 2 - REVERSE
- 3 - LOW/REVERSE
- 4 - 2/4
- 5 - UNDERDRIVE
- 6 - TORQUE CONVERTER CLUTCH ON
- 7 - OVERDRIVE

Pressure testing is a very important step in the diagnostic procedure. These tests usually reveal the cause of most transmission problems.

Before performing pressure tests, be certain that fluid level and condition, and shift cable adjustments have been checked and approved. Fluid must be at operating temperature (150 to 200 degrees F.).

Install an engine tachometer, raise vehicle on hoist which allows the wheels to turn, and position tachometer so it can be read.

Using special adapters L-4559, attach 300 psi gauge(s) C-3293SP to the port(s) required for test being conducted.

Test port locations are shown in the Pressure Taps graphic.

TEST ONE - SELECTOR IN MANUAL 1 (1st Gear)

NOTE: This test checks pump output, pressure regulation and condition of the low/reverse clutch hydraulic circuit and shift schedule.

1. Attach pressure gauge to the low/reverse clutch tap.
2. Move selector lever to the MANUAL 1 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed to 20 mph.
4. Low/reverse clutch pressure should read 115 to 145 psi.

TEST TWO - SELECTOR IN MANUAL 2 (Second Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the MANUAL 2 position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph.
4. In second gear the underdrive clutch pressure should read 110 to 145 psi.

TEST TWO A - SELECTOR IN DRIVE (OD ON - Fourth Gear)

NOTE: This test checks the underdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the underdrive clutch tap.
2. Move selector lever to the DRIVE position. Verify that the OD switch is ON.
3. Allow wheels to rotate freely and increase throttle opening to achieve an indicated speed of 40 mph.
4. Underdrive clutch pressure should read below 5 psi. If not, than either the solenoid assembly or controller is at fault.

TEST THREE - SELECTOR IN DRIVE (OD OFF - Third and Second Gear)

NOTE: This test checks the overdrive clutch hydraulic circuit as well as the shift schedule.

1. Attach gauge to the overdrive clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 20 mph.
4. Overdrive clutch pressure should read 74 to 95 psi.
5. Move selector lever to the DRIVE position and increase indicated vehicle speed to 30 mph.

6. The vehicle should be in second gear and overdrive clutch pressure should be less than 5 psi.

TEST FOUR - SELECTOR IN DRIVE (OD ON - Fourth Gear)

NOTE: **This test checks the 2/4 clutch hydraulic circuit.**

1. Attach gauge to the 2/4 clutch tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle front wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 30 mph. Vehicle should be in fourth gear.
4. The 2/4 clutch pressure should read 75 to 95 psi.

TEST FIVE-SELECTOR IN DRIVE (OD ON - Fourth Gear, CC on)

NOTE: **These tests check the torque converter clutch hydraulic circuit.**

1. Attach gauge to the torque converter clutch off pressure tap.
2. Move selector lever to the DRIVE position.
3. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph. Vehicle should be in 4th gear, CC on.

CAUTION: Both wheels must turn at the same speed.

4. Torque converter clutch off pressure should be less than 5 psi.
5. Now attach the gauge to the torque converter clutch on pressure tap.
6. Move selector to the OD position.
7. Allow vehicle wheels to turn and increase throttle opening to achieve an indicated vehicle speed of 50 mph.
8. Verify the torque converter clutch is applied mode using the RPM display of the scan tool.
9. Torque converter clutch on pressure should be 60-90 psi.

TEST SIX-SELECTOR IN REVERSE

NOTE: **This test checks the reverse clutch hydraulic circuit.**

1. Attach gauge to the reverse and low/reverse clutch tap.
2. Move selector lever to the REVERSE position.
3. Read reverse clutch pressure with output stationary (foot on brake) and throttle opened to achieve 1500 RPM.
4. Reverse and low/reverse clutch pressure should read 165 to 235 psi.

TEST RESULT INDICATIONS

1. If proper line pressure is found in any one test, the pump and pressure regulator are working properly.
2. Low pressure in all positions indicates a defective pump, a clogged filter, or a stuck pressure regulator valve.
3. Clutch circuit leaks are indicated if pressures do not fall within the specified pressure range.
4. If the overdrive clutch pressure is greater than 5 psi in 6 of Test Three, a worn reaction shaft seal ring or a defective solenoid assembly is indicated.
5. If the underdrive clutch pressure is greater than 5 psi in 4 of Test Two-A, a defective solenoid/pressure switch assembly or controller is the cause.

ALL PRESSURE SPECIFICATIONS ARE PSI (on hoist, with wheels free to turn)

Gear Selector Position	Actual Gear	PRESSURE TAPS						
		Underdrive Clutch	Overdrive Clutch	Reverse Clutch	Torque Converter Clutch Off	Torque Converter Clutch On	2/4 Clutch	Low/Reverse Clutch
PARK - 0 mph *	PARK	0-2	0-5	0-2	60-110	45-100	0-2	115-145
REVERSE - 0 mph *	REVERSE	0-2	0-7	165-235	50-100	35-85	0-2	165-235
NEUTRAL - 0 mph *	NEUTRAL	0-2	0-5	0-2	60-110	45-100	0-2	115-145
Low - 20 mph #	FIRST	110-145	0-5	0-2	60-110	45-100	0-2	115-145
Third - 30 mph #	SECOND	110-145	0-5	0-2	60-110	45-100	115-145	0-2
Third - 45 mph #	DIRECT	75-95	75-95	0-2	60-90	45-80	0-2	0-2
OD - 30 mph #	OVERDRIVE	0-2	75-95	0-2	60-90	45-80	75-95	0-2
OD - 50 mph #	OVERDRIVE WITH TCC	0-2	75-95	0-2	0-5	60-95	75-95	0-2

* Engine Speed at 1500 RPM

CAUTION: Both wheels must be turning at same speed.

CLUTCH AIR PRESSURE TESTS

Fig. 9: Air Pressure Test Plate
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - AIR PRESSURE TEST PLATES
2 - 2/4 CLUTCH RETAINER HOLE |
|--|

Inoperative clutches can be located by substituting air pressure for fluid pressure. The clutches may be tested by applying air pressure to their respective passages after the valve body has been removed. Use Plate Set 6599-1 (1) and 6599-2 (1) to perform test .

To make air pressure tests, proceed as follows:

NOTE: **The compressed air supply must be free of all dirt and moisture. Use a pressure of 30psi.**

1. Remove oil pan and valve body. See **Transmission and Transfer Case/Automatic - 42RLE/VALVE BODY - Removal.**
2. Apply air pressure to the holes in the plates (1), one at a time.
3. Listen for the clutch to apply. It will give a slight thud sound. If a large amount of air is heard escaping, the transmission must be removed from vehicle, disassembled and all seals inspected.

2/4 CLUTCH

Apply air pressure to the feed hole located on the 2/4 clutch retainer (2). Look in the area where the 2/4 piston contacts the first separator plate and watch carefully for the 2/4 piston to move rearward. The piston should return to its original position after the air pressure is removed.

OVERDRIVE CLUTCH

Apply air pressure to the overdrive clutch apply passage and watch for the push/pull piston to move forward. The piston should return to its starting position when the air pressure is removed.

REVERSE CLUTCH

Apply air pressure to the reverse clutch apply passage and watch for the push/pull piston to move rearward. The piston should return to its starting position when the air pressure is removed.

LOW/REVERSE CLUTCH

Apply air pressure to the low/reverse clutch feed hole passage. Look in the area where the low/reverse piston contacts the first separator plate. Watch carefully for the piston to move forward. The piston should return to its original position after the air pressure is removed.

UNDERDRIVE CLUTCH

Fig. 10: Testing Underdrive Clutch
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - AIR PRESSURE TEST PLATE 6599-1
2 - AIR NOZZLE |
|--|

Because this clutch piston cannot be seen, its operation is checked by function. Use an air nozzle (2) to apply air pressure to the low/reverse or the 2/4 clutch opening in Test Plate 6599-1 (2). This locks the output shaft. Use a piece of rubber hose wrapped around the input shaft and a pair of clamp-on pliers to turn the input shaft. Next apply air pressure to the underdrive clutch. The input shaft should not rotate with hand torque. Release the air pressure and confirm that the input shaft will rotate.

FLUID LEAKAGE

TRANSMISSION OIL LEAK

Begin with a thorough inspection of the transmission, particularly at the area of the suspected leak. If an oil leak source is not readily identifiable, the following steps should be followed:

1. Clean or degrease the transmission with a water soluble solvent only.
2. Add an oil soluble dye (use as recommended by manufacturer) while the powertrain is at ambient temperature. Start the engine and let idle for approximately 15 minutes. Check the oil dip stick (if equipped) to make sure the dye is thoroughly mixed as indicated with a fluorescent color under a black light.
3. Using a black light, inspect the entire transmission for fluorescent dye, practically at the suspected area of oil leak. If the oil leak is found and identified, repair per service information instructions.
4. If dye is not observed, drive the vehicle at various speeds for approximately 24 km (15 miles) and repeat inspection.

TORQUE CONVERTER HOUSING AREA

Fig. 11: Converter Housing Leak Paths
Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - PUMP SEAL |
| 2 - PUMP VENT |
| 3 - PUMP BOLT |
| 4 - PUMP GASKET |
| 5 - CONVERTER HOUSING |
| 6 - CONVERTER |
| 7 - REAR MAIN SEAL LEAK |

When diagnosing converter housing (5) fluid leaks, three actions must be taken before repair:

1. Verify proper transmission fluid level.
2. Verify that the leak originates from the converter housing area and is transmission fluid.
3. Determine the true source of the leak.

Fluid leakage at or around the torque converter area may originate from an engine oil leak (7). The area should be examined closely. Factory fill fluid is red and, therefore, can be distinguished from engine oil.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill, or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair.

Pump seal (1) leaks tend to move along the drive hub and onto the rear of the converter. Pump o-ring or pump body leaks follow the same path as a seal leak. Pump attaching bolt (3) leaks are generally deposited on the inside of the converter housing (5) and not on the converter itself. Pump seal (1) or gasket (4) leaks usually travel down the inside of the converter housing.

TORQUE CONVERTER LEAKAGE

Fig. 12: Converter Leak Points - Typical
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - OUTSIDE DIAMETER WELD
2 - TORQUE CONVERTER HUB WELD
3 - STARTER RING GEAR
4 - LUG |
|--|

Possible sources of torque converter leakage are:

- Torque converter weld leaks at the outside diameter weld (1).
- Torque converter hub weld (2).

STANDARD PROCEDURE

ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils®, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil® tap, or equivalent, and installing a Heli-Coil® insert, or

equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil®, or equivalent, tools, and inserts are readily available from most automotive parts suppliers.

REMOVAL

REMOVAL

27. Remove all remaining bolts (2) holding the engine (1) to the transmission (3).
28. Carefully work transmission and torque converter assembly rearward off engine block dowels.
29. Hold torque converter in place during transmission removal.
30. Lower transmission and remove assembly from under the vehicle.
31. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

DISASSEMBLY

CAUTION: Do not intermix clutch discs or plates as the unit might then fail.

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .

NOTE: Tag all clutch pack assemblies, as they are removed, for reassembly identification.

Fig. 27: Removing Torque Converter
Courtesy of CHRYSLER LLC

1. Move the shift lever clockwise as far as it will go and then remove the shift lever.
2. Remove the torque converter (1) from the transmission input shaft (3).

| 1 - TOOL 8266-8 |
| 2 - TOOL 8266-2 |
| 3 - TOOL C-3339A |

3. Measure input shaft end play using End Play Set 8266A (1, 2). Set up End Play Set 8266A and a dial indicator as shown in illustration.
4. Move input shaft in and out to obtain end play reading. End play specifications are 0.13 to 0.64 mm (0.005 to 0.025 inch). Record indicator reading for reference when reassembling the transmission. If endplay exceeds the specified range, the #4 thrust plate needs to be inspected and changed if necessary.

|--|
| 1 - RETAINING RING
2 - OUTPUT SHAFT BEARING |
|--|

NOTE: It is not necessary to remove the output shaft flange to disassemble the transmission. Perform the following steps only if it necessary to replace a component in the extension housing assembly.

5. Place the transmission in PARK to prepare for the removal of the output shaft nut.
6. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
7. Remove the transmission rear oil seal with a suitable slide hammer and screw.
8. Remove the transmission output shaft washer.
9. Remove the transmission rear output shaft bearing retaining ring (1).

| 2 - SPECIAL TOOL C-4171 |
| 3 - SPECIAL TOOL 6052 |
| 4 - REAR CARRIER |

13. Install rear carrier (4) front bearing cone.

Fig. 99: Bearing Installation
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL 6618A 2 - REAR OUTPUT SHAFT BEARING

Check output bearing preload. **Output bearing preload must be checked and/or adjusted if any of the following items have been replaced:**

- Output shaft (rear carrier assembly)
- Output shaft bearings
- Transmission case

14. **PRELOAD CHECK/SHIM SELECTION:** Install rear output shaft bearing cone and Support Plate 6618A (1).

Fig. 100: Special Tool Installed
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL 6618A

15. Install Support Plate 6618A (1). Lightly tighten retaining screws. Screws should be below the plate surface, but do not snug screws.
16. Turn case over on arbor press so that the plate is resting on the press base. **CAUTION: The output shaft will extend through the hole of Support Plate 6618A. Ensure your press table has clearance for the output shaft.**

Fig. 101: Shim Installation
Courtesy of CHRYSLER LLC

1 - SHIM
2 - OUTPUT SHAFT

17. Install shim (1) on output shaft (2). Apply small amount of petrolatum onto the shim to hold it in place. Use the original shim as a starting point. If original shim is not available, use the thickest shim available.

9321-142

Fig. 102: Press Shaft Into Case
Courtesy of CHRYSLER LLC

1 - SPECIAL TOOL C-4171 AND C-4171-2
2 - SPECIAL TOOL MD-998911

18. Install output shaft/rear carrier into rear bearing. The shaft must be pressed into position. Use special tool MD-998911 (Disc) (2) and C-4171 and C-4171-2 (Handle) (1) to press shaft into rear bearing.

Fig. 103: Checking Turning Torque
Courtesy of CHRYSLER LLC

1 - TORQUE WRENCH 2 - SPECIAL TOOL 6498A 3 - OUTPUT SHAFT NUT

CAUTION: Do not re-use old output shaft nut because the removed stake weakens the nut flange. Using special tools 6497 and 6498A, install new output shaft nut. Tighten new output shaft nut to 200 N.m (147 ft. lbs.).

19. Check the turning torque (1) of the output shaft. The shaft should have 1 to 8 in. lbs. of turning torque. If the turning torque is **higher than** 8 in. lbs., install a thicker shim. If turning torque is **less than** 1 in. lb., install a thinner shim. Make sure there is no end play.

Fig. 104: Staking Output Shaft Nut - Typical
Courtesy of CHRYSLER LLC

1 - ARBOR PRESS 2 - STAKING TOOL - 6639 3 - NEW NUT

CAUTION: Failure to stake nut could allow the nut to back-off during use.

20. The new nut (3) must be staked after the correct turning torque is obtained. Use Staking Tool 6639 (2) to stake output shaft nut.

Fig. 105: Properly Staked Nut

- 3 - DIAL INDICATOR TIP TOOL 6268

36. **Measure 2/4 clutch clearance:** Set up dial indicator (1) as shown in illustration. Press down clutch pack with finger and zero dial indicator. Record measurement in four (4) places and take average reading. **The 2/4 clutch pack clearance is 0.76 to 2.64 mm (0.030 to 0.104 inch).** If not within specifications, the clutch is not assembled properly or is excessively worn. **There is no adjustment for the 2/4 clutch clearance.**

Fig. 119: Remove/Install Rear Sun Gear & No. 7 Bearing
Courtesy of CHRYSLER LLC

1 - #7 BEARING 2 - REAR SUN GEAR

37. Install the #7 needle bearing (1) to the rear sun gear (2). The number 7 needle bearing has three anti-reversal tabs and is common with the number 5 and number 2 position. The orientation should allow the bearing to seat flat against the rear sun gear. A small amount of petrolatum can be used to hold the bearing to the rear sun gear.

Fig. 120: Remove/Install Rear Sun Gear

- | |
|--|
| 1 - OVERDRIVE SHAFT ASSEMBLY
2 - #4 THRUST PLATE (SELECT)
3 - PETROLATUM FOR RETENTION |
|--|

41. Determine proper #4 thrust plate thickness. Select the thinnest available #4 thrust plate.
42. Install #4 thrust plate (2) using petrolatum to hold into position.
43. Install input clutch assembly. Ensure the input clutch assembly is completely seated by viewing position through input speed sensor hole. **If the speed sensor tone wheel is not centered in the opening, the input clutches assembly is not seated properly.**

80afb4f6

Fig. 124: Removing Oil Pump O-Ring
 Courtesy of CHRYSLER LLC

- | |
|-------------------------------------|
| 1 - OIL PUMP ASSEMBLY
2 - O-RING |
|-------------------------------------|

44. Remove the oil pump o-ring (2) and install oil pump and gasket to transmission. **Use screw-in dowels or Phillips head screwdrivers to align pump to case. Be sure to reinstall O-ring on oil pump after selecting the proper No. 4 thrust plate.**

80bcd18

Fig. 125: Measure Input Shaft End Play Using Tool 8266A - Typical
Courtesy of CHRYSLER LLC

- | |
|------------------|
| 1 - TOOL 8266-8 |
| 2 - TOOL 8266-2 |
| 3 - TOOL C-3339A |

45. Measure the input shaft end play with the transmission in the vertical position. This will ensure that the measurement will be accurate.
46. Set up and measure endplay using End Play Set 8266A (1, 2) and Dial Indicator Set C-3339A (3) as shown in illustration.
47. Measure input shaft end play. **Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch).** For example, if end play reading is 0.055 inch, select No. 4 Thrust Plate which is 0.071 to 0.074 thick. This should provide an input shaft end play reading of 0.020 inch, which is within specifications.

Fig. 126: Remove/Install Input Clutch Assembly
Courtesy of CHRYSLER LLC

1 - INPUT CLUTCH ASSEMBLY

48. Remove oil pump, gasket, and input clutch assembly to gain access to and install proper #4 thrust plate.
49. Install input clutch assembly (1) with proper thrust plate.

Fig. 127: Remove/Install No. 1 Caged Needle Bearing
Courtesy of CHRYSLER LLC

1 - #1 CAGED NEEDLE BEARING

2 - NOTE: TANGED SIDE OUT

50. Install #1 caged needle bearing (1).

Fig. 128: Remove/Install By-Pass Valve
Courtesy of CHRYSLER LLC

1 - BYPASS VALVE

CAUTION: By-pass valve MUST be replaced if transmission failure occurs.

51. Replace cooler by-pass valve (1) if transmission failure has occurred.

Fig. 129: Remove/Install Oil Pump Gasket
Courtesy of CHRYSLER LLC

1 - BELLHOUSING 2 - OIL PUMP GASKET
--

52. Install oil pump gasket (2).

Fig. 130: Remove/Install Oil Pump Attaching Bolts
Courtesy of CHRYSLER LLC

1 - BOLTS 2 - OIL PUMP

NOTE: To align oil pump, gasket, and case during installation, use threaded dowels or Phillips screwdrivers.

53. Install oil pump (2) and torque oil pump-to-case bolts (1) to 30 N.m (265 in. lbs.). Do not reuse original oil pump bolts.

Fig. 131: Remove/Install Low/Reverse Accumulator Piston
Courtesy of CHRYSLER LLC

1 - ACCUMULATOR PISTON

54. Install low/reverse accumulator (1) as shown in illustration.

Fig. 132: Remove/Install Low/Reverse Accumulator Plug

- | |
|---|
| 1 - OVERDRIVE PISTON AND SPRING
2 - UNDERDRIVE PISTON AND SPRING |
|---|

57. Install underdrive (2) and overdrive (1) accumulators and springs.

Fig. 135: Remove/Install Valve Body
Courtesy of CHRYSLER LLC

1 - VALVE BODY

CAUTION: Do not handle the valve body by the manual shaft. Damage could result.

58. Install valve body (1) into place as shown in illustration.

Fig. 136: Remove/Install Valve Body Fasteners
Courtesy of CHRYSLER LLC

1 - BOLTS

59. Install seven (7) valve body-to-case bolts (1) and torque to 12 N.m (105 in. lbs.).

Fig. 137: Remove/Install Transmission Filter
Courtesy of CHRYSLER LLC

1 - TRANSMISSION FILTER

60. Install transmission oil filter (1) and o-ring. Tighten the bolts to 5 N.m (45 in. lbs.).
61. If necessary, install a new transmission fill tube grommet into the transmission case with Installer 8254.

Fig. 138: Remove/Install Transmission Oil Pan
Courtesy of CHRYSLER LLC

1 - TRANSMISSION OIL PAN

62. Install transmission oil pan (1) with a bead of Mopar® ATF RTV.

Fig. 139: Pan Fastener

 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - INPUT SPEED SENSOR
2 - OUTPUT SPEED SENSOR
3 - TRANSMISSION RANGE SENSOR |
|--|

NOTE: Before installing either speed sensor bolt, it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock AND Seal Adhesive.

64. Install both speed sensors (1, 2) into the transmission case. Torque the speed sensor bolts to 9 N.m (80 in. lbs.).

80bcbdb18

Fig. 141: Measure Input Shaft End Play Using Tool 8266A - Typical

Courtesy of CHRYSLER LLC

1 - TOOL 8266-8
2 - TOOL 8266-2
3 - TOOL C-3339A

65. As a final check of the transmission, measure the input shaft end play. This will indicate when a #4 thrust plate change is required. The #4 thrust plate is located behind the overdrive clutch hub. Attach a dial indicator to transmission bell housing with its plunger seated against end of input shaft. Move input shaft in and out to obtain end play reading. **Input shaft end play must be 0.127 to 0.635 mm (0.005 to 0.025 inch).** If not within specifications, make the necessary thrust plate adjustment.

80761679

Fig. 142: Lube Tube Grommet
Courtesy of CHRYSLER LLC

1 - HOUSING
2 - LUBE TUBE
3 - GROMMET
4 - PRY SLOTS

66. Inspect the lube tube grommet (2) for damage. If the grommet lip is damaged, it will need to be replaced.

Fig. 143: Installing Output Shaft Bearing
Courtesy of CHRYSLER LLC

- | |
|----------------------------|
| 1 - BEARING INSTALLER 9287 |
| 2 - BEARING |
| 3 - TRANSMISSION CASE |

67. Install output shaft bearing in the rear transmission housing. Using Bearing Installer 9287 (1), install the output shaft bearing (2) into the transmission housing. **The closed side of the plastic cage must point towards the transmission.**

Fig. 144: Remove/Install Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER LLC

- | |
|--------------------------|
| 1 - RETAINING RING |
| 2 - OUTPUT SHAFT BEARING |

68. Install the snap-ring into the groove in the output shaft.

69. Install the output shaft into the output shaft bearing.
70. Install the retaining ring (1). Be sure that the retaining ring is seated correctly in the groove.
71. Install the output shaft washer onto the output shaft.

Fig. 145: Install Output Shaft Seal
Courtesy of CHRYSLER LLC

1 - SEAL INSTALLER 8902A 2 - TRANSMISSION CASE

72. Install a new transmission rear seal into the transmission case with Seal Installer 8902A (1).
73. Install the propeller shaft flange onto the output shaft and install an new flange nut finger tight.

Fig. 146: Remove/Install Extension Housing
Courtesy of CHRYSLER LLC

74. Install the extension housing (2) onto the transmission case.

81377454

Fig. 147: Remove/Install Adapter/Extension Housing Bolts
 Courtesy of CHRYSLER LLC

NOTE: Before installing the lowermost four extension housing bolts, it will be necessary to replenish the sealing patch on the bolts using Mopar® Lock AND Seal Adhesive.

75. Install the bolts that hold the extension housing onto the transmission case. Be sure to install any stud bolts to their original locations. Tighten the bolts to 54 N.m (40 ft.lbs.).

810b9520

2 - STAKING TOOL 9078
3 - ALIGNMENT PIN
4 - OUTPUT SHAFT NOTCH |
|--|

76. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut. Tighten the flange nut to 200 N.m (147 ft.lbs.).
77. Stake the output shaft nut to the output shaft as follows. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
78. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4).

Fig. 149: Stake Output Shaft Nut
Courtesy of CHRYSLER LLC

- | |
|-----------------------|
| 1 - STAKING TOOL 9078 |
| 2 - PROPELLER FLANGE |
| 3 - STAKING PIN |

79. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2).
80. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.

INSTALLATION

INSTALLATION

Fig. 150: Torque Converter Installation Depth
Courtesy of CHRYSLER LLC

1. Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

NOTE: Pay attention to transfer all clips, clip retainers, brackets, shields, etc. from the original transmission to the replacement transmission.

2. If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.
3. Lubricate oil pump seal lip with transmission fluid.
4. Place torque converter (1) in position in transmission (2).

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

5. Align torque converter to oil pump seal opening.
6. Insert torque converter hub into oil pump.
7. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
8. Check converter seating with a scale and straightedge (measurement A). Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.

8134b2cc

Fig. 151: Remove/Install Transmission
Courtesy of CHRYSLER LLC

9. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**
10. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
11. Raise transmission (3) and align the torque converter with the drive plate and the transmission converter housing with the engine block (1).
12. Position transmission forward. Then raise, lower or tilt transmission to align the converter housing with the engine block dowels.
13. Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires or the transmission vent hose have become trapped between the engine block and the transmission.
14. Securely install two bolts (2) to secure the transmission to the engine.
15. Install remaining transmission to engine bolts (2). Tighten all bolts to 68N.m (50 ft.lbs.).

Fig. 152: Remove/Install Rear Support & Cushion
 Courtesy of CHRYSLER LLC

16. Install rear transmission crossmember (1). Tighten crossmember to frame bolts to 68 N.m (50 ft.lbs.).
17. Install rear support (3) to transmission. Tighten bolts to 47 N.m (35 ft.lbs.).
18. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts(2) to 47 N.m (35 ft.lbs.).
19. Remove engine support fixture.

Fig. 153: Removing/Installing Engine Oil Pan To Transmission Bolts - 3.5L
 Courtesy of CHRYSLER LLC

20. Install the bolts (1) that secure the transmission (3) to the engine oil pan (2). Tighten bolts to 39 N.m (29 ft.lbs.).

Fig. 154: Input And Output Speed Sensors & Transmission Range Sensor
Courtesy of CHRYSLER LLC

21. Connect the transmission wiring harness to the input speed sensor (1), output speed sensor (2) and transmission range sensor (3).

Fig. 155: Solenoid/Pressure Switch Assembly
Courtesy of CHRYSLER LLC

22. Connect transmission wire harness to the solenoid/pressure switch assembly (1).

Fig. 156: Crankshaft Position Sensor
Courtesy of CHRYSLER LLC

23. Install the crankshaft position sensor and retaining bolt and connect transmissaion wire harness to the sensor. Refer to **Fuel System/Fuel Injection/SENSOR, Crankshaft Position - Installation** .
24. Verify that the transmission is in the PARK position by trying to rotate the propeller shaft. If the propeller shaft rotates, move the transmission manual shift lever to the full rearward position and turn the propeller shaft until the PARK system is engaged.

Fig. 157: Remove/Install Gearshift Cable
Courtesy of CHRYSLER LLC

25. Route the gearshift cable (1) through the mounting bracket (2).
26. Engage the gearshift cable (1) eyelet onto the transmission manual shift lever (3).

27. Install the gearshift cable retaining clip (4) (if equipped).

81376c0b

Fig. 158: Removing/Installing Torque Converter Bolts
Courtesy of CHRYSLER LLC

CAUTION: It is essential that the correct length bolts are used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

28. Install all torque converter-to-driveplate bolts (3) by hand.
29. Verify that the torque converter is pulled flush to the driveplate.
30. Tighten all torque converter-to-driveplate bolts to 88N.m (65 ft. lbs.).

81376c0d

Fig. 159: Removing/Installing Torque Converter Access Cover - 3.5L
Courtesy of CHRYSLER LLC

31. Install the torque converter bolt cover (1) and bolts (2). Tighten the bolts to 11 N.m (8 ft.lbs.).

Fig. 160: Relocate Starter
Courtesy of CHRYSLER LLC

32. Install starter motor (1), closeout (3) and retaining bolts (3). Tighten bolts securely. Refer to **Electrical - Engine Systems/Starting/STARTER - Installation** .

Fig. 161: Transmission Lines
Courtesy of CHRYSLER LLC

33. Connect the cooler line fittings (2) and cooler lines (1) to the transmission.
34. Install the transmission cooler line bracket (3) as equipped.

Fig. 162: Remove/Install Transmission Fill Tube
 Courtesy of CHRYSLER LLC

NOTE: Inspect the fill tube grommet to determine if the grommet is new or used. If a new fill tube grommet is in the transmission case, pierce the center of the grommet with a ballpoint pen, or similar instrument, to prepare the grommet for the fill tube installation.

35. Install the transmission fill tube (2) onto the transmission (1).
36. Install the transmission fill tube retaining bolt (3). Tighten the bolt securely.
37. Install exhaust components.

Fig. 163: Remove/Install Propeller Shaft
 Courtesy of CHRYSLER LLC

38. Align and connect the propeller shaft flange (3) to the transmission output shaft flange (4) and install the retaining bolts (2). Refer to **Differential and Driveline/Propeller Shaft - Installation**.
39. Adjust gearshift cable if necessary.

40. Lower vehicle.
41. Connect negative battery cable.
42. Fill transmission with appropriate transmission fluid. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Description** according to the standard procedure. Refer to **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure**.
43. Verify proper operation.

ACCUMULATOR

DESCRIPTION

DESCRIPTION

811f652d

Fig. 221: Underdrive and Overdrive Accumulators
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OVERDRIVE PISTON AND SPRING
2 - UNDERDRIVE PISTON AND SPRING |
|---|

The 42RLE underdrive, overdrive, low/reverse, and 2/4 clutch hydraulic circuits each contain an accumulator. An accumulator typically consists of a piston, return spring(s), and a cover or plug. The overdrive (1) and underdrive (2) accumulators are located within the transmission case, and are retained by the valve body .

811f672

Fig. 222: Low/Reverse Accumulator
 Courtesy of CHRYSLER LLC

- | |
|----------------------------------|
| 1 - PISTON
2 - RETURN SPRINGS |
|----------------------------------|

The low reverse (1) accumulator is also located within the transmission case, but the assembly is retained by a cover and a snap-ring.

5 - PISTON |
|---|

The 2/4 accumulator (5) is located in the valve body. It is retained by a cover and retaining screws .

OPERATION

OPERATION

The function of an accumulator is to cushion the application of a frictional clutch element. When pressurized fluid is applied to a clutch circuit, the application force is dampened by fluid collecting in the respective accumulator chamber against the piston and springs. The intended result is a smooth, firm clutch application.

ASSEMBLY, INPUT CLUTCH

DISASSEMBLY

NOTE: If the input clutch assembly is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the Quick Learn Procedure using the scan tool. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .

1. Mount input clutch assembly to Input Clutch Pressure Fixture (Tool 8391).
2. Tap down (2) reverse clutch reaction plate (4) to release pressure from snap ring.

ASSEMBLY, TRANSMISSION SOLENOID AND PRESSURE SWITCH

DESCRIPTION

DESCRIPTION

Fig. 289: Valve Body Assembly
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - SOLENOID/PRESSURE SWITCH ASSEMBLY2 - TRS3 - TRANSFER PLATE4 - SEPARATOR PLATE5 - VALVE BODY |
|---|

The Solenoid/Pressure Switch Assembly (1) is inside the transmission and mounted to the valve body assembly. The assembly consists of four solenoids that control hydraulic pressure to the L/R, 2/4, OD, and UD friction elements (transmission clutches), and the torque converter clutch. The reverse clutch is controlled by line pressure from the manual valve in the valve body. The solenoids are contained within the Solenoid/Pressure Switch Assembly, and can only be serviced by replacing the assembly.

The solenoid assembly also contains pressure switches that monitor and send hydraulic circuit information to the TCM. Likewise, the pressure switches can only be service by replacing the assembly.

OPERATION

OPERATION

SOLENOIDS

The solenoids receive electrical power from the Transmission Control Relay through a single wire. The TCM energizes or operates the solenoids individually by grounding the return wire of the solenoid needed. When a solenoid is energized, the solenoid valve shifts, and a fluid passage is opened or closed (vented or applied), depending on its default operating state. The result is an apply or release of a frictional element.

The 2/4 and UD solenoids are normally applied, which allows fluid to pass through in their relaxed or "off" state. By design, this allows transmission limp-in (P,R,N,2) in the event of an electrical failure.

The continuity of the solenoids and circuits are periodically tested. Each solenoid is turned on or off depending on its current state. An inductive spike should be detected by the TCM during this test. If no spike is detected, the circuit is tested again to verify the failure. In addition to the periodic testing, the solenoid circuits are tested if a speed ratio or pressure switch error occurs.

PRESSURE SWITCHES

The TCM relies on three pressure switches to monitor fluid pressure in the L/R, 2/4, and OD hydraulic circuits. The primary purpose of these switches is to help the TCM detect when clutch circuit hydraulic failures occur. The range for the pressure switch closing and opening points is 11-23 psi. Typically the switch opening point will be approximately one psi lower than the closing point. For example, a switch may close at 18 psi and open at 17 psi. The switches are continuously monitored by the TCM for the correct states (open or closed) in each gear as shown in the following chart:

PRESSURE SWITCH STATES

GEAR	L/R	2/4	OD
R	OP	OP	OP
P/N	CL	OP	OP
1st	CL	OP	OP
2nd	OP	CL	OP
D	OP	OP	CL
OD	OP	CL	CL
OP = OPEN			
CL = CLOSED			

A Diagnostic Trouble Code (DTC) will set if the TCM senses any switch open or closed at the wrong time in a given gear.

The TCM also tests the 2/4 and OD pressure switches when they are normally off (OD and 2/4 are tested in 1st gear, OD in 2nd gear, and 2/4 in 3rd gear). The test simply verifies that they are operational, by looking for a closed state when the corresponding element is applied. Immediately after a shift into 1st, 2nd, or 3rd gear with the engine speed above 1000 RPM, the TCM momentarily turns on element pressure to the 2/4 and/or OD clutch circuits to identify that the appropriate switch has closed. If it doesn't close, it is tested again. If the switch fails to close the second time, the appropriate Diagnostic Trouble Code (DTC) will set.

REMOVAL

REMOVAL

NOTE: If the Solenoid/Pressure Switch Assembly is being replaced, the Quick Learn Procedure must be performed. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .

2. Install and tighten retaining screws (2) to 5.5 N.m (50 in. lbs.) torque.
3. Install valve body. See **Transmission and Transfer Case/Automatic - 42RLE/VALVE BODY - Installation**.

BEARING

ADJUSTMENTS

ADJUSTMENTS

Take extreme care when removing and installing bearing cups and cones. **Use only an arbor press for installation**, as a hammer may not properly align the bearing cup or cone. Burrs or nicks on the bearing seat will give a false end play reading, while gauging for proper shims. Improperly seated bearing cup and cones are subject to low-mileage failure.

Bearing cups and cones should be replaced if they show signs of pitting or heat distress.

If distress is seen on either the cup or bearing rollers, both cup and cone must be replaced.

NOTE: **Bearing drag torque specifications must be maintained to avoid premature bearing failures.**

Used (original) bearing may lose up to 50 percent of the original drag torque after break-in.

NOTE: **All bearing adjustments must be made with no other component interference or gear inter-mesh.**

Oil all bearings before checking turning torque.

|--|

1. Raise and support vehicle.
2. Remove the propeller shaft. Refer to **Differential and Driveline/Propeller Shaft - Removal** .
3. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
4. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
5. Remove the transmission rear oil seal with a suitable slide hammer and screw.
6. Remove the transmission rear output shaft bearing retaining ring (1) .

3 - STAKING PIN |
|--|

- Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2) .
- Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.
- Install the propeller shaft. Refer to **Differential and Driveline/Propeller Shaft - Installation** .

CABLE, PARK LOCK

DESCRIPTION

DESCRIPTION

The Park Lock Cable is no longer used. The ignition lock out is controlled by means of a Gated Park Switch (electronic micro switch) located in the shifter assembly.

CABLE, SHIFT

DIAGNOSIS AND TESTING

GEARSHIFT CABLE

1. Engine starts must be possible with shift lever in PARK or NEUTRAL positions only. Engine starts must not be possible in any other gear position.
2. With the shift lever in the:
 - a. PARK position - Apply upward force on the shift arm and remove pressure. Engine starts must be possible.
 - b. PARK position - Apply downward force on the shift arm and remove pressure. Engine starts must be possible.
 - c. NEUTRAL position - Normal position. Engine starts must be possible.
 - d. NEUTRAL position - Engine running and brakes applied, apply upward force on the shift arm. Transmission shall not be able to shift from neutral to reverse.

REMOVAL

REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.

Fig. 303: Remove/Install Gearshift Cable
Courtesy of CHRYSLER LLC

3. Remove the gearshift cable retaining clip (4) (if equipped).
4. Disconnect the gearshift cable (1) eyelet at transmission manual shift lever (3) and pull the cable out of the mounting bracket (2).

Fig. 304: Gearshift Cable At Shifter Assembly

|---|
| 1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER
5 - ADJUSTMENT BOLT |
|---|

13. Verify that the shifter is in the PARK position and tighten the adjustment screw (5) to 7 N.m (65 in.lbs.).
14. Verify correct shifter operation.
15. If necessary, install the shield, covering the gearshift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
16. Install the floor console. Refer to **Body/Interior/CONSOLE, Floor - Installation** as necessary.

ADJUSTMENTS

GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position contact may be faulty.

Fig. 311: Gearshift Cable At Shifter Assembly

| <p>1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER
5 - ADJUSTMENT BOLT</p> |
|--|

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. Refer to **Body/Interior/CONSOLE, Floor - Removal** .
3. Loosen the shift cable adjustment screw (5) .
4. Raise vehicle.

5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.

9. Lower vehicle
10. Tighten the shift cable adjustment screw (5) to 7 N.m (65 in.lbs.).
11. Verify correct operation.
12. Install any floor console components removed for access. Refer to **Body/Interior/CONSOLE, Floor - Installation** .

DRIVING CLUTCHES

DESCRIPTION

DESCRIPTION

Fig. 313: Input Clutch Assembly
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - INPUT SHAFT
2 - UNDERDRIVE CLUTCH
3 - OVERDRIVE CLUTCH
4 - REVERSE CLUTCH
5 - OVERDRIVE SHAFT
6 - UNDERDRIVE SHAFT |
|---|

Three hydraulically applied input clutches are used to drive planetary components. The underdrive (2), overdrive (3), and reverse (4) clutches are considered input/driving clutches and are contained within the input clutch assembly . The input clutch assembly also contains:

- Input shaft.
- Input hub.
- Clutch retainer.
- Underdrive piston.
- Overdrive/reverse piston.
- Overdrive hub.
- Underdrive hub.

OPERATION

OPERATION

The three input clutches are responsible for driving different components of the planetary geartrain.

NOTE: See Transmission and Transfer Case/Automatic - 42RLE - Diagnosis and Testing for a collective view of which clutch elements are applied at each position of the selector lever.

UNDERDRIVE CLUTCH

The underdrive clutch is hydraulically applied in first, second, and third (direct) gears by pressurized fluid against the underdrive piston. When the underdrive clutch is applied, the underdrive hub drives the rear sun gear.

OVERDRIVE CLUTCH

The overdrive clutch is hydraulically applied in third (direct) and overdrive gears by pressurized fluid against the overdrive/reverse piston. When the overdrive clutch is applied, the overdrive hub drives the front planet carrier.

REVERSE CLUTCH

The reverse clutch is hydraulically applied in reverse gear only by pressurized fluid against the overdrive/reverse piston. When the reverse clutch is applied, the front sun gear assembly is driven.

FLUID AND FILTER

DIAGNOSIS AND TESTING

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

1. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
2. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes

with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

CHECK OIL LEVEL

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

WARNING: Risk of accident from vehicle starting off by itself when engine running. Risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

3. Actuate the service brake. Start engine and let it run at idle speed in selector lever position "P".

4. Shift through the transmission modes several times with the vehicle stationary and the engine idling
5. Warm up the transmission, wait at least 2 minutes and check the oil level with the engine running. Push the Oil Dipstick 9336A into transmission fill tube until the dipstick tip contacts the oil pan and pull out again, read off oil level, repeat if necessary.

NOTE: The dipstick protrudes from the fill tube when installed.

Fig. 314: 42RLE Fluid Temperature Chart
Courtesy of CHRYSLER LLC

1427320

6. Check transmission oil temperature using the appropriate scan tool.
7. The transmission Oil Dipstick 9336A has indicator marks every 10mm. Determine the height of the oil level on the dipstick and using the height, the transmission temperature, and the Transmission Fluid Graph, determine if the transmission oil level is correct.
8. Add or remove oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

FLUID/FILTER SERVICE

NOTE: Only fluids of the type labeled Mopar® ATF+4, Automatic Transmission Fluid, should be used in the transmission sump. A filter change should be made at the time of the transmission oil change. The magnet (on the inside of the oil pan) should also be cleaned with a clean, dry cloth.

NOTE: If the transmission is disassembled for any reason, the fluid and filter should be changed.

1. Raise vehicle on a hoist. Place a drain container with a large opening, under transmission oil pan.

Fig. 315: Pan Fastener
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - FRONT DRIVESHAFT |
| 2 - PRESSURE PORTS |
| 3 - TRANSMISSION CASE |
| 4 - TRANSMISSION OIL PAN |
| 5 - SECOND TRANSMISSION OIL PAN BOLT ON LEFT SIDE |
| 6 - FIRST TRANSMISSION OIL PAN BOLT |

NOTE: One of the oil pan bolts (5) has a sealing patch applied from the factory. Separate this bolt for reuse.

2. Loosen pan bolts and tap the pan at one corner to break it loose allowing fluid to drain, then remove the oil pan.
3. Install a new filter and o-ring on bottom of the valve body and tighten retaining screws to 5 N.m (45 in. lbs.).

NOTE: Before installing the oil pan bolt (5) in the bolt hole located between the

torque converter clutch on and U/D clutch pressure tap circuits , it will be necessary to replenish the sealing patch on the bolt using Mopar® Lock AND Seal Adhesive.

4. Clean the oil pan and magnet. Reinstall pan using new Mopar® Silicone Adhesive sealant. Tighten oil pan bolts to 20 N.m (14.5 ft. lbs.).
5. Pour four quarts of Mopar® ATF+4, Automatic Transmission Fluid, through the dipstick opening.
6. Start engine and allow to idle for at least one minute. Then, with parking and service brakes applied, move selector lever momentarily to each position, ending in the park or neutral position.
7. Check the transmission fluid level and add an appropriate amount to bring the transmission fluid level to 3mm (1/8 in.) below the lowest mark on the dipstick.
8. Recheck the fluid level after the transmission has reached normal operating temperature, 82° C (180°F).
9. To prevent dirt from entering transmission, make certain that dipstick is fully seated into the dipstick opening.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Remove dipstick and insert clean funnel in transmission fill tube.
2. Add following initial quantity of Mopar® ATF +4, Automatic Transmission Fluid, to transmission:
 - a. If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF +4 to transmission.
 - b. If transmission was completely overhauled, or torque converter was replaced or drained, add **12 pints (6 quarts)** of ATF +4 to transmission.
3. Apply parking brakes.
4. Start and run engine at normal curb idle speed.
5. Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.
6. Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticeably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.
7. Drive vehicle until transmission fluid is at normal operating temperature.
8. With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

9. Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in

fill tube.

GEARTRAIN, PLANETARY

DESCRIPTION

DESCRIPTION

Fig. 316: Planetary Geartrain
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - FRONT SUN GEAR ASSEMBLY2 - #6 THRUST BEARING3 - #7 THRUST BEARING4 - REAR CARRIER FRONT ANNULUS ASSEMBLY5 - REAR SUN GEAR6 - FRONT CARRIER REAR ANNULUS ASSEMBLY |
|---|

The planetary geartrain is located between the input clutch assembly and the rear of the transmission case. The planetary geartrain consists of two sun gears, two planetary carriers, two annulus (ring) gears, and one output shaft .

OPERATION

OPERATION

The planetary geartrain utilizes two planetary gear sets that connect the transmission input shaft to the output shaft. Input and holding clutches drive or lock different planetary members to change output ratio or direction.

HOLDING CLUTCHES

DESCRIPTION

DESCRIPTION

Fig. 317: 2/4 and Low/Reverse Clutches
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - FRONT PLANET CARRIER/REAR ANNULUS2 - 2/4 CLUTCH3 - L/R CLUTCH4 - REAR PLANET CARRIER/FRONT ANNULUS5 - REAR SUN GEAR6 - FRONT SUN GEAR ASSEMBLY |
|---|

Two hydraulically applied multi-disc clutches are used to hold planetary geartrain components stationary while the input clutches drive others. The 2/4 (2) and Low/Reverse (3) clutches are considered holding clutches and are contained at the rear of the transmission case .

OPERATION

OPERATION

NOTE: See Transmission and Transfer Case/Automatic - 42RLE - Diagnosis and Testing for a collective view of which clutch elements are applied at each

position of the selector lever.

2/4 CLUTCH

The 2/4 clutch is hydraulically applied in second and fourth gears by pressurized fluid against the 2/4 clutch piston. When the 2/4 clutch is applied, the front sun gear assembly is held or grounded to the transmission case.

LOW/REVERSE CLUTCH

The Low/Reverse clutch is hydraulically applied in park, reverse, neutral, and first gears by pressurized fluid against the Low/Reverse clutch piston. When the Low/Reverse clutch is applied, the front planet carrier/rear annulus assembly is held or grounded to the transmission case.

MECHANISM, BRAKE TRANSMISSION SHIFT INTERLOCK

DESCRIPTION

DESCRIPTION

81d2c3ce

Fig. 318: Brake Transmission Shift Interlock (BTSI) Override
Courtesy of CHRYSLER LLC

The Brake Transmission Shifter/Ignition Interlock (BTSI) is a electronically operated system that prevents the transmission gear shifter from being moved out of PARK without the proper driver inputs. The system also contains a solenoid that is integral to the shifter assembly.

A BTSI override (2) is provided on the inside of the shifter mechanism (1) to allow the vehicle to be shifted out of PARK in the event of an electrical failure.

OPERATION

OPERATION

Fig. 319: Ignition Key/Switch Positions
Courtesy of CHRYSLER LLC

- 1 - LOCK

2 - ACC

3 - ON

4 - START

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK (1) position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A solenoid in the shifter assembly is energized when the brake pedal is depressed. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position. An electronic micro switch also prevents the ignition switch from being turned to the LOCK position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.

3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear position, except PARK, and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.
5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, and the brake depressed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

BTSL Override

81d2c3f1

Fig. 320: Cubby Bin Liner
Courtesy of CHRYSLER LLC

In the event of an electrical failure, the vehicle can be shifted out of PARK by using the following procedure.

1. Turn the key to the ACC or ON position.
2. Remove the liner (1) to the cubby bin on the right side of the shifter.

81d2c3ce

Fig. 321: Brake Transmission Shift Interlock (BTSI) Override
Courtesy of CHRYSLER LLC

3. Depress the BTSI override (2) on the inside of the shifter assembly (1).
4. While the override is depressed, move the shifter out of the PARK position.
5. Return the cubby bin liner to its original location.

DIAGNOSIS AND TESTING

BRAKE TRANSMISSION SHIFT INTERLOCK

SYSTEM VERIFICATION

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from ACC to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.

ADJUSTMENTS

BRAKE TRANSMISSION SHIFT INTERLOCK

The park interlock cable is part of the brake/shift lever interlock system. Correct cable adjustment is important to proper interlock operation. The gear shift and park lock cables must both be correctly adjusted in order to shift out of PARK.

ADJUSTMENT PROCEDURE

1. Remove floor console as necessary for access to the park lock cable. Refer to **Body/Interior/CONSOLE, Floor - Removal**.
2. Shift the transmission into the PARK position.
3. Turn ignition switch to LOCK position. **Be sure ignition key cylinder is in the LOCK position. Cable will not adjust correctly in any other position.**

NOTE: If the key will not turn to the LOCK position, pull up on the cable lock button and manually move the cable in and out until the key can be turned to the LOCK position.

4. Pull cable lock button up to release cable, if necessary.
5. Remove and discard the cable adjuster lock pin, if a new cable is being installed.
6. Ensure that the cable is free to self-adjust by pushing cable rearward and releasing.
7. Push lock button down until it snaps in place. The lock should be 1-2mm below the surface of the cylindrical portion of the cable adjustment housing.

BTSS FUNCTION CHECK

1. Verify removal of ignition key allowed in PARK position only.
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely LOCK position. When the shifter is in any other position, the ignition key should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.
7. The floor shifter lever and gate positions should be in alignment with all transmission detent positions.
8. Engine starts must be possible with shifter lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gate positions other than PARK or NEUTRAL.
9. With the shifter lever handle in the:

- PARK position- apply forward force on center of handle and remove pressure. Engine start must be possible.
- PARK position- apply rearward force on center of handle and remove pressure. Engine start must be possible.
- NEUTRAL position- engine start must be possible.
- NEUTRAL position, engine running and brakes applied- Apply forward force on center of shift handle. Transmission should not be able to shift into REVERSE detent.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

Fig. 322: Oil Pump Assembly

| 1 - PUMP HOUSING
2 - OUTER PUMP GEAR
3 - INNER PUMP GEAR
4 - REACTION SHAFT SUPPORT
5 - SEAL RINGS (4)
6 - REACTION SHAFT
7 - CRESCENT |
|--|

The oil pump is located in the pump housing inside the bell housing of the transmission case. The oil pump assembly consists of an inner (3) and outer (2) gear, a housing (1), and a cover that also serves as the reaction shaft support (6).

OPERATION

OPERATION

As the torque converter rotates, the converter hub rotates the inner and outer gears. As the gears rotate, the clearance between the gear teeth increases in the crescent area, and creates a suction at the inlet side of the pump. This suction draws fluid through the pump inlet from the oil pan. As the clearance between the gear teeth in the crescent area decreases, it forces pressurized fluid into the pump outlet and to the valve body.

DISASSEMBLY

DISASSEMBLY

CLEANING

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

INSPECTION

Fig. 325: Measure Outer Gear to Pocket
 Courtesy of CHRYSLER LLC

1 - OUTER GEAR
 2 - POCKET

1. Re-install the gears and check clearances.
2. Measure the clearance between the outer gear (1) and the pump pocket (2) . Clearance should be 0.089-0.202 mm (0.0035-0.0079 in.).
3. Measure clearance between outer gear and crescent. Clearance should be 0.060-0.298 mm (0.0023-0.0117 in.).
4. Measure clearance between inner gear and crescent. Clearance should be 0.093-0.385 mm (0.0036-0.0151 in.).

RELAY, TRANSMISSION CONTROL

DESCRIPTION

DESCRIPTION

NOTE: Due to different power control configurations, the Transmission Control Relay (if equipped) may be referred to as a PCM relay.

The relay is supplied fused B+ voltage, energized by the TCM, and is used to supply power to the solenoid pack when the transmission is in normal operating mode.

OPERATION

OPERATION

NOTE: Due to different power control configurations, the Transmission Control Relay (if equipped) may be referred to as a PCM relay.

When the relay is "off", no power is supplied to the solenoid pack and the transmission is in "limp-in" mode. After a controller reset, the TCM energizes the relay. Prior to this, the TCM verifies that the contacts are open by checking for no voltage at the switched battery terminals. After this is verified, the voltage at the solenoid pack pressure switches is checked. After the relay is energized, the TCM monitors the terminals to verify that the voltage is greater than 3 volts.

SEAL, OIL PUMP

REMOVAL

REMOVAL

1. Remove the transmission from the vehicle. See Transmission and Transfer Case/Automatic - 42RLE - Removal.
2. Remove the torque converter from the transmission bellhousing.
3. Use a screw mounted in a slide hammer to remove oil pump seal.

INSTALLATION

INSTALLATION

1. Clean and inspect oil pump seal seat. Then install seal using Seal Installer C-4193A.
2. Clean and inspect torque converter hub. If nicks, scratches or hub wear are found, torque converter replacement will be required.

CAUTION: If the torque converter is being replaced, apply a light coating of grease to the crankshaft pilot hole. Also inspect the engine drive plate for cracks. If any cracks are found replace the drive plate. Do not attempt to repair a cracked drive plate. Always use new torque converter to drive plate bolts.

3. Apply a light film of transmission oil to the torque converter hub and oil seal lips. Then install torque converter into transmission. Be sure that the hub lugs mesh with the front pump lugs when installing.
4. Reinstall the transmission into the vehicle. See Transmission and Transfer Case/Automatic - 42RLE - Installation.

SEAL, OUTPUT SHAFT

REMOVAL

REMOVAL

1. Remove the propeller shaft. Refer to Differential and Driveline/Propeller Shaft - Removal . Move propeller shaft to the right and tie up.
2. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
3. Remove the nut holding the propeller shaft flange to the output shaft and remove the flange.
4. Remove the output shaft seal with suitable screw and slide hammer.

INSTALLATION

INSTALLATION

Fig. 328: Installing A New Transmission Rear Seal
 Courtesy of CHRYSLER LLC

1 - SEAL INSTALLER 8902A 2 - TRANSMISSION CASE

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Use Seal Installer 8902A (1) to install the seal.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
4. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut to 200 N.m (147 ft.lbs.).

 Courtesy of CHRYSLER LLC

1 - PROPELLER SHAFT FLANGE 2 - STAKING TOOL 9078

3 - ALIGNMENT PIN 4 - OUTPUT SHAFT NOTCH

5. Stake the output shaft nut to the output shaft as follows. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
6. Rotate the Staking Tool 9078 (2) until the alignment pin (3) engages the output shaft notch (4) .

Fig. 330: Stake Output Shaft Nut
Courtesy of CHRYSLER LLC

1 - STAKING TOOL 9078 2 - PROPELLER FLANGE 3 - STAKING PIN
--

7. Press downward on the staking tool until the staking pin (3) contacts the output shaft nut flange (2) .
8. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.
9. Install the propeller shaft. Refer to Differential and Driveline/Propeller Shaft - Installation .

SENSOR, SPEED, INPUT

DESCRIPTION

DESCRIPTION

Fig. 331: Input And Output Speed Sensors & Transmission Range Sensor
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - INPUT SPEED SENSOR
2 - OUTPUT SPEED SENSOR
3 - TRANSMISSION RANGE SENSOR |
|--|

The Input (1) and Output (2) Speed Sensors are two-wire magnetic pickup devices that generate AC signals as rotation occurs. They are mounted in the left side of the transmission case and are considered primary inputs to the Transmission Control Module (TCM).

OPERATION

OPERATION

The Input Speed Sensor provides information on how fast the input shaft is rotating. As the teeth of the input clutch hub pass by the sensor coil, an AC voltage is generated and sent to the TCM. The TCM interprets this information as input shaft RPM.

The Output Speed Sensor generates an AC signal in a similar fashion, though its coil is excited by rotation of the rear planetary carrier lugs. The TCM interprets this information as output shaft RPM.

The TCM compares the input and output speed signals to determine the following:

- Transmission gear ratio
- Speed ratio error detection
- CVI calculation

The TCM also compares the input speed signal and the engine speed signal to determine the following:

- Torque converter clutch slippage

- Torque converter element speed ratio

SENSOR, TRANSMISSION OIL TEMPERATURE

DESCRIPTION

DESCRIPTION

80be46c0

Fig. 337: Transmission Temperature Sensor
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - TRANSMISSION RANGE SENSOR
2 - TEMPERATURE SENSOR |
|---|

The transmission temperature sensor (2) is located in the transmission range sensor (1) and communicates transmission sump temperature to the TCM.

OPERATION

OPERATION

The transmission range sensor (TRS) has an integrated thermistor that the TCM uses to monitor the transmission's sump temperature. Since fluid temperature can affect transmission shift quality and converter lock up, the TCM requires this information to determine which shift schedule to operate in. The TCM also monitors this temperature data so it can energize the vehicle cooling fan(s) when a transmission "overheat" condition exists. If the thermistor circuit fails, the TCM will revert to calculated oil temperature usage.

CALCULATED TEMPERATURE

A failure in the temperature sensor or circuit will result in calculated temperature being substituted for actual temperature. Calculated temperature is a predicted fluid temperature which is calculated from a combination of inputs:

- Battery (ambient) temperature
- Engine coolant temperature
- In-gear run time since start-up

SENSOR, TRANSMISSION RANGE

DESCRIPTION

DESCRIPTION

Fig. 338: Valve Body Assembly
Courtesy of CHRYSLER LLC

- | |
|---|
| <ul style="list-style-type: none">1 - SOLENOID/PRESSURE SWITCH ASSEMBLY2 - TRS3 - TRANSFER PLATE4 - SEPARATOR PLATE5 - VALVE BODY |
|---|

The Transmission Range Sensor (TRS) (2) is mounted to the top of the valve body inside the transmission and can only be serviced by removing the valve body assembly. The electrical connector extends through the transmission case.

The Transmission Range Sensor (TRS) has four switch contacts that monitor shift lever position and send the information to the PCM.

OPERATION

OPERATION

The Transmission Range Sensor (TRS) communicates shift lever position (SLP) to the TCM as a

combination of open and closed switches. Each shift lever position has an assigned combination of switch states (open/closed) that the TCM receives from four sense circuits. The TCM interprets this information and determines the appropriate transmission gear position and shift schedule.

Since there are four switches, there are 16 possible combinations of open and closed switches (codes). Seven of these codes are related to gear position and three are recognized as "between gear" codes. This results in six codes which should never occur. These are called "invalid" codes. An invalid code will result in a DTC, and the TCM will then determine the shift lever position based on pressure switch data. This allows reasonably normal transmission operation with a TRS failure.

|--|
| 1 - PRESSURE CONTROL SOLENOID
2 - LINE PRESSURE SENSOR
3 - SHOULDER SCREW
4 - VARIABLE LINE PRESSURE HEADER
5 - MANUAL SHAFT
6 - SCREWS |
|--|

The line pressure sensor (2) is mounted on the top of the valve body, next to the pressure control solenoid (1).

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure sensor monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

OPERATION

The TCM calculates the desired line pressure based upon inputs from the transmission and engine. The TCM calculates the torque input to the transmission and uses that information as the primary input to the calculation. The line pressure is set to a predetermined value during shifts and when the transmission is in the PARK and NEUTRAL positions. This is done to ensure consistent shift quality. During all other operation, the actual line pressure is compared to the desired line pressure and adjustments are made to the pressure control solenoid duty cycle.

SHIFTER, TRANSMISSION

DESCRIPTION

DESCRIPTION

81d2c3ce

Fig. 346: Brake Transmission Shift Interlock (BTSI) Override
Courtesy of CHRYSLER LLC

The automatic transmission is operated with the help of a shift lever assembly (SLA) (1) located in the floor console. There are six positions to which the selection lever can be shifted: P, R, N, D, 2, 1.

All selector lever positions are identified by the SLA and transmitted by a shift cable to the selector shaft in the transmission.

The SLA is comprised of the following functions:

- **Key lock:** Depending on the selector lever position, the ignition cylinder is locked/unlocked, i.e., the ignition key can be removed only if the selector lever is in position "P". An electronic micro switch in the shifter assembly is used to perform this function.

- **Park lock:** The selector lever is not released from position "P" until the brake pedal has been applied and the ignition key is in the ON" position. Shift lock is controlled by the ignition module in conjunction with a brake switch and a locking solenoid in the SLA. As soon as the brake pedal is applied firmly, the locking solenoid is energized and retracted to unlock the selector lever. If the selector lever cannot be moved out of position "P" due to a malfunction, the shift lock function can be overridden (2).

OPERATION

OPERATION

With the selector lever in position "D", the transmission control module (TCM) automatically shifts the gears that are best-suited to the current operating situation. This means that shifting of gears is continuously adjusted to current driving and operating conditions in line with the selected shift range and the accelerator pedal position. Starting off is always performed in 1st gear.

The current selector lever position or, if the shift range has been limited, the current shift range limit is indicated in the instrument cluster display.

The permissible shifter positions and transmission operating ranges are:

- P = Parking lock and engine starting.
- R = Reverse.
- N = Neutral and engine starting (no power is transmitted to the axles).
- D = The shift range includes all forward gears.
- 2 = Shift range is limited to gears 1 to 3.
- 1 = Shift range is limited to the 1st gear.

- | |
|--|
| 1 - PRESSURE CONTROL SOLENOID
2 - LINE PRESSURE SENSOR
3 - SHOULDER SCREW
4 - VARIABLE LINE PRESSURE HEADER
5 - MANUAL SHAFT |
|--|

6 - SCREWS

The pressure control solenoid (1) is mounted on the top of the valve body, next to the line pressure sensor (2).

The TCM utilizes a closed-loop system to control transmission line pressure. The system contains a variable force style solenoid, the Pressure Control Solenoid. The solenoid is duty cycle controlled by the TCM to vent the unnecessary line pressure supplied by the oil pump back to the sump. The system also contains a variable pressure style sensor, the Line Pressure Sensor, which is a direct input to the TCM. The line pressure solenoid monitors the transmission line pressure and completes the feedback loop to the TCM. The TCM uses this information to adjust its control of the pressure control solenoid to achieve the desired line pressure.

OPERATION

OPERATION

The pressure control solenoid (PCS) is a variable force (VFS) style solenoid. A VFS solenoid is an electro-hydraulic actuator, combining a solenoid and a regulating valve.

The transmission control module varies the current for the PCS, which varies the pressure in the line pressure hydraulic circuit. When the current (duty cycle) of the PCS is low, the pressure in the circuit is higher. At 0 current (0% duty cycle), the pressure is at the maximum value. Conversely, when the current is maximized (100% duty cycle), the pressure in the circuit is at the lowest possible value.

TORQUE CONVERTER

DESCRIPTION

DESCRIPTION

Fig. 358: Torque Converter Assembly
Courtesy of CHRYSLER LLC

- 1 - TURBINE
- 2 - IMPELLER
- 3 - HUB
- 4 - STATOR
- 5 - FRONT COVER
- 6 - CONVERTER CLUTCH DISC
- 7 - DRIVE PLATE

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (4), an overrunning clutch, an impeller (2) and an electronically applied converter clutch (6). The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

TORQUE CONVERTER IMPELLER IDENTIFICATION

IMPELLER VANE
CONSTRUCTION
AND CURVATURE

80bfe26a

Fig. 359: Impeller
Courtesy of CHRYSLER LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

80bfe26b

Fig. 360: Turbine
Courtesy of CHRYSLER LLC

1 - TURBINE VANE	4 - PORTION OF TORQUE CONVERTER COVER
2 - ENGINE ROTATION	5 - ENGINE ROTATION
3 - INPUT SHAFT	6 - OIL FLOW WITHIN TURBINE SECTION

The turbine is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

80bfe26d

Fig. 361: Stator Location
Courtesy of CHRYSLER LLC

- 1 - STATOR
- 2 - IMPELLER
- 3 - FLUID FLOW
- 4 - TURBINE

The stator assembly is mounted on a stationary shaft which is an integral part of the oil pump. The stator (1) is located between the impeller (2) and the turbine (4) within the torque converter case.

Fig. 362: Stator Components
Courtesy of CHRYSLER LLC

- 1 - CAM (OUTER RACE)
- 2 - ROLLER
- 3 - SPRING
- 4 - INNER RACE

The stator contains an over-running clutch (1-4) , which allows the stator to rotate only in a clockwise direction. When the stator is locked against the over-running clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

Fig. 363: Torque Converter Clutch (TCC)
Courtesy of CHRYSLER LLC

- 1 - IMPELLER FRONT COVER
- 2 - THRUST WASHER ASSEMBLY
- 3 - IMPELLER
- 4 - STATOR
- 5 - TURBINE
- 6 - PISTON
- 7 - FRICTION DISC

The TCC was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller (3) and turbine (5) were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston (6) with friction material (7) was added

to the turbine assembly (5) to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the L/R-CC Solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

80bfe276

Fig. 364: Torque Converter Fluid Operation - Typical
Courtesy of CHRYSLER LLC

1 - APPLY PRESSURE	3 - RELEASE PRESSURE
2 - THE PISTON MOVES SLIGHTLY FORWARD	4 - THE PISTON MOVES SLIGHTLY REARWARD

The converter impeller (driving member), which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft.

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Fig. 365: Stator Operation
Courtesy of CHRYSLER LLC

- | |
|---|
| <p>1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES</p> <p>2 - FRONT OF ENGINE</p> <p>3 - INCREASED ANGLE AS OIL STRIKES VANES</p> <p>4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES</p> |
|---|

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.4:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

In a standard torque converter, the impeller and turbine are rotating at about the same speed and the stator is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction

material to the front cover, a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, and fourth gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear. If the control switch is in the OFF position, the clutch will engage after the shift to third gear.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the L/R-CC Solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

NO EMCC

Under No EMCC conditions, the L/R Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the L/R Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the L/R Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine RPM.

GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the L/R Solenoid duty cycle.

REMOVAL

REMOVAL

1. Remove transmission and torque converter from vehicle. See **Transmission and Transfer Case/Automatic - 42RLE - Removal** or, see refer to **Transmission and Transfer**

Case/Automatic - NAG1 - Removal .

2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

NOTE: Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

Fig. 366: Checking Torque Converter Seating - Typical
Courtesy of CHRYSLER LLC

1 - SCALE 2 - STRAIGHTEDGE

1. Lubricate oil pump seal lip with transmission fluid.

2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale (1) and straightedge (2) . Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle. See Transmission and Transfer Case/Automatic - 42RLE - Installation or, refer to Transmission and Transfer Case/Automatic - NAG1 - Installation .
9. Fill the transmission with the recommended fluid.

VALVE BODY

DESCRIPTION

DESCRIPTION

50865f1e

Fig. 367: Valve Body Assembly
Courtesy of CHRYSLER LLC

- 1 - SOLENOID/PRESSURE SWITCH ASSEMBLY
- 2 - TRS
- 3 - TRANSFER PLATE
- 4 - SEPARATOR PLATE
- 5 - VALVE BODY

The valve body assembly consists of a cast aluminum valve body (5), separator plate (4), and transfer plate (3). The valve body contains valves and check balls that control fluid delivery to the torque converter clutch, solenoid/pressure switch assembly, and frictional clutches.

Also mounted to the valve body assembly are the solenoid/pressure switch assembly and the transmission range sensor (2) .

- 4 - CONVERTER CLUTCH CONTROL VALVE
- 5 - MANUAL VALVE
- 6 - CONVERTER CLUTCH SWITCH VALVE
- 7 - SOLENOID SWITCH VALVE
- 8 - REGULATOR VALVE

The valves contained within the valve body (1) include the following:

- Regulator valve (8)

- Solenoid switch valve (7)
- Manual valve (5)
- Converter clutch switch valve (6)
- Converter clutch control valve (4)
- Torque converter regulator valve (2)
- Low/Reverse switch valve (3)

In addition, the valve body also contains the thermal valve, #2, 3, 4 AND 5 check balls and the 2/4 accumulator assembly.

OPERATION

OPERATION

NOTE: See Transmission and Transfer Case/Automatic - 42RLE - Schematics and Diagrams for a visual aid in determining valve location, operation and design.

THERMAL VALVE

8077b957

Fig. 369: Thermal Valve
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - THERMAL VALVE
2 - U1 ORIFICE
3 - NUMBER 2 CHECK BALL |
|--|

The thermal valve (1) is a bi-metallic shudder valve that helps control the venting rate of oil pressure in the underdrive clutch passage during release of the clutch. When the oil temperature is approximately 20 degrees Fahrenheit or less, the valve is fully open to assist in venting oil past the U1 orifice (2). At temperatures above 20 degrees, the valve starts to close and becomes fully closed at approximately 140 degrees. The thermal valve is located in the transfer plate of the valve body.

A schematic diagram of a mechanical pump assembly. The diagram shows a cross-section of the device. At the top, a vertical shaft (1) passes through a seal (9) into a pump chamber. A drive mechanism (2) is connected to the shaft. The pump chamber is part of a larger housing (3). A fluid inlet (4) enters from the bottom right. The fluid is drawn into the pump chamber and then pushed out through a vertical outlet (10) on the left. A return line (8) leads from the outlet back to the inlet. A check valve (6) is located on the inlet line. A filter (7) is also present on the inlet line. The entire assembly is mounted on a base (5).

- 4 - LR/CC SOLENOID DE-ENERGIZED
- 5 - MANUAL VALVE
- 6 - LINE PRESSURE
- 7 - CONVERTER CLUTCH SWITCH AND CONTROL VALVES
- 8 - LR CLUTCH

The solenoid switch valve controls line pressure from the LR/CC solenoid (4). In one position, it allows the low/reverse clutch to be pressurized. In the other, it directs line pressure to the converter control and converter clutch valves (7).

MANUAL VALVE

Fig. 372: Manual Valve

- 7 - CONVERTER CLUTCH CONTROL VALVE
- 8 - 2/4 CLUTCH
- 9 - 2/4 - L/R SOLENOID
- 10 - L/R CLUTCH

The manual valve (4) is operated by the mechanical shift linkage. Its primary responsibility is to send line pressure to the appropriate hydraulic circuits and solenoids. The valve has three operating ranges or positions.

CONVERTER CLUTCH SWITCH VALVE

Fig. 373: Converter Clutch Switch Valve
Courtesy of CHRYSLER LLC

- 1 - CONVERTER CLUTCH
- 2 - TORQUE CONVERTER
- 3 - LR CLUTCH
- 4 - DRIBBLERS
- 5 - REGULATOR VALVE
- 6 - SOLENOID SWITCH VALVE
- 7 - CONVERTER CLUTCH CONTROL VALVE
- 8 - TORQUE CONVERTER REGULATOR VALVE
- 9 - CONVERTER CLUTCH CONTROL VALVE
- 10 - CONVERTER CLUTCH SWITCH VALVE
- 11 - BYPASS VALVE
- 12 - LUBE
- 13 - COOLER

The main responsibility of the converter clutch switch valve (10) is to control hydraulic pressure applied to the front (off) side of the converter clutch piston. Line pressure from the regulator valve (5) is fed to the torque converter regulator valve (8). The pressure is then directed to the converter clutch switch valve (10) and to the front side of the converter clutch piston. This pressure pushes the piston back and disengages the converter clutch.

CONVERTER CLUTCH CONTROL VALVE

Fig. 374: Converter Clutch Control Valve
Courtesy of CHRYSLER LLC

- 1 - CONVERTER CLUTCH
- 2 - TORQUE CONVERTER
- 3 - LR/CC SOLENOID
- 4 - FROM MANUAL VALVE
- 5 - CONVERTER CLUTCH CONTROL VALVE
- 6 - TORQUE CONVERTER REGULATOR VALVE
- 7 - CONVERTER CLUTCH SWITCH VALVE
- 8 - BYPASS VALVE
- 9 - COOLER

The converter clutch control valve (5) controls the back (on) side of the torque converter clutch (1). When the controller energizes or modulates the LR/CC solenoid to apply the converter clutch piston, both the converter clutch control valve (5) and the converter control valve move, allowing pressure to be applied to the back side of the clutch.

T/C REGULATOR VALVE

The torque converter regulator valve slightly regulates the flow of fluid to the torque converter.

LOW/REVERSE SWITCH VALVE

The low/reverse clutch is applied from different sources, depending on whether low (1st) gear or reverse is selected. The low/reverse switch valve alternates positions depending on from which direction fluid pressure is applied. By design, when the valve is shifted by fluid pressure from one

channel, the opposing channel is blocked. The switch valve alienates the possibility of a sticking ball check, thus providing consistent application of the low/reverse clutch under these operating conditions.

REMOVAL

REMOVAL

NOTE: If valve body is being reconditioned or replaced, it is necessary to perform the Quick Learn Procedure. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .

The NAG1 automatic transmission is an electronically controlled 5-speed transmission with a lock-up clutch in the torque converter. The ratios for the gear stages are obtained by 3 planetary gear sets. Fifth gear is designed as an overdrive with a high-speed ratio.

NAG1 identifies a family of transmissions and means "N"ew "A"utomatic "G"earbox, generation 1.

Various marketing names are associated with the NAG1 family of transmissions, depending on the transmission variation being used in a specific vehicle. Some examples of the marketing names are: W5A300, W5A380, and W5A580. The marketing name can be interpreted as follows:

- W = A transmission using a hydraulic torque converter.
- 5 = 5 forward gears.
- A = Automatic Transmission.
- 580 = Maximum input torque capacity in Newton meters.

The gears are actuated electronically/hydraulically. The gears are shifted by means of an appropriate combination of three multi-disc holding clutches, three multi-disc driving clutches, and two freewheeling clutches.

Electronic transmission control enables precise adaptation of pressures to the respective operating conditions and to the engine output during the shift phase which results in a significant improvement in shift quality.

Furthermore, it offers the advantage of a flexible adaptation to various vehicle and engines.

Basically, the automatic transmission with electronic control offers the following advantages:

- Reduces fuel consumption.
- Improved shift comfort.
- More favorable step-up through the five gears.
- Increased service life and reliability.
- Lower maintenance costs.

TRANSMISSION IDENTIFICATION

The transmission can be generically identified visually by the presence of a round 13-way connector located near the front corner of the transmission oil pan, on the right side. Specific transmission information can be found stamped into a pad on the left side of the transmission, above the oil pan rail.

TRANSMISSION GEAR RATIOS

The gear ratios for the NAG1 automatic transmission are as follows:

1st Gear

3.59:1

2nd Gear

2.19:1

3rd Gear

1.41:1

4th Gear

1.00:1

5th Gear

0.83:1

Reverse

3.16:1

TRANSMISSION HOUSING

The converter housing and transmission are made from a light alloy. These are bolted together and centered via the outer multi-disc carrier of multi-disc holding clutch, B1. A coated intermediate plate provides the sealing. The oil pump and the outer multi-disc carrier of the multi-disc holding clutch, B1, are bolted to the converter housing. The stator shaft is pressed into it and prevented from rotating by splines. The electrohydraulic unit is bolted to the transmission housing from underneath. A sheet metal steel oil pan forms the closure.

MECHANICAL SECTION

The mechanical section consists of a input shaft, output shaft, a sun gear shaft, and three planetary gear sets which are coupled to each other. The planetary gear sets each have four planetary pinion gears. The oil pressure for the torque converter lock-up clutch and clutch K2 is supplied through bores in the input shaft. The oil pressure to clutch K3 is transmitted through the output shaft. The lubricating oil is distributed through additional bores in both shafts. All the bearing points of the gear sets, as well as the freewheeling clutches and actuators, are supplied with lubricating oil. The parking lock gear is connected to the output shaft via splines.

Freewheeling clutches F1 and F2 are used to optimize the shifts. The front freewheel, F1, is supported on the extension of the stator shaft on the transmission side and, in the locking direction, connects the sun gear of the front planetary gear set to the transmission housing. In the locking direction, the rear freewheeling clutch, F2, connects the sun gear of the center planetary gear set to the sun gear of the rear planetary gear set.

ELECTROHYDRAULIC CONTROL UNIT

The electrohydraulic control unit comprises the shift plate made from light alloy for the hydraulic control and an electrical control unit. The electrical control unit comprises of a supporting body made of plastic, into which the electrical components are assembled. The supporting body is mounted on the shift plate and screwed to it.

Strip conductors inserted into the supporting body make the connection between the electrical components and a plug connector. The connection to the wiring harness on the vehicle and the transmission control module (TCM) is produced via this 13-pin plug connector with a bayonet lock.

SHIFT GROUPS

The hydraulic control components (including actuators) which are responsible for the pressure distribution before, during, and after a gear change are described as a shift group. Each shift group contains a command valve, a holding pressure shift valve, a shift pressure shift valve, overlap regulating valve, and a solenoid.

The hydraulic system contains three shift groups: 1-2/4-5, 2-3, and 3-4. Each shift group can also be described as being in one of two possible states. The active shift group is described as being in the shift phase when it is actively engaging/disengaging a clutch combination. The 1-2/4-5 shift group control the B1 and K1 clutches. The 2-3 shift group controls the K2 and K3 clutches. The 3-4 shift group controls the K3 and B2 clutches.

OPERATION

OPERATION

The transmission control is divided into the electronic and hydraulic transmission control functions. While the electronic transmission control is responsible for gear selection and for matching the pressures to the torque to be transmitted, the transmission's power supply control occurs via hydraulic elements in the electrohydraulic control module. The oil supply to the hydraulic elements, such as the hydrodynamic torque converter, the shift elements and the hydraulic transmission control, is provided by way of an oil pump connected with the torque converter.

The Transmission Control Module (TCM) allows for the precise adaptation of pressures to the corresponding operating conditions and to the engine output during the gearshift phase, resulting in a noticeable improvement in shift quality. The engine speed limit can be reached in the individual gears at full throttle and kickdown. The shift range can be changed in the forward gears while driving, but the TCM employs a downshift safeguard to prevent over-revving the engine. The system offers the additional advantage of flexible adaptation to different vehicle and engine variants.

EMERGENCY RUNNING FUNCTION

In order to ensure a safe driving state and to prevent damage to the automatic transmission, the TCM control module switches to limp-home mode in the event of critical faults. A diagnostic trouble code (DTC) assigned to the fault is stored in memory. All solenoid and regulating valves are thus de-energized.

The net effect is:

- The last engaged gear remains engaged.
- The modulating pressure and shift pressures rise to the maximum levels.
- The torque converter lockup clutch is deactivated.

In order to preserve the operability of the vehicle to some extent, the hydraulic control can be used to engage 2nd gear or reverse using the following procedure:

- Stop the vehicle.
- Move selector lever to "P".
- Switch off engine.
- Wait at least 10 seconds.
- Start engine.
- Move selector lever to D: 2nd gear.
- Move selector lever to R: Reverse gear.

The limp-home function remains active until the DTC is rectified or the stored DTC is erased with the appropriate scan tool. Sporadic faults can be reset via ignition OFF/ON.

CLUTCH APPLICATION

Refer to **CLUTCH APPLICATION** for which shift elements are applied in each gear position.

CLUTCH APPLICATION

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred to the output shaft (26).

Front Planetary Gear Set

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch

B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

Rear Planetary Gear Set

The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (15). The sun gear (23) is held against the housing by the engaged multiple-disc holding clutch B2 (6), by the locked freewheel F2 (24) during acceleration and by the engaged multiple-disc clutch K3 (12) during deceleration. The planetary gears (19) turn on the fixed sun gear (23) and increase the torque from the annulus gear (11) to the planetary carrier (15). The planetary carrier (15) moves at a reduced speed in the running direction of the engine.

Center Planetary Gear Set

The annulus gear (10) is driven at the same speed as the rear planetary carrier (15) as a result of a mechanical connection. The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and the center and rear planetary gearset and transferred to the output shaft (26).

Front Planetary Gear Set

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore blocked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and input shaft.

Rear Planetary Gear Set

The annulus gear (11) turns at the input speed as a result of the mechanical connection to the front planetary carrier (13). The sun gear (23) is held against the housing by the engaged multiple-disc holding clutch B2 (6), by the locked freewheel F2 (24) during acceleration and by the engaged multiple-disc clutch K3 (12) during deceleration. The planetary pinion gears (19) turn on the fixed sun gear (23) and increase the torque from the annulus gear (11) to the planetary carrier (15). The planetary carrier (15) moves at a reduced speed in the running direction of the engine.

Center Planetary Gear Set

The annulus gear (10) is driven at the same speed as the rear planetary carrier (15) as a result of a mechanical connection. The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (5) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and the center planetary gearset and transferred to the output shaft (26).

Front Planetary Gear Set

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore locked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and input shaft (25).

Rear Planetary Gear Set

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns in the same way as the planetary carrier (15) due to the mechanical connection with the locked front planetary gearset. This planetary gearset is therefore locked and turns as a closed unit.

Center Planetary Gear Set

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The sun gear (22) is held against the housing by the multiple-disc holding clutch B2 (6). The planetary pinion gears (18) turn on the fixed sun gear (22) and increase the torque from the annulus gear (10) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the running direction of the engine.

A - ENGINE SPEED	B - TRANSMISSION INPUT SPEED

Speed and torque are not converted by the direct gear ratio of the 4th gear. Power is transferred from the input shaft (25) to the output shaft (26) via three locked planetary gearsets.

Front Planetary Gear Set

The planetary carrier (13) and sun gear (21) are connected via the engaged multiple-disc clutch K1 (7). The planetary gearset is therefore locked and turns as a closed unit at the input speed due to the mechanical connection of the annulus gear (8) and the input shaft (25).

Rear Planetary Gear Set

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns in the same way as the planetary carrier (15) due to the mechanical connection with the locked front planetary gearset. The planetary gearset is therefore locked and turns as a closed unit.

Center Planetary Gear Set

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The multiple-disc clutch K3 (12) connects the sun gears (22) and (23) of the rear and center planetary gearset. The planetary gearset is locked by the same speeds of the annulus gear (10) and the sun gear (22) and it turns as a closed unit.

B - TRANSMISSION INPUT SPEED	E - THIRD GEAR RATIO
C - FIRST GEAR RATIO	F - FIXED PARTS

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred to the output shaft (26).

Front Planetary Gear Set

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

Rear Planetary Gear Set

The multiple-disc clutch K2 (9) is engaged and transfers the input speed of the input shaft (25) to the planetary carrier (15) via the annulus gear (10). The annulus gear (11) turns at a reduced speed due to the mechanical connection with the front planetary carrier (13). The planetary pinion gears (19) turn between the annulus gear (11) and the sun gear (23). The sun gear (23) moves at an increased speed in the running direction of the engine.

Center Planetary Gear Set

The annulus gear (10) turns at the input speed as a result of the engaged multiple-disc clutch K2 (9). The multiple-disc clutch K3 (12) transfers an increased speed to the sun gear (22) due to the connection with the sun gear (23). The planetary pinion gears (18) turn between the annulus gear (10) and the sun gear (22). The speed of the planetary carrier (14) and the output shaft connected to the planetary carrier (5) lies between that of the annulus gear (10) and the sun gear (22). This provides a step-up ratio.

A - ENGINE SPEED	D - SECOND GEAR RATIO
B - TRANSMISSION INPUT SPEED	E - THIRD GEAR RATIO
C - FIRST GEAR RATIO	F - FIXED PARTS

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred with reversed direction of rotation to the output shaft (26).

Front Planetary Gear Set

The annulus gear (8) is driven by the input shaft (25). The sun gear (21) is held against the housing by the locked freewheel F1 (20) during acceleration and via the engaged multiple-disc holding clutch B1 (4) during deceleration. The planetary pinion gears (17) turn on the fixed sun gear (21) and increase the torque from the annulus gear (8) to the planetary carrier (13). The planetary carrier (13) moves at a reduced speed in the running direction of the engine.

Rear Planetary Gear Set

The planetary carrier (15) is held against the housing by the engaged multiple-disc holding clutch B3 (5). The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (13). The planetary gears (19) turn between the annulus gear (11) and the sun gear (23). The direction is reversed by the held planetary carrier (15) so that the sun gear (23) turns in the opposite direction to the running direction of the engine.

Center Planetary Gear Set

The annulus gear (10) is held against the housing by the multiple-disc holding clutch B3 (5) via the mechanical connection to the planetary carrier (15). The sun gear (22) turns backwards due to the engaged multiple-disc clutch K3 (12). The planetary gears (18) turn on the fixed annulus gear (10) and increase the torque from the sun gear (22) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the opposite direction to the running direction of the engine.

Torque from the torque converter is increased via the input shaft (25) and all three planetary gearsets and transferred with reversed direction of rotation to the output shaft (26) .

Front Planetary Gear Set

The clutch K1 (7) is shifted. The planetary carrier (13) and sun gear (21) are connected to each other as a result. The annulus gear (8) is driven via the input shaft (25). The planetary gear set is locked

and turns as a unit.

Rear Planetary Gear Set

The planetary carrier (15) is held against the housing by the engaged multiple-disc holding clutch B3 (5). The annulus gear (11) turns at a reduced speed due to the mechanical connection to the front planetary carrier (13). The planetary pinion gears (19) turn between the annulus gear (11) and the sun gear (23). The direction is reversed by the held planetary carrier (15) so that the sun gear (23) turns in the opposite direction to the running direction of the engine.

Center Planetary Gear Set

The annulus gear (10) is held against the housing by the multiple-disc holding clutch B3 (5) via the mechanical connection to the planetary carrier (15). The sun gear (22) turns backwards due to the engaged multiple-disc clutch K3 (12). The planetary gears (18) turn on the fixed annulus gear (10) and increase the torque from the sun gear (22) to the planetary carrier (14). The output shaft (26) connected to the planetary carrier (14) turns at a reduced speed in the opposite direction to the running direction of the engine.

SHIFT GROUPS/ SHIFT SEQUENCE

1-2 Shift - First Gear Engaged

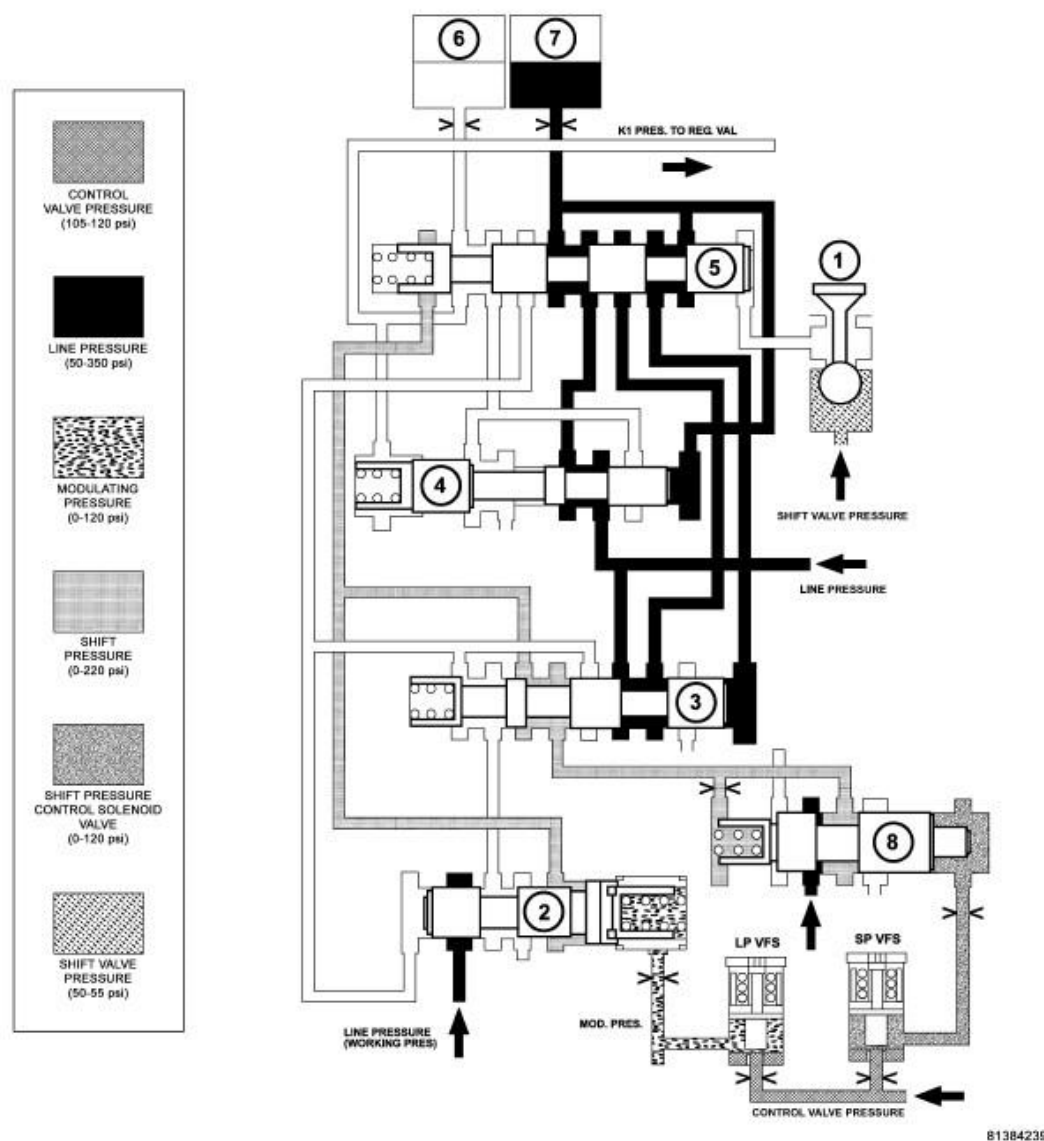

Fig. 16: First Gear Engaged

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

The end face of the command valve (5) is kept unpressurized via the solenoid valve for 1-2 and 4-5 shift (1). Because of the holding pressure shift valve (4), the working pressure (p-A) is present at the multiple-disc holding clutch B1 (7). Clutch K1 (6) is unpressurized.

Shift Phase - 1-2 Shift Phase 1

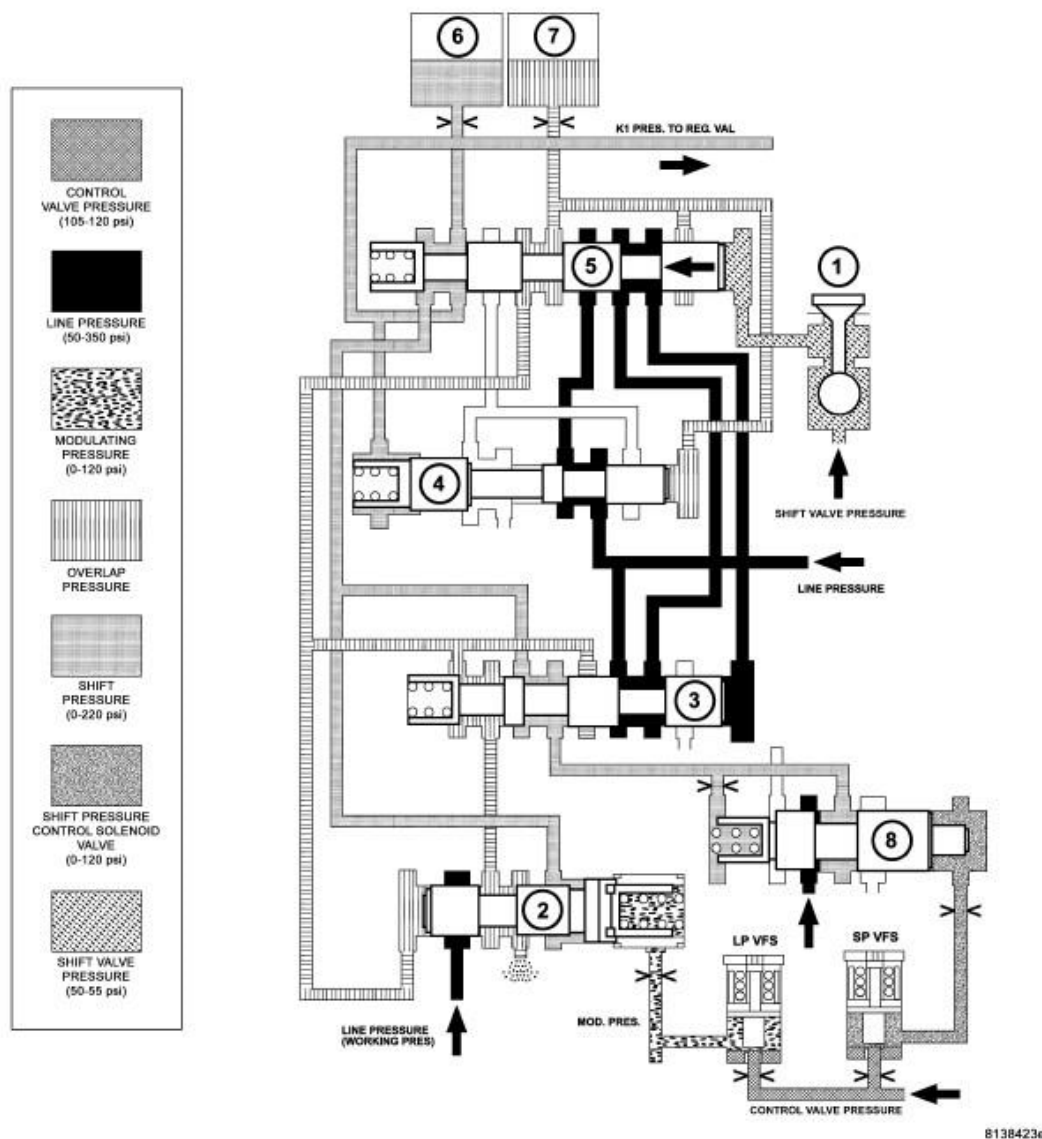

Fig. 17: Shift Phase - 1-2 Shift Phase 1
Courtesy of CHRYSLER LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

When the 1-2 and 4-5 shift solenoid valve (1) is turned on, the shift valve pressure (p-SV) is directed onto the end face of the command valve (5). The command valve is moved and the shift pressure (p-S) coming from the shift pressure shift valve (3) is directed via the command valve (5) onto clutch K1 (6).

Simultaneously the clutch B1 (7) is subjected to overlap pressure by the overlap regulating valve (2). The pressure in the clutch B1 (7) as it disengages is controlled during the shift phase depending on engine load by the modulating pressure and the applying clutch pressure (the shift pressure in clutch K1). The controlled pressure in clutch B1 (7) is inversely proportional to the capacity of the clutch being engaged. The rising shift pressure (p-S) at clutch K1 (6) acts on the annular face of the overlap regulating valve (2) and reduces the overlap pressure regulated by the overlap regulating valve (2). When a corresponding pressure level is reached at the holding pressure shift valve (4), this valve switches over.

Shift Phase - 1-2 Shift Phase 2

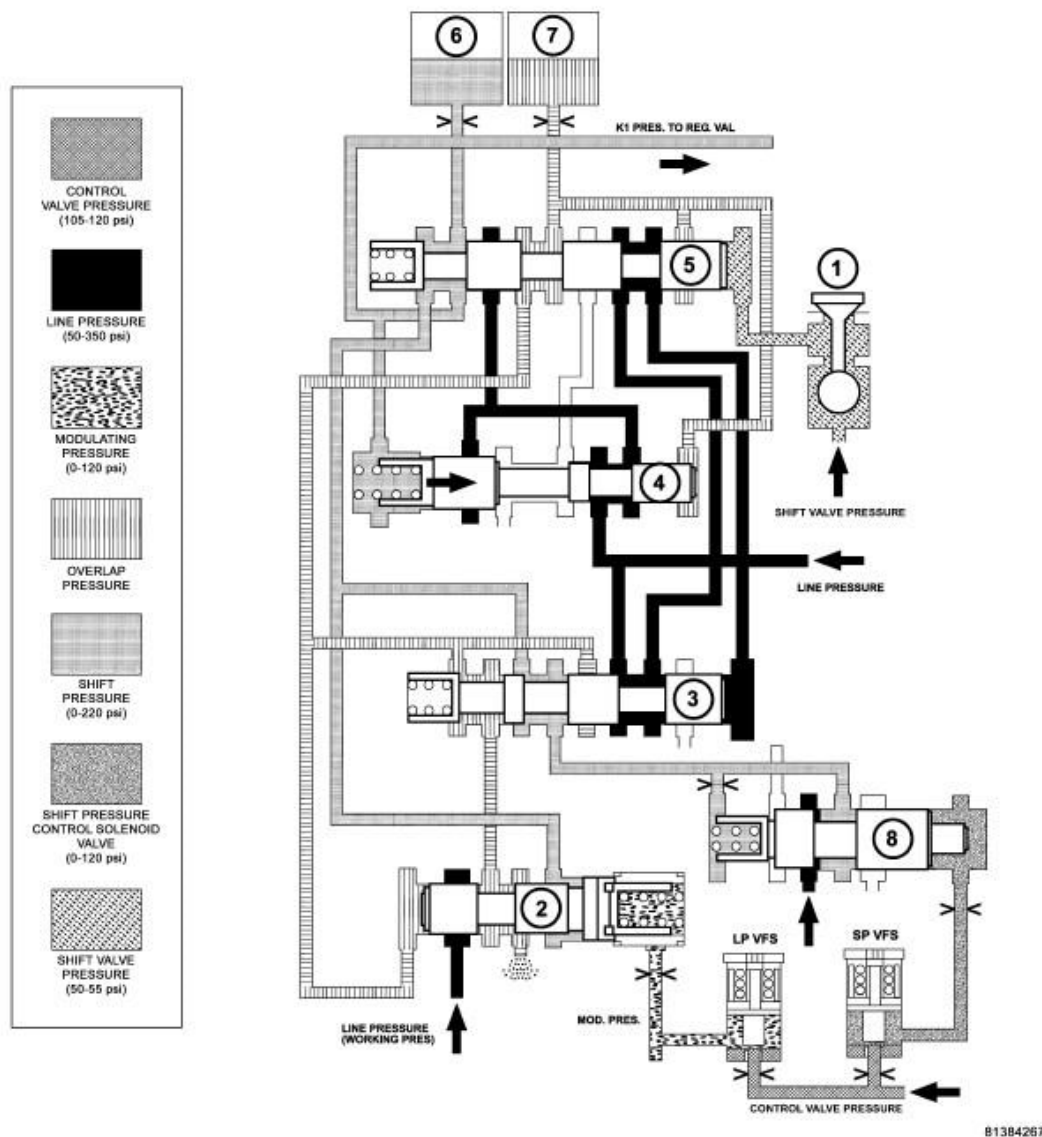

Fig. 18: Shift Phase - 1-2 Shift Phase 2
 Courtesy of CHRYSLER LLC

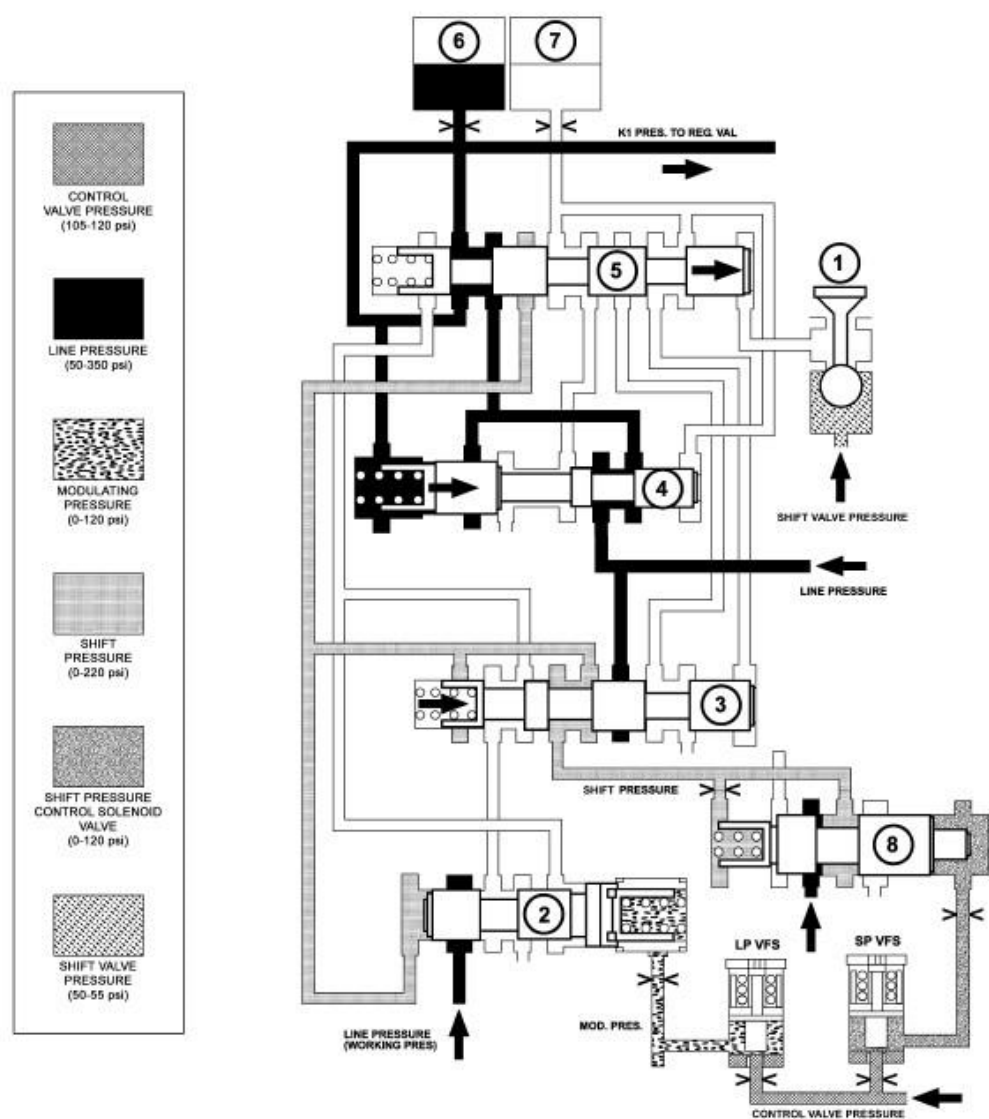

1 - 1-2/4-5 SHIFT SOLENOID

5 - 1-2/4-5 COMMAND VALVE

- | | |
|--|-------------------------------------|
| 2 - 1-2/4-5 OVERLAP VALVE | 6 - DRIVING CLUTCH K1 |
| 3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE | 7 - HOLDING CLUTCH B1 |
| 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE | 8 - SHIFT PRESSURE REGULATING VALVE |

The B1 (7) pressure acting on the end face of the shift pressure shift valve (3) is replaced by the working pressure (p-A). The shift pressure is also routed to the spring end of the holding valve (4) and the holding valve downshifts. The line pressure is then routed to the command valve (5).

Second Gear Engaged

- | | |
|--|-------------------------------------|
| 1 - 1-2/4-5 SHIFT SOLENOID | 5 - 1-2/4-5 COMMAND VALVE |
| 2 - 1-2/4-5 OVERLAP VALVE | 6 - DRIVING CLUTCH K1 |
| 3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE | 7 - HOLDING CLUTCH B1 |
| 4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE | 8 - SHIFT PRESSURE REGULATING VALVE |

After the gearchange is complete, the pressure on the end face of the command valve (5) is reduced via the 1-2 and 4-5 shift solenoid valve (1), and the command valve (5) is pushed back to its basic position. Via the holding pressure shift valve (4) the working pressure (p-A) now passes via the command valve (5) to clutch K1 (6). The multiple-disc holding clutch B1 (7) is deactivated (unpressurized). The spring of the shift pressure shift valve (3) pushes the valve back to its basic position.

Shift Phase - 2-1 Shift Phase 1

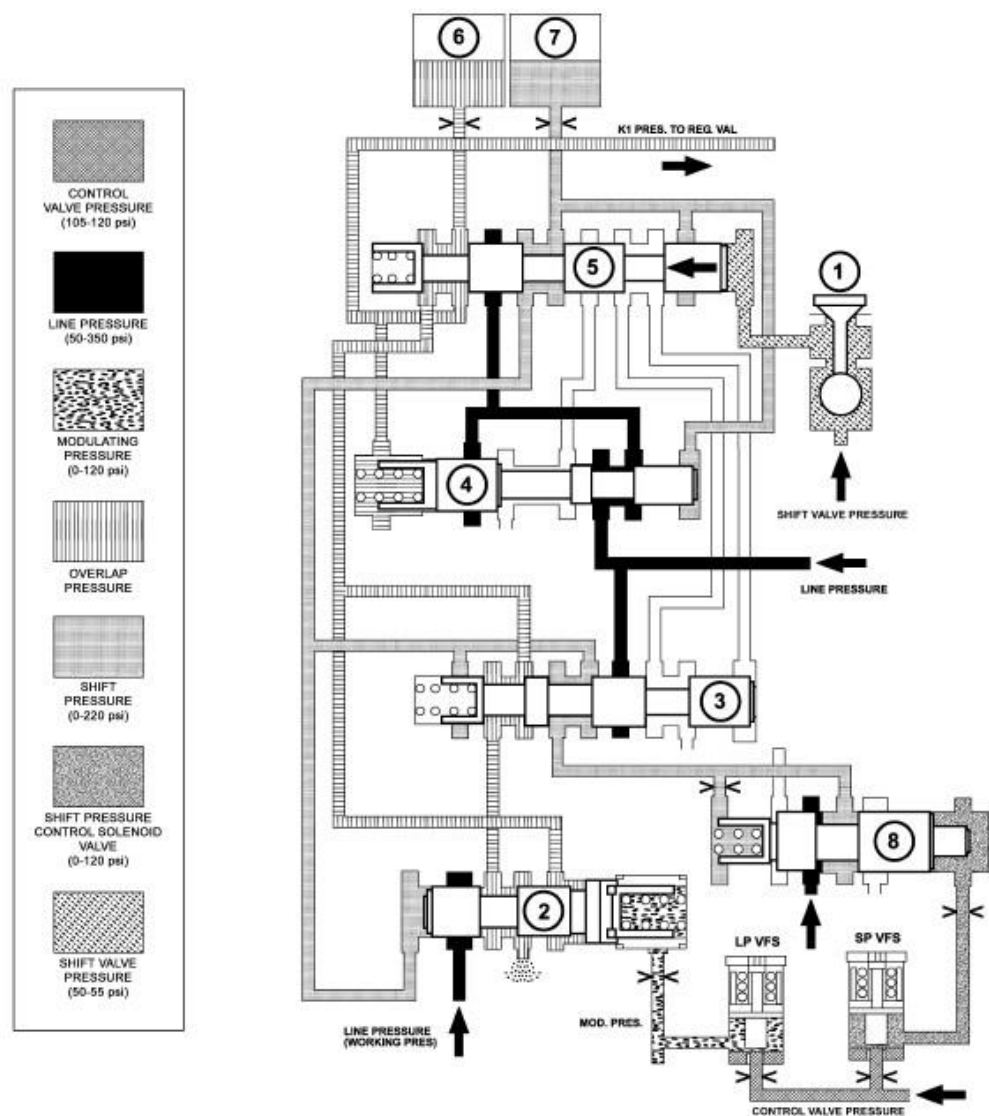

Fig. 20: Shift Phase - 2-1 Shift Phase 1
Courtesy of CHRYSLER LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

The 1-2/4-5 shift solenoid (1) is turned ON to apply shift pressure (p-S) to the end face of the 1-2/4-5 command valve (5). This allows the command valve to up-shift and the shift pressure coming from the 1-2/4-5 shift valve (3) is routed to the holding clutch B1 (7) via the command valve.

Simultaneously, the pressure in the releasing clutch, K1 (6), is regulated at the 1-2/4-5 overlap valve (2). The pressure in the K1 clutch as it disengages is controlled during the shift phase depending on engine load, via the modulating pressure (p-MOD), and the shift pressure in clutch B1 (7). The increasing shift pressure in clutch B1, which also acts on the end face of the overlap valve, reduces the overlap pressure.

Shift Phase - 2-1 Shift Phase 2

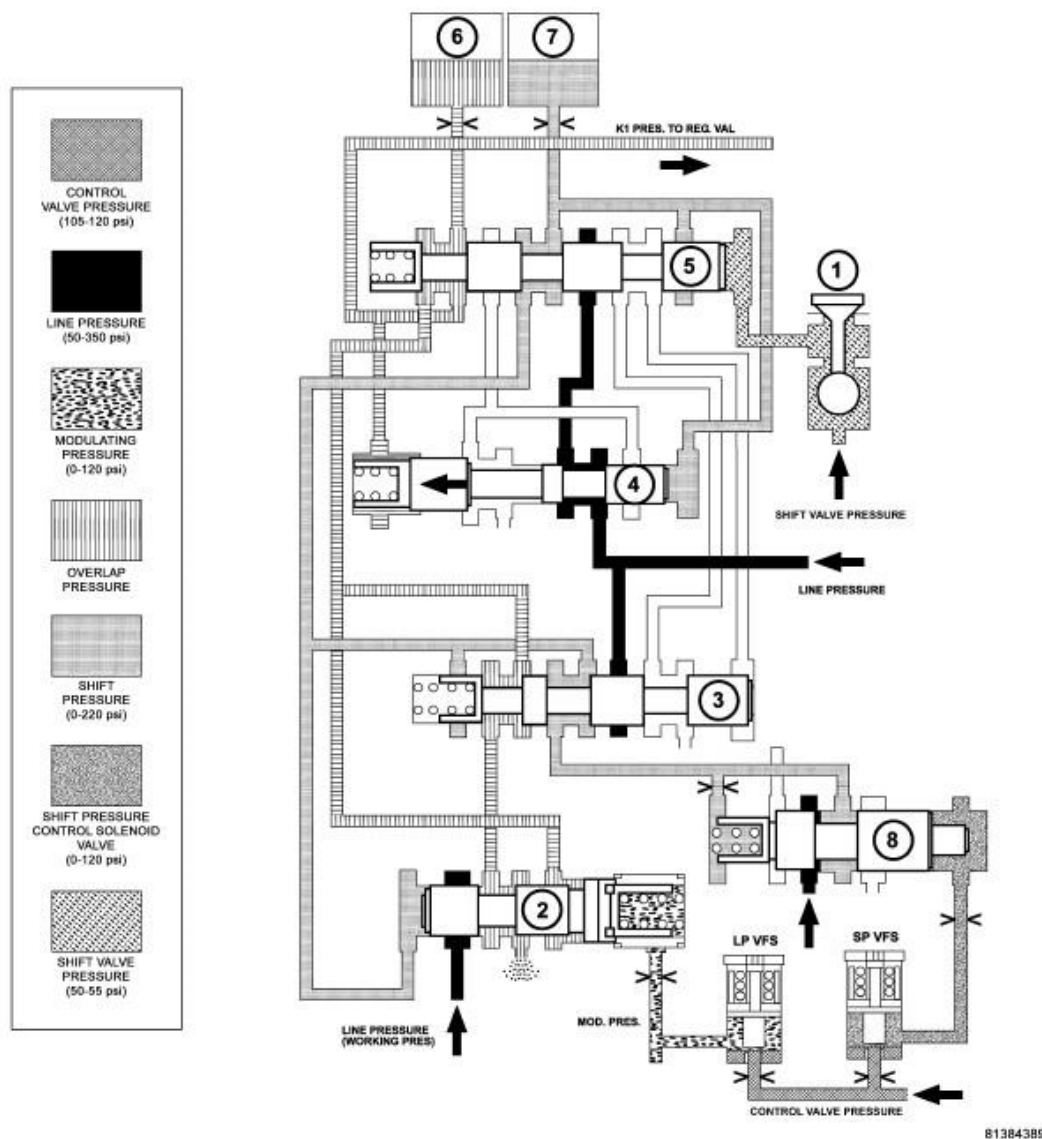

Fig. 21: Shift Phase - 2-1 Shift Phase 2
Courtesy of CHRYSLER LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

The pressure in clutch B1 (7) acting on the end face of the 1-2/4-5 holding valve (4) forces the valve to up-shift against the spring pressure and allows line pressure (p-A) to pass through the command valve (5).

2-1 Shift - First Gear Engaged

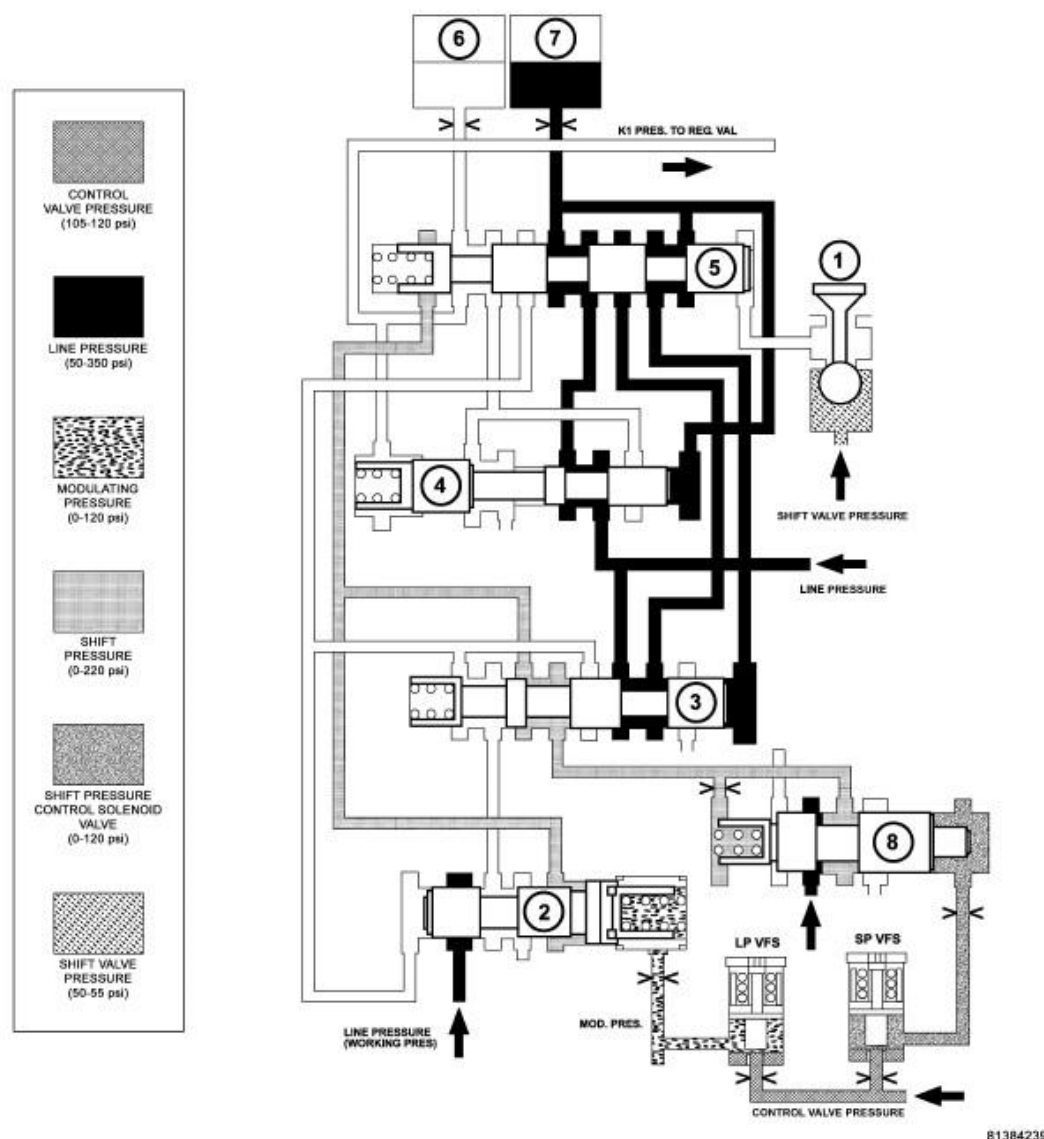

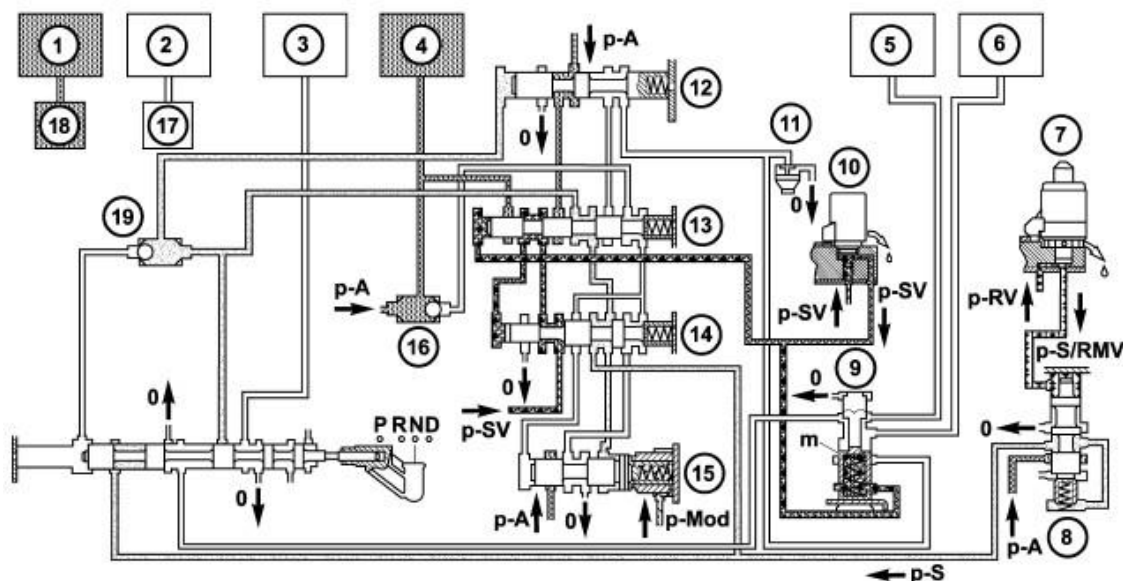

Fig. 22: First Gear Engaged
Courtesy of CHRYSLER LLC

1 - 1-2/4-5 SHIFT SOLENOID	5 - 1-2/4-5 COMMAND VALVE
2 - 1-2/4-5 OVERLAP VALVE	6 - DRIVING CLUTCH K1
3 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE	7 - HOLDING CLUTCH B1
4 - 1-2/4-5 HOLDING PRESSURE SHIFT VALVE	8 - SHIFT PRESSURE REGULATING VALVE

After the gear change is complete, the 1-2/4-5 shift solenoid (1) is turned off. This reduces the pressure on the end face of the 1-2/4-5 command valve (5) to 0 psi and the spring pressure downshifts the valve to its initial position. The line pressure (p-A) is switched to the holding clutch B1 (7) and the end face of the holding valve by the downshifted command valve. The upshifted holding valve also allows the remaining pressure in clutch K1 (6) to be vented.

Gear Shift N to D (1st gear) - Engine Started

8 - SHIFT PRESSURE REGULATING VALVE	18 - 1-2/4-5 COMMAND VALVE
9 - SHIFT VALVE B2	19 - BALL VALVE
10 - 3-4 SHIFT SOLENOID	

With the engine started and the gearshift lever in the NEUTRAL or PARK positions, holding clutch B1 (1) and driving clutch K3 (4) are applied and the various valves in the 1-2/4-5 shift group are positioned to apply pressure to the holding clutch B2.

Activation Sequence

6 - HOLDING CLUTCH B2 PISTON OPPOSING FACE	16 - BALL VALVE
7 - SHIFT PRESSURE REGULATING SOLENOID	17 - 1-2/4-5 COMMAND VALVE
8 - SHIFT PRESSURE REGULATING VALVE	18 - 1-2/4-5 COMMAND VALVE
9 - SHIFT VALVE B2	19 - BALL VALVE
10 - 3-4 SHIFT SOLENOID	

The selector valve opens the shift pressure (p-S) feed connection from the ball valve (19) with the shift valve B2 (9). With the shift valve B2 (9) in the upper position, shift pressure (p-S) travels behind the piston B2 (5) and simultaneously to the opposing face of the piston B2 (6). The multiple-disc holding clutch B2 begins to close.

The pressure on the opposing face of the piston B2 (6) ensures a soft activation of the multiple-disc holding clutch B2.

First Gear Engaged

6 - HOLDING CLUTCH B2 PISTON OPPOSING FACE	16 - BALL VALVE
7 - SHIFT PRESSURE REGULATING SOLENOID	17 - 1-2/4-5 COMMAND VALVE
8 - SHIFT PRESSURE REGULATING VALVE	18 - 1-2/4-5 COMMAND VALVE
9 - SHIFT VALVE B2	19 - BALL VALVE
10 - 3-4 SHIFT SOLENOID	

The TCM monitors the activation sequence via the speed of the input shaft, which slows down as the frictional connection in the multiple-disc holding clutch increases. When the speed drops to the specified level, the TCM shuts off the power to the 3-4 shift solenoid valve (10). The spring chamber of the shift valve B2 (9) is depressurized and switches downwards. This connects the line to the opposing face of the piston B2 (6) with the pressure holding valve (11). The pressure on the opposing face of the piston B2 (6) drops to a residual pressure.

The working pressure (p-A) is formed and travels via the 2-3 holding pressure shift valve, the 2-3 command valve and the ball valve (16) to multi-plate clutch K3 (4) and via the 3-4 command valve (13) to the end face of the 3-4 shift pressure shift valve (14). The 3-4 shift pressure shift valve (14) is moved against the force of the spring towards the right. At the same time the 3-4 solenoid valve (10)

is energized. This allows shift valve pressure (p-SV) to enter the spring chamber of the shift valve B2 (9) and to reach the end face of the 3-4 command valve (13). The shift valve B2 (9) is held in the upper position and the 3-4 command valve (13) switches towards the right. At the end face of the 3-4 shift pressure shift valve (14) the working pressure (p-A) is replaced by shift valve pressure (p-SV).

The 3-4 command valve (13) moves to the left. Working pressure (p-A) travels via the holding pressure shift valve (12) and the 3-4 command valve (13) to the piston of multiple-disc holding clutch B2 (5).

DIAGNOSIS AND TESTING

AIR CHECKING TRANSMISSION CLUTCH OPERATION
