FUEL INJECTION, GAS

OPERATION

INJECTION SYSTEM

All engines used in this service information have a sequential Multi-Port Electronic Fuel Injection system. The MPI system is computer regulated and provides precise air/fuel ratios for all driving conditions. The Powertrain Control Module (PCM) operates the fuel injection system.

The PCM regulates:

- Ignition timing
- Air/fuel ratio
- Emission control devices
- Cooling fan
- Charging system
- Idle speed
- Vehicle speed control

Various sensors provide the inputs necessary for the PCM to correctly operate these systems. In addition to the sensors, various switches also provide inputs to the PCM.

The PCM can adapt its programming to meet changing operating conditions.

Fuel is injected into the intake port above the intake valve in precise metered amounts through electrically operated injectors. The PCM fires the injectors in a specific sequence. Under most operating conditions, the PCM maintains an air fuel ratio of 14.7 parts air to 1 part fuel by constantly adjusting injector pulse width. Injector pulse width is the length of time the injector is open.

The PCM adjusts injector pulse width by opening and closing the ground path to the injector. Engine RPM (speed) and manifold absolute pressure (air density) are the **primary** inputs that determine injector pulse width.

MODES OF OPERATION

As input signals to the PCM change, the PCM adjusts its response to output devices. For example, the PCM must calculate a different injector pulse width and ignition timing for idle than it does for Wide Open Throttle (WOT). There are several different modes of operation that determine how the PCM responds to the various input signals.

The multi-port fuel injection systems has the following modes of operation:

- Ignition switch ON (Zero RPM)
- Engine start-up
- Engine warm-up
- Cruise
- Idle
- Acceleration

- Deceleration
- Wide-Open-Throttle
- Ignition switch OFF

Within these modes of operation, there are two different types of operation, OPEN LOOP and CLOSED LOOP.

During OPEN LOOP operation the PCM receives input signals and responds according to preset PCM programming. Inputs from the upstream and downstream heated oxygen sensors are not monitored during OPEN LOOP operation, except for heated oxygen sensor diagnostics (they are checked for shorted conditions at all times).

During CLOSED LOOP operation the PCM monitors the inputs from the upstream and downstream heated oxygen sensors. The upstream heated oxygen sensor input tells the PCM if the calculated injector pulse width resulted in the ideal air-fuel ratio of 14.7 to one. By monitoring the exhaust oxygen content through the upstream heated oxygen sensor, the PCM can fine tune injector pulse width. Fine tuning injector pulse width allows the PCM to achieve optimum fuel economy combined with low emissions.

For the PCM to enter CLOSED LOOP operation, the following must occur:

1. Engine coolant temperature must be over 35°F (1.7°C).
 - If the coolant is over 35°F (1.7°C) the PCM will wait 38 seconds.
 - If the coolant is over 50°F (10°C) the PCM will wait 15 seconds.
 - If the coolant is over 167°F (75°C) the PCM will wait 3 seconds.
 - For other temperatures the PCM will interpolate the correct waiting time.
2. O2 sensor must read either greater than 0.745 volts or less than 0.29 volt.

OPEN LOOP operation is used for engine start-up (crank), engine warm-up, deceleration with fuel shutoff and wide open throttle. Under most conditions, acceleration, deceleration (with A/C on), idle and cruise modes, **with the engine at operating temperature** occur in CLOSED LOOP operation.

IGNITION SWITCH ON (ZERO RPM) MODE

When the ignition switch activates the fuel injection system, the following actions occur:

- The PCM monitors the engine coolant temperature sensor and throttle position sensor input. The PCM determines basic fuel injector pulse width from this input.
- The PCM determines atmospheric air pressure from the MAP sensor input to modify injector pulse width.

When the key is in the ON position and the engine is not running (zero rpm), the Auto Shutdown (ASD) and fuel pump relays de-energize after approximately 1 second. Therefore, battery voltage is not supplied to the fuel pump, ignition coil, fuel injectors and heated oxygen sensors.

ENGINE START-UP MODE

This is an OPEN LOOP mode. If the vehicle is in park or neutral (automatic transaxles) or the clutch pedal is depressed (manual transaxles) the ignition switch energizes the starter relay when the engine is not running. The following actions occur when the starter motor is engaged.

- If the PCM receives the camshaft position sensor and crankshaft position sensor signals, it energizes the Auto Shutdown (ASD) relay and fuel pump relay. If the PCM does not receive both signals within approximately one second, it will not energize the ASD relay and fuel pump relay. The ASD and fuel pump relays supply battery voltage to the fuel pump, fuel injectors, ignition coil, (EGR solenoid and PCV heater if equipped) and heated oxygen sensors.
- The PCM energizes the injectors (on the 69° falling edge) for a calculated pulse width until it determines crankshaft position from the camshaft position sensor and crankshaft position sensor signals. The PCM determines crankshaft position within 1 engine revolution.
- After determining crankshaft position, the PCM begins energizing the injectors in sequence. It adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.
- When the engine idles within ± 64 RPM of its target RPM, the PCM compares current MAP sensor value with the atmospheric pressure value received during the Ignition Switch On (zero RPM) mode.

Once the ASD and fuel pump relays have been energized, the PCM determines injector pulse width based on the following:

- MAP
- Engine RPM
- Battery voltage
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Throttle position
- The number of engine revolutions since cranking was initiated

During Start-up the PCM maintains ignition timing at 9° BTDC.

ENGINE WARM-UP MODE

This is an OPEN LOOP mode. The following inputs are received by the PCM:

- Manifold Absolute Pressure (MAP)
- Crankshaft position (engine speed)
- Engine coolant temperature
- Inlet/Intake air temperature (IAT)
- Camshaft position
- Knock sensor

- Throttle position
- A/C switch status
- Battery voltage
- Vehicle speed
- Speed control
- O2 sensors

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts ignition timing and engine idle speed. Engine idle speed is adjusted through the idle air control motor.

CRUISE OR IDLE MODE

When the engine is at operating temperature this is a CLOSED LOOP mode. During cruising or idle the following inputs are received by the PCM:

- Manifold absolute pressure
- Crankshaft position (engine speed)
- Inlet/Intake air temperature
- Engine coolant temperature
- Camshaft position
- Knock sensor
- Throttle position
- Exhaust gas oxygen content (O2 sensors)
- A/C switch status
- Battery voltage
- Vehicle speed

The PCM adjusts injector pulse width and controls injector synchronization by turning the individual ground paths to the injectors On and Off.

The PCM adjusts engine idle speed and ignition timing. The PCM adjusts the air/fuel ratio according to the oxygen content in the exhaust gas (measured by the upstream and downstream heated oxygen sensor).

The PCM monitors for engine misfire. During active misfire and depending on the severity, the PCM either continuously illuminates or flashes the malfunction indicator lamp (Check Engine light on instrument panel). Also, the PCM stores an engine misfire DTC in memory, if 2nd trip with fault.

The PCM performs several diagnostic routines. They include:

- Oxygen sensor monitor
- Downstream heated oxygen sensor diagnostics during open loop operation (except for shorted)
- Fuel system monitor
- EGR monitor (if equipped)
- Purge system monitor
- Catalyst efficiency monitor
- All inputs monitored for proper voltage range, rationality.
- All monitored components (refer to **EMISSION APPLICATIONS** for On-Board Diagnostics).

The PCM compares the upstream and downstream heated oxygen sensor inputs to measure catalytic converter efficiency. If the catalyst efficiency drops below the minimum acceptable percentage, the PCM stores a diagnostic trouble code in memory, after 2 trips.

During certain idle conditions, the PCM may enter a variable idle speed strategy. During variable idle speed strategy the PCM adjusts engine speed based on the following inputs.

- A/C status
- Battery voltage
- Battery temperature or Calculated Battery Temperature
- Engine coolant temperature
- Engine run time
- Inlet/Intake air temperature
- Vehicle mileage

ACCELERATION MODE

This is a CLOSED LOOP mode. The PCM recognizes an abrupt increase in Throttle Position sensor output voltage or MAP sensor output voltage as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased fuel demand.

- Wide Open Throttle-open loop

DECELERATION MODE

This is a CLOSED LOOP mode. During deceleration the following inputs are received by the PCM:

- A/C status
- Battery voltage
- Inlet/Intake air temperature
- Engine coolant temperature
- Crankshaft position (engine speed)
- Exhaust gas oxygen content (upstream heated oxygen sensor)

- Knock sensor
- Manifold absolute pressure
- Throttle position sensor
- IAC motor (solenoid) control changes in response to MAP sensor feedback

The PCM may receive a closed throttle input from the Throttle Position Sensor (TPS) when it senses an abrupt decrease in manifold pressure. This indicates a hard deceleration (Open Loop). In response, the PCM may momentarily turn off the injectors. This helps improve fuel economy, emissions and engine braking.

WIDE-OPEN-THROTTLE MODE

This is an OPEN LOOP mode. During wide-open-throttle operation, the following inputs are used by the PCM:

- Inlet/Intake air temperature
- Engine coolant temperature
- Engine speed
- Knock sensor
- Manifold absolute pressure
- Throttle position

When the PCM senses a wide-open-throttle condition through the Throttle Position Sensor (TPS) it de-energizes the A/C compressor clutch relay. This disables the air conditioning system and disables EGR (if equipped).

The PCM adjusts injector pulse width to supply a predetermined amount of additional fuel, based on MAP and RPM.

IGNITION SWITCH OFF MODE

When the operator turns the ignition switch to the OFF position, the following occurs:

- All outputs are turned off, unless 02 Heater Monitor test is being run. Refer to **EMISSION APPLICATIONS** for On-Board Diagnostics.
- No inputs are monitored except for the heated oxygen sensors. The PCM monitors the heating elements in the oxygen sensors and then shuts down.

FUEL ECONOMY AND MAINTENANCE

A vehicle that is not properly tuned and maintained cannot be expected to perform at its maximum efficiency and can have an adverse effect on fuel economy. The following recommendations will ensure that the vehicle is performing at its maximum efficiency:

- **Use the recommended motor oil grade.** Using the manufacturer's recommended grade of

Mopar® motor oil can improve fuel mileage by 1-2%. Mopar® motor oil labeled "Energy Conserving" contains friction-reducing additives.

- **Check and replace air filters.** Replacing a clogged air filter with a new Mopar® air filter can improve fuel mileage by as much as 10%.
- **Keep the engine tuned.** Repairing a vehicle that is noticeably out of tune can improve fuel mileage by an average of 4%. Maintaining a vehicle and repairing problems, such as a faulty oxygen sensor, can improve mileage by as much as 40%.
- **Keep tires properly inflated.** Underinflated tires can lower fuel mileage by 0.4% for every 1 psi drop in pressure of all four tires.

FUEL CORRECTION or ADAPTIVE MEMORIES

OPERATION

Short Term

Short Term Adaptive or Short Term Fuel Trim (STFT) is an immediate correction to fuel injector pulse width. During Closed Loop operation, Short Term Adaptive makes immediate adjustments to fuel delivery in direct response to the signal from the upstream O2 sensor. The PCM infers air/fuel ratio by monitoring oxygen content measured by the upstream O2 stream sensor.

This is an immediate response to the O2 sensor signal that is not switching or is consistently high or low. If the upstream oxygen sensor voltage is not consistently switching between 2.5 and 3.5 volts, the PCM knows that the base pulse width calculation needs to be modified by adjusting the injector pulse width until the correct O2 sensor voltage is achieved. The need to adjust the injector pulse width may be a result of vehicle operating conditions, engine wear, fuel quality, etc. The maximum range of authority for Short Term Adaptive is $\pm 33\%$. Short Term Adaptive values are not stores when the ignition is off.

Long Term

The main function of Long Term Adaptive is to make fuel corrections that permit Short Term Adaptive to hover around zero. In order to maintain correct emissions throughout all operating ranges of the engines, a cell structure based on engine rpm and load (MAP) is used.

There are 26 cells used for the NGC. Two of the cells are used only during idle, as determined by throttle position and park/neutral switch input. The other cells each represent a given off-idle manifold pressure and rpm range.

After the vehicle has reached full operating temperature, short term correction factors will update Long Term Adaptive Memory cells based on vehicle load (RPM/MAP) to allow the Short Term Adaptive value to be brought back to near zero. Once this correction factor is updated in the memory, it will be used by the PCM under all operating conditions, open loop and closed loop. However, the values stored in the Long-term are updated only after the vehicle has entered long-term closed loop at full operating temperature. This is done to prevent any transition temperature or start-up compensation from corrupting long term fuel correction.

Long Term and Short Term Adaptive can each change the pulse width by as much as $\pm 33\%$ for a maximum total correction of $\pm 66\%$ from base pulse width calculation. Long Term Adaptive values are used during both Open Loop and Closed Loop operation.

SYSTEM DIAGNOSIS

OPERATION

The PCM can test many of its own input and output circuits. If the PCM senses a fault in a major system, the PCM stores a Diagnostic Trouble Code (DTC) in memory.

For DTC information see On-Board Diagnostics. Refer to **Electrical/Electronic Control Modules/MODULE, Powertrain Control - Description** .

INJECTOR(S), FUEL

Removal

3.5L

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel injector(s), fuel system pressure must be released.

To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect negative cable to battery.
3. Remove intake manifold plenum. Refer to **Engine/Manifolds/MANIFOLD, Intake - Removal** .
4. Cover intake manifold to prevent foreign material from entering engine.
5. Disconnect fuel supply tube quick connect fittings at the rear of intake manifold. See **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure**.

Fig. 138: Fuel Rail And Injector
Courtesy of CHRYSLER LLC

6. If the injector connectors are not tagged with their cylinder number, tag them to identify the correct cylinder
7. Remove electrical connectors from the fuel injectors.
8. Remove fuel rail mounting bolts.
9. Lift fuel rail straight up off of the cylinder head.
10. Remove retaining clips from fuel injectors at fuel rail.
11. Remove fuel injectors.
12. Repeat for remaining injectors.

13. Check injector O-ring for damage. If O-ring is damaged, it must be replaced. Replace the injector clip if it is damaged.

REMOVAL

Fig. 139: Fuel Injector Mounting-Typical
Courtesy of CHRYSLER LLC

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel injector(s), fuel system pressure must be released.

NOTE: To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

1. Perform the fuel system pressure release procedure. See Fuel System/Fuel Delivery - Standard Procedure
2. Remove the fuel rail assembly. See Fuel System/Fuel Delivery/RAIL, Fuel - Removal
3. Remove the fuel injector (4) retaining clip(s) (3) from the fuel rail (2).
4. Remove the injector(s) from the fuel rail assembly.

Installation

3.5L

Fig. 140: Fuel Rail And Injector
Courtesy of CHRYSLER LLC

1. Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.
2. Install retaining clips on fuel injectors.
3. Push injectors into fuel injector rail until clips are in the correct position.
4. Position fuel rail over cylinder head, and push rail into place. Tighten fuel rail mounting bolts to 11 N.m (100 in. lbs.) torque.
5. Connect fuel supply tube quick connect fittings at the rear of intake manifold. See **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure**.
6. Connect electrical connectors to fuel injectors.
7. Install intake manifold plenum. Refer to **Engine/Manifolds/MANIFOLD, Intake - Installation**.
8. Connect negative cable to battery.
9. Use the scan tool to pressurize the fuel system. Check for leaks.

INSTALLATION

Fig. 141: Fuel Injector Mounting-Typical
 Courtesy of CHRYSLER LLC

1. Apply a small amount of engine oil to each fuel injector O-ring. This will help with the fuel rail installation.
2. Install the fuel injector(s) (4) into the fuel rail and install the retainer clip(s) (3).
3. Install the fuel rail assembly. See **Fuel System/Fuel Delivery/RAIL, Fuel - Installation**
4. Start the engine and check for leaks.

PEDAL, ACCELERATOR

Removal

REMOVAL

Fig. 142: Adjuster Cable And Accelerator Adjuster Motor

Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Disconnect electrical connectors, if equipped with adjustable pedals remove the adjuster cable (1) at accelerator adjuster motor (2).

Fig. 143: Removing/Installing Pedal Assembly
Courtesy of CHRYSLER LLC

3. Remove 3 mounting nuts.
4. Remove pedal assembly.

Installation

INSTALLATION

Fig. 144: Removing/Installing Pedal Assembly
Courtesy of CHRYSLER LLC

1. Install pedal assembly to mounting studs.
2. Install nuts.
3. Tighten mounting nuts to 34 N.m (25 ft. lbs.).

Fig. 145: Adjuster Cable And Accelerator Adjuster Motor
Courtesy of CHRYSLER LLC

4. Connect electrical connector to assembly. If equipped with adjustable pedals perform the synchronization of brake pedal to accelerator pedal.
5. Connect negative battery cable.

6. Synchronize brake pedal to accelerator pedal, then connect adjuster cable (1) to adjuster motor (2). Refer to **Brakes/Hydraulic/Mechanical/PEDAL(S), Brake and/or Accelerator - Installation** .

SENSOR, AIR TEMPERATURE, INLET

Removal

3.5L

Fig. 146: Locating Inlet Air Temperature Sensor - 3.5L
Courtesy of CHRYSLER LLC

1. Sensor location.
2. Disconnect negative battery cable.

Fig. 147: Inlet Air Temperature Sensor Electrical Connector
Courtesy of CHRYSLER LLC

3. Unlock the electrical connector.
4. Remove electrical connector from sensor.

Fig. 148: Identifying Inlet Air Temperature Sensor
Courtesy of CHRYSLER LLC

5. Note sensor orientation.
6. Remove sensor.

Fig. 149: Locating Inlet Air Temperature Sensor - 5.7L
Courtesy of CHRYSLER LLC

The Inlet Manifold Air Temperature (IAT) sensor is installed into the rubber air intake hose near front of throttle body.

1. Disconnect electrical connector from IAT sensor.
2. Clean dirt from sensor base.
3. Pull sensor from rubber hose.

6.1L

Fig. 150: Air Duct To Throttle Body
Courtesy of CHRYSLER LLC

The Inlet Manifold Air Temperature (IAT) sensor (4) is installed into the rubber air intake hose near front of throttle body.

1. Connect electrical connector (1) to sensor (2).
2. Press sensor into rubber air hose. Mate the notches. Be careful not to bend or damage probe

(3).

SENSOR, CRANKSHAFT POSITION

Description

DESCRIPTION

Fig. 158: Crankshaft Position Sensor
Courtesy of CHRYSLER LLC

The Crankshaft Position (CKP) sensor (1) is a hall effect device combined with an internal magnet.

The CKP sensor is mounted into the right rear side of the cylinder block. It is positioned and bolted into a machined hole.

Operation

OPERATION

Fig. 159: Crankshaft Position Sensor, Engine Crankshaft, And Tonewheel Notches
 Courtesy of CHRYSLER LLC

The engine speed and crankshaft position are provided through the CKP (Crankshaft Position) sensor (3). The sensor generates pulses which sends an input signal to the Powertrain Control Module (PCM). The PCM interprets the sensor input signal to determine the crankshaft position. The PCM then uses this information, along with other inputs, to determine injector sequence and ignition timing.

A tonewheel (targetwheel) is bolted to the engine crankshaft (1). This tonewheel has notches (2) on the outer edge.

Fig. 160: Crankshaft Position Sensor

Courtesy of CHRYSLER LLC

The sensor (1) is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

Fig. 161: CKP Sensor Operation And Notches - 5.7L V-8
Courtesy of CHRYSLER LLC

The notches (3) cause a pulse to be generated when they pass under the sensor. The generated pulses are the input signal to the PCM.

Removal

3.5L

Fig. 162: Crankshaft Position Sensor Location
 Courtesy of CHRYSLER LLC

1. Disconnect negative battery cable.
2. Raise vehicle and support.

Fig. 163: Crankshaft Position Sensor
 Courtesy of CHRYSLER LLC

3. Unlock and disconnect the electrical connector.
4. Remove mounting bolt.
5. Remove sensor.

REMOVAL

The Crankshaft Position (CKP) sensor is located at the right-rear side of the engine block (1). It is positioned and bolted into a machined hole in the engine block.

Fig. 164: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Raise and support the vehicle.
3. Remove the starter motor. Refer to **Electrical/Starting/STARTER - Removal**
4. Disconnect the CKP sensor electrical connector (1).

Fig. 165: Crankshaft Position Sensor Mounting Bolt
Courtesy of CHRYSLER LLC

5. Remove the CKP sensor mounting bolt (1).
6. Using a slight twisting motion, remove the CKP sensor from the engine block.

2486094

Courtesy of CHRYSLER LLC

7. Check the condition of the sensor O-ring (1) and replace if necessary.

Installation

3.5L

8133ca5e

Fig. 167: Crankshaft Position Sensor
Courtesy of CHRYSLER LLC

NOTE: If reinstalling the sensor, check the sensor O-ring for damage and replace if necessary. Lubricate the O-ring with clean engine oil before installing the sensor.

1. Push the crankshaft position (CKP) sensor into the transmission case with a twisting motion until fully seated.

CAUTION: Before tightening the sensor mounting bolt, be sure the sensor is completely flush to the mounting surface. If the sensor is not flush, damage to the sensor mounting tang may result.

2. While holding the sensor in this position, install and tighten the retaining bolt to 12 N.m (105 in. lbs.).
3. Connect and lock the electrical connector to the CKP sensor.
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. Refer to DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure

INSTALLATION

2486094

Fig. 168: Crankshaft Position Sensor
Courtesy of CHRYSLER LLC

NOTE: Before installing the Crankshaft Position (CKP) sensor, check the condition of the sensor O-ring (1) and replace if necessary.

1. Clean the machined hole in the engine block.
2. Apply a small amount of engine oil to the CKP sensor O-ring (1).
3. Install the CKP sensor into the engine block with a slight twisting motion.

Fig. 169: Crankshaft Position Sensor Mounting Bolt
Courtesy of CHRYSLER LLC

CAUTION: Before tightening the CKP sensor mounting bolt (1), be sure the sensor is completely flush to the cylinder block. If sensor is not flush, damage to the sensor mounting tang may result.

4. Install the CKP sensor mounting bolt (1) and tighten to 12 N.m (9 ft. lbs.).

Fig. 170: Crankshaft Position Sensor Electrical Connector
Courtesy of CHRYSLER LLC

5. Connect the CKP sensor electrical connector (1).
6. Install the starter motor. Refer to **Electrical/Starting/STARTER - Installation**
7. Lower the vehicle.
8. Install the negative battery cable.

SENSOR, MANIFOLD AIR PRESSURE (MAP)

Removal

3.5L

SENSOR, OXYGEN

Removal

3.5L

Fig. 186: Oxygen Sensor Location
Courtesy of CHRYSLER LLC

The engine uses two heated oxygen sensors, one in each exhaust manifold.

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

WARNING: The exhaust manifold, exhaust pipes and catalytic converter become very hot during engine operation. Allow engine to cool before removing oxygen sensor.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

1. Remove the negative battery cable.
2. Raise vehicle and support.
3. Disconnect the heated oxygen sensor electrical connector.
4. Use a socket such as Snap-On YA8875 or a crow foot wrench to remove oxygen sensor.

5.7L

Fig. 187: Oxygen Sensor Location
Courtesy of CHRYSLER LLC

Refer to illustration for typical O2S (oxygen sensor) locations if equipped with four oxygen sensors.

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

WARNING: The exhaust manifold, exhaust pipes and catalytic converter become very hot during engine operation. Allow engine to cool before removing oxygen sensor.

1. Raise and support vehicle.
2. Disconnect wire connector from O2S sensor.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

3. Remove O2S sensor with an oxygen sensor removal and installation tool.
4. Clean threads in exhaust pipe using appropriate tap.

6.1L

Fig. 188: Oxygen Sensor Location
Courtesy of CHRYSLER LLC

Refer to illustration for typical O2S (oxygen sensor) locations if equipped with four oxygen sensors.

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

WARNING: The exhaust manifold, exhaust pipes and catalytic converter become very hot during engine operation. Allow engine to cool before removing oxygen sensor.

1. Raise and support vehicle.
2. Disconnect wire connector from O2S sensor.

CAUTION: When disconnecting sensor electrical connector, do not pull directly on wire going into sensor.

3. Remove O2S sensor with an oxygen sensor removal and installation tool.
4. Clean threads in exhaust pipe using appropriate tap.

Installation

3.5L

Fig. 189: Oxygen Sensor Location
Courtesy of CHRYSLER LLC

NOTE: When replacing an O2 Sensor, the PCM RAM memory must be cleared, either by disconnecting the PCM C-1 connector or momentarily disconnecting the Battery negative terminal. The NGC learns the characteristics of each O2 heater element and these old values should be cleared when installing a new O2 sensor. The customer may experience driveability issues if this is not performed.

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

The engine uses two heated oxygen sensors, one in each exhaust manifold.

1. After removing the sensor, the exhaust manifold threads must be cleaned with an 18 mm X 1.5 + 6E tap. If reusing the original sensor, coat the sensor threads with an anti-seize compound such as Loctite 771- 64 or equivalent. New sensors have compound on the threads and do not require an additional coating. Tighten the sensor to 41 N.m (30 ft. lbs.) torque.
2. Connect the heated oxygen sensor electrical connector.
3. Lower vehicle.
4. Install the negative battery cable.

5.7L

Fig. 190: Oxygen Sensor Location
Courtesy of CHRYSLER LLC

NOTE: When replacing an O2 Sensor, the PCM's RAM memory must be cleared. This can be done by either by disconnecting the PCM's C-1 connector, or by momentarily disconnecting the negative battery cable. The PCM learns the characteristics of each O2 heater element, and these old values should be cleared when installing a new O2 sensor. Driveability problems may be experienced if this step is not performed.

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT** add any additional anti-seize compound to threads of a new oxygen sensor.

1. Install O2S sensor. Tighten to 41 N.m (30 ft. lbs.) torque.
2. Connect O2S sensor wire connector.
3. Lower vehicle.

6.1L

Fig. 191: Oxygen Sensor Location
 Courtesy of CHRYSLER LLC

NOTE: When replacing an O2 Sensor, the PCM's RAM memory must be cleared. This can be done by either by disconnecting the PCM's C-1 connector, or by momentarily disconnecting the negative battery cable. The PCM learns the characteristics of each O2 heater element, and these old values should be cleared when installing a new O2 sensor. Driveability problems may be experienced if this step is not performed.

CAUTION: Never apply any type of grease to the oxygen sensor electrical connector, or attempt any soldering of the sensor wiring harness.

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to threads of a new oxygen sensor.**

1. Install O2S sensor. Tighten to 41 N.m (30 ft. lbs.).
2. Connect O2S sensor wire connector.
3. Lower vehicle.

SOLENOID, SHORT RUNNER VALVE

Operation

OPERATION

The SRV system operates under WOT conditions above 5000 rpm to maximize engine performance. When actuated by the PCM, the SRV solenoid energizes, allowing mechanical linkage to redirect the intake air flow to six short runners. The PCM looks for a current spike when actuating the solenoid. If

the spike is not present, the PCM sets the DTC.

Removal

REMOVAL

1. Disconnect negative battery cable.

5. Install inlet hose and tighten clamp.

6. Connect negative cable to battery.
7. Use a scan tool and perform the ETC RELEARN function.

5.7L

Fig. 207: Throttle Body O-Ring At Front Of Intake Manifold
Courtesy of CHRYSLER LLC

1. Clean and check condition of throttle body-to-intake manifold o-ring (2).
2. Clean mating surfaces of throttle body and intake manifold (1).

Fig. 208: Throttle Body - 5.7L
Courtesy of CHRYSLER LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

3. Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.
4. Install and tighten four mounting bolts (2). Refer to **TORQUE** .
5. Install electrical connector (3).
6. Install rubber air hose to throttle body.
7. A Scan Tool may be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Relearn. If the relearn is not preformed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

6.1L

Fig. 209: Throttle Body O-Ring At Front Of Intake Manifold
Courtesy of CHRYSLER LLC

1. Clean and inspect the throttle body-to-intake manifold O-ring (2).
2. Clean mating surfaces of throttle body and intake manifold (1).

Fig. 210: Throttle Body - 6.1L
Courtesy of CHRYSLER LLC

CAUTION: Do not use spray (carb) cleaners on any part of the throttle body. Do not apply silicone lubricants to any part of the throttle body.

3. Install throttle body to intake manifold by positioning throttle body to manifold alignment pins.
4. Install and tighten four mounting bolts (3). See **Fuel System/Fuel Delivery - Specifications**.
5. Install electrical connector (2). To lock connector, slide the red colored tab towards throttle body. Pull firmly on connector to verify a good lock.
6. Install rubber air hose to throttle body.
7. A scan tool may be used to learn electrical parameters. Go to the Miscellaneous menu, and then select ETC Relearn. If the relearn is not preformed, a Diagnostic Trouble Code (DTC) will be set. If necessary, use a scan tool to erase any Diagnostic Trouble Codes (DTC's) from PCM.

VALVE, SHORT RUNNER

Description

DESCRIPTION

The intake manifold features a dual shaft Short Runner Valve (SRV) system to maximize both low end torque and peak power. The SRV is bolted to the rear of the intake manifold and can be service separately from the manifold.

The SRV system operates under Wide Open Throttle conditions to maximize engine performance. When activated by the PCM, the SRV actuates a mechanical linkage to redirect the intake air flow to eight short runners. The PCM looks for a signal feedback when the actuator is activated. If the signal feedback is not present, the PCM sets the DTC.

Removal

REMOVAL

ACCESSORIES AND EQUIPMENT

Heated Glass - Service Information - Challenger

DESCRIPTION

DESCRIPTION

CAUTION: Grid lines can be damaged or scraped off with sharp instruments. Care should be taken in cleaning glass or removing foreign materials, decals or stickers. Normal glass cleaning solvents or hot water used with rags or toweling is recommended.

Fig. 1: Identifying Vertical Bus Bars, Grid Lines & Rear Window
Courtesy of CHRYSLER LLC

The rear window defogger system, also known as electric backlight (EBL), consists of two vertical bus bars (1) linked by a series of grid lines (2) fired onto the inside surface of the rear window (3).

The EBL system is turned On or Off by a switch and timing circuit integral to the A/C-heater control located at the center of the instrument panel.

Circuit protection is provided by two cartridge fuses located in the power distribution center (PDC). One fuse is for the heated rear window grid circuit and the other fuse is for the heated outside mirror grid circuit, when equipped.

OPERATION

OPERATION

98772

Fig. 2: Identifying A/C-heater Control, Indicator Lamp & Rear Window Defogger Switch
 Courtesy of CHRYSLER LLC

The electric backlight (EBL) system is controlled by a momentary switch (2) located in the A/C-heater control (1) on the instrument panel. When the rear window defogger switch is pressed to ON, the A/C-heater control energizes the rear window defogger (EBL) relay and fused battery current is then directed through the relay and to the rear window defogger grid lines and to the heated outside rear view mirrors, when equipped. The grid lines heat the glass to help clear the rear window and outside mirror surfaces of fog or frost.

An amber indicator (3) in the rear window defogger switch will illuminate to indicate when the EBL system is turned on. The A/C-heater control contains the EBL system control circuitry including the timer logic.

NOTE: **The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.**

The EBL system will automatically turn off after a programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Repair of the rear window defogger grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent. See **Electrical - Heated/Cooled Systems/Heated Glass/GRID, Defogger - Standard Procedure.**

DIAGNOSIS AND TESTING

ELECTRIC BACKLIGHT (EBL) SYSTEM

NOTE: Illumination of the defogger switch indicator lamp does not necessarily mean that electrical current is reaching the rear glass heating grid lines.

NOTE: See SYSTEM WIRING DIAGRAMS for circuit descriptions and diagrams of the rear window defogger system.

Operation of the electric backlight (EBL) system can be confirmed by the following:

Fig. 3: Rear Window Glass Grid Test
Courtesy of CHRYSLER LLC

1. Use a scan tool and check for diagnostic trouble codes (DTCs) related to the A/C-heater control. If no DTCs are found, go to 2. If any DTCs are found, repair as required, then proceed to 2.
2. Turn the ignition switch to RUN. Set the rear window defogger switch to ON. Rear window defogger operation can be checked by feeling the rear window glass, or the heated outside rear view mirror glass, when equipped with heated mirrors. A distinct difference in temperature between the grid lines (5) and the adjacent clear glass or the heated mirror glass should be detected within 3 to 4 minutes of operation.
3. If a temperature difference is not detected, use a 12-volt DC voltmeter and contact the rear glass heating grid terminal A (1) with the negative lead, and terminal B (2) with the positive lead. The voltmeter should read battery voltage. If the voltmeter does not read battery voltage, check the following:
 - Confirm the ignition switch is in RUN.
 - Confirm the rear window defogger switch is ON.
 - Confirm the EBL feed wire (3) is connected to the heating grid positive terminal and that there is continuity between the EBL relay and the heating grid.
 - Confirm the EBL ground wire (6) is connected to the heating grid negative terminal and that there is continuity to ground.
 - Check the EBL relay and fuses located in the power distribution center (PDC) in the engine compartment. The relay and fuses must be tight in their receptacles and all electrical connections must be secure.
4. If broken defogger grid lines or bus bars are suspected, use a 12-volt DC voltmeter and contact

the rear glass heating grid ground terminal A with the negative lead and each rear glass heating grid line at its mid-point (4) with the positive lead. The voltmeter should read approximately 6 volts at each grid line mid-point. If the voltmeter does not read approximately 6 volts, repair the open grid line(s) or bus bar(s). See **Electrical - Heated/Cooled Systems/Heated Glass/GRID, Defogger - Standard Procedure**.

5. If the EBL system operation has been verified but the rear window defogger indicator lamp does not illuminate, replace the A/C-heater control. Refer to **Heating and Air Conditioning/Controls/CONTROL, A/C and Heater - Removal** .

GRID, DEFOGGER, REAR

STANDARD PROCEDURE

GRID LINE AND TERMINAL REPAIR

WARNING: Materials contained in the Repair Kit (Part Number 04549275) may cause skin or eye irritation. The kit contains epoxy resin and amine type hardener, which are harmful if swallowed. Avoid contact with the skin and eyes. For skin contact, wash the affected areas with soap and water. For contact with the eyes, flush with plenty of water. Do not take internally. If taken internally, induce vomiting and call a physician immediately. Use with adequate ventilation. Do not use near fire or flame. Contains flammable solvents. Keep out of the reach of children. Failure to follow these instructions may result in serious or fatal injury.

Repair of the rear glass heating grid lines, bus bars, terminals or pigtail wires can be accomplished using the Mopar® Rear Window Defogger Repair Kit (Part Number 04549275) or equivalent.

Fig. 4: Grid Line Repair - Typical
Courtesy of CHRYSLER LLC

1. Mask the repair area with masking tape (3) so that the conductive epoxy can be applied neatly. Extend the epoxy application onto the grid line (2) or the bus bar on each side of the break (1).
2. Follow the instructions in the repair kit for preparing the damaged area.

3. Remove the package separator clamp and mix the two conductive epoxy components thoroughly within the packaging. Fold the package in half and cut the center corner to dispense the epoxy.
4. Apply the epoxy through the slit in the masking tape or template. Overlap both ends of the break by at least 19 millimeters (0.75 inch).
5. For a terminal or pigtail wire replacement, mask the adjacent areas so the epoxy can be extended onto the adjacent grid line as well as the bus bar. Apply a thin layer of epoxy to the area where the terminal or pigtail wire was fastened and onto the adjacent grid line.
6. Apply a thin layer of conductive epoxy to the terminal or bare wire end of the pigtail and place it in the proper location on the bus bar. To prevent the terminal or pigtail wire from moving while the epoxy is curing, it must be wedged or clamped.
7. Carefully remove the masking tape or template.

CAUTION: Do not allow the glass surface to exceed 204° C (400° F) when using a heat gun, or the glass may fracture.

8. Allow the epoxy to cure 24 hours at room temperature or carefully use a heat gun for 15 minutes. When using a heat gun, hold it approximately 25.4 centimeters (10 inches) from the repair and do not allow the glass surface to exceed 204° C (400° F).
9. After the conductive epoxy is properly cured, remove the wedge or clamp from the terminal or pigtail wire.
10. Connect the wire harness leads to the grid terminals or pigtail wires and verify EBL operation.

RELAY, DEFOGGER, REAR

DESCRIPTION

DESCRIPTION

Fig. 5: Rear Window Defogger (EBL) Relay
Courtesy of CHRYSLER LLC

The rear window defogger (EBL) relay (1) is an International Standards Organization (ISO)-type relay. Relays conforming to the ISO specifications have common physical dimensions, current capacities, terminal functions and patterns (2). The EBL relay is a electromechanical device that switches battery current through a fuse in the power distribution center (PDC) to the rear window defogger grid and when equipped, switches battery current through a fuse in the PDC to the heated outside rear view mirrors. The EBL relay is energized when the relay coil is provided a ground path by the control circuitry within the A/C-heater control.

The EBL relay is located in the PDC at the rear of the vehicle, near the battery.

OPERATION

OPERATION

The ISO-standard rear window defogger (EBL) relay is an electromechanical switch that uses a low current input controlled by the A/C-heater control to control the high current output to the rear window defogger grid lines. The movable, common feed relay contact is held against the fixed, normally closed relay contact by spring pressure. When the electromagnetic relay coil is energized, it draws the movable common feed relay contact away from the fixed, normally closed relay contact and, holds it against the fixed, normally open relay contact. This action allows high current to flow to the rear window defogger grid lines.

When the relay coil is de-energized, spring pressure returns the movable relay contact back against the fixed, normally closed contact point. The resistor or diode is connected in parallel with the relay coil, and helps to dissipate voltage spikes and electromagnetic interference that can be generated as the electromagnetic field of the relay coil collapses.

The EBL relay terminals are connected to the vehicle electrical system through a receptacle in the

power distribution center (PDC). The inputs and outputs of the EBL relay include:

- The common feed terminal (30) receives a battery current input from a fused B(+) circuit at all times.
- The coil ground terminal (85) receives a ground through the EBL relay control circuit only when the A/C-heater control electronically pulls the circuit to ground.
- The coil battery terminal (86) receives a battery current input from a fused B(+) circuit at all times.
- The normally open terminal (87) provides battery current to the rear window defogger grid through the EBL relay output circuit and a fuse located in the PDC only when the EBL relay coil is energized.
- The normally closed terminal (87A) is not connected to any circuit in this application, but provides a battery current output only when the EBL relay coil is de-energized.

The EBL relay cannot be repaired and must be replaced if inoperative or damaged. See **SYSTEM WIRING DIAGRAMS** for diagnosis and testing of the EBL relay and for complete rear window defogger (EBL) wiring diagrams.

REMOVAL

REMOVAL

Fig. 6: EBL Relay Location
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Open the cover of the power distribution center (PDC) (1) located at the rear of the vehicle near the battery (2).
3. Remove the EBL relay (3) from the PDC.

INSTALLATION

INSTALLATION

Fig. 7: EBL Relay Location
Courtesy of CHRYSLER LLC

1. Position the EBL relay (3) into the proper receptacle of the power distribution center (PDC) (1) located at the rear of the vehicle near the battery (2).
2. Align the EBL relay terminals with the terminal cavities in the PDC receptacle and push down firmly on the relay until the terminals are fully seated.
3. Close the cover of the PDC.
4. Reconnect the negative battery cable.

SWITCH, DEFOGGER, REAR

DESCRIPTION

DESCRIPTION

88772

Fig. 8: Identifying A/C-heater Control, Indicator Lamp & Rear Window Defogger Switch
Courtesy of CHRYSLER LLC

The switch for the rear window defogger (EBL) system (2) is integrated into the A/C-heater control (1), located in the center of the instrument panel. When the rear window defogger switch is activated, the timing circuit integral to the A/C-heater control operates the rear window defogger (EBL) relay. An amber indicator (3) in the rear window defogger switch will illuminate to indicate when the EBL system is turned on.

When the EBL relay is activated, current is directed to the rear window defogger grid lines and when equipped, to the heated outside rear view mirrors. The grid lines heat the window and mirror glass to help clear the surfaces of fog or frost.

OPERATION

OPERATION

When the rear window defogger switch is activated, the A/C-heater control operates the rear window defogger (EBL) relay and the amber indicator lamp will illuminate. The EBL relay controls the current flow to the heating grid of the rear window and to the heated outside rear view mirrors, when equipped.

NOTE: The EBL system turns off automatically after 10 minutes of initial operation. Each following activation cycle of the EBL system will last 5 minutes.

The EBL system will automatically turn off after a programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the EBL system will automatically turn off after about 5 minutes. The EBL system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

NOTE: **ATC A/C-heater controls are NOT interchangeable between other model years or other vehicle lines. If replacement of the A/C-heater control is required, only use the control designed for the vehicle being serviced.**

The rear window defogger switch and the rear window defogger indicator lamp cannot be repaired and the A/C-heater control must be replaced if found inoperative or damaged. Refer to **Heating and Air Conditioning/Controls/CONTROL, A/C and Heater - Removal** .

ACCESSORIES AND EQUIPMENT

Heated Mirrors - Service Information - Challenger

DESCRIPTION

DESCRIPTION

88772

Fig. 1: Identifying A/C-heater Control, Indicator Lamp & Rear Window Defogger Switch
Courtesy of CHRYSLER LLC

The optional heated mirror system is controlled by the momentary rear window defogger switch (2), which is integral to the A/C-heater control (1). An amber indicator lamp (3) will illuminate to indicate when the rear window defogger (EBL) system is turned on.

The heated mirror system only operates in concert with the EBL system, and will automatically turn off after a programmed time interval of about 10 minutes as long as the ignition switch is in RUN. After the initial time interval has expired, if the rear window defogger switch is pressed to ON again during the same ignition cycle, the heated mirror system will automatically turn off after about 5 minutes. The heated mirror system will also turn off if the ignition switch is turned to any position other than RUN or by manually pressing the rear window defogger switch a second time.

Circuit protection is provided by a fuse located in the power distribution center (PDC).

OPERATION

OPERATION

When the rear window defogger switch is pressed, the rear window defogger (EBL) system becomes activated and an electric heater grid located behind the glass of each of the outside rear view mirrors is energized. When energized, each of these heater grids produce heat to help clear the outside rear view mirrors of ice, snow, or fog.

If the outside mirror heating grids are both inoperative. Refer to **Electrical - Heated/Cooled Systems/Heated Glass - Diagnosis and Testing** in this service information. If only one of the outside mirror heating grids is inoperative. Refer to **Electrical - Power Systems/Power Mirrors - Diagnosis and Testing** .

The heating grid behind each outside mirror glass cannot be repaired and the mirror glass must be replaced if found inoperative or damaged. Refer to **Body/Exterior/MIRROR, Outside Rearview - Removal** .

ACCESSORIES AND EQUIPMENT

Heated Seats - Service Information - Challenger

DESCRIPTION

DESCRIPTION

WARNING: The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. Failure to follow these instructions may result in serious or fatal injury. The following requirements must be strictly adhered to:

- Do not modify the front passenger seat assembly or components in any way.
- Do not modify the front seat center console or center position seat in any way.
- Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.
- Do not replace the seat trim cover with an aftermarket trim cover.
- Do not add a secondary trim cover other than those approved by Chrysler/Mopar.
- At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by Chrysler/Mopar.

88012

Fig. 1: Instrument Panel, Center Stack & Heated Seat Switches
Courtesy of CHRYSLER LLC

Vehicles with the heated seat option can be identified by the two heated seat switches (3) located in the center stack (2) of the instrument panel (1). The heated seat system allows the driver and front passenger to select from two different levels of electrical seat heating (HI/LO). The heated seat system for this vehicle includes the following major components, which are described in further detail later in this service information:

- **Heated Seat Elements** - There are four heated seat elements are used per vehicle. Two heated seat elements are integral to each seat, one in the seat back and the other in the seat cushion.
- **Heated Seat Module** - There is one heated seat module in each vehicle with heated seats. The heated seat module is mounted under the right front seat and contains the control logic and software for the front heated seat system. The module communicates on the Controller Area Network (CAN) data bus.
- **Heated Seat Switches** - Each heated seat is operated by a heated seat switch. These switches are mounted on the center stack of the instrument panel.
- **Instrument Cluster** - A Cab Compartment Node (CCN) is part of the instrument cluster on this vehicle. The CCN uses integrated software and information carried on the CAN data bus. The CCN serves as the link between the heated seat switches and the heated seat module.

OPERATION

OPERATION

The heated seat system operates on battery current received through a fuse in the Totally Integrated Power Module (TIPM). Fused ignition switch output (run) circuits are used, so that the heated seat system will only operate when the ignition switch is in the On position. The heated seat system will turn Off automatically whenever the ignition switch is turned to any position except On.

A Heated Seat Module is used to control the heated seat system. The module responds to heated seat switch messages and ignition switch status inputs by controlling the 12v output to the front seat heating elements through integral solid-state relays.

When either of the heated seat switches are depressed a resistance signal is sent to the Cab Compartment Node (CCN) or instrument cluster. The CCN then sends a message via the Controller Area Network (CAN) data bus to the heated seat module, signaling the module to energize the heating element for the selected seat. Amber Light Emitting Diodes (LEDS) in the top portion of each switch indicate the level of heat in use: Two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once will select high-level heating. Pressing the switch a second time will select low-level heating. Pressing the switch a third time will shut the heating elements off.

The heated seat module energizes an integral solid-state relay, which supplies battery current to the heating elements. When high-temperature heating is selected, the heaters provide a boosted heat level during the first four minutes of operation after heating is activated. The heat output then drops to the normal high-temperature level. If high-level heating is selected, the control system will automatically switch to the low level after two hours of continuous operation. At that time, the number of illuminated LEDs changes from two to one, indicating the change. Operation on the low setting also turns off automatically after two hours.

The module will automatically turn off the heating elements if it detects an OPEN or LOW short in the heating element circuit.

DIAGNOSIS AND TESTING

HEATED SEAT SYSTEM

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.1v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

MODULE, HEATED SEAT

DESCRIPTION

DESCRIPTION

813635d4

Fig. 2: Heated Seat Module
Courtesy of CHRYSLER LLC

The heated seat module (1) is located under the right front seat. It has a single electrical connector (3) and four locking tabs (2) that secure it to the floor cross member. The module can be accessed through the separation between the front and rear carpet assemblies.

The heated seat module is a microprocessor designed to use Controller Area Network (CAN) data bus messages from the instrument cluster also known as the Cabin Compartment Node (CCN). The CCN receives inputs from the heated seat switches and in turn signals the heated seat module to operate the heated seat elements for both front seats.

OPERATION

OPERATION

The heated seat module operates on fused battery current received from the ignition switch. The module is grounded to the body at all times through the electrical connector. Inputs to the module include Controller Area Network (CAN) data bus messages and standard hardwired 12volt power and ground. In response to the CAN inputs the heated seat module will control the battery current to the appropriate heated seat elements.

When a heated seat switch CAN data bus signal is received by the heated seat module, the module energizes the selected heated seat element. The Low heat set point is about 38°C (100.4°F), and the High heat set point is about 42°C (107.6°F).

If the heated seat module detects a heated seat element OPEN or SHORT circuit, it will record and store the appropriate diagnostic trouble code (DTC).

DIAGNOSIS AND TESTING

HEATED SEAT MODULE

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.0v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

REMOVAL

REMOVAL

Fig. 3: Heated Seat Module
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the right front seat from the vehicle. Refer to **Body/Seats/SEAT - Removal**.
3. Reposition the front carpet assembly aside to gain access to the heated seat module (1).
4. Disconnect the wire harness connector (3) from the heated seat module (1).
5. Unsnap the heated seat module retaining clips (2) from the floor crossmember.
6. Remove the heated seat module (1) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 4: Heated Seat Module
Courtesy of CHRYSLER LLC

1. Install the heated seat module (3) into the vehicle.
2. Position the tab into the hole in the floor crossmember. Firmly apply even pressure to the heated seat module (3) until the retaining clips (2) snap into place.
3. Connect the electrical connector (3) to the heated seat module (1).
4. Reposition the front carpet assembly.
5. Install the right front seat. Refer to **Body/Seats/SEAT - Installation** .
6. Connect the battery negative cable.
7. Check for proper heated seat system operation.

PAD, HEATER

DESCRIPTION

DESCRIPTION

Vehicles equipped with the optional heated seat system have two, carbon fiber heated seat elements, located in each front seat. One heating element is used for each seat cushion and another for each seat back.

Each of the heated seat element consists of multiple heating circuits operating in parallel throughout the carbon fiber element. The heated seat elements are captured between the leather trim cover and the seat cushion assembly. If a malfunction occurs in one or more of the individual carbon fiber

circuits, the others will continue to provide heat.

The heated seat elements cannot be repaired. If found to be damaged or inoperative, a new heating element assembly must be installed.

OPERATION

OPERATION

One end of the heated seat element is connected to ground at all times through a splice under the seat. Battery current is directed to the other end of the heated seat element by the heated seat module. The heated seat module will energize the heated seat element when the heated seat switch is depressed in the Low or High position.

As electrical current passes through the heated seat element, the resistance of the wire used in the element disperses some of the electrical current in the form of heat. The heat produced by the heated seat element then radiates through the underside of the seat cushion and seat back trim covers, warming the seat cover and its occupant.

DIAGNOSIS AND TESTING

HEATED SEAT ELEMENT

81104126

Fig. 5: Wire Harness Connectors
Courtesy of CHRYSLER LLC

Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information.

The wire harness connectors (2 AND 3) for the heating elements are located under the seat (1).

NOTE: When checking heated seat elements for continuity, be certain to move the heating element being checked. Moving the element, such as sitting in the seat will eliminate the possibility of an intermittent open in the element which would only be evident if the element was in a certain position. Failure to check the element in various positions could result in an incomplete test.

1. Locate and disconnect the seat electrical connector.
2. Check the resistance between the circuit leading in and out of the suspect heated seat element. The resistance should be between 3.8 - 4.8 ohms for a seat cushion element and 4.3 - 5.4 ohms for a seat back element. If OK. See [Electrical - Heated/Cooled Systems/Heated Seats - Diagnosis and Testing](#). If not OK, replace the inoperative heated seat element.

REMOVAL

REMOVAL

Fig. 6: Identifying Seat Back Element Electrical Connector And Heating Element
Courtesy of CHRYSLER LLC

NOTE: The factory installed heating element can be removed from foam cushion (3) by carefully peeling the element off along the adhesive lines.

1. Disconnect and isolate the battery negative cable.
2. Remove the appropriate seat cushion. Refer to [Body/Seats/COVER, Seat Cushion - Removal](#) or seat back trim cover. Refer to [Body/Seats/SEAT BACK - Removal](#)

3. Disconnect the inoperative heated seat cushion or seat back element electrical connectors (2).
4. Carefully peel the heating element off of the foam pad (3), being careful not to remove excessive foam in the process.

INSTALLATION

INSTALLATION

80c91ct2

Fig. 7: Peeling Off Adhesive Backing On Back Of Replacement Heating Element
Courtesy of CHRYSLER LLC

1. Peel the adhesive backing from the back of the replacement heating element (2), and place on foam pad directly where the original element was placed (there will be adhesive marks on the foam outlining the factory installed element) (1).

CAUTION: During the installation of the replacement heating element, be careful not to fold or crease the element assembly. Folds or creases will cause premature failure.

Fig. 8: Identifying Heating Element Electrical Connectors
Courtesy of CHRYSLER LLC

2. Connect the new heating element electrical connectors (3 and 4).
3. Connect the battery negative cable.
4. Verify heated seat system operation.
5. Install the appropriate seat cushion. Refer to **Body/Seats/COVER, Seat Cushion - Installation** or seat back trim cover. Refer to **Body/Seats/SEAT BACK - Installation**

NOTE: Make certain the heated seat wire harness is correctly routed through the seat cushion and seat back. The excess wire between the cushion and back elements should be securely tucked between the rear of the cushion foam and the rear carpet flap of the trim cover. The factory installed heater element should be completely removed from the system and discarded.

SWITCH, HEATED SEAT

DESCRIPTION

DESCRIPTION

88012

Fig. 9: Instrument Panel, Center Stack & Heated Seat Switches
 Courtesy of CHRYSLER LLC

The heated seat switches (3) are located in the instrument panel (1). The two switches are snapped into mounting holes in the instrument panel center bezel (2). The two heated seat switches are identical in appearance and construction.

89018

Fig. 10: Heated Seat Switch
 Courtesy of CHRYSLER LLC

Each heated seat switch provides a resistor multiplexed signal to the Cab Compartment Node (CCN). Amber Light Emitting Diodes (LEDs) in the top portion of each switch indicate the level of heat in use: two LEDs are illuminated for high, one for low, and none for off. Pressing the switch once selects high level heating. Pressing the switch a second time selects low level heating. Pressing the switch a third time shuts the heating elements off.

The LED indicators in each heated seat switch cannot be repaired. If the LED indicators are

inoperative or damaged, or the switch is inoperative or damaged the individual heated seat switch assembly must be replaced.

OPERATION

OPERATION

The heated seat switches receive battery current through a fused ignition switch output (run) circuit when the ignition switch is in the On position. Depressing the heated seat switch provides a hard-wired resistor multiplexed signal to the Cabin Compartment Node (CCN). The CCN is responsible for supplying the Controller Area Network (CAN) data bus message to the heated seat module, signaling the module to power the heated seat element of the selected seat and maintain the temperature setting.

If the heated seat switch is depressed to a different position (Low or High) than the currently selected state, the CCN will go through the process again to change the temperature setting. If a heated seat switch is depressed a second time to the same position as the currently selected state, the CCN and heated seat module interprets the second input as a request to turn the seat heater OFF. The CCN will then signal the heated seat module to turn the heated seat elements for that seat off.

DIAGNOSIS AND TESTING

HEATED SEAT SWITCH

In order to obtain conclusive testing, the heated seat system and the Controller Area Network (CAN) data bus circuit must be checked. **Any diagnosis of the heated seat system should begin with, the use of a scan tool and the appropriate diagnostic service information.**

Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information.

NOTE: Vehicles equipped with the heated seat option utilize a low voltage cut-off feature. This feature turns off power to the heated seat system anytime vehicle voltage is below 11.0v or above 15.5v. Be certain to check the vehicle electrical system for proper voltage anytime the power seat system appears inoperative.

Before any testing of the power seat system is attempted, the battery should be fully-charged.

REMOVAL

REMOVAL

Fig. 11: Heated Seat Switch, Center Bezel & Tabs
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the center bezel (2) from the instrument panel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal**.
3. Disconnect the heated seat switch electrical connector.
4. From the back of the center bezel (2) squeeze the two tabs (3) at the top and bottom of the switch and push the heated seat switch (1) through the opening of the center bezel.

INSTALLATION

INSTALLATION

Fig. 12: Heated Seat Switch, Center Bezel & Tabs
Courtesy of CHRYSLER LLC

1. From the front of the center bezel (2), carefully push the heated seat switch (1) in through the front of the bezel until both tabs (3) lock into place.
2. Connect the heated seat switch electrical connector.
3. Install the center bezel (2) into the instrument panel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** .
4. Connect the battery negative cable.
5. Verify heated seat operation.

ACCESSORIES AND EQUIPMENT

Universal Transmitter - Challenger

TRANSMITTER, UNIVERSAL

DESCRIPTION

DESCRIPTION

Fig. 1: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

The universal transmitter transceiver is integral to the overhead console. The only visible component of the universal transmitter are the three transmitter push buttons (4) at the front of the overhead console. The buttons are marked with one, two or three illuminated dots, respectively, for identification of each channel.

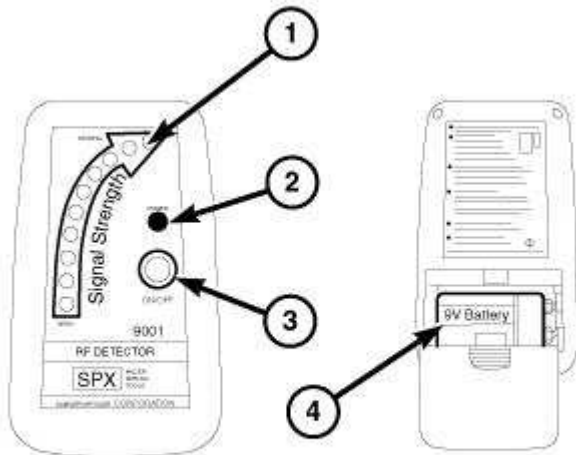

Each of the three universal transmitter push buttons controls an independent radio transmitter channel. Each of these three channels can be trained to transmit a different radio frequency signal for the remote operation of garage door openers, motorized gate openers, home or office lighting, security systems or just about any other device that can be equipped with a radio receiver in the 286 to 399 MegaHertz (MHz) frequency range for remote operation. The universal transmitter is capable of operating systems using either rolling code or non-rolling code technology. The system will not transmit operating signals if the Vehicle Theft Security System is armed.

The universal transmitter cannot be repaired, and is available for service only as a unit. This unit includes the push button switches and the plastic module.

DIAGNOSIS AND TESTING

UNIVERSAL TRANSMITTER

If the Universal Transmitter is inoperative, but the Electronic Vehicle Information Center (EVIC) is operating normally. See **Electrical - Message Systems/Universal Transmitter/TRANSMITTER, Universal - Standard Procedure** for instructions on training the Transmitter. Retrain the Transmitter with a known good transmitter as instructed and test the Transmitter operation again.

114508

Fig. 2: Radio Frequency Detector #9001
Courtesy of CHRYSLER LLC

If the unit is still inoperative, test the universal transmitter with Radio Frequency Detector special tool as described below:

1. Turn the Radio Frequency (RF) Detector ON. A "chirp" will sound and the green power Light Emitting Diode (LED) will light. If the green LED does not light, replace the battery.
2. Hold the RF detector within one inch of the TRAINED universal transmitter and press any of the transmitters buttons.
3. The red signal detection LEDs will light and the tool will beep if a radio signal is detected. Repeat this test for each button. If any button is inoperative, replace the universal transmitter assembly. See **Electrical - Message Systems/Universal Transmitter/TRANSMITTER, Universal - Removal**.

If both the Transmitter and the EVIC module are inoperative. Refer to **Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Diagnosis and Testing** for further diagnosis. Refer to the appropriate **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information.

STANDARD PROCEDURE

PROGRAMMING TRANSMITTER CODES

Fig. 3: Identifying Overhead Console Components
 Courtesy of CHRYSLER LLC

CAUTION: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the transceiver. Exhaust gas can cause serious or fatal injury.

CAUTION: Your motorized door or gate will open and close while you are training the Universal Transceiver. Do not train the transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious or fatal injury to people and pets or damage to objects.

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display which includes HomeLink® system messages. The EVIC is located in the lower part of the speedometer.

1. Press and hold the two outer HomeLink® buttons (4), and release only when the EVIC display shows "Channels Cleared" (after 20 seconds). **Do not** hold the buttons for longer than 30 seconds and **do not** repeat step one to program a second and/or third hand-held transmitter to the remaining two HomeLink® buttons.
2. Position the end of your hand-held transmitter 1-3 inches (3-8 cm) away from the HomeLink® buttons.
3. Simultaneously press and hold both the HomeLink® button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**
4. The EVIC display will show "Channel X Training" (where X is Channel 1, 2, or 3). Release both buttons after the EVIC display shows "Channel X Trained".

NOTE: If the EVIC display shows "Did Not Train" repeat steps 2-4.

5. Press and hold the just trained HomeLink® button and observe the EVIC display. If the EVIC display shows "Channel X Transmit" (where X is Channel 1, 2, or 3), programming is complete and your device should activate when the HomeLink® button is pressed and released.

NOTE: To program the remaining two HomeLink® buttons, begin with "Programming" step two. Do not repeat step one.

NOTE: If your hand-held transmitter appears to program the universal transceiver, but your garage door does not operate using the transmitter and your garage door opener was manufactured after 1995, your garage door opener may have a multiple security code system (rolling code system). Please proceed to steps 6-8 to complete the programming of a rolling code equipped device (most common garage door openers require this step).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

NOTE: There are 30 seconds in which to initiate step eight.

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink® button. Repeat the "**press/hold/release**" sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.
9. HomeLink® should now activate your rolling code equipped device.
10. To program the remaining two HomeLink® buttons, begin with "Programming" **step two. Do not repeat step one.**

ERASING TRANSMITTER CODES

NOTE: Individual channels cannot be erased. Erasing the transmitter codes will erase **ALL** programmed codes.

To erase programming from the three buttons (individual buttons cannot be erased but can be "reprogrammed" - note below), follow the step noted:

- Press and hold the two outer HomeLink® buttons and release only when the Electronic Vehicle Information Center (EVIC) display shows "Channels Cleared" (after 20 seconds). Release both buttons. Do not hold for longer than 30 seconds. HomeLink® is now in the train (or learning) mode and can be programmed at any time. See **Electrical - Message Systems/Universal Transmitter/TRANSMITTER, Universal - Standard Procedure.**

REPROGRAMMING TRANSMITTER CODES

CAUTION: Vehicle exhaust contains carbon monoxide, a dangerous gas. Do not run the vehicle's exhaust while training the transceiver. Exhaust gas can cause serious or fatal injury.

CAUTION: Your motorized door or gate will open and close while you are training the Universal Transceiver. Do not train the transceiver if people or pets are in the path of the door or gate. A moving door or gate can cause serious or fatal injury to people and pets or damage to objects.

To program a device to HomeLink® using a HomeLink® button previously trained, follow these steps:

Fig. 4: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

1. Press and hold the desired HomeLink® button (4). **Do NOT** release the button.
2. The EVIC display will show "Channel X Transmit" (where X is Channel 1, 2, or 3) for 20 seconds and then change to "Channel X Training". Without releasing the HomeLink® button, proceed to step 3.
3. Position the end of your hand-held transmitter 1-3 inches (3-8 cm) away from the HomeLink® buttons.
4. Simultaneously press and hold both the HomeLink® button that you want to train and the hand-held transmitter buttons. **Do not release the buttons until step 4 has been completed.**
5. Press and hold the just trained HomeLink® button and observe the EVIC display. If the EVIC display shows "Channel X Transmit" (where X is Channel 1, 2, or 3), programming is complete and your device should activate when the HomeLink® button is pressed and released.

NOTE: To program the remaining two HomeLink® buttons, begin with "Programming" step two. Do not repeat step one.

NOTE: If your hand-held transmitter appears to program the universal transceiver, but your garage door does not operate using the transmitter and your garage door opener was manufactured after 1995, your garage door opener may have a multiple security code system (rolling code system). Please proceed to steps 6-8 to complete the programming of a rolling code equipped device (most common garage door openers require this step).

6. At the garage door opener receiver (motor-head unit) in the garage, locate the "learn" or "smart" button. This can usually be found where the hanging antenna wire is attached to the motor-head unit.
7. Firmly press and release the "learn" or "smart" button. (The name and color of the button may vary by manufacturer.)

NOTE: **There are 30 seconds in which to initiate step eight.**

8. Return to the vehicle and firmly **press, hold for two seconds and release** the programmed HomeLink® button. Repeat the "**press/hold/release**" sequence a second time, and, depending on the brand of the garage door opener (or other rolling code equipped device), repeat this sequence a third time to complete the programming.
9. HomeLink® should now activate your rolling code equipped device.

REMOVAL

REMOVAL

Fig. 5: Universal Transmitter Retaining Screws
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console assembly. Refer to **Electrical - Message Systems/Overhead Console - Removal** .
3. Remove the universal transmitter retaining screws (2) and separate the transmitter from the overhead console.

INSTALLATION

INSTALLATION

Fig. 6: Universal Transmitter Retaining Screws
Courtesy of CHRYSLER LLC

NOTE: In addition to the Universal Transmitter operation the Electronic Overhead Module is responsible for some of the compass functions. Anytime the Electronic Overhead Module is replaced the compass variance value must be set. Refer to Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Standard Procedure .

1. Position the universal transmitter onto the overhead console assembly and install the retaining screws (2).
2. Install the overhead console assembly. Refer to Electrical - Message Systems/Overhead Console - Installation .
3. Connect the battery negative cable.
4. Program the universal transmitter codes. Refer to Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Standard Procedure .

ACCESSORIES AND EQUIPMENT

Horn System - Service Information - Challenger

DESCRIPTION

DESCRIPTION

Fig. 1: Horn Mounting
Courtesy of CHRYSLER LLC

The dual-note horn system features two electromagnetic horn units. The horn system includes the following major components:

- **Horn** - The two horns are located behind the grille below a trim cover.
- **Horn Switch** - The horn switch is molded into the driver airbag trim cover.

OPERATION

OPERATION

The horn system operates on battery current received through a fuse in the Integrated Power Module (IPM). The horn system circuit is designed so the system remains operational, regardless of the ignition switch position.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HORN SYSTEM

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to **SYSTEM WIRING DIAGRAMS** .

In most cases, any problem involving continually sounding horns can be quickly alleviated by removing the horn fuse from the Integrated Power Module (IPM).

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

HORN

REMOVAL

REMOVAL

Fig. 2: Horn Mounting
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

1. Disconnect and isolate the battery negative cable.
2. Remove cover above horn.
3. Disconnect electrical harness connector.
4. Remove mounting fastener and remove horn.

INSTALLATION

INSTALLATION

Fig. 3: Horn Mounting
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position horn. Install and tighten mounting fasteners.
2. Connect electrical harness connector.
3. Install cover above horn.
4. Connect battery negative cable.

SWITCH, HORN

DESCRIPTION

DESCRIPTION

The horn switch is molded into the driver airbag cover. The horn switch cannot be serviced separately. Refer to Restraints/COVER, Driver Air Bag - Removal .

DIAGNOSIS AND TESTING

HORN SWITCH

The most reliable, efficient, and accurate means to diagnose the horn system requires the use of a scan tool and the proper Diagnostic Procedures information.

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

WARNING: Disable the airbag system before attempting any steering wheel, steering column, seat belt tensioner, side airbag, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

HVAC

Heating & Air Conditioning - Service Information - Challenger

DESCRIPTION

HEATING AND AIR CONDITIONING SYSTEM

A manual temperature control (MTC) single zone type heating-A/C system is standard equipment on this vehicle.

To maintain the performance level of the heating, ventilation and air conditioning (HVAC) system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or A/C condenser will reduce the performance of the A/C and engine cooling systems.

The engine cooling system includes the radiator, thermostat, radiator hoses and the engine coolant pump. See **COOLING** for more information before opening or attempting any service to the engine cooling system.

9630

Fig. 1: (HVAC) Housing
Courtesy of CHRYSLER LLC

This vehicle is equipped with a heater, ventilation and air conditioning (HVAC) housing (1) that combines A/C, heating, and ventilating capabilities into a single unit mounted within the passenger compartment behind the instrument panel. The HVAC housing includes:

- Recirculation-air door and actuator (2)
- Blower motor (3)
- Blower motor resistor (4)

- Evaporator temperature sensor (5)
- Mode-air doors and actuator (6)
- Blend-air door and actuator (7)
- Heater core (8)
- A/C evaporator (9)

Based upon the system and selected mode, conditioned air can exit the HVAC housing through one or a combination of the three main housing outlets: defrost, panel or floor. The defrost and panel outlets are located on the top of the HVAC housing and the floor outlets are located on the bottom of the HVAC housing. Once the conditioned air exits the HVAC housing, it is further directed through molded plastic ducts to the outlets within the vehicle interior. These outlets and their locations are as follows:

- **Defroster Outlets** - Two large defroster outlets are located near the center of the instrument panel top cover, near the base of the windshield.
- **Side Window Demister Outlets** - There are two side window demister outlets, one is located at each outboard end of the instrument panel top cover, near the belt line at the A-pillars.
- **Panel Outlets** - There are four panel outlets in the instrument panel, one located near each outboard end of the instrument panel facing the rear of the vehicle and one located on each side of the instrument panel center bezel.
- **Floor Outlets** - There is one floor outlet located above each side of the floor panel center tunnel near the dash panel. There is also one outlet located under each front seat.
- **Console Outlets** - There are two console outlets located at the back of the center floor console facing the rear of the vehicle.

OPERATION

OPERATION

The manual temperature control (MTC) heating-A/C system used in this vehicle is a blend-air type system. In a blend-air system, a blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core. The temperature control determines the discharge air temperature by operating the blend door actuator, which move the blend-air door. This design allows almost immediate control of output air temperature.

Fig. 2: Blend Air System Schematic
Courtesy of CHRYSLER LLC

The heating-A/C system pulls outside (ambient) air through the fresh air intake (4) located at the cowl panel at the base of the windshield and into the air inlet housing above the heating, ventilation and air conditioning (HVAC) housing and then passes through the A/C evaporator (7). Air flow is then directed either through or around the heater core (2). This is done by adjusting the position of the blend-air door (3) with the temperature control located on the A/C-heater control in the instrument panel. Air flow is then directed out the floor outlet (8), instrument panel outlet (10) or the defroster outlet (1) in various combinations by adjusting the position of the mode-air doors (9 and 11) using the mode control located on the A/C-heater control. The temperature and mode control uses electrical actuators to operate the air doors.

The velocity of the air flow out of the outlets can be adjusted with the blower speed control located on the A/C-heater control.

The fresh air intake can be shut off by pressing the Recirculation button on the A/C-heater control. This will operate the electrically actuated recirculation-air door (5), which closes off the fresh air intake. With the fresh air intake closed, the conditioned air within the vehicle is pulled back into the HVAC housing through the recirculation air intake (6) located within the passenger compartment.

The A/C compressor can be engaged by pressing the A/C (snowflake) button on the A/C-heater control. It will automatically engage when the mode control is set in any Floor to Defrost position. This will remove heat and humidity from the air before it is directed through or around the heater core. The mode control on the A/C-heater control is used to direct the conditioned air to the selected system outlets.

The two slot-type defroster outlets receive airflow from the HVAC housing through the molded plastic defroster ducts, which connect to the HVAC housing defroster outlets. The airflow from the defroster outlets is directed by fixed vanes in the defroster outlet grilles and cannot be adjusted. The defroster outlet grilles are integral to the instrument panel top cover.

The side window demister outlets receive airflow from the HVAC housing through the molded plastic demister ducts. The demisters direct air from the HVAC housing through the outlets located on the top corners of the instrument panel. The airflow from the side window demister outlets is directed by fixed vanes in the demister outlet grilles and cannot be adjusted. The side window demister outlet grilles are serviceable from the instrument panel. The demisters operate when the controls are set in Heat, Floor, Mix and Defrost modes.

The four instrument panel outlets receive airflow from the HVAC housing through two molded plastic main panel ducts. One duct directs air flow out of the right side instrument panel outlets, while the other duct delivers air flow to the left side outlets. Each of these outlets can be individually adjusted to direct the flow of air.

The floor outlets receive airflow from the HVAC housing through the floor distribution ducts which are integral to the rear cover of the HVAC air distribution housing. Two plastic rear distribution ducts and one center console duct attach to the rear cover and provide conditioned air to the rear seating positions. The two console outlets can be individually adjusted to direct the flow of air, but the floor outlets cannot be adjusted.

NOTE: It is important to keep the HVAC air intake opening clear of debris. Leaf particles and other debris that is small enough to pass through the cowl opening screen can accumulate within the HVAC housing. The closed, warm, damp and dark environment created within the housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh intake-air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C operation if the air intake opening is not kept clear of debris.

The A/C system is designed for the use of non-CFC, R-134a refrigerant and uses an A/C expansion valve to meter the flow of refrigerant to the A/C evaporator. The A/C evaporator cools and dehumidifies the incoming air prior to blending it with the heated air. To maintain minimum evaporator temperatures and prevent evaporator freezing, an evaporator temperature sensor is used. The sensor is located downstream of the evaporator and supplies an evaporator temperature signal to the A/C-heater control. The A/C-heater control sends the request for A/C to the cabin compartment node (CCN) on the CAN B bus. The CCN then broadcasts the A/C request on the CAN B bus, where it is read and processed by the totally integrated power module (TIPM), which in turn broadcasts the A/C request on the CAN C bus, where it is read and processed by the powertrain control module (PCM).

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The A/C system is designed to provide the passenger compartment with low temperature and low humidity air. The A/C evaporator, located in the HVAC housing is cooled to temperatures near the freezing point. As warm damp air passes over the fins of the A/C evaporator, the air transfers its heat to the refrigerant in the evaporator coils and the moisture in the air condenses on the evaporator fins.

During periods of high heat and humidity, an A/C system will be more effective in the Recirculation mode (max-A/C). With the system in the Recirculation mode, only air from the passenger compartment passes through the A/C evaporator. As the passenger compartment air dehumidifies, the A/C system performance levels rise.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the A/C system. When humidity is high, the A/C evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and coils. This reduces the amount of heat the A/C evaporator can absorb from the air. High humidity greatly reduces the ability of the A/C evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their A/C system on humid days. A performance test is the best way to determine whether the system is performing up to design standards. This test also provides valuable clues as to the possible cause of trouble with the A/C system.

A/C PERFORMANCE TEST

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in serious or fatal injury.

CAUTION: The use of an A/C recycling/charging station for purposes of determining the actual charge level of an A/C system is not recommend. Service recycling/charging stations do not reflect the correct amount of refrigerant charge in the A/C system after a single "reclaim" cycle. Tests have shown that it takes up to two or more "reclaim" cycles to remove all of the refrigerant charge, depending on the equipment being used. Use only the following procedure for determining the proper A/C system charge level.

1. Make sure the following conditions are met in the area where the test is to be performed:
 - Maximum ambient temperature: 110°F (43.3°C)
 - Minimum ambient temperature: 60° F (15.5°C)
 - Minimum relative humidity: 20%
 - Maximum relative humidity: 90%
2. Operate the heating-A/C system under the following conditions.
 - Engine at normal operating temperature
 - Engine at normal idle speed
 - No sun-load in the cabin of the vehicle

- Vehicle doors and windows closed
- Transmission in Park or Neutral with the parking brake set (depending on transmission application)
- A/C-heater controls set to Recirculation mode, full cool, panel mode, high blower and with A/C compressor engaged. If the A/C compressor does not engage, see the **A/C SYSTEM DIAGNOSIS** table
- All panel outlet vanes open and positioned straight rearward

NOTE: **If the following step is not performed, the results of this test will not be accurate.**

3. Using a scan tool, operate the engine cooling fans at high speed from the Totally Integrated Power Module (TIPM) Electronic Control Unit (ECU) view.
4. Insert a thermometer in the driver side center panel air outlet and operate the A/C system until the thermometer temperature stabilizes or a minimum of 5 minutes.

NOTE: **This procedure requires you to know what the temperature and relative humidity is in your location at the time of the test. This information can be obtained from multiple sources, such as the internet or local news media.**

5. With the A/C compressor clutch engaged, compare the observed panel outlet air temperature along with ambient temperature and the relative humidity of the work area to the Maximum Panel Outlet Temperature chart.
6. If the air outlet temperature fails to meet the specifications in the Maximum Panel Outlet Temperature chart, see the **A/C SYSTEM DIAGNOSIS** table.

A/C SYSTEM DIAGNOSIS

Condition	Possible Causes	Correction
Rapid A/C compressor clutch cycling (ten or more cycles per minute).	1. Low refrigerant system charge.	1. See <u>REFRIGERANT SYSTEM LEAKS</u> . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
Equal pressures, but the compressor clutch does not engage.	1. No refrigerant in the refrigerant system.	1. See <u>REFRIGERANT SYSTEM LEAKS</u> . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Open fuse.	2. See <u>SYSTEM WIRING DIAGRAMS</u> . Check the fuses in the totally integrated power module (TIPM) and the rear power distribution center (PDC). Repair the shorted circuit or component and replace the fuse(s), if required.
	3. Inoperative A/C compressor clutch coil.	3. See <u>A/C COMPRESSOR CLUTCH COIL</u> . Test the compressor clutch coil

		and replace, if required.
	4. Improperly installed or inoperative evaporator temperature sensor.	4. See <u>SENSOR, Evaporator Temperature</u> . Test the sensor and replace, if required.
	5. Inoperative A/C pressure transducer.	5. See <u>TRANSDUCER, A/C Pressure</u> . Test the sensor and replace, if required.
	6. Inoperative Powertrain Control Module (PCM).	6. See appropriate Engine ELECTRICAL DIAGNOSTICS article. Test the Powertrain Control Module (PCM) and replace, if required.
Normal pressures, but A/C Performance Test air temperatures at center panel outlet are too high.	1. Excessive refrigerant oil in system.	1. See <u>OIL, Refrigerant</u> . Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required.
	2. Blend door actuator improperly installed or inoperative.	2. See <u>ACTUATOR, Blend Door</u> . Inspect the actuator for proper operation and replace, if required.
	3. Blend-air door inoperative or sealing improperly.	3. See <u>HOUSING, HVAC</u> . Inspect the blend-air door for proper operation and sealing. Repair if required.
The low side pressure is normal or slightly low, and the high side pressure is too low.	1. Low refrigerant system charge.	1. See <u>REFRIGERANT SYSTEM LEAKS</u> . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	2. Refrigerant flow through the A/C evaporator is restricted.	2. See <u>EVAPORATOR, A/C</u> . Replace the restricted A/C evaporator, if required.
	3. Inoperative A/C compressor.	3. See <u>COMPRESSOR, A/C</u> . Replace the A/C compressor, if required.
The low side pressure is normal or slightly high, and the high side pressure is too high.	1. A/C condenser air flow restricted.	1. See <u>CONDENSER, A/C</u> . Check the A/C condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Clean, repair, or replace components as required.
	2. Refrigerant flow through the A/C receiver/drier is restricted.	2. See <u>DRIER, A/C Receiver</u> . Replace the restricted A/C receiver/drier, if required.
	3. Inoperative radiator cooling fans.	3. See <u>COOLING</u> . Test the radiator cooling fans and replace, if required.
	4. Refrigerant system overcharged.	4. See <u>REFRIGERANT SYSTEM CHARGE</u> . Recover the refrigerant from the refrigerant system. Charge the

		refrigerant system to the proper level, if required.
	5. Air in the refrigerant system.	5. See <u>REFRIGERANT SYSTEM LEAKS</u> . Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required.
	6. Engine overheating.	6. See <u>COOLING</u> . Test the engine cooling system and repair, if required.
The low side pressure is too high, and the high side pressure is too low.	1. Accessory drive belt slipping.	1. See <u>COOLING</u> . Inspect the accessory drive belt condition and tension. Repair as required.
	2. Inoperative A/C expansion valve.	2. See <u>VALVE, A/C Expansion</u> . Test and replace the valve, if required.
	3. Inoperative A/C compressor.	3. See <u>COMPRESSOR, A/C</u> . Replace the A/C compressor, if required.
The low side pressure is too low, and the high side pressure is too high.	1. Restricted refrigerant flow through the refrigerant lines.	1. See <u>LINE, A/C Liquid</u> , <u>LINE, A/C Suction</u> and <u>LINE, A/C Discharge</u> in this service information. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required.
	2. Restricted refrigerant flow through the A/C expansion valve.	2. See <u>VALVE, A/C Expansion</u> . Test and replace the valve, if required.
	3. Restricted refrigerant flow through the A/C condenser.	3. See <u>CONDENSER, A/C</u> . Replace the restricted A/C condenser, if required.

HEATER PERFORMANCE

See **COOLING** before performing the following tests. Check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Perform the A/C System Performance Test, which is found within the HVAC System Test. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** . If any Diagnostic Trouble Codes (DTCs) are found in the A/C-heater control or the Powertrain Control Module (PCM), repair as necessary.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control to the full hot position, the mode control to the floor position, and the blower motor control to the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the front floor outlets. Compare the test thermometer reading to the Heater Temperature Reference chart.

HEATER TEMPERATURE REFERENCE

--	--	--	--	--

Ambient Air Temperature	16° C (60° F)	21° C (70° F)	27° C (80° F)	32° C (90° F)
Minimum Heater System Air Outlet Temperature	52° C (125° F)	56° C (133° F)	59° C (139° F)	62° C (144° F)

See **COOLING** if the heater outlet air temperature is below the minimum specification. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow are as follows:

- Inoperative water pump.
- Inoperative thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- Plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat due to mechanical problems are as follows:

- Obstructed cowl air intake.
- Obstructed heater system outlets.
- Inoperative engine thermostat.
- Inoperative blower motor system.
- Inoperative A/C-heater control.
- Inoperative blend door actuator(s).
- Inoperative, obstructed or improperly installed blend-air door.

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control on the A/C-heater control, the following could require service:

- Inoperative A/C-heater control.

- Inoperative blend door actuator(s).
- Inoperative, obstructed or improperly installed blend-air door.
- Improper engine coolant temperature.
- Inoperative related wiring harness or connectors.

CONTROLS

ACTUATOR, BLEND DOOR

Description

DESCRIPTION

812c574e

Fig. 6: Actuator-Air Door Description
Courtesy of CHRYSLER LLC

The blend door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. Models equipped with the MTC single zone heating-A/C system have a single blend-air door, which is controlled by a single blend door actuator.

The blend door actuator for the single zone heating-A/C system is located on the driver side end of the HVAC air distribution housing, close to the dash panel.

The blend door actuator is interchangeable with the actuators for the mode-air door and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connect it to its respective door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the HVAC housing. The blend door actuator does not require mechanical indexing to the blend-air door, as it is electronically calibrated by the A/C-heater control.

Operation

OPERATION

The blend door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The blend door actuator can move the blend-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the blend-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the blend-air door moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the blend-air door stops and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the blend door actuator and the blend-air door. The A/C-heater control learns the blend-air doors stop positions during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the blend door actuator circuit.

The blend door actuator is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The blend door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further

diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

Fig. 7: Actuator-Blend Door-Single/Dual Driver Removal & Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. If equipped, remove the instrument panel silencer from the driver side of the instrument panel.
3. Remove the two screws (4) that secure the blend door actuator (1) to the driver side of the HVAC air distribution housing (3).
4. Remove the blend door actuator from the air distribution housing, disconnect the HVAC wire harness connector (2) and remove the actuator.

Installation

INSTALLATION

Fig. 8: Actuator-Blend Door-LF Align
 Courtesy of CHRYSLER LLC

1. Position the blend door actuator (1) into the vehicle.
2. Install the blend door actuator onto the driver side of the HVAC air distribution housing (4). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (2) with those on the blend door cam (3).

Fig. 9: Actuator-Blend Door-Single/Dual Driver Removal & Installation

3. Install the two screws (4) that secure the blend door actuator (1) to the air distribution housing (3). Tighten the screws to 2 N.m (17 in. lbs.).

4. Connect the HVAC wire harness connector (2) to the blend door actuator.
5. If equipped, install the instrument panel silencer onto the driver side of the instrument panel.
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

ACTUATOR, MODE DOOR

Description

DESCRIPTION

Fig. 10: Actuator-Air Door Description
Courtesy of CHRYSLER LLC

The mode door actuator (1) is a reversible, 12-volt direct current (DC), servo motor. The mode door actuator is located on the driver side end of the HVAC air distribution housing, close to the instrument panel. The mode door actuator is mechanically connected to the floor, defrost/demist and the panel-air doors.

The mode door actuator is interchangeable with the actuators for the blend-air door and the recirculation-air door. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connect it to its door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the HVAC housing. The mode door actuator does not require mechanical indexing to the mode-air doors, as it is electronically calibrated by the A/C-heater control.

Operation

OPERATION

The mode door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The mode door actuator can move the floor, defrost/demist and the panel-air doors in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the mode-air doors will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the mode-air doors moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or both connections low, the mode-air doors stop and will not move. The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the mode door actuator and the mode-air doors. The A/C-heater control learns the mode-air doors stop position during the calibration procedure and will store a diagnostic trouble code (DTC) for any problems it detects in the mode door actuator circuits.

The mode door actuator is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The mode door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

Fig. 11: ACTUATOR-MODE DOOR REMOVAL & INSTALLATION

 Courtesy of CHRYSLER LLC

1. Position the mode door actuator (1) into the vehicle.
2. Install the mode door actuator onto the driver side of the HVAC air distribution housing (2). If necessary, rotate the actuator slightly to align the splines on the actuator output shaft (3) with those on the mode door cam (4).

Fig. 13: ACTUATOR-MODE DOOR REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

3. Install the screws (1) that secure the mode door actuator (2) to the driver side of the air distribution housing (3). Tighten the screws to 2 N.m (17 in. lbs.).

4. Connect the HVAC wire harness connector (4) to the mode door actuator.
5. Install the instrument panel silencer onto the driver side of the instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

ACTUATOR, RECIRCULATION DOOR

Description

DESCRIPTION

Fig. 14: Actuator-Air Door Description
Courtesy of CHRYSLER LLC

The recirculation door actuator (1) is a reversible, 12 volt direct current (DC), servo motor. The recirculation door actuator is located on the inboard side of the HVAC air inlet housing and is directly connected to the pivot shaft of the recirculation-air door.

The recirculation door actuator is interchangeable with the actuators for the blend-air door(s) and the mode-air doors. Each actuator is contained within an identical black molded plastic housing with an integral wire connector receptacle (2). Each actuator also has an identical output shaft with splines (3) that connect it to its door linkage and three integral mounting tabs (4) that allow the actuator to be secured to the air inlet housing. The recirculation door actuator does not require mechanical indexing to the recirculation-air door, as it is electronically calibrated by the A/C-heater control.

Operation

OPERATION

The recirculation door actuator is connected to the A/C-heater control through the vehicle electrical system by a dedicated two-wire lead and connector of the HVAC wire harness. The recirculation door actuator moves the recirculation-air door in two directions. When the A/C-heater control pulls the voltage on one side of the motor connection high and the other connection low, the recirculation-air door will move in one direction. When the A/C-heater control reverses the polarity of the voltage to the motor, the recirculation-air door moves in the opposite direction.

When the A/C-heater control makes the voltage to both connections high or low, the recirculation-air door stops and will not move.

The A/C-heater control uses a pulse-count positioning system to monitor the operation and relative position of the recirculation door actuator and the recirculation-air door. The A/C-heater control learns the recirculation-air door stop positions during the calibration procedure and stores a diagnostic trouble code (DTC) for any problems it detects in the recirculation door actuator circuits.

The recirculation door actuator is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The recirculation door actuator cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

3. Install the screws (1) that secure the recirculation door actuator (2) to the air inlet housing (3). Tighten the screws to 2 N.m (17 in. lbs.).

4. Connect the HVAC wire harness connector (4) to the recirculation door actuator.
5. Install the glove box into the instrument panel. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
6. Reconnect the negative battery cable.
7. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

CONTROL, A/C AND HEATER

Description

DESCRIPTION

The A/C-heater control for the manual temperature control (MTC) single zone system allows one temperature setting for the entire vehicle. All controls are identified by ISO graphic symbols.

The heating-A/C system uses a dedicated microprocessor to drive the electrically operated door actuators. This control provides the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle.

11048

Fig. 18: Identifying A/C Heater Control
Courtesy of CHRYSLER LLC

The A/C-heater control (1) is located in the instrument panel and contains:

- a rotary control for blower motor speed selection and to turn the blower motor off (2).
- a rotary control for temperature control of the discharged air (3).
- a rotary control for mode control of the discharged air (4).
- a push-button control with indicator lamp to turn the rear window defogger system on and off (5).
- a push-button control with indicator lamp to turn the A/C system on and off (6).

- a push-button control with indicator lamp for recirculation control of the discharged air (7).

Prior to replacing an A/C-heater control, perform the HVAC System Test and the Actuator Calibration function to verify that the concern is not a system issue. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure** .

The A/C-heater control and A/C system and is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The A/C-heater control cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: A/C-heater controls are NOT interchangeable between other vehicle lines. If replacement of the A/C-heater control is required, only use the control designed for the vehicle being serviced.

NOTE: Take the proper precautions to protect the front face of the instrument panel center bezel from cosmetic damage during this service procedure.

Fig. 19: Removing/Installing A/C-Heater Control At Rear Side Panel Center Bezel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the center bezel (3) from the instrument panel and place it on a workbench. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal**.
3. Remove the four screws (1) that secure the A/C-heater control (2) to the instrument panel center bezel and remove the control.

Installation

INSTALLATION

Fig. 20: Removing/Installing A/C-Heater Control At Rear Side Panel Center Bezel
Courtesy of CHRYSLER LLC

1. Position the A/C-heater control (2) into the instrument panel center bezel (3).
2. Install the four screws (1) that secure the A/C-heater control to the instrument panel center bezel. Tighten the screws to 2 N.m (17 in. lbs.).
3. Install the instrument panel center bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation**.

NOTE: The A/C-heater control automatically performs the Actuator Calibration function when the ignition is initially turned on when installing a new control or reinstalling the original control. However, the Actuator Calibration function must be manually initiated using a scan tool if the A/C-heater control has been previously installed in another vehicle.

4. Reconnect the negative battery cable.
5. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based**

Diagnostics/HVAC - Standard Procedure .

RESISTOR, BLOWER MOTOR

Description

DESCRIPTION

Fig. 21: Blower Motor Resistor Consists Of A Molded Plastic Mounting Plate
Courtesy of CHRYSLER LLC

A blower motor resistor is used with the manual temperature control (MTC) heating-A/C system.

The blower motor resistor is mounted to the rear of the HVAC housing, directly behind the glove box. The blower motor resistor consists of a molded plastic mounting plate (1) with an integral wire connector receptacle (2). Concealed behind the mounting plate are coiled resistor wires contained within a ceramic heat sink (3).

The blower motor resistor is accessed for service by removing the glove box.

Operation

OPERATION

The blower motor resistor is connected to the vehicle electrical system through a dedicated wire lead and connector of the HVAC wire harness. The blower motor resistor has multiple resistor wires, each of which will reduce the current flow through the blower motor to change the blower motor speed.

The blower motor control in the MTC heating-A/C system directs the ground path for the blower motor through the correct resistor wire to obtain the selected speed. With the blower motor control in the lowest speed position, the ground path for the blower motor is applied through all of the resistor wires. Each higher speed selected with the blower motor control applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed.

The blower motor resistor cannot be adjusted or repaired and must be replaced if inoperative or damaged (such as a cracked ceramic heat sink).

Diagnosis and Testing

Diagnosis and Testing

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: See SYSTEM WIRING DIAGRAMS for circuit descriptions and diagrams. Wiring Information includes wiring diagrams, proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the blower motor resistor. See Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Removal.
3. Using an ohmmeter, check for continuity between all of the blower motor resistor terminals. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor speed control and the blower motor resistor or blower motor as required. If not OK, replace the inoperative blower motor resistor.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

WARNING: The blower motor resistor may get very hot during normal operation. If the blower motor was turned on prior to servicing the blower motor resistor, wait five minutes to allow the blower motor resistor to cool before performing diagnosis or service. Failure to take this precaution can result in possible injury.

CAUTION: Do not operate the blower motor with the blower motor resistor removed from the circuit. Failure to take this precaution can result in vehicle damage.

Fig. 22: Identifying Screws, Blower Motor Resistor, HVAC Housing & Wire Harness Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
3. Disconnect the wire harness connector (4) from the blower motor resistor (2).
4. Remove the two screws (1) that secure the blower motor resistor to the HVAC housing (3) and remove the resistor.

Installation

INSTALLATION

Courtesy of CHRYSLER LLC

1. Position the blower motor resistor (2) into the HVAC housing (3).
2. Install the two screws (1) that secure the blower motor resistor to the HVAC housing. Tighten the screws to 2 N.m (17 in. lbs.).
3. Connect the wire harness connector (4) to the blower motor resistor and engage the locking tab.
4. Install the glove box into the instrument panel. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
5. Reconnect the negative battery cable.

SENSOR, EVAPORATOR TEMPERATURE

Description

DESCRIPTION

Fig. 24: Sensor-Evaporator Temperature
Courtesy of CHRYSLER LLC

The evaporator temperature sensor (1) measures the temperature of the conditioned air downstream of the A/C evaporator (2). The evaporator temperature sensor is an electrical thermistor within a molded plastic case that is inserted into the HVAC housing (3) near the coldest point of the A/C evaporator. Two terminals within the connector receptacle (4) connect the sensor to the vehicle electrical system through a wire lead and connector of the HVAC wire harness.

The external location of the evaporator temperature sensor allows the sensor to be removed or installed without disturbing the refrigerant in the A/C system.

Operation

OPERATION

The evaporator temperature sensor monitors the temperature of the conditioned air downstream of the A/C evaporator and supplies an input signal to the A/C-heater control. The A/C-heater control uses the evaporator temperature sensor input signal to optimize A/C system performance and to protect the A/C system from evaporator freezing. The evaporator temperature sensor will change its internal resistance in response to the temperatures it monitors and is connected to the A/C-heater control through sensor ground circuit and a 5-volt reference signal circuit. As the temperature of the A/C evaporator decreases, the internal resistance of the evaporator temperature sensor decreases.

The A/C-heater control uses the monitored voltage reading as an indication of evaporator temperature. The A/C-heater control is programmed to respond to this input by requesting the powertrain control module (PCM) to cycle the A/C compressor clutch as necessary to optimize A/C system performance and to protect the A/C system from evaporator freezing.

The evaporator temperature sensor is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Diagnosis and Testing** .

The evaporator temperature sensor cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the glove box from the instrument panel. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
3. Disconnect the HVAC wire harness connector (1) from the evaporator temperature sensor (2) located on the HVAC housing (3) and remove the sensor.

Installation

INSTALLATION

Fig. 26: Sensor-Evaporator Temperature Removal & Installation
Courtesy of CHRYSLER LLC

1. Install the evaporator temperature sensor (2) into HVAC housing (3).
2. Connect the HVAC wire harness connector (1) to the evaporator temperature sensor.
3. Install the glove box into the instrument panel. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .
4. Reconnect the negative battery cable.

TRANSDUCER, A/C PRESSURE

Description

DESCRIPTION

Fig. 27: A/C Pressure Transducer
Courtesy of CHRYSLER LLC

The A/C pressure transducer (1) is a switch that is installed on a fitting located on the A/C liquid line. An internally threaded fitting on the A/C pressure transducer connects it to the externally threaded Schrader-type fitting on the A/C liquid line. A rubber O-ring seals the connection between the A/C pressure transducer and the liquid line fitting. The A/C pressure transducer is connected to the vehicle electrical system by a molded plastic connector with three terminals.

Operation

OPERATION

The A/C pressure transducer monitors the pressures in the high side of the refrigerant system through its connection to a fitting on the A/C liquid line. The A/C pressure transducer will change its internal resistance in response to the pressures it monitors. A Schrader-type valve in the liquid line fitting permits the A/C pressure transducer to be removed or installed without disturbing the refrigerant in the A/C system.

The totally integrated power module (TIPM) provides a five volt reference signal and a sensor ground to the A/C pressure transducer. The powertrain control module (PCM) monitors the output voltage of the A/C pressure transducer on the CAN B bus to determine refrigerant pressure. The PCM is programmed to respond to the A/C pressure transducer and other sensor inputs and control the operation of the A/C compressor clutch and the radiator cooling fan to help optimize A/C system performance and to protect the system components from damage. The PCM will disengage the A/C compressor clutch when high side pressure rises above 3082 kPa (447 psi) and re-engage the clutch when high side pressure drops below 2937 kPa (426 psi). The A/C pressure transducer will also disengage the A/C compressor clutch if the high side pressure drops below 110 kPa (16 psi) and will re-engage the clutch when the high side pressure rises above 221 kPa (32 psi). If the refrigerant pressure rises above 1655 kPa (240 psi), the PCM will actuate the cooling fan. The A/C pressure transducer input to the PCM will also prevent the A/C compressor clutch from engaging when

ambient temperatures are below about 4.5° C (40° F) due to the pressure/temperature relationship of the refrigerant.

The A/C pressure transducer is tested using a scan tool. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** .

The A/C pressure transducer cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Removal

REMOVAL

NOTE: It is not necessary to discharge the refrigerant system to replace the A/C pressure transducer.

Fig. 28: Transducer-A/C Pressure Removal & Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector (1) from the A/C pressure transducer (2).
3. Remove the A/C pressure transducer from the A/C liquid line (3) and remove and discard the O-ring seal.

Installation

INSTALLATION

NOTE: Use only the specified O-ring as it is made of special material for R-134a. Use only refrigerant oil of the type required for the A/C compressor.

Fig. 29: Transducer-A/C Pressure Removal & Installation
Courtesy of CHRYSLER LLC

1. Lubricate a new rubber O-ring seal with clean refrigerant oil and install it onto the liquid line fitting.
2. Install the A/C pressure transducer (2) onto the A/C liquid line (3). Tighten the A/C pressure transducer securely.
3. Connect the wire harness connector (1) to the A/C pressure transducer.
4. Reconnect the negative battery cable.

DISTRIBUTION

DUCT, DEFROSTER

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: Take the proper precautions to protect the front face of the instrument panel from cosmetic damage.

Fig. 40: DUCTS-INSTRUMENT PANEL REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Remove the instrument panel and place it on a workbench. Refer to **Body/Instrument Panel/PANEL, Instrument - Removal** .
2. Remove the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2).
3. Remove the four screws that secure the driver side instrument panel duct and demister duct assembly (3) to the instrument panel and remove the duct assembly.
4. Remove the four screws that secure the passenger side instrument panel duct and demister duct assembly (4) to the instrument panel and remove the duct assembly.

Installation

INSTALLATION

Fig. 41: DUCTS-INSTRUMENT PANEL REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

1. Position the passenger side instrument panel duct and demister duct assembly (4) into the instrument panel.
2. Install the passenger side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
3. Install the four screws that secure the passenger side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N.m (20 in. lbs.).
4. Position the driver side instrument panel duct and demister duct assembly (3) into the instrument panel.
5. Install the driver side instrument panel duct and demister duct assembly onto the outlets of the instrument panel. Make sure that the ducts are correctly installed over the instrument panel and demister outlet seals.
6. Install the four screws that secure the driver side instrument panel duct and demister duct assembly to the instrument panel. Tighten the screws to 2.2 N.m (20 in. lbs.).
7. Install the screw that secures the instrument panel top pad (1) to the reinforcement bracket (2). Tighten the screw to 2.2 N.m (20 in. lbs.).
8. Install the instrument panel. Refer to **Body/Instrument Panel/PANEL, Instrument - Installation** .

FILTER, PARTICULATE AIR

Description

DESCRIPTION

Fig. 42: Filter-Particulate Air Description
Courtesy of CHRYSLER LLC

All models are equipped with a particulate air filter (1) that helps purify the outside air entering the HVAC housing. The filter is mounted in the engine compartment, inside of the fresh air inlet housing of the heating-A/C system.

The filter should be replaced at least every 24,000 km (15,000 miles) or each year and checked if heating-A/C system performance seems lower than expected. The particulate air filter is labeled with "REAR OF VEHICLE" and an arrow (2) to indicate air flow direction through the filter.

Removal

REMOVAL

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 43: Door-Particulate Air Filter Removal & Installation
 Courtesy of CHRYSLER LLC

1. Remove the air inlet grille (1) from the wiper module screen (2) located near the dash panel in the engine compartment.
2. Open the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5).

Fig. 44: FILTER-PARTICULATE AIR REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: To aid in reinstallation, note the installed position of the particulate air filter prior to removal of the filter.

3. Remove the particulate air filter (1) from the particulate air filter housing (2) located inside of the dash panel plenum (3). Note the direction of air flow indicated by an arrow (4) on the filter.

Installation

INSTALLATION

NOTE: The particulate air filter is labeled with "REAR OF VEHICLE" and an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 45: FILTER-PARTICULATE AIR REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Install the particulate air filter (1) into the particulate air filter housing (2) located inside of the dash panel plenum (3). Insert the particulate air filter down directly into the filter housing with the arrow (4) on the filter pointing to the rear of the vehicle. The particulate air filter is held in place by friction between the filter element and the filter housing, so no fasteners are required.

Fig. 46: Door-Particulate Air Filter Removal & Installation
 Courtesy of CHRYSLER LLC

2. Close the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5).
3. Install the air inlet grille (1) onto the wiper module screen (2).

HOUSING, HVAC

Description

DESCRIPTION

Fig. 47: Housing-HVAC Description

Courtesy of CHRYSLER LLC

This model uses a housing assembly that combines heating, A/C and ventilation capabilities into a single unit. The HVAC housing assembly is mounted in the passenger compartment and consists of three separate housings:

- **HVAC housing** - The HVAC housing (1) is mounted to the dash panel behind the instrument panel and contains the A/C evaporator and the blower motor resistor. The HVAC housing consists of an upper and a lower housing that are attached together with mounting provisions for the air inlet housing, blower motor, air distribution housing and the HVAC wire harness.
- **Air inlet housing** - The air inlet housing (2) is mounted to the right end of the HVAC housing and contains the recirculation-air door and actuator.
- **Air distribution housing** - The air distribution housing (3) is mounted to the rear of the HVAC housing and contains the heater core, blend-air door and actuator, mode-air doors and actuator and door linkage.

The heating-A/C system is a blend-air type system. The blend-air door controls the amount of conditioned air that is allowed to flow through, or around, the heater core.

The A/C system is designed for the use of a non-CFC, R-134a refrigerant and uses an A/C evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. The temperature control determines the discharge air temperature by operating the blend door actuator, which moves the blend-air door. This allows an almost immediate control of the output air temperature of the system. The mode door actuator operates the mode-air doors which direct the flow of the conditioned air out the various air outlets, depending on the mode selected. The recirculation door actuator operates the recirculation-air door which closes off the fresh air intake and recirculates the air already inside the vehicle. The electric door actuators are connected to the vehicle electrical system by the HVAC wire harness. The blower motor controls the velocity of air flowing through the HVAC housing assembly by spinning the blower wheel within the HVAC housing at the selected speed by use of the blower motor resistor.

The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors. The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door. The HVAC housing must be removed from the vehicle and disassembled to service the A/C evaporator.

Removal

HOUSING-AIR DISTRIBUTION

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: Disable the airbag system before attempting any steering wheel, steering

column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow these instructions may result in a coolant leak and possible serious or fatal injury.

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

8957

Fig. 48: HVAC Wire Harness-Actuators Removal/Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the HVAC housing assembly and place it on a suitable workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
3. Disconnect the HVAC wire harness (1) from the mode door actuator (2) and the blend door actuator (3) located on the driver side of the air distribution housing (4).

Fig. 49: Heater Core Removal & Installation
 Courtesy of CHRYSLER LLC

4. Remove the blend door actuator (1) from the driver side of the HVAC air distribution housing (2). See **Heating and Air Conditioning/Controls/ACTUATOR, Blend Door - Removal**.
5. Remove the two screws (8) that secure the flange (7) to the front of the HVAC housing near the dash panel and remove the flange.
6. Remove the screw (5) that secures the heater core retaining bracket (3) to the driver side of the HVAC air distribution housing and remove the bracket.
7. Disengage the heater core tubes (6) from the HVAC housing and carefully pull the heater core (4) straight out of the side of the air distribution housing.

Fig. 50: Housing-Air Distribution Removal

Courtesy of CHRYSLER LLC

8. Remove the two screws (1) that secure the air distribution housing (2) to the rear of the HVAC housing (3).
9. Tilt the top of the air distribution housing rearward to disconnect the distribution housing from the tab-and-slot type retainers located at the bottom of the housing.
10. Disconnect the air distribution housing from rear floor distribution ducts.
11. Remove the air distribution housing from the vehicle.
12. If required, disassemble the air distribution housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Disassembly**.

HOUSING-AIR INLET

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **Heating and Air Conditioning/Plumbing - Warning**. See **Heating and Air Conditioning/Plumbing - Caution**. Failure to follow the warnings and cautions could result in possible serious or fatal injury.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.

Fig. 51: Housing-Air Inlet Removal & Installation
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
3. Disconnect the HVAC wire harness (1) from the recirculation door actuator (2).
4. Carefully cut the foam seal (3) along the parting line (4) of the air inlet housing (6). If the seal is deformed or damaged, it must be replaced.
5. Remove the five screws (5) that secure the air inlet housing to HVAC housing (7).
6. Remove the air inlet housing from the HVAC housing.
7. If required, disassemble the air inlet housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Disassembly**.

HOUSING-FRESH AIR INLET

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **Heating and Air Conditioning/Plumbing - Warning**. See **Heating and Air Conditioning/Plumbing - Caution**. Failure to follow these instructions may result in serious or fatal injury.

NOTE: The fresh air inlet housing must be removed from the vehicle for removal of the HVAC housing.

Fig. 52: Strut Support- Driver Side
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the cowl top panel from the dash panel. Refer to **Body/Exterior/COVER, Cowl Panel - Removal**.
3. Remove the two bolts (1) that secure the strut support (2) to the driver side strut tower (3).
4. Disengage the wiper motor (5) from the bracket (4) located on the strut support.

Fig. 53: Strut Support- Passenger Side
 Courtesy of CHRYSLER LLC

5. Disengage the retainer that secures the wire harness (4) to the bottom of the strut support (3).

6. Remove the purge solenoid (5) from its mounting bracket and position the solenoid out of the way.
7. Remove the two bolts (1) that secure the strut support to the passenger side strut tower (6) and remove the support from the engine compartment.
8. Position the powertrain control module (PCM) out of the way.

Fig. 54: Push Pins-Fresh Air inlet Housing
Courtesy of CHRYSLER LLC

9. Remove the push-pin retainer (1) that secures the fresh air inlet housing (2) to the passenger side inner fender (6).
10. Disengage the wire harness retainer (3) from inside the bottom of the fresh air inlet housing, if equipped.
11. Remove the push-pin retainer (5) that secures the insulator (4) to the front of the fresh air inlet housing and position the insulator out of the way.

Fig. 55: Fresh Air inlet Housing
Courtesy of CHRYSLER LLC

12. Remove the two nuts (5) that secure the fresh air inlet housing (3), particulate air filter (1) and filter housing (4) to the dash panel (2).
13. Remove the fresh air inlet housing, particulate air filter and filter housing as an assembly from the dash panel.

HOUSING-HVAC ASSEMBLY

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

NOTE: The HVAC housing must be removed from the vehicle and disassembled for service of the A/C evaporator.

Fig. 56: Housing-HVAC-Exterior Removal & Installation
Courtesy of CHRYSLER LLC

1. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
2. Drain the engine cooling system. Refer to **Cooling - Standard Procedure**.
3. Disconnect and isolate the negative battery cable.
4. Remove the fresh air inlet housing from the dash panel. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
5. Disconnect the A/C liquid line and the A/C suction line from the A/C evaporator. See **Heating and Air Conditioning/Plumbing/LINE, A/C Liquid - Removal**.
6. Disconnect the heater hoses from the heater core tubes.
7. Remove the three nuts (1 and 3) that secure the HVAC housing to the engine compartment side of the dash panel (2).

Fig. 57: Housing-HVAC-Interior Removal & Installation
Courtesy of CHRYSLER LLC

8. Remove the instrument panel from the passenger compartment. Refer to **Body/Instrument Panel/PANEL, Instrument - Removal**.
9. Disconnect the floor console duct. See **Heating and Air Conditioning/Distribution/DUCT, Floor Console - Removal**.
10. Disconnect the rear floor distribution ducts. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Removal**.
11. Remove the defroster ducts. See **Heating and Air Conditioning/Distribution/DUCT, Defroster - Removal**.
12. Remove the two nuts (1) that secure the HVAC housing (2) to the passenger compartment side of the dash panel (5).
13. Pull the HVAC housing assembly rearward so that the mounting studs clear the dash panel.
14. Lift the HVAC housing assembly upwards so that the condensate drain tube clears the grommet (4) in the floor panel (3) and remove the HVAC housing assembly from the passenger compartment.
15. If required, disassemble the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Disassembly**.

Disassembly

HOUSING-AIR DISTRIBUTION

NOTE: The air distribution housing must be removed from the HVAC housing and disassembled for service of the mode-air and blend-air doors.

Fig. 58: Air Housing-Actuators and Brackets-LH Removal & Installation
 Courtesy of CHRYSLER LLC

1. Remove the air distribution housing (1) from the HVAC housing and place it on a workbench. See Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal.
2. Remove the screws (2) that secure the mode door actuator (4) and the blend door actuator (7) to the driver side of the air distribution housing and remove the actuators.
3. Remove the screws (5) that secure the blend door actuator mounting bracket (6) and the mode door actuator mounting bracket (3) to the driver side of the air distribution housing and remove the mounting brackets.

Fig. 59: Air Housing-Actuator Linkages-LH Removal & Installation
 Courtesy of CHRYSLER LLC

4. Remove the instrument panel door linkage (3) from the pivot shaft located on the driver side of

the air distribution housing (8) and carefully disconnect the linkage rod (2) from the instrument panel door lever (1).

5. Remove the defrost/demister door linkage (7) from the pivot shaft on the air distribution housing and carefully disconnect the linkage rod (12) from the defrost/demister door lever (11).
6. Remove the mode door cam (6) from the air distribution housing.
7. Remove the floor door linkage (5) from the floor door lever (4) and the air distribution housing.
8. Remove the blend door cam (9) from the blend door lever (10) and the air distribution housing.

Fig. 60: Duct-Front Floor Distribution
Courtesy of CHRYSLER LLC

9. Remove the six screws (1) that secure the front floor distribution duct (2) to the bottom of the air distribution housing (3) and remove the duct.

Fig. 61: Air Housing-Seal and Screws Removal & Installation
 Courtesy of CHRYSLER LLC

10. Carefully cut the foam seal (1) along the parting line (2) of the two halves of the air distribution housing (3). If the seal is deformed or damaged, it must be replaced.
11. Remove the screws (4) that secure the two halves of the air distribution housing together.

Fig. 62: Air Housing-Partition Removal & Installation
 Courtesy of CHRYSLER LLC

12. Carefully separate the left half of the air distribution housing (1) from the right half of the housing (2).
13. Remove the center partition (3).

Fig. 63: Air Housing-Air Doors Removal/Installation
Courtesy of CHRYSLER LLC

14. To remove the air doors (1) from the air distribution housing (2), first carefully push down on the tab (3) of the air door lever (4) located in the pivot shaft of the air door being removed.

NOTE: **If the seal on the air door is deformed or damaged, the air door must be replaced.**

15. Gently pull the air door lever out of the pivot shaft and remove the air door(s) from the air distribution housing as required.

HOUSING-AIR INLET

NOTE: **The air inlet housing must be removed from HVAC housing and disassembled for service of the recirculation-air door.**

Fig. 64: Identifying Air Inlet Housing, Screws, Recirculation Door Actuator & Recirculation-air Door

17. Carefully lift the A/C evaporator (1) and foam seal (2) out of the lower half of the HVAC housing (3).
18. If required, remove the foam seal from the tapping block of the A/C evaporator. If the seal is deformed or damaged, it must be replaced.

Assembly

HOUSING-AIR DISTRIBUTION

Fig. 71: Air Housing-Air Doors Install
Courtesy of CHRYSLER LLC

1. Install the air doors (1) into the air distribution housing (2) as required. Align the air door with the pivot shaft hole in the housing.
2. Align and install the air door lever (4) into the pivot shaft of the air door. Make sure that the tab (3) on the door lever is securely engaged to the pivot shaft.

Fig. 72: Air Housing-Partition Removal & Installation
Courtesy of CHRYSLER LLC

3. Align the air door pivot shafts with the pivot holes in the center partition (3) and install the partition onto the left half of the air distribution housing (1).

4. Align the air door pivot shafts to each other and carefully install the left half of the air distribution housing to the right half of the housing (2).

Fig. 73: Air Housing-Seal and Screws Removal & Installation
Courtesy of CHRYSLER LLC

5. Install the screws (4) that secure the two halves of the air distribution housing (3) together. Tighten the screws to 2.2 N.m (20 in. lbs.).
6. Inspect the foam seal (1), especially at the parting line (2). If the seal is deformed or damaged, it must be replaced.

Fig. 74: Duct-Front Floor Distribution
Courtesy of CHRYSLER LLC

7. Position the front floor distribution duct (2) onto the air distribution housing (3).
8. Install the six screws (1) that secure the front floor distribution duct to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).

Fig. 75: Air Housing-Actuator Linkages-LH Removal & Installation
Courtesy of CHRYSLER LLC

9. Install the blend door cam (9) onto the blend door lever (10) and the pivot shaft located on the driver side of the air distribution housing (8).
10. Install the floor door linkage (5) onto the floor door lever (4) and the pivot shaft on air distribution housing.

NOTE: **Align the guide pin on the floor door linkage with the guides on the mode door cam during installation of the floor door linkage.**

11. Install the mode door cam (6) onto the pivot shaft on air distribution housing.
12. Connect the defrost/demister door linkage rod (12) onto the defrost/demister door lever (11).

NOTE: **Align the guide pin on the defrost/demister linkage with the guides on the mode door cam during installation of the defrost/demister linkage.**

13. Install the defrost/demister linkage (7) onto the pivot shaft on air distribution housing.
14. Connect the instrument panel door linkage rod (2) onto the instrument panel door lever (1).

NOTE: **Align the guide pin on the instrument panel linkage with the guides on the mode door cam during installation of the instrument panel linkage.**

15. Install the instrument panel linkage (3) onto the pivot shaft on air distribution housing.

Fig. 76: Air Housing-Actuators and Brackets-LH Removal & Installation
Courtesy of CHRYSLER LLC

16. Position the blend door actuator mounting bracket (6) and the mode door actuator mounting bracket (3) onto the driver side of the air distribution housing (1).
17. Install the screws (5) that secure the mounting brackets to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
18. Position the blend door actuator (7) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend door cam. See **Heating and Air Conditioning/Controls/ACTUATOR, Blend Door - Installation**.
19. Position the mode door actuator (4) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the mode door cam. See **Heating and Air Conditioning/Controls/ACTUATOR, Mode Door - Installation**.
20. Install the screws (2) that secure the blend door actuator to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
21. Position the mode door actuator mounting bracket (6) onto the driver side of the air distribution housing (1).
22. Install the screws that secure the blend door actuator mounting bracket to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
23. Position the blend door actuator (7) onto the air distribution housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the blend-air door linkage. See **Heating and Air Conditioning/Controls/ACTUATOR, Blend Door - Installation**.
24. Install the screws (2) that secure the blend door and mode door actuators to the air distribution housing. Tighten the screws to 2 N.m (17 in. lbs.).
25. Install the air distribution housing onto the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.

HOUSING-AIR INLET

Fig. 77: Identifying Air Inlet Housing, Screws, Recirculation Door Actuator & Recirculation-air Door

Courtesy of CHRYSLER LLC

1. Position the recirculation-air door (4) into the air inlet housing (1).

CAUTION: Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the air inlet housing.

2. Install the recirculation door actuator (3) onto the air inlet housing. If necessary, rotate the actuator slightly to align the splines on the actuator output shaft with those on the recirculation door pivot shaft. See Heating and Air Conditioning/Controls/ACTUATOR, Recirculation Door - Installation.
3. Install the three screws (2) that secure the recirculation door actuator to the air inlet housing. Tighten the screws to 2 N.m (17 in. lbs.).
4. Install the air inlet housing onto the HVAC housing. See Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation.

HOUSING-HVAC

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant

- Standard Procedure.

NOTE: If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

Fig. 78: Evaporator-A/C Removal & Installation
Courtesy of CHRYSLER LLC

1. If removed, install the foam seal (2) over the tapping block of the A/C evaporator (1). If the seal is deformed or damaged, it must be replaced.
2. Install the A/C evaporator into the lower half of the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.

8131df60

Fig. 79: Housing-HVAC
Courtesy of CHRYSLER LLC

3. Install the upper half of the HVAC housing (3) onto the lower half of the HVAC housing (4).
4. Install the screws (2) that secure the two halves of the HVAC housing together. Tighten the screws to 2.2 N.m (20 in lbs.).
5. Install the HVAC wiring harness (1). Make sure the harness is routed through all wiring retainers.

8131df68

Fig. 80: Valve-A/C Expansion Removal & Installation
Courtesy of CHRYSLER LLC

6. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.

7. Lubricate new rubber O-ring seals with clean refrigerant oil and install them on the evaporator tube fittings. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C expansion valve (2) onto the evaporator tube tapping block located within the foam seal (3).
9. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N.m (97 in. lbs.).

Fig. 81: HVAC Housing-Controls Removal & Installation
Courtesy of CHRYSLER LLC

10. Install the evaporator temperature sensor (2). See **Heating and Air Conditioning/Controls/SENSOR, Evaporator Temperature - Installation**.
11. Install the blower motor resistor (3). See **Heating and Air Conditioning/Controls/RESISTOR, Blower Motor - Installation**.
12. Install the blower motor (4). See **Heating and Air Conditioning/Distribution/MOTOR, Blower - Installation**.
13. Connect the HVAC wire harness (1) to the evaporator temperature sensor, blower motor resistor and the blower motor.
14. Install the two HVAC wire harness retainers (5) onto the blower motor.

Fig. 82: HVAC Housing-Flange Removal & Installation
 Courtesy of CHRYSLER LLC

15. Install the heater core tubes (4) and the flange (2) to the front of the HVAC housing (3).
16. Install the two screws (1) that secure the flange to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).

Fig. 83: Housing-HVAC Description
 Courtesy of CHRYSLER LLC

17. Install the air inlet housing (2) onto the HVAC housing (1). See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
18. Install the air distribution housing (3) onto the HVAC housing. See **Heating and Air**

Conditioning/Distribution/HOUSING, HVAC - Installation.

19. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation.**
20. If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.** Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

Installation

HOUSING-AIR DISTRIBUTION

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow these instructions may result in a coolant leak and possible serious or fatal injury.

Fig. 84: Housing-Air Distribution Install
Courtesy of CHRYSLER LLC

1. Position the air distribution housing (1) into the vehicle.
2. Install the air distribution housing onto the rear of the HVAC housing (2) by inserting the tabs on the bottom of the distribution housing into the slots located on the bottom of the HVAC housing and tipping the distribution housing forward until it is properly aligned with the HVAC housing.
3. Connect the floor distribution ducts to the air distribution housing.
4. Install the screws (3) that secure the air distribution housing to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).

Fig. 85: Heater Core Removal & Installation
 Courtesy of CHRYSLER LLC

5. Carefully install the heater core (4) into the driver side of the HVAC air distribution housing (2) and position the heater core tubes (6) to the HVAC housing (9).
6. Install heater core retaining bracket (3) onto the air distribution housing and install the retaining screw (5). Tighten the screw to 2.2 N.m (20 in. lbs.).
7. Install the flange (7) over the heater core tubes and onto the HVAC housing and install the two flange retaining screws (8). Tighten the screws to 2.2 N.m (20 in. lbs.).
8. Install the blend door actuator (1) to the driver side of the air distribution housing. See **Heating and Air Conditioning/Controls/ACTUATOR, Blend Door - Installation.**

Fig. 86: HVAC Wire Harness-Actuators Removal/Installation

Courtesy of CHRYSLER LLC

9. Connect the HVAC wire harness (1) to the mode door actuator (2) and the blend door actuator (3) located on the driver side of the air distribution housing (4).
10. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation.**
11. Reconnect the negative battery cable.
12. If the heater core is being replaced, flush the cooling system. Refer to **Cooling - Standard Procedure**.
13. Refill the engine cooling system. Refer to **Cooling - Standard Procedure**.
14. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure.**
15. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure.**
16. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure**.

HOUSING-AIR INLET

Fig. 87: Housing-Air Inlet Removal & Installation
Courtesy of CHRYSLER LLC

1. Position the air inlet housing (6) onto the HVAC housing (7).

CAUTION: Make sure that the recirculation-air door pivot shaft is properly seated in the pivot seats located on the top of the HVAC housing.

2. Install the five screws (5) that secure the air inlet housing to the HVAC housing. Tighten the

screws to 2.2 N.m (20 in. lbs.).

3. Inspect the foam seal (3). If the seal is deformed or damaged, it must be replaced.
4. Connect the HVAC wire harness (1) to the recirculation door actuator (2).
5. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
6. Reconnect the negative battery cable.

HOUSING-FRESH AIR INLET

Fig. 88: Fresh Air inlet Housing
Courtesy of CHRYSLER LLC

1. Position the fresh air inlet housing (3), particulate air filter (1) and filter housing (4) as an assembly onto the engine compartment side of the dash panel (2).
2. Install the two nuts (5) that secure the fresh air inlet housing and filter housing to the dash panel. Tighten the nuts to 7 N.m (62 in. lbs.).

Fig. 89: Push Pins-Fresh Air inlet Housing
Courtesy of CHRYSLER LLC

3. Position the insulator (4) into its installed location and install the push-pin retainer (5) that secures the insulator to the front of the fresh air inlet housing (2).
4. Install the push-pin retainer (1) that secures the fresh air inlet housing to the right inner fender (6).
5. Reach under the fresh air inlet housing and install the wire harness retainer (3) into the bottom of the air inlet housing, if equipped.

Fig. 90: Strut Support- Passenger Side
Courtesy of CHRYSLER LLC

6. Position the powertrain control module (PCM) into its installed location.
7. Position the strut support (3) into the engine compartment and loosely install the two bolts (1) that secure the strut support and the PCM to the passenger side strut tower (6).
8. Install the purge solenoid (5) onto its mounting bracket located on the right strut tower.
9. Engage the retainer that secures the wire harness (4) to the bottom of the strut support.

Fig. 91: Strut Support- Driver Side
Courtesy of CHRYSLER LLC

10. Engage the wiper motor (5) to the bracket (4) located on the strut support (2).
11. Position the strut support to the driver side strut tower and loosely install the two bolts (1) that secure the support to the tower.
12. Tighten all four bolts that secure the strut support to 38 N.m (28 ft. lbs.).
13. Install the cowl top panel onto the dash panel. Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .
14. Reconnect the negative battery cable.

HOUSING-HVAC ASSEMBLY

Fig. 92: Housing-HVAC-Interior Removal & Installation
 Courtesy of CHRYSLER LLC

1. Position the HVAC housing (2) into the passenger compartment with the mounting studs in their proper locations in the dash panel (5) and the condensate drain tube into the grommet (4) on the floor panel (3).
2. Install the two nuts (1) that secure the HVAC housing to the passenger compartment side of the dash panel. Tighten the nuts to 3 N.m (26 in. lbs.).
3. Install the defroster ducts. See **Heating and Air Conditioning/Distribution/DUCT, Defroster - Installation**.
4. Connect the rear floor distribution ducts. See **Heating and Air Conditioning/Distribution/DUCT, Floor Distribution - Installation**.
5. Connect the floor console duct. See **Heating and Air Conditioning/Distribution/DUCT, Floor Console - Installation**.
6. Install the instrument panel. Refer to **Body/Instrument Panel/PANEL, Instrument - Installation**.

Fig. 93: Housing-HVAC-Exterior Removal & Installation
Courtesy of CHRYSLER LLC

7. Install the three nuts (1 and 3) that secure the HVAC housing to the engine compartment side of the dash panel (2). Tighten the nuts to 7 N.m (62 in. lbs.).
8. Connect the heater hoses to the heater core tubes.
9. Connect the A/C suction and liquid lines to the A/C evaporator. See **Heating and Air Conditioning/Plumbing/LINE, A/C Liquid - Installation**.
10. Install the fresh air inlet housing to the engine compartment side of the dash panel. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
11. Reconnect the negative battery cable.
12. If the heater core was replaced, flush the cooling system. Refer to **Cooling - Standard Procedure**.
13. Refill the engine cooling system. Refer to **Cooling - Standard Procedure**.
14. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
15. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
16. Initiate the Actuator Calibration function using a scan tool. Refer to **DTC-Based Diagnostics/HVAC - Standard Procedure**.

MOTOR, BLOWER

Description

DESCRIPTION

Fig. 94: Blower Motor Description
Courtesy of CHRYSLER LLC

The blower motor is mounted to the bottom of the HVAC housing, on the passenger side of the vehicle. The blower motor assembly is a squirrel type blower cage (2) connected to a 12-volt, direct current (DC) motor located within a plastic housing (4). The blower motor has an integral wire harness bracket (1), three mounting provisions (3) and a wire connector receptacle (5).

The blower motor can be accessed for service from underneath the instrument panel.

Operation

OPERATION

The blower motor is used to control the velocity of air moving through the HVAC housing by spinning the blower wheel within the HVAC air inlet housing at the selected speed.

The blower motor will operate whenever the ignition switch is in the On position and the blower motor control in any position except Off.

Blower motor speed is controlled by directing the ground path for the blower motor through the correct resistor wire to obtain the selected speed.

The blower motor and blower wheel are factory balanced and cannot be adjusted or repaired and must be replaced as an assembly if inoperative or damaged.

Diagnosis and Testing

BLOWER MOTOR

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect

and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

NOTE: See **SYSTEM WIRING DIAGRAMS** for circuit descriptions and diagrams.

OPERATION

Possible causes of an inoperative blower motor include:

- Open fuse
- Inoperative blower motor resistor
- Inoperative blower motor switch
- Inoperative mode control switch
- Inoperative blower motor
- Inoperative blower motor circuit wiring or wire harness connectors

NOISE

To determine if the blower motor is the source of the noise, simply switch the blower motor from Off to On. To verify that the blower motor is the source of the noise, unplug the blower motor wire harness connector and operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material on fresh air inlet screen
- Foreign material in blower wheel
- Foreign material in the HVAC housing
- Improper blower motor mounting
- Deformed or damaged blower wheel
- Worn blower motor bearings or brushes

VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Foreign material in blower wheel
- Deformed or damaged blower wheel
- Worn blower motor bearings

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

Fig. 95: Wire Harness Connector From Blower Motor
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the instrument panel silencer from the passenger side of the instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Removal** .
3. Disengage the wire harness connector locking tab and disconnect the wire harness connector (1) from the blower motor (5).
4. Disengage the wire harness (4) from the two wire harness retainers (6).
5. Remove the three screws (2) that secure the blower motor to the HVAC housing (3).
6. Remove the blower motor from the HVAC housing.

Installation

INSTALLATION

Fig. 96: Wire Harness Connector From Blower Motor
Courtesy of CHRYSLER LLC

1. Position the blower motor (5) into the HVAC housing (3).
2. Install the three screws (2) that secure the blower motor to the HVAC housing. Tighten the screws to 2.2 N.m (20 in. lbs.).
3. Connect the wire harness connector (1) to the blower motor and engage the wire harness connector locking tab.
4. Engage the HVAC wire harness onto the two wire harness retainers (6).
5. Install the instrument panel silencer onto the passenger side of the instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
6. Reconnect the negative battery cable.

OUTLET, AIR

Description

DESCRIPTION

88372

Fig. 97: Identifying Defroster Air Outlets, Defroster Grille, Instrument Panel, Air Outlets & Grille
Courtesy of CHRYSLER LLC

There are two defroster air outlets (1) in the defroster grille (2) located on the top of the instrument panel (3). The airflow from the defroster outlets is directed by fixed vanes in the defroster grille and cannot be adjusted. The defroster air outlets are not serviceable from the defroster grille.

There are two side window demister air outlets (4). One located on each end of the instrument panel top cover. The airflow from the side window demister air outlets is directed by fixed vanes in the outlets and cannot be adjusted. The side window demister air outlets are only serviced with the top cover.

There are four instrument panel air outlets (5). One air outlet is located near each outboard end of the instrument panel facing the rear of the vehicle and two air outlets are located at the top of the instrument panel center bezel. Each of the instrument panel air outlets contain a non-serviceable grille with movable vanes (6) that are used to direct or shut off the flow of the conditioned air leaving the instrument panel outlets. All instrument panel air outlets can be serviced separately.

Removal

REMOVAL

Fig. 98: Identifying Instrument Panel Air Outlet, Trim Stick & Instrument Panel
 Courtesy of CHRYSLER LLC

NOTE: Center outlet shown in illustration. Other outlets similar.

1. Gently pry on both sides of the instrument panel air outlet (1) being serviced using Trim Stick C-4755 (2) or equivalent until the air outlet snap clip retainers are released from the face of the instrument panel (3).
2. Gently pull the air outlet from the instrument panel.

Installation

INSTALLATION

Fig. 99: Identifying Instrument Panel Air Outlet, Trim Stick & Instrument Panel
 Courtesy of CHRYSLER LLC

NOTE: Center outlet shown in illustration. Other outlets similar.

1. Position the air outlet (1) into its location on the instrument panel (3).

NOTE: Make sure that the foam seal on the outlet is properly installed and the air outlet is properly aligned to the duct within the instrument panel opening.

2. Align the air outlet foam seal with the duct in the instrument panel and engage the outlet to the instrument panel. Gently push on the air outlet until the snap clip retainers on the outlet are fully engaged to the instrument panel.

PLUMBING

DESCRIPTION

DESCRIPTION

The A/C refrigerant lines and hoses are used to carry the refrigerant between the various A/C system components. The refrigerant lines and hoses for the R-134a A/C system consist of a barrier-hose design with a nylon tube sandwiched between rubber layers. The nylon tube helps to contain the R-134a refrigerant, which has a small molecular structure. The ends of the refrigerant lines are made from lightweight aluminum with brazed fittings.

Any kinks or sharp bends in the refrigerant lines and hoses will reduce the capacity of the entire A/C system and can reduce the flow of refrigerant within the system.

OPERATION

OPERATION

High pressures are produced in the refrigerant system when the A/C compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses are coupled to other A/C system components with block-type fittings. A flat steel gasket with an integral O-ring (dual plane seal) is used to mate the refrigerant line fittings with A/C system components to ensure the integrity of the refrigerant system.

The refrigerant lines and hoses cannot be repaired and must be replaced if leaking or damaged.

WARNING

WARNING

WARNING: The A/C system contains refrigerant under high pressure. Repairs should only be performed by qualified service personnel. Serious or fatal injury may result from improper service procedures.

WARNING: Avoid breathing the refrigerant and refrigerant oil vapor or mist. Exposure

may irritate the eyes, nose, and/or throat. Wear eye protection when servicing the A/C refrigerant system. Serious eye injury can result from direct contact with the refrigerant. If eye contact occurs, seek medical attention immediately.

WARNING: Do not expose the refrigerant to open flame. Poisonous gas is created when refrigerant is burned. An electronic leak detector is recommended. Serious or fatal injury may result from improper service procedures.

WARNING: If accidental A/C system discharge occurs, ventilate the work area before resuming service. Large amounts of refrigerant released in a closed work area will displace the oxygen and cause suffocation and serious or fatal injury.

WARNING: The evaporation rate of R-134a refrigerant at average temperature and altitude is extremely high. As a result, anything that comes in contact with the refrigerant will freeze. Always protect the skin or delicate objects from direct contact with the refrigerant.

WARNING: The R-134a service equipment or the vehicle refrigerant system should not be pressure tested or leak tested with compressed air. Some mixtures of air and R-134a have been shown to be combustible at elevated pressures. These mixtures are potentially dangerous, and may result in fire or explosion causing property damage and serious or fatal injury.

WARNING: The engine cooling system is designed to develop internal pressures up to 145 kPa (21 psi). Do not remove or loosen the coolant pressure cap, cylinder block drain plugs, radiator drain, radiator hoses, heater hoses, or hose clamps while the engine cooling system is hot and under pressure. Allow the vehicle to cool for a minimum of 15 minutes before opening the cooling system for service. Failure to observe this warning can result in serious burns from the heated engine coolant.

CAUTION

CAUTION

CAUTION: Never add R-12 to a refrigerant system designed to use R-134a. Do not use R-12 equipment or parts on an R-134a A/C system. These refrigerants are not compatible and damage to the A/C system will result.

CAUTION: Never use R-12 refrigerant oil in an A/C system designed to use R-134a refrigerant oil. These refrigerant oils are not compatible and damage to the A/C system will result.

CAUTION: The use of A/C system sealers may result in damage to A/C refrigerant recovery/evacuation/recharging equipment and/or A/C system. Many federal, state/provincial and local regulations prohibit the recharge of A/C systems with known leaks. Chrysler LLC recommends the detection of A/C system leaks through the use of approved leak detectors and fluorescent leak detection dyes. Vehicles found with A/C system sealers should be treated as contaminated and replacement of the entire A/C refrigerant system is recommended. A/C systems found to be contaminated with A/C system sealers, A/C stop-leak products or seal conditioners voids the warranty for the A/C system.

CAUTION: Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: If equipped, do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.

CAUTION: The internal parts of the A/C system will remain stable as long as moisture-free refrigerant and refrigerant oil is used. Abnormal amounts of dirt, moisture or air can upset the chemical stability. This may cause operational troubles or even serious damage if present in more than very small quantities. Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system. Keep service tools and the work area clean. Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug. This will prevent contamination from entering the A/C system.

CAUTION: Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.

CAUTION: Do not overcharge the refrigerant system. Overcharging will cause excessive compressor head pressure and can cause compressor noise and A/C system failure.

DIAGNOSIS AND TESTING

REFRIGERANT SYSTEM LEAKS

WARNING: R-134a service equipment or vehicle A/C system should not be pressure tested or leak tested with compressed air. Mixture of air and R-134a can be combustible at elevated pressures. These mixtures are potentially dangerous and may result in fire or explosion causing property damage and possible serious or fatal injury.

Avoid breathing A/C refrigerant and lubricant vapor or mist. Exposure may irritate eyes, nose and throat. Use only approved service equipment meeting SAE requirements to discharge an R-134a system. If accidental system discharge occurs, ventilate work area before resuming service.

NOTE: If the A/C system refrigerant charge is empty or low, a leak in the A/C system is likely. Visually inspect all A/C lines, fittings and components for an oily residue. Oil residue can be an indicator of an A/C system leak location.

NOTE: The only way to correctly determine if the A/C system is fully charged with refrigerant to perform the A/C Performance Test. See Heating and Air Conditioning - Diagnosis and Testing.

Connect a suitable manifold gauge set and determine if the static A/C system pressure is above or below 345 kPa (50 psi). See Heating and Air Conditioning/Plumbing - Standard Procedure. If less than 345 kPa (50 psi), proceed to **SYSTEM EMPTY**. If greater than 345 kPa (50 psi), go to **SYSTEM LOW**.

SYSTEM EMPTY

1. Evacuate the refrigerant system to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater vacuum). See Heating and Air Conditioning/Plumbing - Standard Procedure. Determine if the system holds a vacuum for 15 minutes. If vacuum is held, a leak is probably not present. If system will not maintain vacuum level, proceed to step 2.
2. Prepare and dispense 0.284 kilograms (10 ounces) of R-134a refrigerant into the evacuated refrigerant system. See Heating and Air Conditioning/Plumbing - Standard Procedure and proceed to step 1 of the System Low procedure.

SYSTEM LOW

1. Position the vehicle in a wind free work area. This will aid in detecting small leaks.
2. Operate the heating-A/C system with the engine at idle under the following conditions for at least 5 minutes.
 - Doors or windows open
 - Transmission in Park
 - A/C-heater controls set to outside air, full cool, panel mode, high blower and with A/C compressor engaged

CAUTION: A leak detector only designed for R-12 refrigerant will not detect

leaks in an R-134a refrigerant system.

3. Shut the vehicle Off and wait 2-7 minutes. Then use an electronic leak detector that is designed to detect R-134a refrigerant and search for leaks. Fittings, lines or components that appear to be oily usually indicate a refrigerant leak. To inspect the A/C evaporator for leaks, insert the leak detector probe into the drain tube opening or an air outlet. A dye for R-134a is available to aid in leak detection. Use only Chrysler LLC approved refrigerant dye.

STANDARD PROCEDURE

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: Eye protection must be worn when servicing an A/C refrigerant system. Turn all valves off (rotate clockwise) on the equipment being used before connecting or disconnecting service equipment from the refrigerant system. Failure to follow these instructions may result in serious or fatal injury.

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in serious or fatal injury.

Fig. 100: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER LLC

When servicing the A/C system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1° C (70° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). When charging, the refrigerant recovery station must charge the system to an accuracy of 14 grams (0.5 oz.). Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. See

the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

Fig. 101: Identifying Manifold Gauge Set
Courtesy of CHRYSLER LLC

A manifold gauge set (1) may be needed with some recovery/recycling/charging equipment. The manifold gauge set should have manual shut-off valves (2 and 6), or automatic back-flow valves located at the service port connector end of the manifold gauge set hoses (4 and 5). This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE - The center manifold hose (Yellow, or White, with Black stripe) (3) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened the refrigerant in the system will escape through this hose.

HIGH PRESSURE GAUGE HOSE - The high pressure hose (Red with Black stripe) (4) attaches to the high side service port. This service port is located on the A/C liquid line next to the left shock tower. On this model, an A/C pressure transducer is also installed on the liquid line. A/C high-side pressures can be read using a scan tool. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** .

LOW PRESSURE GAUGE HOSE - The low pressure hose (Blue with Black stripe) (5) attaches to the low side service port. This service port is located on the A/C suction line behind the left shock tower.

REFRIGERANT SYSTEM RECOVERY

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 102: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER LLC

When servicing the A/C system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must recover 95% of the refrigerant system within 30 minutes at 21.1° C (70° F) and be able to measure the amount of refrigerant removed from the system to an accuracy of 28 grams (1 oz.). See the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

NOTE: Special effort must be used to prevent moisture from entering the A/C system oil. Moisture in the oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

If an A/C compressor designed to use R-134a refrigerant is left open to the atmosphere for an extended period of time, it is recommended that the refrigerant oil be drained and replaced with new oil, or a new A/C compressor be used. This will eliminate the possibility of contaminating the refrigerant system.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be filled. Moisture and air mixed with the refrigerant will raise the compressor head pressure

above acceptable operating levels. This will reduce the performance of the A/C system and damage the A/C compressor. Moisture will boil at near room temperature when exposed to vacuum. Use the following procedure to evacuate the refrigerant system:

NOTE: When connecting the service equipment coupling to the line fitting, verify that the valve of the coupling is fully closed. This will reduce the amount of effort required to make the connection.

1. Recover the refrigerant system. See [Heating and Air Conditioning/Plumbing - Standard Procedure](#).
2. Connect a suitable charging station, refrigerant recovery machine or a manifold gauge set with vacuum pump and refrigerant recovery equipment. See [Heating and Air Conditioning/Plumbing - Standard Procedure](#).
3. Open the suction and discharge valves and start the vacuum pump. The vacuum pump should run a minimum of 45 minutes prior to charge to eliminate all moisture in system. When the suction gauge reads to the lowest degree of vacuum possible (approximately -88 kPa (- 26 in. Hg) or greater) for 30 minutes, close all valves and turn off vacuum pump. If the system fails to reach specified vacuum, the refrigerant system likely has a leak that must be corrected. If the refrigerant system maintains specified vacuum for at least 30 minutes, start the vacuum pump, open the suction and discharge valves. Then allow the system to evacuate an additional 10 minutes.
4. Close all valves. Turn off and disconnect the vacuum pump.
5. Charge the refrigerant system. See [Heating and Air Conditioning/Plumbing - Standard Procedure](#).

REFRIGERANT SYSTEM CHARGE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in serious or fatal injury.

NOTE: The Underhood HVAC Specification Label contains the refrigerant fill specification of the vehicle being serviced.

Fig. 103: Identifying R-134A Refrigerant Recovery/Recycling/Charging Station
Courtesy of CHRYSLER LLC

After all refrigerant system leaks have been repaired and the refrigerant system has been evacuated, a refrigerant charge can be injected into the system

When servicing the A/C system, use an R-134a refrigerant recovery/recycling/charging station (1) that meets SAE standard J2788. Per SAE standard J2788, refrigerant recovery stations must charge the system to an accuracy of 14 grams (0.5 oz.). See the operating instructions supplied by the equipment manufacturer for proper care and use of this equipment.

CHARGING PROCEDURE

CAUTION: A small amount of refrigerant oil is removed from the A/C system each time the refrigerant system is recovered and evacuated. Before charging the A/C system, you **MUST** replenish any oil lost during the recovery process. Refer the equipment manufacturer instructions for more information.

1. Evacuate the refrigerant system. See Heating and Air Conditioning/Plumbing - Standard Procedure.
2. Connect an R-134a refrigerant recovery/recycling/charging station that meets SAE standard J2788 to the refrigerant system.
3. Measure the proper amount of refrigerant and heat it to 52° C (125° F) with the charging station. See Heating and Air Conditioning/Plumbing/REFRIGERANT - Specifications. See the operating instructions supplied by the equipment manufacturer for proper use of this equipment.
4. Open both the suction and discharge valves, then open the charge valve to allow the heated refrigerant to flow into the system.
5. When the transfer of refrigerant has stopped, close both the suction and discharge valves.
6. If all of the refrigerant charge did not transfer from the dispensing device, open all of the windows in the vehicle and set the heating-A/C system controls so that the A/C compressor is engaged and the blower motor is operating at its lowest speed setting. Run the engine at a

steady high idle (about 1400 RPM). If the A/C compressor does not engage, test the compressor clutch circuits and repair as required.

WARNING: Take care not to open the discharge (high pressure) valve at this time. Failure to follow this warning may result in serious or fatal injury.

7. Open the low-side valve to allow the remaining refrigerant to transfer to the refrigerant system.
8. Disconnect the charging station from the refrigerant system service ports.
9. Reinstall the caps onto the refrigerant system service ports.

COMPRESSOR, A/C

Description

A/C CLUTCH

Fig. 104: A/C Compressor Clutch Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C clutch assembly shown in illustration.

The clutch assembly for the A/C compressors consists of a stationary electromagnetic A/C clutch field coil (4), pulley bearing and pulley assembly (3), clutch plate (2) and shims (7). These components provide the means to engage and disengage the A/C compressor from the engine accessory drive belt.

The A/C clutch field coil and the pulley bearing and pulley assembly are both retained on the nose of the A/C compressor with snap rings (5 and 6). The clutch plate is splined to the compressor shaft and secured with a bolt (1).

A/C COMPRESSOR

812c0181

Fig. 105: A/C Compressor -Typical
Courtesy of CHRYSLER LLC

NOTE: Typical A/C compressor shown in illustration.

The A/C system on all models use a Denso, ten cylinder, double-acting swash plate-type A/C compressor (1). The A/C compressor has both the suction and discharge ports (2) located on the cylinder head (3) at the rear of the compressor.

A label identifying the use of R-134a refrigerant is located on the A/C compressor.

HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head at the rear of the A/C compressor. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Description**. This mechanical valve is designed to vent refrigerant from the A/C system to protect against damage to the A/C compressor and other A/C system components caused by condenser air flow restriction or an overcharge of refrigerant.

Operation

A/C CLUTCH

The clutch components for the A/C compressor provide the means to engage and disengage the compressor from the engine accessory drive belt. When the electromagnetic A/C clutch field coil is energized, it magnetically draws the clutch plate into contact with the clutch pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley assembly.

A/C compressor clutch engagement is controlled by the powertrain control module (PCM). When the A/C-heater control is set to any A/C position, it sends a request signal on the CAN-B bus to the totally integrated power module (TIPM), which then transfers the request on the CAN-C Bus to the PCM, which determines if operating conditions are correct for A/C clutch engagement. When all operating conditions have been met, the PCM sends a signal on a dedicated hard-wired circuit back to the totally integrated power module (TIPM) to energize the internal A/C clutch high side driver. When energized, the A/C clutch high side driver provides battery current to the A/C clutch field coil.

The A/C clutch control system is diagnosed using a scan tool. Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** .

The A/C compressor clutch components cannot be adjusted or repaired and must be replaced if inoperative or damaged.

A/C COMPRESSOR

The A/C compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The A/C compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The A/C compressor draws in low-pressure refrigerant vapor from the A/C evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the A/C condenser through the compressor discharge port.

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level can prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

The A/C compressor cannot be repaired and must be replaced if inoperative or damaged. The compressor clutch, pulley and bearing assembly, and clutch field coil are available for service. If an internal failure of the A/C compressor has occurred, the A/C receiver/drier must also be replaced. See **Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Removal**.

HIGH PRESSURE RELIEF VALVE

The high pressure relief valve vents refrigerant from the A/C system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The high pressure relief valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the A/C system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the A/C system. If the high pressure relief valve vents refrigerant, it does not mean the valve is inoperative.

The high pressure relief valve is factory-calibrated and cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the A/C compressor.

Diagnosis and Testing

A/C SYSTEM NOISE TESTING

When investigating an A/C system related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during A/C operation can often be misleading. For example: What sounds like a failed front engine bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon drive belt tension, drive belts can develop noises that are mistaken for an A/C compressor noise. Improper drive belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the accessory drive belt condition and tension as described in Cooling before beginning this procedure.

1. Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Turn the A/C compressor On and Off several times to clearly identify the compressor noise. Listen to the A/C compressor while the clutch is engaged and disengaged. Probe the A/C compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.
2. Loosen all of the compressor mounting hardware and retighten. Check the compressor clutch retainer. Be certain that the clutch field coil is mounted securely to the A/C compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Installation**.
3. To duplicate high-ambient temperature conditions (high head pressure), restrict the air flow through the A/C condenser. Install a manifold gauge set or a scan tool to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).
4. Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines and hoses for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. See **Heating and Air Conditioning/Plumbing - Description**.
5. If the noise is from opening and closing of the high pressure relief valve, recover, evacuate and recharge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
6. If the high pressure relief valve still does not seat properly, replace the A/C compressor. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Removal**.

A/C COMPRESSOR CLUTCH COIL

The A/C compressor clutch coil electrical circuit is controlled by the powertrain control module (PCM) through the totally integrated power module (TIPM). The A/C clutch coil can be tested by either measuring clutch field coil resistance or by measuring current draw. Begin testing of a suspected compressor clutch coil problem by performing the preliminary checks.

PRELIMINARY CHECKS

1. If the A/C compressor clutch will not engage, perform the A/C System Performance Test, which is found within the HVAC System Test. Refer to **Non-DTC Diagnostics/HVAC - Diagnosis and Testing** . If no diagnostic trouble codes (DTCs) are found in the A/C-heater control, PCM or the TIPM, go to step 2. If any DTCs are found, repair as required.
2. If the A/C compressor clutch still will not engage, verify the refrigerant charge level. See **Heating and Air Conditioning - Diagnosis and Testing**. If the refrigerant charge level is OK, go to **COIL RESISTANCE TEST** and/or **COIL CURRENT DRAW TEST**. If the refrigerant charge level is not OK, adjust the refrigerant charge as required.

COIL RESISTANCE TEST

1. Disconnect and isolate the negative battery cable.
2. Disconnect the wire harness connector from the A/C clutch field coil connector.
3. Use an ohm meter and Back Probe Tool 6801 and measure the resistance of the clutch field coil at the field coil connector terminals.
4. See the **A/C CLUTCH FIELD COIL SPECIFICATIONS** table for the acceptable A/C clutch coil resistance. Specifications apply for a work area temperature of 21° C (70° F).
 - a. If the A/C clutch coil reading is below specifications, the coil is shorted and must be replaced.
 - b. If the A/C clutch coil reading is above specifications, the coil is open and must be replaced.

COIL CURRENT DRAW TEST

1. Verify the battery state of charge. Refer to **Electrical - Engine Systems/Battery System/BATTERY - Diagnosis and Testing** .
2. Connect an ammeter (0 to 10 ampere scale selected) in series with the clutch field coil feed terminal using Back Probe Tool 6801. Connect a voltmeter (0 to 20 volt scale selected) to measure voltage across the battery and the clutch coil.
3. With the A/C-heater control in the A/C mode and the blower motor at low speed, start the engine and allow it to run at a normal idle speed.
4. The A/C clutch should engage immediately, and the clutch field coil supply voltage should be within two volts of the battery voltage. If the field coil supply voltage is OK, go to step 5. If the field coil supply voltage is not within two volts of battery voltage, test the clutch field coil feed circuit for excessive voltage drop and repair as necessary.
5. See the **A/C CLUTCH FIELD COIL SPECIFICATIONS** table for the acceptable A/C clutch field coil current draw. Specifications apply for a work area temperature of 21° C (70° F). If voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until voltage reads below 12.5 volts.
 - a. If the A/C clutch field coil current reading is zero, the coil is open and must be replaced.
 - b. If the A/C clutch field coil current reading is above specifications, the coil is shorted and must be replaced.

A/C CLUTCH FIELD COIL SPECIFICATIONS

--	--

Coil Resistance	Current Draw
3.6 ± 0.2 ohms	3.2 - 3.3 amps @ 11.5 - 12.5 volts

Standard Procedure

A/C CLUTCH PLATE INSPECTION

NOTE: The A/C clutch can be serviced in the vehicle. The refrigerant system can remain fully-charged during compressor clutch, pulley and bearing assembly, or coil replacement.

Fig. 106: Identifying Compressor Shaft, Clutch Plate & Shim
Courtesy of CHRYSLER LLC

Examine the friction surfaces of the pulley and the clutch plate (2) for wear. The pulley and clutch plate should be replaced if excessive wear or scoring is found.

If the friction surfaces are oily, inspect the shaft and nose area of the A/C compressor (1) for refrigerant oil. If refrigerant oil is found, the compressor shaft seal is leaking and the A/C compressor must be replaced.

Check the pulley bearing for roughness or excessive leakage of grease. The pulley and clutch plate should be replaced if bearing roughness or excessive leakage is found.

Removal

A/C CLUTCH

NOTE: The compressor clutch assembly can be serviced with the refrigerant system fully-charged and with the A/C compressor installed on the engine.

NOTE: Typical A/C compressor and clutch assembly shown in illustrations.

Fig. 107: A/C Compressor Shaft Bolt
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the air intake hose and the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal** .
3. Remove the radiator fan and shroud assembly. Refer to **Cooling/Engine/FAN, Cooling - Removal** .
4. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1) located on the top of the A/C compressor (5).

NOTE: Some models (depending on engine application) may require the A/C compressor to be removed from its installed location to gain access to the compressor shaft bolt and/or pulley and field coil snap rings. However, the refrigerant system can still remain fully charged.

6. Carefully remove the compressor clutch field coil connector and wire lead from the connector bracket (2).

7. Remove the compressor shaft bolt (3). A band-type oil filter wrench or a strap wrench may be used to hold the clutch plate (4) from rotating during bolt removal.

Fig. 108: Clutch Plate and Shim(s)
Courtesy of CHRYSLER LLC

CAUTION: Do not pry between the clutch plate and the pulley and bearing assembly to remove the clutch plate from the compressor shaft as this may damage the clutch plate.

NOTE: Use care not to lose any clutch shim(s) during removal of the clutch plate, as they may be reused during the clutch plate installation process.

8. Tap the clutch plate (2) lightly with a plastic mallet to release it from the splines on the compressor shaft (1) and remove the clutch plate and shim(s) (3).

Fig. 109: Clutch Pulley and Snap Ring
 Courtesy of CHRYSLER LLC

9. Using A/C Snap Ring Pliers 9764 or equivalent (1), remove the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor and remove the pulley and bearing assembly.

Fig. 110: Clutch Coil and Snap Ring
 Courtesy of CHRYSLER LLC

10. Using A/C Snap Ring Pliers 9764 or equivalent (1), remove the snap ring (4) that secures the compressor clutch field coil (2) to the front of the A/C compressor (3) and remove the field coil.

3.5L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in serious or fatal injury.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch field coil or engine.

Fig. 111: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See [Heating and Air Conditioning/Plumbing - Standard Procedure](#).
3. Remove the air cleaner housing. Refer to [Engine/Air Intake System/BODY, Air Cleaner - Removal](#).
4. Remove the accessory drive belt. Refer to [Cooling/Accessory Drive/BELT, Serpentine - Removal](#).
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard

the dual plane seals.

8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

Fig. 112: COMPRESSOR REMOVAL & INSTALLATION

Courtesy of CHRYSLER LLC

9. Raise and support the vehicle.
10. Remove the front belly pan. Refer to **Body/Exterior/BELLY PAN - Removal** .

NOTE: Bolt 3 securing the A/C compressor to the engine cannot be fully removed until the compressor is positioned away from the cylinder block.

11. Fully loosen the bolt (3) that secures the A/C compressor (5) and automatic transmission cooler line bracket (4) (if equipped) to the cylinder block (6).
12. Support the A/C compressor and remove the bolts (1 and 2) that secure the compressor to the cylinder block.

CAUTION: Use care not to deform or damage the automatic transmission cooler lines and retaining bracket when repositioning the A/C compressor.

13. Position the A/C compressor to gain clearance to remove bolt 3 and remove the bolt.
14. Remove the A/C compressor from the engine compartment.

5.7L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **Heating and Air Conditioning/Plumbing - Warning**. See **Heating and Air**

Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch coil or engine.

Fig. 113: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Remove the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal**.
4. Remove the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal**.
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.

8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

Fig. 114: COMPRESSOR-A/C 5.7L REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

9. Raise and support the vehicle.
10. Remove the front belly pan. Refer to **Body/Exterior/BELLY PAN - Removal**.
11. Remove the bolt (2) that secures the rear of the A/C compressor (4) and the automatic transmission cooler line bracket (1), if equipped, to the cylinder block (5).
12. Support the A/C compressor and remove the two bolts (3) that secure the front of the compressor to the cylinder block.
13. Position the cooler lines out of the way and remove the A/C compressor from the engine compartment.

6.1L ENGINE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See **Heating and Air Conditioning/Plumbing - Warning**. See **Heating and Air Conditioning/Plumbing - Caution**. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: The A/C compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch, clutch field coil or engine.

Fig. 115: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See Heating and Air Conditioning/Plumbing - Standard Procedure.
3. Remove the air cleaner housing. Refer to Engine/Air Intake System/BODY, Air Cleaner - Removal.
4. Remove the accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal.
5. Disconnect the engine wire harness from the compressor clutch field coil connector (1).
6. Remove the nuts (2) that secure the A/C suction line (3) and A/C discharge line (4) to the A/C compressor (5).
7. Disconnect the suction and discharge lines from the A/C compressor and remove and discard the dual plane seals.
8. Install plugs in, or tape over all of the opened refrigerant line fittings and the compressor ports.

Fig. 116: COMPRESSOR-A/C 6.1L REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

9. Raise and support the vehicle.
10. Remove the front belly pan. Refer to **Body/Exterior/BELLY PAN - Removal** .
11. Support the A/C compressor (3) and remove the bolts (1) that secure the automatic transmission cooler line bracket (2) and the compressor to the cylinder block (4).
12. Position the transmission cooler lines out of the way and remove the A/C compressor from the engine compartment.

Installation

A/C CLUTCH

NOTE: **Typical A/C compressor and clutch assembly shown in illustrations.**

Fig. 117: Clutch Coil and Snap Ring
Courtesy of CHRYSLER LLC

1. Align the dowel pin on the back of the compressor clutch field coil (2) with the hole in the front of the A/C compressor (3) and position the field coil onto the compressor. Be certain that the compressor clutch field coil wire lead is properly routed so that it is not pinched between the A/C compressor and the field coil.

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the compressor clutch field coil to the A/C compressor. The bevel side of the snap ring must face outward and both snap ring eyelets must be oriented to the right or to the left of the field coil dowel pin location on the A/C compressor.

2. Using A/C Snap Ring Pliers 9764 or equivalent (1), install the snap ring (4) that secures the compressor clutch field coil to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove and oriented correctly.

Fig. 118: Clutch Pulley - Installation
Courtesy of CHRYSLER LLC

CAUTION: Be certain to position the A/C clutch coil wire lead so that it is not damaged during A/C compressor pulley and bearing installation.

CAUTION: When installing the pulley and bearing assembly, **DO NOT** mar the friction surfaces of the pulley or premature failure of the A/C clutch will result.

3. Install the pulley and bearing assembly (1) onto the front of the A/C compressor. If necessary, tap the pulley gently with a block of wood (2) placed on the pulley friction surface.

Fig. 119: Clutch Pulley and Snap Ring
Courtesy of CHRYSLER LLC

CAUTION: The snap ring must be fully and properly seated in the groove or it will vibrate out, resulting in a clutch failure and severe damage to the A/C compressor.

NOTE: A new snap ring must be used to secure the pulley and bearing assembly to the A/C compressor. The bevel side of the snap ring must face outward.

4. Using A/C Snap Ring Pliers 9764 or equivalent (1), install the snap ring (2) that secures the pulley and bearing assembly (3) to the front of the A/C compressor. Be certain that the snap ring is fully and properly seated in the groove.

81229afa

Fig. 120: Clutch Plate and Shim(s)
Courtesy of CHRYSLER LLC

5. If the original clutch plate (2) and pulley and bearing assembly are to be reused, reinstall the original shim(s) (3) onto the compressor shaft (1). If a new clutch plate and pulley and bearing assembly are being used, install a trial stack of shims 2.54 mm (0.010 in.) thick onto the compressor shaft.

81229afc

Fig. 121: A/C Compressor Shaft Bolt
Courtesy of CHRYSLER LLC

6. Install the clutch plate (4) onto the front of the A/C compressor (5).
7. Install the compressor shaft bolt (3). Tighten the bolt to 19 N.m (168 in. lbs.).

NOTE: The shims may compress after tightening the shaft bolt. Check the air gap in four or more places to verify the air gap is correct. Spin the pulley before performing a final check of the air gap.

NOTE: On models with the clutch plate recessed into the pulley, use a 90° wire gap gauge to measure the clutch air gap. On other models, use a blade type feeler gauge to measure the air gap.

8. With the clutch plate assembled tight against the shim(s), measure the air gap between the clutch plate and the pulley and bearing assembly. The air gap should be between 0.35 - 0.60 mm (0.014 - 0.024 in.). If the air gap is not between specifications, add or subtract shims as needed until the correct air gap is obtained.

CAUTION: Be certain that the compressor clutch coil wire lead is routed so that it is not pinched between the A/C compressor and the coil connector bracket.

9. Carefully route the compressor clutch field coil wire lead behind the connector bracket (2).
10. Install the compressor clutch field coil connector (1) onto the connector bracket.
11. Connect the engine wire harness to the compressor clutch field coil connector.
12. Install the accessory drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Installation.
13. Install the radiator fan and shroud assembly. Refer to Cooling/Engine/FAN, Cooling - Installation.
14. Install the air cleaner housing and air intake hose. Refer to Engine/Air Intake System/BODY, Air Cleaner - Installation.
15. Reconnect the negative battery cable.

3.5L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can

cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be removed from the new A/C compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 122: COMPRESSOR REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. If the A/C compressor (5) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

CAUTION: When equipped, use care not to deform or damage the automatic transmission cooler lines and retaining bracket when repositioning the A/C compressor.

NOTE: Bolt 3 that secures the A/C compressor and transmission cooler line

bracket (when equipped) must be installed through the bracket and the lower front mounting hole of the compressor prior to final positioning of the compressor to the cylinder block.

2. Loosely install the bolt (3) that secures the A/C compressor and automatic transmission cooler line bracket (4) (when equipped) to the compressor and position the compressor, bracket and bolt to the cylinder block (6).
3. Loosely install the bolts (1 and 2) that secure the A/C compressor to the cylinder block.
4. Tighten all three bolts that secure the A/C compressor to the engine in the following order to 26 N.m (19 ft. lbs.):
 1. Upper front bolt.
 2. Lower front bolt.
 3. Rear bolt.
5. Install the front belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .
6. Lower the vehicle.

Fig. 123: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

7. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
8. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the suction and discharge lines onto the A/C compressor (5).
10. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N.m (17 ft. lbs.).

11. Connect the engine wire harness to the compressor clutch field coil connector (1).
12. Install the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .
13. Replace the A/C receiver/drier if the A/C compressor is being replaced due to an internal failure. See **Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Installation**.
14. Install the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation** .
15. Reconnect the negative battery cable.
16. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
17. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

5.7L ENGINE

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be removed from the new A/C compressor. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

928725

Fig. 124: COMPRESSOR-A/C 5.7L REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

1. If the A/C compressor (4) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Position the A/C compressor into the engine compartment.
3. Loosely install the two bolts (3) that secure the front of the A/C compressor to the cylinder block (5).
4. Loosely install the bolt (2) that secures the rear of the A/C compressor and the automatic transmission cooler line bracket (1), if equipped, to the cylinder block.
5. Tighten the three bolts in the following order to 50 N.m (37 ft. lbs.).
 1. Upper front bolt
 2. Lower front bolt
 3. Rear bolt
6. Install the front belly pan. Refer to **Body/Exterior/BELLY PAN - Installation**.
7. Lower the vehicle.

Fig. 125: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

8. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
9. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
10. Connect the suction and discharge lines onto the A/C compressor (5).
11. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N.m (17 ft. lbs.).
12. Connect the engine wire harness to the compressor clutch field coil connector (1).
13. Install the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation**.
14. Replace the A/C receiver/drier if the A/C compressor is being replaced due to an internal failure. See **Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Removal**.
15. Install the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
16. Reconnect the negative battery cable.
17. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
18. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

CAUTION: If the A/C compressor is being replaced, be certain to adjust the refrigerant system oil level. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be removed from the new A/C compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 126: COMPRESSOR-A/C 6.1L REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. If the A/C compressor (3) is being replaced, the refrigerant oil in the old compressor must be first drained and measured. Then the oil in the new A/C compressor must be drained. Finally, the new compressor must be refilled with the same amount of new refrigerant oil that was drained out of the old compressor. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard

Procedure. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

2. Position the A/C compressor into the engine compartment and reposition the transmission cooler lines and bracket (2).
3. Loosely install all the bolts (1) that secure the A/C compressor and the automatic transmission cooler line bracket to the cylinder block (4).
4. Tighten the bolts to 50 N.m (37 ft. lbs.):
5. Install the front belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .
6. Lower the vehicle.

Fig. 127: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

7. Remove the tape or plugs from the opened fittings on the A/C suction line (3) and the A/C discharge line (4) and the compressor ports.
8. Lubricate new dual plane seals with clean refrigerant oil and install them onto the suction and the discharge line fittings. Use only the specified seals as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
9. Connect the suction and discharge lines onto the A/C compressor (5).
10. Install the nuts (2) that secure the suction and discharge lines to the A/C compressor. Tighten the nuts to 23 N.m (17 ft. lbs.).
11. Connect the engine wire harness to the compressor clutch field coil connector (1).
12. Install the accessory drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .

13. Replace the A/C receiver/drier if the A/C compressor is being replaced due to an internal failure. See Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Removal and Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Installation.
14. Install the air cleaner housing. Refer to Engine/Air Intake System/BODY, Air Cleaner - Installation.
15. Reconnect the negative battery cable.
16. Evacuate the refrigerant system. See Heating and Air Conditioning/Plumbing - Standard Procedure.
17. Charge the refrigerant system. See Heating and Air Conditioning/Plumbing - Standard Procedure.

CONDENSER, A/C

Description

DESCRIPTION

Fig. 128: Power Steering Cooler Is Integrated Into A/C Condenser
Courtesy of CHRYSLER LLC

The A/C condenser (1) is located in the front of the engine compartment behind the front fascia. The A/C condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the A/C compressor to give up its heat to the air passing over the condenser fins, which causes the refrigerant to cool and change to a liquid state.

The A/C condenser is equipped with two fittings for the integral automatic transmission cooler when equipped with an automatic transmission (2), fittings for the integral power steering cooler (3), tapping blocks for the A/C refrigerant lines (4), a tapping block for the receiver/drier (5) and integral mounting brackets (6).

Operation

OPERATION

When air passes through the fins of the A/C condenser, the high-pressure refrigerant gas within the A/C condenser gives up its heat. The refrigerant then condenses as it leaves the A/C condenser and becomes a high-pressure liquid. The volume of air flowing over the condenser fins is critical to the proper cooling performance of the A/C system. Therefore, it is important that there are no objects placed in front of the radiator grille openings at the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or A/C condenser service.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C condenser has no serviceable parts. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever a refrigerant line is disconnected from the A/C condenser.

The A/C condenser cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in serious or fatal injury.

919123

Fig. 129: A/C Condenser & Radiator
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with A/C condenser and radiator removed from vehicle for clarity.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See Heating and Air Conditioning/Plumbing - Standard Procedure.
3. Remove the front fascia. Refer to Frame and Bumpers/Bumpers/FASCIA, Front - Removal.
4. If equipped, disconnect the automatic transmission cooler lines from the transmission cooler ports (1). Refer to Cooling - Standard Procedure.
5. Disconnect the power steering cooler lines from the two power steering cooler fittings (3 and 10).
6. Install plugs in the power steering cooler fittings and automatic transmission cooler ports, as equipped.
7. Disconnect the A/C discharge line and the A/C liquid line from the refrigerant line tapping blocks (4 and 6). See Heating and Air Conditioning/Plumbing/LINE, A/C Liquid - Removal. See Heating and Air Conditioning/Plumbing/LINE, A/C Discharge - Removal.
8. Install plugs in, or tape over the opened refrigerant line fittings and condenser ports.
9. Remove the four bolts (2, 5, 8 and 11) that secure A/C condenser (7) to the radiator (12).
10. Carefully tilt the bottom of the A/C condenser forward and lower the condenser out of the vehicle.
11. If required, place the A/C condenser onto a workbench and remove A/C receiver/drier (9). See Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Removal.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: If only the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime

a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: Be certain that each of the radiator and condenser air seals are installed in their proper locations. These air seals are required for the A/C and engine cooling systems to perform as designed.

Fig. 130: A/C Condenser & Radiator
Courtesy of CHRYSLER LLC

NOTE: Illustration shown with A/C condenser and radiator removed from vehicle for clarity.

1. If removed, install the A/C receiver/drier (9) onto the A/C condenser (7). See Heating and Air Conditioning/Plumbing/DRIER, A/C Receiver - Installation.
2. Carefully position the A/C condenser onto the radiator (12).
3. Install the four bolts (2, 5, 8 and 11) that secure the A/C condenser to the radiator. Tighten the bolts to 5 N.m (44 in. lbs.).
4. Remove the tape or plugs from the opened refrigerant line fittings and condenser ports.
5. Connect the A/C discharge line and the A/C liquid line onto the refrigerant line tapping blocks (4 and 6). See Heating and Air Conditioning/Plumbing/LINE, A/C Discharge - Installation. See Heating and Air Conditioning/Plumbing/LINE, A/C Liquid - Installation.
6. Remove the plugs and connect the power steering cooler lines to the power steering cooler fittings (3 and 10). Make sure the retaining clamps are securely engaged.
7. If equipped, remove the plugs and connect the automatic transmission cooler lines to the cooler ports (1). Refer to Cooling - Standard Procedure.
8. Install the front fascia. Refer to Frame and Bumpers/Bumpers/FASCIA, Front - Installation.
9. Reconnect the negative battery cable.

10. Evacuate the refrigerant system. Refer to **REFRIGERANT**.
11. If the A/C condenser is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. Charge the refrigerant system. Refer to **REFRIGERANT**.
13. If equipped, check the automatic transmission fluid level. Refer to **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure**. Fill as required. Refer to **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure**.

CORE, HEATER

Description

DESCRIPTION

Fig. 131: Core-Heater Description
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The heater core (1) is mounted into the driver side of HVAC air distribution housing (2), located behind the instrument panel. The heater core is a heat exchanger made of rows of tubes and fins and is secured to the air distribution housing by a plastic retaining bracket (3). The heater core tubes (4) are secured to the HVAC housing by a removable flange (5).

The heater core tubes are not serviced separately from the heater core. The HVAC housing must be removed from the vehicle to service the heater core.

Operation

OPERATION

Engine coolant is circulated through the heater hoses to the heater core at all times. As the coolant flows through the heater core, heat is removed from the engine and is transferred to the heater core tubes and fins. Air directed through the heater core picks up the heat from the heater core fins. The blend-air door(s) allows control of the heater output air temperature by regulating the amount of air flowing through the heater core. The blower motor speed controls the volume of air flowing through the HVAC housing.

The heater core cannot be repaired and must be replaced if restricted, leaking or damaged.

Removal

REMOVAL

WARNING: Disable the airbag system before attempting any steering wheel, steering column or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable and wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in accidental airbag deployment and possible serious or fatal injury.

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow this warning could result in a coolant leak and possible serious or fatal injury.

Fig. 132: Heater Core Removal & Installation
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the HVAC housing assembly (9) and place it on a suitable workbench. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal**.
3. On LHD models, remove the blend door actuator (1) from the driver side of the HVAC air distribution housing (2). See **Heating and Air Conditioning/Controls/ACTUATOR, Blend Door - Removal**.
4. Remove the two screws (8) that secure the flange (7) to the front of the HVAC housing near the dash panel and remove the flange.
5. Remove the screw (5) that secures the heater core retaining bracket (3) to the driver side of the HVAC air distribution housing and remove the bracket.
6. Disengage the heater core tubes (6) from the HVAC housing and carefully pull the heater core (4) straight out of the side of the air distribution housing.

Installation

INSTALLATION

WARNING: The heater core tubes are not serviced separately from the heater core. The heater core tubes should not be repositioned, loosened or removed from the heater core. Failure to follow this warning could result in a coolant leak and possible serious or fatal injury.

Fig. 133: Heater Core Removal & Installation
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Carefully install the heater core (4) into the driver side of the HVAC air distribution housing (2) and position the heater core tubes (6) to the HVAC housing (9).
2. Install heater core retaining bracket (3) onto the air distribution housing and install the retaining screw (5). Tighten the screw to 2.2 N.m (20 in. lbs.).
3. Install the flange (7) over the heater core tubes and onto the HVAC housing and install the two flange retaining screws (8). Tighten the screws to 2.2 N.m (20 in. lbs.).
4. On LHD models, install the blend door actuator (1) to the driver side of the air distribution housing. See **Heating and Air Conditioning/Controls/ACTUATOR, Blend Door - Installation**.
5. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
6. Reconnect the negative battery cable.
7. If the heater core is being replaced, flush the cooling system. Refer to **Cooling - Standard Procedure**.
8. Refill the engine cooling system. Refer to **Cooling - Standard Procedure**.
9. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
10. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

CORE, SERVICE PORT VALVE

Description

DESCRIPTION

Fig. 134: Refrigerant System Service Ports Description
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

Refrigerant system service ports are used to recover, recycle, evacuate, charge and test the A/C refrigerant system. Unique sizes are used on the two service ports for the R-134a refrigerant system to ensure the system is not accidentally contaminated with R-12 refrigerant or by service equipment used for R-12 refrigerant.

The high side service port (1) is located on the liquid line (2) near the left shock tower (3). The low side service port (4) is located on the suction line (5) near the left shock tower. Both the high side and low side A/C service port valve cores are serviceable.

NOTE: The protective cap aids in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

Each of the service ports has a threaded plastic protective cap (6) installed over it from the factory. The service port caps are serviceable items.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning. See [Heating and Air](#)

Conditioning/Plumbing - Caution. Failure to follow the warnings and cautions may result in serious or fatal injury.

Fig. 135: Identifying A/C Service Port Components
Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown in illustration.

1. Remove the protective cap (1) from the service port (2).
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure.**
3. Using a Schrader-type valve core tool, remove the valve core (3) from the service port.
4. Install a plug in, or tape over the opened service port(s).

Installation

INSTALLATION

Fig. 136: Identifying A/C Service Port Components
 Courtesy of CHRYSLER LLC

NOTE: Typical A/C service port shown in illustration.

1. Lubricate the valve core (3) with clean refrigerant oil prior to installation. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
2. Remove the tape or plug from the service port (2).

CAUTION: A valve core that is not fully seated in the A/C service port can result in damage to the valve during refrigerant system evacuation and charge. Such damage may result in a loss of system refrigerant while uncoupling the charge adapters.

3. Install and tighten the valve core into the service port(s) using a Schrader type valve core tool.
4. Evacuate and charge the refrigerant system. See Heating and Air Conditioning/Plumbing - Standard Procedure.

NOTE: The protective cap helps aid in service port sealing and helps protect the refrigerant system from contamination. Remember to always reinstall the protective cap onto the service port when refrigerant system service is complete.

5. Install the protective cap (1) onto the service port.

DRIER, A/C RECEIVER

Description

DESCRIPTION

Fig. 137: Receiver/Drier Description
Courtesy of CHRYSLER LLC

The receiver/drier (1) stores unnecessary refrigerant, filters the refrigerant, helps remove moisture from the refrigerant and retains any refrigerant vapor that may leave the A/C condenser (2) until it becomes a liquid. The receiver/drier is installed on the high-side of the A/C system and is connected directly to the right end of the A/C condenser. The receiver/drier can be easily serviced by removing the front fascia.

Operation

OPERATION

The A/C receiver/drier performs a filtering action to prevent foreign material in the refrigerant from contaminating the A/C expansion valve. Refrigerant enters the A/C receiver/drier as a high-pressure, low temperature liquid. Desiccant inside the A/C receiver/drier absorbs any moisture which may have entered and become trapped within the refrigerant system. In addition, during periods of high demand operation of the A/C system, the A/C receiver/drier acts as a reservoir to store surplus refrigerant.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C receiver/drier has no serviceable parts except for the O-ring seals, gaskets and the high side service port valve and cap. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals and gaskets must be replaced whenever the A/C receiver/drier is removed.

The A/C receiver/drier cannot be repaired and must be replaced if leaking or damaged, or if an internal failure of the A/C compressor has occurred.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in serious or fatal injury.

902523

Fig. 138: RECEIVER/DRYER REMOVAL & INSTALLATION

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See [Heating and Air Conditioning/Plumbing - Standard Procedure](#).
3. Remove the front fascia. Refer to [Frame and Bumpers/Bumpers/FASCIA, Front - Removal](#).
4. Remove the screw (1) that secures the receiver/drier mounting bracket (2) to the right end of the A/C condenser (3).
5. Remove the bolt (4) that secures the receiver/drier (5) to the A/C condenser.
6. Disconnect the receiver/drier from the A/C condenser and remove and discard the dual-plane seal.
7. Install plugs in, or tape over the opened receiver/drier fitting and the condenser ports.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See [Heating and Air Conditioning/Plumbing/OIL](#).

Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level prevents the A/C system from operating as designed and can cause serious A/C compressor damage.

CAUTION: The A/C receiver/drier must be replaced if an internal failure of the A/C compressor has occurred. Failure to replace the A/C receiver/drier can cause serious damage to the replacement A/C compressor.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: If only the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

902523

Fig. 139: RECEIVER/DRYER REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Position the receiver/drier (5) into the engine compartment.
2. Remove the tape or plugs from the receiver/drier fitting and the ports of the A/C condenser (3).
3. Lubricate a new dual-plane seal with clean refrigerant oil and install it onto the receiver/drier fitting. Use only the specified seal, as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

4. Connect the receiver/drier to the right end of the A/C condenser.
5. Install the bolt (4) that secures the receiver/drier to the A/C condenser. Tighten the bolt to 22 N.m (16 ft. lbs.).
6. Install the receiver/drier mounting bracket (2) onto the A/C condenser.
7. Install the screw (1) securing the receiver/drier mounting bracket onto the A/C condenser. Tighten the screw to 5 N.m (44 in. lbs.).
8. Install the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation** .
9. Reconnect the negative battery cable.
10. Evacuate the refrigerant system. Refer to **REFRIGERANT**.
11. If the A/C receiver/drier is being replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
12. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

EVAPORATOR, A/C

Description

DESCRIPTION

Fig. 140: Evaporator-A/C Description
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C evaporator (1) for the heating-A/C system is located within the HVAC housing, behind the instrument panel. The A/C evaporator and its insulator (2) are positioned in the HVAC housing so that all air entering the housing must pass over the evaporator fins before it is distributed through the heating-A/C system ducts and outlets. However, air passing over the evaporator fins will only be conditioned when the A/C compressor is engaged and circulating refrigerant through the A/C evaporator.

The A/C evaporator tubes (3) are connected and sealed to the A/C expansion valve by use of rubber O-rings (4) and a tapping block (5).

The A/C evaporator can only be serviced by removing and disassembling the HVAC housing assembly.

Operation

OPERATION

Refrigerant enters the A/C evaporator from the A/C expansion valve as a low-temperature, low-pressure mixture of liquid and gas. As air flows over the fins of the A/C evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas when it leaves the A/C evaporator.

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line or expansion valve is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C evaporator has no serviceable parts except for the O-ring seals. The O-ring seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The O-ring seals must be replaced whenever the A/C expansion valve is removed from the A/C evaporator.

The A/C evaporator cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

Fig. 141: Evaporator-A/C Removal & Installation
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Remove the HVAC housing assembly. See Heating and Air Conditioning/Distribution/HOUSING, HVAC - Removal.
2. Disassemble the HVAC housing as necessary to access the A/C evaporator (1). See Heating and Air Conditioning/Distribution/HOUSING, HVAC - Disassembly.
3. Carefully lift the A/C evaporator and the foam seal (2) out of the lower half of the HVAC housing (3).
4. If required, remove the foam seal from the tapping block of the A/C evaporator. If the seal is deformed or damaged, it must be replaced.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: If only the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 142: Evaporator-A/C Removal & Installation
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. If removed, install the foam seal (2) over the tapping block of the A/C evaporator (1). If the seal is deformed or damaged, it must be replaced.
2. Install the A/C evaporator into the lower half of the HVAC housing (3). Make sure that the evaporator drain within the HVAC housing is clean and unrestricted and that the insulator around the A/C evaporator is properly installed.
3. Assemble the HVAC housing. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Assembly**.
4. Install the HVAC housing assembly. See **Heating and Air Conditioning/Distribution/HOUSING, HVAC - Installation**.
5. If the A/C evaporator is being replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.

LINE, A/C DISCHARGE

Description

DESCRIPTION

Fig. 143: Line-A/C Discharge Description
Courtesy of CHRYSLER LLC

The A/C discharge line (1) is the refrigerant line that carries refrigerant from the A/C compressor to the A/C condenser (2).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C discharge line has no serviceable parts except for the dual plane seals. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C discharge line is disconnected.

The A/C discharge line cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may

result in serious or fatal injury.

Fig. 144: LINE-A/C DISCHARGE REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Remove the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal**.
4. Reach through the headlamp opening in the upper radiator support and remove the nut (1) that secures the A/C discharge line (2) to the A/C condenser (5).
5. Disconnect the A/C discharge line from the A/C condenser and remove and discard the dual plane seal.
6. Install plugs in, or tape over the discharge line fitting and condenser inlet port.

Fig. 145: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

7. Remove the nut (2) that secures the A/C discharge line (4) to the A/C compressor (5).
8. Disconnect the A/C discharge line from the A/C compressor and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened refrigerant line fitting and the compressor port.
10. Remove the A/C discharge line from the engine compartment.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

Fig. 146: LINE-A/C DISCHARGE REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Position the A/C discharge line (2) into the engine compartment.
2. Remove the tape or plugs from the opened discharge line fitting and the inlet port on the A/C condenser (5).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the A/C discharge line onto the A/C condenser.
5. Reach through the headlamp opening in the upper radiator support and install the nut (1) that secures the A/C discharge line to the A/C condenser. Tighten the nut to 22 N.m (16 ft. lbs.).

Fig. 147: COMPRESSOR-A/C LINES REMOVAL & INSTALLATION

NOTE: Typical A/C compressor and refrigerant lines shown in illustration.

6. Remove the tape or plugs from the opened fitting on the A/C discharge line (4) and the outlet port on the A/C compressor (5).
7. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the discharge line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
8. Install the A/C discharge line onto the A/C compressor.
9. Install the nut (2) that secures the A/C discharge line to the A/C compressor. Tighten the nut to 23 N.m (17 ft. lbs.).
10. Install the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation**.
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
13. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
14. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

LINE, A/C LIQUID

Description

DESCRIPTION

81318c69

Fig. 148: Line-A/C liquid Description
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C liquid line is the refrigerant line that carries refrigerant from the A/C condenser to the A/C evaporator. The A/C liquid line is serviced in two sections. The front section of the liquid line (1) connects to the rear section of the liquid line (5) with a nut (2) and includes the high side service port (8). The rear section of the A/C liquid line includes the fitting for the A/C pressure transducer (6) and a mounting bracket (7) and is secured to the A/C expansion valve by a tapping plate (4). The rear section of the A/C liquid line is serviced as an assembly with the rear section of the A/C suction line (3).

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

The A/C liquid line has no serviceable parts except for the dual plane seals, high-side service port valve and its protective cap. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C liquid line is disconnected.

The A/C liquid lines cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See [Heating and Air Conditioning/Plumbing - Warning](#). See [Heating and Air Conditioning/Plumbing - Caution](#). Failure to follow these instructions may result in serious or fatal injury.

NOTE: The A/C liquid line is serviced in two sections. The rear section of the liquid line is serviced as an assembly with the rear section of the A/C suction line.

FRONT SECTION

Fig. 150: Removing/Installing Front Liquid A/C Line
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

9. Lower the vehicle.
10. Remove the nut (1) that secures the front section of the A/C liquid line (2) to the rear section of the liquid line (3).
11. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
12. Install plugs in, or tape over the opened liquid line fittings.
13. Remove the front section of the A/C liquid line from the engine compartment.

REAR SECTION

Fig. 151: Line-A/C Liquid/Suction-Rear Removal & Installation
 Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. On LHD models, remove the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal**.
4. Remove the nut (6) that secures the front section of the A/C liquid line (8) to the rear section of the liquid line (10).
5. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened liquid line fittings.
7. Remove the nut (7) that secures the front section of the A/C suction line (9) to the rear section of the suction line (12).
8. Disconnect the front section of the A/C suction line from the rear section of the suction line and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened suction line fittings.
10. Disconnect the wire harness (3) from the A/C pressure transducer (2).
11. Remove the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4).
12. Remove the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve (1).
13. Disconnect the rear section of the A/C liquid and suction lines from the A/C expansion valve.
14. Remove the dual plane seal from the suction and liquid line fittings and discard.

15. Install plugs in, or tape over the opened suction and liquid line fittings and the expansion valve ports.
16. Remove the rear section of the A/C liquid and suction lines as an assembly from the engine compartment.
17. If required, remove the A/C pressure transducer from the rear section of the A/C liquid line. See **Heating and Air Conditioning/Controls/TRANSDUCER, A/C Pressure - Removal.**

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.** Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.**

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: The A/C liquid line is serviced in two sections. The rear section of the liquid line is serviced as an assembly with the rear section of the A/C suction line.

FRONT SECTION

Fig. 152: Removing/Installing Front Liquid A/C Line
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

1. Position the front section of the liquid line (2) into the engine compartment.
2. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line to the rear section of the A/C liquid line (3).
3. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
5. Install the nut (1) that secures the front section of the A/C liquid line to the rear section of the A/C liquid line. Tighten the nut to 22 N.m (16 ft. lbs.).

LINE, A/C SUCTION

Description

DESCRIPTION

Fig. 155: LINE-A/C SUCTION DESCRIPTION
Courtesy of CHRYSLER LLC

NOTE: LHD model shown in illustration. RHD model similar.

The A/C suction line is the refrigerant line that carries refrigerant from the A/C evaporator to the A/C compressor. The A/C suction line is serviced in two sections. The front section of the suction line (1) connects to the rear section of the suction line (3) with a nut (6). The rear section of the A/C suction line includes the low side service port (2) and is secured to the A/C expansion valve by a tapping plate (4). The rear section of the A/C suction line is serviced as an assembly with the rear section of the A/C liquid line (5).

NOTE: **Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.**

The A/C suction line has no serviceable parts except for the dual plane seals, low-side service port valve and its protective cap. The seals used on the connections are made from a special type of rubber not affected by R-134a refrigerant. The seals must be replaced whenever the A/C suction line is disconnected.

The A/C suction lines cannot be repaired and must be replaced if leaking or damaged.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

NOTE: **The A/C suction line is serviced in two sections. The rear section of the suction line is serviced as an assembly with the rear section of the A/C liquid line.**

FRONT SECTION

NOTE: LHD model shown in illustration. RHD model similar.

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Remove the air cleaner housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal**.
4. Remove the nut (7) that secures the front section of the A/C suction line (9) to the rear section of the suction line (12).
5. Disconnect the front section of the A/C suction line from the rear section of the suction line and remove and discard the dual plane seal.
6. Install plugs in, or tape over the opened suction line fittings.
7. Remove the nut (6) that secures the front section of the A/C liquid line (8) to the rear section of the liquid line (10).
8. Disconnect the front section of the A/C liquid line from the rear section of the liquid line and remove and discard the dual plane seal.
9. Install plugs in, or tape over the opened liquid line fittings.
10. Disconnect the wire harness (3) from the A/C pressure transducer (2).
11. Remove the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4).
12. Remove the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve (1).
13. Disconnect the rear section of the A/C suction and liquid lines from the A/C expansion valve.
14. Remove the dual plane seal from the suction and liquid line fittings and discard.

15. Install plugs in, or tape over the opened suction and liquid line fittings and the expansion valve ports.
16. Remove the rear section of the A/C suction and liquid lines as an assembly from the engine compartment.
17. If required, remove the A/C pressure transducer from the rear section of the A/C liquid line. See **Heating and Air Conditioning/Controls/TRANSDUCER, A/C Pressure - Removal.**

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.** Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the **REFRIGERANT OIL CAPACITIES** chart to determine how much oil should be added to the refrigerant system. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.**

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: The A/C suction line is serviced in two sections. The rear section of the suction line is serviced as an assembly with the rear section of the A/C liquid line.

FRONT SECTION

NOTE: LHD model shown in illustration. RHD model similar.

1. If removed, install the A/C pressure transducer (2) onto the A/C liquid line (10). See **Heating and Air Conditioning/Controls/TRANSDUCER, A/C Pressure - Installation**.
2. Position the rear section of the A/C suction line (12) and the rear section of the A/C liquid line (10) as an assembly into the engine compartment.
3. Remove the tape or plugs from the suction and liquid line fittings and the ports in the A/C expansion valve (1).
4. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
5. Connect the rear section of the A/C liquid and suction lines to the A/C expansion valve.
6. Install the nut (11) that secures the liquid and suction line tapping block (13) to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
7. Install the bolt (5) that secures the refrigerant line mounting bracket to the left front shock tower (4). Tighten the bolt to 11 N.m (97 in. lbs.).
8. Connect the wire harness (3) to the A/C pressure transducer.
9. Remove the tape or plugs from the fittings that connect the front section of the A/C liquid line (8) to the rear section of the A/C liquid line.
10. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the liquid line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
11. Connect the front section of the A/C liquid line to the rear section of the A/C liquid line.
12. Install the nut (6) that secures the front section of the A/C liquid line to the rear section of the

A/C liquid line. Tighten the nut to 22 N.m (16 ft. lbs.).

13. Remove the tape or plugs from the fittings that connect the front section of the A/C suction line (9) to the rear section of the A/C suction line.
14. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction line fitting. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
15. Connect the front section of the A/C suction line to the rear section of the A/C suction line.
16. Install the nut (7) that secures the front section of the A/C suction line to the rear section of the A/C suction line. Tighten the nut to 22 N.m (16 ft. lbs.).
17. Install the air cleaner housing.
18. Reconnect the negative battery cable.
19. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
20. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
21. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

OIL, REFRIGERANT

Description

DESCRIPTION

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, polyalkylene glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The A/C compressor used in this vehicle is designed to use ND-8 PAG refrigerant oil. Use only this type of refrigerant oil the refrigerant system.

Operation

OPERATION

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause A/C compressor damage, and too much can reduce A/C system performance.

PAG refrigerant oil is more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

Standard Procedure

REFRIGERANT OIL CAPACITY

When an A/C system is assembled at the factory, all components except the A/C compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the A/C compressor is dispersed throughout the refrigerant system. The receiver/drier, A/C evaporator, A/C condenser and the A/C compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of refrigerant oil in the A/C system. This ensures proper lubrication of the A/C compressor. Too little oil will result in damage to the A/C compressor, while too much oil will reduce the cooling capacity of the A/C system and consequently result in higher discharge air temperatures.

CAUTION: The oil used in the A/C compressor is ND-8 PAG R-134a refrigerant oil. Only refrigerant oil of the same type should be used to service the A/C system. Do not use any other refrigerant oil. The oil container should be kept tightly capped until it is ready for use and then tightly capped after use to prevent contamination from dirt and moisture. Refrigerant oil will quickly absorb any moisture it comes in contact with, therefore, special effort must be used to keep all R-134a system components moisture-free. Moisture in the refrigerant oil is very difficult to remove and will cause a reliability problem with the A/C compressor.

NOTE: Most reclaim/recycling equipment will measure the lubricant being removed during recovery. This amount of lubricant should be added back into the system. Refer to the reclaim/recycling equipment manufacturers instructions.

It will not be necessary to check the oil level in the A/C compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when an A/C condenser, A/C evaporator or A/C receiver/drier is replaced (refer to the REFRIGERANT OIL CAPACITIES chart).

The refrigerant oil level in a new A/C compressor must first be adjusted prior to compressor installation (refer to **COMPRESSOR OIL DRAIN PROCEDURE**).

REFRIGERANT OIL CAPACITIES

COMPONENT	ml.	oz.
Total System Fill	180	6.1
A/C Condenser	30	1.0
A/C Evaporator	60	2.0

A/C Receiver/drier	30	1.0
A/C Compressor	Drain and measure the oil from the old compressor (See COMPRESSOR OIL DRAIN PROCEDURE below)	

COMPRESSOR OIL DRAIN PROCEDURE

CAUTION: Be certain to adjust the refrigerant system oil level when replacing an A/C compressor. Failure to properly drain and measure the refrigerant oil from the A/C compressor can prevent the A/C system from operating as designed and cause serious compressor damage.

The A/C compressor is filled with refrigerant oil from the factory. Use the following procedure to drain and measure refrigerant oil from the A/C compressor.

1. Drain all of the refrigerant oil from the old A/C compressor into a clean measured container.
2. Drain all of the refrigerant oil from the new A/C compressor into a clean measured container.
3. Refill the new A/C compressor with the same amount of refrigerant oil that was drained out of the old compressor. Use only clean refrigerant oil of the type recommended for the A/C compressor in the vehicle.
4. Install the new A/C compressor onto the engine. See **Heating and Air Conditioning/Plumbing/COMPRESSOR, A/C - Installation**.

REFRIGERANT

Description

DESCRIPTION

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

Operation

OPERATION

R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure, refrigerant oil sludge or poor A/C system performance. In addition, the polyalkylene glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a refrigerant system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the A/C compressor to identify that the A/C system is equipped with R-134a refrigerant.

VALVE, A/C EXPANSION

Description

DESCRIPTION

Fig. 162: A/C Expansion Valve-Typical
Courtesy of CHRYSLER LLC

The A/C expansion valve controls the amount of refrigerant entering the A/C evaporator and is of a thermostatic expansion valve (TXV) design. The A/C expansion valve consists of an aluminum H-valve type body (1) with an integral thermal sensor (2) and is located at the dash panel between the A/C refrigerant lines and the A/C evaporator.

Operation

OPERATION

The A/C expansion valve controls the high-pressure, low temperature liquid refrigerant from the A/C liquid line and converts it into a low-pressure, low-temperature mixture of liquid and gas before it

enters the A/C evaporator. A mechanical sensor in the A/C expansion valve monitors the temperature and pressure of the refrigerant leaving the A/C evaporator through the A/C suction line, and adjusts the orifice size at the liquid line port to let the proper amount of refrigerant into the evaporator to meet the vehicle A/C cooling requirements. Controlling the refrigerant flow through the A/C evaporator ensures that none of the refrigerant leaving the A/C evaporator is still in a liquid state, which could damage the A/C compressor.

NOTE: Replacement of the refrigerant line O-ring seals is required anytime a refrigerant line is disconnected from the expansion valve. Failure to replace the rubber O-ring seals could result in a refrigerant system leak.

The A/C expansion valve is factory calibrated and cannot be adjusted or repaired and must be replaced if inoperative or damaged.

Diagnosis and Testing

A/C EXPANSION VALVE

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

NOTE: The A/C expansion valve should only be tested following testing of the A/C compressor.

NOTE: Liquid CO² is required to test the A/C expansion valve. This material is available from most welding supply facilities. Liquid CO² is also available from companies which service and sell fire extinguishers.

When testing the A/C expansion valve, the work area and the vehicle temperature must be 21° to 27° C (70° to 85°F). To test the expansion valve:

1. Connect a charging station or manifold gauge set to the refrigerant system service ports. See Heating and Air Conditioning/Plumbing - Standard Procedure.
2. Verify the refrigerant system charge level by conducting the A/C Performance Test. See Heating and Air Conditioning - Diagnosis and Testing.
3. Close all doors, windows and vents to the passenger compartment.
4. Set the A/C-heater controls so that the A/C compressor is operating, the temperature control is in the highest temperature position, the mode-air doors is directing air output to the floor and the blower motor operating is operating at the highest speed.
5. Start the engine and allow it to idle. After the engine has reached normal operating temperature, allow the passenger compartment to heat up. This will create the need for maximum refrigerant flow into the A/C evaporator.

6. If the refrigerant charge is sufficient, the discharge (high pressure) gauge should read 827 kPa to 1655 kPa (120 psi to 240 psi). The suction (low pressure) gauge should read 207 kPa to 345 kPa (30 psi to 50 psi). If OK, go to step 7. If not OK, replace the inoperative A/C expansion valve.

WARNING: Protect the skin and eyes from exposure to liquid CO² or personal injury can result.

7. If the suction (low pressure) gauge reads within the specified range, freeze the A/C expansion valve for 30 seconds using liquid CO² or another suitable super-cold material. **Do not spray R-134a or R-12 refrigerant on the A/C expansion valve for this test.** The suction (low pressure) gauge reading should drop by 69 kPa (10 psi). If OK, go to step 8. If not OK, replace the inoperative A/C expansion valve. See Heating and Air Conditioning/Plumbing/VALVE, A/C Expansion - Removal.
8. Allow the A/C expansion valve to thaw. The suction (low pressure) gauge reading should stabilize at 207 kPa to 345 kPa (30 psi to 50 psi). If not OK, replace the inoperative A/C expansion valve. See Heating and Air Conditioning/Plumbing/VALVE, A/C Expansion - Removal.

Removal

REMOVAL

WARNING: Refer to the applicable warnings and cautions for this system before performing the following operation. See Heating and Air Conditioning/Plumbing - Warning. See Heating and Air Conditioning/Plumbing - Caution. Failure to follow these instructions may result in serious or fatal injury.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 163: Valve-A/C Expansion-Refrigerant Lines Removal & Installation
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Recover the refrigerant from the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
3. Remove the bolt (5) that secures the refrigerant line mounting bracket (6) to the left front shock tower (4).
4. Remove the nut (9) that secures the refrigerant line tapping block (10) to the A/C expansion valve (1).
5. Disconnect the wire harness (3) from the A/C pressure transducer (2) to help allow access to the A/C expansion valve.
6. Disconnect the A/C suction line (7) and the A/C liquid line (8) from the A/C expansion valve and position the refrigerant lines out of the way.
7. Remove the dual plane seal from the suction and liquid line fittings and discard.
8. Install plugs in, or tape over the opened suction and liquid line fittings.

Fig. 164: Valve-A/C Expansion Removal & Installation
Courtesy of CHRYSLER LLC

9. Remove the two bolts (1) that secure the A/C expansion valve (2) to the evaporator tube tapping block located within the foam seal (3).
10. Remove the A/C expansion valve from the evaporator tube tapping block and foam seal.
11. Remove the dual plane seal from the evaporator tube fittings and discard.
12. Install plugs in, or tape over the opened evaporator tube fittings and all expansion valve ports.

Installation

INSTALLATION

CAUTION: Be certain to adjust the refrigerant oil level when servicing the A/C refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure. Failure to properly adjust the refrigerant oil level will prevent the A/C system from operating as designed and can cause serious A/C compressor damage.

NOTE: When replacing multiple A/C system components, refer to the REFRIGERANT OIL CAPACITIES chart to determine how much oil should be added to the refrigerant system. See Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure.

NOTE: Replacement of the refrigerant line O-ring seals and gaskets is required anytime a refrigerant line is disconnected. Failure to replace the rubber O-ring seals and metal gaskets could result in a refrigerant system leak.

NOTE: LHD model shown in illustrations. RHD model similar.

Fig. 165: Valve-A/C Expansion Removal & Installation
 Courtesy of CHRYSLER LLC

1. Remove the tape or plugs from the evaporator tube fittings and all of the expansion valve ports.
2. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the evaporator tube fittings. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
3. Install the A/C expansion valve (2) onto the evaporator tube tapping block located within the foam seal (3).
4. Install the two bolts (1) that secure the A/C expansion valve to the evaporator tube tapping block. Tighten the bolts to 11 N.m (97 in. lbs.).

Fig. 166: Valve-A/C Expansion-Refrigerant Lines Removal & Installation

Courtesy of CHRYSLER LLC

5. Remove the tape or plugs from the suction and liquid line fittings.
6. Lubricate a new dual plane seal with clean refrigerant oil and install it onto the suction and liquid line fittings. Use only the specified seal as it is made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the A/C compressor in the vehicle.
7. Connect the A/C suction line (7) and the A/C liquid line (8) to the A/C expansion valve (1).
8. Install the nut (9) that secures the refrigerant line tapping block (10) to the A/C expansion valve. Tighten the nut to 23 N.m (17 ft. lbs.).
9. Install the bolt (5) that secures the refrigerant line mounting bracket (6) to the left front shock tower (4). Tighten the bolt to 11 N.m (97 in. lbs.).
10. Connect the wire harness (3) to the A/C pressure transducer (2).
11. Reconnect the negative battery cable.
12. Evacuate the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.
13. Adjust the refrigerant oil level. See **Heating and Air Conditioning/Plumbing/OIL, Refrigerant - Standard Procedure**.
14. Charge the refrigerant system. See **Heating and Air Conditioning/Plumbing - Standard Procedure**.

ENGINE

Ignition Control - Service Information - Challenger

DESCRIPTION

DESCRIPTION

NOTE: All engines use a fixed ignition timing system. Basic ignition timing is not adjustable. All spark advance is determined by the Powertrain Control Module (PCM).

The ignition system used on these engines is referred to as coil on plug. The system's four main components are the coils, crankshaft position sensor, spark plugs, and camshaft position sensors. The coil on plug ignition system utilizes an ignition coil for every cylinder. The ignition coils are mounted directly over the each spark plug.

OPERATION

OPERATION

The crankshaft position sensor and camshaft position sensor are hall effect devices. The camshaft position sensor and crankshaft position sensor generate square wave pulses that are inputs to the Powertrain Control Module (PCM). The PCM determines engine position from these sensors. The PCM calculates injector sequence and ignition timing from crankshaft AND camshaft position.

SPECIFICATIONS

CAPACITOR, IGNITION

REMOVAL

3.5L

Fig. 1: IGNITION CAPACITOR - 3.5L
Courtesy of CHRYSLER LLC

The ignition capacitor is located on the drivers side of the engine.

1. Disconnect and isolate negative battery cable at battery.
2. Remove electrical connector (3).
3. Remove mounting bolt (1) and ignition capacitor (2).

6.1L

Fig. 2: CAPACITOR - 6.1L
Courtesy of CHRYSLER LLC

The ignition capacitor (2) is attached to the left-rear corner of the intake manifold (3).

1. Disconnect and isolate the negative battery cable.
2. Remove electrical connector (1).
3. Remove mounting bolt and remove capacitor (2).

INSTALLATION

3.5L

Fig. 3: IGNITION CAPACITOR - 3.5L
Courtesy of CHRYSLER LLC

1. Install ignition coil capacitor (2) and bolt (1).
2. Tighten bolt to 28 N.m (20.5 ft. lbs.).
3. Connect electrical connector (3).
4. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

6.1L

Fig. 4: CAPACITOR - 6.1L
 Courtesy of CHRYSLER LLC

1. Install ignition capacitor (2) to left rear corner of intake manifold (3).
2. Install mounting bolt.
3. Install electrical connector (1).
4. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

COIL, IGNITION

REMOVAL

3.5L

Fig. 5: IGNITION COILS AND FUEL RAIL
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the upper intake manifold. Refer to **Engine/Manifolds/MANIFOLD, Intake - Removal** .

Fig. 6: Identifying Coil & Fuel Injector Connectors
Courtesy of CHRYSLER LLC

3. Unlock and disconnect electrical connector (2) from ignition coils.
4. Remove ignition coil mounting bolts.

CAUTION: Prior to removing the ignition coils, spray compressed air around the coils and spark plugs. If dirt and debris enter the engine, this may cause internal engine damage.

5. Twist, lift and remove ignition coil from engine.

6.1L

Fig. 7: IGNITION COIL MOUNTING BOLTS - 6.1L
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Unlock electrical connector (1) by pressing on tab while pulling electrical connector from coil.
3. Remove two coil mounting bolts (3).

Fig. 8: IGNITION COIL REMOVAL - 6.1L
 Courtesy of CHRYSLER LLC

4. Carefully pull up coil from cylinder head opening with a slight twisting action. Twisting will help break loose boots (1) from spark plugs.

INSTALLATION

3.5L

Fig. 9: IGNITION COILS AND FUEL RAIL
Courtesy of CHRYSLER LLC

1. Install ignition coil (1). Tighten bolts to 8 N.m (71 in. lbs.).

Fig. 10: COIL AND FUEL INJECTOR CONNECTORS
Courtesy of CHRYSLER LLC

2. Connect electrical connector and lock (2).
3. Install intake manifold. Refer to **Engine/Manifolds/MANIFOLD, Intake - Installation**.
4. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

6.1L

Fig. 11: IGNITION COIL REMOVAL - 6.1L
Courtesy of CHRYSLER LLC

1. Before installing coil(s), apply dielectric grease to inside of spark plug boots (1).

Fig. 12: IGNITION COIL MOUNTING BOLTS - 6.1L
Courtesy of CHRYSLER LLC

2. Position ignition coil into valve cover and push both spark plug boots onto each spark plug.
3. Install two coil mounting bolts (3) and tighten to 12 N.m (106 in. lbs.).
4. Connect electrical connector (1) to coil and lock connector.

5. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SENSOR, CAMSHAFT POSITION

REMOVAL

3.5L

Fig. 13: 3.5L CAMSHAFT SENSOR
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable at battery.
2. Disconnect electrical connector (3) from camshaft position (CMP) sensor (2).
3. Remove bolt (1) and CMP sensor (2).

5.7L/6.1L

Fig. 14: CAMSHAFT POSITION SENSOR-5.7L
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect the electrical connector (4) at the Camshaft Position (CMP) sensor (1).
3. Remove the CMP sensor mounting bolt (3).
4. Using a slight rotating motion, carefully remove the CMP sensor from the timing chain cover (2).
5. Check the condition of the sensor O-ring.

INSTALLATION

3.5L

Fig. 15: 3.5L CAMSHAFT SENSOR
 Courtesy of CHRYSLER LLC

CAUTION: Install camshaft position (CMP) sensor utilizing twisting motion. Make sure CMP sensor is fully seated. Do not drive CMP sensor into the bore with mounting screw. This may cause CMP sensor to be incorrectly seated causing a faulty signal or no signal at all.

NOTE: If reinstalling the sensor, check the sensor O-ring for damage and replace if necessary. Lubricate the O-ring with clean engine oil before installing the sensor.

1. Push the CMP sensor (2) into the timing belt cover with a twisting motion until fully seated.
2. While holding the sensor (2) in this position, install and tighten the retaining bolt (1) to 12 N.m (106 in. lbs.).
3. Connect and lock the electrical connector (3) to the CMP sensor (2).
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

NOTE: The Cam/Crank Variation Relearn procedure must be performed anytime there has been a repair/replacement made to a powertrain system, for example: flywheel, valvetrain, camshaft and/or crankshaft sensors or components. Refer to DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Standard Procedure

INSTALLATION

Fig. 16: CAMSHAFT POSITION SENSOR-5.7L
Courtesy of CHRYSLER LLC

CAUTION: Install the Camshaft Position (CMP) sensor using a rotating motion (side to side). Make sure the CMP sensor is fully seated. Do not drive the CMP sensor into the bore with the mounting screw. This may cause the CMP sensor to be incorrectly seated causing a faulty signal or no signal at all.

1. Using a rotating motion, carefully install the CMP sensor (1) into the timing chain cover (2).

CAUTION: Before tightening the sensor mounting bolt, be sure the sensor is completely flush to the timing chain cover. If the sensor is not flush, damage to the sensor mounting tang may result.

2. Install the CMP mounting bolt (3) and tighten to 12 N.m (9 ft. lbs.).
3. Connect the electrical connector (4) to the CMP sensor.
4. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SENSOR, KNOCK

REMOVAL

3.5L

Fig. 17: KNOCK SENSOR CONNECTOR
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the upper intake manifold. Refer to **Engine/Manifolds/MANIFOLD, Intake - Removal**
3. Disconnect the electrical connector.

Fig. 18: KNOCK SENSOR LOCATION
 Courtesy of CHRYSLER LLC

4. Remove the knock sensor.

REMOVAL

Fig. 19: KNOCK SENSOR HEAT SHIELD - 6.1L
 Courtesy of CHRYSLER LLC

Two knock sensors are used. Each sensor is bolted to the outside of cylinder block below the exhaust manifold.

1. Disconnect and isolate the negative battery cable.

2. Raise vehicle.
3. Remove heat shield (1) from knock sensor. Shield snaps to sensor.

Fig. 20: 5.7L/6.1L KNOCK SENSOR
Courtesy of CHRYSLER LLC

4. Disconnect knock sensor electrical connector (5).
5. Remove sensor mounting bolt (2). Note foam strip on bolt threads. This foam is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.
6. Remove sensor from engine.

INSTALLATION

3.5L

Fig. 21: KNOCK SENSOR LOCATION
 Courtesy of CHRYSLER LLC

CAUTION: Over or under tightening effects knock sensor performance, possibly causing improper spark control.

1. Install knock sensor and tighten to 20 N.m (15 ft. lbs.).

Fig. 22: KNOCK SENSOR WIRE ROUTE
 Courtesy of CHRYSLER LLC

2. Route the knock sensor wire in the proper location.
3. Install the intake manifold. Refer to **Engine/Manifolds/MANIFOLD, Intake - Installation**

Fig. 23: KNOCK SENSOR CONNECTOR
 Courtesy of CHRYSLER LLC

4. Connect electrical connector.
5. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

INSTALLATION

Fig. 24: 5.7L/6.1L KNOCK SENSOR
 Courtesy of CHRYSLER LLC

CAUTION: Over or under tightening the sensor mounting bolts will affect knock sensor performance, possibly causing improper spark control.

1. Install knock sensor (1) onto cylinder block.

NOTE: The foam strip used on bolt threads is used only to retain the bolts to sensors for plant assembly. It is not used as a sealant. Do not apply any adhesive, sealant or thread locking compound to these bolts.

2. Install mounting bolt and tighten (2) to 20 N.m (15 ft. lbs.).
3. Connect electrical connector (5) to sensor.

Fig. 25: KNOCK SENSOR HEAT SHIELD - 6.1L
Courtesy of CHRYSLER LLC

4. Install heat shield (1) to sensor.
5. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SPARK PLUG

DESCRIPTION

DESCRIPTION

The spark plugs are platinum resistor design. They have resistance values of 3,500 to 20,000 ohms when checked with at least a 1000 volt tester. For spark plug identification and specifications. See **Electrical - Ignition Control/Ignition Control - Specifications**.

Do not use an ohm meter to check the resistance of the spark plugs. This will give an

inaccurate reading.

When the spark plugs use a single or double platinum tips and they have a recommended service life of 100,000 miles for normal driving conditions per schedule A in this manual. The spark plugs have a recommended service life of 75,000 miles for severe driving conditions per schedule B in this manual. A thin platinum pad is welded to both or just the center electrode end(s). Extreme care must be used to prevent spark plug cross threading, incorrect gapping and ceramic insulator damage during plug removal and installation.

8008a54t

Fig. 26: Platinum Pads
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - APPLY ANTI-SEIZE COMPOUND HERE ONLY |
| 2 - PLATINUM SPARK SURFACE |

CAUTION: Cleaning of the platinum plug may damage the platinum tip.

803f5851

 Courtesy of CHRYSLER LLC

1 - TAPER GAUGE

REMOVAL

3.5L

81ad2d13

Fig. 28: IGNITION COILS
 Courtesy of CHRYSLER LLC

1. Remove engine cover.

2. Disconnect and isolate the negative battery cable.
3. Remove the intake manifold. Refer to **Engine/Manifolds/MANIFOLD, Intake - Removal** .
4. Unlock and disconnect electrical connector (2) from ignition coils.
5. Remove mounting bolts and engine cover studs (1).
6. Twist, lift and remove ignition coil from engine.

CAUTION: Prior to removing the spark plugs, use compressed air to remove any accumulated dirt and debris. If dirt and debris enter the engine, this may cause internal engine damage.

7. Remove spark plug using a quality socket with a rubber or foam insert.

REMOVAL

Fig. 29: IGNITION COIL MOUNTING BOLTS - 6.1L
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Disconnect coil electrical connectors (1).
3. Remove coil mounting bolts (3).

Fig. 30: IGNITION COIL REMOVAL - 6.1L
Courtesy of CHRYSLER LLC

4. Carefully pull up coil from cylinder head opening with a slight twisting action. Twisting will help break loose boots (1) from spark plugs.

CAUTION: Prior to removing the spark plugs, use compressed air to remove any accumulated dirt and debris. If dirt and debris enter the engine, this may cause internal engine damage.

5. Remove spark plugs.

INSTALLATION

3.5L

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head. Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

Fig. 31: IGNITION COILS
Courtesy of CHRYSLER LLC

1. To avoid cross threading, start the spark plug into the cylinder head by hand.
2. Tighten spark plugs to 27 N.m (20 ft. lbs.).
3. Install ignition coil.
4. Install engine cover studs (1) in the two outside ignition coils on the front of the engine. Install bolts on the other ignition coils.
5. Tighten studs and bolts to 8 N.m (71 in. lbs.).

Fig. 32: COIL AND FUEL INJECTOR CONNECTORS
Courtesy of CHRYSLER LLC

6. Connect electrical connector and lock (2).
7. Install intake manifold. Refer to **Engine/Manifolds/MANIFOLD, Intake - Installation** .

8. Reconnect the negative battery cable.
9. Install the engine cover.

INSTALLATION

Fig. 33: IGNITION COIL REMOVAL - 6.1L
Courtesy of CHRYSLER LLC

CAUTION: Handle the spark plugs with care. Do not drop or force the spark plugs into the wells, damage to the electrodes and/or porcelain body may occur. Always start each spark plug by hand in order to avoid cross-threading the spark plug in the cylinder head. Always tighten spark plugs to the specified torque. Too much or not enough torque will cause damage to the cylinder head and/or spark plug and may lead to poor engine performance.

1. To avoid cross threading, start the spark plug into the cylinder head by hand.
2. Tighten spark plugs to 17.5 N.m (13 ft. lbs.).
3. Apply dielectric grease to inside of spark plug boots (1) and install the coil assembly.
4. Position ignition coil into valve cover and push both spark plug boots onto each spark plug.

Fig. 34: IGNITION COIL MOUNTING BOLTS - 6.1L
Courtesy of CHRYSLER LLC

5. Install coil mounting bolts (3) and tighten to 12 N.m (106 in. lbs.).
6. Connect coil electrical connectors (1).
7. Connect negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

SWITCH, IGNITION

DESCRIPTION

DESCRIPTION

This vehicle is equipped with a Wireless Ignition Node (WIN). The WIN, along with the FOB with Integrated Key (FOBIK) are the primary components of the keyless ignition system. The only visible component of the WIN is the ignition switch located on the face of the instrument panel just to the inboard side of the steering column. The remainder of the WIN including its mounting provisions and electrical connections are concealed within the instrument panel.

In addition to replacing a conventional keyed ignition switch, the WIN is an integrated electronic receiver that serves as the base station in the vehicle. It communicates with other electronic modules in the vehicle over the Controller Area Network (CAN) data bus.

The WIN interfaces with the Remote Keyless Entry (RKE) FOBIK and the Tire Pressure Monitor (TPM) sensors (if equipped) using Radio Frequency (RF) communication, with the Sentry Key Immobilizer System (SKIS) transponder within the FOBIK using Low Frequency (LF) RF communication.

The WIN cannot be adjusted or repaired, but is flash update capable. If ineffective or damaged the entire WIN must be replaced. Refer to **Electrical - Electronic Control Modules/Electronic Control**

Modules/RECEIVER, Wireless Ignition Node - Removal .

ACCESSORIES AND EQUIPMENT

Lamps/Lighting - Exterior - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The exterior lighting system for this model includes the following exterior lamp units:

- **Center High Mounted Stop Lamp** - A Center High Mounted Stop Lamp (CHMSL) is centered on the rear shelf trim panel at the base of the backlite on sedans, and on the liftgate spoiler just above the liftgate glass opening at the rear of the vehicle on the wagon.
- **Front Fog Lamps** - Vehicles equipped with this option have a fog lamp unit mounted near each outboard end of the front bumper support, behind the lower portion of the front fascia.
- **Front Headlamp Units** - A front headlamp unit is mounted to the front of each front fender panel on either side of the grille opening.
- **License Plate Lamp** - A rear license plate lamp unit is mounted to the rear fascia, just above the license plate tub.
- **Tail Lamp Units** - A tail lamp unit is mounted to the rear of each quarter panel on either side of the liftgate opening.

These exterior lighting lamps and their controls are combined to provide the following exterior lighting features:

- **Automatic Headlamps** - Vehicles with the automatic (auto low) headlamps option are equipped with a unique headlamp switch that includes an **A** (Automatic) position and have an automatic headlamp sensor to sense ambient levels. The automatic headlamp sensor is integral to the sun load sensor located on the top of the instrument panel of vehicles without automatic wipers, or is integral to the Rain Sensor Module (RSM) located on the inside of the windshield below the inside rear view mirror mounting button of vehicles with automatic wipers. When the **A** position of the headlamp switch is selected, the headlamps are turned ON and OFF automatically as ambient light levels dictate.
- **Daytime Running Lamps** - Vehicles manufactured for sale in Canada illuminate the low beam filament of the headlamp bulb in each front lamp unit to serve as the Daytime Running Lamps (DRL). Fleet vehicles manufactured for sale in the United States illuminate the high beam filament of the headlamp bulb in each front lamp unit to serve as the DRL.

Other components of the exterior lighting system for this vehicle include:

- **Backup Lamp Switch** - A Transmission Range Sensor (TRS) integral to the solenoid pack on the valve body of the electronic automatic transmission performs the backup lamp switch function for this model.
- **Brake Lamp Switch** - A plunger-type brake lamp switch is located on the steering column support bracket under the instrument panel and is actuated by the brake pedal arm.

- **Totally Integrated Power Module** - The Totally Integrate Power Module (TIPM) is located in the engine compartment, near the battery and the Power Distribution Center (PDC). Refer to **Electrical - Wiring/Power Distribution - Description** .
- **Headlamp Switch** - A headlamp switch is located on the left side of the instrument panel, below and outboard of the steering column. The headlamp switch includes a rotary knob for the park lamps and headlamps On or Off, and a push button switch for selecting the front fog lamps on vehicles so equipped. The headlamp switch also features a vertical thumbwheel for selecting the panel lamps dimming level, a Parade mode to illuminate all Vacuum Fluorescent Display (VFD) units at full brightness for visibility when driving in daylight with the exterior lighting turned On, and for interior lighting control.
- **Instrument Cluster** - The Electronic Vehicle Information Center (EVIC) is also known as the Cab Control Node (CCN) in this vehicle. The EVIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Multi-Function Switch** - The multi-function switch is located on the steering column, just below the steering wheel. A control stalk that extends from the left side of the switch is used to select the turn signal lamps (right or left) and to select the headlamp beam (low, high or optical horn).

OPERATION

OPERATION

AUTOMATIC HEADLAMP SYSTEM

Automatic headlamps are controlled by the Cab Compartment Node (CCN). With the headlamp switch in the AUTO position, the CCN controls the headlamp, parking, side marker, tail and instrumentation lamps based on ambient light levels. Ambient light levels are monitored by the CCN using the ambient light signal present. Ambient light readings are averaged to limit cycling the lamps on and off when passing through areas with varying light levels. The automatic headlamps only function when the engine is running higher than 300 RPM. When the headlamp switch is in the AUTO position (Automatic mode), the headlamp time delay system functions when the ignition switch is placed in any position other than run/start.

DAYTIME RUNNING LAMPS

Power is reduced using Pulse-Width Modulation (PWM) to the high beams, where by power is switched on and off rapidly instead of remaining on continuously. The duration and interval of the power pulses is programmed into the Integrated Power Module (IPM).

HEADLAMP TIME DELAY SYSTEM

The headlamp time delay system is activated by turning the headlamps on (high or low beam) while the engine is running, turning the ignition switch off, and then turning the headlamp switch off. The Cab Compartment Node (CCN) will allow the headlamps to remain on for 90 seconds (configurable) before they automatically turn off. If the key is in the ignition during the headlamp time delay mode, both the headlamps and park lamps (including panel dimming) will be on. Refer to the Owner's Manual for more information.

If the headlamp switch is in the auto headlamp position, the headlamps are on due to the night signal from the ambient light sensor and the ignition switch is in any position other than run/start, the CCN enters a 90 second (configurable) auto headlamps time delay mode. If the key is in the ignition during the headlamp time delay mode, both the headlamps and park lamps (including panel dimming) will be on. If the key is not in the ignition, only the headlamps are on. The CCN allows the headlamps to remain ON for 90 seconds before they automatically turn off. Refer to the Owner's Manual for more information.

WARNING

WARNING

Eye protection should be used when servicing glass components. Personal injury or death could result.

This vehicle contains mercury added devices added by the manufacturer: High Intensity Discharge (HID) headlamps. Remove devices before vehicle disposal. Upon removal of devices, please reuse, recycle, or dispose of as hazardous waste.

Do not back probe any connectors or pierce any wiring to the HID headlamp system. High voltage (a/c voltage) is used in this system and component and personal injury or death could result.

Do not power up the headlamp assembly with the headlamp access cover off. A high voltage a/c (alternating current) shock may occur causing personal injury or death.

On vehicles equipped with airbags, disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury or death.

Do not touch the glass of halogen bulbs with fingers or other possibly oily surface, reduced bulb life will result. Do not use bulbs other than those indicated in the bulb application table. Damage to lamp and/or daytime running lamp module can result. Do not use fuses, circuit breakers or relays having greater amperage value than indicated on the fuse panel or in the owner's manual.

Do not use bulbs other than those listed in the bulb application table. Damage to lamp can result. Do not touch bulbs with fingers or other oily surfaces. Bulb life will be reduced.

STANDARD PROCEDURE

FRONT LAMP AIMING

VEHICLE PREPARATION FOR LAMP ALIGNMENT

1. Check for and replace any burnt out bulbs.
2. Repair or replace any faulty, worn or damaged body or suspension components that could hinder proper lamp alignment.
3. Verify proper tire inflation pressures.
4. Remove any accumulations of mud, snow or ice from the vehicle underbody and clean the front lamp lenses.
5. Verify there is no load in the vehicle (cargo or passengers), except for the driver.
6. The fuel tank should be full. Add 2.94 kilograms (6.5 pounds) of weight over the fuel tank for each estimated gallon of missing fuel.
7. Verify correct vehicle suspension height.

LAMP ALIGNMENT SCREEN PREPARATION

8128f0d5

Fig. 1: Lamp Alignment Screen Preparation
Courtesy of CHRYSLER LLC

The following procedure prepares a suitable front lamp alignment screen.

1. Tape a line on a level floor 7.62 meters (25 feet) away from and parallel to the flat wall that will

be used as the lamp alignment screen. The level floor will be used as the horizontal zero reference.

2. An adjacent wall or floor member that is perpendicular to the alignment screen can be used as the vertical zero reference. If there is no adjacent wall or floor member that is perpendicular to the screen, tape a second line on the floor perpendicular to both the alignment screen and the first line, and outboard of either side of where the vehicle will be positioned. This will be used as the vertical zero reference.
3. Position the vehicle so the side of the vehicle is parallel to the vertical zero reference, and the front of the lamp lenses are in the vertical plane of the parallel line taped on the floor 7.62 meters (25 feet) away from the screen.
4. Rock the vehicle side-to-side three times to allow the suspension to stabilize.
5. Jounce the front suspension three times by pushing downward on the front bumper and releasing.
6. Measure the distance between the optical center of one of the lamps being aimed (head or fog) and the floor (horizontal zero reference). Transfer this measurement to the alignment screen with a piece of tape placed horizontally to the floor. This line will be used as the lamp horizontal reference.
7. Measure the distance between the vertical zero reference and the optical center of the nearest lamp being aimed (head or fog). Transfer this measurement to the alignment screen with a piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the first lamp.
8. Measure the distance on center between the first and the second lamp being aimed. Transfer this measurement to the alignment screen with a second piece of tape placed vertically across the appropriate (head or fog) lamp horizontal reference. This is the centerline reference for the second lamp.

HEADLAMP ALIGNMENT

There are two different kinds of headlamp aiming procedures:

- Visual Aim Optical Left (VOL)
- Visual Aim Optical Right (VOR)

The VOL or VOR is embossed on the lower front of each headlamp unit.

VOL HEADLAMP AIMING

Fig. 2: VOL LAMP AIMING
Courtesy of CHRYSLER LLC

With the horizontal centerline of the headlamp (2) transferred on the wall, measure down 53 mm (2.1 in). This line (1) will be the vertical aiming mark. Using the left side of the headlamp vertical centerline (3), adjust the headlamp unit so the residual light from the headlamp, not the hot spot, is even with the line (1) that was marked previously 53 mm (2.1 in) below the horizontal centerline (2). The ideal alignment should be (5). The right headlamp aiming will be the same, but using the area left of right headlamp vertical centerline (not shown).

1. Turn the headlamps on and select the low beams.
2. Rotate the headlamp vertical adjustment screw (horizontal on export) on each lamp to adjust the beam height as required.

VOR HEADLAMP AIMING

Fig. 3: VOR LAMP AIMING
Courtesy of CHRYSLER LLC

With the horizontal centerline of the headlamp (1) transferred on the wall, this line (1) will be the vertical aiming mark. Using the right side of the headlamp vertical centerline (two for the left and four for the right), adjust the headlamp unit so the residual light from the headlamp is even with the horizontal centerline (1). The ideal alignment should be (5).

1. Turn the headlamps On and select the Low beams.
2. Rotate the headlamp vertical adjustment screw (and horizontal on export) on each lamp to adjust the beam height as required.

FOG LAMP ALIGNMENT

A properly aimed front fog lamp projects a pattern on the alignment screen 100 millimeters (4 inches) below the fog lamp centerline and straight ahead of the lamp.

Fig. 4: Identifying Fog Lamp Vertical Adjustment Screw
 Courtesy of CHRYSLER LLC

1. Turn the fog lamps on.
2. Rotate the fog lamp vertical adjustment screw (2) on each lamp to adjust the beam height as required.

BALLAST, HIGH INTENSITY DISCHARGE (HID)

DESCRIPTION

DESCRIPTION

Fig. 5: Identifying Electronic Ballast Module & Front Lamp Unit
Courtesy of CHRYSLER LLC

Vehicles equipped with the optional High Intensity Discharge (HID) headlamps have an electronic ballast module (1) mounted to the underside of each front lamp unit (2). The electronic circuitry of the module is contained within a die cast aluminum module housing, which is secured by four screws through four integral mounting lugs to the molded plastic front lamp unit housing.

The connector receptacles of the module are integral to the side of the housing that is sealed within front lamp unit housing when the module is installed. The connector receptacles contain terminal pins that connect the module to the vehicle electrical system and to the high tension HID cable through dedicated take outs and connectors of the front lamp unit wire harness.

The electronic ballast module cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced.

OPERATION

OPERATION

The electronic ballast module operates on battery current and ground received directly from the Totally Integrated Power Module (TIPM). Each module controls operation of the High Intensity Discharge (HID) igniter and lighting element for the front lamp unit on which it is installed. The TIPM monitors electronic message inputs received from the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cabin Compartment Node/CCN) over the Controller Area Network (CAN) data bus to determine the proper control outputs to the electronic ballast module, which then provides a controlled voltage to operate the HID lamp igniter as appropriate.

The EMIC monitors hard wired multiplexed inputs received from the headlamp switch and electronic message inputs from the Steering Control Module (SCM) over the Local Interface Network (LIN) data

bus based upon multi-function switch inputs to determine the proper lighting request message outputs to send to the TIPM.

When a proper 12 volt Direct Current (DC) control output is received from the TIPM, the HID electronic ballast module activates the HID igniter integral to the lighting element through a high-tension cable to provide a high voltage (up to about 800 volts Alternating Current/AC) surge. The igniter further steps up this AC voltage to up to about 25,000 volts, which creates a light arc between the lighting element electrodes. Once the igniter and electronic ballast module detect a suitably stable light arc, they switch over to a power-limiting mode to sustain the light arc, which requires only about 85 volts to sustain proper lighting element output.

The hard wired electronic ballast module circuits may be diagnosed using conventional diagnostic tools and procedures. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the electronic ballast module or the electronic controls and communication that provide some features of the HID lamp system. Proper diagnosis of the electronic ballast module, the TIPM, the EMIC, the SCM, the CAN data bus, the LIN data bus and the electronic communication related to electronic ballast module operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic service information.

REMOVAL

REMOVAL

Fig. 6: Identifying Ballast Module, Front Lamp Unit Housing & Screws
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front lamp unit from the vehicle. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Removal**.
3. Remove the four screws (3) that secure the ballast module (1) to the underside of the front lamp unit housing (2).

Fig. 7: Identifying High Tension Cable Connector, Wire Harness Connector & Ballast Module

Courtesy of CHRYSLER LLC

4. Pull the ballast module (1) away from the front lamp unit housing far enough to access and disconnect the front lamp unit wire harness connector (2) and the high tension cable connector (3) from the module connector receptacles.
5. Remove the ballast module from the front lamp unit.

INSTALLATION

INSTALLATION

Courtesy of CHRYSLER LLC

1. Connect the headlamp switch electrical connector.
2. Position headlamp switch in instrument panel and firmly snap into place.
3. Install the steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .

SWITCH, MULTIFUNCTION

DESCRIPTION

DESCRIPTION

Fig. 43: Multi-Function Switch
Courtesy of CHRYSLER LLC

The multi-function switch (2) is located on the steering column, just below the steering wheel, within the Steering Column Control Module (SCCM).

8135af22

Fig. 44: Control Stalk & Control Knob
Courtesy of CHRYSLER LLC

The only visible components of the multi-function switch are the control stalk and control knob that extend through the SCCM on the left side of the column. The remainder of the switch including its mounting provisions, its electrical connection, and the turn signal cancel actuator are concealed within the SCCM.

Each of the switch controls has white International Control and Display Symbol graphics applied to it, which clearly identify its many functions. Three integral locating posts on the switch housing, slide into channels in a receptacle in the circuit board within the SCCM. A single integral connector receptacle in the circuit board connects the switch to the vehicle electrical system through the instrument panel wire harness.

The multi-function switch provides the vehicle operator with a control interface for the following functions:

- **Front Washer Control** - The multi-function switch control knob provides a momentary position for front washer system operation.
- **Front Wiper Control** - The multi-function switch control knob provides two continuous front wipe switch positions, low speed or high speed; and, an intermittent front wipe mode with six delay interval positions.
- **Headlamp Beam Selection** - The multi-function switch control stalk provides detent switching for selection of the headlamp high or low beams. There is also an intermediate momentary position that allows the headlamp high beam circuits to be momentarily flashed to provide an optical horn feature (sometimes referred to as flash-to-pass) as an optical signalling device.
- **Turn Signal Control** - The multi-function switch control stalk provides momentary non-detent (lane change) switching and detent switching with automatic cancellation for both the left and right turn signal lamps.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is faulty, or if the switch is damaged, the entire switch must be replaced as a unit. Refer to **Steering/Column/MODULE, Steering Column Control - Disassembly** .

OPERATION

OPERATION

The multi-function switch operates as follows:

- **Front Washer Control** - The control knob on the end of the multi-function switch control stalk is depressed towards the steering column to momentarily activate the washer pump in the front washer mode. The washer pump will continue to operate in the front washer mode until the control knob is released. The multi-function switch provides an output by sending electronic front washer switch status messages to the Front Control Module (FCM) over the Controller Area Network (CAN) data bus. The FCM responds by energizing or de-energizing the washer pump in the front washer mode.
- **Front Wiper Control** - The control knob on the end of the multi-function switch control stalk is rotated to one of the continuous front wiper detents, to one of six intermittent (or auto wipe sensitivity positions if so equipped) wiper detents, or to the Off position to select the front wiper mode. The multi-function switch provides an output by sending electronic front wiper switch status messages to the FCM over the CAN data bus. The FCM responds by energizing or de-energizing the wiper on/off and high/low relays in the Power Distribution Center (PDC) for front wiper system control.
- **Headlamp Beam Selection** - The control stalk of the multi-function switch is pushed toward the instrument panel for a latching high beam selection. Pulling the stalk rearward toward the steering wheel for a latching low beam selection. Each time the control stalk is actuated to the momentary position with the headlamps turned off, the headlamp high beams will be illuminated for as long as the control stalk is held in this position. The multi-function switch provides an output to the FCM over the CAN data bus. The FCM energizes or de-energizes the selected low or high beam circuits.
- **Turn Signal Control** - The control stalk of the multi-function switch is moved upward to activate the right turn signal circuitry, and, downward to activate the left turn signal circuitry. The turn signal switch has a detent position in each direction that provides turn signals with automatic cancellation, and an intermediate, momentary position in each direction that provides turn signals only until the control stalk is released. When the control stalk is moved to a turn signal switch detent position, the cancel actuator extends toward the center of the steering column. A turn signal cancel cam that is integral to the clockspring rotates with the steering wheel and the cam lobes contact the cancel actuator when it is extended from the multi-function switch. When the steering wheel is rotated during a turning maneuver, one of the two turn signal cancel cam lobes will contact the turn signal cancel actuator. The cancel actuator latches against the cancel cam rotation in the direction opposite that which is signaled. If the left turn signal detent is selected, the lobes of the cancel cam will ratchet past the cancel actuator when the steering wheel is rotated to the left, but will unlatch the cancel actuator as the steering wheel rotates to the right and returns to center, which will cancel the turn signal event and release the control stalk from the detent so it returns to the neutral Off position. When a turn signal is activated, the multi-function switch provides an output to the FCM over the CAN data bus. In addition, the message is sent to the CCN via the CAN bus to activate the proper signal within the EMIC. The FCM energizes and flashes or de-energizes the selected left or right turn signal circuits.

The multi-function switch can be diagnosed using a diagnostic scan tool and the appropriate diagnostic information.

The multi-function switch cannot be adjusted or repaired. If any function of the switch is faulty, or if the switch is damaged, the entire switch must be replaced as a unit. Refer to **Steering/Column/MODULE, Steering Column Control - Disassembly** .

SWITCH, STOP LAMP

DESCRIPTION

DESCRIPTION

Fig. 45: STOP LAMP SWITCH AND PEDAL ROD
Courtesy of CHRYSLER LLC

The stop lamp switch (2) is located under the instrument panel at the brake pedal arm. This switch contains three internal switches controlling various functions of the vehicle, one of them controls operation of the vehicle's brake lamps. Other functions of the internal switches include speed control deactivation and brake sense for the ABS and the brake transmission shift interlock.

OPERATION

OPERATION

The stop lamp switch has three internal switches used for various functions. Among these are:

- Brake lamp actuation
- Speed control deactivation, and
- Brake sense for ABS and brake transmission shift interlock

When the brake pedal is in the released position, the plunger on the outside of the stop lamp switch is pushed inward by the brake pedal. In this position, the electrical contacts for one internal switch are

open while the electrical contacts for other two internal switches are closed.

When the brake pedal is pressed, the plunger on the outside of the stop lamp switch extends outward. This action closes the electrical contacts for the one internal switch and opens the contacts for the remaining two switches within the stop lamp switch. The internal switch which closes when the brake pedal is pressed completes the circuit to the brake lamps at the rear of the vehicle, thus allowing illumination of the brake lamps and the center-high-mounted stop lamp (CHMSL).

DIAGNOSIS AND TESTING

STOP LAMP SWITCH

NOTE: Before proceeding with this diagnostic test, verify the adjustment of the stop lamp switch to rule out misadjustment. See Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Adjustments

If the electrical circuit has been tested and the stop lamp switch is suspected of being faulty, it can be tested using the following method.

1. Remove the switch from the vehicle. See Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Removal

Fig. 46: SWITCH TEST - RELEASED
Courtesy of CHRYSLER LLC

2. With the switch in the released position (plunger extended), use an ohmmeter to test each of the three internal switches as shown in illustration. You should achieve the results as indicated in the figure.

Fig. 47: SWITCH TEST - DEPRESSED POSITION
Courtesy of CHRYSLER LLC

3. Gently push the plunger on the stop lamp switch in until it stops.
4. With the switch in the depressed position (plunger pushed in), use an ohmmeter to test each of the three internal switches as shown in illustration. You should achieve the results as indicated in the figure.

If you do not achieve the results as indicated in both figures, the switch is faulty and must be replaced.

5. Install the switch in the vehicle. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Installation**

REMOVAL

REMOVAL

Fig. 48: STOP LAMP SWITCH AND PEDAL ROD
Courtesy of CHRYSLER LLC

1. Depress and hold the brake pedal.
2. Remove the stop lamp switch (2) from it's bracket on the brake pedal assembly (6). To do so, rotate the stop lamp switch in a counterclockwise direction approximately 30 degrees from its proper mounting position. Pull the switch rearward and remove it from its mounting bracket.
3. Disconnect the wiring harness connector (1) from the switch.

INSTALLATION

INSTALLATION

NOTE: Prior to installing the stop lamp switch into its bracket, the plunger must be moved to its fully extended position using the procedure described in 1.

1. Hold the stop lamp switch firmly in one hand. Using your other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.

Fig. 49: STOP LAMP SWITCH AND PEDAL ROD
Courtesy of CHRYSLER LLC

2. Connect the wiring harness connector (1) to the stop lamp switch (2).
3. Mount the stop lamp switch into the bracket on the brake pedal assembly (6) as follows: Depress the brake pedal as far down as possible. Install the switch in its bracket by aligning the index key on switch with the notch in the square mounting hole of the mounting bracket. Once the switch is fully seated, rotate the switch clockwise approximately 30 degrees to lock the switch into the bracket.

CAUTION: Do not use excessive force when pulling back on the brake pedal to adjust the stop lamp switch. If too much force is used, damage to the stop lamp switch or striker can result.

4. Gently pull back on brake pedal until the pedal stops moving. This will cause the switch plunger to ratchet backward to the correct position.
5. Check for proper operation of the brake lamps and speed control.

ADJUSTMENTS

STOP LAMP SWITCH ADJUSTMENT

1. Depress and hold the brake pedal.
2. Remove the stop switch from its bracket. To do so, rotate the stop lamp switch in a counterclockwise direction approximately 30 degrees from its proper mounting position. Pull the switch rearward and remove it from its mounting bracket.
3. Hold the stop lamp switch firmly in one hand. Using your other hand, pull outward on the plunger of the switch until it has ratcheted out to its fully extended position.
4. Mount the stop lamp switch into the bracket as follows: Depress the brake pedal as far down as

possible. Install the switch in its bracket by aligning the index key on switch with the notch in the square mounting hole of the mounting bracket. Once the switch is fully seated, rotate the switch clockwise approximately 30 degrees to lock the switch into the bracket.

CAUTION: Do not use excessive force when pulling back on the brake pedal to adjust the stop lamp switch. If too much force is used, damage to the stop lamp switch or striker can result.

5. Gently pull back on brake pedal until the pedal stops moving. This will cause the switch plunger to ratchet backward to the correct position.
6. Check for proper operation of the brake lamps and speed control.

UNIT, FRONT LAMP

REMOVAL

LAMP

Fig. 50: Identifying Front Fascia Components
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the front fascia (9) from the vehicle. Refer to Frame and Bumpers/Bumpers/FASCIA, Front - Removal.

Fig. 51: Headlamp Assembly
Courtesy of CHRYSLER LLC

3. Remove the three screws (2) that secure the front lamp unit (3) to the radiator closure panel.
4. Grasp the front lamp unit firmly and pull it forward far enough to unsnap the ball stud on the upper outboard corner of the lamp housing from the grommet in the radiator closure panel.
5. Pull the lamp away from the vehicle far enough to access and disconnect the wire harness connectors (1) from the connector receptacles on the back of the lamp housing.
6. Remove the front lamp unit from the from the vehicle.

LIGHTING ELEMENT - HIGH INTENSITY DISCHARGE

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of death caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.

Fig. 52: Identifying Igniter Opening & Tab
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the HID front lamp unit from the vehicle. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Removal**.
3. Place the front lamp unit on a suitable work surface. Be certain to use the appropriate precautions to protect the lamp lens from cosmetic damage.
4. Grasp the tab (3) at the bottom of the rubber boot seal and pull it off of the lighting element and igniter opening (1) on the back of the lamp housing.

Fig. 53: Identifying Spring Steel Igniter Retainer, Igniter Receptacle, High Tension Cable Connector & Tabs
Courtesy of CHRYSLER LLC

5. Disconnect the high tension cable connector (3) from the connector receptacle integral to the igniter.

WARNING: Use care not to cut your fingers on the sharp edges of the spring steel igniter retainer.

6. Grasp the tabs (4) of the spring steel igniter retainer (1), one at a time, and pull them toward the side and away from the igniter connector far enough to disengage the retainer from the latch feature on each side of the igniter receptacle (2).
7. With the latch feature on each side of the igniter retainer disengaged, remove the retainer from the igniter receptacle.

Fig. 54: Identifying Lighting Element, Coiled Metal Grounding Ring & Igniter
Courtesy of CHRYSLER LLC

CAUTION: Use care not to lose and be certain to retrieve the coiled metal grounding ring (2) that must be positioned around the insulator at the base of the lighting element during reinstallation.

8. Pull the igniter (3) and lighting element (1) unit straight out of the igniter receptacle.

Fig. 55: Identifying Grounding Ring & Igniter Receptacle
 Courtesy of CHRYSLER LLC

9. After removing the igniter and lighting element from the igniter receptacle, carefully inspect them to be certain the coiled metal grounding ring is still engaged on the insulator at the base of the lighting element. If it is not engaged on the lighting element, retrieve the grounding ring (1) from the igniter receptacle (2).

INSTALLATION

LAMP

Fig. 56: Headlamp Assembly
 Courtesy of CHRYSLER LLC

1. Position the front lamp unit (3) to the front of the vehicle.
2. Reconnect the wire harness connectors (1) to the connector receptacles on the back of the lamp housing.
3. Align the ball stud on the back of the upper outboard corner of the lamp housing with the grommet in the radiator closure panel.
4. Using hand pressure, push firmly and evenly on the upper outboard corner of the lamp until the ball stud snaps into the grommet.
5. Install and tighten the three screws (2) that secure the front lamp unit to the radiator closure panel. Tighten the screws securely.

164373

Fig. 57: Identifying Front Fascia Components
 Courtesy of CHRYSLER LLC

6. Reinstall the front fascia onto the vehicle. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation**.
7. Reconnect the battery negative cable.
8. Confirm proper headlamp alignment. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior - Standard Procedure**.

LIGHTING ELEMENT - HIGH INTENSITY DISCHARGE

WARNING: To avoid serious or fatal injury when working on the High Intensity Discharge (HID) headlamp system, be certain to take the proper

precautions. The headlamp switch must be in the OFF position. Disconnect and isolate the battery negative cable. There is a risk of death caused by contact with high voltage used in the HID headlamps. There is a risk of explosion or fire caused by highly flammable materials in the vicinity of damaged HID lighting elements. There is a risk of injury caused by exposure to Ultra Violet (UV) light, a risk of burns caused by high component operating temperatures, a risk of mercury poisoning through glass splinters produced by bursting HID lighting elements. There is also a risk of poisoning caused by inhalation of mercury vapors and by toxic salts and mercury compounds being ingested or coming into contact with the skin. Do not come into contact with parts that are under high voltage. Persons with active electronic implants (e.g. heart pacemakers) must never work on HID headlamps. Wear insulated safety shoes, safety glasses and protective gloves. Remove flammable materials and ensure sufficient ventilation in the working area.

CAUTION: Do not contaminate the lighting element glass by touching it with your fingers or by allowing it to contact other oily surfaces. Shortened lighting element life will result.

Fig. 58: Identifying Grounding Ring & Igniter Receptacle
Courtesy of CHRYSLER LLC

1. If the coiled metal grounding ring is not engaged on the insulator at the base of the lighting element, retrieve the grounding ring (1) from the igniter receptacle (2). Also be certain the high tension cable connector (3) is accessible and, if necessary, retrieve it from within the front lamp unit housing.

Fig. 59: Identifying Lighting Element, Coiled Metal Grounding Ring & Igniter
 Courtesy of CHRYSLER LLC

2. Inspect the lighting element (1) and igniter (3) unit to be certain the coiled metal grounding ring (2) is in position around the insulator at the base of the lighting element.

Fig. 60: Identifying Spring Steel Igniter Retainer, Igniter Receptacle, High Tension Cable Connector & Tabs
 Courtesy of CHRYSLER LLC

3. Using care not to dislodge the grounding ring, align and insert the lighting element and igniter into the opening of the igniter receptacle (2) until the igniter is fully seated. Continue to hold the igniter firmly engaged in the receptacle until the spring steel igniter retainer (1) has been reinstalled.

WARNING: Use care not to cut your fingers on the sharp edges of the spring

steel igniter retainer.

4. Position the spring steel igniter retainer over the igniter receptacle, then push down firmly and evenly on both sides of the retainer until it snaps into place over the latch feature on each side of the igniter receptacle.
5. Reconnect the high tension cable connector (3) to the connector receptacle integral to the igniter.

Fig. 61: Identifying Igniter Opening & Tab
Courtesy of CHRYSLER LLC

6. Align and reinstall the rubber boot seal over the lighting element and igniter opening (1) on the back of the lamp housing. Be certain the pull tab (3) is oriented toward the bottom of the lamp housing and the **TOP** text (2) is oriented toward the top.
7. Reinstall the HID front lamp unit into the vehicle. See **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Installation**.
8. Reconnect the battery negative cable.

1. Insert new bulb into bulb socket.
2. Install socket into shifter assembly.
3. Snap shifter assembly back into the center console.
4. Install shifter console trim panel and shift console trim ring. Refer to **Body/Interior/CONSOLE, Floor - Installation**
5. Connect battery negative cable.

REMINDER INDICATOR RESET PROCEDURES

Chrysler / Dodge / Plymouth / RAM

ASSYST MAINTENANCE COMPUTER

NOTE: To determine the appropriate reset procedure, refer to ASSYST MAINTENANCE COMPUTER RESET INDEX. Only vehicles listed in this index have an ASSYST Maintenance Computer reset.

ASSYST MAINTENANCE COMPUTER RESET INDEX

Model & Year	Reset Procedure
Sprinter	
2003-09	<u>Assyst Maintenance Computer Reset - Procedure 1</u>

ASSYST MAINTENANCE COMPUTER RESET - PROCEDURE 1

When a service as been performed, the ASSYST maintenance computer can be reset as follow:

1. Turn the key to position 2 in the ignition lock and immediately press the "mi" ("km") button twice and hold. Keep the "mi" ("km") button pressed.
2. Within 10 seconds, return the key to position 0 in the ignition lock.
3. Continue to press and hold the "mi" ("km") button. Turn the key to position 2 in the ignition lock. Keep the "mi" ("km") button pressed.
4. The maintenance indicator with the current remaining time/distance is shown.
5. After about 10 seconds, an acoustic signal will sound and the maintenance indicator is displayed with the new remaining time/distance.
6. Release the "mi" ("km") button.

EGR/MAINTENANCE REQUIRED WARNING LIGHT

NOTE: To determine the appropriate reset procedure, refer to EGR/MAINTENANCE REQUIRED WARNING LIGHT RESET INDEX. Only vehicles listed in this index have an EGR/Maintenance Required Warning Light reset.

EGR/MAINTENANCE REQUIRED WARNING LIGHT RESET INDEX

Model & Year	Reset Procedure
Colt & Colt Vista	
1978-94	<u>EGR/Maintenance Required Warning Light Reset - Procedure 1</u>
Ram-50	
1985-93	<u>EGR/Maintenance Required Warning Light Reset - Procedure 1</u>

EGR/MAINTENANCE REQUIRED WARNING LIGHT RESET - PROCEDURE 1

1. On some models, an EGR or MAINTENANCE REQUIRED warning light in dash will come on as a reminder to have EGR system serviced (each 50,000 miles), oxygen sensor replaced (each 80,000 miles), or evaporative carbon canister replaced (100,000 miles).
2. After servicing or replacing components, reset mileage counter. Reset switch is located on back of instrument cluster. See **Fig. 1**, **Fig. 2** and **Fig. 3** . Slide switch to opposite side to reset indicator light.
3. Remove light bulb after 120,000 mile service on Ram-50.

EMR MILEAGE RESET

NOTE: To determine the appropriate reset procedure, refer to EMR MILEAGE RESET INDEX. Only vehicles listed in this index have a EMR mileage reset.

EMR MILEAGE RESET INDEX

Model & Year	Reset Procedure
Light Duty Trucks & Vans	
1989-92	<u>EMR Mileage Reset - Procedure 1</u>

EMR MILEAGE RESET - PROCEDURE 1

1. Using DRB-II tester, select EMR MEMORY CHECK. DRB-II display will read, EMR MEMORY CHECK ARE YOU SURE? Press YES key.
2. Display will read, WRITE TEST. Display will read, IS INSTRUMENT PANEL MILEAGE BETWEEN XXXXXX AND XXXXXX? If odometer mileage on vehicle is within specification, press YES key. DRB-II will display EMR MEMORY CHECK TEST COMPLETE.

NOTE: DRB-II may display **EMR MEMORY WRITE FAILURE** or **EMR MEMORY CHECK WRITE REFUSED** if there is a problem with SMEC/SBEC.

3. If odometer mileage on vehicle is not within specification shown on DRB-II, press NO key. DRB-II will read DO YOU WANT TO CORRECT EMR MILEAGE? Press YES key on DRB-II. DRB-II will display ENTER MILEAGE SHOWN ON INSTRUMENT PANEL.
4. Enter mileage shown on instrument panel. DO NOT enter tenths. Press ENTER key on DRB-II. DRB-II will ask for verification of entry. If mileage entry was correct, DRB-II will display SETTING ENGINE DATA and EMR MEMORY CHECK TEST COMPLETE. Vehicle must be driven for at least 8 miles for mileage reset to be accepted.

MAINT REQD OR CHECK EGR INDICATOR LIGHT

CAUTION: There is no test procedure for this system. Any attempt to test this system will damage system components.

NOTE: To determine the appropriate reset procedure, refer to **MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET INDEX**. Only vehicles listed in this index have a MAINT REQD OR CHECK EGR INDICATOR LIGHT reset.

MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET INDEX

Model & Year	Reset Procedure

1989-92	<u>Maint REQD Or Check EGR Indicator Light Reset - Procedure 2</u>

MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET - PROCEDURE 1

The Service Reminder Indicator (SRI) module is not an emissions warning system. It is only a reminder to perform emissions servicing. Components to be serviced include the EGR system, PCV valve, oxygen sensor, delay valves, and bi-level purge valve.

The SRI module will illuminate the MAINT REQD or CHECK EGR light after a predetermined time. The light will remain on until the SRI module is reset by inserting a small screwdriver into the hole in the module (RWD only) and/or depressing the reset switch (FWD and RWD). Replace 9-volt battery (if equipped).

The SRI module is located on steering column, behind instrument panel on RWD vans and in instrument cluster, under fuel gauge, on FWD vans. See **Fig. 4** or **Fig. 5**. On light trucks except Dakota, SRI module is located behind the far right side of dash panel next to glove box. See **Fig. 6**. On Dakota models, module is located on bracket below headlight switch, on rear of instrument panel. See **Fig. 7**.

Fig. 4: Locating SRI Module (1987-88 FWD Vans)

MAINT REQD OR CHECK EGR INDICATOR LIGHT RESET - PROCEDURE 2

NOTE: If any other scan tool is used, use scan tool manufacturer's instructions.

Attach DRB-II tester to diagnostic connector. Turn ignition on but do not start engine. Access SELECT SYSTEMS function of DRB-II tester. Select appropriate engine. Select with or without A/C. Select FUEL & IGNITION. Select ADJUSTMENTS. Select RESET EMR LIGHT. Reset EMR light. When DRB-II is finished resetting light, DRB-II display will read EMR LIGHT IS RESET.

NOTE: If Single Module Engine Controller (SMEC) or Single Board Engine Controller (SBEC) is replaced, vehicle mileage must be programmed back into the SMEC/SBEC. DRB-II tester **MUST** be used for this procedure. If the following procedure is not performed, EMR light will not turn on at the proper mileage

intervals.

MAINT REQD OR SERVICE REMINDER INDICATOR (SRI) LIGHT

The components to be serviced include the EGR system, PCV valve, oxygen sensor and some vacuum-operated components. SRI will illuminate after a predetermined mileage. To reset SRI, a Chrysler Diagnostic Readout Box (DRB) Tester or suitable scan tool is required.

NOTE: To determine the appropriate reset procedure, refer to MAINT REQD OR SRI LIGHT RESET INDEX. Only vehicles listed in this index have a MAINT REQD OR SRI LIGHT reset.

MAINT REQD OR SRI LIGHT RESET INDEX

Model & Year	Reset Procedure
Light Duty Trucks & Vans	
1993	<u>Maint REQD Or SRI Light Reset - Procedure 1</u>
Ram Pickup 2500/3500	
1994-02	<u>Maint REQD Or SRI Light Reset - Procedure 2</u>

MAINT REQD OR SRI LIGHT RESET - PROCEDURE 1

1. Attach DRB tester to diagnostic connector. Turn ignition on, but do not start engine. Using DRB, perform Service Reminder Indicator (SRI) memory test. If DRB displays WRITE FAILURE, replace Powertrain Control Module (PCM).
2. If DRB displays WRITE REFUSED, go to step 4. If DRB displays SRI MILEAGE INVALID, update mileage and retest SRI memory. If DRB does not display SRI MILEAGE INVALID, compare SRI mileage stored with instrument panel odometer.
3. If mileage is same, retest SRI memory. If mileage is not same, update mileage and retest SRI memory.
4. PCM was busy. Using DRB, perform SRI memory test. Retest SRI memory 2 or more times, if necessary. If WRITE REFUSED trouble code returns, replace PCM. If WRITE REFUSED does not return, procedure is complete.

MAINT REQD OR SRI LIGHT RESET - PROCEDURE 2

The components to be serviced include the EGR system, PCV valve, and oxygen sensor. The SRI or Maintenance Required will illuminate after a predetermined mileage. To reset the light, a Chrysler Diagnostic Readout Box (DRB) Tester or suitable scan tool is required. Follow scan tool manufacturer's information to reset SRI.

OIL CHANGE REQUIRED MESSAGE

2008-15	<u>Oil Change Required Message Reset - Procedure 1</u>

OIL CHANGE REQUIRED MESSAGE RESET - PROCEDURE 1

NOTE: The message can be temporarily turned off by pressing and releasing the Trip Odometer button in instrument cluster.

To reset oil change indicator after performing scheduled maintenance:

1. Turn ignition on, with engine off.

NOTE: On vehicles with keyless START, without pressing the brake pedal, push the **ENGINE START/STOP** button and cycle the ignition to the **ON/RUN** position (Do not start the engine).

2. Fully depress accelerator pedal slowly 3 times within 10 seconds.
3. Turn ignition off.

NOTE: On vehicles with keyless START, without pressing the brake pedal, push the **ENGINE START/STOP** button once to return the ignition to the **OFF/LOCK** position.

4. Start engine. If indicator message illuminates when engine is started, repeat reset procedure.

PERFORM SERVICE MESSAGE

NOTE: To determine the appropriate reset procedure, refer to **PERFORM SERVICE MESSAGE RESET INDEX**. Only vehicles listed in this index have a perform service message reset.

PERFORM SERVICE MESSAGE RESET INDEX

Model & Year	Reset Procedure
300M	
2001-04	<u>Perform Service Message Reset - Procedure 1</u>

Dodge Pickup 1500	
2002	<u>Perform Service Message Reset - Procedure 3</u>
Town & Country	
2003-07	<u>Perform Service Message Reset - Procedure 4</u>

PERFORM SERVICE MESSAGE RESET - PROCEDURE 1

The PERFORM SERVICE message is a warning message delivered from the Electronic Vehicle Information Center (EVIC). This indicates that regular maintenance is due. After regular required maintenance is performed, the counter is reset by pressing and holding the reset button for 3 seconds.

PERFORM SERVICE MESSAGE RESET - PROCEDURE 2

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.
2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last previous message.
4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

PERFORM SERVICE MESSAGE RESET - PROCEDURE 3

The Vehicle Information Center (VIC) displays a PERFORM SERVICE message. PERFORM SERVICE message is displayed when "miles/kms" to service is zero, indicating that regular service and maintenance is due. After performing necessary services, reset service distance by pressing the STEP button when in this display will select "Yes" or "No".

PERFORM SERVICE MESSAGE RESET - PROCEDURE 4

1. The Electronic Vehicle Information Center (EVIC) displays a PERFORM SERVICE message when distance to service interval has been reached, indicating that regular service and

maintenance is due. After performing necessary services, reset service distance by selecting a distance to service interval.

2. To program EVIC, turn ignition switch to ON position. Depress and release MENU push button until SERVICE INTV. = is displayed. Press and release STEP button to step through available options. The last selected distance option displayed becomes the service interval at which the PERFORM SERVICE message will be displayed.
3. If a new distance interval is selected, RESET SERVICE DISTANCE? with a yes or no option. When YES is selected, the accumulated distance since the last previous PERFORM SERVICE message will be reset to zero because the service interval has been changed. When NO is selected, the distance until the next PERFORM SERVICE message is reduced by the accumulated distance since the last previous message.
4. EVIC exits programming mode and returns to its normal operation mode when the C/T button is depressed or when the end of the programmable feature menu list is reached, whichever occurs first.

SERVICE REMINDER INDICATOR LIGHT

NOTE: To determine the appropriate reset procedure, refer to **SERVICE REMINDER INDICATOR LIGHT RESET INDEX**. Only vehicles listed in this index have a service reminder indicator light reset.

SERVICE REMINDER INDICATOR LIGHT RESET INDEX

Model & Year	Reset Procedure
Models With Electronic Type Counter	
1980	<u>Service Reminder Indicator Light Reset - Procedure 1</u>
Monaco	
1990-92	<u>Service Reminder Indicator Light Reset - Procedure 2</u>

SERVICE REMINDER INDICATOR LIGHT RESET - PROCEDURE 1

A mileage counter activates the service reminder indicator between 12,000 and 30,000 mile intervals, depending on whether mechanical or electronic type is used. On 1987 Dakota models, mileage counter in the odometer will illuminate reminder light at 52,500, 82,500 and 105,000 miles.

The electronic type uses a 9-volt battery which supplies power to the electronic counter, preventing memory loss when vehicle battery is disconnected.

NOTE: **Vehicle battery must be connected during resetting procedure to prevent power loss to memory.**

To reset electronic type, locate Green, Red, White or Tan plastic case behind instrument panel in lower left cluster area. Slide case from bracket and open cover. Remove 9-volt battery, and insert a small rod or screwdriver into hole in switch, closing contacts. Replace battery with a new 9-volt alkaline type. Close case. Slide case back into bracket. See **Fig. 8**.

NOTE: Some models use a non-resettable mileage counter. Replace it with a resettable type.

95E14674

Fig. 8: Chrysler Electronic Type Reset Switch
Courtesy of CHRYSLER CORP.

SERVICE REMINDER INDICATOR LIGHT RESET - PROCEDURE 2

Every 7500 miles, a Vehicle Maintenance Monitor (VMM) will illuminate a SERVICE interval reminder indicator light. This indicates regular maintenance is due. After required service is performed, press RESET button on dash below VMM display. Hold button until a beep is heard. VMM display will now be clear.

SERVICE REMINDER MESSAGE

NOTE: To determine the appropriate reset procedure, refer to **SERVICE REMINDER MESSAGE RESET INDEX**. Only vehicles listed in this index have a Service Reminder Message reset.

SERVICE REMINDER MESSAGE RESET INDEX

New Yorker	
1988-89	<u>Service Reminder Message Reset - Procedure 1</u>
1990	<u>Service Reminder Message Reset - Procedure 2</u>

SERVICE REMINDER MESSAGE RESET - PROCEDURE 1

Every 7500 miles or 12 months which ever comes first, a service reminder message on Electronic Vehicle Information Center (EVIC) display will illuminate, indicating an oil change is due. The EVIC is an optional accessory located in the overhead console.

Pressing INFO button with the ignition on will activate a MONITORED SYSTEMS OK message on the display if all systems are operating properly. If service is required, SERVICE REMINDER message will be displayed. Pressing the RESET button after message has been displayed will clear the message.

SERVICE REMINDER MESSAGE RESET - PROCEDURE 2

Every 7500 miles or 12 months which ever comes first, a service reminder message on Electronic Vehicle Information Center (EVIC) display will illuminate, indicating an oil change is due. The EVIC is an optional accessory located in the overhead console.

Pressing INFO button with the ignition on will activate a MONITORED SYSTEMS OK message on the display if all systems are operating properly. If service is required, SERVICE REMINDER message will be displayed. To clear message, press INFO button and within 5 seconds, press SET button.

(1) Some early Dodge/RAM Pickup 3500 and Cab & Chassis models may not be equipped with TPMS.	

TPMS RESET - PROCEDURE 1

NOTE: In a low tire pressure situation, the TPMS indicator light (and message) will turn OFF only after the tires are inflated to the vehicles recommended cold placard pressure value. The vehicle may need to be driven for up to 20 minutes above 20 mph (32 km/h) in order for the TPMS to determine that the inflation pressures are correct.

Once a sensor has been replaced and vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

NOTE: The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location (Left Front, Left Rear, Right Front, and Right Rear). Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

TPMS RESET - PROCEDURE 2

TPMS Indicator Reset

Once a sensor has been replaced and vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 20 mph (32 km/h). During this time, the system will learn the new sensor ID code and will clear any DTCs automatically. If a sensor cannot be trained, see appropriate manufacturer service information.

Tire Sensors Programming

WARNING: In the following procedure, Relearn Magnet (8821) is used. Death or serious injury can occur if magnetically sensitive devices are exposed to the retraining magnet used in the TPM system. Magnets can affect pacemakers.

NOTE: If a tire is changed (tire rotation), one or more tire pressure sensors fail, or if TPM module is replaced, the TPM system needs to relearn tire pressure sensor IDs. To perform this procedure, a Chrysler DRB-III® scan tool and a Relearn Magnet (8821) must be used.

NOTE: **The vehicle's tires must not have been rotated above 5 mph (8 km/h) in the last 2 minutes prior to programming.**

1. Connect Chrysler DRB-III® scan tool to vehicle's Data Link Connector (DLC), which is located beneath instrument panel, near steering column.
2. Using scan tool, access "CHASSIS SYSTEM".
3. Once in "CHASSIS SYSTEM", select "MISCELLANEOUS FUNCTIONS".
4. Select "TRAIN ALL MODE" from the menu selections. Select "YES" to continue.
5. Place Relearn Magnet (8821) over the valve stem for the left front wheel.
6. Each sensor/transmitter will automatically sense the presence of the magnet and begin transmitting. When the tire pressure sensor on each wheel has been programmed, the DRB-III® will automatically beep and direct you to the next wheel to be programmed. Move the magnet to each of the remaining wheels as directed by scan tool.
7. Remove magnet from last tire to be programmed (left rear wheel).
8. Once "TRAINING COMPLETED" is displayed, exit the program function screen and use the following to verify TPM functionality:
 - Verify TPM module programming is complete by viewing the "INPUT/OUTPUT DISPLAY" selection of the DRB-III® and confirming the tire pressure sensors are trained.
 - Verify TPM module programming is complete by viewing the "SENSOR DISPLAY" selection of the DRB-III® and confirming the tire pressure sensor pressure readings are accurate.

TPMS RESET - PROCEDURE 3

NOTE: **If a tire is changed (tire rotation), one or more tire pressure sensors fail, or if TPM module is replaced, the TPM system needs to relearn tire pressure sensor IDs. The procedure is similar to Tire Sensors Programming in TPMS RESET - PROCEDURE 2.**

When tire pressure is low, the "Low Tire" Pressure Indicator Lamp signal circuit will be pulsed to ground by the TPM module for two seconds on and then two seconds off, over and over. The BCM will then illuminate the "Low Tire" Pressure Indicator Lamp at the same rate and sound the audible chime as one single long tone.

When tire pressure is critical, the low tire pressure warning lamp signal circuit will be pulsed to ground by the low tire pressure warning module for one second on and then one second off, over and over. The BCM will then illuminate the "Low Tire" Pressure Indicator Lamp and sound the audible chime at the rate of one second on and one second off.

In either case, the TPM module will continue to pulse to ground the "Low Tire" Pressure Indicator Lamp signal circuit until the sensor/transmitter(s) transmits a pressure above the calibrated thresholds (and car is then driven above 20 mph (32 km/h)) or the ignition is turned off. If the conditions has not been corrected when the ignition is turned off, the indicator lamp will remain off when the ignition is turned on again until the vehicle reaches a speed of approximately 20 mph (32

km/h).

NOTE: In the event a diagnostic trouble code (DTC) is set, the "Low Tire" Pressure Indicator Lamp will illuminate continuously until the ignition is turned off. A low tire pressure condition cannot set a diagnostic trouble code (DTC).

TPMS RESET - PROCEDURE 4

The TPMS will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

NOTE: If a tire pressure sensor has been replaced, the TPM system needs to relearn tire pressure sensor IDs.

Wireless Control Module (WCM): The WCM automatically learns and stores new sensor IDs while driving "within 10-20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

A new sensor ID can also be programmed directly into the WCM by using an RKE-TPM Analyzer in conjunction with a Scan Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (Left Front, Left Rear, Right Front, and Right Rear) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool"

For further information, refer to the Owners Manual or the Appropriate Diagnostic Information.

TPMS RESET - PROCEDURE 5

There are two tire pressure monitoring systems available, a base system and a premium system. The base system does not specify how many tires are low or where they are located. The premium system does indicate which tire is low. Sensor types are the Tire Pressure Monitoring (TPM) module for the 2500/3500 series, or the Wireless Ignition Node (WIN) for the 1500 series.

Base Tire Pressure Monitoring System:

The TPMS will not turn off the indicator lamp until the tire pressure is at or above specified tire pressure. The system will automatically update and the TPM indicator lamp will extinguish once the updated tire pressures have been received.

Premium Tire Pressure Monitoring System:

If the TPMS detects that the tire pressure in any road tire is going low, a chime will sound and the indicator lamp will turn on. In addition to the chime and lamp, a graphic display of the pressure value (s) and position of the low tire(s) will flash in the Electronic Vehicle Information Center (EVIC). Once pressure in the suspect tire(s) raises above the specified tire pressure, and the TPM module receives

a valid transmission from the sensor the lamp will go out. If a system fault is detected due to a missing sensor signal, in addition to a chime and a indicator lamp flashing, a "Check TPM System" text message will be displayed in the instrument cluster, and the tire pressure graphic display will display "- -" in place of the pressure value. After the flash sequence the TPM indicator lamp will remain illuminated. The system will return to normal once the TPM module receives a valid transmission from that sensor location. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

Base and Premium Systems:

NOTE: If a tire pressure sensor has been replaced, the TPM system needs to relearn tire pressure sensor IDs.

The WIN or TPM automatically learns and stores the sensor IDs while driving "within 10-20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate after the vehicle has been stopped for more than 20 minutes.

A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).

NOTE: The matching full size spare wheel and tire assembly (if equipped) has a TPM sensor. The spare can be used in place of any of the four road tires. The TPMS will only monitor the pressure in the full size spare when it is used in place of a road tire. Otherwise, a spare with pressure below the low-pressure limit will not cause the TPMS indicator light to illuminate or the chime to sound.

TPMS RESET - PROCEDURE 6

NOTE: If tires have been rotated or a tire pressure sensor has been replaced, the tire pressure sensors must be retrained. Refer to the following procedure to program the module for identification of one new or all tire pressure sensor/transmitters.

NOTE: The vehicle's tires must not have been rotated above 5 mph (8 km/h) in the last two minutes prior to programming.

1. Connect a DRBIII® scan tool to the vehicle's diagnostic connector beneath the instrument panel, to the right of the steering column.
2. Access the Chassis System using the DRBIII.
3. Once in the Chassis System, select Tire Pressure Monitor, followed by Miscellaneous.
4. Select the appropriate function from the next screen displaying the following options:
 - Program LF Pressure Sensor
 - Program RF Pressure Sensor

- Program RR Pressure Sensor
 - Program LR Pressure Sensor
 - Program Module (4 Sensors)
 - Monitor
5. Place a magnet (or special tool 8821), at the valve stem for that wheel as directed by the DRBIII. If the Program Module function has been chosen, the DRBIII will direct you to the left front wheel pressure sensor/transmitter first.

NOTE: **When programming the module (all four sensor/transmitters), the magnet should be moved from wheel to wheel in a clockwise direction starting at the left front wheel.**

6. When that wheel's pressure sensor/transmitter has been programmed, the DRBIII will display Program Transmitter Complete or will automatically direct you to the next wheel sensor/transmitter to be programmed.
7. Remove the magnet and if programming the entire module, move the magnet to each of the remaining wheels as directed by the DRBIII. Each sensor/transmitter will automatically sense the presence of the magnet and begin programming.
8. Once Program Transmitter Complete is displayed, exit the program function screen.
9. Verify that the module programming is complete by looking at the tire pressure sensor/transmitter ID's in the Sensor Display using the DRBIII.

MANUAL TRANSMISSION

TR6060 - Service Information - Challenger

DIAGNOSIS AND TESTING

MANUAL TRANSMISSION - TR6060

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill, or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the gear case or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at the rear of the housing will be from the oil seals. Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening, or use of a non-recommended sealer.

A leak at the front of the transmission will be from either the front bearing retainer or retainer seal. Lubricant may be seen dripping from the clutch housing after extended operation. If the leak is severe, it may also contaminate the clutch disc causing the disc to slip, grab, and/or chatter.

A correct lubricant level check can only be made when the vehicle is level. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an underfill or overfill condition. Always check the lubricant level after any addition of fluid to avoid an incorrect lubricant level condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants. The consequence of using non-recommended lubricants is noise, excessive wear, internal bind, and hard shifting. Substantial lubricant leaks can result in gear, shift rail, synchro, and bearing damage. If a leak goes undetected for an extended period, the first indications of component damage are usually hard shifting and noise.

Shift component damage, incorrect clutch adjustment or a damaged clutch pressure plate or disc are additional probable causes of increased shift effort. If clutch problem is advanced, gear clash during shifts can result. Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing hard or noisy shifts. In most cases, this condition will decline as the rings wear-in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears generate a mild whine that is audible, but generally only at extreme speeds.

Severe, highly audible transmission noise is generally the initial indicator of a lubricant problem. Insufficient, improper or contaminated lubricant will promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear and bearing damage.

STANDARD PROCEDURE

DRAIN AND FILL

Fig. 1: FILL PLUG
Courtesy of CHRYSLER LLC

CAUTION: Hypoid gear lube must not be used in this transmission. Use of hypoid gear lube will cause hard shifting effort/transmission failure.

1. With vehicle in neutral, position vehicle on hoist.
2. Remove belly pan.
3. Remove drain plug located on the right side of the transmission tail housing.
4. Remove transmission fill plug located on the left side of the transmission case.
5. Install drain plug into tail housing and tighten to 27 N.m (20 ft. lbs.).
6. Fill transmission with Mopar ® ATF + 4. The transmission is full when the fluid level is even with the bottom of the fill hole.
7. Install transmission fill plug (1) and tighten to 27 N.m (20 ft. lbs.).
8. Install belly pan.

REMOVAL

REMOVAL

1. Disconnect battery power source.
2. Hoist and secure the vehicle.
3. Remove the exhaust system and necessary heat shields. Refer to **Exhaust System/MUFFLER, Exhaust - Removal** . Refer to **Exhaust System/RESONATOR, Exhaust - Removal** and refer to **Exhaust System/SHIELD, Heat - Removal** .

Fig. 2: Identifying Fasteners & Heat Shield
Courtesy of CHRYSLER LLC

4. Remove the fasteners (1) and propeller shaft center bearing heat shield (2).

NOTE: Failing to mark the original alignment of the propeller shaft and the transmission output shaft prior to disassembly may result in misalignment of the propeller shaft during reassembly, which in turn, can cause vibration and other driveability concerns.

5. Mark the propeller shaft and the transmission output shaft flange for alignment during assembly.
6. Remove the propeller shaft center bearing support mounting bolts.
7. Remove the propeller shaft flange mounting bolts, then remove the propeller shaft.

Fig. 3: Shifter Rod

2. Remove mainshaft bearing cups with Remover 9369 (2) and Handle C-4171 (1).

Fig. 95: CASE RAIL BEARING REMOVER
 Courtesy of CHRYSLER LLC

3. Remove shift rail bearing with Slide Hammer C-637 (1) and Remover 9609 (2).

TRANSMISSION ADAPTER

Fig. 96: ADAPTER BEARING REMOVER
 Courtesy of CHRYSLER LLC

1. Remove shift rail bearing with Slide Hammer C-637 (1) and Remover 9609 (2).

Fig. 97: ADAPTER BUSHING REMOVER
 Courtesy of CHRYSLER LLC

2. Remove shift rail bushing with Slide Hammer C-3752 (1) and Remover 6786 (2).

Fig. 98: SELECT SHIMS
 Courtesy of CHRYSLER LLC

3. Remove countershaft bearing cup and select shim (1). Remove mainshaft bearing cup and

select shim (2).

Fig. 99: INPUT SEAL PULLER
Courtesy of CHRYSLER LLC

4. Remove input shaft seal with Slide Hammer C-637 (1) and Puller 7794-A (2).

CLEANING

CLEANING

Clean the gears, bearings shafts, extension/adaptor housing and gear case with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

INSPECTION

INSPECTION

81b2d0ee

Fig. 100: MIANSHAFT
Courtesy of CHRYSLER LLC

NOTE: Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth.

Mainshaft: Inspect bearing surfaces (1) for wear or flat-spots. Inspect splines (2) and snap ring grooves for wear. Inspect output seal surface for wear.

81b2bc70

Fig. 101: COUNTERSHAFT
Courtesy of CHRYSLER LLC

Countershaft: Inspect roller bearings (1) for wear, peeling, pitting or flat-spots. Inspect bearing surfaces (2) for wear or flat-spots. Inspect gear teeth (3) for worn, chips or cracks. Inspect splines and snap ring grooves for wear.

Fig. 102: INPUT SHAFT
 Courtesy of CHRYSLER LLC

Input Shaft: Inspect input shaft bearing (1) for wear, peeling, pitting or flat-spots. Inspect input shaft splines (2) for wear. Inspect forth gear (3) for worn, chipped, or cracked teeth. Inspect input seal surface for wear.

Fig. 103: GEAR AND BEARING
 Courtesy of CHRYSLER LLC

Gears: Inspect gears (1) for worn, chips or cracked teeth and bearing surfaces for wear, peeling, pitting or flat-spots. Inspect gear bearings (2) for wear, peeling, pitting, flat-spots or damaged bearing cage.

81b2bc80

Fig. 104: SYNCHRONIZER
Courtesy of CHRYSLER LLC

Synchronizer components: Inspect synchronizer rings (1) for worn, chips, or cracked teeth and burned or flaking friction material. Place blocker rings on gears. While applying pressure and rotating the blocker ring measure the clearance between the blocker ring and gear. If clearance is greater than 0.75 mm (0.030 in.) replace blocker ring. **Synchronizer rings (1) are serviced as an assembly.**

81b4d1cf

Fig. 105: SYNCHRONIZER SLEEVE
 Courtesy of CHRYSLER LLC

Inspect synchronizer sleeve (1) and hub (2) for worn teeth. Inspect synchronizer detents (3) for broken springs, missing balls or cracked/damaged housings.

81b2bc74

Fig. 106: SHIFT FORK
 Courtesy of CHRYSLER LLC

Shift Forks/Shift Rails: Inspect shift forks (1) for distortion. Inspect fork shoes (2) for wear or cracks. Fit shoes in synchronizer sleeve to ensure parts fit and work smoothly. Inspect shift rails for wear.

Inspect shift rail bushings and bearings for wear.

ASSEMBLY

ASSEMBLY

TRANSMISSION ADAPTER

Fig. 107: SELECT SHIMS
Courtesy of CHRYSLER LLC

1. Install countershaft select shims and bearing cup (1) into adapter plate. Install mainshaft select shims and bearing cup (2) into adapter plate.

Fig. 108: ADAPTER BEARING INSTALLER
 Courtesy of CHRYSLER LLC

2. Install shift rail bearing with Handle C-4171 (1) and Installer 10028 (2).

Fig. 109: ADAPTER BUSHING INSTALLER
 Courtesy of CHRYSLER LLC

3. Install shift rail bushing with Installer 8475 (1).

Fig. 110: INPUT SHAFT SEAL
Courtesy of CHRYSLER LLC

4. Install input shaft seal with Handle C-4171 (1) and Installer 9366 (2).

TRANSMISSION CASE

Fig. 111: CASE RAIL BEARING INSTALLER
Courtesy of CHRYSLER LLC

1. Install shift rail bearing with Handle C-4171 (1) and Installer 10028 (2).

Fig. 112: MAINSHAFT BEARING CUP
Courtesy of CHRYSLER LLC

2. Install mainshaft bearing cup with Handle C-4171 (1) and Installer 9373 (2).

Fig. 113: COUNTERSHAFT BEARING CUP
Courtesy of CHRYSLER LLC

3. Install countershaft bearing cup with Handle C-4171 (1) and Installer 9373 (2).

EXTENSION HOUSING

Fig. 114: EXTENSION HOUSING BEARING
Courtesy of CHRYSLER LLC

1. Install countershaft bearing (1) with Installer 9394 (2) and Handle C-4171 (3) then install snap ring.

Fig. 115: MAINSHAFT BEARING RACE
Courtesy of CHRYSLER LLC

2. Install mainshaft bearing cup (1) with Installer 9392 (2) and Handle C-4171 (3).

Fig. 116: MAINSHAFT RACE SNAP RING
 Courtesy of CHRYSLER LLC

3. Install mainshaft bearing cup (2) snap ring (1).

Fig. 117: Thrust Washer, Gear And Bearing
 Courtesy of CHRYSLER LLC

4. Install reverse idler gear shaft in extension housing (1).
5. Install reverse idler gear bearing (2) and idler gear (3).

Fig. 118: Idler Gear Bracket Bolts
 Courtesy of CHRYSLER LLC

6. Install idler gear bracket into the tail housing (1).
7. Apply Mopar® Lock AND Seal Adhesive or equivalent on idler gear bracket bolts (2). Install bolts (2) and tighten to 30 N.m (22 ft. lbs.).

Fig. 119: RAIL BUSHING INSTALLER
 Courtesy of CHRYSLER LLC

8. Install shift rail bushings (1) with Installer 8475 (2).

INPUT SHAFT

Fig. 120: BEARING HEATER
Courtesy of CHRYSLER LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

81b2cbf9

Fig. 121: INPUT SHAFT BEARING
 Courtesy of CHRYSLER LLC

1. Heat input shaft bearing to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit) and install bearing (1) on input shaft (2) with tongs or welding gloves.

81b90ecd

Fig. 122: INPUT SHAFT BEARING CUP
 Courtesy of CHRYSLER LLC

2. Install input shaft bearing cup with Handle C-4171 (1) and Installer 9380 (2).

COUNTERSHAFT

Fig. 123: BEARING HEATER
Courtesy of CHRYSLER LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

Fig. 124: COUNTERSHAFT BEARINGS

Courtesy of CHRYSLER LLC

1. Heat countershaft (1) bearings (2) to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit).
Install countershaft (1) bearings (2) on shaft with tongs or welding gloves.

MAINSHAFT

Fig. 125: 3RD GEAR BEARING
Courtesy of CHRYSLER LLC

1. Install third gear bearing (1) on mainshaft (2).

Fig. 126: 3RD GEAR BEARING SPACER
Courtesy of CHRYSLER LLC

2. Install third gear bearing spacer (1) on mainshaft (2).

Fig. 127: 3RD GEAR
 Courtesy of CHRYSLER LLC

3. Install third gear (1) on mainshaft (2).

Fig. 128: 3RD GEAR SYNCHRO RINGS
 Courtesy of CHRYSLER LLC

4. Install third gear synchronizer rings (1) on third gear (2).

Fig. 129: 3-4 SYNCHRO HUB
 Courtesy of CHRYSLER LLC

5. Install 3-4 synchronizer hub (1) on mainshaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and third gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

Fig. 130: 3-4 HUB SNAP RING

Courtesy of CHRYSLER LLC

6. Install 3-4 synchronizer hub (1) snap ring (2) on mainshaft.

Fig. 131: 3-4 HUB DETENTS
Courtesy of CHRYSLER LLC

7. Install synchronizer detents (1) in 3-4 synchronizer hub (2).

NOTE: 1-2 and 3-4 synchronizer detents are the same.

Fig. 132: 3-4 SYNCHRO SLEEVE
Courtesy of CHRYSLER LLC

8. Install 3-4 synchronizer sleeve (1) on 3-4 synchronizer hub (2).

Fig. 133: BEARING HEATER
Courtesy of CHRYSLER LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

9. Heat mainshaft transmission adapter bearing to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit) and install on mainshaft with tongs or welding gloves.

Fig. 134: 2ND GEAR BEARING
Courtesy of CHRYSLER LLC

10. Install second gear bearing (1) on mainshaft (2).

Fig. 135: 2ND BEARING SPACER
Courtesy of CHRYSLER LLC

11. Install second gear bearing spacer (1) on mainshaft (2).

81b2cedc

Fig. 136: 2ND GEAR
Courtesy of CHRYSLER LLC

12. Install second gear (1) on mainshaft (2).

81b2cec9

Fig. 137: 2ND GEAR SYNCHRO RINGS
Courtesy of CHRYSLER LLC

13. Install second gear synchronizer rings (1) on second gear (2).

Fig. 138: 1-2 SYNCHRO HUB
Courtesy of CHRYSLER LLC

14. Install 1-2 synchronizer hub (1) on mainshaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and second gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

Fig. 139: 1-2 SYNCHRO SLEEVE
 Courtesy of CHRYSLER LLC

15. Install 1-2 synchronizer hub sleeve (1) and detents (2).

NOTE: 1-2 and 3-4 synchronizer detents are the same.

Fig. 140: 1ST SPLIT RINGS
 Courtesy of CHRYSLER LLC

16. Install 1-2 synchronizer hub split rings (1) on mainshaft (2).

Fig. 141: 1ST SPLIT RING RETAINER
Courtesy of CHRYSLER LLC

17. Install 1-2 synchronizer hub split rings retainer (1) on split rings (2).

Fig. 142: 1ST GEAR SYNCHRO
Courtesy of CHRYSLER LLC

18. Install first gear synchronizer rings (1) on 1-2 synchronizer hub (2).

Fig. 143: 1ST GEAR BEARING
Courtesy of CHRYSLER LLC

19. Install first gear bearing (1) on mainshaft (2).

Fig. 144: 1ST GEAR
Courtesy of CHRYSLER LLC

20. Install first gear (1) on mainshaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and first gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

Fig. 145: BEARING HEATER
Courtesy of CHRYSLER LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

21. Heat mainshaft case bearing to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit) and install on mainshaft with tongs or welding gloves.

Fig. 146: MAIN 6TH GEAR
Courtesy of CHRYSLER LLC

22. Position sixth gear (1) on mainshaft (2).
23. Install sixth gear on mainshaft with Installer 9391.

TRANSMISSION HOUSING

Fig. 147: INPUT SHAFT SYNCHRO RINGS
Courtesy of CHRYSLER LLC

1. Install input shaft (2) into transmission adapter plate. Install fourth gear synchronizer rings (1) onto fourth gear.

Fig. 148: COUNTERSHAFT
Courtesy of CHRYSLER LLC

2. Install countershaft (1) assembly into transmission adapter.

Fig. 149: MAINSHAFT AND SHIFT RAIL
Courtesy of CHRYSLER LLC

3. Tilt countershaft (4) sideways then install mainshaft (1) and shift rail (2) assemblies into transmission adapter (3).

Fig. 150: COUNTERSHAFT WASHER
Courtesy of CHRYSLER LLC

4. Install countershaft thrust washer (1) on countershaft (2).

812c0783

Fig. 151: REVERSE SHAFT RAIL ASSEMBLY
Courtesy of CHRYSLER LLC

5. Install reverse rail assembly (2) into transmission adapter (3).

812a58c1

Fig. 152: TRANSMISSION CASE
 Courtesy of CHRYSLER LLC

6. Apply Mopar ® ATF-RTV to transmission adapter (2) sealing surface.
7. Install transmission case (1) on gear set until shift rail passes through case bushing. Then install skip shift lever on shift rail and seat transmission case on adapter (2).

9321-80

Fig. 153: Adapter Bolt Location

Courtesy of CHRYSLER LLC

8. Install transmission adapter (2) bolts (3) and tighten to 34 N.m (25 ft. lbs.).

Fig. 154: TORX SCREWS

Courtesy of CHRYSLER LLC

9. Apply Mopar® Lock AND Seal Adhesive to shift lever guide bolts. Install guide bolts (2) in transmission case (1) and tighten to 27 N.m (20 ft. lbs.).

Fig. 155: DETENT AND SPRING
Courtesy of CHRYSLER LLC

10. Install roller detent (1) and spring (2) into transmission adapter.

Fig. 156: TOP DETENT
Courtesy of CHRYSLER LLC

11. Apply Mopar® Lock AND Seal to roller detent bolt threads. Install bolt (1) into transmission adapter (2) and tighten to 40 N.m (30 ft. lbs.).

Fig. 157: SKIP SHIFT SOLENOID
Courtesy of CHRYSLER LLC

12. Install skip shift solenoid (1) into side of case (2) and tighten to 34 N.m (25 ft. lbs.).

Fig. 158: SKIP SHIFT LEVER
Courtesy of CHRYSLER LLC

13. Install skip shift lever (1) roll pin (2) with a hammer and punch.

Fig. 159: SIDE DETENT

Courtesy of CHRYSLER LLC

14. Install side shift detent (1) into case (2) and tighten to 40 N.m (30 ft. lbs.).

Fig. 160: TOP COVER
Courtesy of CHRYSLER LLC

15. Apply Mopar® ATF-RTV to top cover sealing surface.
16. Install top cover (1) on case (2) and tighten bolts to 20 N.m (15 ft. lbs.).

Fig. 161: 6TH BEARING SPACER
Courtesy of CHRYSLER LLC

17. Install sixth gear bearing spacer (1) on countershaft (2).

81b227ac

Fig. 162: 6TH GEAR BEARING
Courtesy of CHRYSLER LLC

18. Install sixth gear bearing (1) on countershaft (2).

81b227a7

Fig. 163: 6TH GEAR

Courtesy of CHRYSLER LLC

19. Install sixth gear (1) on countershaft (2).

Fig. 164: 6TH SYNCHRO RINGS
Courtesy of CHRYSLER LLC

20. Install sixth gear synchronizer rings (1) on countershaft sixth gear (2).

Fig. 165: 5-6 HUB INSTALLER
Courtesy of CHRYSLER LLC

21. Install 5-6 synchronizer hub (2) on countershaft with Installer 9391 (1).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and sixth gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

Fig. 166: 5-6 HUB SNAP RING
Courtesy of CHRYSLER LLC

22. Install 5-6 synchronizer hub (1) snap ring (2).

Fig. 167: 5-6 FORK AND SLEEVE
Courtesy of CHRYSLER LLC

23. Install 5-6 synchronizer shift fork (1) synchronizer sleeve (2) and hub detents (3).

NOTE: 5-6 and reverse synchronizer detents are the same.

Fig. 168: 5-6 HUB SNAP RING
Courtesy of CHRYSLER LLC

24. Install 5-6 synchronizer hub snap ring (1).
25. Install **new** 5-6 gear shift fork snap ring.

Fig. 169: 5TH GEAR MAINSHAFT
Courtesy of CHRYSLER LLC

26. Install fifth gear (1) on mainshaft with Installer 9391(2).

Fig. 170: SPLIT RINGS
Courtesy of CHRYSLER LLC

27. Install fifth gear split rings (1) on mainshaft (2).

Fig. 171: 5TH RETAINER RING
Courtesy of CHRYSLER LLC

28. Install fifth gear split rings retainer (1) on mainshaft (2).

Fig. 172: 5TH GEAR SYNCHRO RINGS

Courtesy of CHRYSLER LLC

29. Install fifth gear synchronizer rings (1) on 5-6 synchronizer hub (2).

Fig. 173: 5TH GEAR BEARING SPACER
Courtesy of CHRYSLER LLC

30. Install fifth gear bearing spacer (1) on countershaft (2).

Fig. 174: 5TH GEAR BEARING
Courtesy of CHRYSLER LLC

31. Install fifth gear bearing (1) on countershaft (2).

Fig. 175: 5TH GEAR
Courtesy of CHRYSLER LLC

32. Install fifth gear (1) on countershaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and fifth gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

Fig. 176: 5TH GEAR SNAP RING
 Courtesy of CHRYSLER LLC

33. Install fifth gear thrust washer (2) and snap ring (1) on countershaft.

Fig. 177: REVERSE COUNTER SHAFT GEAR
Courtesy of CHRYSLER LLC

34. Install reverse gear (1) on countershaft with Installer 9391 (2).

Fig. 178: REVERSE COUNTERSHAFT SNAP RING
Courtesy of CHRYSLER LLC

35. Install reverse gear (1) snap ring (2) on countershaft.

Fig. 179: REVERSE HUB AND FORK

Courtesy of CHRYSLER LLC

36. Install reverse shift fork (1) synchronizer hub with detents (2) and sleeve.

NOTE: 5-6 and reverse synchronizer detents are the same.

Fig. 180: REVERSE SYCHRO SNAP RING
Courtesy of CHRYSLER LLC

37. Install reverse synchronizer hub (1) snap ring (2).

Fig. 181: REVERSE FORK SNAP RING
Courtesy of CHRYSLER LLC

38. Install **new** reverse shift fork (1) snap ring (2).

Fig. 182: REVERSE SYNCHRO RINGS
Courtesy of CHRYSLER LLC

39. Install reverse synchronizer rings (1) on reverse synchronizer hub.

Fig. 183: REVERSE GEAR BEARING

Courtesy of CHRYSLER LLC

40. Install reverse gear bearing (1) on mainshaft.

81b20ed3

Fig. 184: REVERSE GEAR
Courtesy of CHRYSLER LLC

41. Install reverse gear (1) on mainshaft (2).

CAUTION: Synchronizer rings must be aligned with synchronizer hub and reverse gear during installation. Failure to follow these instructions will result in damage to the synchronizer rings.

Fig. 185: REVERSE GEAR THRUST WASHER
 Courtesy of CHRYSLER LLC

42. Install reverse gear (1) thrust washer (2) on mainshaft.

Fig. 186: REVERSE GEAR SNAP RING
 Courtesy of CHRYSLER LLC

43. Install reverse gear (1) snap ring (2) on mainshaft.

Fig. 187: ROLLER BEARING AND SPACERS
 Courtesy of CHRYSLER LLC

44. Install mainshaft roller bearing (1) and spacers (2) on mainshaft.

Fig. 188: ROLLER BEARING SNAP-RING
 Courtesy of CHRYSLER LLC

45. Install mainshaft roller bearing (1) snap ring (2).

81b20e4a

Fig. 189: EXTENSION HOUSING REMOVAL
 Courtesy of CHRYSLER LLC

46. Apply Mopar® ATF-RTV to extension housing sealing surface.
47. Install extension housing (1) on transmission case (2).

81b20e39

Fig. 190: EXTENSION HOUSING BOLTS
 Courtesy of CHRYSLER LLC

48. Install extension housing (1) bolts (2) and tighten bolts to 48 N.m (35 ft. lbs.).

Fig. 191: EXTENSION HOUSING NUTS
 Courtesy of CHRYSLER LLC

49. Install extension housing (1) nuts (2) and tighten bolts to 48 N.m (35 ft. lbs.).

Fig. 192: OFFSET LEVER
 Courtesy of CHRYSLER LLC

50. Install offset lever (1) on shift rail (2).

Fig. 193: OFFSET LEVER ROLL PIN
 Courtesy of CHRYSLER LLC

51. Install offset lever (1) roll pin (2) with a hammer and punch.

Fig. 194: SHIFT COVER BOLTS
 Courtesy of CHRYSLER LLC

52. Install Mopar® ATF-RTV to the shift cover sealing surface.
53. Install shift cover (1) bolts (2) and tighten to 20 N.m (15 ft. lbs.).

81b4d1fe

Fig. 195: OUTPUT SEAL INSTALLER
 Courtesy of CHRYSLER LLC

54. Install output shaft seal in extension housing (1) with Installer 7884 (2).

INSTALLATION

INSTALLATION

81ef27d0

Fig. 196: Identifying Shift Linkage Bolt & Roll Pins
Courtesy of CHRYSLER LLC

1. If necessary install the shift linkage bolt (1) and the roll pins (2) and the shift linkage onto the transmission.

11152

Fig. 197: Identifying Transmission Bolts
Courtesy of CHRYSLER LLC

2. Position the transmission into the clutch and seat against the bell housing.
3. Install transmission bolts (1) and tighten bolts to:
 - Top four bolts to engine - 41 N.m (30 ft. lbs.)
 - Bottom two bolts to engine - 68 N.m (50 ft. lbs.)
 - Bottom four bolts to oil pan - 30 N.m (22 ft. lbs.)

11141

Fig. 198: Isolator
 Courtesy of CHRYSLER LLC

4. Install any necessary electrical connectors.
5. Install the isolator (1) with the upper mounting bolts onto the transmission.

81ee1771

Fig. 199: Transmission Isolator Bracket Upper Bolts
 Courtesy of CHRYSLER LLC

6. Tighten the upper isolator bolts (1) to 41 N.m (31 ft.lbs.).

Fig. 200: Identifying Crossmember
 Courtesy of CHRYSLER LLC

7. Install the crossmember (1) onto the transmission with the mounting nuts (2).

Fig. 201: Identifying Crossmember To Body Bolts
 Courtesy of CHRYSLER LLC

8. Install the crossmember to body bolts. Tighten retainers to 61 N.m (45 ft. lbs.).

Fig. 202: Identifying Locking Tab
 Courtesy of CHRYSLER LLC

9. Install hydraulic clutch hose to the transmission. Push in the locking tab (1), securely.

Fig. 203: STARTER BOLTS
 Courtesy of CHRYSLER LLC

10. Install the starter motor and the mounting bolts (1). Tighten the bolts to 54 N.m (40 ft. lbs.).

Fig. 204: INSPECTION COVER
 Courtesy of CHRYSLER LLC

11. Install the inspection cover and mounting bolt (1). Tighten to 11 N.m (8 ft.lbs.).
12. Install the propeller shaft center bearing support mounting bolts. Tighten the bolts to 27 N.m (20 ft. lbs.).
13. Align the propeller shaft with the pre-scribed marks. Install the propeller shaft flange mounting bolts. Tighten the bolts to 58 N.m (43 ft. lbs.).
14. Install the exhaust system and necessary heat shields. See **EXHAUST SYSTEM** .
15. Lower the vehicle.

Fig. 205: SHIFTER NUT
 Courtesy of CHRYSLER LLC

16. Install the nut (1) securing the shift linkage to the vehicle. Tighten the nut to 20 N.m (15 ft. lbs.).

Fig. 206: SHIFTER BOLTS
Courtesy of CHRYSLER LLC

17. Disconnect battery power source.
18. Install the shift lever and the bolts (1). Tighten the bolts to 20 N.m (15 ft. lbs.).
19. Install the shift lever bezel.
20. Check and fill the brake fluid / clutch reservoir as necessary.

NOTE: While bleeding the hydraulic clutch system, be certain the clutch pedal returns to the most upright position. It may take as many as two hundred clutch strokes to bleed the system.

21. Check the operation of the clutch and bleed clutch hydraulic system as necessary.

ADJUSTMENTS

MAINSHAFT/COUNTERSHAFT - END-PLAY

Fig. 207: INPUT SHAFT
 Courtesy of CHRYSLER LLC

NOTE: The following procedure must be performed, when a shaft or tapered bearing has been replaced. The measurement is performed with all shims removed from the front adapter.

1. Install input shaft (2) into front adapter.

Fig. 208: INPUT SHAFT SYNCHRO RINGS
 Courtesy of CHRYSLER LLC

2. Install fourth gear synchronizer rings (1) on input shaft (2).
3. Install mainshaft and countershaft.
4. Install the case and tighten the bolts to 34 N.m (25 ft. lbs).

MAINSHAFT BEARINGS END-PLAY

Fig. 209: MAINSHAFT
Courtesy of CHRYSLER LLC

1. Rotate input shaft/mainshaft several time to seat the bearings.
2. Screw dial indicator Stud 8161 into the case.
3. Attach a dial indicator (1) to the stud and set dial indicator (1) plunger on the end of the mainshaft (2).
4. Zero the dial indicator (1), then push up on the input shaft and record the dial indicator end-play measurement.
5. Subtract 0.0127 - 0.0889 mm (0.0005 - 0.0035 in.) from the recorded dial indicator end-play measurement. The remainder is the shim thickness needed behind the input shaft bearing cup in the front adapter.

COUNTERSHAFT BEARINGS END-PLAY

Fig. 210: COUNTERSHAFT
Courtesy of CHRYSLER LLC

1. Rotate countershaft several time to seat the bearings.
2. Screw Stud 8161 into the case.
3. Attach a dial indicator (1) to the stud and set dial indicator (1) plunger on the end of the countershaft (2).
4. Zero dial indicator, then pull up on the countershaft and record the dial indicator end-play measurement.
5. Subtract 0.0127 - 0.0889 mm (0.0005 - 0.0035 in.) from the recorded dial indicator end-play measurement. The remainder is the shim thickness needed behind the countershaft bearing cup in the front adapter.

INPUT SHAFT, TRANSMISSION

REMOVAL

REMOVAL

Fig. 242: Front Adapter Bolts
Courtesy of CHRYSLER LLC

NOTE: If input shaft is damaged behind the seal, the transmission must be disassembled and inspected.

1. Measure output shaft end play and record number.
2. Remove clutch slave cylinder from transmission adapter plate.
3. Remove front adapter plate bolts (1).

Fig. 243: Removing Adapter
Courtesy of CHRYSLER LLC

4. Pry front cover adapter loose.
5. Hold input shaft while removing adapter (2).
6. Remove input shaft seal from adapter with a seal puller.
7. Clean and inspect all sealing surfaces for wear or damage.

Fig. 244: Removing Input Shaft
Courtesy of CHRYSLER LLC

8. Lift countershaft slightly and remove input shaft (2) from transmission (1).

Fig. 245: INPUT SHAFT BEARING
Courtesy of CHRYSLER LLC

9. Remove input shaft bearing (1) with Splitter 1130 (2) and a press.

INSTALLATION

INSTALLATION

Fig. 246: BEARING HEATER
Courtesy of CHRYSLER LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacture's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

81b2cbf9

Fig. 247: INPUT SHAFT BEARING
Courtesy of CHRYSLER LLC

1. Heat input shaft bearing to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Install bearing (1) on input shaft (2) with tongs or welding gloves.
2. Install new bearing cup in front adapter with original shim behind cup.
3. Clean sealing surfaces of the transmission case and adapter plate.
4. Install input shaft and adapter plate.
5. Check output shaft end play and adjust shim to achieve the original reading.

Fig. 248: INPUT SHAFT SEAL
Courtesy of CHRYSLER LLC

6. Remove adapter plate and install a new input shaft seal with Handle C-4171 and Installer 9366.
7. Apply Mopar® ATF-RTV to the cleaned sealing surfaces.
8. Install adapter and tighten bolts to 34 N.m (25 ft. lbs.).

LEVER, SHIFT

REMOVAL

REMOVAL

Fig. 249: Trim Stick C-4755
 Courtesy of CHRYSLER LLC

1 - TRIM STICK C-4755

1. Using a trim stick C-4755, separate the shifter boot from the shift lever.

Fig. 250: SHIFT LEVER BOLTS
 Courtesy of CHRYSLER LLC

2. Remove the shift lever bezel.
3. Remove the shift lever bolts (1) and the shift lever.

INSTALLATION

INSTALLATION

Fig. 251: SHIFT LEVER BOLTS
Courtesy of CHRYSLER LLC

1. Install shift lever boot onto shift lever.
2. Install shift lever into shifter assembly.
3. Install shift lever mounting bolts into shifter assembly. Tighten the bolts to 20 N.m (15 ft. lbs.)
4. Install the shift lever bezel.

MECHANISM, GEARSHIFT

REMOVAL

REMOVAL

Fig. 252: SHIFT LEVER BOLTS
 Courtesy of CHRYSLER LLC

1. Disconnect battery power source.
2. Place transmission in neutral. Using a trim stick, remove the shifter bezel to expose the shift lever mounting bolts. Remove the bolts (1).

Fig. 253: SHIFTER NUT
 Courtesy of CHRYSLER LLC

3. Remove the nut (1) securing the shift linkage to the vehicle.
4. Hoist and secure the vehicle.
5. Remove the exhaust system. Refer to **Exhaust System/MUFFLER, Exhaust - Removal**

6. Remove the propeller shaft center bearing heat shield. Refer to **Exhaust System/SHIELD, Heat - Removal**
7. Mark propeller shaft and the transmission flange for assembly alignment.
8. Remove the center bearing support mounting bolts.
9. Remove the propeller shaft.

Fig. 254: Identifying Crossmember To Body Bolts
Courtesy of CHRYSLER LLC

10. Raise transmission slightly with service jack to relieve load on crossmember and supports.
11. Remove the crossmember and isolator mounting bolts (1). Remove the crossmember.
12. Lower the transmission enough to gain access to the shift linkage.

81ef27d0

| 1 - SHIFT LINKAGE MOUNTING BOLT |
| 2 - SHIFT LINKAGE ROLL PINS |

3. Install the shifter linkage bolt (1). Tighten the bolt to 20 N.m (15 ft. lbs.)

Fig. 261: Identifying Crossmember To Body Bolts
Courtesy of CHRYSLER LLC

4. Raise the transmission into place and install transmission crossmember. Tighten crossmember bolts (1) to 61 N.m (45 ft. lbs.).
5. Install the propeller shaft center bearing support mounting bolts. Tighten the bolts to 27 N.m (20 ft. lbs.).
6. Align the propeller shaft with the pre-scribed marks. Install the propeller shaft flange mounting bolts. Tighten the bolts to 58 N.m (43 ft. lbs.).
7. Install the propeller shaft center bearing heat shield. Refer to **Exhaust System/SHIELD, Heat - Installation**
8. Install the exhaust system. Refer to **Exhaust System/MUFFLER, Exhaust - Installation**
9. Lower the vehicle.

Fig. 262: SHIFTER NUT
Courtesy of CHRYSLER LLC

10. Install the nut (1) securing the shift linkage to the vehicle. Tighten the nut to 20 N.m (15 ft. lbs.).

Fig. 263: SHIFTER BOLTS
Courtesy of CHRYSLER LLC

11. Install the shift lever and the bolts (1). Tighten the bolts to 20 N.m (15 ft. lbs.).
12. Install the shift lever bezel.

SEAL, EXTENSION HOUSING

REMOVAL

REMOVAL

1. Remove belly pan.
2. Remove propeller shaft.
3. Remove seal with seal puller.
4. Clean and inspect extension housing seal location.

INSTALLATION

INSTALLATION

81b4d1fe

Fig. 264: OUTPUT SEAL INSTALLER
Courtesy of CHRYSLER LLC

1. Install output shaft seal into extension housing (1) with Installer 7884 (2).
2. Install propeller shaft.

CAUTION: The drive shaft strap bolts use a Loctite patch, the bolts must be replaced or cleaned and applied Mopar® Lock AND Seal Adhesive or equivalent. Replace drive shaft joint straps whenever they are removed. The straps slightly deform when torqued in place. Reuse of the straps may result in reduced clamp load on the universal joint cap.

3. Check transmission fluid level.
4. Install belly pan.

SOLENOID, TRANSMISSION SKIP SHIFT

DESCRIPTION

DESCRIPTION

1496188

Fig. 265: Identifying Skip Shift Solenoid
Courtesy of CHRYSLER LLC

The skip shift solenoid (1) prevents the operator from shifting into second or third gear during part throttle operation. The solenoid is threaded into the left side of the transmission case.

OPERATION

OPERATION

The PCM controls the skip shift solenoid, locking out second and third gear when all of the following conditions are met:

- Engine coolant exceeds 41°C (106°F)
- Vehicle speed is between 12 and 20 MPH
- Engine operating above 1322 RPM
- The PCM verified first gear speed/RPM
- Throttle position sensor (TPS) signal is less than 0.68 volt above closed throttle (23 percent throttle opening)

The solenoid resets when vehicle speed drops below 3 MPH.

SOLENOID, TRANSMISSION, REVERSE LOCKOUT

DESCRIPTION

DESCRIPTION

1436188

Fig. 266: Identifying Skip Shift Solenoid
Courtesy of CHRYSLER LLC

The reverse lockout solenoid (2) prevents the operator from shifting into reverse when the vehicle speed is greater than 3 mph. The solenoid is mounted to the left side of the transmission with a bolt.

OPERATION

OPERATION

If vehicle speed is less than 3 mph, the PCM sends a ground to energize the solenoid which allows shifting into reverse. If vehicle speed is greater than 3 mph, the solenoid is deactivated, preventing the transmission from being shifted into reverse.

ACCESSORIES AND EQUIPMENT

Message Center - Service Information - Challenger

CENTER, ELECTRONIC VEHICLE INFORMATION

DESCRIPTION

DESCRIPTION

Fig. 1: Electronic Vehicle Information Center
Courtesy of CHRYSLER LLC

The Electronic Vehicle Information Center (EVIC) features a driver-interactive display. The display is located in the lower part of the speedometer. This system conveniently allows the driver to select a variety of useful information by pressing the switches mounted on the steering wheel. The EVIC displays information related to the following:

- System Status
- Vehicle information warning message displays
- Tire Pressure Monitor System - If Equipped
- Personal Settings (customer programmable features)
- Compass display
- Outside temperature display
- Trip computer functions
- UConnect™ hands-free communication system displays - If Equipped
- Navigation system screens - If Equipped
- Keyless Go system displays - If Equipped
- Audio mode display

The EVIC system is comprised of several different components. Those components are:

- Instrument Cluster
- Steering Wheel Switches
- Ambient Temperature Sensor
- Electronic Overhead Module

- Controller Area Network (CAN) Data Bus
- Local Interface Network (LIN) Data Bus

The EVIC display is part of the Instrument Cluster assembly and is not serviced as a separate component. If the display is inoperative, the complete Instrument Cluster assembly must be replaced. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Removal** . If the steering wheel switches are inoperative and require replacement. Refer to **Electrical - Audio and Video/Audio and Video/SWITCH, Remote Radio - Removal** for the appropriate procedure. If the compass position sensor (Electronic Overhead Module) is inoperative and requires replacement. Refer to **Electrical - Message Systems/Universal Transmitter/TRANSMITTER, Universal - Removal** for the appropriate procedure.

OPERATION

OPERATION

The Electronic Vehicle Information Center (EVIC) uses both non-switched and ignition switched sources of battery current so that some of its features remain operational at any time, while others may only operate with the ignition switch in the On position. When the ignition switch is turned to the On position, the EVIC display will return to the last function being displayed before the ignition was turned to the Off position.

The EVIC system is comprised of several different components that communicate over the Controller Area Network (CAN) and Local Interface Network (LIN) Data Buses. If the system is inoperative a scan tool and the appropriate diagnostic information must be used to diagnose the system.

Fig. 2: MENU Button & Compass/Thermometer Button
Courtesy of CHRYSLER LLC

The steering wheel switches are used to operate the different functions of the EVIC system. Pressing and releasing the MENU button (1) will change the mode displayed between Trip Functions, Navigation (If Equipped), System Status, Personal Settings, and Telephone (If Equipped). Pressing

and releasing the compass/thermometer button (3) will cause the EVIC to return to the compass/thermometer/trip computer display mode from any other mode.

Fig. 3: SCROLL Buttons, FUNCTION SELECT Button, And AUDIO MODE SELECT Button
Courtesy of CHRYSLER LLC

The SCROLL buttons (3) are used to scroll through Trip Functions, Navigation (If Equipped), System Status Messages, and Personal Settings (Customer Programmable Features). Pressing and releasing the FUNCTION SELECT button (1) accepts a selected choice. The AUDIO MODE SELECT button (2) changes the mode of the radio from AM to FM to Tape to CD, or to Satellite (SAT) depending on which radio is in the vehicle. This button can also be used to return to a previous navigation menu selection.

EVIC DISPLAY MODES

SYSTEM STATUS MODE

Displays warnings and user interaction messages. Initial warnings will be displayed full-screen for three seconds, then override the odometer and show text warnings on the bottom line of the display. Critical text warnings will be displayed until the failure is corrected. Non-critical text warnings will be displayed for 60 seconds. The driver can scroll to view multiple messages by using the SCROLL buttons.

When the appropriate conditions exist, the EVIC displays the following messages:

- Turn Signal On (with a continuous warning chime)
- Left Front Turn Signal Lamp Out
- Left Rear Turn Signal Lamp Out
- Right Front Turn Signal Lamp Out
- Right Rear Turn Signal Lamp Out

- RKE Battery Low (with a single chime)
- Memory 1/2 Profile Set
- Memory 1/2 Profile Recall
- Memory System Disabled - Vehicle Not In Park (with a single chime)
- Memory System Disabled - Seat Belt Buckled (with a single chime)
- Personal Settings Not Available - Vehicle Not in Park
- Left/Right Front Door Ajar (one or more, with a single chime if speed is above 1 mph)
- Left/Right Rear Door Ajar (one or more, with a single chime if speed is above 1 mph)
- Door (S) Ajar (with a single chime if vehicle is in motion)
- Trunk Ajar (with a single chime)
- Low Washer Fluid (with a single chime)
- Adjustable Pedals Disabled - Cruise Engaged
- Adjustable Pedals Disabled - Vehicle In Reverse
- Channel 1, 2, OR 3 Transmit
- Channel 1, 2, OR 3 Training
- Channel 1, 2, OR 3 Trained
- Clearing Channels
- Channels Cleared
- Channels Defaulted
- Did Not Train
- Left Front Tire Low Pressure
- Left Rear Tire Low Pressure
- Right Front Tire Low Pressure
- Right Rear Tire Low Pressure
- Check Tire Pressure Monitoring (TPM) System

TRIP MODE

Provides a choice of units displayed in English or metric. The following information can be displayed at the top of the screen:

- Average Miles Per Gallon (MPG)
- Distance to empty (DTE)
- Trip A odometer
- Trip B odometer
- Elapsed time

The EVIC trip computer features several functions that can be reset. Pressing and releasing the FUNCTION SELECT button once will clear the resettable function currently being displayed. Reset will only occur if a resettable function is currently being displayed. To reset all resettable functions,

press and release the FUNCTION SELECT button a second time within 3 seconds of resetting the currently displayed function (>Reset ALL will be displayed during this 3 second window).

The odometer is displayed at the bottom of the screen. If warnings exist, they will replace the odometer in the display. The driver can scroll to view information in the EVIC by using the SCROLL buttons.

COMPASS, TEMPERATURE AND AUDIO MODE

Compass heading and outside temperature are displayed at the top of the screen. On the lower half of the screen the audio mode is displayed along with the odometer. Eight-point compass headings are displayed (N, S, E, W, NE, NW, SE, SW) and up to 15 compass variance settings can be set and recalled. Outside temperature is displayed in °C (degrees Celsius) or °F (degrees Fahrenheit). Audio mode can display any one of 12 radio station preset frequencies, CD disc number, CD track number, tape, and one of 200 Satellite Radio Channels - if equipped.

TELEPHONE MODE - IF EQUIPPED

Provides the following information and features for the optional hands-free communications system:

- Phone status: idle, voice mail, roaming, battery strength and signal strength in increments of 20 percent
- Call status: Incoming call, connecting, connected, air time in minutes and seconds, call ended, busy, call failed, roaming and no phone connection
- Caller ID phone number display

NAVIGATION MODE - IF EQUIPPED

When the Navigation System is On, the steering wheel buttons can be used to select the Map or Menu display on the Navigation Unit. When the Menu display is active, the SCROLL buttons can be used to scroll through the list, the FUNCTION SELECT button can be used to select an item, and the AUDIO MODE SELECT button can be used to return to the previous menu. When the Map display is active, pressing the FUNCTION SELECT button will change the Navigation Unit Display to the Menu.

If Turn by Turn Navigation is enabled through Personal Settings, the Navigation System will provide turn by turn directions to the programmed destination in the EVIC display. The name of the approaching road is displayed at the top of the screen, followed by an arrow to show the direction of the turn and the remaining distance to the turn counted down.

PERSONAL SETTINGS MODE (CUSTOMER PROGRAMMABLE FEATURES)

Allows the driver to set and recall features when the transmission is in Park by pressing and releasing the MENU button until Personal Settings is displayed in the EVIC. The following personal settings can be set and recalled:

- Language: English, Spanish, German, Italian or French
- Display units in English or Metric

- Lock doors automatically at 15 mph (24 Kph), On or Off
- Unlock door automatically on exit, On or Off
- Remote Keyless Entry unlock driver door on first press or unlock all doors on first press
- Recall Memory with Remote Keyless Entry Unlock, On or Off
- Sound horn with Remote Keyless Entry Lock, On or Off
- Delay turning headlamps off for 0, 30, 60 or 90 seconds
- Headlamps on with wipers, On or Off
- Rain Sensing Intermittent Wipers, On or Off
- Automatically move seat back on exit, On or Off
- Tilt mirrors down and in when transmission is shifted to Reverse, On or Off
- Delay Power off to accessories until exit off, 45-seconds maximum, 5-minute maximum, 10-minute maximum or 60-minute maximum
- Turn headlamps on with Remote Keyless Entry Lock, On or Off
- Turn headlamps on with Remote Keyless Entry Unlock, Off or 30 seconds
- Park Assist System, On or Off
- Confirmation of Voice Commands, On or Off
- Turn-by-Turn Navigation, On or Off

DIAGNOSIS AND TESTING

ELECTRONIC VEHICLE INFORMATION CENTER

The Electronic Vehicle Information Center (EVIC) data is obtained from several components on the Controller Area Network (CAN) Data Bus circuit. The EVIC will not function properly if the bus messages from any of these components is not received. If no EVIC data is displayed, check the CAN Data Bus circuit communications, the Instrument Cluster functions and the Front Control Module (FCM).

The use of a scan tool and the proper diagnostic procedures information are recommended for further testing of the EVIC and the CAN Data Bus circuit. Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information.

STANDARD PROCEDURE

COMPASS CALIBRATION

CAUTION: Do not place any external magnets, such as magnetic roof mount antennas, in the vicinity of the compass. Do not use magnetic tools when servicing the overhead console.

The electronic compass unit features a self-calibrating design, which simplifies the calibration procedure. This feature automatically updates the compass calibration while the vehicle is being driven. This allows the compass unit to compensate for small changes in the residual magnetism that

the vehicle may acquire during normal use. If the compass readings appear to be erratic or the Electronic Vehicle Information Center (EVIC) displays "CAL", perform the following calibration procedure. Also, any time EVIC service replacement components are installed, they must be calibrated using this procedure. Do not attempt to calibrate the compass near large metal objects such as other vehicles, large buildings, or bridges; or, near overhead or underground power lines.

Calibrate the compass manually as follows:

Fig. 4: MENU Button & Compass/Thermometer Button
Courtesy of CHRYSLER LLC

1. Turn the ignition switch to the On position.
2. Depress and hold the compass/thermometer button (3) for approximately two seconds.

Fig. 5: SCROLL Buttons, FUNCTION SELECT Button, And AUDIO MODE SELECT Button

Courtesy of CHRYSLER LLC

3. Use the SCROLL buttons (3) until MANUAL COMPASS CALIBRATION is highlighted.
4. Press and release the FUNCTION SELECT button (1) to start the calibration. The message "CAL" will appear in the EVIC display.
5. Drive the vehicle on a level surface, away from large metal objects and power lines, through one or two **complete** circles in not less than 16 seconds. The "CAL" message will disappear from the display to indicate that the compass is now calibrated.

NOTE: A blank compass display indicates that vehicle degaussing (demagnetizing) is necessary.

NOTE: If the "CAL" message remains in the display, either there is excessive magnetism near the compass, or the unit is inoperative. Repeat the calibration procedure at least one more time.

NOTE: If the wrong direction is still indicated in the compass display, the area selected for calibration may be too close to a strong magnetic field. Repeat the calibration procedure in another location.

COMPASS DEMAGNETIZING

Fig. 6: Degaussing Tool #6029
Courtesy of CHRYSLER LLC

A degaussing tool (Special Tool 6029) is used to demagnetize, or degauss, the roof panel above the overhead console. Equivalent units must be rated as continuous duty for 110/115 volts and 60 Hz. They must also have a field strength of over 350 gauss at 7 millimeters (0.25 inch) beyond the tip of the probe.

J908E-27

Fig. 7: Demagnetizing Procedure
Courtesy of CHRYSLER LLC

To demagnetize the roof panel proceed as follows:

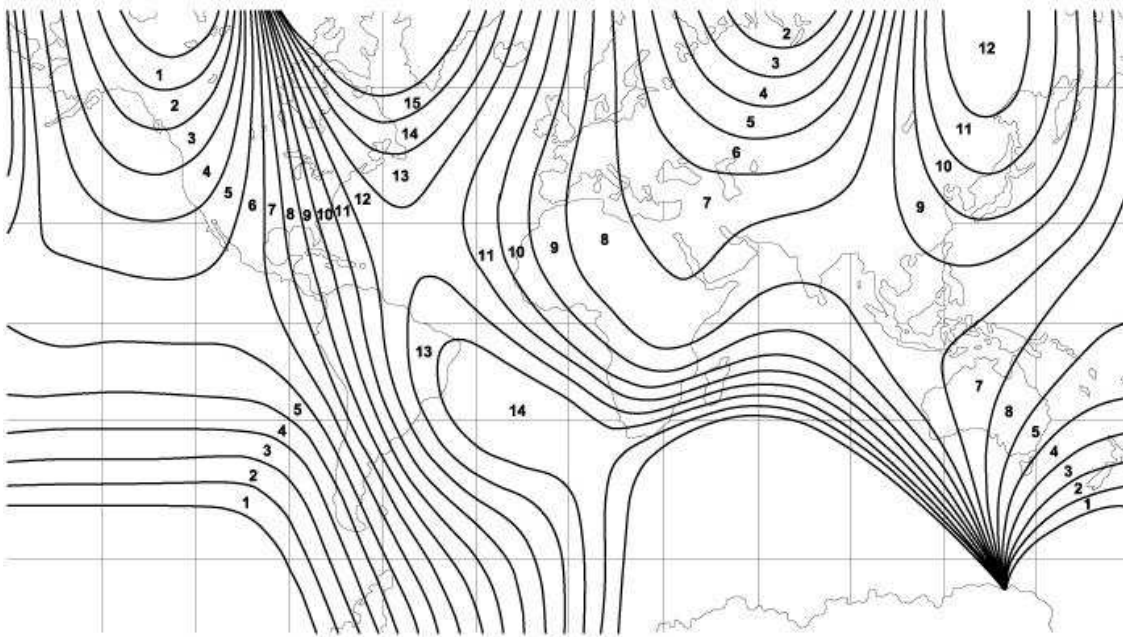

1. Be certain that the ignition switch is in the Off position, before you begin the demagnetizing procedure.
2. Place a piece of paper approximately 22 by 28 centimeters (8.5 by 11 inches), oriented on the vehicle lengthwise from front to rear, on the center line of the roof at the windshield header. The purpose of the paper is to protect the roof panel from scratches, and to define the area to be demagnetized.
3. Connect the degaussing tool to an electrical outlet, while keeping the tool at least 61 centimeters (2 feet) away from the compass unit.
4. Slowly approach the center line of the roof panel at the windshield header, with the degaussing tool connected.
5. Contact the roof panel with the plastic coated tip of the degaussing tool. Be sure that the template is in place to avoid scratching the roof panel. Using a slow, back-and-forth sweeping motion, and allowing 13 millimeters (0.50 inch) between passes, move the tool at least 11 centimeters (4 inches) to each side of the roof center line, and 28 centimeters (11 inches) back from the windshield header.

6. With the degaussing tool still energized, slowly back it away from the roof panel. When the tip of the tool is at least 61 centimeters (2 feet) from the roof panel, disconnect the tool.
7. Calibrate the compass. See **Electrical - Message Systems/Message Center/CENTER, Electronic Vehicle Information - Standard Procedure** and adjust the compass variance.

COMPASS VARIATION ADJUSTMENT

Compass variance, also known as magnetic declination, is the difference in angle between magnetic north and true geographic north. In some geographic locations, the difference between magnetic and geographic north is great enough to cause the compass to give false readings. If this problem occurs, the compass variance setting may need to be changed.

To set the compass variance:

511375

Fig. 8: Compass Variance Settings Map
Courtesy of CHRYSLER LLC

1. Using the Variance Settings map, find your geographic location and note the zone number.

Fig. 9: MENU Button & Compass/Thermometer Button
 Courtesy of CHRYSLER LLC

2. Turn the ignition switch to the On position.
3. Press and hold the compass/thermometer button (3) for approximately two seconds.

Fig. 10: SCROLL Buttons, FUNCTION SELECT Button, And AUDIO MODE SELECT Button
 Courtesy of CHRYSLER LLC

4. Use the SCROLL buttons (3) until COMPASS VARIANCE is highlighted. The "COMPASS VARIANCE" message and the last variance zone number will be displayed.
5. Press and release the FUNCTION SELECT button (1) until the zone number for your geographic location appears in the display.

Fig. 11: MENU Button & Compass/Thermometer Button
Courtesy of CHRYSLER LLC

6. Press and release the compass/thermometer button (3) to exit.
7. Confirm that the correct directions are now indicated by the compass.

GENERAL INFORMATION

Mopar Accessories - Challenger

DRIVING CONVENIENCE

INSTRUCTION SHEET

REMOTE START

CHALLENGER

Fig. 1: Remote Start Components

Courtesy of CHRYSLER LLC

CALL OUT	DESCRIPTION	QUANTITY
1	Hood Switch Harness	1
2	Hood Switch	1
3	Wireless Ignition Node (WIN)	1
4	FOBIK	2
5	WIN Antenna	1
6	Zip Ties	10

CAUTION: XBM remote start can **ONLY** be installed on vehicles that have the following factory options: Automatic Transmission, Remote Keyless Entry and Immobilizer.

WinFobik based vehicles, the sales code must be added to the database and the Restore Vehicle Configuration (using a diagnostic scan tool) must be performed prior to installing the new WIN module. Failure to do so will render the WIN module's remote start function inoperative. The technician should wait 1/2 hour between adding XBM sales code in DealerConnect before installing the WIN module & restoring vehicle configuration. In the interim, the technician can install all other components except the WIN module.

PROCEDURE STEPS:

UPDATE VEHICLE CONFIGURATION

1. VIN must be updated with the sales code of the added accessory in order to enable system functionality. Using the DealerCONNECT website and a diagnostic scan tool, complete the vehicle configuration.
2. Log on to <https://dealerconnect.chrysler.com>
3. In the "Vehicle Option" screen under the "Global Claims System" category in the "Service" tab, enter vehicle VIN and add sales code(s) noted below as a "Dealer Installed Option".

XBM (REMOTE START)

4. Confirm that the new sales code has been successfully added to the VIN.
5. With the diagnostic scan tool connected to both the Internet (via Ethernet port or wireless connection) and the vehicle, perform the following steps from the Initial Start Up Screen:
 - Select "VEHICLE PREPARATION"
 - Select "RESTORE VEHICLE CONFIGURATION"
 - Select "START"

- Select "NEXT"
- If necessary, select proper vehicle line and model year and select "NEXT"
- Confirm correct selection and select "NEXT"
- Enter vehicle VIN using On-Screen keyboard or confirm that auto-filled VIN plate and select "NEXT"
- Select "OK"
- Enter user ID, password and dealer code using On-Screen keyboard and Select "OK"
- Wait for vehicle configuration data to be downloaded and select "NEXT"
- Select "NEXT"
- Confirm that vehicle configuration has been programmed successfully
- Note On-Screen instructions and select "FINISH"

VALIDATION PROCESS

1. To validate that the remote start is activated in the system.
2. Select "ECU VIEW"
3. Select "TIPM/CGW"
4. Select "MORE OPTIONS"
5. Select "ECU DETAILS"
6. Select "CONFIG INFO"
7. Toggle down, verify:
 - Select "ECU VIEW"
 - Select "TIPM/CGW"
 - Select "MORE OPTIONS"
 - Select "ECU DETAILS"
 - Select "CONFIG INFO"
 - Toggle down, verify:

NAME	VALUE
REMOTE START PRESENT	SET

HOOD SWITCH INSTALLATION

1. Disconnect and isolate the negative battery cable.

NOTE: There may be an unused factory installed hood switch harness taped back on the existing wiring harness near the hood switch mounting location. If present, route it through the switch mounting bracket and install the switch. If the factory hood switch harness is not preset, follow steps 2 through 14.

NOTE: Do not push the hood switch by hand, when the hood closes the switch will automatically adjust.

Fig. 2: PCM Location In Vehicle
Courtesy of CHRYSLER LLC

2. Route the hood switch harness (2) underneath the brace located at the rear of the engine compartment, through the opening designated for the hood switch (1), located near the rear of the passenger fender.
3. Connect the hood switch to the harness and insert it into the opening (1) until it is properly seated.
4. Route the hood switch harness (2) into the engine compartment and secure along the factory harness with tie wraps.
5. Install the hood switch harness ground terminal on the ground lug.

Fig. 3: Integrated Power Module
Courtesy of CHRYSLER LLC

6. Disengage the outboard retaining clip, and rotate the TIPM to access wire harness connectors.
7. Disengage the two inboard retaining clips.
8. Lift the TIPM up to gain access to the "B" connector.

1985019

Fig. 4: Front View Of TIPM "B" Connector
Courtesy of CHRYSLER LLC

NOTE: This is the front view of the TIPM "B" connector.

Fig. 5: Totally Integrated Power Module Connector
Courtesy of CHRYSLER LLC

9. Unplug the "B" connector (1) and release the "Secondary Lock" (2) from the front of the connector.

1955622

Fig. 6: Identifying TIPM "B" Connector Cavity 10
 Courtesy of CHRYSLER LLC

10. Insert the Violet/Lt. Blue wire from the hood switch harness into the "B" connector (2), cavity 10 (1).
11. Install the ground wire from the hood switch harness to the grounding stud on the strut tower.
12. Reinstall the "Secondary Lock" into the front of the connector.
13. Reinstall the "B" connector back into the TIPM.
14. Reinstall the TIPM on the TIPM mounting bracket by engaging the retaining clips.

WIN MODULE REMOVAL

8131ad90

Fig. 7: Reinforcement I/P Steering Column
 Courtesy of CHRYSLER LLC

1. Remove the screws that secure the steering column cover to the instrument panel.
2. Pull the steering column cover rearward at the top and right side of the cover to release the snap retainers from the instrument panel.
3. Disconnect the wire harness connector from the trunk release switch, if equipped.
4. If required, remove the four screws (3) that secures the instrument panel steering column cover reinforcement (1) to the bracket (2) and remove the reinforcement from the vehicle.

Fig. 8: Lower Instrument Cluster Trim Screws
Courtesy of CHRYSLER LLC

5. Remove the two screws (1) from the lower instrument cluster trim.

Fig. 9: Edge Of Instrument Cluster Trim
Courtesy of CHRYSLER LLC

6. Using a trim stick or equivalent, gently pry (1) along the edge of the trim to remove the instrument cluster trim.

Fig. 10: Wireless Ignition Node Screws
Courtesy of CHRYSLER LLC

7. Remove the 4 screws from the WIN (1).

Fig. 11: Wireless Ignition Node
Courtesy of CHRYSLER LLC

8. Remove the WIN (1) from the rear if the instrument panel bringing it through the opening below the steering column and disconnect the electrical connector (2) from the WIN.

REMOTE START ANTENNA INSTALLATION

Fig. 12: Removing/Installing Glove Box Bin
 Courtesy of CHRYSLER LLC

1. Open the glove box bin (1).
2. Push in on both sides of glove box bin to disengage the glove box stops (2) and lower the bin.
3. Pivot the glove box bin downward and disengage the glove box hinge hooks (3) from the instrument panel hinge brackets (4) located at each end of the bin.

Fig. 13: Bin-Glove Box Support Strap
 Courtesy of CHRYSLER LLC

4. Turn the glove box bin (1) sideways and remove the support strap and retainer assembly (2) from the outboard end of the bin.

5. Remove the glove box bin from the vehicle.

88012

Fig. 14: Instrument Panel Cover & Center Bezel
Courtesy of CHRYSLER LLC

6. Using trim stick C-4755 or equivalent, remove the center bezel (2) from the instrument panel (1) by releasing the snap retainers from the instrument panel.
7. Disconnect the electrical connectors and remove the center bezel.

81cc276e

Fig. 15: RSA Module At Dash
Courtesy of CHRYSLER LLC

8. Install the remote start antenna module (2), and screws (1) to instrument panel assembly. Tighten screws to 2.5 N.m (22 in. lbs.).

Fig. 16: RSA Routing
Courtesy of CHRYSLER LLC

9. Route the remote start coaxial cable (1) to the WIN module.
10. Install the remote start antenna coaxial cable to the mounting clips, if equipped.

Fig. 17: Instrument Panel Cover & Center Bezel
Courtesy of CHRYSLER LLC

11. Position the center bezel (2) near the instrument panel (1) and connect the electrical connectors.
12. Install the center bezel onto the instrument panel and carefully push on the outside edges of the center bezel to fully seat the snap clip retainers.

Fig. 18: Bin-Glove Box Support Strap
 Courtesy of CHRYSLER LLC

13. Position the glove box bin (1) into the instrument panel.
14. Turn the glove box bin sideways and install the support strap and retainer assembly (2) onto the outboard end of the bin.

Fig. 19: Removing/Installing Glove Box Bin
 Courtesy of CHRYSLER LLC

15. Engage the glove box bin hinge hooks (3) onto the instrument panel hinge brackets (4) located at each end of the glove box bin (1) and pivot the bin upward.
16. To engage the glove box stops (2), push inward on both sides of the glove box bin and pivot the

glove box into the instrument panel.

17. Close the glove box bin.

WIN MODULE INSTALLATION

81cc2301

Fig. 20: RSA Electrical Connector
Courtesy of CHRYSLER LLC

1. Connect the remote start antenna coaxial cable connector (1) to the new wireless ignition node (WIN) (2).

81d100a1

Fig. 21: Node - Wireless Ignition
Courtesy of CHRYSLER LLC

2. Connect the electrical connector (2) to the WIN (1) and position the WIN back into the instrument panel.

Fig. 22: Node - Wireless Ignition
 Courtesy of CHRYSLER LLC

3. Install the four screws (1) through the instrument panel into the WIN.
4. Install the instrument panel trim cover. Make sure that the cover snaps into the securing clips.

Fig. 23: I/P Lower Screws
 Courtesy of CHRYSLER LLC

5. Install the two lower instrument panel screws (1).

Fig. 24: Reinforcement I/P Steering Column
 Courtesy of CHRYSLER LLC

6. If removed, position the instrument panel steering column cover reinforcement (1) onto the bracket (2).
7. Install the screws (3) that secure the instrument panel steering column cover reinforcement to the bracket. Tighten the screws securely.

Fig. 25: Steering Column Cover
 Courtesy of CHRYSLER LLC

8. Position the steering column cover (1) onto the instrument panel.
9. Connect the release cable (4) to the emergency brake release handle (5).
10. Connect the wire harness connector (3) to the trunk release switch, if equipped.
11. Install the steering column cover onto the instrument panel and carefully push on the top and right side of the cover to fully seat the snap clip retainers into the instrument panel.
12. Install the screws (2 and 6) that secure the steering column cover (1) to the instrument panel. Tighten the screws securely.
13. Connect the negative battery cable.

PROGRAMMING THE WIN

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.

NOTE: Have the vehicle PIN readily available before running the routine

CAUTION: If the PCM and WIN are replaced at the same time, the PCM **MUST** be programmed before the WIN.

3. Select "ECU View."
4. Select "WCM".
5. Select "Miscellaneous Functions."
6. Select "WIN Replaced".
7. Enter the PIN when prompted.
8. Cycle ignition key after the successful routine completion.

PROGRAMMING IGNITION KEYS TO THE WIN

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.
3. Have a unique vehicle PIN readily available before running the routine.
4. Ignition key should be in RUN position.
5. Select "ECU View".
6. Select "WIN".

7. Select "Miscellaneous Functions."
8. Select "Program Ignition Keys or Key FOBs", Start
9. Enter the PIN when prompted.
10. Verify the correct information.
11. Cycle ignition key after the successful routine completion.

NOTE: If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: A maximum of eight keys can be learned by the WIN. Once a key is learned by a WIN, that key has acquired the Secret Key for that WIN and cannot be transferred to any other vehicle.

ECU RESET

With the diagnostic scan tool connected to the vehicle, perform the following steps from the Initial Start Up Screen:

1. Select "ECU VIEW"
2. Select "WIN"
3. Select "MISC FUNCTIONS"
4. Select "RESET ECU"
5. Select "START"
6. Select "NEXT"

UPDATE PRESSURE THRESHOLDS

NOTE: You must know the PIN to do the steps below.

1. Select "ECU VIEW"
2. Select "TIPMCGW"
3. Select "MISC FUNCTIONS"
4. Select "UPDATE PRESSURE THRESHOLDS"
5. Get tire pressure data from placecard on drivers side door jam.
6. Select "NEXT"
7. Select "NEXT"
8. From the drop down menu select the tire pressure from the placecard.
9. Select "NEXT"
10. Enter the four digit PIN
11. Select "NEXT"

12. Select "FINISHED"

NOTE: The vehicle must be driven before the TPMS light will turn off.

REMOTE START DISABLE OVERRIDE

With the diagnostic scan tool, perform the following steps.

1. Select "ECU VIEW"
2. Select "TIPMCGW"
3. Select "MISC FUNCTIONS"
4. Select "Temporary Remote Start Disable"
5. Select "START"
6. Select "NEXT"
7. Verify that "Current state: Disabled" is displayed. If not select "DISABLE"
8. Select "FINISH"

CLEAR ALL DTC'S

1. Use the diagnostic scan tool to clear all DTC's

ACTIVATE THE REMOTE START

To activate the remote start the vehicle must have been driven at least 35 MPH.

With the vehicle off, and the doors closed and locked, verify the remote start is functioning properly.

INTERIOR STORAGE

INSTRUCTION SHEET

CENTERSTACK AND SHIFTER BEZEL

CHALLENGER

PROCEDURE STEPS:

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable, then wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to take the proper precautions could result in accidental airbag deployment and possible serious or fatal injury.

1. Disconnect the negative battery cable.

Fig. 26: Center Console Shifter Trim Ring & Console Trim Plate
Courtesy of CHRYSLER LLC

2. Using trim stick C-4755 or equivalent, remove the shifter trim ring (2) and console trim plate (1) by releasing the snap retainers from the console.
3. Install the new console trim plate (1) and shifter trim ring (2) by pressing the snap retainers into the console.

Fig. 27: Instrument Panel Cover & Center Bezel
Courtesy of CHRYSLER LLC

4. Using trim stick C-4755 or equivalent, remove the center bezel (2) from the instrument panel (1) by releasing the snap retainers from the instrument panel.
5. Disconnect the heated seat switch (3) electrical connectors, if equipped

6. Disconnect the A/C-heater control and hazard switch connectors.
7. Remove the center bezel from the vehicle.

NOTE: Take the proper precautions to protect the front face of the instrument panel center bezel from cosmetic damage during this service procedure.

Fig. 28: Removing/Installing A/C-Heater Control At Rear Side Panel Center Bezel
Courtesy of CHRYSLER LLC

8. Remove the four screws (1) that are securing the A/C-heater control (2) to the instrument panel center bezel and remove the control.
9. Remove the two screws that are securing the hazard switch to the instrument panel center bezel and remove the switch.
10. From the back of the center bezel squeeze the two tabs at the top and bottom of the heated seat switch and push the heated seat switch through the opening of the center bezel.

Fig. 29: Removing/Installing A/C-Heater Control At Rear Side Panel Center Bezel
 Courtesy of CHRYSLER LLC

11. Transfer the A/C-heater control (2), heated seat switch, and the hazard switch to the new instrument panel center bezel (3).
12. Position the A/C-heater control (2) into the instrument panel center bezel (3).
13. Install the four screws (1) that secure--> the A/C-heater control to the instrument panel center bezel. Tighten the screws to 2 Nm (17 in.lbs.).
14. Install the two screws that secure the hazard switch to the instrument panel center bezel. Tighten the screws to 2 Nm (17 in.lbs.).

Fig. 30: Heated Seat Switch, Center Bezel & Tabs
 Courtesy of CHRYSLER LLC

15. Install the heated seat switches. From the front of the center bezel (2), carefully push the heated seat switch (1) in through the front of the bezel until both tabs (3) lock into place.

88Q12

Fig. 31: Instrument Panel Cover & Center Bezel
Courtesy of CHRYSLER LLC

16. Position the center bezel (2) near the instrument panel (1).
17. Connect the electrical connectors for the A/C control, heated seat switches, if equipped, and the hazard switch.
18. Install the center bezel onto the instrument panel and carefully push on the outside edges of the center bezel to fully seat the snap clip retainers.
19. Connect the negative battery cable.

NOTE: The A/C-heater control automatically performs the Actuator Calibration function when the ignition is initially turned on when installing a new control or reinstalling the original control. However, the Actuator Calibration function must be manually initiated using a scan tool if the A/C-heater control has been previously installed in another vehicle.

20. If required, initiate the Actuator Calibration function using a scan tool.

22. Install the four push-pin fasteners (2) that secure the trim panel to the deck opening lower panel.
23. Install the spare tire.
24. Connect the battery positive and negative cables.
25. Install the spare tire cover.

ACCESSORY HOOD

DODGE CHALLENGER

2679031

Fig. 42: Hood Accessory - Challenger
Courtesy of CHRYSLER LLC

Call Out	Description	Parts	Quantity
1	Hood	Supplied in kit	1
2	Hood Scoop Bezel	Supplied in kit	2
3	Hood Scoop	supplied in kit	1
4	Gasket	supplied in kit	1

5	Bezel Screws	supplied in kit	6
6	Hood Scoop Nuts	supplied in kit	5
7	Windshield Wiper Fluid Hose	supplied in kit	1
8	Hood Scoop J-clips	supplied in kit	5

PROCEDURE STEPS:

Fig. 43: Installing Hood Scoop J-Clips
Courtesy of CHRYSLER LLC

NOTE: For safety, ease of installation and to avoid damage to any parts, it is recommended to have an assistant aid in installing this kit.

1. Prior to installation, paint the hood and the hood scoop supplied in the kit to match the vehicle's body color or color as desired. Let paint dry thoroughly before proceeding with installation.
2. If desired, paint the hood scoop bezels supplied in the kit to match the vehicle's body color or color as desired. Let paint dry thoroughly before proceeding with installation.
3. Pre-assemble the hood scoop (2) by installing the five J-clips (1) to the rear underside of the scoop (2).

2679853

Fig. 44: Installing Hood Scoop Bezel
 Courtesy of CHRYSLER LLC

CAUTION: To avoid damage to any of the parts, do not install the hood scoop bezels with power tools,

4. Using a phillips screwdriver, install the hood scoop bezel (3) to the hood scoop (1). Insert the screws (2) provided in the kit through the hood scoop bezel (3) and into the hood scoop (1). Tighten the screws (2) until tight. Repeat steps for opposite side of hood scoop (1).

2679667

Fig. 45: Removing Tan Adhesive Backing From Gasket
 Courtesy of CHRYSLER LLC

5. Wet the gasket installation area on the hood with a 50/50 mixture of isopropyl alcohol and water. This will prevent the gasket (1) from immediately sticking to the hood and allows you to easily adjust the gasket (1) it into position. The mixture will not interfere with the adhesion after it

has evaporated.

CAUTION: Take caution not to tear or rip any part of the gasket.

6. **Carefully** remove the tan adhesive backing from the gasket (1).

Fig. 46: Installing Gasket To Hood Scoop Channel
Courtesy of CHRYSLER LLC

7. Install the gasket (2) to the hood scoop channel. The rear portion of the gasket (2) must be lined up with the edge of scoop channel. Have an assistant hold the gasket in place while the other person aligns and promotes the adhesion of the gasket (2).

CAUTION: Take caution not to tear or rip any part of the gasket.

8. Once aligned, press down firmly on the gasket (2) for 30 seconds to allow for proper adhesion. **Let the 50/50 mixture of isopropyl alcohol and water dry completely before proceeding with the hood scoop installation portion.**

2679761

Fig. 47: Installing Scoop To Hood - Rear Side
 Courtesy of CHRYSLER LLC

CAUTION: Take care not to damage the paint when installing the hood scoop to the hood.

NOTE: Install the scoop to the hood as shown in illustration. If the hood is not installed in the order depicted in steps 9-10, the scoop will not align to hood.

9. Install the scoop (2) by first tilting the rear portion of the hood scoop (2) up, insert the hooks located on the front underside of the scoop (2) into the front slots (1) of the hood and push the scoop (2) forward until the hooks are properly seated into the hood slots (1).

2679787

Fig. 48: Installing Scoop To Hood - Front Side

Courtesy of CHRYSLER LLC

10. Once the front portion of the hood scoop (2) is properly installed, press down on the rear portion of the scoop (2) to insert the hood scoop's (2) pre-installed J-clips into the slots located on the hood (1). The pre-installed J-clip studs should align with the five slots located at the rear of the hood scoop channel. If one or more of the J-clips studs do not align to the slots, use a non-scratching pusher stick (ie paint stick with a 'v' on the end) to push the stud(s) into the slot(s).

Fig. 49: Installing Hood Scoop Nut
Courtesy of CHRYSLER LLC

CAUTION: Be sure to not to damage the paint finish of the hood by placing the hood on non-abrasive surface.

11. With the help of an assistant, turn the hood upright or upside down while holding the hood scoop in place to locate the five access holes in the inner hood.
12. Install the hood scoop nut (1) included in the kit to the J-clip stud (1) through the inner hood access hole. Tighten the nuts to 20 +/- 2 lbs. in.
13. Tighten the 2 side nuts first and then tighten the middle rear nut. Finally tighten the 2 outer corner rear nuts. Tighten the nuts again in the same sequence after all are tightened the first time.

2679367

Fig. 50: Removing/Installing Vehicle Hood Silencer Pad
 Courtesy of CHRYSLER LLC

14. Open the vehicle hood.

CAUTION: Take caution not damage the retaining clips when removing.

15. Remove the vehicle hood silencer pad (2) by removing the nine retaining clips (1). **Save the clips for re-installation.**

8136b668

Fig. 51: Identifying Wiper Hose, Reservoir Pump & Washer Fluid Level Sensor
 Courtesy of CHRYSLER LLC

16. Disconnect the wiper hose (2) from the reservoir and drain the washer fluid into suitable

container.

2679295

Fig. 52: Identifying Wiper Hose Routing
Courtesy of CHRYSLER LLC

17. Remove the wiper hose (1) from the engine compartment.

2679269

Fig. 53: Removing/Installing Hood Wiper Nozzle Hoses

21. Remove the hood latch striker (1) and mounting screws (2) from the vehicle hood (3). **Save the hood latch striker (1) and mounting screws (2) for re-installation.**

Fig. 56: Upper Hinge Bracket
Courtesy of CHRYSLER LLC

22. With the aid of an assistant, remove the two bolts (1) from the vehicle hood hinge (3). Repeat steps on opposite side. Remove and discard the vehicle hood (2). **Save the hood hinge bolts for re-installation.**

Fig. 57: Upper Hinge Bracket
Courtesy of CHRYSLER LLC

23. With the aid of an assistant, support and position the hood (2) included in the kit to the two upper hinge brackets (3) on the vehicle.
24. Install and hand tighten the hinge bolts (1). Repeat steps on opposite side.

25. Adjust the kit hood to the correct position, refer to the hood flushness chart. Once the hood is positioned properly, tighten the hood hinge bolts (1) to 28 N.m (21 ft. lbs.). Repeat steps on opposite side.

Fig. 58: Removing/Installing Hood Latch Striker
Courtesy of CHRYSLER LLC

26. Transfer and position the hood latch striker (1) and mounting screws (2) to the underside of the kit hood (3).
27. Install and tighten the two screws (2) that secure the striker to the hood inner reinforcement. Tighten the screws to 28 N.m (21 ft. lbs.).

Fig. 59: Removing/Installing Hood Wiper Nozzles
Courtesy of CHRYSLER LLC

28. Transfer the wiper nozzles (1) into the kit hood.

2679269

Fig. 60: Removing/Installing Hood Wiper Nozzle Hoses
Courtesy of CHRYSLER LLC

29. Connect the wiper hose (2) included in kit to the windshield wiper nozzles (1).
30. Install the wiper hose (2) included in kit to the formed flange of the hood.

2679295

Fig. 61: Identifying Wiper Hose Routing
Courtesy of CHRYSLER LLC

CAUTION: To avoid pinching or cutting the washer hose (1), the washer hose (1) must be installed as shown in illustration with the rear portion of the washer hose (2) fed into the cavity in the shape of a "U".

31. Install the wiper hose (1, 2) to the engine compartment as shown in illustration.

Fig. 62: Identifying Wiper Hose, Reservoir Pump & Washer Fluid Level Sensor
Courtesy of CHRYSLER LLC

32. Connect the wiper hose (2) to the reservoir and fill the reservoir with washer fluid. Run the washers and verify there are no leaks.

Fig. 63: Removing/Installing Vehicle Hood Silencer Pad
Courtesy of CHRYSLER LLC

33. Install the hood silencer pad (2) to the hood using the transferred nine retaining clips (1).
34. Close the hood.

HOOD FLUSHNESS CHART

NOTE:

All measurements are in millimeters.

WiFi ROUTER

300/Charger/CHALLENGER

PROCEDURE STEPS:

657996

Fig. 64: Removing Spare Tire Cover
 Courtesy of CHRYSLER LLC

1. Remove the spare tire cover.

8133b050

Fig. 65: Disconnecting/Connecting Battery Cables
 Courtesy of CHRYSLER LLC

2. Disconnect the negative battery cable. (2)

885422

Fig. 66: Removing/Installing Power Distribution Center (PDC)
 Courtesy of CHRYSLER LLC

3. Remove the Power Distribution Center (PDC) by pressing the releasing tabs (1) and pulling the PDC straight up.

Fig. 67: Locating Circuit
Courtesy of CHRYSLER LLC

4. Remove the back cover of the PDC (2).
5. Locate the F981 (RD/BR) circuit (1) going to fuse 18. Refer to the wire schematic.
6. Measure the appropriate length of wire so that the wire harness will reach the router from the PDC.

Fig. 68: Splice Band
Courtesy of CHRYSLER LLC

1 - SPLICE BAND

7. Remove one-half (1/2) inch of insulation from each wire that needs to be spliced.
8. Place a piece of adhesive lined heat shrink tubing on one side of the wire. Make sure the tubing will be long enough to cover and seal the entire repair area.
9. Place the strands of wire overlapping each other inside of the splice clip (1).

Fig. 69: Crimping Tool
Courtesy of CHRYSLER LLC

1 - CRIMPING TOOL

10. Using crimping tool (1), Mopar p/n 05019912AA, crimp the splice clip and wires together.

Fig. 70: Solder Splice
Courtesy of CHRYSLER LLC

1 - SOLDER
2 - SPLICE BAND
3 - SOLDERING IRON

11. Solder (3) the connection (2) together using rosin core type solder (1) only.

CAUTION: Do not use acid core solder.

Fig. 71: Heat Shrink Tube

Courtesy of CHRYSLER LLC

1 - SEALANT 2 - HEAT SHRINK TUBE

12. Center the heat shrink tubing (2) over the joint and heat using a heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) comes out of both ends of the tubing.
13. Attach the black wire to the negative battery terminal stud.
14. Install the PDC back cover, being careful not to pinch any wires between the PDC and the PDC cover.
15. Install the PDC.
16. Connect the negative battery cable.
17. Install the spare tire cover.

Fig. 72: Securing Wi-Fi Router
Courtesy of CHRYSLER LLC

18. Secure the Wi-Fi Router (1) with the supplied fasteners on the back of the passenger rear seat (2). Measure 230 mm (9.1 in.) from the bottom of the seat back (3) to the top of the Wi-Fi Router.

Fig. 73: Wi-Fi Router Position
Courtesy of CHRYSLER LLC

19. The Wi-Fi Router (3) should be 50 mm (2 in.) from the left edge (1) of the seat back (2).
20. Route and secure the twisted pair wire harness from the PDC to the Wi-Fi Router along the passenger side trunk.
21. Connect the twisted pair wire harness to the router.
22. Verify system operation.

SDARS ANTENNA

DODGE CHALLENGER

PROCEDURE STEPS:

NOTE: Verify that the radio is satellite compatible. Look for the SIRIUS® logo on the radio.

WARNING: Disable the airbag system before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Disconnect and isolate the negative battery (ground) cable. Wait two minutes for the airbag system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the airbag system. Failure to follow these instructions may result in possible serious or fatal injury.

142392

Fig. 74: Removing/Installing Lower Cowl Trim Panel
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove both door opening scuff plates.
3. Remove the A-pillar lower trim cover.
4. Remove the cowl side trim panel.
5. Remove the vehicle left side carpet retainers.

694898

Fig. 75: Steering Column Cover
 Courtesy of CHRYSLER LLC

6. Remove the steering column cover (1) and disconnect the electrical switch.
7. Remove the sound insulator.

Fig. 76: Rear Seat Cushion
Courtesy of CHRYSLER LLC

8. Remove the rear seat cushion.
9. Remove the left side front and rear lower seatbelt anchor bolts.
10. Remove the left rear quarter trim panel.
11. Remove the left inside upper quarter trim panel.
12. Remove the right side front and rear lower seatbelt anchor bolts.

Fig. 77: Removing/Installing Lower Quarter Trim Panel
Courtesy of CHRYSLER LLC

13. Remove the right rear quarter trim panel (2).

14. Remove the right inside upper quarter trim panel.
15. Remove the rear corner interior trim panels.
16. Remove the coat hooks.

CAUTION: Pulling the antenna cable straight out of the radio without pulling on the locking antenna connector could damage the cable or radio.

88012

Fig. 78: Instrument Panel Cover & Center Bezel
Courtesy of CHRYSLER LLC

17. Remove the instrument panel center bezel (1) and disconnect electrical connectors.
18. Remove and disconnect the radio.

8135ba89

Fig. 79: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

19. Remove the overhead console assembly and disconnect the electrical connectors.
20. Remove the sun visor assemblies and disconnect the electrical connectors.
21. Remove the assist handle assembly.

141893

Fig. 80: Removing/Installing A-Pillar Trim Panel
Courtesy of CHRYSLER LLC

22. Remove the upper A-pillar trim panels (2).
23. Release clips and lower the headliner.
24. Locate center line of roof, cut out template as indicated, center template and tape in place.
25. Carefully center punch at the two locations for the antenna mounting holes. Remove and discard template.

Fig. 81: Satellite Radio Antenna
Courtesy of CHRYSLER LLC

26. Drill a 3mm (1/8") pilot hole at the marked locations.
27. Drill a 5mm (13/64 in.) diameter hole at the mark closest to the vehicles rear glass.
28. Using a hole saw, drill a 19mm (3/4") hole at the mark forward of the previous hole drilled at the second mark.
29. Deburr holes and remove rough edges.
30. Clean and prepare bare metal surfaces.
31. Apply primer to bare metal surfaces.
32. Route harness and set antenna in place.
33. Install fastener and tighten to spec.
 - Tighten to 9Nm (80in.lbs.)
34. Connect hard-shell connector.

Fig. 82: Wire Harness Connectors
Courtesy of CHRYSLER LLC

35. Route the antenna cable down the left D-pillar, along the left inner apron along the lower instrument panel brace and up to the radio opening. Secure to the vehicles body electrical harness and lower instrument panel brace.
36. Raise headliner and secure clips.
37. Connect and install both sun visor assemblies.
38. Install the assist handle assembly.

141893

Fig. 83: Removing/Installing A-Pillar Trim Panel
Courtesy of CHRYSLER LLC

39. Install the upper A-pillar trim panels.
40. Connect electrical and install the overhead console.
41. Connect the antenna cable into the open antenna port on the radio.

NOTE: The antenna ports are keyed and color coded for there specific antenna connection.

NOTE: All SDARS antenna connections are Yellow.

813f9aa0

Courtesy of CHRYSLER LLC

54. Install the door opening scuff plates.
55. Connect the negative battery cable.

SDARS VEHICLE CONFIGURATION

Vehicle VIN must be updated with the sales code of the added accessory in order to enable system functionality.

Using the DealerCONNECT website and a scantool, complete the procedure below.

- Log on to [Http://dealerconnect.chrysler.com](http://dealerconnect.chrysler.com).
- In the "Vehicle Options" screen under the "Global Claims System" category in the "Service tab, enter the vehicle VIN and add the sales code **RSC (SIRIUS SATELLITE RADIO)** as a "Dealer Installed option".
- Confirm the new sales code has been successfully added to the VIN.

With the ScanTool connected to both the internet (via Ethernet port or wireless connection) and the vehicle, follow the steps below:

- In the "Initial Start Up" screen select **VEHICLE PREPARATION**
- Toggle down and highlight **RESTORE VEHICLE CONFIGURATION**
- Press **START**
- Press **NEXT**
- If necessary, select proper vehicle line and model year and press **NEXT**
- Confirm correct selection and press **NEXT**
- Enter vehicle VIN using the on screen keyboard or confirm that the Auto Filled VIN plate is correct and press **NEXT**

- Press **OK**
- Enter the user ID, password and dealer code using the one screen keyboard and press **OK**

NOTE: **At this point the ScanTool is downloading the vehicle configuration from the network.**

- Confirm that the new vehicle configuration has been successfully programmed, follow the on screen instructions and press **FINISH**

VALIDATION PROCESS

from the "Initial Start up" screen on the ScanTool follow the steps below:

- Using a ScanTool follow the menu to **ECU VIEW** , select either **TPIMCGW CENTRAL GATEWAY** or **FCMCGW CENTRAL GATEWAY** depending on the vehicle.
- Select **MORE OPTIONS, ECU DETAILS**, and then **CONFIG INFO** .
- Verify **SDARV - - - - SET** is present.
- Drive the vehicle outside for a clear satellite signal to the antenna and verify system operation.

ACCESSORIES AND EQUIPMENT

Navigation/Telecommunication - Service Information - Challenger

DESCRIPTION

DESCRIPTION

TELECOMMUNICATIONS

NOTE: The hands free module is contained with the radio, if equipped with the navigation radio (RER).

The hands-free cellular system uses Bluetooth™ technology to provide wireless communication between the operator's compatible cellular telephone and the vehicle's on-board receiver.

The system uses voice recognition technology to control operation. The incoming voice is broadcast through the vehicle's radio speakers, automatically overriding any other audio signals on the front speakers when the hands-free system is in use. A microphone in the rear view mirror receives the vehicle occupant's voices. If a call is in progress when the ignition is switched off, the hands-free system will continue to operate for up to 45 seconds as part of the Accessory Relay Delay function. Thereafter, the call can continue on the hand-held telephone.

The system will communicate with a telephone that is anywhere within the vehicle. However, covering the hand held phone or the hands-free phone module with a metal object may block the signal. The system will recognize up to seven telephones, each of which is given a spoken identification by the user during the setup process. The system includes Spanish and French voice recognition in addition to English.

Two buttons on the radio, identified with ISO icons, control the system: A "phone" button turns the system on and off; a "voice recognition" (or voice command) button prompts the hands-free system to listen for a voice command.

NAVIGATION

The navigation system offers several new customer features for expanded usability and convenience with hands-free voice-activated operation in addition to the touch screen buttons. The navigation system uses the Bluetooth microphone in the rear view mirror. Navigation routes can be based on a variety of formats including some of the following:

- Destination entry by street intersection, city, zip code, street name, street address and number, state/province/country and phone number
- Stop/change route
- Save current position
- Personal menu, including Guide Me Home (Go Home), Trip Itinerary, List of Saved Locations, Favorite Points of Interest (from a data base), Manage Personal User and Choose User

- Personal Interests including recent routes, address book, Where Am I Now, Emergency (police stations, Dodge dealerships, fire stations, hospitals and emergency care centers), Trail and geo- coordinates
- Route options include shortest, quickest, maximize freeways, minimize freeways, avoid toll roads and avoid ferries
- Navigation can be put into DEMO mode to enhance trip planning

This navigation system will support Traffic Messaging. Traffic Messaging displays voice and pop up warning messages for medium and high priority situations on the route such as road closures due to accidents/hazardous situations and it can even generate a traffic detour for a traffic event located on the route.

OPERATION

OPERATION

TELECOMMUNICATION

Two buttons on the radio, identified with ISO icons, control the system: A "phone" button turns the system on and off; a "voice recognition" (or voice command) button prompts the hands-free system to listen for a voice command. The system includes the following features:

- Phonebook - Stores telephone numbers for later recall by name or other verbal identification, called a voice tag, and memory location.
- Four memory locations - Home, Work, Cellular and Pager. A maximum of 32 unique names or voice tags may be stored at the same time, with a different number in each of the four memory locations.
- Voice tag dialing - Dials the number associated with a voice tag and memory location.
- Digit dialing - Dials the telephone number by recognizing the names of the digits as they are spoken.
- Receiving calls - A voice prompt notifies the user of an incoming call. A voice response accepts or rejects the call without manual intervention.
- Privacy Mode - Switches the call to the handheld telephone and the hands-free system and back again using the "voice recognition" (or "voice command") button and a voice command, if desired.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TELECOMMUNICATION

Any diagnosis of the Telecommunication system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

WARNING: On vehicles equipped with airbags, refer to SERVICE INFORMATION before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to take the proper precautions could result in accidental airbag deployment and possible personal injury.

TELECOMMUNICATION SYSTEM DIAGNOSIS

CONDITION	POSSIBLE CAUSE	CORRECTION
Phone Not Available	1. Bluetooth™ phone not paired to the system.	1. Ensure that phone(s) are paired to the system.
	2. Bluetooth™ phone not present or turned OFF.	2. Make sure paired phone is present, turned ON and that the Bluetooth™ option is enabled on the phone.
	3. Bluetooth™ phone has low battery.	3. At low battery levels, some phones will turn off Bluetooth™ functionality. Ensure cellular phone is charged to an adequate level.
Phone Pairing Failed	1. Phone does not support Hands Free Profile	1. The Telecommunication system requires the cellular phone to be Bluetooth™ enabled, as well as supporting the Hands Free Profile. The customer will have to upgrade their phone to one supporting Hands Free Profile. A list of suggested phones is available at: http://www.chrysler.com/uconnect .
	2. Phone not Bluetooth™ enabled.	2. The Telecommunication system requires the cellular phone to be Bluetooth™ enabled. A list of suggested phones is available at: http://www.chrysler.com/uconnect .
	3. PIN entered on the phone is not the same as PIN spoken to the system.	3. The PIN spoken to the system must be the same PIN entered into the phone.
	4. Phone has reached maximum number of allowed devices paired.	4. Remove one of the previously paired devices from it's list.
Poor Voice Recognition	1. Microphone failure	1. Using a scan tool, check for microphone fault codes.
	2. Customer not waiting for the beep before speaking.	2. Ensure customer is waiting for the system "beep" prior to beginning the speech to be recognized.
	3. Customer not speaking in a smooth normal manner.	3. Verify that the customer is attempting to use the system with a smooth consistent voice. The system is designed to accept normal speech spoken at a normal tone, some people tend to speak to a computer loud and slow, which results in reduced

		performance.
-	4. Rear view mirror not properly attached to mounting.	4. Mirror must be firmly mounted to the mounting location. Ensure that mirror is tightened to the specified torque.
-	5. High levels of noise in vehicle compartment	5. System performance is increased when noise conditions in the vehicle are lowered. Ideal conditions include windows closed.
-	6. Object interfering with microphone input	6. Verify that there is no object, hanging from the mirror, that could be obstructing the microphone.
-	7. User not saying "send" after a pager dialing request	7. User must say "send" at the end of a Pager Dialing request.
-	8. Other passengers talking while customer is attempting to use the system	8. Although designed for primary use by the driver, the microphone will pick up passengers in any seat of the vehicle. System performance is increased in low noise environments.
Phonebook names not recognized consistently	1. Phonebook names recorded in high noise conditions	1. For increased system performance, it is recommended that the phone book entries are recorded in a low noise environment. That is, vehicle in park, with windows up.
-	2. Phonebook name (s) short	2. For increased performance it is recommended that the user use both first and last name as a phonebook entry. Example " James Johnson" as opposed to "James".
-	3. Phonebook names recorded by another user	3. It is recommended that each user of the system record their own phonebook entries. This will increase the recognition performance.
-	4. Similar names in phonebook	4. For increased system performance it is recommended that the user do not enter similar sounding names in the phonebook.
-	5. Object interfering with microphone input	5. Object interfering with microphone input.
Poor Phone audio quality.	1. Microphone failure	1. Use a scan tool, and check for Microphone faults.
-	2. Rear view mirror not properly fixed to mounting button	2. Mirror must be firmly mounted to the mounting location. Tighten mirror to the specified torque.
-	3. System being used in high noise conditions	3. System performance is increased when noise conditions in the vehicle are lowered. Ideal conditions include windows closed.
No Phone Audio	1. Phone setting	1. Route audio to "Hands free" device.

	cause phone audio to be routed to handset.

ANTENNA, NAVIGATION

REMOVAL

REMOVAL

Fig. 1: Locating Navigation Antenna & Fasteners
Courtesy of CHRYSLER LLC

1. Remove the radio. Refer to **Electrical - Audio and Video/Audio and Video/RADIO - Removal** .
2. Remove the instrument cluster. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Removal** .
3. Remove the navigation antenna fasteners (1).
4. Remove the navigation antenna (2) from the vehicle.

INSTALLATION

INSTALLATION

Fig. 2: Locating Navigation Antenna & Fasteners
 Courtesy of CHRYSLER LLC

1. Install the navigation antenna (2) into the vehicle.
2. Install the navigation antenna fasteners (1).
3. Install the instrument cluster. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Installation** .
4. Install the radio. Refer to **Electrical - Audio and Video/Audio and Video/RADIO - Installation** .

MODULE, HANDS FREE (HFM)

REMOVAL

REMOVAL

Fig. 3: Disconnecting/Connecting Hands Free Module Connector
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove the glove box.
3. Disconnect the electrical harness connector.

Fig. 4: Removing/Installing Hands Free Module
Courtesy of CHRYSLER LLC

4. Remove the mounting fasteners
5. Remove the hands free module.

INSTALLATION

INSTALLATION

Fig. 5: Removing/Installing Hands Free Module

2. Connect wire harness connector.
3. Install glove box.
4. Connect battery negative cable.

ACCESSORIES AND EQUIPMENT

Overhead Console - Service Information - Challenger

DESCRIPTION

DESCRIPTION

Fig. 1: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

An overhead console is standard on this vehicle and includes the following components:

- Overhead storage compartment (1)
- Front map/reading lamps (2)
- Power sunroof switch (3) - if equipped
- Universal transmitter (4)
- Electronic Overhead Module

Fig. 2: Retaining Screws
 Courtesy of CHRYSLER LLC

The overhead console assembly is mounted by three snap clips (1) securing it to a molded plastic retainer bracket located above the headliner. The Electronic Overhead Module is secured to the overhead console with screws (2).

REMOVAL

REMOVAL

Fig. 3: Identifying Overhead Console Components
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Pull downward on the sides of the overhead console housing firmly and evenly to disengage the snap clips from the overhead console bracket.

Fig. 4: Harness Connectors
Courtesy of CHRYSLER LLC

3. Lower the overhead console from the headliner far enough to access the wire harness connectors (2).
4. Disconnect the roof wire harness connectors (2) from the overhead console wire harness connector.
5. Remove the overhead console from the headliner.

INSTALLATION

INSTALLATION

Fig. 5: Harness Connectors
Courtesy of CHRYSLER LLC

1. Position the overhead console near the mounting location on the headliner.
2. Reconnect the roof wire harness connectors (2) to the overhead console.
3. Align the snap clips on the overhead console housing with their receptacles (1) in the overhead console bracket.
4. Push upward firmly and evenly on the sides of the overhead console housing over the snap clip locations until the snap clip is fully engaged with its receptacle in the overhead console bracket.
5. Reconnect the battery negative cable.

SENSOR, AMBIENT TEMPERATURE

DESCRIPTION

DESCRIPTION

938C-10

Fig. 6: Ambient Temperature Sensor
Courtesy of CHRYSLER LLC

The ambient temperature sensor is a variable resistor type sensor. It is mounted to the lower front fascia behind the radiator grille and in front of the engine compartment.

The ambient temperature sensor cannot be adjusted or repaired and, if inoperative or damaged, it must be replaced.

OPERATION

OPERATION

The ambient temperature sensor is a variable resistor that operates on a five-volt reference signal sent by the Totally Integrated Power Module (TIPM). The resistance in the sensor changes as temperature changes, changing the temperature sensor signal circuit voltage to the TIPM. Based upon the resistance in the sensor, the TIPM senses a specific voltage on the temperature sensor signal circuit. The TIPM then translates the voltage into a temperature reading that it sent over the Controller Area Network (CAN) data bus to other modules utilizing temperature information.

DIAGNOSIS AND TESTING

AMBIENT TEMPERATURE SENSOR

The temperature function is supported by the ambient temperature sensor, a wiring circuit, and the Front Control Module (FCM). If any portion of the ambient temperature sensor circuit fails or if the Controller Area Network (CAN) data bus information is missing, a (- -) will appear in the Electronic Vehicle Information Center (EVIC) display in place of the temperature. When the sensor is exposed to temperatures above 55°C (130°F), or if the sensor circuit is shorted, 55°C (130°F) will appear in the EVIC display in place of the temperature. When the sensor is exposed to temperatures below - 40°C (- 40°F) or if the sensor circuit is open, - 40°C (- 40°F) will appear in the EVIC display.

NOTE: **The system displays the last known temperature when starting the vehicle and may take some time/mileage to update to an accurate current reading, up to 5 minutes at a maintained speed above 40 mph (64.3 kph). Customers with very short commutes may not get an updated reading before the vehicle is turned off, or if the ignition does not remain in the OFF position for more than 255 minutes (4hrs. 15min.). This strategy was intended to eliminate wildly fluctuating readings and may cause some customer confusion leading to unnecessary diagnostics/parts replacements.**

The ambient temperature sensor circuit can be diagnosed using the following Sensor Test, and Sensor Circuit Test. If the temperature sensor and circuit are confirmed to be OK, but the temperature display is inoperative or incorrect, test the EVIC operation. Refer to **Electrical/Message Center/CENTER, Electronic Vehicle Information - Diagnosis and Testing** .

SENSOR TEST

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the ambient temperature sensor harness connector.
2. Measure the resistance of the ambient temperature sensor. At - 40° C (- 40° F), the sensor resistance is 336 kilohms. At 55° C (130° F), the sensor resistance is 2.488 kilohms. The sensor resistance should read between these two values. If OK, refer to **SENSOR CIRCUIT TEST** in this service information. If not OK, replace the inoperative ambient temperature sensor.

SENSOR CIRCUIT TEST

Refer to **SYSTEM WIRING DIAGRAMS** for complete circuit schematic or connector pin-out information.

1. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Disconnect the wire harness connectors from the ambient temperature sensor and the FCM.
2. Connect a jumper wire between the two terminals in the body half of the ambient temperature sensor harness connector.
3. Check for continuity between the sensor return circuit and the ambient temperature sensor signal circuit cavities of the FCM harness connector. There should be continuity. If OK, go to 4. If not OK, repair the open sensor return circuit or ambient temperature sensor signal circuit to the ambient temperature sensor as required.
4. Check for continuity between the ambient temperature sensor signal circuit cavity of the FCM harness connector and a good ground. There should be no continuity. If OK, test the EVIC operation. Refer to **Electrical/Message Center/CENTER, Electronic Vehicle Information - Diagnosis and Testing** . If not OK, repair the shorted ambient temperature sensor signal circuit as required.

REMOVAL

REMOVAL

1. Disconnect and isolate the battery negative cable.
2. Remove the belly pan. Refer to **Body/Exterior/BELLY PAN - Removal** .

Fig. 7: Ambient Temperature Sensor Connector
Courtesy of CHRYSLER LLC

3. Disconnect the wire harness connector (1) from the ambient temperature sensor (2).

Fig. 8: Ambient Temperature Sensor Fastener
Courtesy of CHRYSLER LLC

4. Remove the fastener that secures the ambient temperature sensor bracket to the front fascia.
5. Remove the ambient temperature sensor from the vehicle.

INSTALLATION

INSTALLATION

Fig. 9: Ambient Temperature Sensor Fastener
 Courtesy of CHRYSLER LLC

1. Position the ambient temperature sensor in the vehicle.
2. Install the fastener that secures the ambient temperature sensor to the front fascia.

Fig. 10: Ambient Temperature Sensor Connector
 Courtesy of CHRYSLER LLC

3. Connect the wire harness connector (1) to the ambient temperature sensor (2).
4. Install the belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .
5. Connect the battery negative cable.

ACCESSORIES AND EQUIPMENT

Power Distribution - Challenger

DESCRIPTION

DESCRIPTION

CAUTION: Within the power distribution system there are replaceable diodes that can be installed incorrectly. Ensure when replacing a diode that it is inserted in the correct orientation.

The power distribution system for this vehicle consists of the following components:

- Cigar Lighter Outlet
- Totally Integrated Power Module (TIPM) - located underhood
- Power Distribution Center (PDC) - located in trunk
- Power Outlets

Refer to the appropriate **SYSTEM WIRING DIAGRAMS** for complete circuit schematics.

The power distribution system also incorporates various types of circuit control and protection features, including:

- Automatic resetting circuit breakers
- Blade-type fuses
- Cartridge fuses
- Relays
- Mini fuses

OPERATION

OPERATION

The power distribution system for this vehicle is designed to provide safe, reliable, and centralized distribution points for the electrical current required to operate all of the many standard and optional factory-installed electrical and electronic powertrain, chassis, safety, security, comfort and convenience systems. At the same time, the power distribution system was designed to provide ready access to these electrical distribution points for the technician to use when conducting diagnosis and repair of inoperative circuits. The power distribution system can also prove useful for the sourcing of additional electrical circuits that may be required to provide the electrical current needed to operate many accessories that the vehicle owner may choose to have installed.

CENTER, POWER DISTRIBUTION (PDC)

DESCRIPTION

DESCRIPTION

Fig. 1: Power Distribution Center
Courtesy of CHRYSLER LLC

The majority of electrical system fuses and relays are housed in the two Power Distribution Centers (PDC). One is located in the engine compartment, the Totally Integrated Power Module (TIPM). See **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Description**. The PDC is located next to the battery in the rear of the vehicle. The PDC located next to the battery is replaced only as part of the body wiring harness.

For fuse description and layout. Refer to **Vehicle Quick Reference/Fuse Locations and Types - Specifications**.

MODULE, TOTALLY INTEGRATED POWER (TIPM)

DESCRIPTION

DESCRIPTION

The majority of electrical system fuses and relays are housed in the Totally Integrated Power Module (TIPM) located in the engine compartment and the rear Power Distribution Center (PDC) next to the battery in the trunk of the vehicle. For the rear PDC. See **Electrical - Wiring/Power Distribution/CENTER, Power Distribution (PDC) - Description**.

For fuse description and layout. Refer to **Vehicle Quick Reference/Fuse Locations and Types -**

Specifications .

STANDARD PROCEDURE

PROGRAMMING

1. Install a battery charger.
2. Verify that the charging rate provides approximately 13.5 volts.

**NOTE: Do not allow the charger to time out during the reconfiguration process.
 Set the battery charger timer (if so equipped) to continuous charge.**

3. Connect the CH9410 StarSCAN ethernet cable to the StarSCAN and the dealer's network drop.
4. Connect the CH9404 StarSCAN vehicle cable to the StarSCAN and the vehicle.
5. Place the Ignition in the "RUN" position, then Power "ON" the StarSCAN.
6. Select "ECU View".
7. Select "TIPMCGW" or "FCMCGW".
8. Select "MISC".
9. Select "Restore Vehicle Configuration".
10. Follow prompts on StarSCAN to complete the reconfigure procedure.
11. Once complete, Wait one minute and turn the ignition key to the "OFF" position.
12. Remove the StarSCAN unit, cable and charger from the vehicle.
13. Verify proper operation.

REMOVAL

REMOVAL

262199

Fig. 2: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable (2).

Fig. 3: Disconnecting/Connecting Negative Battery Cable
 Courtesy of CHRYSLER LLC

2. Open the positive battery cable nut cover to expose nut.
3. Remove the battery cable nut and the battery cable from the Totally Integrated Power Module (TIPM).

Fig. 4: Integrated Power Module

Courtesy of CHRYSLER LLC

4. Disengage the outboard retaining clip, and rotate the TIPM to access wire harness connectors.
5. Disconnect the wire harness connectors from TIPM.
6. Disengage the two inboard retaining clips.

Fig. 5: Removing TIPM From Vehicle
Courtesy of CHRYSLER LLC

7. Remove the TIPM from vehicle.

INSTALLATION

INSTALLATION

Fig. 6: Positioning TIPM Retaining Clips
Courtesy of CHRYSLER LLC

CAUTION: The original Cab Compartment Node (CCN) and Powertrain Control Module (PCM) must be installed and functioning properly prior to powering up the new Totally Integrated Power Module (TIPM). The TIPM receives vehicle configuration data from the CCN and Vehicle Identification Number information from the PCM. If configuration information becomes lost or corrupted, the data can be obtained from Dealer CONNECT

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position Totally Integrated Power Module (TIPM) to vehicle. Engage the three retaining clips.

6. Connect negative battery cable (2).
7. Insert the ignition key and turn it to the RUN position and wait twenty seconds. The TIPM will collect the necessary vehicle configuration and VIN data from the CCN and PCM at this time. After twenty seconds turn the ignition key to the OFF position and then back to the ON position and verify proper vehicle systems operation.

OUTLET, POWER

DESCRIPTION

DESCRIPTION

Sedans are equipped with two 12-volt electrical outlets. Five-door models are equipped with three 12-volt electrical outlets. The outlets are located in the following locations:

- Cargo area right quarter trim panel (Five-door models only).
- Inside the center console.
- Next to the ash receiver in the center stack.

The outlets in the console and quarter trim panel have power at all times, and include tethered

covers. The outlet in the ash receiver tray is shipped with power available only when the ignition is in the ON position. This outlet can be changed to provide power at all times by moving a fuse in the fuse block.

REMOVAL

REMOVAL

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Pull the cigar lighter knob and element out of the cigar lighter receptacle base, or unsnap the protective cap from the power outlet.
3. Look inside the cigar lighter or power outlet and note the position of the rectangular retaining bosses of the mount that secures the receptacle base.
4. Insert a pair of external snap ring pliers into the cigar lighter or power outlet receptacle base and engage the tips of the pliers with the retaining bosses of the mount.
5. Squeeze the pliers to disengage the mount retaining bosses from the receptacle base and, using a gentle rocking motion, pull the pliers and the receptacle base out of the mount.
6. Pull the receptacle base away far enough to access the wire harness connector.
7. Disconnect the wire harness connector from the cigar lighter or power outlet.
8. Remove the cigar lighter or power outlet.

INSTALLATION

INSTALLATION

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Connect the wire harness connector to the cigar lighter or power outlet receptacle base connector receptacle.
2. Install the cigar lighter or power outlet mount into position.
3. Align the splines on the outside of the cigar lighter or power outlet receptacle base connector receptacle with the grooves on the inside of the mount.
4. Press firmly on the cigar lighter or power outlet receptacle base until the retaining bosses of the mount are fully engaged in their receptacles.
5. Install the cigar lighter knob and element into the cigar lighter receptacle base, or the protective cap into the power outlet receptacle base.
6. Connect the battery negative cable.

ACCESSORIES AND EQUIPMENT

Power Locks - Service Information - Challenger

DESCRIPTION

PASSIVE ENTRY SYSTEM

Fig. 1: Passive Entry Module (PEM)
Courtesy of CHRYSLER LLC

The Passive Entry Module (PEM) is located in the passenger compartment of the vehicle, secured to the back side of the instrument panel above the glove box. The PEM communicates between the FOB with Integrated Key (FOBIK) and other vehicle modules for specific system use.

POWER LOCKS

The power lock system allows all of the doors and liftgate to be locked or unlocked electrically by operating a switch on either front door trim panel. The power lock system receives a non-switched battery current through a fuse in the Junction Block (JB), so that the power locks remain operational, regardless of the ignition switch position.

The instrument cluster locks the doors automatically when the vehicle speed exceeds 25.7 Km/h (15 mph), all doors are closed and the accelerator pedal is pressed. The rolling door lock feature can be disabled through the EVIC.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences.

The power lock system for this vehicle can also be operated remotely using the Remote Keyless Entry (RKE) transmitters.

CENTRAL LOCKING/UNLOCKING

The central locking system controls powered operation of the door, liftgate locks and the illuminated entry system. Central locking includes the following features:

- Automatic locking of the doors and liftgate when the vehicle speed exceeds approximately 25 km/h (15 mph).
- Locking prevention with a door lock switch or the RKE transmitter, if the key is in the ignition switch and the driver's door is open.
- Driver selectable unlocking mode: Unlocks only the driver's door or all doors and the liftgate, with one press of the RKE transmitter unlock button. The driver's door cylinder can also be used to unlock the door. One turn of the cylinder will unlock the driver's door, two turns within five seconds unlocks all doors.
- Automatic illumination of the interior courtesy lamps when the vehicle is unlocked.
- Locking all doors and the liftgate by pressing the lock button on the RKE transmitter, or by pressing a lock switch on one of the front doors.

DOOR LOCK MOTORS

The lock mechanisms are actuated by a reversible electric motor mounted within each door. The power lock motors are integral to the door latch units.

The power lock motors cannot be adjusted or repaired. If inoperative or damaged, the door latch unit must be replaced.

REMOTE KEYLESS ENTRY

The Remote Keyless Entry (RKE) system locks and unlocks the doors and liftgate, turns on the interior lamps, and arms and disarms the Vehicle Theft Security System (if equipped). The RKE system operates on non-switched battery current through a fuse in the Integrated Power Module (IPM), so that the system remains operational regardless of the ignition switch position.

The RKE transmitters are also equipped with a Panic button. If the Panic button on the RKE transmitter is pressed, the horn will sound and the exterior lights flash on the vehicle for about three minutes or until the Panic button is pressed a second time. A vehicle speed of approximately 25.7 kilometers-per-hour (15 miles-per-hour) also cancels the panic event.

The RKE system can also perform other functions on this vehicle. If the vehicle is equipped with the optional Vehicle Theft Security System (VTSS), the RKE transmitter arms the VTSS when the Lock button is pressed and disarms the VTSS when the Unlock button is pressed.

The RKE system includes two transmitters when the vehicle is shipped from the factory, but the system can retain the vehicle access codes of up to a total of eight transmitters. The transmitter codes are retained in the RKE module memory, even if the battery disconnects. If an RKE transmitter is faulty or lost, new transmitter vehicle access codes can be programmed into the system using a scan tool.

This vehicle also offers several customer programmable features, which allows the selection of several optional electronic features to suit individual preferences. Customer programmable feature

options affecting the RKE system include:

- **Remote Unlock Sequence** - Allows the option of having only the driver side front door unlock when the RKE transmitter Unlock button is pressed the first time. The remaining doors unlock when the button is pressed a second time within five seconds of the first unlock press. Another option is having all doors and liftgate unlock upon the first pressing of the RKE transmitter Unlock button.
- **Sound Horn on Lock** - Allows the option of having the horn sound a short chirp as an audible verification that the RKE system received a valid Lock request from the RKE transmitter or having no audible verification.
- **Flash Lights with Lock and Unlock** - Allows the option of having the park lamps flash as an optical verification that the RKE system received a valid Lock request or Unlock request from the RKE transmitter or having no optical verification.
- **Programming Additional Transmitters** - Allows up to a total of eight transmitter vehicle access codes to be stored in the receiver memory.

Certain functions and features of the RKE system rely upon resources shared with other electronic modules in the vehicle over the CAN data bus network. For diagnosis of these electronic modules or of the data bus network, the use of a scan tool and the appropriate diagnostic service information are required.

OPERATION

PASSIVE ENTRY SYSTEM

The Passive Entry Module (PEM) transmits low frequency signals and receives very high frequency signals through the hardwired antennas. The low frequency and very high frequency signals are used to locate available authentic Fob with Integrated Key (FOBIK) (s) inside and outside the vehicle. Once an authentic FOBIK is found, the PEM communicates to other vehicle modules for specific system use.

POWER LOCKS

The instrument cluster locks or unlocks the doors when an actuation input signal from a door lock switch or Remote Keyless Entry (RKE) transmitter is received. The instrument cluster turns on the output drivers and provides a voltage level to the door lock motor for a specified time. All passenger doors locks or unlocks using a mechanical button mounted on the door trim panel. The drivers door locks or unlocks by using the key cylinder.

DOOR LOCK MOTORS

The door lock motors are controlled by the instrument cluster. A positive and negative battery connection to the two motor terminals, causes the motor to move in one direction. Reversing the current causes the motor to move in the opposite direction.

REMOTE KEYLESS ENTRY

- **LOCK** : Pressing the LOCK button locks all doors, sounds horn (chirp) once if enabled, flashes the park lamps once if enabled and arms the Vehicle Theft Security System (VTSS), if enabled. The chirp verifies that the instrument cluster has sent a message for door lock operation. If a door has not been closed before pressing the LOCK button, the vehicle may not be secured and the VTSS (if equipped) will not arm until the door closes.
- **UNLOCK** : Pressing the UNLOCK button once unlocks the driver's door first if enabled, flashes the park lamps twice if enabled, activates the illuminated entry system and disarms the Vehicle Theft Security System (VTSS), if equipped. Pressing the UNLOCK button twice within five seconds unlocks all doors, if driver's door first enables.
- **PANIC** : Pressing the PANIC button sounds the horns at half second intervals, flashes the exterior lamps and turns ON the interior lamps. The panic alarm remains on for three minutes or until either the PANIC button is actuated again or the vehicle speed exceeds 25.7 Km/h (15 mph) which cancels the panic event.

DIAGNOSIS AND TESTING

POWER LOCKS

The most reliable, efficient, and accurate means to diagnose the power lock system requires the use of a scan tool and the proper Diagnostic Procedures information.

Refer to **SYSTEM WIRING DIAGRAMS** .

Following are tests that will help to diagnose the hard wired components and circuits of the power lock system. However, these tests may not prove conclusive in the diagnosis of this system. In order to obtain conclusive testing of the power lock system, the CAN data bus network must be checked.

PRELIMINARY DIAGNOSIS

As a preliminary diagnosis for the power lock system, note the system operation while you actuate both the Lock and Unlock functions with the power lock switches and with the Remote Keyless Entry (RKE) transmitter. Then, proceed as follows:

- If the entire power lock system fails to function with either the power lock switches or the RKE transmitter, check the fuse in the Junction Block (JB).
- If the power lock system functions with both power lock switches, but not with the RKE transmitter, proceed to diagnosis of the Remote Keyless Entry (RKE) system.
- If the power lock system functions with the RKE transmitter, but not with one or both power lock switches, proceed to diagnosis of the door lock switches.
- If the driver side power lock switch operates only the driver side front door power lock motor, but all other power lock motors operate with the passenger side power lock switch or the RKE transmitter, use a scan tool and the appropriate diagnostic information to diagnose the CAN data bus.
- If only one power lock motor fails to operate with both power lock switches and the RKE transmitter, use a scan tool and the appropriate diagnostic information to diagnose the CAN

data bus.

ANTENNA, PASSIVE ENTRY

DESCRIPTION

DESCRIPTION

208479

Fig. 2: Passive Entry Antenna
Courtesy of CHRYSLER LLC

The passive entry antennas are identical in construction and calibration. The antennas are located throughout the passenger compartment. The location and number of antennas vary depending on the amount of coverage needed. On this vehicle there are two antennas used. One is located on the back side of the instrument panel under the radio, and the second antenna is located under the rear seat cushion.

OPERATION

OPERATION

The passive entry antennas communicate the identity of the FOB with Integrated Key (FOBIK) and its location for use with the Keyless Go (KG) and Passive Entry System (PES), if equipped. The passive entry antennas receive the wirelessly transmitted signals from the FOBIK and then transfer those signals to the Passive Entry Module (PEM).

5. Connect the Negative Battery Cable.

SWITCH, LOCK, WITH WINDOW SWITCHES

DESCRIPTION

DESCRIPTION

A window/lock switch located in each front door trim panel. The driver's side window/lock switch includes the following:

- **Power Lock Switch** - A two-way, momentary, resistor multiplexed switch to control the power lock system.
- **Power Window Lockout Switch** - A two-way, latching, push-button switch allows the vehicle operator to lock out the power window switches on each passenger door so that the passenger door power windows may be operated only from the master switches.
- **Power Window Switches** - A two-way, momentary power window switch for the driver side front door also has a second detent in the Down direction and internal circuitry to provide an

Auto-Down feature for the driver side front door power window. In addition to the power window switch for its own door, the window/lock switch houses individual master switches for each passenger door power window.

The passenger side window/lock switch includes the following:

- **Power Lock Switch** - A two-way, momentary, resistor multiplexed switch to control the power lock system.
- **Power Window Switch** - A two-way, momentary power window switch for the passenger side front door.

OPERATION

OPERATION

The driver side window/lock switch combines a power lock switch, a driver power window switch with an Auto-down feature, master switches for each passenger door power window, a power window lockout switch, a power mirror selector switch, and four power mirror adjustment switches in a single assembly. The switches in the window/lock switch can be diagnosed using conventional diagnostic tools and methods.

Power Lock Switch

The power lock switch circuitry is connected in series between ground and the driver door switch mux input of the instrument cluster (without memory). If equipped with the memory system, the circuitry is connected to the memory mirror module. Each power lock switch position (Lock, Unlock, and Neutral) provides a different resistance value to the instrument cluster or memory mirror input, which allows the instrument cluster or memory module to sense the switch position. Based upon the power lock switch input, the instrument cluster or memory module controls the battery and ground feed outputs to the individual power lock motors to lock or unlock the door latches. The Light-Emitting Diode (LED) in the power lock switch is connected to battery current through the power window circuit breaker in the Integrated Power Module (IPM) on a fused ignition switch output (run-acc) circuit so that the switch will be illuminated whenever the ignition switch is in the On or Accessory positions.

Power Window Switches

The power window switch circuitry is connected to battery current through a circuit breaker in the Integrated Power Module (IPM) on a fused ignition switch output (run-acc) circuit so that the power windows will operate whenever the ignition switch is in the On or Accessory positions. Each two-way, momentary master passenger power window switch in the window/lock switch provides battery current and ground to the individual power window switches on each passenger door so that the power window switch controls the battery current and ground feeds to its respective power window motor. The switch for the driver side front door power window includes an auto-down feature. When this switch is depressed to a second momentary detent position and released, the driver door power window is automatically operated through an internal circuit and relay to its fully lowered position. The Auto-down event is cancelled if the switch paddle is depressed a second time in either the Up or Down direction. When the two position window lockout switch in the window/lock switch is depressed and latched in the lockout position, the battery current feed to each of the individual passenger power

window switches is interrupted so that the passenger door power windows can only be operated from the switches in the window/lock switch. The window lockout switch also controls the battery current feed for the LED in each passenger power window switch so that the switch will not be illuminated when it is locked out.

REMOVAL

REMOVAL

309192

Fig. 7: Window/Lock Switch
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical/Battery System - Standard Procedure .

1. Disconnect and isolate the negative battery cable.
2. Remove the door trim panel. Refer to Body/Door - Front/PANEL, Door Trim - Removal .
3. Using a flat-bladed tool, remove the window/lock switch (2) from the door trim panel.

INSTALLATION

INSTALLATION

309192

Fig. 8: Window/Lock Switch

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical/Battery System - Standard Procedure .

1. Install window/lock switch (2) to door trim panel and snap into place.
2. Install door trim panel. Refer to Body/Door - Front/PANEL, Door Trim - Installation .
3. Connect negative battery cable.

TRANSMITTER, INTEGRATED KEY FOB

DIAGNOSIS AND TESTING

REMOTE KEYLESS ENTRY TRANSMITTER

114508

Fig. 9: Radio Frequency Detector 9001
Courtesy of CHRYSLER LLC

Using special tool 9001, first test to ensure that the transmitter is functioning. Typical testing distance is 2.5 centimeters (1 inch) for Asian transmitters and 30.5 centimeters (12 inches) for all others. To test, position the transmitter as shown in illustration. Press any transmitter button, then test each button individually. The tool will beep if a radio signal strength that lights five or more LEDs is detected. Repeat this test three times. If transmitter fails any of the test refer to the proper Diagnostic Procedures information.

FOBIK TRAPPED IN WIN

The Fob with Integrated Key (FOBIK) cannot be rotated to the LOCK position, allowing it to be removed from the ignition switch also referred to as the Wireless Ignition Node/WIN. The automatic transmission or transaxle is shifted mechanically through a cable from the gearshift lever mechanism to the transmission or transaxle valve body. A gated park switch is physically located on and integral to the gearshift lever mechanism and is hard wired directly to the WIN. The gated park switch is a simple plunger-like actuated open or closed contact switch that could be considered redundant to the Transmission Range Sensor (TRS) except that it monitors the position selected with the gearshift lever, while the TRS monitors the position or gear of the transmission or transaxle that is actually engaged. A damaged or improperly adjusted gearshift cable could result in a different gear being engaged than that which is selected. The WIN uses the gated park switch input to control an internal key lock solenoid, which controls whether the FOBIK can be rotated to the LOCK position. When the gearshift lever is not in the PARK position, the gated park switch is a closed circuit, the key lock solenoid is energized and the FOBIK cannot be rotated to the LOCK position for removal.

CONDITION	POSSIBLE CAUSES	CORRECTION
	1. Damaged, binding or improperly adjusted	1. Inspect and replace or adjust gearshift

CANNOT TURN FOB/K TO LOCK POSITION	gearshift cable.	cable, if required.
	2. Damaged or binding gearshift lever mechanism.	2. Inspect and replace or adjust gearshift lever mechanism.
	3. No gated park switch input to WIN.	3. Use a diagnostic scan tool with software release version 8.05 or greater to read and confirm no gated park switch input to the WIN. Refer to the appropriate CONDITION that follows.
	4. Key lock solenoid (WIN) unresponsive to gated park switch input.	4. Use a diagnostic scan tool with software release version 8.05 or greater to read and confirm gated park switch input to the WIN. Refer to the appropriate CONDITION that follows.
NO GATED PARK SWITCH INPUT	1. Open TRS park signal circuit.	1. Repair the open TRS park signal circuit between the gated park switch (gearshift lever mechanism) and the WIN, if required
	2. Damaged or ineffective gated park switch.	2. Replace the damaged or ineffective gated park switch (gearshift lever mechanism), if required.
KEY LOCK SOLENOID UNRESPONSIVE TO GATED PARK SWITCH INPUT	1. Damaged or ineffective key lock solenoid.	1. Replace the damaged or ineffective key lock solenoid (WIN), if required.

STANDARD PROCEDURE

FOBIK TRANSMITTER BATTERY REPLACEMENT

FOBIK WITH BATTERY COVER

1953754

Fig. 10: FOBK With Battery Cover
Courtesy of CHRYSLER LLC

NOTE: Do not disturb the metal terminal near the battery. Avoid touching the new battery. Skin oils may cause battery deterioration. If battery are touched, clean with rubbing alcohol.

To replace the FOBK transmitter battery:

1. Using a small flat bladed tool, carefully remove the battery cover on the back of the FOBK.

1953797

Fig. 11: FOBIK With Battery Cover Removed
Courtesy of CHRYSLER LLC

2. Remove the battery one at a time by slightly lifting up and sliding out from the FOBIK.
3. Replace the battery with the same type of battery cell.
4. Install the battery with the positive terminal up.
5. Install battery cover and snap into place.
6. Test FOBIK operation.

FOBIK WITHOUT BATTERY COVER

Fig. 12: FOBIK Without Battery Cover
Courtesy of CHRYSLER LLC

NOTE: Do not disturb the metal terminal near the battery. Avoid touching the new battery. Skin oils may cause battery deterioration. If battery are touched, clean with rubbing alcohol.

This design is a clam shell design whereby both halves are split apart.

1. Remove the valet/spare key from the FOBIK if present.
2. Using a trim stick C-4755 or equivalent, carefully separate the top half from the bottom half.

Fig. 13: FOBIK Without Battery Cover Separated
Courtesy of CHRYSLER LLC

3. Lift up on the battery to remove.
4. Replace battery with the same type of cell.
5. Install new battery negative side up.
6. Snap the top and bottom halves together.
7. Test FOBIK operation.

FOBIK PROGRAMING

Make sure instructions are followed in order, refer to **RECEIVER, WIRELESS IGNITION NODE** .

SPECIFICATIONS

SPECIFICATIONS

BATTERY

The transmitter has two 3 volt batteries, which can be removed and replaced without special tools. Insert a dime in the side slot of the transmitter case and twist. The halves should separate and the batteries are stacked on top of each other. The batteries are available at local retail stores. Recommended batteries are Duracell DL 2016 or equivalent. Typical battery life is about two years.

CAUTION: Do not handle the batteries any more than necessary. Hands must be clean and dry.

RANGE

Normal Remote Keyless Entry (RKE) transmitter operation range for vehicles manufactured for domestic markets is up to 20 meters (66 feet) away from the vehicle. On vehicles manufactured for export markets, normal RKE transmitter range is up to 10 meters (33 feet) away from the vehicle. If a domestic market vehicle is equipped with the optional factory-installed Remote Start System, the normal transmitter range is increased to up to 91 meters (300 feet). Please note that the actual RKE transmitter range values may be better or worse than specified above, depending upon many possible variables in the environment at the specific time and location that any RKE transmission is attempted.

ACCESSORIES AND EQUIPMENT

Power Mirrors - Service Information - Challenger

DESCRIPTION

DESCRIPTION

AUTOMATIC DAY/NIGHT MIRROR

The automatic day/night mirror system is able to automatically change the reflectance of the inside rear view and outside left mirror in order to reduce the glare of headlamps approaching the vehicle from the rear. The automatic day/night rear view mirror receives battery current through a fuse in the junction block only when the ignition switch is in the ON position.

OUTSIDE REAR VIEW MIRROR

The power operated rear view mirrors allow the driver to adjust both outside mirrors electrically from the driver side front seat position by operating a switch on the driver side front door trim panel. The power mirrors receive a non-switched battery feed through a fuse in the junction block so that the system will remain operational, regardless of the ignition switch position.

OPERATION

OPERATION

AUTOMATIC DAY/NIGHT MIRROR

A switch located on the bottom of the automatic day/night mirror housing allows the vehicle operator to select whether the automatic dimming feature is operational. When the automatic day/night mirror is turned on, the mirror switch is lighted by an integral Light-Emitting Diode (LED). The mirror will automatically disable its self-dimming feature whenever the vehicle is being driven in reverse. The day/night mirror is automatically turned ON each time the ignition is turned to the ON position, regardless if it was previously turned OFF.

DIAGNOSIS AND TESTING

POWER MIRRORS

Any diagnosis of the Power Mirror system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

1. Check the fuses in the Power Distribution Center (PDC) and the junction block. If OK, go to 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse(s).

2. Check for battery voltage at the fuse in the junction block. If OK, go to 3. If not OK, repair the open circuit to the PDC as required.
3. Disconnect and isolate the battery negative cable. Remove the driver side power window switch and bezel assembly and unplug the wire harness connector from the power mirror switch. Connect the battery negative cable. Check for battery voltage at the fused B(+) circuit cavity in the door wire harness half of the power mirror switch wire harness connector. If OK, go to 4. If not OK, repair the open circuit to the junction block as required.
4. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity in the door wire harness half of the power mirror switch wire harness connector and a good ground. There should be continuity. If not OK, repair open in the ground circuit.

MIRROR, INSIDE REARVIEW

DESCRIPTION

DESCRIPTION

The automatic day/night mirror uses a thin layer of electrochromic material between two pieces of conductive glass to form the face of the mirror. When the mirror switch is in the ON position, two photocell sensors are used by the mirror circuitry to monitor external light levels and adjust the reflectance of the mirror.

OPERATION

OPERATION

The ambient photocell sensor is located on the forward-facing (windshield side) of the rear view mirror housing, and detects the ambient light levels outside of the vehicle. The headlamp photocell sensor is located inside the rear view mirror housing behind the mirror glass and faces rearward, to detect the level of the light being received at the rear window side of the mirror. When the circuitry of the automatic day/night mirror detects that the difference between the two light levels is too great (the light level received at the rear of the mirror is much higher than that at the front of the mirror), it begins to darken the mirror.

The automatic day/night mirror circuitry also monitors the transmission using an input from the backup lamp circuit. The mirror circuitry is programmed to automatically disable its self-dimming feature whenever it senses that the transmission backup lamp circuit is energized.

The automatic day/night mirror is a completely self-contained unit and cannot be repaired. If faulty or damaged, the entire mirror assembly must be replaced.

DIAGNOSIS AND TESTING

AUTOMATIC DAY/NIGHT MIRROR

For complete circuit diagrams, refer to SYSTEM WIRING DIAGRAMS .

1. Check the fuse in the junction block. If OK, go to 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.
2. Turn the ignition switch to the ON position. Check for battery voltage at the fuse in the junction block. If OK, go to 3. If not OK, repair the open circuit to the ignition switch as required.
3. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Unplug the wire harness connector from the automatic day/night mirror. Connect the battery negative cable. Turn the ignition switch to the ON position. Check for battery voltage at the fused ignition switch output (run/start) circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to 4. If not OK, repair the open circuit to the junction block as required.
4. Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Check for continuity between the ground circuit cavity of the automatic day/night mirror wire harness connector and a good ground. There should be continuity. If OK, go to 5. If not OK, repair the circuit to ground as required.
5. Connect the battery negative cable. Turn the ignition switch to the ON position. Apply the parking brake. Place the transmission gear selector lever in the Reverse position. Check for battery voltage at the backup lamp switch output circuit cavity of the automatic day/night mirror wire harness connector. If OK, go to 6. If not OK, repair the open circuit as required.
6. Turn the ignition switch to the Off position. Disconnect the battery negative cable. Plug in the automatic day/night mirror wire harness connector. Connect the battery negative cable. Cover the forward facing ambient photocell sensor to keep out any ambient light. Turn the ignition switch to the ON position. Place the transmission gear selector lever in the Neutral position. Place the mirror switch in the ON (the LED in the mirror switch is lighted) position. Cover the forward facing ambient photocell sensor to keep out any ambient light.

NOTE: **The ambient photocell sensor must be covered completely, so that no light reaches the sensor. Use a finger pressed tightly against the sensor, or cover the sensor completely with electrical tape.**

7. Shine a light into the rearward facing headlamp photocell sensor. The mirror glass should darken. If OK, go to 8. If not OK, replace the faulty automatic day/night mirror unit.
8. With the mirror glass darkened, place the transmission gear selector lever in the Reverse position. The mirror should return to its normal reflectance. If not OK, replace the faulty automatic day/night mirror.

SWITCH, MIRROR

DESCRIPTION

DESCRIPTION

A power mirror switch is located on the driver's door trim panel, attached to the window/lock switch. The power mirror switch includes the following:

- **Power Mirror Selector Switch** - A three-position rotary joystick switch selects the right or left

power mirror for adjustment, or turns the power mirror system Off in the center position.

- **Power Mirror Adjustment Switch** - A momentary joystick directional switch allows the driver to adjust the selected power mirror in the Up, Down, Right or Left directions.

OPERATION

OPERATION

The power mirror switch circuitry is connected to battery current through a fuse in the IPM on a fused B(+) circuit so that the power mirrors remain operational regardless of the ignition switch position. A rotary joystick selector switch has three positions, one to select the right mirror, one to select the left mirror, and a center OFF position. After the right or left mirror is selected, the joystick is moved to adjust the selected mirror Up, Down, Right or Left.

In vehicles without Memory Mirrors the power mirror switch circuitry controls the battery current and ground feeds to each of the four (two in each mirror head) power mirror motors. In vehicles with Memory Mirrors the mirror switch connects to the driver power mirror module. The driver memory mirror module uses the mirror switch inputs to control the battery current and ground feeds to driver mirror motor and sends a CAN Bus message to the passenger mirror module. The passenger mirror module controls the battery current and ground feeds to passenger mirror motors based on the CAN bus message from the driver memory module.

In vehicles equipped with the exterior day/night mirror, the operation of the dimming feature is controlled by the interior day/night mirror. The exterior mirror is hard wired to the interior mirror.

DIAGNOSIS AND TESTING

POWER MIRROR SWITCH

1. Disconnect and isolate the battery negative cable.
2. Remove the power mirror switch. See **Electrical - Power Systems/Power Mirrors/SWITCH, Mirror - Removal**.
3. Disconnect the wire harness connector from the switch.
4. Test the switch continuity. Refer to the **POWER MIRROR SWITCH TEST** to determine if the continuity is correct for the switch in each switch position. If not OK, replace the inoperative switch as required.

POWER MIRROR SWITCH TEST

SWITCH POSITION	CONTINUITY BETWEEN PINS OF MIRROR SWITCH
LEFT MIRROR SELECTED	
UP	PINS 5 AND 7, PINS 4 AND 3
DOWN	PINS 4 AND 7, PINS 5 AND 3
RIGHT	PINS 4 AND 9, PINS 5 AND 3
LEFT	PINS 4 AND 3, PINS 5 AND 9

ACCESSORIES AND EQUIPMENT

Power Seats - Service Information - Challenger

DESCRIPTION

DESCRIPTION

POWER SEAT SYSTEM

WARNING: The front passenger seat assembly contains critical components that affect the front passenger airbag deployment. Correctly functioning front passenger seat components are critical for the Occupant Classification System (OCS) to properly classify the front passenger and calculate the proper airbag deployment. Unapproved modifications or service procedures to the front passenger seat assembly, its related components, or trim cover may inadvertently change the airbag deployment in case of a frontal crash. This could result in death or serious injury to the front seat passenger if the vehicle is involved in an accident. The following requirements must be strictly adhered to:

- Do not modify the front passenger seat assembly or components in any way.
- Do not modify the front seat center console or center position seat in any way.
- Do not use prior or future model year seat trim covers not designated for the specific model being repaired. Always use the correct seat trim cover specified for the vehicle.
- Do not replace the seat trim cover with an aftermarket trim cover.
- Do not add a secondary trim cover other than those approved by Chrysler LLC/Mopar®.
- At no time should any Supplemental Restraint System (SRS) component or SRS related component or fastener be modified or replaced with any part except those which are approved by Chrysler LLC/Mopar®.

Fig. 1: Power Seat Frame
Courtesy of CHRYSLER LLC

The power seat system allows the driver and front seat passenger to electrically adjust their seating positions using the power seat switches located on the outboard seat cushion side shield of each front seat.

The eight-way power seat includes a six-way adjustable seat cushion track and a two-way power seat back. The power seat can be adjusted up, down, front up, front down, forward, rearward, recliner forward, and recliner rearward. The power seat system is also available with the heated seat option. Refer to **Electrical - Heated/Cooled Systems/Heated Seats - Description** .

Fig. 2: Power Seat Adjuster
Courtesy of CHRYSLER LLC

The power seat system for this vehicle includes the following major components:

Power Seat Adjuster - The power seat adjuster is made up of the upper and lower power seat adjuster assemblies. The upper power seat adjuster contains two reversible motors that are connected to worm-drive gearboxes that move the seat adjuster through a combination of screw-type drive units. These motors are the height adjust motor and the front tilt motor. Each motor contains a self-resetting circuit breaker to protect it from overload. Consecutive or frequent resetting of the circuit breakers may damaged the motors.

The height adjust motor is located on the rear of the upper power seat adjuster assembly and controls the up and down movement of the entire seat. The height adjust motor can be serviced separately from the power seat adjuster assembly.

Fig. 3: Front Tilt Motor
Courtesy of CHRYSLER LLC

The front tilt motor is located on the front of the upper power seat adjuster assembly and controls the up and down movement of the seat front only. The front tilt motor can be serviced separately from the power seat adjuster assembly.

8132c180

Fig. 4: Lower Power Seat Adjuster
Courtesy of CHRYSLER LLC

The lower power seat adjuster contains one reversible motor that is connected to a worm-drive gearbox that moves the seat adjuster through a screw-type drive unit. The motor contains a self-resetting circuit breaker to protect it from overload. The motor is part of the lower power seat track unit and must be replaced as an assembly. See **Electrical - Power Systems/Power Seats/MOTOR, Seat Adjuster - Removal**.

8132c192

Fig. 5: Power Seat Recliner
Courtesy of CHRYSLER LLC

Power Seat Recliner - The power seat recliner replaces the manual seat recliner.

The power seat option includes an electrically operated power seat back recliner mechanism. The power seat recliner switch is integral to the power seat switch assembly, but is actuated with a separate switch knob.

The power seat recliner motor cannot be repaired. If the unit is inoperative or damaged, the seat back frame must be replaced. See **Electrical - Power Systems/Power Seats/MOTOR, Seat - Removal**.

Fig. 6: Power Seat Switches
Courtesy of CHRYSLER LLC

Power Seat Switches - Vehicles may be equipped with driver only, or driver and passenger power seat switches. One seat switch is used for each front seat. The power seat switches are paddle-type levers mounted on the outboard seat side shields. Movement of the seat cushions and backs mimics the action of the switch paddles. See **Electrical - Power Systems/Power Seats/SWITCH, Seat - Description** for additional information.

OPERATION

OPERATION

POWER SEAT SYSTEM

The power seat system receives battery current through a 50 amp fuse in the Power Distribution Center (PDC) so that the power seats remain operational, regardless of the ignition switch position.

When a power seat switch is actuated, a battery feed and a ground path are applied through the power seat switch contacts to the appropriate motor or motors. The motor and drive unit operate to move the seat in the selected direction until the switch is released, or until the travel limit of the power seat track is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the motor to run in the opposite direction.

DIAGNOSIS AND TESTING

POWER SEAT ADJUSTER

Operate the power seat switch and move the seat in all directions. The seat should move in each of the selected directions.

If the power seat adjuster fails to operate in more than one direction, proceed as follows:

1. Inspect the power seat adjuster motors to ensure the electrical connectors are fully seated to the motors. If OK, go to 2. If not OK, connect the electrical connector to the fully seated position.
2. Check the power seat fuse in the power distribution center. If OK, go to 3. If not OK, replace the inoperative fuse.
3. Remove the power seat switch from the seat cushion side panel. Check for battery voltage at the fused B(+) circuit cavity of the power seat switch wire harness connector. If OK, go to 4. If not OK, repair the open circuit to the power distribution center as required.
4. Check for continuity between the ground circuit cavity of the power seat switch wire harness connector and a good ground. There should be continuity. If OK, go to 5. If not OK, repair the open circuit to ground as required.
5. See **Electrical - Power Systems/Power Seats/SWITCH, Seat - Diagnosis and Testing**. If the switch tests OK, check the wire harness between the power seat switch and the motor. If the circuits check OK, replace the inoperative power seat adjuster assembly. If the circuits are not OK, repair the wire harness as required.

MOTOR, SEAT ADJUSTER

REMOVAL

REMOVAL

Fig. 7: Locking Pawl

Courtesy of CHRYSLER LLC

WARNING: A seat structure that has seen significant load may have the locking mechanism activated and may exhibit the following symptoms:

- Locking pawl (2) loose
- Locking pawl (2) engaged into the seat frame sidemember (1)
- Height adjuster only works on outboard side
- Broken or missing shear pin (3)

If any of above symptoms exist, replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in possible serious or fatal injury.

If any one or more of these symptoms exist replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in personal injury or death.

FRONT TILT MOTOR

Fig. 8: Seat Adjuster Motor Components
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the affected seat with the inoperative motor (1). Refer to **Body/Seats/SEAT - Removal** .
3. Remove the seat cushion and pan. Refer to **Body/Seats/COVER, Seat Cushion - Removal** .

Fig. 9: Seat Adjuster Motor
Courtesy of CHRYSLER LLC

4. Disconnect the motor electrical connector.

Fig. 10: Motor Fasteners
Courtesy of CHRYSLER LLC

5. Remove the fasteners holding the motor to the seat adjuster (1).
6. Remove motor from seat adjuster (2).

HEIGHT ADJUST MOTOR

WARNING: Use caution when removing the height adjust motor (3) if the motor is inoperative, and the power seat is not in the full up position. The seat adjuster assembly (2) is under load from the height adjust spring and may cause the motor to rotate under pressure when the fasteners are removed. The seat adjuster assembly also may spring upward when the motor is removed. If the height adjust motor is operative, move the power seat to the full up position prior to disconnecting the battery.

Fig. 11: Seat Adjuster Motor Components
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the affected seat with the inoperative motor (3). Refer to **Body/Seats/SEAT - Removal** .
3. Remove the seat cushion and pan. Refer to **Body/Seats/COVER, Seat Cushion - Removal** .

Fig. 12: Motor Electrical Connector
Courtesy of CHRYSLER LLC

4. Disconnect the motor electrical connector.

Fig. 13: Motor Electrical Connector
Courtesy of CHRYSLER LLC

5. Remove the fasteners (1) holding the motor (3) to the seat adjuster (2).
6. Remove screw and washer from the motor shaft.
7. Remove motor (3) from seat adjuster (2).

INSTALLATION

INSTALLATION

Fig. 14: Locking Pawl
Courtesy of CHRYSLER LLC

WARNING: A seat structure that has seen significant load may have the locking mechanism activated and may exhibit the following symptoms:

- Locking pawl (2) loose
- Locking pawl (2) engaged into the seat frame sidemember (1)
- Height adjuster only works on outboard side
- Broken or missing shear pin (3)

If any of above symptoms exist, replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in possible serious or fatal injury.

If any one or more of these symptoms exist replace the height adjuster assembly. Do not attempt any repairs. Failure to follow these instructions may result in personal injury or death.

FRONT TILT MOTOR

Fig. 15: Seat Adjuster Motor Components
 Courtesy of CHRYSLER LLC

1. Position motor (1) on seat adjuster (2).

Fig. 16: Motor Fasteners
 Courtesy of CHRYSLER LLC

2. Install the fasteners (1) holding the motor to the seat adjuster (2). Tighten the screws to 5 N.m (44 in. lbs.).

Fig. 17: Seat Adjuster Motor
Courtesy of CHRYSLER LLC

3. Connect the motor electrical connector.
4. Install the seat cushion. Refer to **Body/Seats/COVER, Seat Cushion - Installation** .
5. Clip the wire harness to cushion pan.
6. Install the seat assembly. Refer to **Body/Seats/SEAT - Installation** .
7. Connect the battery negative cable.
8. Verify normal operation of the power seat assembly.

HEIGHT ADJUST MOTOR

Fig. 18: Seat Adjuster Motor Components

Courtesy of CHRYSLER LLC

1. Ensure the seat adjuster (2) is in the full up position by pulling upward on the upper adjuster assembly.
2. Position motor (3) on seat adjuster (2).
3. Install the motor shaft screw and washer and tighten until snug. **Do not torque screw at this time.**

Fig. 19: Motor Electrical Connector
Courtesy of CHRYSLER LLC

4. Install the screws (1) holding the motor (3) to the seat adjuster (2). **It may be necessary to twist the motor slightly to align the fastener holes.**
5. Starting with the bottom screw, tighten the motor screws (1) to 9 N.m (80 in. lbs.).
6. Tighten the motor shaft screw and washer to 6.5 N.m (57.5 in. lbs.).

Fig. 20: Motor Electrical Connector
Courtesy of CHRYSLER LLC

7. Connect the motor electrical connector.
8. Install the seat cushion. Refer to **Body/Seats/COVER, Seat Cushion - Installation** .
9. Clip the wire harness to cushion pan.
10. Install the seat assembly. Refer to **Body/Seats/SEAT - Installation** .
11. Connect the battery negative cable.
12. Verify normal operation of the power seat assembly.

MOTOR, SEAT, FORE AFT

REMOVAL

REMOVAL

Fig. 21: Removing/Installing Fore/Aft Motor
Courtesy of CHRYSLER LLC

1. Remove the seat cover and cushion assembly. Refer to **Body/Seats/COVER, Seat Cushion - Removal** .
2. Cut the tie-straps holding the fore/aft motor, as necessary, and disconnect the electrical connector.
3. Remove the fore/aft motor and flex shafts from the bracket.

NOTE: Do not remove the fore/aft motor bracket before any adjustment of the tracks.

NOTE: If motor bracket is too severely bent, or if the fore/aft motor is damaged to

the point step 10 can't be performed, proceed to Step 11. Still read and follow Cautions and/or Notes between steps 4 and 10.

4. Measure from the front or rear track stop to the front or back of the adjuster track on each seat track.

Fig. 22: Adjusting Seat Tracks
Courtesy of CHRYSLER LLC

5. Remove the long flex shaft from the motor and put it in a cordless drill. Insert other end in gear box on adjuster track. Adjust both seat tracks until they are within +/- 2mm of each other at a low speed.

Fig. 23: Adjuster Track
Courtesy of CHRYSLER LLC

NOTE: Do not drive the adjuster track more than 12mm (1/2 in) in any one direction at one time before driving the other side to minimize twist in the adjuster.

6. Install the short flex shaft into the seat track gear box.

88441

Fig. 24: Installing Long Flex Shaft Into Seat Track
Courtesy of CHRYSLER LLC

7. Install the fore/aft motor with grommets on the short flex shaft side first, then install the long flex shaft into outboard side track gear box first then slide flex shaft cover over long flex shaft and then insert in to motor.
8. Install the long flex shaft into the seat track and clip long flex shaft sheathing into the clips.

108958

Fig. 25: Fore/Aft Motor
Courtesy of CHRYSLER LLC

9. Connect electrical connector to the fore/aft motor.
10. Connect the battery.

NOTE: **Make sure front and rear rail end stops, rail ends, and drive screws are free of foreign material before fully drive seat to the full rear position.**

11. Adjust the seat to the full rear position.
12. Disconnect the battery.
13. Remove the fore/aft motor and flex shafts from bracket.
14. Using cordless drill and flex shaft, verify that the tracks are all the way back and within +/- 1mm of each other.

NOTE: **As you reach the end of the adjuster track travel slow down the speed so you do not over twist the flex shaft.**

15. Remove fore/aft motor bracket bolts taking care to make sure no thread locker particles enter drive screws.
16. Inspect both ends of each drive screw for foreign material, and remove as necessary.

INSTALLATION

INSTALLATION

109190

Fig. 26: Fore/Aft Motor Bracket
Courtesy of CHRYSLER LLC

1. Install new fore/aft motor bracket and bolts 26 +/- 2 Nm (19 +/- 1.5 ft lbf).
2. Install new short flex shaft into gear box.
3. Install fore/aft motor into fore/aft motor bracket and short flex shaft.
4. Install new long flex shaft into gear box.

5. Slide new long flex shaft cover over long flex shaft.
6. Install long flex shaft into fore/aft motor.
7. Seat fore/aft motor into fore/aft motor bracket.
8. Install tie straps as shown in illustration, making sure the tie strap goes under connector and cut off excess.
9. Install seat. Refer to **Body/Seats/SEAT - Installation** .
10. Install seat cover and cushion. Refer to **Body/Seats/COVER, Seat Cushion - Installation** .

NOTE: **Make sure all electrical connectors are properly connected to seat pan.**

11. Verify that the power seat is working correctly by running through the full travel, and that there is not excessive noise coming from the motor or track.

RECLINER

REMOVAL

REMOVAL

Fig. 27: Power Seat Recliner
Courtesy of CHRYSLER LLC

NOTE: **The recliner motor is serviced as part of the seat back frame. Do not attempt to transfer the motor as the service part will come equipped with a new motor installed.**

1. Remove the seat back frame assembly. Refer to **Body/Seats/SEAT BACK - Removal** .
2. Remove any parts that will need to be installed on new seat back frame assembly.

INSTALLATION

INSTALLATION

Fig. 28: Power Seat Recliner
Courtesy of CHRYSLER LLC

1. Install parts from old seat back assembly as necessary.
2. Install the seat back (1). Refer to **Body/Seats/SEAT BACK - Installation** .

SWITCH, SEAT

DESCRIPTION

DESCRIPTION

Both the driver and passenger power seats can be adjusted in eight different ways using the power seat switch. The power seat switch is located on the lower outboard side of the seat cushion on the seat cushion side shield on all models.

The individual switches in the power seat switch assembly cannot be repaired. If one switch is damaged or faulty, the entire power seat switch must be replaced.

OPERATION

OPERATION

When a power seat switch is actuated, a battery feed and a ground path are applied through the switch contacts to the power seat adjuster or recliner adjuster motor. The selected adjuster motor operates to move the seat or recliner through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached. When the switch is moved in the opposite direction, the battery feed and ground path to the motor are reversed through the switch contacts. This causes the adjuster motor to run in the opposite direction.

On vehicles equipped with memory system, a resistance signal is sent to the Memory Seat Module (MSM) via the Controller Area Network (CAN) bus circuit, when the driver memory seat switch control knob is actuated. The MSM is responsible for the 12v battery feed and ground path to the power seat adjuster motor. The adjuster motor operates to move the power seat adjuster mechanism through its drive unit in the selected direction until the switch is released, or until the travel limit of the adjuster is reached.

No power seat switch should be held applied in any direction after the adjuster has reached its travel limit. The power seat adjuster motors each contain a self-resetting circuit breaker to protect them from overload. However, consecutive or frequent resetting of the circuit breaker may result in motor damage.

DIAGNOSIS AND TESTING

POWER SEAT SWITCH

DRIVER

8132c253

Fig. 29: Power Seat Switch Terminals
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the power seat switch from the seat. See **Electrical - Power Systems/Power Seats/SWITCH, Seat - Removal**.

- Use an ohmmeter to test the continuity of the power seat switch. Refer to **DRIVER POWER SEAT SWITCH** table. If not OK, replace the inoperative power seat switch. If switch tests OK. See **Electrical - Power Systems/Power Seats - Diagnosis and Testing**.

DRIVER POWER SEAT SWITCH

SWITCH POSITION	CONTINUITY BETWEEN
OFF	7-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER UP	6-3, 7-1, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
RECLINER DOWN	6-1, 7-3, 7-4, 7-5, 7-8, 7-9, 7-10, 7-11
HORIZONTAL FORWARD	6-8, 7-1, 7-3, 7-4, 7-5, 7-9, 7-10, 7-11
HORIZONTAL REARWARD	6-4, 7-1, 7-3, 7-5, 7-8, 7-9, 7-10, 7-11

REMOVAL

REMOVAL

Fig. 31: Power Seat Switch
Courtesy of CHRYSLER LLC

NOTE: Left side shown in illustration. Right side similar.

1. Position the seat so the screws that secure seat cushion side trim panel (1) can be accessed.
2. Disconnect and isolate the negative battery cable.
3. Remove the three seat cushion side trim panel screws and position the trim panel to gain access to the back of the power seat switch (3).
4. Disconnect the electric connector (5) from the power seat switch.
5. Using a small flat bladed tool, carefully disengage the four tabs (2 and 4) that secure the power seat switch to the seat cushion side trim panel and remove the switch.

INSTALLATION

INSTALLATION

Fig. 32: Power Seat Switch
Courtesy of CHRYSLER LLC

NOTE: Left side shown in illustration. Right side similar.

1. Position the power seat switch (3) to the seat cushion side trim panel (1) and engage the four retaining tabs (2 and 4). Make sure the retaining tabs are fully engaged.
2. Connect the electrical connector (5) to the power seat switch.
3. Reposition the seat cushion side trim panel and install the three screws. Tighten the screws securely.
4. Reconnect the negative battery cable.

STEERING

Steering - Challenger

DESCRIPTION

STEERING SYSTEMS

8135e637

Fig. 1: RWD POWER STEERING SYSTEM
Courtesy of CHRYSLER LLC

Power steering systems consist of:

- Steering column
- Rack and pinion steering gear (9)
- Belt driven hydraulic steering pump (7)
- Pump pressure (8), return (1 and 3) and supply (6) hoses
- Oil Cooler (2)
- Remote Reservoir (5)

- Inner and Outer tie rod ends (4)

WARNING

WARNING

WARNING: Power steering fluid, engine parts and exhaust system may be extremely hot if engine has been running. Do not start engine with any loose or disconnected hoses. Do not allow hoses to touch hot exhaust manifold or catalyst.

WARNING: Fluid level should be checked with the engine off to prevent personal injury from moving parts.

CAUTION

CAUTION

CAUTION: Anytime the battery has been disconnected and is reconnected it is important that this be performed properly. The vehicle may be equipped with systems that require special calibration processes. Refer to Electrical/Battery System - Standard Procedure

CAUTION: When the power steering system is open, cap all open ends of the hoses, power steering pump fittings or power steering gear ports to prevent entry of foreign material into the components.

CAUTION: When servicing power steering components, do not pinch off power steering hoses in any way to stop fluid flow. Damage to hoses may result.

CAUTION: If the steering wheel is excessively off-center, outside of Chassis specifications, inadvertent ESP activations may occur on a vehicle so equipped.

DIAGNOSIS AND TESTING

HYDRAULIC FLOW AND PRESSURE TEST

The following procedure is used to test the operation of the power steering system on this vehicle. This test will provide the gallons per minute (GPM) or flow rate of the power steering pump along with the maximum relief pressure. Perform this test anytime a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following test is performed using the Power Steering Analyzer Kit 6815 (with appropriate hoses)

and Adapters from Power Steering Analyzer Adapter Kit 6893A. See **Steering - Special Tools**

Fig. 2: Analyzer Setup To Test At Pump
Courtesy of CHRYSLER LLC

1. Check power steering belt to ensure it is in good condition and adjusted properly.
2. Assemble Power Steering Analyzer as follows:
 - a. Gauge end (inlet) of Flow Meter And Gauge 6800 (3) - Hose 6905 (6), Hose 6713 (4), Adapter Tube 6844 (5)
 - b. Valve end (outlet) of Flow Meter And Gauge 6800 (3) - Hose 6959 (1), Adapter Fitting 6826 (2)
3. Unthread pressure hose tube nut at power steering pump.
4. Connect Adapter Tube 6844 to pressure fitting on power steering pump. Tighten tube nut to specifications. See **Steering - Specifications**
5. Connect power steering pressure hose to Adapter Fitting 6826. Tighten tube nut to specifications. See **Steering - Specifications**
6. Open Analyzer test valve completely.
7. Start engine and allow to idle long enough to circulate power steering fluid through Analyzer flow meter and hoses.
8. Shut off engine and check fluid level; add fluid as necessary. Repeat 7 and 8 until air is bled from system.
9. Start engine and allow to idle.
10. Check Analyzer gauge (3) pressure. Initial pressure reading should be less than 1379 kPa (300 psi). If pressure is higher, inspect hoses for restrictions and repair as necessary.
11. Increase engine speed to 1,100 rpm (1,200 rpm for SRT8) and read Analyzer Flow Meter. The reading should be 8.2 LPM (2.2 GPM) minimum. If flow reading is below specification, replace power steering pump.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than five seconds as the pump could be damaged.

12. Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

CAUTION: Do not force the pump to operate against the stops for more than 2 to 4 seconds at a time because, pump damage will result.

- Power steering pump pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
 - Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.
13. Completely open the valve on the Power Steering Analyzer. Turn the steering wheel to the extreme left until the stop in the steering gear is met, then turn the steering wheel to the right until the right stop is met. Record the highest indicated pressure at each position. Compare the recorded readings to the specifications. If the highest recorded output pressure reading against one stop is not within 345 kPa (50 psi) of the highest recorded reading at the other stop, the steering gear is leaking internally and must be replaced.

PUMP SPECIFICATIONS

VEHICLE	RELIEF PRESSURE
Non-SRT Vehicles	10273 to 10963 kPa (1490 -1590 psi)
SRT Vehicles	11307 to 11997 kPa (1640-1740 psi)

STEERING DIAGNOSIS CHARTS

NOTE: There are three diagnosis charts following that cover **NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES, PERFORMANCE ISSUES, and FLUID ISSUES.**

NOISE, VIBRATION AND HARSHNESS (NVH) ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
OBJECTIONABLE HISS OR WHISTLE WHILE TURNING STEERING WHEEL WHEN STATIONARY OR MOVING SLOWLY*	1. Damaged or mispositioned steering column shaft/coupling dash boot seal.	1. Check to ensure boot is properly installed and seals against sheet metal. Reposition or replace steering column shaft/coupling dash boot seal as necessary.
-	2. Mis-routed power steering hose.	2. Check routing of power steering hoses. Ensure hoses do not come in unwanted contact with other components and objects.
		3. Using an electronic listening tool,

	<p>3. Restriction in pressure or return hose.</p> <p>4. Noisy valve in power steering gear.</p>	<p>determine if noise is coming from either pressure or return hose. Replace hose that noise is present within.</p> <p>4. For evaluation and correction. See <u>Steering/Gear - Diagnosis and Testing.</u></p>
RATTLE OR EXCESSIVE CLUNK**	<p>1. Power steering gear loose on engine cradle/crossmember.</p> <p>2. Loose strut assembly mounting fasteners at tower or knuckle.</p> <p>3. Excessive play in outer tie rod.</p> <p>4. Engine cradle/crossmember mounting fasteners loose at frame or bushings worn.</p> <p>5. Wheel mounting (lug) nuts loose.</p> <p>6. Power steering hose touching the body or frame of vehicle.</p> <p>7. Stabilizer bar link joints worn (occurs with steering input only when moving, not stationary).</p> <p>8. Loose lower control arm or tension strut mounting bolts at engine cradle, frame or crossmember (occurs with steering input only when moving, not stationary).</p> <p>9. Loose intermediate shaft or column.</p> <p>10. Lower control arm pivot bushing worn (occurs with steering input only when moving, not stationary).</p> <p>11. Internal power steering</p>	<p>1. Check fastener torque and tighten to specifications. Replace as necessary. Check steering wheel center following repair.</p> <p>2. Check fastener torque and tighten to specifications.</p> <p>3. For evaluation and correction. See <u>Steering/Gear/TIE ROD, Steering - Diagnosis and Testing.</u></p> <p>4. Check fastener torque and tighten to specifications. Inspect bushings and repair as necessary.</p> <p>5. Inspect wheel mounting (lug) nuts and studs and repair as necessary. Tighten nuts to specifications.</p> <p>6. For evaluation and correction. See <u>Steering/Pump - Diagnosis and Testing.</u></p> <p>7. At park, jounce only one side of vehicle front to exercise stabilizer bar. Replace stabilizer bar link.</p> <p>8. Check control arm or tension strut mounting bolts and tighten to specified torque.</p> <p>9. Rotate intermediate (steering) shaft in relationship to gear, checking for free-play. Check column fasteners and tighten to specifications as necessary.</p> <p>10. Inspect bushings for wear and replace lower control arm as necessary.</p> <p>11. Drive vehicle on rough road, then</p>

- - -	gear noise. 12. Loose inner tie rod. 13. Damaged engine cradle/crossmember.	steer rapidly back and forth when stopped. Replace power steering gear as necessary. 12. For evaluation and correction. See <u>Steering/Gear/TIE ROD, Steering - Diagnosis and Testing.</u> 13. Inspect the cradle/crossmember for cracks or other damage. Replace as necessary.
POPPING NOISE - - - - -	1. Loose steering gear mounting fasteners. 2. Loose outer tie rod mounting nut or jam nut. 3. Loose intermediate (steering) shaft coupling at gear input shaft. 4. Worn tie rod (outer or inner). 5. Worn axle half-shaft.	1. Check fasteners for proper torque and retighten as necessary. 2. Check fastener torque. Replace nuts as necessary and tighten to specifications. 3. Make sure coupling is fully seated on gear input shaft. Retighten or re-seat as necessary. 4. For evaluation and correction. See <u>Steering/Gear/TIE ROD, Steering - Diagnosis and Testing.</u> 5. For evaluation and correction. Refer to <u>Differential and Driveline/Half Shaft - Diagnosis and Testing .</u>
CHIRP OR SQUEAL (POWER STEERING PUMP) - - - -	1. Loose power steering pump drive belt. 2. Pulley alignment incorrect. 3. Malfunctioning belt auto-tensioner. 4. Power steering pump noisy (worn bearing/bushing noise). 5. Generator or water pump noisy.	1. Inspect belt. Replace belt if worn or glazed. Tighten/adjust power steering pump drive belt if equipped with a manual tensioner. 2. Realign accessory drives. 3. Verify belt tension. Replace belt auto-tensioner. 4. Using an electronic listening tool, determine if noise is coming from pump. Replace power steering pump as required. 5. Using an electronic listening tool, determine if noise is coming from Generator or water pump. Replace faulty component.
WHINE, GROWL, MOAN OR GROAN (POWER STEERING PUMP)***	1. Low power steering fluid level. 2. Air in power steering	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid). 2. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and

-	fluid.	replace as necessary. Bleed air from fluid. See <u>Steering - Standard Procedure</u>
-	3. Power steering hose touching body or frame of vehicle.	3. For evaluation and correction. See <u>Steering/Pump - Diagnosis and Testing.</u>
-	4. Wear of power steering pump internal components.	4. For evaluation and correction. See <u>Steering/Pump - Diagnosis and Testing.</u>
COLD START WHINE OR MOAN (POWER STEERING PUMP)***	1. Low power steering fluid level.	1. Fill power steering fluid reservoir to proper level and check for leaks (make sure all air is bled from the system fluid).
-	2. Extremely low ambient temperature (near -18 C°(0 F°) or below).	2. Some noise is expected as pump attempts to pull cold, thick fluid. Noise should go away as vehicle warms up. Acceptable levels of excessive noise are one second at -18 C°(0 F°) and 15 seconds at -29 C° (-20 F°). If noise is excessive, look for poor sealing on the return hose or a possible fluid leak.
SQUEAKING OR RUBBING SOUND	1. Steering column shroud or shaft rubbing.	1. While turning the steering wheel, listen down column to locate. Check interference between moving components. Move or realign shrouds or shaft as necessary. Replace components if this does not correct problem.
-	2. Clockspring inside steering column noisy.	2. Remove clockspring and reinstall steering wheel for testing. If noise is gone, replace clockspring.
-	3. Boot/dash seal lubrication inadequate.	3. Remove boot seal and recheck for noise. Lubricate seal as necessary.
-	4. Steering gear outer tie rod noisy.	4. While a helper turns the steering wheel, use an electronic listening tool to determine if noise is coming from either outer tie rod. Replace outer tie rods as necessary.
-	5. Steering gear internally noisy.	5. Remove dash seal boot, then exercise the steering wheel. If noise is still present at gear, replace steering gear.
SCRUBBING OR KNOCKING SOUND	1. Incorrect tire or wheel size.	1. Replace incorrect size tire or wheel with original equipment size.
-	2. Worn motor or transmission mount.	2. Drive vehicle, moving accelerator pedal rapidly up and down attempting to locate noise. Try in both forward and reverse. Replace mounts as necessary.

-	3. Tires contacting wheel well.	3. Make sure wheel house is properly positioned. If not, reposition as necessary. If steering wheel is properly centered, check steering gear travel left to right by rotating the steering wheel to each stop. Steering wheel should rotate the same amount in both directions from center. If not, replace steering gear.
-	4. Interference between moving steering components and other components.	4. Check for bent or misaligned components. Correct or replace as necessary.
-	5. Accessory drive pulley rubbing against another component.	5. Check pulleys for wear. Check for worn engine or transmission mount. Reposition components or replace mounts as necessary.

NOTE: *** There is some noise in all power steering systems. One of the most common is a hissing sound evident when turning the steering wheel when at a standstill or when parking and the steering wheel is at the end of its travel. Hiss is a very high frequency noise similar to that experienced while slowly closing a water tap. The noise is present in every valve and results when high velocity fluid passes valve orifice edges. There is no relationship between this noise and the performance of the steering system.**

NOTE: **** A light clunk may be felt or heard during steering wheel reversal while vehicle is stationary. This results from internal steering gear rack movement at the bushings and in no way affects the performance of the steering system. This movement may be felt in the steering components during steering wheel reversal.**

NOTE: ***** Power steering pump growl/moan/groan results from the development of high pressure fluid flow. Normally this noise level should not be high enough to be objectionable.**

PERFORMANCE ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
STEERING WHEEL OR COLUMN HAS FREE-PLAY/LASH/LOOSENESS (CLUNKING OR RATTLING)	1. Loose coupling pinch bolt at gear input shaft.	1. Check pinch bolt torque. Replace pinch bolt if equipped with thread locker patch and tighten to specifications.
-	2. Power steering gear loose on cradle/crossmember.	2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.
	3. Excessive free-play or	3. Replace steering column.

	<p>noise from steering column bearings.</p> <p>4. Excessive intermediate (steering) shaft coupling U-joint free-play.</p> <p>5. Loose or worn outer tie rod.</p> <p>6. Lack of lubrication in lower ball joint or ball joint is damaged.</p> <p>7. Excessive lash inside steering gear.</p>	<p>4. Rotate steering wheel back-and-forth while watching coupling. Observe for free-play. Replace intermediate shaft as necessary.</p> <p>5. For evaluation and correction. See <u>Steering/Gear/TIE ROD, Steering - Diagnosis and Testing</u>.</p> <p>6. For evaluation. Refer to <u>Front Suspension/Front/BALL JOINT, Suspension - Diagnosis and Testing</u> . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.</p> <p>7. Disconnect intermediate shaft and turn steering gear input shaft. Observe for any movement without a corresponding tire movement. Replace steering gear as necessary.</p>
STEERING WHEEL HAS FORE AND AFT LOOSENESS	<p>1. Steering wheel retaining bolt loose.</p> <p>2. Loose steering column to instrument panel fasteners.</p> <p>3. Steering column lower bearing spring retainer slipped on steering column shaft.</p>	<p>1. Check steering wheel retaining bolt torque and tighten to specifications as necessary.</p> <p>2. Check steering column to instrument panel fastener torque and tighten to specifications as necessary.</p> <p>3. Pull steering wheel fore-and-aft while observing movement. Replace steering column as necessary.</p>
STEERING WHEEL, DASH OR VEHICLE VIBRATES DURING STEERING MANEUVERS (ESPECIALLY AT LOW SPEED OR STANDSTILL)	<p>1. Air in power steering fluid.</p> <p>2. Tire(s) not properly inflated.</p> <p>3. Excessive engine vibration.</p> <p>4. Loose tie rod end jam nut.</p>	<p>1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See <u>Steering - Standard Procedure</u></p> <p>2. Check and inflate tires to the specified pressure.</p> <p>3. Ensure that the engine is tuned properly.</p> <p>4. Check torque and tighten the inner to outer tie rod jam nut to specifications.</p>

	<p>5. Overcharged air conditioning (A/C) system.</p> <p>6. Grounded, damaged or loose engine mount.</p> <p>7. Loose or worn outer tie rod.</p> <p>8. Steering gear noisy.</p>	<p>5. Turn A/C off and verify issue goes away. Repair A/C as necessary.</p> <p>6. Visually inspect for damaged or misaligned mounts. Check fastener torque. Replace, realign or retighten as necessary.</p> <p>7. For evaluation and correction. See <u>Steering/Gear/TIE ROD, Steering - Diagnosis and Testing</u>.</p> <p>8. During a parking event at 0 mph, verify there is vibration only with steering. Steer in both directions and verify that the noise follows the steering input. Check TSB's for any known issue. Replace steering gear as necessary.</p>
STEERING CATCHES, SURGES OR STICKS IN CERTAIN POSITIONS OR IS DIFFICULT TO TURN	<p>1. Low power steering fluid level.</p> <p>2. Tire(s) not properly inflated.</p> <p>3. Loose or slipping power steering/accessory drive belt.</p> <p>4. Lack of lubrication in lower ball joint or ball joint is damaged.</p> <p>5. Lack of lubrication in steering gear outer tie rod end(s).</p> <p>6. Faulty power steering pump.</p> <p>7. Excessive friction in intermediate</p>	<p>1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system.</p> <p>2. Check and inflate tires to the specified pressure.</p> <p>3. Verify belt tension. Replace belt auto-tensioner and belt as necessary.</p> <p>4. For evaluation. Refer to <u>Front Suspension/Front/BALL JOINT, Suspension - Diagnosis and Testing</u> . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.</p> <p>5. For evaluation and correction. See <u>Steering/Gear/TIE ROD, Steering - Diagnosis and Testing</u>.</p> <p>6. Perform Power Steering Flow and Pressure Test. See <u>Steering - Diagnosis and Testing</u>. Look for low or erratic flow or pressure. Replace power steering pump as necessary.</p> <p>7. Disconnect intermediate shaft/coupler at steering gear and</p>

	<p>shaft/coupler joint.</p> <p>8. Excessive friction in steering column.</p> <p>9. Worn or binding seat and bearing in front strut assembly.</p> <p>10. Faulty steering gear.</p>	<p>check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.</p> <p>8. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions. Damage to the clockspring may occur. Replace steering column as necessary.</p> <p>9. Disconnect outer tie rod ends from knuckles, then turn tire and wheel assembly checking for smooth operation. Replace front strut assembly seat and bearing.</p> <p>10. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).</p>
STEERING WHEEL DOES NOT RETURN TO CENTER POSITION	<p>1. Tire(s) not properly inflated.</p> <p>2. Improper front wheel alignment.</p> <p>3. Lack of lubrication in lower ball joint or ball joint is damaged.</p> <p>4. Excessive friction in intermediate shaft/coupler joint.</p> <p>5. Excessive friction in steering column.</p>	<p>1. Check and inflate tires to the specified pressure.</p> <p>2. Check and adjust wheel alignment as necessary.</p> <p>3. For evaluation. Refer to <u>Front Suspension/Front/BALL JOINT, Suspension - Diagnosis and Testing</u> . Lubricate ball joint if equipped with a zerk fitting and check for function. If not equipped with a zerk fitting, test and replace ball joint as necessary.</p> <p>4. Disconnect intermediate shaft/coupler at steering gear and check joint for smooth operation in all directions. Replace intermediate shaft/coupler joint.</p> <p>5. Disconnect intermediate shaft/coupler at steering gear. Turn steering wheel two revolutions in either direction from on center and check for smooth operation. DO NOT turn past two revolutions.</p>

	<p>6. Worn or binding seat and bearing in front strut assembly.</p> <p>7. Excessive friction in power steering gear.</p>	<p>Damage to the clockspring may occur. Replace steering column as necessary.</p> <p>6. Disconnect steering gear outer tie rod ends at knuckles, then turn tire and wheel assembly in and out checking for smooth operation. Replace seat and bearing as necessary.</p> <p>7. With vehicle on hoist, tires unsupported and engine off, steer gear throughout travel and check for smooth operation. Replace steering gear (only after all previous components have been checked).</p>
EXCESSIVE STEERING WHEEL KICKBACK FROM ROAD INPUTS	<p>1. Air in power steering fluid.</p> <p>2. Power steering gear loose on cradle/crossmember.</p> <p>3. Steering column, coupling or intermediate shaft worn or loose.</p> <p>4. Power steering pump flow is too low.</p>	<p>1. Inspect for excessive air bubbles in fluid (fluid will appear foamy and lighter in color). Inspect hoses for leaks and replace as necessary. Bleed air from fluid. See <u>Steering - Standard Procedure</u></p> <p>2. Inspect gear mounting bolts. Replace if necessary and tighten to specifications.</p> <p>3. Rotate steering wheel back-and-forth while inspecting intermediate shaft going into steering gear. Look for excessive free-play. Retighten if loose bolt is found. Replace steering column, coupling or intermediate shaft if necessary.</p> <p>4. Perform Power Steering Flow and Pressure Test. See <u>Steering - Diagnosis and Testing</u>. Look for low or erratic flow or pressure. Replace power steering pump as necessary.</p>

FLUID ISSUES

CONDITION	POSSIBLE CAUSES	EVALUATION/CORRECTION
LOW FLUID LEVEL WITH VISIBLE LEAK	1. Loose power steering hose fittings or connections.	1. Check torque on all tube nuts (at gear and pump). Inspect clamps at all rubber hose connections for correct position, damage and tension. Tighten tube nuts as required. Reposition or replace clamps at hose connections. Clean

-	2. Damaged or missing O-ring at power steering hose tube nuts.	joints and reinspect for leaks. 2. Remove tube nut and inspect O-ring. If damaged or missing, replace O-ring. Clean joints and reinspect for leaks.
-	3. Power steering line or hose failure.	3. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace hoses as necessary.
-	4. Power steering component leaking (reservoir, pump, gear).	4. Clean fluid from around suspect areas. Run vehicle and inspect for leaks. Look inside reservoir to see if air is being ingested. Replace power steering component as necessary.
AERATED FLUID*	1. Low power steering fluid level. 2. Air leak at power steering supply hose, reservoir or pump.	1. Check fluid level and fill to proper level as necessary. Check for leaks. Make sure all air is bled from system. 2. Inspect components. Place a hand vacuum pump with Adapter 9688 on reservoir and verify that system can sustain vacuum. System should not lose more than 1 psi (7 kPa) in 2 minutes (make sure vacuum pump is sealed well to the reservoir). Replace steering component as necessary.
RESERVOIR FLUID OVERFLOW OR FLUID THAT IS MILKY IN COLOR	1. Water contamination of power steering fluid.	1. Inspect fluid for milky appearance. Completely drain power steering fluid. Refill and bleed system. See <u>Steering - Standard Procedure</u>

NOTE: * Extremely cold temperatures may cause power steering fluid aeration. The air should work its way out of the system as the fluid warms.

STANDARD PROCEDURE

POWER STEERING SYSTEM BLEEDING

WARNING: The fluid level should be checked with engine off to prevent injury from moving components.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

CAUTION: If the air is not purged from the power steering system correctly, pump failure could result.

81873a49

Fig. 3: HAND VACUUM PUMP ON RESERVOIR
Courtesy of CHRYSLER LLC

NOTE: Be sure the vacuum tool used in the following procedure is clean and free of any fluids.

1. Check the fluid level. As measured on the side of the reservoir, the level should indicate between ADD and FULL COLD when the fluid is at normal ambient temperature. Adjust the fluid level as necessary. See **Steering/Pump/FLUID - Standard Procedure**
2. Tightly insert Power Steering Cap Adapter (4), Special Tool 9688, into the mouth of the reservoir (3).

CAUTION: Failure to use a vacuum pump reservoir (1) may allow power steering fluid to be sucked into the hand vacuum pump.

3. Attach Hand Vacuum Pump (2), Special Tool C-4207 or equivalent, with reservoir (1) attached, to the Power Steering Cap Adapter (4).

CAUTION: Do not run the vehicle while vacuum is applied to the power steering system. Damage to the power steering pump can occur.

NOTE: When performing the following step make sure the vacuum level is maintained during the entire time period.

4. Using Hand Vacuum Pump (2), apply 68-85 kPa (20-25 in. Hg) of vacuum to the system for a minimum of three minutes.
5. Slowly release the vacuum and remove the special tools.
6. Adjust the fluid level as necessary. Refer to 1.
7. Repeat 1 through 6 until the fluid no longer drops when vacuum is applied.
8. Start the engine and cycle the steering wheel lock-to-lock three times.

NOTE: Do not hold the steering wheel at the stops.

9. Stop the engine and check for leaks at all connections.
10. Check for any signs of air in the reservoir and check the fluid level. If air is present, repeat the procedure as necessary.

COLUMN

DESCRIPTION

DESCRIPTION

813728e3

Fig. 12: STEERING COLUMN
Courtesy of CHRYSLER LLC

The tilt, telescoping and electronic telescoping steering column (5) is designed to be serviced as an assembly (including the intermediate shaft (10)); less wiring, switches, shroud, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

When servicing any component of the steering column, refer to **SERVICE INFORMATION** and observe all WARNINGS and CAUTIONS. Refer to **Restraints - Warning** .

WARNING: The airbag system is a sensitive, complex electro-mechanical unit. Before attempting to diagnose, remove or install the airbag system components you must first disconnect and isolate the battery negative (ground) cable. Then wait two minutes for the system capacitor to discharge. Failure to do so could result in accidental deployment of the airbag and possible personal injury. The fasteners, screws, and bolts, originally used for the airbag components, have special coatings and are specifically designed for the airbag system. They must never be replaced with any substitutes. Anytime a new fastener is needed, replace with the correct fasteners provided in the service package or fasteners listed in the parts books.

CAUTION: Do not hammer on steering column shaft. This may cause damage to the column internally.

NOTE: When servicing the steering wheel after removing the old bolt, a **NEW** bolt must be used when installing.

NOTE: When servicing the steering coupler a NEW bolt must be used when installing.

DIAGNOSIS AND TESTING

STEERING COLUMN

If the vehicle is involved in a front end collision or the air bag has deployed or both, the steering column must be replaced.

REMOVAL

REMOVAL

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

NOTE: If steering column being removed is an electric telescoping column and it is being reused, place column in mid-tilt position before removal to ease installation.

1. Position the front wheels straight ahead.
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative battery cable from the battery.

Fig. 13: DRIVER AIRBAG REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

4. Remove the driver air bag (3). Refer to Restraints/AIR BAG, Driver - Removal .

Fig. 14: STEERING WHEEL REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

5. Remove the steering wheel retainer bolt (2), then slide the steering wheel (1) off the shaft.
6. Remove the steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Removal** .

Fig. 15: REINFORCEMENT INSTRUMENTAL PANEL STEERING COLUMN
 Courtesy of CHRYSLER LLC

7. Remove the steering column opening reinforcement (1).

Fig. 16: Clockspring Screws
 Courtesy of CHRYSLER LLC

8. Loosen at least one clockspring screw (1) to prevent the clockspring from unwinding.

Fig. 17: STEERING COLUMN CONTROL MODULE SCREW
 Courtesy of CHRYSLER LLC

9. Back out the set screw (1) through the access hole (3) in the Steering Column Control Module (SCCM) (2) securing the multi-function SCCM assembly.

Fig. 18: STEERING COLUMN CONTROL MODULE REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

10. Pull the SCCM assembly (1) off the steering column shaft.

Fig. 19: UNLATCH TILT LEVER FROM COLUMN
Courtesy of CHRYSLER LLC

11. Manual tilt and telescoping columns - Unsnap and move the adjustment handle locking tab (3) forward as shown in illustration unlatching the handle (2) from the column.

Fig. 20: ROLL TOP SHROUD
Courtesy of CHRYSLER LLC

12. Remove three roll top shroud mounting screws and remove roll top shroud (1) along with manual tilt/telescope handle (3) (if equipped).

Fig. 21: RETAINING NUTS
Courtesy of CHRYSLER LLC

13. Remove the two retaining nuts (1) at the bulkhead (2) for the steering column.
14. Remove the instrument cluster assembly. Refer to **Electrical/Instrument Cluster - Removal** .

Fig. 22: REMOVING WIRING HARNESS CONNECTOR
 Courtesy of CHRYSLER LLC

15. Depress the tabs on the rear of the column wiring harness connector and remove the connector from the steering column.
16. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 23: RETAINING NUTS
 Courtesy of CHRYSLER LLC

17. Remove the pinch bolt (4) at the lower coupling shaft (5).
18. Slide the steering shaft (3) out of the lower coupling shaft (5).

Fig. 24: BOLT AT LOWER PART OF COLUMN
 Courtesy of CHRYSLER LLC

19. Remove the lower steering column mounting pivot bolt and nut (2).

Fig. 25: UPPER COLUMN MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

CAUTION: When handling the steering column use care to avoid holding the column by any part of the tilt/telescope mechanism or by the shaft boot. The column should be held by its mounting bracket and the

shaft by the exposed portions.

20. Remove the two upper mounting screws (1) from the steering column (2).
21. Remove the steering column assembly from the vehicle.
22. Transfer remaining parts if necessary to the new column.

INSTALLATION

INSTALLATION

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

CAUTION: When handling the steering column use care to avoid holding the column by any part of the tilt/telescope mechanism or by the shaft boot. The column should be held by its mounting bracket and the shaft by the exposed portions.

CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

NOTE: New bolts must be used for installation.

Fig. 26: UPPER COLUMN MOUNTING BOLTS

Courtesy of CHRYSLER LLC

1. Position the steering column (2) on the instrument panel and loosely install the upper mounting screws (1).

Fig. 27: BOLT AT LOWER PART OF COLUMN
Courtesy of CHRYSLER LLC

2. Firmly slide the steering column upward against the instrument panel and loosely install the pivot bolt and nut (2).

Fig. 28: UPPER COLUMN MOUNTING BOLTS
Courtesy of CHRYSLER LLC

3. Tighten the steering column upper mounting screws (1) to 30 N.m (22 ft. lbs.).

Fig. 29: BOLT AT LOWER PART OF COLUMN
Courtesy of CHRYSLER LLC

4. Tighten the pivot bolt (2) to 30 N.m (22 ft. lbs.).

Fig. 30: RETAINING NUTS
Courtesy of CHRYSLER LLC

CAUTION: When handling the steering column, care must be taken not to squeeze the boot or distort the seal to the body.

5. Center the boot for the steering column at the bulkhead (2). Install and tighten the two mounting nuts (1) to 7 N.m (62 in. lbs.).
6. Raise and support vehicle.

Fig. 31: BOOT INSTALLATION OVER SHAFT COLLAR
Courtesy of CHRYSLER LLC

7. Check and make sure plastic collar (2) on column shaft is engaged in groove within boot (1).

Fig. 32: RETAINING NUTS

Courtesy of CHRYSLER LLC

8. Align the pin on the steering shaft with the nut in the lower coupling shaft and slide the steering shaft (3) into the lower coupling (5).
9. Install a **NEW** pinch bolt (4). Tighten pinch bolt to 31 N.m (23 ft. lbs.).
10. Install the steering column wiring harness connector into the holder on the steering column. Make sure the connector is captured in the holder.
11. Install the instrument cluster. Refer to **Electrical/Instrument Cluster - Installation** .

Fig. 33: ROLL TOP SHROUD
Courtesy of CHRYSLER LLC

12. Position the roll top shroud (1) and install the three mounting screws.

Fig. 34: LATCH TILT LEVER TO COLUMN
 Courtesy of CHRYSLER LLC

13. Position the manual adjustment handle (2) over the column adjustment pin and rotate the locking tab (3) rearward as shown in illustration latching the handle to the column. Make sure the tab snaps into locked position.

Fig. 35: STEERING COLUMN CONTROL MODULE REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

14. Install the SCCM assembly (1) onto the steering column.

Fig. 36: STEERING COLUMN CONTROL MODULE SCREW
 Courtesy of CHRYSLER LLC

15. Tighten the set screw (1) securing the SCCM assembly (2).

Fig. 37: Clockspring Screws
 Courtesy of CHRYSLER LLC

16. Tighten clockspring screw(s) (1) that were backed out to keep the clockspring from unwinding.

Fig. 38: REINFORCEMENT INSTRUMENTAL PANEL STEERING COLUMN
Courtesy of CHRYSLER LLC

17. Install the steering column opening reinforcement (1).
18. Install the steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .

Fig. 39: STEERING WHEEL REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

19. Align the spline on the steering wheel hub to shaft.
20. Install the steering wheel (1) and install a **NEW** retainer bolt (2). Tighten the bolt to 70 N.m (52 ft. lbs.).

Fig. 40: DRIVER AIRBAG REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

21. Install the driver air bag (3). Refer to **Restraints/AIR BAG, Driver - Installation** .
22. Install the negative battery terminal on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). Refer to **Electrical/Battery System - Standard Procedure**

CAUTION: If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESP activations may occur on a vehicle so equipped.

23. Test the operation of the horn, lights and any other functions that are steering-column operated.

Removal

REMOVAL

1. Fully extend or pull out adjustable steering column.
2. Center the steering wheel and lock the steering wheel with a steering wheel holder.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 41: RETAINING NUTS
Courtesy of CHRYSLER LLC

4. Remove the pinch bolt (4) connecting the steering shaft (3) to the lower steering coupling shaft (5).
5. Separate the lower coupling (5) from the steering shaft (3).

Fig. 42: STEERING COUPLING
 Courtesy of CHRYSLER LLC

6. Remove the pinch bolt (1) from the steering coupling (2) at the steering gear (3).
7. Carefully slide the coupling (2) from the steering gear (3).
8. Remove the steering coupling (2) from the vehicle.

Installation

INSTALLATION

Fig. 43: STEERING COUPLING
 Courtesy of CHRYSLER LLC

1. Align the lower coupling (2), then carefully slide it onto steering gear input shaft (3).
2. Install a **NEW** pinch bolt (1) to the steering coupling (2) at the steering gear (3). Tighten the pinch bolt to 54 N.m (40 ft. lbs).

Fig. 44: RETAINING NUTS
Courtesy of CHRYSLER LLC

3. Align the pin on the steering shaft with the nut in the lower coupling shaft and slide the shaft (3) into the lower coupling (5).
4. Install a **NEW** steering coupling pinch bolt (4). Tighten the pinch bolt to 31 N.m (23 ft. lbs.).

Fig. 45: BOOT INSTALLATION OVER SHAFT COLLAR
Courtesy of CHRYSLER LLC

5. Check and make sure the plastic collar (2) on the column shaft is engaged in the groove within the boot (1).
6. Lower the vehicle.
7. Remove the steering wheel holder.
8. Check the operation of the steering column for binding or noises.

COUPLING, STEERING COLUMN, POWER

Removal

REMOVAL

1. Remove the steering column from the vehicle. See **Steering/Column - Removal**

CAUTION: When handling the steering column, use care to avoid holding the column by any part of the tilt/telescope mechanism or by the shaft boot. The column should be held by its mounting bracket and the shaft by the exposed portions.

2. Place the steering column on a clean work bench.
3. Remove black and white wiring connectors from the connector bracket by lifting the pin located in the middle of the connectors and sliding the connectors backwards off the connector bracket.
4. Remove the black plastic connector support from the column mounting bracket and discard.

Fig. 46: JACKET BOLT REMOVAL

|---|
| 1 - JACKET BOLT
2 - STEERING COLUMN JACKET |
|---|

5. Remove the jacket bolt (1) from the upper tilt gear assembly.
6. Remove the bushings from the tilt gear.

CAUTION: Avoid turning the gear while disassembling the tilt gear assembly throughout this procedure.

3 - JACKET BOLT MOUNTING HOLES CHAMFER
FACES OUTBOARD
4 - JACKET BOLT MOUNTING HOLES HAVE NO
CHAMFER ON INBOARD SURFACE |
|--|

7. Lift the column jacket. Secure column jacket from falling down (1) and remove the bolts (2) attaching the electric tilt gear drive motor.
8. Slide the motor toward the rear of the column and remove the motor.
9. Remove the coupling from tilt gear assembly.

Installation

INSTALLATION

| <ul style="list-style-type: none">1 - SECURE JACKET FROM FALLING DOWN2 - MOTOR ATTACHING BOLTS3 - JACKET BOLT MOUNTING HOLES CHAMFER FACES OUTBOARD4 - JACKET BOLT MOUNTING HOLES HAVE NO CHAMFER ON INBOARD SURFACE |
|---|

1. Install the coupling on the tilt gear assembly.
2. Install the tilt drive motor. Install and Tighten the bolts (2) to 4 Nm (36 in. lbs.).

Fig. 49: CONNECTOR SUPPORT ORIENTATION
Courtesy of CHRYSLER LLC

1 - CONNECTOR SUPPORT

3. Install the connector support (1).
4. Install black wiring connector in the upper support position. Install white connector in the lower support position. Ensure retaining connector clips are engaged.
5. Ensure the chamber in the mounting holes in the tilt gear assembly for the jacket bolt face (outboard) away from the column jacket prior to column jacket installation.
6. Lower the steering column jacket into the installed position.
7. Install two NEW bushings in the tilt gear assembly.

Fig. 50: JACKET BOLT REMOVAL
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - JACKET BOLT
2 - STEERING COLUMN JACKET |
|---|

CAUTION: Do not allow the jacket bolt to rotate while tightening the nut.

8. Install a NEW jacket bolt (1) and NEW jacket bolt nut so that the nut is on the left side of the column when the column is installed in the vehicle. Ensure the bushings are seated properly. While holding the jacket bolt stationary, tighten the nut to 8 Nm (71 in. lbs.). Loosen the nut 180 degrees, then tighten the nut to a final torque of 4 Nm (36 in. lbs.).
9. Install the steering column. See **Steering/Column - Installation**
10. Verify column is functional in tilt and telescope. No binding or noise must be present. If full travel is not achieved, use the scan tool to run the column to the full up position. The column should then achieve full travel.

MODULE, STEERING COLUMN CONTROL

Description

DESCRIPTION

WARNING: To service any component of the SCCM, the entire assembly must be removed from the column. This must be done due to the clockspring

**passing through the assembly and into the self docking connector.
Failure to remove the assembly could damage the pins of the clockspring
and prevent the airbag system from operating properly.**

Tilt and telescope steering columns are standard on all models.

A lever on the left side of the column controls powered adjustment. Fore and aft motion of the lever operates the telescoping mechanism. Up and down motion operates the tilt mechanism. Two electric motors turning threaded actuators move the column. The mechanisms lock in place when movement stops.

The Steering Column Control Module (SCCM) is mounted on the steering column and is removed as a complete unit. The components of the unit are:

- **Clockspring** - is attached to the top of the SCCM with three screws. The clockspring connector passes through the body of the SCCM and its terminals slide into the male side of the self docking connector within the Steering Column Module (SCM). Refer to **Electrical/Electronic Control Modules/MODULE, Steering Column - Description** .
- **Multi-Function Switch** - is the middle left lever, and is plugged into, and mounting pins pass through, the SCM secured to the SCCM housing by three screws. Refer to **Electrical/Lamps/Lighting - Exterior/SWITCH, Multifunction - Description** .
- **Steering Angle Sensor (if equipped with Electronic Stability Program (ESP))** - is mounted on the right side of the SCCM, below the clockspring and is responsible for informing the ESP of steering angle.
- **Steering Control Module (SCM)** - is the module located in the bottom of the SCCM, retained by three screws, and is the mating point for all the switches and clockspring located in the SCCM.
- **Shroud** - is the outer housing or shell of the SCCM.

The SCCM communicates via the Local Interconnect Network (LIN) serial data bus. This is an ultra-low voltage serial data bus that allows the following components to communicate with the Controller Area Network (CAN) B and C data buses.

- Steering Wheel Switches
- Horn
- Speed Control Switch
- Multi-function Switch
- Steering Angle Sensor (if equipped with Electronic Stability Program (ESP))
- Steering Control Module (SCM)

Removal

REMOVAL

WARNING: To service any component of the SCCM, the entire assembly must be

removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly.

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury or death.

CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

Fig. 51: DRIVER AIRBAG REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Position the front wheels **straight-ahead** .
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.
4. Remove the driver airbag (3). Refer to **Restraints/AIR BAG, Driver - Removal**

Fig. 52: STEERING WHEEL REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

5. Remove the steering wheel retaining bolt (2), then slide the steering wheel (1) off the shaft.

Fig. 53: Clockspring Screws
 Courtesy of CHRYSLER LLC

6. Unscrew at least one clockspring screw (1) but don't take it all the way out, This will help keep the clockspring from uncentering itself.

Fig. 54: STEERING COLUMN CONTROL MODULE SCREW
 Courtesy of CHRYSLER LLC

7. Back out the set screw (1) through the access hole (3) in the bottom of the Steering Column Control Module (SCCM) (2).

Fig. 55: STEERING COLUMN CONTROL MODULE REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

8. Pull the SCCM (1) off the steering column shaft.
9. To service the individual components contained within the SCCM. See **Steering/Column/MODULE, Steering Column Control - Disassembly.**

Disassembly

DISASSEMBLY

Fig. 56: Clockspring Screws
Courtesy of CHRYSLER LLC

WARNING: To service any component of the SCCM, the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly. Failure to follow these instructions may result in serious or fatal injury.

1. Loosen the three clockspring screws (1) just far enough to release the clockspring from the SCCM. Leave them in the clockspring so it won't unwind.

Fig. 57: Clockspring
Courtesy of CHRYSLER LLC

2. Carefully pull straight up on clockspring to remove.

NOTE: After the clockspring is removed, there is only one more screw on the top side of the SCCM that needs to be removed and is located at approximately the six o'clock position on the SCCM. It holds the lower side of the steering angle sensor, the lower side of the electric tilt lever assembly, or the strengthening strut if not equipped with electric tilt.

Fig. 58: STEERING ANGLE SENSOR
Courtesy of CHRYSLER LLC

3. Remove the steering angle sensor screw located at the six o'clock position on the SCCM and remove the steering angle sensor (1) from the SCCM (2).

Fig. 59: STRUT UNDER ESP

Courtesy of CHRYSLER LLC

4. Remove the strut screw, located at the six o'clock position, and strut (1).

Fig. 60: Speed Control From SCCM
Courtesy of CHRYSLER LLC

5. Remove the speed control switch (1).

Fig. 61: MULTIFUNCTION REAR
Courtesy of CHRYSLER LLC

6. Remove the three screws (1) at the bottom of the SCCM shroud for the multi-function switch and Steering Control Module (SCM).

Fig. 62: Multi-Function Switch & Circuit Board
Courtesy of CHRYSLER LLC

7. Separate the multi-function switch from the SCM.

Assembly

ASSEMBLY

Fig. 63: Multi-Function Switch & Circuit Board
Courtesy of CHRYSLER LLC

WARNING: To service any component of the SCCM, the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly.

1. Position the Steering Control Module (SCM) onto the multi-function switch.

Fig. 64: MULTIFUNCTION REAR
Courtesy of CHRYSLER LLC

2. Install the multi-function switch and SCM in the SCCM shroud and tighten the three screws (1) from the bottom.

Fig. 65: Speed Control From SCCM
Courtesy of CHRYSLER LLC

3. Install the speed control switch (1).

Fig. 66: STRUT UNDER ESP
Courtesy of CHRYSLER LLC

4. Install the strut (1).

Fig. 67: STEERING ANGLE SENSOR SCREW
Courtesy of CHRYSLER LLC

5. Install the steering angle sensor (3) and screw located at the six o'clock position.

Fig. 68: Clockspring Screws
 Courtesy of CHRYSLER LLC

6. Install the clockspring and screws (1) leaving one out so it will not unwind.
7. Install the SCCM on the steering column. See **Steering/Column/MODULE, Steering Column Control - Installation** and tighten the one clockspring screw (1) that was left loose.

Installation

INSTALLATION

Fig. 69: STEERING COLUMN CONTROL MODULE REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

WARNING: To service any component of the SCCM, the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly. Failure to follow these instructions may result in serious or fatal injury.

1. Install the SCCM (1) onto the steering column.

Fig. 70: STEERING COLUMN CONTROL MODULE SCREW
Courtesy of CHRYSLER LLC

2. Tighten the set screw (1) securing the SCCM (2).

Fig. 71: Clockspring Screws

Courtesy of CHRYSLER LLC

3. Tighten clockspring screw(s) (1) that were backed out to keep the clockspring from unwinding.

Fig. 72: STEERING WHEEL REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

4. Align the spline on the steering wheel hub to shaft and install the steering wheel (1).
5. Install a **NEW** retaining bolt (2). Tighten the bolt to 70 N.m (52 ft. lbs.).

Fig. 73: DRIVER AIRBAG REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

6. Install the driver airbag (3). Refer to **Restraints/AIR BAG, Driver - Installation** .
7. Connect the battery negative cable. If equipped with Electronic Stability Program (ESP), the steering angle sensor must be calibrated. Refer to **Electrical/Battery System - Standard Procedure** .

SHROUD, STEERING COLUMN

Removal

REMOVAL

The steering column shroud is part of the Steering Column Control Module (SCCM). Remove and disassemble the SCCM. See **Steering/Column/MODULE, Steering Column Control - Removal**. See **Steering/Column/MODULE, Steering Column Control - Disassembly**

Installation

INSTALLATION

The steering column shroud is part of the steering column control module (SCCM). See **Steering/Column/MODULE, Steering Column Control - Assembly**

SHROUD, STEERING COLUMN, ROLL TOP

Removal

REMOVAL

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury or death.

Fig. 74: STEERING COLUMN CONTROL MODULE REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Access and remove the steering column control module (SCCM) (1) from the column. See **Steering/Column/MODULE, Steering Column Control - Removal**.
2. Remove the steering column opening cover (1). Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Removal** .

Fig. 75: REINFORCEMENT INSTRUMENTAL PANEL STEERING COLUMN
 Courtesy of CHRYSLER LLC

3. Remove the steering column opening reinforcement (1).
4. Remove the cluster bezel. Refer to **Body/Instrument Panel/BEZEL, Instrument Cluster - Removal**

Fig. 76: UNLATCH TILT LEVER FROM COLUMN
 Courtesy of CHRYSLER LLC

5. Unsnap and move the adjustment handle locking tab (3) forward as shown in illustration unlatching the handle (2) from the column.

Fig. 77: SHROUD SCREWS
 Courtesy of CHRYSLER LLC

6. Remove the three shroud mounting screws (2).

Fig. 78: ROLL TOP SHROUD
 Courtesy of CHRYSLER LLC

7. Remove the roll top shroud (1) along with manual tilt/telescope handle (3) (if equipped).

Installation

INSTALLATION

Fig. 79: ROLL TOP SHROUD
 Courtesy of CHRYSLER LLC

1. Install the roll top shroud (1) over the steering column (2).

Fig. 80: SHROUD SCREWS
 Courtesy of CHRYSLER LLC

2. Install the three shroud mounting screws (2).

Fig. 81: LATCH TILT LEVER TO COLUMN
 Courtesy of CHRYSLER LLC

3. Position the manual adjustment handle (2) over the column adjustment pin and rotate the locking tab (3) rearward as shown in illustration latching the handle to the column. Make sure the tab snaps into locked position.
4. Install the cluster bezel (3). Refer to **Body/Instrument Panel/BEZEL, Instrument Cluster - Installation** .

Fig. 82: REINFORCEMENT INSTRUMENTAL PANEL STEERING COLUMN
 Courtesy of CHRYSLER LLC

5. Install the steering column opening reinforcement (1).

6. Install the steering column opening cover (1).

Fig. 83: STEERING COLUMN CONTROL MODULE REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

7. Install the steering column control module (SCCM) (1) and all components removed to access it. See **Steering/Column/MODULE, Steering Column Control - Installation**
8. Install the negative battery cable on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). Refer to **Electrical/Battery System - Standard Procedure** .
9. Test the operation of the horn, lights and any other functions that are steering-column operated.

SLIDER, STEERING COLUMN

Removal

REMOVAL

1. Remove the steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Removal**

Fig. 84: REINFORCEMENT INSTRUMENTAL PANEL STEERING COLUMN
 Courtesy of CHRYSLER LLC

2. Remove the steering column opening reinforcement (1).
3. Unlock the manual column tilt and telescoping adjustment handle, then telescope the column full forward.

Fig. 85: UNLATCH TILT LEVER FROM COLUMN
 Courtesy of CHRYSLER LLC

4. Unsnap and move the adjustment handle locking tab (3) forward as shown in illustration unlatching the handle (2) from the column.

81bbfb2a

Fig. 86: RETAINER PINS - SLIDER REMOVAL
Courtesy of CHRYSLER LLC

5. Using a small screwdriver (3) through the access hole, lift the retaining tab, then move the slider bar (2) toward the steering wheel until the large holes in the slots align with the casting pins (1) on the column.

81bbfcdb

Fig. 87: SLIDER BAR REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

6. Move the slider bar (1) off the casting pins, then tip it down at the steering wheel end and slide it off the slider sled (2).

81bbfd50

Fig. 88: SLIDER SLED REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

7. Rotate the slider sled (1) as shown in illustration and remove it from the lever arm (2).

Installation

INSTALLATION

81bbfd50

Fig. 89: SLIDER SLED REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

1. Position the slider sled (1) as shown in illustration and insert it into the lever arm (2).

81bbfcb

Fig. 90: SLIDER BAR REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

2. Insert the slider bar (1) through the slider sled (2) as shown in illustration.

81bc1085

Fig. 91: RETAINER PINS - SLIDER INSTALLATION
Courtesy of CHRYSLER LLC

3. Place the slider bar onto the column by aligning the large holes in the mounting slots with the casting pins (1) on the column, then slide the slider bar (2) into mounted position.

Fig. 92: LATCH TILT LEVER TO COLUMN
 Courtesy of CHRYSLER LLC

4. Position the tilt and telescoping adjustment handle (2) over the column adjustment pin (on slider sled) and rotate the locking tab (3) rearward as shown in illustration latching the handle to the column. Make sure the tab snaps into locked position.

Fig. 93: REINFORCEMENT INSTRUMENTAL PANEL STEERING COLUMN
 Courtesy of CHRYSLER LLC

5. Install the steering column opening reinforcement (1).
6. Install the steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation**

7. Test the steering column tilt and telescoping operation.

WHEEL, STEERING

Removal

REMOVAL

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible personal injury.

CAUTION: All fasteners must be torqued to specification to ensure proper operation of the steering column.

Fig. 94: DRIVER AIRBAG REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

1. Position the front wheels **straight-ahead** .
2. Fully extend or pull out adjustable steering column.
3. Disconnect the negative (ground) cable from the battery.
4. Remove the driver airbag (3). Refer to **Restraints/AIR BAG, Driver - Removal** .

Fig. 95: STEERING WHEEL REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

5. Remove the steering wheel retainer bolt (2), then slide the steering wheel (1) off the shaft.
6. If wheel is being replaced, transfer attached components as necessary.

Installation

INSTALLATION

Fig. 96: STEERING WHEEL REMOVAL & INSTALLATION
 Courtesy of CHRYSLER LLC

1. Align the spline on the steering wheel hub to the column shaft, then install the steering wheel (1).
2. Install a **NEW** retainer bolt (2). Tighten the bolt to 70 N.m (52 ft. lbs.).

Fig. 97: DRIVER AIRBAG REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

3. Install the driver airbag (3). Refer to **Restraints/AIR BAG, Driver - Installation**
4. Install the negative battery terminal on the battery. It is important that this is performed properly (including calibration of steering angle sensor if equipped with ESP). Refer to **Electrical/Battery System - Standard Procedure**

CAUTION: If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESP activations may occur on a vehicle so equipped.

5. Test the operation of the horn, lights and any other functions that are steering column operated.

GEAR

DESCRIPTION

DESCRIPTION

8146015e

Fig. 98: RWD POWER STEERING GEAR
Courtesy of CHRYSLER LLC

A power rack and pinion steering gear is used on this vehicle. Components of the power steering gear are as follows:

- (1) Outer tie rods
- (2) Inner tie rods
- (3) Bellows
- (4) Mount Bushings
- (5) Housing

The gear cannot be adjusted or internally serviced. If a malfunction or a fluid leak occurs, the gear must be replaced as an assembly. The only serviceable component on the steering gear is the outer tie rod (1).

DIAGNOSIS AND TESTING

POWER STEERING GEAR

NOTE: This information is designed to be used in conjunction with the diagnostic charts . See **STEERING DIAGNOSIS CHARTS**

OBJECTIONABLE HISS OR WHISTLE POSSIBLY CAUSED BY A NOISY STEERING GEAR

1. Check and adjust power steering fluid level in the reservoir as necessary. See **Steering/Pump/FLUID - Standard Procedure**
2. Start the vehicle and heat system by steering lock-to-lock 5 times with the engine running at 3000 rpm. Do not hold the gear against the stops for more than 15 seconds at a time.

3. Return the engine to idle speed.
4. Listen for the noise when turning the wheel slowly off center during a dry park maneuver.
5. Replace power steering gear if the hiss or whistle is present. See **Steering/Gear - Removal**

REMOVAL

REMOVAL

8133bb50

Fig. 99: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 100: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

4. Remove wheel mounting nuts (3), then both front tire and wheel assemblies (1).

Fig. 101: FRONT OUTER TIE ROD
 Courtesy of CHRYSLER LLC

CAUTION: When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

5. Loosen tie rod jam nut (3) at each outer tie rod (5).

6. Remove outer tie rod nut (1) at each knuckle (2).

Fig. 102: USING PULLER ON OUTER TIE ROD
Courtesy of CHRYSLER LLC

7. Using Remover 9360 (2), separate outer tie rod (1) from each knuckle.

Fig. 103: STEERING COUPLING
Courtesy of CHRYSLER LLC

8. Remove steering coupling (2) pinch bolt (1) at steering gear (3). See **Steering/Column/COUPLING, Steering Column - Removal.**

Fig. 104: HOSES AT RWD STEERING GEAR
 Courtesy of CHRYSLER LLC

9. Unthread pressure hose tube nut (2) from steering gear (1). Remove pressure hose from steering gear.
10. Unthread return hose tube nut (3) from steering gear (1). Remove return hose from steering gear.

Fig. 105: GEAR MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

11. Remove steering gear mounting bolts (1).
12. If necessary, remove outer tie rods from gear. Count number of revolutions off for each tie rod

for reference upon installation to replacement gear.

INSTALLATION

INSTALLATION

Fig. 106: GEAR MOUNTING BOLTS
Courtesy of CHRYSLER LLC

1. If necessary, install outer tie rods from original gear to replacement inner tie rods. Install each outer tie rod same amount of threads as it was installed on original gear. This will get toe setting close, saving some time when toe is set later in this procedure.
2. Lift steering gear (2) into mounted position and install steering gear mounting bolts (1). Tighten bolts to 95 N.m (70 ft. lbs.).

Fig. 107: HOSES AT RWD STEERING GEAR
 Courtesy of CHRYSLER LLC

NOTE: Always use a NEW O-ring on the ends of the steering hoses.

3. Lubricate new O-ring on end of return hose with clean power steering fluid.
4. Install return hose (3) to steering gear (1). Tighten tube nut to 47 N.m (35 ft. lbs.).
5. Lubricate new O-ring on end of pressure hose with clean power steering fluid.
6. Install pressure hose (2) to steering gear (1). Tighten tube nut to 47 N.m (35 ft. lbs.).

Fig. 108: STEERING COUPLING
 Courtesy of CHRYSLER LLC

CAUTION: Prior to coupling installation, make sure gear is centered in its travel to match clockspring centering in steering column.

7. Align coupling (2) with input shaft (3) and install steering coupling. Install new pinch bolt. Tighten bolt to 54 N.m (40 ft. lbs.).

Fig. 109: FRONT OUTER TIE ROD
Courtesy of CHRYSLER LLC

8. Install each outer tie rod end (5) to its knuckle (2). Install nuts (1) and tighten to 85 N.m (63 ft. lbs.).

Fig. 110: TIRE AND WHEEL MOUNTING

Courtesy of CHRYSLER LLC

9. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **Tires and Wheels - Installation**
10. Lower vehicle.

8133bb50

Fig. 111: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

11. Connect negative battery cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical/Battery System - Standard Procedure**
12. Fill and bleed power steering system. See **Steering - Standard Procedure**
13. Perform wheel alignment setting toe to specifications. Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

Fig. 112: FRONT OUTER TIE ROD
 Courtesy of CHRYSLER LLC

14. Tighten both tie rod jam nuts (3) to 75 N.m (55 ft. lbs.).

TIE ROD, STEERING

Diagnosis and Testing

TIE ROD

Tie rod free-play can be measured using the following methods:

OUTER TIE ROD

Fig. 113: Attaching Magnetic Dial Indicator To Inside Or Outside Of Brake Rotor
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .
2. Remove the front wheels. Refer to **Tires and Wheels - Removal** .
3. Install two standard wheel mounting nuts, flat side to rotor, diagonally opposite to each on the rotor.
4. Attach a magnetic dial indicator (2) to the inside of the brake rotor, then align dial indicator's contact pointer (1) with direction of stud axis and touch outer tie rod.
5. Zero dial indicator (3).

81d2625b

Fig. 114: Checking Outer Tie Rod Free-Play
Courtesy of CHRYSLER LLC

NOTE: When checking free-play, **DO NOT** rotate the tie rod. Just because a tie rod rotates easily does not mean that it is necessarily faulty. Using more than light hand pressure will result in a false reading.

6. Grasp the outer tie rod near the ball stud and attempt to move the tie rod straight up and down using light hand pressure. (Less than 10 lbs. of force.)
7. Measure and record any tie rod free-play movement.
8. Remove the magnetic dial indicator.
9. Remove the standard wheel mounting nuts from the two studs.
10. If the free-play in the tie rod exceeds 0.05 mm (.002 in.), replace the outer tie rod. See **Steering/Gear/TIE ROD, Steering - Removal**. If the free-play is less than 0.05 mm (.002 in.) at the outer tie rod, check the inner tie rod for free-play. See the following procedure.

INNER TIE ROD

NOTE: Always check and repair (if necessary) outer tie rod free-play before checking inner tie rod free-play. False results can otherwise be obtained.

81d26263

Fig. 115: Checking Inner Tie Rod Free-Play
Courtesy of CHRYSLER LLC

1. Grasp the inner tie rod near the steering gear bellows and attempt to move the tie rod straight up and down. If any free-play is felt, replace the inner tie rod. See **Steering/Gear/TIE ROD, Steering - Removal**.
2. If no free-play is felt, install the front wheels. Refer to **Tires and Wheels - Installation**.
3. Remove support and lower the vehicle.

Removal

OUTER TIE ROD

Fig. 116: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure.
2. Remove wheel mounting nuts (3), then front tire and wheel assembly (1).

Fig. 117: FRONT OUTER TIE ROD
 Courtesy of CHRYSLER LLC

CAUTION: When loosening jam nut and rotating inner tie rod, use care not to twist bellows at inner tie rod. Remove clamp at inner tie rod and make sure bellows moves freely before rotating inner tie rod.

3. Loosen tie rod jam nut (3) at outer tie rod (5).
4. Remove outer tie rod end nut (1) at knuckle (2).

Fig. 118: USING PULLER ON OUTER TIE ROD
Courtesy of CHRYSLER LLC

5. Using Remover 9360 (2), separate outer tie rod end (1) from knuckle.
6. Unthread outer tie rod from inner tie rod. **Count number of turns when removing outer tie rod. This will give a good starting point when reassembling and when setting toe.**

INNER TIE ROD

Fig. 119: BELLOWS CLAMPS

Courtesy of CHRYSLER LLC

1. Remove outer tie rod. See **Steering/Gear/TIE ROD, Steering - Removal**.
2. Remove tie rod jam nut from inner tie rod.
3. Remove clamp (1) securing bellows (3) to inner tie rod.
4. Remove clamp (2) securing bellows (3) to steering gear body.
5. Remove bellows (3).

Fig. 120: INNER TIE ROD HEX
Courtesy of CHRYSLER LLC

6. Install appropriate inner tie rod removal tool on inner tie rod hex (1).

CAUTION: If inner tie rod cannot be removed using specified tools, do not use a hammer or heat to loosen. Damage to steering gear will occur. Replace entire steering gear.

7. Unthread and remove inner tie rod (2).

Fig. 121: RESTRICTOR REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

8. Remove travel restrictor (2) from rack gear (3).

Installation

OUTER TIE ROD

Fig. 122: FRONT OUTER TIE ROD
 Courtesy of CHRYSLER LLC

CAUTION: When rotating inner tie rod, use care not to twist bellows at inner tie rod.
 Remove clamp at inner tie rod and make sure bellows moves freely before

rotating inner tie rod.

1. Thread outer tie rod (5) onto inner tie rod (4). Install outer tie rod using same number of turns as when removed.
2. Install outer tie rod end (5) into steering knuckle (2). Install and tighten nut (1) to 85 N.m (63 ft. lbs.).

Fig. 123: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

3. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **Tires and Wheels - Installation** .
4. Lower vehicle.
5. Perform wheel alignment setting toe to specifications. Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

Fig. 124: FRONT OUTER TIE ROD
Courtesy of CHRYSLER LLC

6. Tighten tie rod jam nut (3) to 75 N.m (55 ft. lbs.).

INNER TIE ROD

Fig. 125: RESTRICTOR REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: The travel restrictor (2) has a beveled lip (1) on one end of its inside diameter to keep the restrictor from being install too far onto the rack gear. Install the restrictor with the beveled lip side outward (away from gear) to avoid misinstallation and restrictor damage.

1. Install travel restrictor (2), beveled lip (1) side outward, on end of rack gear (3). Once installed, restrictor will be flush with end of rack gear.
2. Apply Mopar® Lock and Seal Adhesive or equivalent medium thread locker adhesive to inboard end threads of inner tie rod.

Fig. 126: INNER TIE ROD HEX
Courtesy of CHRYSLER LLC

3. Install inner tie rod (2) onto gear using appropriate inner tie rod installer tool or crows foot wrench on hex (1). Tighten inner tie rod to 115 N.m, (85 ft. lbs.).
4. Loosely place new clamp over large end of bellows.
5. Slide new bellows with clamp over end of inner tie rod and onto gear body.

Fig. 127: GROOVE IN INNER TIE ROD
Courtesy of CHRYSLER LLC

6. Push small end of bellows (2) past groove (1) machined into inner tie rod.
7. Apply a small amount of Mopar® Lubriplate or equivalent uniformly to groove (1) in inner tie rod shaft. This allows for toe adjustment without twisting bellows.
8. Pull small end of bellows outward until ridge inside bellows engages groove.

Fig. 128: BELLOWS CLAMPS
Courtesy of CHRYSLER LLC

9. Install new clamp (1) over small end of bellows (3).

Fig. 129: CRIMPING BELLOWS CLAMP
Courtesy of CHRYSLER LLC

10. Using crimping pliers (2), crimp bellows clamp (1) at gear body.
11. Thread tie rod jam nut onto inner tie rod far enough to install outer tie rod.
12. Install outer tie rod. See **Steering/Gear/TIE ROD, Steering - Installation**.

PUMP

DESCRIPTION

DESCRIPTION

Fig. 130: POWER STEERING PUMP
Courtesy of CHRYSLER LLC

- | |
|---------------------|
| 1 - SHAFT |
| 2 - SUPPLY INLET |
| 3 - PRESSURE OUTLET |

Hydraulic pressure for operation of the power steering gear is provided by a belt-driven all-aluminum power steering pump. Most vehicles use a common droop flow rate and constant displacement type pump that is mounted in a common location (left front of engine). The SRT8 power steering pump is a constant-flow type, but appears the same externally and is mounted in the same location as others.

DIAGNOSIS AND TESTING

POWER STEERING PUMP AND HOSES

NOTE: This information is designed to be used in conjunction with the diagnostic charts . See **STEERING DIAGNOSIS CHARTS**

CHECKING FOR WEAR OF POWER STEERING PUMP INTERNAL COMPONENTS

1. Place gear selector in PARK (or NEUTRAL) with wheels chalked.
2. With the engine idling, have a helper turn the steering wheel.
3. Using an electronic listening tool, determine if noise is coming from the pump.
4. Increase the engine speed and have a helper turn the steering wheel. Does the noise change with load?
5. Replace the power steering pump if excessive noise is present. See **Steering/Pump - Removal**

CHECKING FOR POWER STEERING HOSES TOUCHING BODY OR FRAME OF VEHICLE

Check hoses and hose tubes as following:

- Inspect hoses and hose tubes for witness marks. If witness marks are present, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. See **Steering - Specifications**. **Do not bend tubing to adjust**. Replace the hose assembly if damaged.
- Check fastener torque of hose mounting brackets and tube nuts. See **Steering - Specifications**
- Have a helper bump the steering gear off of the stops to induce pressure fluctuations which may move the hose. If hose contact is made, adjust hose(s) to the proper position by loosening, repositioning and tightening attachments to the specified torque. See **Steering - Specifications**. **Do not bend tubing to adjust**. Replace the hose assembly if damaged.

PUMP LEAKAGE

The pump is serviced as an assembly and should not be disassembled.

Check for leaks in the following areas:

- Pump shaft seal behind the pulley
- Pressure and return lines
- Flow control valve fitting

REMOVAL

3.5L

81330050

Fig. 131: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Remove air cleaner housing and inlet tube to throttle body. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal**
4. Remove serpentine drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal**

8137865c

Fig. 132: SUPPLY HOSE 3.5L
Courtesy of CHRYSLER LLC

5. Remove hose clamp (2), then supply hose (3) from pump (1).

Fig. 133: PRESSURE HOSE AT PUMP - 3.5L
Courtesy of CHRYSLER LLC

6. Unthread tube nut, then remove pressure hose (2) from pump (1).

Fig. 134: POWER STEERING PUMP - 3.5L
Courtesy of CHRYSLER LLC

7. Remove three pump mounting bolts (1) through access holes in pulley.
8. Remove pump (3) from engine bracket (2).
9. If pulley needs removal. See **Steering/Pump/PULLEY, Power Steering Pump - Removal**.

REMOVAL (5.7L/6.1L)

8133b050

Fig. 135: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable (2).

1375411

Fig. 136: Air Filter Assembly
Courtesy of CHRYSLER LLC

2. Remove the engine cover (1).
3. Disconnect the intake air temperature (IAT) sensor (5) connector.

4. Loosen the clamps at the throttle body and the air filter assembly and remove the clean air tube (4).
5. Remove the make up air hose (MUA) (2).
6. Remove the air filter assembly retaining bolt (3).
7. Lift the air filter assembly out of the vehicle.

Fig. 137: Identifying Accessory Drive Belt Routing - 5.7L
Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

8. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop and remove the accessory drive belt (4), then slowly rotate the tensioner to the freearm position.

Fig. 138: SUPPLY HOSE - 5.7L
Courtesy of CHRYSLER LLC

9. Siphon the power steering fluid from the power steering pump reservoir.
10. Remove the hose clamp and the supply hose (3) from the power steering pump (1).

Fig. 139: PRESSURE HOSE AT PUMP - 5.7L
Courtesy of CHRYSLER LLC

11. Remove the pressure hose (2) from the power steering pump (1).

Fig. 140: POWER STEERING PUMP - 5.7L
Courtesy of CHRYSLER LLC

12. Remove the three power steering pump mounting bolts (2) through the access holes in the power steering pump pulley.
13. Remove the power steering pump (1) from the engine.
14. If the power steering pump pulley needs removal. See **Steering/Pump/PULLEY, Power Steering Pump - Removal**

INSTALLATION

3.5L

Fig. 141: POWER STEERING PUMP - 3.5L
Courtesy of CHRYSLER LLC

1. Align pump (3) with mounting holes on engine bracket (2).
2. Install three pump mounting bolts (1) through access holes in pulley and engine bracket. Tighten bolts to 28 N.m (21 ft. lbs.) torque.

Fig. 142: PRESSURE HOSE AT PUMP - 3.5L
Courtesy of CHRYSLER LLC

NOTE: Always use a NEW O-ring on the end of the pressure hose.

3. Lubricate NEW O-ring on end of pressure hose with clean power steering fluid.
4. Install pressure hose (2) to pump (1). Tighten pressure hose tube nut to 47 N.m (35 ft. lbs.) torque.

8137865c

Fig. 143: SUPPLY HOSE - 3.5L
Courtesy of CHRYSLER LLC

5. Install supply hose (3) on pump. Install clamp (2) securing hose in place.
6. Install serpentine drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation**
7. Install air cleaner housing and inlet tube. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation**

81336b50

Fig. 144: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

8. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

Refer to **Electrical/Battery System - Standard Procedure**

9. Fill and bleed power steering system. See **Steering - Standard Procedure**

INSTALLATION (5.7L/6.1L)

Fig. 145: POWER STEERING PUMP - 5.7
Courtesy of CHRYSLER LLC

1. Align the power steering pump (1) with the mounting holes on the engine.
2. Install the three power steering pump mounting bolts (2) through the access holes in the pulley and tighten the bolts to 28 N.m (21 ft. lbs.).

Fig. 146: PRESSURE HOSE AT PUMP - 5.7L

Courtesy of CHRYSLER LLC

NOTE: Always use a new O-ring on the end of the pressure hose.

3. Lubricate the new O-ring on the end of the pressure hose with clean power steering fluid.
4. Install the pressure hose (2) to the power steering pump (1) and tighten the pressure hose tube nut to 47 N.m (35 ft. lbs.).

81378661

Fig. 147: SUPPLY HOSE - 5.7L
Courtesy of CHRYSLER LLC

5. Install the supply hose (3) on the power steering pump (1) and securely tighten the hose clamp.

212564

Fig. 148: Identifying Accessory Drive Belt Routing - 5.7L
Courtesy of CHRYSLER LLC

CAUTION: Do not let the tensioner arm snap back to the freearm position, sever damage may occur to the tensioner.

6. Rotate the accessory drive belt tensioner (7) counterclockwise until it contacts it's stop and position the accessory drive belt (4), onto the pulleys.

Fig. 149: Air Filter Assembly
Courtesy of CHRYSLER LLC

7. Position the air filter assembly into the vehicle.
8. Install the air filter assembly retaining bolt (3) and securely tighten.
9. Connect the make up air hose (2).
10. Install the clean air tube (4) to the throttle body and the air filter assembly and securely tighten the clamps.
11. Connect the intake air temperature (IAT) sensor (5) connector.
12. Install the engine cover (1).

8133b050

Fig. 150: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

13. Connect the negative battery cable (2).
14. Fill and bleed the power steering system. See **Steering - Standard Procedure**

COOLER, POWER STEERING

Description

DESCRIPTION

918963

Fig. 151: Power Steering Cooler
Courtesy of CHRYSLER LLC

The power steering cooler is integrated into the A/C condenser (1).

The A/C condenser is equipped with two fittings (2) for the integral automatic transmission cooler (when equipped with an automatic transmission), fittings for the integral power steering cooler (3), tapping blocks for the A/C refrigerant lines (4), a tapping block for the receiver/drier (5) and integral mounting brackets (6).

Removal

REMOVAL

The power steering cooler is integrated into the A/C condenser and is serviced as an assembly. Refer to **Heating and Air Conditioning/Plumbing/CONDENSER, A/C - Removal**

Installation

INSTALLATION

The power steering cooler is integrated into the A/C condenser and is serviced as an assembly. Refer to **Heating and Air Conditioning/Plumbing/CONDENSER, A/C - Installation**

FLUID

Description

DESCRIPTION

The recommended fluid for the power steering system is Mopar® Power Steering fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid. Both fluids have the same material standard specifications (MS-9602).

Mopar® ATF+4 (and Mopar® Power Steering fluid + 4), when new, is red in color. ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

Standard Procedure

POWER STEERING FLUID LEVEL CHECKING

WARNING: Fluid level should be checked with the engine OFF to prevent personal injury from moving parts and to assure an accurate fluid level reading.

CAUTION: Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid is to be used in the power steering system. Both

Fluids have the same material standard specifications (MS-9602). No other power steering or automatic transmission fluid is to be used in the system. Damage may result to the power steering pump and system if another fluid is used. Do not overfill the system.

NOTE: Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected.

Fig. 152: COLD AND HOT SIDES OF DIPSTICK
Courtesy of CHRYSLER LLC

The power steering fluid level can be viewed on the dipstick attached to the filler cap. There are two sides to the dipstick, one is for checking the fluid when it is cold, the other is for checking the fluid when it is hot. Before opening the power steering system, wipe the reservoir filler cap free of dirt and debris. Remove the cap and check the fluid level on its dipstick.

Use the COLD side of the dipstick (1) to measure when the fluid is at normal ambient temperature, approximately 21°C to 27°C (70°F to 80°F). The fluid level should read between the ADD and FULL COLD lines.

Use the HOT side of the dipstick (2) to measure when the vehicle has been running and the fluid is hot. When the fluid is hot, the fluid level is allowed to read up to the FULL HOT line. **Only add fluid to the system when the vehicle is cold.**

Use only Mopar® Power Steering Fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid in the power steering system. Do not overfill the power steering system.

HOSE, POWER STEERING, PRESSURE

Removal

REMOVAL

8133b050

Fig. 153: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Remove air cleaner housing and inlet tube to throttle body. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal** .

8145ba85

Fig. 154: PRESSURE HOSE AT PUMP - 5.7L
Courtesy of CHRYSLER LLC

4. Unthread tube nut, then remove pressure hose (2) from pump (1).
5. Raise and support vehicle. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description**
6. Remove belly pan. Refer to **Body/Exterior/BELLY PAN - Removal**

Fig. 155: HOSE ROUTING ALONG ENGINE CRADLE
 Courtesy of CHRYSLER LLC

7. Remove screw (5) securing pressure hose (1) routing clamp to front of engine cradle (3).
8. Remove screw (4) fastening routing clamps securing pressure (1) and return (2) hoses to right side of engine cradle (3).

Fig. 156: HOSES AT RWD STEERING GEAR

Courtesy of CHRYSLER LLC

9. Unthread pressure hose tube nut (2) from steering gear (1).
10. Remove pressure hose from vehicle.

Installation

INSTALLATION

1. Install pressure hose in engine compartment from underneath.

Fig. 157: HOSES AT RWD STEERING GEAR
Courtesy of CHRYSLER LLC

NOTE: Always use a NEW O-ring on the end of the pressure hose.

2. Lubricate new O-ring on steering gear end of pressure hose with clean power steering fluid.
3. Install pressure hose (2) to steering gear (1). **Do not tighten tube nut at this time.**

Fig. 158: HOSE ROUTING ALONG ENGINE CRADLE
 Courtesy of CHRYSLER LLC

4. Route pressure hose along right side of engine cradle. Position pressure hose (1) routing clamp over return hose (2) routing clamp, then install screw (4) securing hoses to right side of engine cradle (3).
5. Route pressure hose along front of engine cradle. Install screw (5) through routing clamp securing hose to front of engine cradle (3).

Fig. 159: HOSES AT RWD STEERING GEAR
 Courtesy of CHRYSLER LLC

6. Tighten pressure hose tube nut at steering gear to 47 N.m (35 ft. lbs.).

7. Install belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .
8. Lower vehicle.

NOTE: Always use a NEW O-ring on the end of the pressure hose.

9. Lubricate new O-ring on power steering pump end of pressure hose with clean power steering fluid.

Fig. 160: PRESSURE HOSE AT PUMP - 5.7L
Courtesy of CHRYSLER LLC

10. Install pressure hose (2) to pump (1). Tighten pressure hose tube nut to 47 N.m (35 ft. lbs.).
11. Install air cleaner housing and inlet tube. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation**

8133b050

Fig. 161: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

12. Connect negative battery cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical/Battery System - Standard Procedure**
13. Fill and bleed power steering system. See **Steering - Standard Procedure**

HOSE, POWER STEERING, RETURN

Removal

COOLER TO RESERVOIR

8133b050

Fig. 162: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Remove air cleaner housing and inlet tube to throttle body. Refer to Engine/Air Intake System/BODY, Air Cleaner - Removal

81378535

Fig. 163: REMOTE RESERVOIR
Courtesy of CHRYSLER LLC

4. Remove hose clamp, then return hose (1) at reservoir (2).
5. Remove upper radiator closer panels.

8137b482

Fig. 164: FLUID COOLER AND HOSES
Courtesy of CHRYSLER LLC

6. Remove hose clamp, then cooler end of return hose (1) at cooler (2).

Fig. 165: RETURN HOSE ROUTING TO RESERVOIR
Courtesy of CHRYSLER LLC

7. Remove return hose from routing clip (4) on headlamp mounting crossmember.
8. Pull cooler end of return hose into engine compartment and remove hose from vehicle.

GEAR TO COOLER

Fig. 166: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.
4. Remove belly pan. Refer to **Body/Exterior/BELLY PAN - Removal**

Fig. 167: RETURN HOSE RESERVOIR TO COOLER
Courtesy of CHRYSLER LLC

5. Remove hose clamp, then return hose (1) at cooler (2).

Fig. 168: HOSE ROUTING ALONG ENGINE CRADLE
Courtesy of CHRYSLER LLC

6. Remove screw (4) fastening routing clamps securing pressure (1) and return (2) hoses to right side of engine cradle (3).

Fig. 169: HOSES AT RWD STEERING GEAR
Courtesy of CHRYSLER LLC

7. Unthread return hose tube nut (3) from steering gear (1).

Fig. 170: RETURN HOSE ROUTING - RIGHT SIDE RADIATOR
Courtesy of CHRYSLER LLC

8. Remove return hose (1) from routing clip (2) on cooling module.
9. Remove return hose from vehicle.

Installation

COOLER TO RESERVOIR

Fig. 171: RETURN HOSE ROUTING TO RESERVOIR
Courtesy of CHRYSLER LLC

1. Install cooler end of return hose (3) from engine compartment side, under headlamp mounting crossmember as shown in illustration.
2. Place hose in routing clip (4) on headlamp mounting crossmember.

8137b482

Fig. 172: FLUID COOLER AND HOSES
 Courtesy of CHRYSLER LLC

NOTE: If a lengthwise paint stripe appears on the return hose (3) near the end, position that paint stripe at the top (12 O'clock position) when installed on the cooler. This positioning must be done to ensure proper hose routing.

3. Slide return hose (3) onto end of cooler (1). Install clamp securing hose in place.

81378535

Fig. 173: REMOTE RESERVOIR
 Courtesy of CHRYSLER LLC

4. Slide return hose (1) onto reservoir (2). Install clamp securing hose in place.

5. Install upper radiator closure panels.
6. Install air cleaner housing and inlet tube. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation**

8133bb50

Fig. 174: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

7. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical/Battery System - Standard Procedure**
8. Fill and bleed power steering system. See **Steering - Standard Procedure**

GEAR TO COOLER

81465831

Fig. 175: HOSE ROUTING ALONG ENGINE CRADLE
Courtesy of CHRYSLER LLC

1. Route cooler end of return hose (2) over steering gear from rear by reversing the steps used in removal.

Fig. 176: HOSES AT RWD STEERING GEAR
Courtesy of CHRYSLER LLC

NOTE: Always use a **NEW O-ring** on the end of the return hose at the steering gear.

2. Lubricate new O-ring on steering gear end of return hose with clean power steering fluid.
3. Lift gear end of return hose to return port on steering gear. Install return hose (2) to steering gear (1). **Do not tighten tube nut at this time.**

Fig. 177: HOSE ROUTING ALONG ENGINE CRADLE
 Courtesy of CHRYSLER LLC

4. Route return hose along right side of engine cradle as shown in illustration. Position pressure hose (1) routing clamp over return hose (2) routing clamp, then install screw (4) securing hoses to right side of engine cradle (3).

Fig. 178: HOSES AT RWD STEERING GEAR
 Courtesy of CHRYSLER LLC

5. Tighten return hose tube nut at steering gear to 47 N.m (35 ft. lbs.).

Fig. 179: RETURN HOSE ROUTING - RIGHT SIDE RADIATOR
 Courtesy of CHRYSLER LLC

6. Route cooler end of return hose (1) under headlamp mounting crossmember (3) as shown in illustration.
7. Place hose in routing clip (2) on cooling module.

Fig. 180: RETURN HOSE GEAR TO COOLER
 Courtesy of CHRYSLER LLC

8. Slide return hose (1) onto end of cooler (2). Install clamp securing hose in place.
9. Install belly pan. Refer to **Body/Exterior/BELLY PAN - Installation**.
10. Lower vehicle.

8133bb50

Fig. 181: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

11. Connect negative battery cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical/Battery System - Standard Procedure**
12. Fill and bleed power steering system. See **Steering - Standard Procedure**

HOSE, POWER STEERING, SUPPLY

Removal

REMOVAL

8133bb50

Fig. 182: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable (2) from battery post.
2. Siphon power steering fluid from pump reservoir.
3. Remove air cleaner housing and inlet tube to throttle body. Refer to Engine/Air Intake System/BODY, Air Cleaner - Removal .

Fig. 183: SUPPLY HOSE - 5.7L
Courtesy of CHRYSLER LLC

4. 6.1L Engines - Remove hose clamp, then supply hose (3) from pump (1).

Fig. 184: REMOTE RESERVOIR

Courtesy of CHRYSLER LLC

5. Remove hose clamp, then supply hose (3) at reservoir (2).
6. Remove supply hose from vehicle.

Installation

INSTALLATION

Fig. 185: REMOTE RESERVOIR
Courtesy of CHRYSLER LLC

1. Install reservoir end of supply hose (3) on reservoir hose fitting. Install clamp securing hose in place.

Fig. 186: SUPPLY HOSE - 5.7L
 Courtesy of CHRYSLER LLC

2. Install supply hose (3) on pump (1). Install clamp securing hose in place.
3. Install air cleaner housing and inlet tube. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation** .

Fig. 187: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

4. Connect negative battery cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical/Battery System - Standard Procedure**
5. Fill and bleed power steering system. See **Steering - Standard Procedure**

PULLEY, POWER STEERING PUMP

Removal

REMOVAL

1. Remove power steering pump from engine. See Steering/Pump - Removal.

CAUTION: Do not hammer on power steering pump pulley or shaft to remove power steering pump pulley. Damage to pulley and power steering pump will occur.

CAUTION: It is very important to use Puller 9962, to remove pulley from power steering pump shaft. Use of other pullers can damage or break pulley and pump shaft.

Fig. 188: BUTTON INSTALLATION ON TOOL
Courtesy of CHRYSLER LLC

2. Coat Screw-Drive (1) with lubricant and thread into Puller Body (2).

NOTE: Two Buttons come with Puller kit (9962-3 and 9962-4). Be sure to use Button that best fits end of pump shaft to avoid damage to Button or pump shaft.

3. Insert Button (4) 9962-4, into end of Screw-Drive. Be sure not to misplace ball bearing that resides behind Button.

Fig. 189: TOOL 9962 INSTALLED ON PULLEY
Courtesy of CHRYSLER LLC

4. Assemble Puller 9962, over end of pump shaft and pulley hub.
 - a. Place Button on end of Screw-Drive against pump shaft.
 - b. Assemble Collets (3) 9962-2, surrounding Puller Body (1) and pulley hub flange, then slide the Collet Sleeve over the Collets.
 - c. Hand tighten Screw-Drive (2) taking up any slack in Puller.
5. Hold Puller Body stationary while turning Screw-Drive until pulley is removed from power steering pump shaft.

NOTE: **Inspect pulley. Replace if pulley is bent, cracked, or loose.**

Installation

INSTALLATION

81349327

Fig. 190: INSTALLING SPACER 6936 ON PULLEY
 Courtesy of CHRYSLER LLC

CAUTION: Do not hammer on power steering pump pulley (2) or pump shaft to install pulley. This action will damage pulley and power steering pump.

1. Place power steering pump pulley (2) squarely on end of power steering pump shaft.
2. Place Installation Spacer (1) 6936, on top of pump pulley (2).

815c90ad

Fig. 191: INSTALL PULLEY USING C-4063C, 6936, AND WASHERS
 Courtesy of CHRYSLER LLC

NOTE: Later build pumps feature a shaft with internal threads that are not as deep as earlier production, thus requiring a stack of washers, approximately 13 mm (0.5 in.) thickness (3), placed over Spacer 6936 (2), before mounting Installer C-4063C (1) on the pump. To know if a replacement pump requires the stack of washers, measure the depth of the shaft hole. A later build pump will have a depth of 20 mm (0.78 in.) while an earlier build pump will have a depth of 32 mm (1.25 in.).

Fig. 192: INSTALL PULLEY USING C-4063C, 6936, AND WASHERS
Courtesy of CHRYSLER LLC

3. As necessary (see above note), place a stack of washers approximately 13 mm (0.5 in.) thickness (3) over Spacer 6936 (2).

NOTE: Installer C-4063C, is a combination of Installer C-4063C, and Forcing Screw C-4063-2. It is important to use Forcing Screw C-4063-2 when performing this procedure.

4. Thread Installer (1) C-4063C, completely into internal threads of power steering pump shaft, then rotate Installer Nut down against washers (as necessary) and Spacer (2) on pump pulley.
5. Ensuring that special tools and pulley remain aligned with pump shaft, tighten Installer Nut, forcing pulley onto power steering pump shaft until Spacer (2) comes in contact with end of pump shaft. **When Spacer (2) is against shaft of power steering pump, Installer (1) Nut will no longer rotate.**
6. Install power steering pump on engine. See Steering/Pump - Installation.

RESERVOIR, POWER STEERING PUMP

Removal

REMOVAL

8133b050

Fig. 193: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable (2).
2. Siphon the power steering fluid from pump reservoir.
3. Remove the air filter housing and clean air tube to throttle body. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal**

81378535

Fig. 194: REMOTE RESERVOIR
Courtesy of CHRYSLER LLC

4. Remove the supply hose (3) retaining clamp at reservoir (2) and disconnect the hose.
5. Remove the return hose (1) retaining clamp at reservoir (2) and disconnect the hose.
6. Remove the reservoir (2) from the coolant bottle (4) by sliding it up and out of the guide.

Installation

INSTALLATION

Fig. 195: REMOTE RESERVOIR
Courtesy of CHRYSLER LLC

1. Install the reservoir (2) onto the coolant bottle (4) by sliding it into the guide and lock in place.
2. Install the return hose (1) on the reservoir hose fitting and securely tighten clamp.
3. Install the supply hose (3) on reservoir hose fitting and securely tighten clamp.
4. Install the air filter assembly and clean air tube. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation**

8133b050

Fig. 196: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

5. Connect the negative battery cable (2).
6. Fill and bleed the power steering system. See **Steering - Standard Procedure**

ACCESSORIES AND EQUIPMENT

DESCRIPTION

DESCRIPTION

813eab57

Fig. 1: Exploded View Of Power Sunroof System
Courtesy of CHRYSLER LLC

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position

electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active. If the sunroof is moving when the key is turned to the START position (crank engine), all motions stop until the key is released, then the previously requested sunroof motion will resume. The sunroof will also complete a requested motion if the Accessory Delay system goes inactive while the motion is in progress.

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. See **Electrical - Power Systems/Power Top/SWITCH, Sunroof - Operation** for additional information.

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. Pressing the "open" or "close" end of the rocker switch moves the sunroof glass panel to the full open or full closed position, respectively. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an

occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.
2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

The motor/module is programmed to learn the speed required to drive the panel based on position and recalibrates itself as needed. If the sunroof becomes uncalibrated, it will only respond to the vent switch. If the vent switch is pressed, the glass will move toward vent; if the switch is released, all motion stops. In the event that the sunroof system becomes uncalibrated perform the sunroof position calibration procedure. See **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure**.

DIAGNOSIS AND TESTING

POWER TOP - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

Refer to the appropriate diagnostic service information.

MOTOR, SUNROOF

DIAGNOSIS AND TESTING

MOTOR/MODULE - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper

hard wired output by the sunroof switch.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

Refer to the appropriate diagnostic service information.

STANDARD PROCEDURE

SUNROOF POSITION CALIBRATION

Press the power sunroof switch (Open, Closed, and Vent). If no movement occurs when either the open switch or closed switch is pressed, but the system does move when the vent button is pressed and held, the system is not calibrated. Perform the following procedure to position calibrate the power sunroof system.

1. Turn the ignition to the RUN position.
2. Press the vent button on the power sunroof switch and hold until the sunroof glass panel has moved to the full vent position and the motor movement has stopped for at least 1 second.
3. Press the close switch on the power sunroof switch and hold for a moment (at least 100ms) and release. The sunroof glass panel should continue travel to the full close position. If the sunroof glass panel does not return to the full close position, refer to the appropriate diagnostic service information for full system diagnosis.
4. Verify proper system operation.

EXCESSIVE FORCE LIMITATION (EFL) CALIBRATION

NOTE: **Verify the battery is in good condition prior to performing this procedure. Do not leave the vehicle on a battery charger while performing this procedure. If the voltage at the sunroof motor/module drops below 11 volts or exceeds 15 volts at anytime while this procedure is being performed, the Excessive Force Limitation (EFL) function will not be properly calibrated.**

1. Turn the ignition to the RUN position.
2. Press the vent button on the power sunroof switch and hold until the sunroof glass panel has moved to the full vent position and the motor movement has stopped for at least 1 second.
3. Press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the first sunroof closed position in a series of four sunroof closes.**
4. Press the vent button on the power sunroof switch and release. The sunroof glass panel should move to the full vent position. After the sunroof motor/module has stopped, press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the second sunroof closed position in a series of four sunroof closes.**

5. Continue to move the sunroof glass to the "vent" then "closed" positions two more times so that the sunroof glass has moved to the closed position a total of four times starting with the first sunroof close in step 3.
6. Press the open position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full open position.
7. Press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **This will be considered the first sunroof closed position in a series of five sunroof closes.**
8. Press the open position on the power sunroof switch and release. The sunroof glass panel should move to the full open position. After the sunroof motor/module has stopped, press the close position on the power sunroof switch and release. The sunroof glass panel should continue travel to the full closed position. **Continue to move the sunroof glass to the "open" then "closed" position four more times so that the sunroof glass has moved to the closed position a total of five times starting with the first sunroof close in step 7.**

Verify proper EFL calibration by placing a standard pencil at the front of the sunroof and then moving the sunroof to the full closed position. The sunroof should reverse direction upon contact without damage to the pencil.

REMOVAL

REMOVAL

1. Disconnect the battery negative cable.
2. Remove the vehicle headliner. Refer to **Body/Interior/HEADLINER - Removal** .

Fig. 2: Locating Sunroof Motor/Module
Courtesy of CHRYSLER LLC

3. Remove the power sunroof motor/module electrical connector (2).
4. Remove the retaining screws (3) and remove the motor/module (1) from the vehicle.

INSTALLATION

INSTALLATION

WARNING: The Excessive Force Limitation (EFL) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. See [Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure](#) for CALIBRATION) for the appropriate procedure.

Fig. 3: Locating Sunroof Motor/Module
Courtesy of CHRYSLER LLC

1. Position the power sunroof motor/module (1) in the vehicle.
2. Install the motor/module retaining screws (3). Tighten the screws to 4 N.m (35 in. lbs.).
3. Connect the motor/module electrical connector (2).
4. Connect the battery negative cable and move the sunroof through one open and close cycle to confirm proper system operation.
5. Install the vehicle headliner. Refer to [Body/Interior/HEADLINER - Installation](#) .
6. Perform the sunroof position calibration. See [Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure](#).
7. Perform the Excessive Force Limitation (EFL) calibration. See [Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure](#) for CALIBRATION).
8. Verify proper operation of the power sunroof system.

SWITCH, SUNROOF

DESCRIPTION

DESCRIPTION

Fig. 4: Identifying Overhead Console Components
Courtesy of CHRYSLER LLC

The power sunroof switch (3) is a combination push-button and rocker switch module mounted in the overhead console. The sunroof switch is a direct contact unit that is directly wired to the sunroof motor/module assembly. The sunroof switch performs the following functions:

- Power sunroof open (back of switch pushed)
- Power sunroof closed (front of switch pushed)
- Power sunroof vent (switch center button pushed)

The power sunroof switch is part of the overhead console assembly and cannot be replaced separately. If the switch is damaged or inoperative the overhead console must be replaced. Refer to Electrical - Message Systems/Overhead Console - Removal .

OPERATION

OPERATION

The power sunroof switch is hard wired to the sunroof motor/module assembly. The switch receives battery current from the motor/module when the ignition switch is in the RUN and ACCESSORY positions or the vehicle Accessory Delay System is active. When one of the switch positions is pressed it sends battery current back to the motor/module, signaling it to move the power sunroof to the appropriate position. The motor/module will perform one of the following functions:

- Power sunroof open (back of switch pushed)

- Power sunroof closed (front of switch pushed)
- Power sunroof vent (switch center button pushed)

DIAGNOSIS AND TESTING

SWITCH - POWER SUNROOF

Any diagnosis of the power sunroof system begins with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool provides confirmation that the Controller Area Network (CAN) data bus circuit is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN data bus, and that the sunroof switch is sending the proper hardwired output to the power sunroof motor/module assembly.

For complete circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS** . The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds. If completing the appropriate diagnostic information results in the sunroof switch being inoperative, perform the following test prior to switch replacement.

Fig. 5: Power Sunroof Switch Wire Harness Connector
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the overhead console. Refer to **Electrical - Message Systems/Overhead Console - Removal** .
3. Disconnect the power sunroof switch wire harness connector.
4. Using an ohmmeter, test the continuity of the power sunroof switch in each switch position. Refer to the **POWER SUNROOF SWITCH CONTINUITY TABLE**. If OK, inspect the wiring harness and connectors for damage. Use a scan tool and the proper Diagnostic Procedures

Information to complete diagnosis of the power sunroof system. If not OK, replace the overhead console.

POWER SUNROOF SWITCH CONTINUITY TABLE

SWITCH POSITION	CONTINUITY BETWEEN PINS
OFF	NO CONTINUITY
SUNROOF OPEN	B AND D
SUNROOF CLOSED	B AND C
SUNROOF VENT	B AND A

RESTRAINTS

Service Information - Challenger

DESCRIPTION

DESCRIPTION

The Occupant Restraint System include both active and passive types. Active restraints require the occupants to take some action to employ, such as fastening a seat belt; while passive restraints require no action by the occupants.

ACTIVE RESTRAINTS

The active restraints include:

- **Front Seat Belts** - Both front seats are equipped with three-point seat belt systems using lower B-pillar mounted inertia latch-type emergency locking retractors, height-adjustable upper B-pillar mounted turning loops, a traveling lower seat belt anchor secured to the outboard side of the seat frame, and a traveling end-release seat belt buckle secured to the inboard side of the seat frame. The driver side front seat belt retractor includes an integral seat belt switch that detects whether the driver side front seat belt has been fastened.
- **Second Row Seat Belts** - All three second row seats are equipped with three-point seat belt systems. The outboard seat belts use lower C-pillar mounted inertia latch-type emergency locking retractors, self-cinching latch plates for compatibility with child seats, and fixed lower seat belt anchors secured to the floor panel. The center position retractor is secured within the center rear seat back panel. The fixed lower seat belt anchor and the fixed end-release buckle are both secured to the floor panel.
- **Child Restraint Anchors** - All vehicles are equipped with three, fixed-position, child seat upper tether anchors for the second row seating. These upper anchors are integral to the rear shelf panel. Two lower anchors are also provided for each second row seat. These lower anchors are accessed from the front of the rear seat where the seat back meets the seat cushion.

PASSIVE RESTRAINTS

Fig. 1: Passive Restraints
Courtesy of CHRYSLER LLC

The passive restraints include the following:

- **Dual Front Airbags** - Multi-stage driver and front passenger airbags are standard in this model. This airbag system is a passive, inflatable, Supplemental Restraint System (SRS) and vehicles with this equipment can be readily identified by the "SRS - AIRBAG" logo molded into the driver airbag trim cover in the center of the steering wheel and also into the passenger airbag door on the top of the instrument panel above the glove box. Vehicles with the airbag system can also be identified by the airbag indicator, which illuminates in the Electro-Mechanical Instrument Cluster (EMIC) for about seven seconds as a bulb test each time the ignition switch is turned to the ON position. A pyrotechnic-type seat belt tensioner is also integral to the driver and passenger front seat belt retractors to work in conjunction with the dual front airbags.
- **Curtain Airbags** - Curtain airbags are available when the vehicle is equipped with dual front airbags. This airbag system is a passive, inflatable, SRS and can be readily identified by a molded identification trim button with the "SRS - AIRBAG" logo located on the headliner above each B-pillar.

SRS

AIRBAG

Fig. 2: Identifying SRS Airbag Label
Courtesy of CHRYSLER LLC

The SRS includes the following major components, which are described in further detail elsewhere in this service information:

- **Airbag Indicator** - The airbag indicator (1) is integral to the EMIC, which is located on the instrument panel in front of the driver.
- **Clockspring** - The clockspring is located near the top of the steering column, directly beneath the steering wheel.
- **Curtain Airbag** - In vehicles equipped with this option, a curtain airbag is secured to each inside roof side rail, and extends from the A-pillar to the C-pillar. The curtain airbags are concealed above the headliner trim.
- **Driver Airbag** - The driver airbag (5) is located in the center of the steering wheel, beneath the driver airbag trim cover.
- **Driver Knee Blocker** - The driver knee blocker is a structural unit secured to the rear of, and integral to, the instrument panel steering column opening cover.
- **Front Impact Sensor** - Two front impact sensors are used on vehicles equipped with dual front airbags, one left side and one right side. One sensor is located on the rear of each vertical member of the radiator support.
- **Occupant Restraint Controller** - The Occupant Restraint Controller (ORC) (4) is mounted on the floor panel transmission tunnel in front of the transmission gear selector, and is concealed below the instrument panel.
- **Passenger Airbag** - The passenger airbag (2) is located in the instrument panel, beneath the passenger airbag door on top of the instrument panel above the glove box on the passenger side of the vehicle.
- **Passenger Knee Blocker** - The passenger knee blocker is a structural reinforcement that is integral to, and concealed within, the glove box door.
- **Seat Airbags** - Seat integrated side airbags are standard equipment in all export market vehicles except Mexico. This airbag system consists of passive, inflatable, SRS components. Vehicles with this equipment can be readily identified by a sewn tag with the **SRS - AIRBAG** logo located on the outboard side of the front seat back trim cover.
- **Seat Belt Tensioner** - A seat belt tensioner is integral to both front seat belt retractor units on vehicles equipped with dual front airbags. The seat belt retractor and tensioner units are secured to the right and left inner B-pillars and concealed beneath the lower quarter trim panel.
- **Seat Track Position Sensor** - The OCS includes two seat track position sensors. One sensor is located on the inboard side of the outboard seat adjuster track on both the driver and the passenger front seats.
- **Side Impact Sensor** - Four side impact sensors are used on vehicles equipped with the curtain airbags, two on each side of the vehicle. One sensor is located near each right and left side B-pillar and C-pillar, concealed behind the interior trim.

The ORC, and the EMIC each contain a microprocessor and programming that allow them to communicate with each other using the Controller Area Network (CAN) data bus. This method of

communication is used by the ORC for control of the airbag indicator in the EMIC. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/COMMUNICATION - Description** .

OPERATION

OPERATION

ACTIVE RESTRAINTS

The primary passenger restraints in this or any other vehicle are the seat belts and child restraint anchors. Seat belts and child restraint anchors are referred to as active restraint because the vehicle occupants are required to physically fasten and properly adjust these restraints in order to benefit from them. See the Owner's Manual in the vehicle glove box for more information on the features, use and operation of all factory-installed active restraints.

PASSIVE RESTRAINTS

The passive restraints are referred to as a Supplemental Restraint System (SRS) because they are designed and intended to enhance the protection for the occupants of the vehicle **only** when used in conjunction with the seat belts. They are referred to as passive restraints because the vehicle occupants are not required to do anything to make them operate; however, the vehicle occupants must be wearing their seat belts in order to obtain the maximum safety benefit from the factory-installed supplemental restraint system.

The supplemental restraint system electrical circuits are continuously monitored and controlled by a microprocessor and software contained within the Occupant Restraint Controller (ORC). An airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) illuminates for about seven seconds as a bulb test each time the ignition switch is turned to the ON or START positions. Following the bulb test, the airbag indicator is turned on or off by the ORC to indicate the status of the SRS. If the airbag indicator comes on at any time other than during the bulb test, it indicates that there is a problem in the SRS electrical circuits. Such a problem may cause airbags not to deploy when required, or to deploy when not required.

Deployment of the supplemental restraints depends upon the angle and severity of an impact. Deployment is not based upon vehicle speed; but, upon the rate of deceleration as measured by the forces of gravity (G force) upon the impact sensors. When an impact is severe enough, the microprocessor in the ORC signals the inflator of the appropriate airbags to deploy their cushions. The front seat belt tensioners are provided with a deployment signal by the ORC in conjunction with the front airbags.

During a frontal vehicle impact, the knee blockers work simultaneously with properly fastened and adjusted seat belts to restrain both the driver and the front seat passenger in the proper position for an airbag deployment. The knee blockers also absorb and distribute the crash energy from the driver and the front seat passenger to the structure of the instrument panel. The seat belt tensioners remove the slack from the front seat belts to provide further assurance the driver and front seat passenger are properly positioned and restrained for an airbag deployment.

The airbag deployment and deflation occur very rapidly. In a typical 48 km/h (30 mp/h) barrier impact, from the moment of impact until the airbags are fully inflated, takes about 40 milliseconds. Within one to two seconds from the moment of impact, the airbags are almost entirely deflated. The times cited for these events are approximations, which apply only to a barrier impact at the given speed. Actual times vary depending upon the vehicle speed, impact angle, severity of the impact, and the type of collision.

When the ORC monitors a problem in any of the dual front airbag system circuits or components, including the seat belt tensioners, it stores a fault code or Diagnostic Trouble Code (DTC) in its memory circuit and sends an electronic message to the EMIC to illuminate the airbag indicator. Proper testing of the SRS components, the Controller Area Network (CAN) data bus, the electronic message inputs to and outputs from the EMIC or the ORC, as well as the retrieval or erasure of a DTC from the ORC or the EMIC, requires the use of a diagnostic scan tool and the appropriate diagnostic information.

See the Owner's Manual in the vehicle glove box for more information on the features, use and operation of all of the passive restraints.

WARNING

WARNINGS

WARNING: To avoid serious or fatal injury on vehicles equipped with the Supplemental Restraint System (SRS), never attempt to repair the electrically conductive circuits or wiring components related to the SRS. Such repairs can compromise the conductivity and current carrying capacity of those critical electrical circuits, which may cause SRS components not to deploy when required, or to deploy when not required. Any wire harness containing broken, cut, burned or otherwise damaged electrically conductive SRS wiring, terminals or connector components must be removed and replaced with an entire new wire harness. Only minor cuts or abrasions of wire and terminal insulation where the conductive material has not been damaged, or connector insulators where the integrity of the latching and locking mechanisms have not been compromised may be repaired using appropriate methods. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury during and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate.

Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury on vehicles equipped with side curtain or seat (thorax) airbags, disable the Supplemental Restraint System (SRS) before attempting any Occupant Restraint Controller (ORC) diagnosis or service. The ORC contains a rollover sensor, which enables the system to deploy the side curtains or seat airbags in the event of a vehicle rollover event. If an ORC is accidentally rolled during service while still connected to battery power, the side curtain and seat airbags will deploy. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

WARNING: To avoid potential physical injury or damage to sensitive electronic circuits and systems, always disconnect and isolate the battery negative (ground) cable and the positive cable, then ground the positive cable to discharge the Occupant Restraint Controller (ORC) capacitor before performing any welding operations on the vehicle. Failure to take the proper precautions could result in accidental airbag deployment, possible damage to the Supplemental Restraint System (SRS) circuits and components, and possible damage to other electronic circuits and components. Whenever a welding process is being performed within 12 inches (30 centimeters) of an electronic module or wiring harness, then that module or harness should be relocated out of the way, or disconnected. Always protect against component or vehicle damage from weld spatter by using weld blankets and screens.

WARNING: To avoid serious or fatal injury, do not attempt to dismantle an airbag unit or tamper with its inflator. Do not puncture, incinerate or bring into contact with electricity. Do not store at temperatures exceeding 93°C

(200°F). An airbag inflator unit may contain sodium azide and potassium nitrate. These materials are poisonous and extremely flammable. Contact with acid, water, or heavy metals may produce harmful and irritating gases (sodium hydroxide is formed in the presence of moisture) or combustible compounds. An airbag inflator unit may also contain a gas canister pressurized to over 17.24 kPa (2500 psi). Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when handling a seat belt tensioner retractor or buckle, proper care should be exercised to keep fingers out from under the retractor or buckle cover and away from the seat belt webbing or cable where it exits from the retractor or buckle cover.

WARNING: To avoid serious or fatal injury, replace all Supplemental Restraint System (SRS) components only with parts specified in the Chrysler Mopar® Parts Catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury, the fasteners, screws, and bolts originally used for the Supplemental Restraint System (SRS) components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the SRS. Anytime a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

WARNING: To avoid serious or fatal injury when a steering column has an airbag unit attached, never place the column on the floor or any other surface with the steering wheel or airbag unit face down. Failure to follow these instructions may result in possible serious or fatal injury.

DIAGNOSIS AND TESTING

AIRBAG SYSTEM

1. With the battery negative cable disconnected, connect the scan tool to the Data Link Connector (DLC).
2. Turn the ignition key to the ON position, then exit vehicle with the scan tool.
3. After checking that no one is inside the vehicle, connect the battery negative remote terminal.
4. Read and record the **ACTIVE** Diagnostic Trouble Code (DTC) data.
5. Read and record any **STORED** DTC's.
6. Refer to the proper diagnostic information if any DTC's are found in 4 and 5.

7. If the airbag warning lamp either fails to light, or goes ON and stays ON, there is a system malfunction. To test the airbag warning lamp (bulb) operation in the cluster. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Diagnosis and Testing** . Refer to the appropriate diagnostic information for any other system problems.

STANDARD PROCEDURE

HANDLING NON-DEPLOYED SUPPLEMENTAL RESTRAINTS

At no time should any source of electricity be permitted near the inflator on the back of a non-deployed airbag or seat belt tensioner. When carrying a non-deployed airbag, the trim cover or airbag cushion side of the unit should be pointed away from the body to minimize injury in the event of an accidental deployment. If the airbag unit is placed on a bench or any other surface, the trim cover or airbag cushion side of the unit should be face up to minimize movement in the event of an accidental deployment.

When handling a non-deployed seat belt tensioner, take proper care to keep fingers out from under the retractor cover and away from the seat belt webbing where it exits from the retractor cover. In addition, the Supplemental Restraint System (SRS) should be disarmed whenever any steering wheel, steering column, seat belt tensioner, airbag, impact sensor, or instrument panel components require diagnosis or service. Failure to observe this warning could result in accidental airbag deployment and possible personal injury.

All damaged, ineffective or non-deployed airbags and seat belt tensioners which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

SUPPLEMENTAL RESTRAINT STORAGE

Airbags and seat belt tensioners must be stored in their original, special container until they are used for service. Also, they must be stored in a clean, dry environment; away from sources of extreme heat, sparks, and high electrical energy. Always place or store any airbag on a surface with its trim cover or airbag cushion side facing up, to minimize movement in case of an accidental deployment.

SERVICE AFTER A SUPPLEMENTAL RESTRAINT DEPLOYMENT

Any vehicle which is to be returned to use following a Supplemental Restraint System (SRS) component deployment must have the deployed restraints replaced. In addition, if the driver airbag has been deployed, the clockspring, the steering wheel and the complete steering column with lower steering column coupler must be replaced. If the passenger airbag is deployed, the instrument panel trim cover must be replaced.

The seat belt tensioners are deployed by the same signal that deploys the driver and passenger airbags and must also be replaced if either front airbag has been deployed. If a seat (thorax) airbag is

deployed, the seat back frame, the seat back foam and the seat back trim cover on the same side of the vehicle as the deployed airbag must also be replaced.

If a side curtain airbag has been deployed, the headliner as well as the upper A, B, and C-pillar trim on the same side of the vehicle as the deployed airbag must be replaced. These components are not intended for reuse and will be damaged or weakened as a result of a SRS component deployment, which may or may not be obvious during a visual inspection. On vehicles with an optional sunroof, the sunroof drain tubes and hoses must be closely inspected following a side curtain airbag deployment.

It is also critical that the mounting surfaces and mounting brackets for the Occupant Restraint Controller (ORC), side impact sensors, and front impact sensors be closely inspected and restored to their original conditions following any vehicle impact damage. Because the ORC and each impact sensor are used by the SRS to monitor or confirm the direction and severity of a vehicle impact, improper orientation or insecure fastening of these components may cause airbags not to deploy when required, or to deploy when not required.

There are two methods by which an airbag or seat belt tensioner may be connected to the vehicle electrical system. The first method involves a short pigtail harness and connector insulator that are integral to the airbag or tensioner unit and are replaced as a unit with the service replacement airbag or seat belt tensioner unit. The second method involves a wire harness takeout and connector insulator (squib circuits) that are connected directly to the air bag or tensioner initiator. The heat created by the initiator during an airbag or tensioner deployment will cause collateral damage to a directly connected wire harness take out and connector insulator. Therefore, these direct-connect type take outs and connector insulators must be repaired following an airbag or seat belt tensioner deployment. See **Restraints - Standard Procedure**.

All other vehicle components should be closely inspected following any SRS component deployment, but are to be replaced only as required by the extent of the visible damage incurred.

AIRBAG SQUIB STATUS

Multistage airbags with multiple initiators (squibs) must be checked to determine that all squibs were used during the deployment event. The driver and passenger airbags in this vehicle are deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver or passenger squib 1 and squib 2 circuits to the two initiators in the airbag inflators. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event. However, it is possible for only one initiator to be used; therefore, it is always necessary to confirm that both initiators have been used in order to avoid the improper handling or disposal of potentially live pyrotechnic or hazardous materials. The following procedure should be performed using a diagnostic scan tool to verify the status of both airbag squibs before either deployed airbag is removed from the vehicle for disposal.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component

and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

1. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, outboard of the steering column.
2. Turn the ignition switch to the ON position.
3. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.

Using the active DTC information, refer to the **AIRBAG SQUIB STATUS** chart to determine the status of both driver and passenger airbag squibs.

AIRBAG SQUIB STATUS		
IF THE ACTIVE DTC IS:	CONDITIONS	SQUIB STATUS
Driver or Passenger Squib 1 open	AND the stored DTC minutes for both Driver or Passenger squibs are within 15 minutes of each other	Both Squib 1 and 2 were used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND the stored DTC minutes for Driver or Passenger Squib 2 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 1 by 15 minutes or more	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND the stored DTC minutes for Driver or Passenger Squib 1 open is GREATER than the stored DTC minutes for Driver or Passenger Squib 2 by 15 minutes or more	Squib 1 is live; Squib 2 was used.
Driver or Passenger Squib 2 open		
Driver or Passenger Squib 1 open	AND Driver or Passenger Squib 2 open is NOT an active code	Squib 1 was used; Squib 2 is live.
Driver or Passenger Squib 2 open	AND Driver or Passenger Squib 1 open is NOT an active code	Squib 1 is live; Squib 2 was used.

CLEANUP PROCEDURE

918M-4

Fig. 3: Clean Up Safety Equipment
Courtesy of CHRYSLER LLC

Following a Supplemental Restraint System (SRS) component deployment, the vehicle interior will contain a powdery residue. This residue consists primarily of harmless particulate by-products of the small pyrotechnic charge that initiates the propellant used to deploy a SRS component. However, this residue may also contain traces of sodium hydroxide powder, a chemical by-product of the propellant material that is used to generate the inert gas that inflates the airbag. Since sodium hydroxide powder can irritate the skin, eyes, nose, or throat, be certain to wear safety glasses, rubber gloves, and a long-sleeved shirt during cleanup.

WARNING: To avoid serious or fatal injury, if you experience skin irritation during cleanup, run cool water over the affected area. Also, if you experience irritation of the nose or throat, exit the vehicle for fresh air until the irritation ceases. If irritation continues, see a physician.

918M-2

Fig. 4: Vacuuming Residual Powder
Courtesy of CHRYSLER LLC

1. Begin the cleanup by using a vacuum cleaner to remove any residual powder from the vehicle interior. Clean from outside the vehicle and work your way inside, so that you avoid kneeling or sitting on a non-cleaned area.
2. Be certain to vacuum the heater and air conditioning outlets as well. Run the heater and air conditioner blower on the lowest speed setting and vacuum any powder expelled from the outlets.

CAUTION: Deployed front airbags having two initiators (squibs) in the airbag inflator may or may not have live pyrotechnic material within the inflator. Do not dispose of these airbags unless you are certain of complete deployment. Refer to the **AIRBAG SQUIB STATUS**. All damaged, ineffective, or non-deployed Supplemental Restraint System (SRS) components which are replaced on vehicles are to be handled and disposed of properly. If an airbag or seat belt tensioner unit is ineffective or damaged and non-deployed, refer to the Hazardous Substance Control System for information regarding the potentially hazardous properties of the subject component and the proper safe handling procedures. Then dispose of all non-deployed and deployed airbags and seat belt tensioners in a manner consistent with state, provincial, local and federal regulations.

3. Next, remove the deployed SRS components from the vehicle. Refer to the appropriate service removal procedures.
4. You may need to vacuum the interior of the vehicle a second time to recover all of the powder.

SUPPLEMENTAL RESTRAINT SYSTEM WIRING REPAIRS

It is important when repairing any Supplemental Restraint System (SRS) electrical circuits to use the recommended splicing kit and procedure. For applicable and available MOPAR wiring repair kits, please visit the MOPAR Connector Web Site at the following address on the internet: (<http://dto.vftis.com/mopar/disclaimer.asp>).

This recommended procedure involves crimping the wires together with a splice band, soldering the crimped connection and, finally, sealing and protecting the repair. The crimp and solder ensure a strong mechanical bond that will always pass a pull test while also maintaining the conductivity and current carrying capacity of the circuit. The adhesive sealant and heat shrink tubing ensures the splice repair will perform as well or better than the original wire and be safe from potential corrosion or short circuits.

There is no limit to the number of splice repairs that can be made in one harness using this procedure. However, as has been past practice, multiple adjacent splices should be offset from each other. This wiring splice repair procedure is approved for harness side repairs only. Repairs and splices to pigtail wires on SRS components such as airbag units, seat belt tensioner units or clocksprings are not approved or recommended.

REPAIR PROCEDURE

CAUTION: If additional wire is needed when making a splice repair to any wire, it is important that the same or next larger size wire gauge be used. Refer to **SYSTEM WIRING DIAGRAMS** for the original wire gauge size.

Fig. 5: Splice Band
Courtesy of CHRYSLER LLC

1. Remove 13 millimeters (0.50 inch) of insulation from each wire that needs to be spliced.
2. Place a piece of adhesive sealant-lined heat shrink tubing (Part Number 04778570 or equivalent) over the wire on one side of the splice. Be certain the length of tubing will be sufficient to cover and seal the entire repair area.
3. Place the strands of the wires being spliced so that they are overlapping each other within the splice band (1).

Fig. 6: Crimping Tool
Courtesy of CHRYSLER LLC

4. Using a crimping tool (1) (MOPAR Part Number 05019912AA, Miller Special Tool Number 10042 or equivalent) crimp the splice band and wires together securely.

Fig. 7: Solder Splice

Courtesy of CHRYSLER LLC

CAUTION: Never use acid core solder for electrical wiring repairs.

5. Using rosin core type solder (1) only and a suitable soldering iron (3), solder the wire and splice band connection (2) together.

Fig. 8: Heat Shrink Tube
Courtesy of CHRYSLER LLC

6. Center the heat shrink tubing (2) over the splice joint repair and heat using a suitable heat gun. Heat the joint until the tubing is tightly sealed and sealant (1) begins to ooze out of both ends of the tubing.

SUPPLEMENTAL RESTRAINTS VERIFICATION TEST

NOTE: The following procedure should be performed using a diagnostic scan tool to verify proper Supplemental Restraint System (SRS) operation following the service or replacement of any SRS component. Refer to the appropriate diagnostic procedures.

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

1. During the following test, the battery negative cable remains disconnected and isolated, as it was during the Supplemental Restraint System (SRS) component removal and installation procedures.
2. Be certain that the diagnostic scan tool contains the latest version of the proper diagnostic software. Connect the scan tool to the 16-way Data Link Connector (DLC). The DLC is located on the driver side lower edge of the instrument panel, near the steering column opening cover

and outboard of the steering column.

3. Turn the ignition switch to the ON position and exit the vehicle with the scan tool.
4. Check to be certain that nobody is in the vehicle, then reconnect the battery negative cable.
5. Using the scan tool, read and record the active (current) Diagnostic Trouble Code (DTC) data.
6. Next, use the scan tool to read and record any stored (historical) DTC data.
7. If any DTC is found in 5 or 6, refer to the appropriate diagnostic information.
8. Use the scan tool to erase the stored DTC data. If any problems remain, the stored DTC data will not erase. Refer to the appropriate diagnostic information to diagnose any stored DTC that will not erase. If the stored DTC information is successfully erased, go to 9.
9. Turn the ignition switch to the OFF position for about 15 seconds, and then back to the ON position. Observe the airbag indicator in the instrument cluster. It should light from four to six seconds, and then go out. This indicates that the SRS is functioning normally and that the repairs are complete. If the airbag indicator fails to light, or lights and stays ON, there is still an active SRS fault or malfunction. Refer to the appropriate diagnostic information to diagnose the problem.

AIR BAG, DRIVER

DESCRIPTION

DESCRIPTION

8144ea37

Fig. 17: Driver Airbag
Courtesy of CHRYSLER LLC

The driver airbag used in this model is a multistage, Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. A radial

deploying fabric cushion with internal tethers is used. The airbag inflator is a dual-initiator, non-azide, pyrotechnic-type unit with four mounting studs and is secured to the stamped metal airbag housing by four flanged hex nuts. Two keyed and color-coded connector receptacles on the driver airbag inflator connect the two inflator initiators to the vehicle electrical system through two yellow-jacketed, two-wire pigtail harnesses of the clockspring.

The driver airbag unit cannot be repaired, and must be replaced if deployed or in any way damaged. The driver airbag trim cover and horn switch unit may be disassembled from the driver airbag unit, and is available for separate service replacement.

Fig. 18: Driver Airbag Protective Trim Cover
Courtesy of CHRYSLER LLC

The driver airbag protective trim cover (1) is the most visible part of the driver airbag. The driver airbag is located in the center of the steering wheel (1), where it is secured with two screws to the armature of the four-spoke steering wheel. Concealed beneath the driver airbag trim cover are the horn switch, the folded airbag cushion, the airbag cushion retainer, the airbag housing, the airbag inflator, and the retainers that secure the inflator to the airbag housing.

The airbag cushion, housing, and inflator are secured within the trim cover.

Fig. 19: Driver Airbag Cover
Courtesy of CHRYSLER LLC

The vertical walls of this trim cover have small windows with blocking tabs that are engaged by hook formations around the perimeter of the airbag housing. Each hook is inserted through one of the windows and the blocking tab in each window keeps the hook properly engaged with the trim cover, locking the trim cover securely into place on the airbag housing.

The resistive membrane-type horn switch is secured with heat stakes to the inside surface of the driver airbag trim cover, between the trim cover and the folded airbag cushion.

OPERATION

OPERATION

The multistage driver airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the driver airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of three delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the back of the airbag housing and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the driver airbag trim cover will split at predetermined breakout lines, then fold back out of the way along with the horn switch unit. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas towards the instrument panel through vent holes within the fabric used to construct the back (steering wheel side) panel of the airbag cushion.

Some of the chemicals used to create the inert gas may be considered hazardous while in their solid state before they are burned, but they are securely sealed within the airbag inflator. Typically, both initiators are used and all potentially hazardous chemicals are burned during an airbag deployment event.

The inert gas that is produced when the chemicals are burned is harmless. However, a small amount of residue from the burned chemicals may cause some temporary discomfort if it contacts the skin, eyes, or breathing passages. If skin or eye irritation is noted, rinse the affected area with plenty of cool, clean water. If breathing passages are irritated, move to another area where there is plenty of clean, fresh air to breathe. If the irritation is not alleviated by these actions, contact a physician.

REMOVAL

REMOVAL

Fig. 20: DRIVER AIRBAG REMOVAL & INSTALLATION

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, which may result in serious or fatal injury.

2. From behind the steering wheel (1), remove the two screw covers and screws (5) to the driver airbag (3).

CAUTION: Do not pull on the horn switch feed pigtail wire to disengage the connector from the driver airbag or to disconnect the horn switch to

steering wheel wire harness connection. Improper pulling on this pigtail wire or connection can result in damage to the horn switch membrane or feed circuit.

3. Carefully pull airbag rearward just far enough to disconnect the two airbag squib connectors (2) and the horn connector (4).
4. Separate driver airbag from steering column.

NOTE: The driver airbag trim cover is available for service separately. If the horn switch is faulty or the trim cover is damaged, the airbag cushion assembly may be transferred to a new trim cover. If the airbag is defective, the entire driver airbag and driver airbag trim cover must be replaced as an assembly.

INSTALLATION

INSTALLATION

Fig. 21: DRIVER AIRBAG REMOVAL & INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: The driver airbag trim cover is available for service separately. If the horn switch is faulty or the trim cover is damaged, the airbag cushion assembly may be transferred to a new trim cover. If the airbag is defective, the entire driver airbag and driver airbag trim cover must be replaced as an assembly.

1. Position driver airbag (3) in steering wheel (1) near mounting location.
2. Connect the two airbag squib connectors (2) and the horn connector (4).
3. Position the driver airbag mounting screws (5) into the driver airbag. From behind the steering

wheel (1) install the two screws (5) to the driver airbag. Torque the two screws (5) to 10 N.m (89 in. lbs.).

WARNING: Do not connect the battery negative cable. See Restraints - Diagnosis and Testing. If the system test is not performed first it may result in serious or fatal injury.

AIR BAG, PASSENGER

DESCRIPTION

DESCRIPTION

Fig. 22: Passenger Airbag
Courtesy of CHRYSLER LLC

The passenger airbag used in this model is a multistage, Next Generation-type that complies with revised federal airbag standards to deploy with less force than those used in some prior models. The passenger airbag consists of a stamped and welded metal housing, the airbag cushion, the airbag inflator, and a stamped metal airbag cushion retainer plate that is secured to the airbag housing. The airbag housing contains the airbag inflator and the folded airbag cushion. A rectangular fabric cushion is used.

The airbag inflator is a non-azide, pyrotechnic-type unit that is secured to and sealed within the airbag housing. A short four-wire pigtail harness with a keyed, yellow connector insulator connects the two inflator initiators to the vehicle electrical system through the instrument panel wire harness.

This passenger airbag cannot be repaired, and must be replaced if deployed, faulty, or in any way damaged.

Fig. 23: Passive Restraints
Courtesy of CHRYSLER LLC

The horizontal surface of the injection molded, thermoplastic passenger airbag door (2) is the most visible part of the passenger airbag. The passenger airbag door is located above the glove box opening on the top of the instrument panel, in front of the front seat passenger seating position.

Fig. 24: Passenger Airbag Location
Courtesy of CHRYSLER LLC

Located below the passenger airbag door within the instrument panel is the passenger airbag. The passenger airbag housing fits into a molded receptacle on the back of the airbag door, where twelve stamped hook formations on the forward and rearward edges of the airbag housing are engaged in mating small window openings on the forward and rearward flanges of the receptacle to secure the airbag door to the airbag housing. These airbag door fasteners and mounting provisions are all concealed beneath the instrument panel base trim.

Fig. 25: Passenger Airbag Fasteners
Courtesy of CHRYSLER LLC

The passenger airbag is secured by four screws (1) through a stamped mounting bracket to the instrument panel cover/pad and two bolts (2) to the instrument panel structural support.

OPERATION

OPERATION

The multistage passenger airbag is deployed by electrical signals generated by the Occupant Restraint Controller (ORC) through the passenger airbag squib 1 and squib 2 circuits to the two initiators in the airbag inflator. By using two initiators, the airbag can be deployed at multiple levels of force. The force level is controlled by the ORC to suit the monitored impact conditions by providing one of three delay intervals between the electrical signals provided to the two initiators. The longer the delay between these signals, the less forcefully the airbag will deploy.

When the ORC sends the proper electrical signals to each initiator, the electrical energy generates enough heat to initiate a small pyrotechnic charge which, in turn ignites chemical pellets within the inflator. Once ignited, these chemical pellets burn rapidly and produce a large quantity of inert gas. The inflator is sealed to the airbag cushion and a diffuser in the inflator directs all of the inert gas into the airbag cushion, causing the cushion to inflate. As the cushion inflates, the passenger airbag door will split at predetermined tear seam lines concealed on the inside surface of the door, then the door will pivot up over the top of the instrument panel and out of the way. Following an airbag deployment, the airbag cushion quickly deflates by venting the inert gas through vent holes within the fabric used to construct the back (windshield side) of the airbag cushion. Typically, both initiators are used during an airbag deployment event.

REMOVAL

REMOVAL

DEPLOYED PASSENGER AIRBAG

Fig. 26: Passenger Airbag Fasteners
Courtesy of CHRYSLER LLC

For deployed passenger airbags, the instrument panel top pad must be replaced.

1. Open hood.
2. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, and serious or fatal injury.

3. Remove instrument panel. Refer to **Body/Instrument Panel/PANEL, Instrument - Removal**.
4. Disconnect the passenger airbag electrical connector (3).
5. Remove the four left and right passenger airbag mounting screws (1).
6. Remove the two lower passenger airbag mounting bolts (2).
7. Separate passenger airbag from instrument panel.
8. Remove and inspect all reusable components from the instrument panel and transfer to the new instrument panel top pad.
9. Clean powder residue from interior of vehicle. See **Restraints - Standard Procedure**.

NONDEPLOYED PASSENGER AIRBAG

Fig. 27: Right Instrument Panel Closeout Panel
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, which may result in serious or fatal injury.

2. Remove the right side silencer pad. Refer to **Body/Instrument Panel/PANEL, Silencer - Removal**.

Fig. 28: Removing/Installing Glove Box Bin
Courtesy of CHRYSLER LLC

3. Remove the glove box assembly. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal**.

Fig. 29: Inboard Mounting Screws

4. Remove the two inboard mounting screws (2) to the passenger airbag just below the distribution duct (1) and to the left of the distribution housing.

Fig. 30: Outboard Mounting Screws
Courtesy of CHRYSLER LLC

5. Remove the two outboard mounting screws (1) to the passenger airbag just below the distribution duct.

Fig. 31: Passenger Airbag Fasteners
Courtesy of CHRYSLER LLC

6. Remove the two passenger airbag mounting bolts (2) to the crosscar beam.
7. Disconnect the passenger airbag electrical connector (3).

Fig. 32: Passenger Airbag
Courtesy of CHRYSLER LLC

8. Maneuver the passenger airbag down in a way to clear any obstacles that may impede the

removal of the airbag.

INSTALLATION

INSTALLATION

DEPLOYED PASSENGER AIRBAG

Fig. 33: Passenger Airbag Location
Courtesy of CHRYSLER LLC

NOTE: For deployed passenger airbags, the instrument panel top pad must be replaced.

1. Clean powder residue from interior of vehicle. See **Restraints - Standard Procedure**.
2. Inspect and transfer all reusable components from the old instrument panel top pad to the new instrument panel top pad.
3. Position new passenger airbag into instrument panel cavity.

Fig. 34: Passenger Airbag Fasteners
Courtesy of CHRYSLER LLC

4. Install the two lower passenger airbag mounting bolts (2). Torque bolts to 11.6 N.m (103 in. lbs.).
5. Install the four left and right passenger airbag mounting screws (1). Torque screws to 2.8 N.m (25 in. lbs.).
6. Connect the passenger airbag electrical connector (3).
7. Install new instrument panel assembly. Refer to **Body/Instrument Panel/PANEL, Instrument - Installation** .

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it may result in serious or fatal injury.

NONDEPLOYED PASSENGER AIRBAG

7. Install the glove box assembly. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation** .

Fig. 41: Right Instrument Panel Closeout Panel
Courtesy of CHRYSLER LLC

8. Install the right side silencer pad. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it may result in serious or fatal injury.

AIR BAG, SIDE CURTAIN

DESCRIPTION

DESCRIPTION

SRS
AIRBAG

Fig. 42: Identifying SRS Airbag Label
Courtesy of CHRYSLER LLC

Curtain airbags are available when the vehicle is equipped with dual front airbags. These airbags are passive, inflatable, Supplemental Restraint System (SRS) components, and are readily identified by a molded identification trim button with the SRS - AIRBAG logo located near the top of each upper B-pillar trim panel. This system is designed to reduce injuries to the vehicle occupants in the event of a side impact collision.

209070

Fig. 43: Curtain Airbag Components
Courtesy of CHRYSLER LLC

Curtain airbags have two individually controlled airbags. These airbags are concealed and mounted above the headliner where they are secured to one of the roof side rails. Each folded airbag cushion extends along the roof rail from the A-pillar at the front of the vehicle to the C-pillar at the rear of the vehicle. The airbag cushion is secured during installation with plastic pushpins to the roof rail.

81366d83

Fig. 44: Curtain Airbag

Courtesy of CHRYSLER LLC

A long tether extends down the A-pillar from the front of the airbag cushion. A short tether is secured near the top of the C-pillar.

The hybrid-type inflator for each airbag is secured to the roof rail at the rear of airbag, back by the C-pillar. The entire assembly is secured to the inside of the roof rail with screws.

An airbag squib harness connector is routed to the rear of the airbag inflator. The body harness then connects the curtain airbag to the Occupant Restraint Controller (ORC).

The curtain airbag cannot be adjusted or repaired and must be replaced if deployed, faulty, or in any way damaged. Once a curtain airbag has been deployed, the complete airbag, headliner, upper A, B, and C-pillar trim, and all other visibly damaged components must be replaced.

OPERATION

OPERATION

Each curtain airbag is deployed individually by an electrical signal generated by the Occupant Restraint Controller (ORC) to which it is connected through squib circuits. The hybrid-type inflator assembly for each airbag contains a small canister of highly compressed inert gas. When the ORC sends the proper electrical signal to the airbag inflator, the electrical energy creates enough heat to ignite chemical pellets within the inflator.

Once ignited, these chemicals burn rapidly and produce the pressure necessary to rupture a containment disk in the inert gas canister. The inflator and inert gas canister are sealed and connected to a tubular manifold so that all of the released gas is directed into the folded curtain airbag cushion, causing the cushion to inflate. As the airbag cushion inflates it will drop down from the roof rail between the edge of the headliner and the side glass/body pillars to form a curtain-like cushion to protect the vehicle occupants during a side impact collision.

The front and rear tethers keep the airbag cushion taut to the side of the vehicle, thus ensuring that the bag will deploy in the proper position. Following the airbag deployment, the airbag cushion quickly deflates by venting the inert gas through the loose weave of the cushion fabric, and the deflated cushion hangs down loosely from the roof rail.

REMOVAL

REMOVAL

Fig. 45: Airbag Squib Connector & Inflator

5. Connect the curtain airbag squib electrical connector (2) to the inflator (3).
6. Install the headliner into the vehicle. Refer to **Body/Interior/HEADLINER - Installation** .

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it may result in serious or fatal injury.

ANCHOR, CHILD SEAT

DESCRIPTION

DESCRIPTION

Fig. 55: Lower Anchor & Tether
Courtesy of CHRYSLER LLC

The Lower Anchors and Tether for Children, or LATCH child restraint anchorage system provides for the installation of suitable child restraints in certain seating positions without using the seat belt provided for that seating position. The second row seats are equipped with a fixed-position child restraint upper tether anchor for both the center and the two outboard seating positions, and child restraint lower anchors for all three seating positions.

The three upper tether anchors are integral to the rear shelf panel. These anchors are each constructed from a heavy-gauge steel wire loop. The child restraint upper tether anchors cannot be adjusted or repaired and, if faulty or damaged, they must be replaced.

Fig. 56: Lower Anchors
Courtesy of CHRYSLER LLC

The lower anchors (1) are permanently mounted to the rear floor pan beneath the seat. These anchors are also constructed from a heavy-gauge steel wire loop welded to the floor pan. They are each accessed from the front of their respective seats, at each side where the seat back meets the seat cushion. These lower anchors cannot be adjusted or repaired and, if faulty or damaged, they must be replaced as a unit.

OPERATION

OPERATION

See the owner's manual in the vehicle glove box for more information on the proper use of all of the factory-installed child restraint anchors.

BUCKLE, SEAT BELT

REMOVAL

REMOVAL

FRONT SEAT BELT BUCKLE

Fig. 57: Seat Belt Buckle
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, which may result in serious or fatal injury.

2. Remove center console from vehicle. Refer to **Body/Interior/CONSOLE, Floor - Removal** .
3. Remove the inner side shield from the front seat cushion.
4. Disconnect the one electrical connector.
5. Remove the one nut to the buckle assembly.

REAR SEAT BELT BUCKLE

Fig. 58: Rear Seat Belt Buckle
 Courtesy of CHRYSLER LLC

1. Remove the rear seat cushion. Refer to **Body/Seats/COVER, Seat Cushion - Removal** .
2. Remove the one nut (2) to the seat belt buckle.

INSTALLATION

INSTALLATION

FRONT SEAT BELT BUCKLE

Fig. 59: Seat Belt Buckle
 Courtesy of CHRYSLER LLC

1. Position the front seat belt buckle onto the stud near the rear of the inboard seat cushion frame.

2. Install the retaining nut onto seat cushion frame. Tighten the nut to 43 N.m (32 ft. lbs.)
3. Connect the seat belt buckle electrical connector.
4. Install the seat cushion side shield.
5. Install floor console. Refer to **Body/Interior/CONSOLE, Floor - Installation** .

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it may result in serious or fatal injury.

WARNING: Following successful completion of the Airbag System test procedure, the Occupant Classification System Verification Test must be done using a scan tool and the appropriate diagnostic information.

REAR SEAT BELT BUCKLE

Fig. 60: Rear Seat Belt Buckle
 Courtesy of CHRYSLER LLC

1. Position the rear seat belt buckle onto mounting studs (3).
2. Install retaining nut. Torque nut to 34 N.m (25 ft. lbs.).
3. Install rear seat cushion. Refer to **Body/Seats/COVER, Seat Cushion - Installation** .

CLOCKSPRING

DESCRIPTION

DESCRIPTION

308979

Fig. 61: Identifying Clockspring Assembly Screws
 Courtesy of CHRYSLER LLC

WARNING: To service any component of the Steering Column Control Module (SCCM), the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly. Failure to follow these instructions may result in possible serious or fatal injury.

The clockspring assembly is secured with three screws (1) onto the top of the Steering Column Control Module (SCCM). Refer to **Steering/Column/MODULE, Steering Column Control - Description** near the top of the steering column behind the steering wheel.

309013

Fig. 62: Clockspring
 Courtesy of CHRYSLER LLC

The clockspring consists of a flat, round molded plastic case. Within the plastic case is a spool-like molded plastic rotor with a hub. The surface of the rotor hub has a large center hole. Within the

plastic case, and wound around the rotor spool, is a long ribbon-like tape that consists of several thin copper wire leads sandwiched between two thin plastic membranes. The outer end of the tape terminates at the connector terminals that align themselves into the SCCM self-docking connector that faces the instrument panel, while the inner end of the tape terminates at the pigtail wires and connector receptacles on the hub of the clockspring rotor that face the steering wheel.

309031

Fig. 63: Clockspring
Courtesy of CHRYSLER LLC

Service replacement clocksprings are shipped pre-centered with the screws backed out and a grenade pin holding the clockspring into place. If reusing a clockspring or installing a new one that you are unsure if it is centered or not. See **Restraints/CLOCKSPRING - Standard Procedure**.

The clockspring cannot be repaired. If the clockspring is faulty, damaged, or if the driver airbag has been deployed, the clockspring must be replaced.

OPERATION

OPERATION

WARNING: To service any component of the Steering Column Control Module (SCCM), the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly. Failure to follow these instructions may result in possible serious or fatal injury.

The clockspring is a mechanical electrical circuit component used to provide continuous electrical continuity between the fixed instrument panel wire harness and the electrical components mounted on or in the rotating steering wheel. On this model the rotating electrical components include the:

- Driver Airbag

- Horn Switch
- Steering Wheel Switches (if the vehicle is equipped)
- Cruise Control Switch

The clockspring case is positioned and secured to Steering Column Control Module (SCCM) housing near the top of the steering column. The connector terminals on the tail of the fixed clockspring case connect the clockspring to the vehicle electrical system through the self-docking connector in the instrument panel wire harness.

The clockspring rotor is movable and is keyed to the steering column shaft molded onto the rotor hub. The lobe on the turn signal cancel cam on the lower surface of the clockspring rotor hub contacts a turn signal cancel actuator of the multifunction switch, to provide automatic turn signal cancellation.

The clockspring has one short, black-sleeved pigtail with black ring wire routing clip. The routing clip slips over the lower left most (of four) airbag studs. The wires on the upper surface of the clockspring rotor connect the clockspring to the multistage driver airbag. The steering wheel wire harness connects the two connector receptacles on the upper surface of the clockspring rotor to the horn switch feed pigtail wire connector and if the vehicle is equipped, to the optional steering wheel switches on the steering wheel.

Like the clockspring in a timepiece, the clockspring tape has travel limits and can be damaged by being wound too tightly during full stop-to-stop steering wheel rotation. To prevent this from occurring, the clockspring is centered when it is installed on the steering column. Centering the clockspring indexes the clockspring tape to the movable steering components so that the tape can operate within its designed travel limits. However, if the clockspring is removed from the steering column or if the steering shaft is disconnected from the steering gear, the clockspring spool can change position relative to the movable steering components. The clockspring must be re-centered following completion of this service or the tape may be damaged.

Service replacement clocksprings are shipped pre-centered. The screws that retain the clockspring to the SCCM should not be removed until the clockspring has been installed on the SCCM. If the screws have been removed before the clockspring is installed on the SCCM, the clockspring centering procedure must be performed. See **Restraints/CLOCKSPRING - Standard Procedure**.

The clockspring is located within the SCCM. If the clockspring has to be replaced. Refer to **Steering/Column/MODULE, Steering Column Control - Disassembly** .

STANDARD PROCEDURE

CLOCKSPRING CENTERING

Fig. 64: Remove/Install SCCM
Courtesy of CHRYSLER LLC

WARNING: To service any component of the Steering Column Control Module (SCCM), the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly. Failure to follow these instructions may result in possible serious or fatal injury.

If the rotating tape (wire coil) in the clockspring is not positioned properly with the steering wheel and the front wheels, the clockspring may fail. The following procedure **must be used** to center the clockspring if it is not known to be properly positioned, or if the front wheels were moved from the straight ahead position.

NOTE: Before starting this procedure, be certain to turn the steering wheel until the front wheels are in the straight ahead position.

1. Position the steering wheel and front wheels straight ahead.
2. Remove the Steering Column Control Module (SCCM). Refer to **Steering/Column/MODULE, Steering Column Control - Removal**.

309031

Fig. 65: Clockspring
Courtesy of CHRYSLER LLC

3. Remove the clockspring. Refer to **Steering/Column/MODULE, Steering Column Control - Disassembly** .
4. The clockspring can rotate approximately 5 3/4 turns from lock-to-lock. To be properly centered, rotate the clockspring rotor clockwise until the rotor stops. Do not apply excessive force.
5. From the end of travel, slowly rotate the rotor counterclockwise until the arrow points to the 12 o'clock position. Then continue two rotations returning to the 12 o'clock position. Temporarily secure the rotor to prevent inadvertent rotation, until the SCCM assembly is reinstalled in the vehicle.

Fig. 66: Remove/Install SCCM
Courtesy of CHRYSLER LLC

6. Install the SCCM. Refer to **Steering/Column/MODULE, Steering Column Control - Installation** .
7. Install the wire pigtail routing clip over the lower left airbag stud, and remove temporary aid used to secure clockspring.

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it

may result in serious or fatal injury.

COVER, DRIVER AIR BAG

REMOVAL

REMOVAL

Fig. 67: Driver Airbag Cover
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, and serious or fatal injury.

CAUTION: Do not pull on the horn switch feed pigtail wire to disengage the connector from the driver airbag or to disconnect the horn switch to steering wheel wire harness connection. Improper pulling on this pigtail wire or connection can result in damage to the horn switch membrane or feed circuit.

2. Remove the driver airbag (2). See **Restraints/AIR BAG, Driver - Removal**.
3. With driver airbag removed, pick a corner and push down on the inflator (1) or latch hook mounting plate until the latch hooks (2) push out of the driver airbag cover (3).
4. Remove driver airbag from driver airbag cover.
5. The membrane type horn switch is integral to the driver airbag trim cover. If inoperative, the

entire trim cover must be replaced.

INSTALLATION

INSTALLATION

Fig. 68: Driver Airbag Cover
Courtesy of CHRYSLER LLC

1. Place the driver airbag into new driver airbag trim cover. Be careful not to pinch the airbag cushion between the latch hook mounting plate and the trim cover.

NOTE: Make sure that the horn switch wire harness is routed through the cut-out on the side of the trim cover and positioned in the hook on the back of the housing. Attach connector to the housing.

2. Push down on the latch hook mounting plate and guide the latch hooks into the slots on the driver airbag cover.

Fig. 69: Secure Driver Airbag Cover Latch Hooks
Courtesy of CHRYSLER LLC

3. Once all the latch hooks have been started, pull the driver airbag cover away from the driver airbag to fully seat the latch hooks.
4. Install the driver airbag (2). See **Restraints/AIR BAG, Driver - Installation**. Torque the two screws (1) to 10 N.m (89 in. lbs.).

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it may result in serious or fatal injury.

MODULE, OCCUPANT RESTRAINT CONTROLLER

DESCRIPTION

DESCRIPTION

Fig. 70: Occupant Restraint Controller
Courtesy of CHRYSLER LLC

The Occupant Restraint Controller (ORC) (2), sometimes referred to as the Airbag Control Module (ACM), is secured with three screws to a stamped steel mounting bracket welded onto the top of the floor panel transmission tunnel underneath the instrument panel center stack, beneath the center floor console in the passenger compartment of the vehicle. Concealed within a hollow in the center of the die cast aluminum ORC housing is the electronic circuitry of the ORC which includes a microprocessor, an electronic impact sensor, an electronic safing sensor, and an energy storage capacitor. A stamped metal cover plate is secured to the bottom of the ORC housing with four screws to enclose and protect the internal electronic circuitry and components.

Fig. 71: Locating Electrical Connectors
Courtesy of CHRYSLER LLC

The ORC housing has integral mounting flanges in three locations. Two molded plastic electrical connectors (1 and 2, referred to as C1 and C2 in the appropriate diagnostic and wiring information) exit the rearward facing side of the ORC housing. These terminal pins connect the ORC to the vehicle electrical system through two connectors.

The impact sensor and safing sensor internal to the ORC are calibrated for the specific vehicle, and are only serviced as a unit with the ORC. The ORC cannot be repaired or adjusted and, if damaged or faulty, it must be replaced.

OPERATION

OPERATION

The microprocessor in the Occupant Restraint Controller (ORC) contains the supplemental restraint system logic circuits and controls all of the Supplemental Restraint System (SRS) components. The ORC uses On-Board Diagnostics (OBD) and communicates with other electronic modules in the vehicle as well as with the diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used for control of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) and for SRS diagnosis and testing through the 16-way data link connector located on the driver side lower edge of the instrument panel.

The ORC microprocessor continuously monitors all of the SRS electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets an active and stored Diagnostic Trouble Code (DTC) and sends electronic messages to the EMIC over the CAN data bus to illuminate the airbag indicator. An active fault only remains for the duration of the fault, or in some cases for the duration of the current ignition switch cycle, while a stored fault causes a DTC to be stored in memory by the ORC. For some DTCs, if a fault does not recur for a number of ignition cycles, the ORC automatically erases the stored DTC. For other internal faults, the stored DTC is latched forever.

The ORC receives battery current through two circuits: a fused ignition switch output (run) circuit and a fused ignition switch output (run-start) circuit. The ORC receives ground through a ground circuit of the instrument panel wire harness. These connections allow the ORC to be operational whenever the ignition switch is in the START or ON positions.

The ORC also contains an energy-storage capacitor. When the ignition switch is in the START or ON positions, this capacitor is continually being charged with enough electrical energy to deploy the front supplemental restraint components for up to one second following a battery disconnect or failure. The purpose of the capacitor is to provide backup SRS protection in case there is a loss of battery current supply to the ORC during an impact.

Two sensors are contained within the ORC, an electronic impact sensor and a safing sensor. The ORC also monitors inputs from two remote front impact sensors located on the back of the right and left vertical members of the radiator support near the front of the vehicle. The electronic impact sensors are accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. On vehicles equipped with curtain airbags, the ORC also monitors inputs from four additional remote impact sensors to control deployment of the curtain airbags. Two are located on the left and right between the B and C-pillars, and two are located on the

left and right doors, underneath the door interior trim panels.

The safing sensor is an electronic accelerometer sensor within the ORC that provides an additional logic input to the ORC microprocessor. The safing sensor verifies the need for a supplemental restraint deployment by detecting impact energy of a lesser magnitude than that of the primary electronic impact sensors, and must exceed a safing threshold in order for the airbags to deploy. Vehicles equipped with curtain airbags, feature a second safing sensor within the ORC to provide confirmation to the ORC microprocessor of side impact forces. This second safing sensor is a bi-directional unit that detects impact forces from either side of the vehicle.

Pre-programmed decision algorithms in the ORC microprocessor determine when the deceleration rate as signaled by the impact sensors and the safing sensors indicate an impact that is severe enough to require SRS protection and, based upon the severity of the monitored impact, determines the level of front airbag deployment force required for each front seating position. When the programmed conditions are met, the ORC sends the proper electrical signals to deploy the dual multistage front airbags at the programmed force levels, the front seat belt tensioners and, if either curtain airbag. For vehicles equipped with the Occupant Classification System (OCS), the passenger airbag and seat belt tensioner will be deployed by the ORC only if enabled by the Occupant Classification Module (OCM) messages (passenger airbag disabled indicator off at the time of the impact).

The most reliable, efficient, and accurate ways to diagnose the ORC, the CAN data bus, and the electronic message inputs to and outputs from the ORC requires the use of a diagnostic scan tool and the appropriate diagnostic information.

REMOVAL

REMOVAL

Fig. 72: Identifying Front Console Components
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, and serious or fatal injury.

2. Remove the center floor console. Refer to **Body/Interior/CONSOLE, Floor - Removal** .

4. Install the center floor console. Refer to **Body/Interior/CONSOLE, Floor - Installation** .

WARNING: Do not connect the battery negative cable. See **Restraints -**

Diagnosis and Testing. If the system test is not performed first it may result in serious or fatal injury.

RETRACTOR, SEAT BELT

STANDARD PROCEDURE

WEB STOP BUTTON REPLACEMENT

The webbing of each of the tip half seat belts in this vehicle is equipped with a molded plastic web stop button, which holds the latch plate of the seat belt tip half in a readily accessible stored position and prevents it from falling to the lower belt anchor while the belt is not in use. If this button becomes damaged or separated from the belt webbing, it may be successfully replaced using the following procedure without the need for removing or replacing the entire seat belt assembly.

The web stop button replacement kit includes two molded plastic replacement button halves: a male button half with a pointed spike in its center, and a female button half with a hole in its center. The button halves are not available separately. In addition to the button replacement kit, a pair of wheel weight pliers (such as KD Tools® #3358, Snap-on® #WWPR13A or equivalent) and a gel-type super adhesive glue (such as Mopar® Bond-All Gel #04467709 or equivalent) are required.

NOTE: **Avoid using heavy-duty, truck-style wheel weight pliers as the jaws may not close far enough to successfully complete web stop button replacement.**

WARNING: Carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or ineffective buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or ineffective seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® Parts Catalog. Failure to follow these instructions may result in possible serious or fatal injury.

Fig. 80: Locating Web Stop Button
 Courtesy of CHRYSLER LLC

1. Carefully inspect the seat belt webbing to identify the hole or witness mark where the original web stop button halves (2 and 5) were installed. If no distinct evidence of the prior button location is found, go to Step 2. If the original button location is clearly evident, go to Step 3.
2. Find the appropriate dimension in the WEB STOP BUTTON LOCATION chart. Measure and mark that distance (4) in the center of the belt webbing from the point where the webbing is secured to the seat belt lower anchor plate (3).

WEB STOP BUTTON LOCATION	
SEATING POSITION	DIMENSION
FRONT	360 +/- 10 millimeters (14.17 +/-0.39 inches)
REAR	400 +/- 10 millimeters (15.75 +/-0.39 inches)
REAR CENTER	400 +/- 10 millimeters (15.75 +/-0.39 inches)

3. Working from the side of the seat belt webbing that faces the interior of the vehicle, pierce the webbing with the spike in the center of the male button half. The male button head should face the interior of the vehicle.

Fig. 81: Applying Small Dot Of Gel-Type Super Adhesive Glue Around Center Hole On Back Side Of Female Button Half
Courtesy of CHRYSLER LLC

4. Apply a small dot of gel-type super adhesive glue (2) around the center hole on the back side of the female button half (1).
5. Press the female button half over the spike of the male button half protruding through the side of the belt webbing that faces away from the interior of the vehicle.

Fig. 82: Flattening Button Half
Courtesy of CHRYSLER LLC

6. Use the flat anvil-like jaw (3) of the wheel weight pliers to flatten the sharp spike (2) of the male button half protruding through the female button half (1) on the back side of the belt webbing (4).

Fig. 83: Forming Button Half
Courtesy of CHRYSLER LLC

7. Carefully use the curved jaw (3) of the wheel weight pliers to compress and form the flattened spike of the male button half (2) on the back side of the seat belt webbing (1) until it is concave and entirely below the outer convex surface of the female button half.
8. Check to be certain the web stop button is secure.

REMOVAL

REMOVAL

FRONT

Fig. 84: Identifying Lower Seat Belt Anchor Bolts

SENSOR, IMPACT

DESCRIPTION

DESCRIPTION

FRONT IMPACT SENSORS

Fig. 103: Front Impact Sensor Location
Courtesy of CHRYSLER LLC

Two front impact sensors (1) are used on this vehicle, one each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each front sensor is secured with two screws (2) to the backs of the right and left vertical members of the radiator support within the engine compartment.

Fig. 104: Side Impact Sensor
Courtesy of CHRYSLER LLC

The right and left front impact sensors are identical in construction and calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. Potting material fills the cavity to seal and protect the internal electronic circuitry and components.

The impact sensors cannot be repaired or adjusted and, if damaged or faulty, they must be replaced.

SIDE IMPACT SENSORS

Four side impact sensors are used on this vehicle if it is equipped with the curtain airbags, two each for the left and right sides of the vehicle. These sensors are mounted remotely from the impact sensor that is internal to the Occupant Restraint Controller (ORC). Each side sensor is secured with two screws to the inner right or left door and the inner rear quarter within the passenger compartment.

813176b5

Fig. 105: Side Impact Sensor
Courtesy of CHRYSLER LLC

The right and left side impact sensors are similar in construction and identical in calibration. A cavity in the center of the molded black plastic impact sensor housing contains the electronic circuitry of the sensor which includes an electronic communication chip and an electronic impact sensor. Potting material fills the cavity to seal and protect the internal electronic circuitry and components.

The impact sensors cannot be repaired or adjusted and, if damaged or faulty, they must be replaced.

OPERATION

OPERATION

FRONT IMPACT SENSORS

The front impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through dedicated left and right sensor plus and minus circuits from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The most reliable, efficient, and accurate means to diagnose the impact sensors, the ORC, and the electronic message communication between the sensors and the ORC requires the use of a scan tool and the appropriate diagnostic information.

SIDE IMPACT SENSORS

The side impact sensors are electronic accelerometers that sense the rate of vehicle deceleration, which provides verification of the direction and severity of an impact. Each sensor also contains an electronic communication chip that allows the unit to communicate the sensor status as well as sensor fault information to the microprocessor in the Occupant Restraint Controller (ORC).

The ORC microprocessor continuously monitors all of the side passive restraint system electrical circuits to determine the system readiness. If the ORC detects a monitored system fault, it sets a Diagnostic Trouble Code (DTC) and controls the airbag indicator operation accordingly. The impact sensors each receive battery current and ground through the same left or right sensor plus and minus circuits in a series arrangement from the ORC. The impact sensors and the ORC communicate by modulating the voltage in the sensor plus circuit.

The most reliable, efficient, and accurate means to diagnose the impact sensors, the ORC, and the electronic message communication between the sensors and the ORC requires the use of a scan tool and the appropriate diagnostic information.

REMOVAL

REMOVAL

FRONT IMPACT SENSOR

Fig. 106: Front Impact Sensor Location
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, which may result in serious or fatal injury.

NOTE: If replacing the left front impact sensor, the air intake system needs to be removed.

2. Disconnect the front impact sensor electrical connector (3).
3. Remove the two front impact sensor retaining screws (2).
4. Remove the impact sensor.

SIDE IMPACT SENSOR

DOOR MOUNTED SIDE IMPACT SENSOR

Fig. 107: Identifying Door, Retaining Screws, Side Impact Sensor & Electrical Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, which may result in serious or fatal injury.

2. Remove the door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Removal** .
3. Disconnect the side impact sensor electrical connector (4).
4. Remove the two retaining screws (2).
5. Remove the side impact sensor (3) from the door (1).

QUARTER PANEL MOUNTED SIDE IMPACT SENSOR

Fig. 108: Identifying Retaining Screws, Side Impact Sensorelectrical Connector & Side Impact Sensor

Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.

WARNING: Wait two minutes for the airbag system reserve capacitor to discharge before beginning any airbag system or component service. Failure to do so may result in accidental airbag deployment, which may result in serious or fatal injury.

2. Remove the lower quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal**.
3. Disconnect the quarter panel mounted side impact sensorelectrical connector (2).
4. Remove the two retaining screws (1).
5. Remove the quarter panel mounted side impact sensor (4).

INSTALLATION

INSTALLATION

FRONT IMPACT SENSOR

Fig. 109: Front Impact Sensor Location
Courtesy of CHRYSLER LLC

1. Position the front impact sensor in the correct location and install the two retaining screws (2). Tighten screws (2) to 7 N.m (62 in. lbs.).
2. Connect the front impact sensor electrical connector (3).

NOTE: If replacing the left front impact sensor, the air intake system needs to be installed.

WARNING: Do not connect the battery negative cable. See Restraints - Diagnosis and Testing. If the system test is not performed first it may result in serious or fatal injury.

SIDE IMPACT SENSOR

DOOR MOUNTED SIDE IMPACT SENSOR

Fig. 110: Identifying Door, Retaining Screws, Side Impact Sensor & Electrical Connector
 Courtesy of CHRYSLER LLC

1. Position the door mounted impact sensor (3) in the correct location and install the two retaining screws (2). Tighten screws (2) to 7 N.m (62 in. lbs.).
2. Connect the door mounted side impact sensor electrical connector (4).
3. Install the door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Installation** .

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it may result in serious or fatal injury.

QUARTER PANEL MOUNTED SIDE IMPACT SENSOR

Fig. 111: Identifying Retaining Screws, Side Impact Sensorelectrical Connector & Side Impact Sensor

Courtesy of CHRYSLER LLC

1. Position the quarter panel mounted side impact sensor (4) in the correct location and install the two retaining screws (1). Tighten screws (2) to 7 N.m (62 in. lbs.).
2. Connect the quarter panel mounted side impact sensorelectrical connector (2).
3. Install the lower quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .

WARNING: Do not connect the battery negative cable. See **Restraints - Diagnosis and Testing**. If the system test is not performed first it may result in serious or fatal injury.

SENSOR, SEAT TRACK POSITION

DESCRIPTION

DESCRIPTION

Fig. 112: Seat Track Position Sensor
Courtesy of CHRYSLER LLC

The seat track position sensor (1) is a Hall Effect-type sensor. This sensor consists of a Hall Effect Integrated Circuit (IC) chip encased in potting material within a cavity of the molded plastic sensor housing.

The sensor housing has two integral snap features (3) and snaps into a stamped metal bracket located on the inboard side of one of the seat adjuster tracks on the front seat of vehicles so equipped. A molded connector receptacle (2) integral to the sensor housing is connected to the vehicle electrical system through a connector and take out of the seat wire harness beneath the front seat cushion frame.

The seat track position sensor cannot be adjusted or repaired and, if ineffective or damaged, the entire sensor must be replaced.

OPERATION

OPERATION

The seat track position sensor is designed to provide a seat position data input to the Occupant Restraint Controller (ORC) indicating whether the front seat is in a full forward or a not full forward position. The ORC uses this data as an additional logic input for use in determining the appropriate deployment force to be used when deploying the multistage front airbag.

The seat track position sensor receives a nominal five volt supply from the ORC. The sensor communicates the seat position by modulating the voltage returned to the ORC on a sensor data circuit. The ORC also monitors the condition of the sensor circuits and will store a Diagnostic Trouble Code (DTC) for any fault that is detected. The ORC then sends messages over the Controller Area Network (CAN) data bus to control the illumination of the airbag indicator in the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN).

The hard wired circuits between the seat track position sensor and the ORC may be diagnosed using conventional diagnostic tools and procedures. Refer to **SYSTEM WIRING DIAGRAMS** . However, conventional diagnostic methods will not prove conclusive in the diagnosis of the seat track position sensor or the electronic controls and communication between other modules and devices that provide features of the Supplemental Restraint System (SRS). The most reliable, efficient, and accurate means to diagnose the seat track position sensor or the electronic controls and communication related to seat track position sensor operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 113: Seat Track Position Sensor
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Wait two minutes for the system capacitor to discharge before further service.
2. Reach under the front edge of the front seat cushion to access the seat track position sensor (3) in a bracket (1) located on the inboard side of the lower outboard seat track (5).
3. Disconnect the seat wire harness connector (4) from the sensor connector receptacle located on the end of the sensor.
4. Using a small screwdriver, depress the snap feature (2) and pull the connector end of the sensor out of the bracket.
5. Remove the sensor from under the front seat.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 114: Seat Track Position Sensor
Courtesy of CHRYSLER LLC

1. Reach under the front seat cushion to position the seat track position sensor (3) to the open end of the bracket (1) located on the inboard side of the lower outboard seat track (5).
2. Push the sensor firmly into the bracket until the snap feature (2) locks into place.
3. Reconnect the seat wire harness connector (4) to the sensor connector receptacle located on the end of the sensor. Be certain that the latch on the connector is fully engaged.
4. Do not reconnect the battery negative cable at this time. The Supplemental Restraint System (SRS) verification test procedure should be performed following service of any SRS component. See **Restraints - Standard Procedure**.

TENSIONER, SEAT BELT

DESCRIPTION

DESCRIPTION

Fig. 115: Seat Belt Tensioner
Courtesy of CHRYSLER LLC

The seat belt tensioners supplement the dual front airbags. The seat belt tensioners are integral to the front seat belt retractors (2), which are secured to the inner quarter panel(1) on the right and left sides of the vehicle. The retractor is concealed beneath the lower quarter trim panel. The seat belt tensioner consists of a sprocket/pinion, a steel tube, a cast metal housing, numerous steel balls, a stamped metal ball trap, a torsion bar, a small pyrotechnically activated gas generator, and a short pigtail wire. All of these components are located on one side of the retractor spool on the outside of the retractor housing except for the torsion bar, which serves as the spindle upon which the retractor spool rides. The seat belt tensioners are controlled by the Occupant Restraint Controller (ORC) and are connected to the vehicle electrical system through the body wire harness (3).

The seat belt tensioners cannot be repaired and, if faulty or damaged, the entire front seat belt and retractor unit must be replaced. If the front airbags have deployed, the seat belt tensioners have also deployed. The seat belt tensioners are not intended for reuse and must be replaced following any front airbag deployment. A growling or grinding sound while attempting to operate the seat belt retractor is a sure indication the seat belt tensioner has been deployed and requires replacement. Refer to **BODY** for diagnosis and testing.

OPERATION

OPERATION

The seat belt tensioners are deployed in conjunction with the front airbags by a signal generated by the Occupant Restraint Controller (ORC) through the driver or passenger seat belt tensioner line 1 and line 2 (or squib) circuits. When the ORC sends the proper electrical signal to the tensioners, the electrical energy generates enough heat to initiate a small pyrotechnic gas generator. The gas generator is installed in one end of a steel tube that contains numerous steel balls. As the gas expands, it pushes the steel balls through the tube into a cast metal housing, where a ball guide directs the balls into engagement with the teeth of a sprocket that is geared to one end of the

retractor spool. As the balls drive past the sprocket, the sprocket turns and drives the seat belt retractor spool causing the slack to be removed from the front seat belts. The ball trap captures the balls as they leave the sprocket and are expelled from the housing.

Removing excess slack from the front seat belts not only keeps the occupants properly positioned for an airbag deployment following a frontal impact of the vehicle, but also helps to reduce injuries that the occupant might experience in these situations as a result of harmful contact with the steering wheel, steering column, instrument panel and/or windshield. Also, the seat belt tensioner torsion bar that the retractor spool rides upon is designed to deform in order to control the loading being applied to the occupants by the seat belts during a frontal impact, further reducing the potential for occupant injuries.

The ORC monitors the condition of the seat belt tensioners through circuit resistance, and will illuminate the airbag indicator in the instrument cluster and store a Diagnostic Trouble Code (DTC) for any fault that is detected. For proper diagnosis of the seat belt tensioners, a scan tool is required and the appropriate body diagnostic information.

ACCESSORIES AND EQUIPMENT

Speed Control - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The speed control system is fully and electronically controlled by the Powertrain Control Module (PCM). **A cable and a vacuum controlled servo are not used. This is a servo-less system.** The switch is labeled: ON/OFF, RES/ACCEL, SET, COAST, and CANCEL.

OPERATION

OPERATION

When speed control is selected by pressing the ON switch, the Powertrain Control Module (PCM) allows a set speed to be stored in its Random Access Memory (RAM) for speed control. To store a set speed, press the SET switch while the vehicle is moving at a speed between 25 - 100 mph (40 - 160 km/h). In order for the speed control to engage, the brakes cannot be applied, and the transmission cannot be in park, neutral or low.

The speed control can be disengaged manually by:

- Pressing the brake pedal
- Pressing the ON/OFF button
- Actuating the cancel function on the lever stalk

NOTE: **Pressing the OFF switch or turning off the ignition switch erases the set speed stored in the PCM (Electronic Control Module (ECM) with a diesel engine).**

For added safety, the speed control system is programmed to disengage for any of the following conditions:

- An indication of park or neutral
- A rapid increase rpm (indicates the clutch has been disengaged)
- Excessive engine rpm (indicates the transmission may be in a low gear)
- The speed signal increases at a rate of 10 mph (16 km/h) per second (indicates the coefficient of friction between the road surface and tires is extremely low)
- The speed signal decreases at a rate of 10 mph (16 km/h) per second (indicates the vehicle may have decelerated at an extremely high rate)

Once the speed control has been disengaged, actuate the lever stalk up to RES/ACCEL (when the speed is greater than 20 mph (32 km/h) restores the vehicle to the target speed stored in the PCM (ECM with a diesel engine).

While the speed control is engaged, the driver can increase the vehicle speed by pressing the RES/ACCEL switch. The new target speed is stored in the PCM (ECM with a diesel engine) when the RES/ACCEL is released. The PCM (ECM with a diesel engine) also has a tap-up feature in which the vehicle speed increases at a rate of approximately 1 mph (1.6 km/h) for each momentary switch activation of the RES/ACCEL switch.

A tap-down feature is used to decelerate without disengaging the speed control system. To decelerate from an existing recorded target speed, momentarily actuate the lever stalk down when in SET/DECEL. For each switch activation, the speed is lowered approximately 1 mph (1.6 km/h).

SWITCH, SPEED CONTROL

DESCRIPTION

DESCRIPTION

The standard passenger style speed control switch is the only style of speed control switch available in this vehicle

81c74605

Fig. 1: Speed Control Switch
 Courtesy of CHRYSLER LLC

The standard passenger style speed control switch shown in illustration has the following functions:

- CANCEL (1)
- RESUME/ACCEL (2)
- CRUISE ON/OFF (3)
- SET/DECEL (4)

REMOVAL

REMOVAL

81c77489

Fig. 2: Speed Control Switch
Courtesy of CHRYSLER LLC

WARNING: Before servicing the steering column the airbag system must be disarmed. Failure to do so may result in accidental deployment of the airbag and possible serious personal and/or fatal injury may result.

NOTE: Position the front wheels straightahead.

1. Disconnect and isolate the negative battery cable before beginning steering wheel removal. Allow the front airbag system capacitor to discharge for two minutes before removing the steering wheel or any front airbag system component.
2. Remove the driver airbag (3). Refer to Restraints/AIR BAG, Driver - Removal .
3. Disconnect the speed control switch electrical connector (2).
4. Remove the screw (1) from the front of the speed control switch (3).

Fig. 3: Speed Control Switch (Rear)
Courtesy of CHRYSLER LLC

5. Remove the screws (1) from the rear of the speed control switch (2).
6. Remove the speed control switch (2) from the steering wheel.

INSTALLATION

INSTALLATION

Fig. 4: Speed Control Switch (Rear)
 Courtesy of CHRYSLER LLC

1. Install the speed control switch (2) to the steering wheel.
2. Install the two screws (1) to the rear of the speed control switch (2) and tighten to 1 N.m (9 in. lbs.).

Fig. 5: Speed Control Switch
 Courtesy of CHRYSLER LLC

3. Install the screw (1) to the front of the speed control switch (3) and tighten to 3.5 N.m (31 in. lbs.).
4. Connect the speed control switch electrical connector (2).
5. Install drivers airbag. Refer to **Restraints/AIR BAG, Driver - Installation** .
6. Verify system operation.

7. Connect the negative battery cable.

ENGINE

Starting - Service Information - Challenger

DESCRIPTION

REMOTE START SYSTEM

NOTE: Available on automatic transmission equipped vehicles only.

Remote start conveniently starts the engine from outside the vehicle by using the Remote Keyless Entry (RKE) key fob while maintaining security. The system has a targeted range of 300 ft. (91.4 m). The vehicle must be locked, the deck lid and hood closed and the transmission in Park in order to start the engine using the Remote Start button on the key fob.

STANDARD STARTING SYSTEM

The starting system consists of:

- Starter relay
- Starter motor (including an integral starter solenoid)

Other components to be considered as part of starting system are:

- Battery
- Battery cables
- Ignition switch and key lock cylinder
- Clutch pedal position switch (manual transmission)
- Park/neutral position switch (automatic transmission)
- Wire harnesses and connections.

The Battery, Starting, and Charging systems operate in conjunction with one another, and must be tested as a complete system. For correct operation of starting/charging systems, all components used in these 3 systems must perform within specifications. When attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used in each of these sections include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliampere ammeter, volt/ohmmeter, battery charger, carbon pile rheostat (load tester), and 12-volt test lamp may be required.

OPERATION

REMOTE START SYSTEM

Remote Start Operating Conditions

In order to operate remote start, the following conditions must be met:

- Key fob sequence must be operated within a 100 meter range of the vehicle.
- The vehicle must be in Park.
- Key is not in the ignition.
- The hazard switch off.
- Vehicle Theft Alarm or Panic is not alarming.
- Doors and hood must be closed.
- The battery voltage is normal (11 to 15 volts).

Remote Start Shut Down/Deactivate Conditions

Engine will NOT start or will shut down/deactivate during any of the following conditions:

- Key in Ignition.
- Doors or hood are opened before remote unlock.
- Hazard Switch depressed.
- Panic or theft alarm active.
- Brake applied.
- A prior remote start cranked the engine , but failed to start the engine.
- Battery voltage NOT in the normal range.
- High (run away) or Low Idle (stall) RPM.
- MIL Active.
- High Engine Coolant Temperature.
- Low Engine Oil Pressure.

Initiate Remote Start

To Remote Start the vehicle:

1. Press remote button on the Key Fob twice within 5 seconds.

NOTE: Engine will run for 15 minutes after a remote start is initiated. After 15 minutes, the engine will shut off. The system allows for only two sequential remote starts without a key ignition cycle.

2. Unlock vehicle with Key Fob to enter the vehicle.
3. Put key in ignition, turn key to run position to exit remote start and enter a normal start without engine shut off.

Identification that Remote Start is Activated

To identify that Remote Start has been activated the following will occur:

- Horn will sound and lights will flash to acknowledge a start command was received.
- Park Lamps will turn on to indicate that the engine is running in remote start mode.

Terminate Remote Start

To terminate Remote Start, press Remote Start button on the Key Fob once.

NOTE: In order to avoid inadvertent shut downs, the one-time press to shut down the vehicle will be disabled for two seconds after receipt of a valid remote start request.

STANDARD STARTING SYSTEM

These components form two separate circuits. A high amperage circuit that feeds the starter motor up to 300+ amps, and a control circuit that operates on less than 30 amps.

The PCM controls a double start over-ride safety that does not allow the starter to be engaged if the engine is already running.

DIAGNOSIS AND TESTING

REMOTE START SYSTEM

For diagnostic and testing information. Refer to Non-DTC Diagnostics/Starting - Diagnosis and Testing .

STANDARD STARTING SYSTEM

The battery, starting, and charging systems operate in conjunction with one another, and must be tested as a complete system. For correct starting/charging system operation, all of the components involved in these three systems must perform within specifications.

Starting System Diagnosis		
CONDITION	POSSIBLE CAUSE	CORRECTION
STARTER FAILS TO OPERATE	1. Battery discharged or faulty.	1. Refer to BATTERY SYSTEM . CHARGE or REPLACE the battery if required.
-	2. Starting circuit wiring faulty.	2. Refer to SYSTEM WIRING DIAGRAMS . Test and repair the starter feed and/or control circuits, if required.
-	3. Starter relay faulty.	3. The starter relay is located within the Totally Integrated Power Module (TIPM). Refer to Vehicle Quick Reference/Fuse Locations and Types - Specifications .

-	4. WIN faulty.	4. Replace the WIN module if required. Refer to <u>Electrical/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Removal</u> .
-	6. Park/Neutral position switch faulty or misadjusted.	6. Refer to <u>42RLE - SERVICE INFORMATION</u> to REPLACE the park/neutral position switch if required.
-	7. Clutch Interlock Switch	Test the operation of the clutch interlock switch. Refer to <u>Non-DTC Diagnostics/Drivability - Gas - Diagnosis and Testing</u>
-	8. Starter solenoid faulty.	8. See <u>Electrical/Starting/STARTER - Removal</u> . REPLACE the starter motor assembly if required.
-	9. Starter motor faulty.	9. If all other starting system components and circuits test OK. See <u>Electrical/Starting/STARTER - Removal</u> to REPLACE the starter motor.
STARTER ENGAGES, FAILS TO TURN ENGINE	1. Battery discharged or faulty.	1. Refer to <u>Electrical/Battery System/BATTERY - Standard Procedure</u> or refer to <u>Electrical/Battery System/BATTERY - Removal</u> if replacement of the battery is required.
	2. Starting circuit wiring faulty.	2. Refer to <u>SYSTEM WIRING DIAGRAMS</u> . Test and repair the starter feed and/or control circuits if required.
	3. Starter motor faulty.	3. If all other starting system components and circuits test OK. See <u>Electrical/Starting/STARTER - Removal</u> to REPLACE the starter motor assembly.
	4. Engine seized.	4. Refer to the appropriate Engine Diagnosis service information.
STARTER ENGAGES, SPINS OUT BEFORE ENGINE STARTS	1. Starter ring gear faulty.	1. See <u>Electrical/Starting/STARTER - Removal</u> . Remove the starter motor to inspect the starter ring gear. REPLACE the starter ring gear if required.
	2. Starter motor faulty.	2. If all other starting system components and circuits test OK, replace the starter motor assembly. See <u>Electrical/Starting/STARTER - Removal</u> .
STARTER DOES NOT DISENGAGE	1. Starter motor improperly installed.	1. See <u>Electrical/Starting - Specifications</u> . Tighten the starter mounting hardware to correct torque specifications.
	2. Starter relay faulty.	2. The starter relay is located within the Totally Integrated Power Module (TIPM). Refer to <u>Vehicle Quick Reference/Fuse Locations and Types - Specifications</u> .
	3. WIN faulty.	3. Replace the WIN module if required. Refer to

		<u>Electrical/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Removal</u>
	4. Starter motor faulty.	4. If all other starting system components and circuits test OK, replace the starter motor assembly. See <u>Electrical/Starting/STARTER - Removal</u> .

INSPECTION

For complete starter wiring circuit diagrams, Refer to **SYSTEM WIRING DIAGRAMS** . Before removing any unit from the starting system for repair or diagnosis, perform the following inspections:

WARNING: On vehicles equipped with airbags, refer to **SERVICE INFORMATION** , before attempting any steering wheel, steering column, or instrument panel component diagnosis or service. Failure to follow these instructions may result in possible serious or fatal injury.

- **Battery** - Visually inspect the battery for indications of physical damage and loose or corroded cable connections. Determine state-of-charge and cranking capacity of battery. Charge or replace battery if required. Refer to **BATTERY SYSTEM** . **Note: If equipped with adiesel engine, a dual battery system may be used, and both batteries must be inspected.**
- **Ignition Switch** - Visually inspect the ignition switch for indications of physical damage and loose or corroded wire harness connections. Refer to **Ignition Switch and Key Lock Cylinder**.
- **Park/Neutral Position Switch** - If equipped with an automatic transmission, visually inspect the park/neutral position switch for indications of physical damage and loose or corroded wire harness connections. Refer to **SENSOR, TRANSMISSION RANGE** .
- **Starter Relay** - The starter relay is located within the Totally Integrated Power Module (TIPM). Refer to **Vehicle Quick Reference/Fuse Locations and Types - Specifications** .
- **Starter Motor** - Visually inspect starter motor for indications of physical damage and loose or corroded wire harness connections.
- **Starter Solenoid** - Visually inspect starter solenoid for indications of physical damage and loose or corroded wire harness connections.
- **Wiring** - Visually inspect wire harnesses for damage. Repair or replace any faulty wiring, as required. Refer to **SYSTEM WIRING DIAGRAMS** .

TESTING

COLD CRANKING TEST

NOTE: For complete starter wiring circuit diagrams, Refer to **SYSTEM WIRING DIAGRAMS** . The battery must be fully-charged and load-tested before proceeding. Refer to **BATTERY SYSTEM** .

Fig. 1: VOLTS-AMPS TESTER CONNECTIONS - TYPICAL
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - POSITIVE CLAMP
2 - NEGATIVE CLAMP
3 - INDUCTION AMMETER CLAMP |
|---|

1. Connect volt-ampere tester (1) and (2) to battery terminals . See instructions provided by manufacturer of volt-ampere tester being used.
2. Fully engage the parking brake.
3. Automatic transmissions, place gearshift selector lever in the Park (P) position.
4. Verify all lamps and accessories are turned off.
5. To prevent a gasoline engine from starting, remove the Automatic ShutDown (ASD) relay. The relay is located in Totally Intraged Power Module (TIPM). Refer to label on the TIPM cover for relay location.

NOTE: **Attempt to start engine a few times before proceeding with following step.**

NOTE: **A cold engine will increase the starter current (amperage) draw reading, and reduce the battery voltage reading.**

6. Rotate and hold the ignition switch in START position. Note the cranking voltage and current (amperage) draw readings shown in illustration on volt-ampere tester.
 - a. If the voltage reads below 7.2 volts, refer to **STARTER MOTOR** . If the starter motor is OK, refer to appropriate Engine Diagnosis service information for further testing of the engine. If the starter motor is not OK, replace the faulty starter motor.
 - b. If the voltage reads above 7.2 volts and current (amperage) draw reads below specifications, refer to **FEED CIRCUIT TEST** .
 - c. If the voltage reads 12.5 volts or greater and the starter motor does not turn, refer to **CONTROL CIRCUIT TESTING**.

- d. If the voltage reads 12.5 volts or greater and the starter motor turns very slowly, refer to **FEED CIRCUIT TEST**.

FEED CIRCUIT TEST

The starter feed circuit test (voltage drop method) will determine if there is excessive resistance in the high-amperage feed circuit. For complete starter wiring circuit diagrams, refer to **SYSTEM WIRING DIAGRAMS**.

When performing these tests, it is important to remember that voltage drop is giving an indication of resistance between two points at which the voltmeter probes are attached.

Example: When testing the resistance of positive battery cable, touch the voltmeter leads to the positive battery cable clamp and the cable connector at the starter solenoid. If you probe the positive battery terminal post and the cable connector at the starter solenoid, you are reading the combined voltage drop in the positive battery cable clamp-to-terminal post connection and positive battery cable.

The following operation requires a voltmeter accurate to 1/10 (0.10) volt. Before performing these tests, make sure the following procedures are accomplished:

- Battery is fully-charged and load-tested. Refer to **BATTERY SYSTEM**.
- Fully engage parking brake.
- Place gearshift selector lever in Park (P) position.
- Verify all lamps and accessories are turned off.
- To prevent a gasoline engine from starting, remove the Automatic ShutDown (ASD) relay. The relay is located in Totally Intraged Power Module (TIPM). Refer to label on the TIPM cover for relay location.

Fig. 2: TEST BATTERY NEGATIVE CONNECTION RESISTANCE - TYPICAL
Courtesy of CHRYSLER LLC

1 - VOLTMETER
2 - BATTERY

1. Connect the positive lead of voltmeter (1) to negative battery cable terminal post. Connect the negative lead of voltmeter to the negative battery cable clamp . Rotate and hold the ignition switch in START position. Observe the voltmeter. If voltage is detected, correct the poor contact between the cable clamp and the terminal post.

Fig. 3: TEST BATTERY POSITIVE CONNECTION RESISTANCE - TYPICAL
Courtesy of CHRYSLER LLC

1 - VOLTMETER
2 - BATTERY

2. Connect the positive lead of voltmeter to the positive battery terminal post. Connect the negative lead of voltmeter to the battery positive cable clamp . Rotate and hold the ignition switch in START position. Observe the voltmeter. If voltage is detected, correct the poor contact between the cable clamp and the terminal post.

Fig. 4: TEST BATTERY POSITIVE CABLE RESISTANCE - TYPICAL
Courtesy of CHRYSLER LLC

1 - BATTERY
2 - VOLTMETER
3 - STARTER MOTOR

3. Connect the voltmeter to measure between the battery positive terminal post and the starter solenoid battery terminal stud . Rotate and hold the ignition switch in START position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery cable connection at the solenoid. Repeat the test. If the reading is still above 0.2 volt, replace the faulty positive battery cable.

1 - VOLTMETER
2 - BATTERY
3 - ENGINE GROUND

4. Connect the voltmeter to measure between negative battery terminal post and a good clean ground on the engine block . Rotate and hold the ignition switch in START position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the negative battery cable attachment on the engine block. Repeat the test. If the reading is still above 0.2 volt, replace the faulty negative battery cable.

Fig. 6: TEST STARTER GROUND - TYPICAL
Courtesy of CHRYSLER LLC

1 - STARTER MOTOR 2 - BATTERY 3 - VOLTMETER

5. Connect the positive lead of the voltmeter to the starter housing. Connect the negative lead of the voltmeter to the negative battery terminal post. Rotate and hold the ignition switch in START position. Observe the voltmeter. If the reading is above 0.2 volt, correct the poor starter to engine block ground contact.
6. If equipped with a dual battery system (certain diesel equipped models), connect the positive lead of voltmeter to the positive battery cable clamp on the battery located on the left side of vehicle. Connect the negative lead of voltmeter to the positive battery terminal post on the battery located on the right side of vehicle. Rotate and hold the ignition switch in START position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery cables at both batteries. Repeat the test. If the reading is still above 0.2 volt, replace the faulty positive battery cable.

If the resistance tests detect no feed circuit problems. See **Electrical/Starting - Diagnosis and Testing**.

CONTROL CIRCUIT TESTING

The starter control circuit components should be tested in the order in which they are listed, as follows:

- Starter Relay - The starter relay is located within the Totally Integrated Power Module (TIPM). Refer to **Vehicle Quick Reference/Fuse Locations and Types - Specifications**.
- Starter Solenoid -. See **Electrical/Starting - Diagnosis and Testing**.
- Ignition Switch - Refer to **SWITCH, IGNITION** and Key Lock Cylinder
- Park/Neutral Position Switch - If equipped with an automatic transmission, refer to **SENSOR,**

TRANSMISSION RANGE .

- Clutch Interlock Switch -. Refer to **Non-DTC Diagnostics/Drivability - Gas - Diagnosis and Testing** .
- Wire harnesses and connections - Refer to **SYSTEM WIRING DIAGRAMS** .

SPECIFICATIONS

STARTER MOTOR

STARTER MOTOR

Engine Application	Power Rating	Cranking Amperage Draw Test
6.1L	1.4 Kilowatt / 1.87 Horsepower	100 - 300 Amperes
* Test at operating temperature. A cold engine, tight (new) engine, or heavy oil increases starter amperage draw. Starters are equipped with permanent magnets. Never strike the starter case in an attempt to loosen a sticking/stuck armature as the permanent magnets may crack or break.

ANTENNA, REMOTE START

DESCRIPTION

DESCRIPTION

Fig. 7: REMOTE START ANTENNA MODULE ASSEMBLY
Courtesy of CHRYSLER LLC

The Remote Start Antenna Module Assembly consists of an electrical connection to the WIN (1), a length of coaxial cable (2), two mounting clips (3) and (4), and a control module/antenna (5).

OPERATION

OPERATION

The remote start antenna is located on the passenger side above and to the left of glove box. The antenna interfaces with the Wireless Ignition Module (WIN) through a coaxial electrical cable and electrical connector. The antenna helps to amplify the signal for the Remote Keyless Entry (RKE) key fob.

REMOVAL

REMOVAL

81cc2301

Fig. 8: RSA ELECTRICAL CONNECTOR
 Courtesy of CHRYSLER LLC

WARNING: Wait two minutes for the system reserve capacitor to discharge before servicing any airbag components. Failure to do this may result in serious or fatal injury.

The remote start antenna is located on the passenger side above and to the left of glove box.

1. Disconnect and isolate the battery negative cable.
2. Remove screws from Wireless Ignition Node (WIN). Refer to **Electrical/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Removal** .
3. Remove the coaxial electrical cable connector (1) from WIN (2).

81cc276a

Fig. 9: RSA ROUTING

Courtesy of CHRYSLER LLC

4. Remove center bezel, refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Removal** .

NOTE: During removal of the remote start antenna note the routing location of the coaxial cable.

5. Remove the remote start antenna coaxial cable from mounting clips, if equipped.

81cc276e

Fig. 10: RSA MODULE AT DASH
Courtesy of CHRYSLER LLC

6. Remove glove box. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
7. Remove the screws (1) from remote start antenna module (2) and remove from instrument panel assembly.

INSTALLATION

INSTALLATION

81cc276e

Fig. 11: RSA MODULE AT DASH
 Courtesy of CHRYSLER LLC

NOTE: Make sure the remote start antenna is positioned the same way noted during the removal procedure.

1. Install the remote start antenna module (2), and screws (1) to instrument panel assembly. Tighten screws to 2.5 N.m (22 in. lbs.).
2. Install the glove box. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation**.

81cc276a

Fig. 12: RSA ROUTING
 Courtesy of CHRYSLER LLC

3. Route the remote start coaxial cable (1) in the position noted during the removal procedure.

4. Install the remote start antenna coaxial cable to mounting clips, if equipped.

81cc2301

Fig. 13: RSA ELECTRICAL CONNECTOR
Courtesy of CHRYSLER LLC

5. Connect remote start antenna coaxial cable connector (1) to wireless ignition node (WIN) (2).
6. Install WIN to instrument panel bracket. Refer to **Electrical/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Installation** .

BUTTON, START/STOP

DESCRIPTION

DESCRIPTION

START/STOP BUTTON

157165

Fig. 14: START/STOP Button
Courtesy of CHRYSLER LLC

The START/STOP button is located on the instrument panel, inserted into the Wireless Ignition Node (WIN) next to the steering column. The START/STOP button is the momentary push button used to change the vehicle's ignition states, instead of the conventional key and lock cylinder. The START/STOP button can be removed and the FOB with Integrated Key (FOBIK) can be used in its place, in a similar manner to a conventional key.

OPERATION

OPERATION

START/STOP BUTTON

Each time the START/STOP button is pressed, a signal is transmitted from the Wireless Ignition Node (WIN) over the Controlled Area Network (CAN) data bus to the Passive Entry Module (PEM), where the signal is then wirelessly transmitted to the FOB with Integrated Key (FOBIK). The signal is then sent back through the PEM over the CAN data bus and back to the WIN for authentication and location. After a valid FOBIK is detected inside the vehicle the ignition state can be changed.

The ignition system for the Keyless Go (KG) feature has three states, similar to a conventional ignition system. These ignition states are OFF, ACCESSORY, and ON. Each time the START/STOP button is pressed and released the ignition state changes to the next ignition state as follows, from OFF to ACCESSORY, from ACCESSORY to ON, and from ON back to OFF.

To start the engine, the transmission must be in park or neutral. From any ignition state, press the brake pedal and press and release the START/STOP button and the engine attempts to start. The starter will continue to crank until the engine starts. If the engine fails to start, the starter will disengage automatically in 10 seconds. If you wish to stop the cranking of the engine before the engine starts, press and release the START/STOP button again.

To shut off the engine while the transmission is in PARK press and release the START/STOP button and the engine shuts off. To shut off the engine while the transmission is out of PARK you must press and hold the START STOP button. The ignition state will change to the ACCESSORY state if the transmission is not in PARK and to the OFF state if the transmission is in PARK motion.

For information regarding an inoperative START/STOP button. See **Electrical/Starting/BUTTON, Start/Stop - Diagnosis and Testing**

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

If the START/STOP button is inoperative, it may be caused by an invalid FOB with Integrated Key (FOBIK), or a FOBIK with a dead battery. To determine the cause of the problem. See **Electrical/Starting/BUTTON, Start/Stop - Standard Procedure**

REMOVAL

REMOVAL

NOTE: The START/STOP button should only be removed or installed with the ignition off.

Fig. 15: Identifying Instrument Panel, Button & Chrome Bezel Ring
Courtesy of CHRYSLER LLC

1. Insert a small screwdriver or trim tool under the chrome bezel ring (3) at the bottom of the button (2), and gently pry the button (2) loose.
2. Remove the button (2) from the receptacle on the instrument panel (1).

INSTALLATION

INSTALLATION

NOTE: The START/STOP button should only be removed or installed with the ignition off.

Fig. 16: Identifying Instrument Panel, Button & Chrome Bezel Ring
 Courtesy of CHRYSLER LLC

1. Position the START/STOP button (2) with the lettering in the horizontal position.
2. Insert the button into the receptacle on the instrument panel (1) and gently press on the chrome bezel ring (3) to seat the button in the receptacle.

STANDARD PROCEDURE

STANDARD PROCEDURE

If the START/STOP button is inoperative remove the Engine START/STOP Button. See **Electrical/Starting/BUTTON, Start/Stop - Removal** and insert the FOB with Integrated Key (FOBIK) in the receptacle. If the FOBIK is not valid the message center displays WRONG KEY. If no message is displayed, it should still be possible to operate the vehicle by turning the FOBIK to the desired ignition position. The FOBIK battery needs to be replaced for the Keyless GO (KG) to operate. For further information regarding KG functionality, refer to the appropriate diagnostic service information.

KEYLESS GO

DESCRIPTION

DESCRIPTION

KEYLESS GO SYSTEM

The Keyless Go (KG) system changes the state of the vehicle's ignition between the OFF, ACCESSORY, RUN, and START states using a momentary button rather than a conventional key.

The KG system includes the following major components, which are described in further detail elsewhere in this service information:

- **FOB with Integrated Key (FOBIK)** - Refer to **Electrical/Vehicle Theft Security/KEY, Transponder - Description**
- **Passive Entry Antenna** - Multiple Low Frequency (LF) antennas are located throughout the passenger compartment. Refer to **Electrical/Power Locks/ANTENNA, Passive Entry - Description**
- **Passive Entry Module (PEM)** - The module is located in the passenger compartment. Refer to **Electrical/Power Locks - Description**
- **START/STOP button** - Located on the instrument panel, inserted into the Wireless Ignition Node (WIN). See **Electrical/Starting/BUTTON, Start/Stop - Description**
- **Wireless Ignition Node (WIN)** - Located to the right of the steering column and is partially concealed beneath the instrument panel. Refer to **Electrical/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Description**

OPERATION

OPERATION

The Keyless GO (KG) system replaces the conventional key and ignition switch with a momentary START/STOP button and a FOB with Integrated Key (FOBIK). When the operator presses the START/STOP button, the FOBIK is checked for authenticity through the Passive Entry Module (PEM). If recognized, the KG system, allows the ignition state to be changed by the operator between the OFF, ACCESSORY, RUN, and START states. This causes changes in the ignition status signals on the vehicle's Controller Area Network (CAN) data buses and hardwired outputs.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

If the Keyless Go (KG) feature is inoperative, it may be caused by an invalid FOB with Integrated Key (FOBIK), or a FOBIK with a dead battery. Additionally if the Remote Keyless Entry (RKE) is inoperative, the KG will also be inoperative.

The message center displays the following messages when certain conditions are met.

- **Key FOB Battery Low** - Displayed when the battery in the FOBIK is low. At this point the Keyless Go function should still operate, but the battery should be replaced soon.
- **Key FOB Not Detected** - Displayed when a valid FOBIK could not be detected inside the vehicle
- **Push Pedal + Button to Start** - Displayed when one enters the vehicle.
- **Service Keyless System** - Displayed when there is a problem with the KGsystem.
- **Vehicle Not in Park** - Displayed when shutting off the vehicle while the transmission is not in the PARK position.

For further information, refer to the proper diagnostic service information.

NOTE: All Wheel Drive procedure shown in illustration. Rear Wheel Drive Similar.

1. Disconnect and isolate negative battery cable at battery.
2. Remove the left side catalytic converter (4). Refer to **Exhaust System/CONVERTER, Catalytic - Removal** .

Fig. 18: 3.5L STARTER ELECTRICAL CONNECTION
Courtesy of CHRYSLER LLC

3. Remove battery cable nut (5) and battery cable (4) from solenoid stud (2).
4. Disconnect electrical connector (3) from starter solenoid terminal (1).

Fig. 19: 3.5L AWD RWD STARTER R AND I
Courtesy of CHRYSLER LLC

5. Remove starter mounting bolts (3), the electrical harness mounting bracket (4) should remain in position.
6. Rotate and remove starter assembly (1) from transmission.
7. Remove starter motor dust shield (2).

5.7L

REAR WHEEL DRIVE (RWD)

Fig. 20: STARTER-5.7L-RWD
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.
3. Remove three starter mounting bolts (1).
4. Move starter motor (2) towards front of vehicle far enough for nose of starter to clear. Always support starter motor (2) during this process. Do not let starter motor hang from wire harness.
5. Remove battery cable-to-solenoid nut.
6. Remove solenoid wire from solenoid stud.
7. Remove starter motor.

ALL WHEEL DRIVE (AWD)

1. Disconnect and isolate negative battery cable.
2. Raise and support vehicle.

The steering gear assembly must be partially lowered to gain access to starter. Do not disconnect any hydraulic hoses or remove any steering linkage. Proceed.

3. Remove coupling bolt (pinch bolt) securing steering gear to steering column.
4. Remove three steering gear mounting bolts and slightly lower gear. Temporarily support the steering gear.
5. Remove steering gear heat-shield.

8136a302

DIAGNOSIS AND TESTING

B2199-16-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

- **When Monitored:**

Continuously.

Set Conditions

- **Set Condition:**

Any time the Tire Pressure Monitoring (TPM) Module senses voltage input below 8.0 volts for over 20 ms, this code will set.

Possible Causes

Possible CauseS
LOW VOLTAGE ENGINE DTC (A913) FUSED B(+) CIRCUIT HIGH RESISTANCE (Z911) GROUND CIRCUIT HIGH RESISTANCE TIRE PRESSURE MONITORING (TPM) MODULE

Diagnostic Test

1. CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs

NOTE: Make sure the battery is fully charged before proceeding.

1. Ignition on, engine not running.
2. With the scan tool, read ENGINE DTCs

Are there any batter or charging systems DTCs?

Yes

- Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 2

2. TEST FOR INTERMITTENT CONDITION

1. With the scan tool, record and erase DTCs.

2. Start the engine and run for two minutes.
3. With the scan tool, read DTCs.

Does the scan tool display: B219916-BATTERY VOLTAGE - CIRCUIT VOLTAGE BELOW THRESHOLD?

Yes

- Go to step 3

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

3. (A913) FUSED B(+) CIRCUIT OPEN OR HIGH RESISTANCE

MODULE-
TIRE
PRESSURE

1. Turn the ignition off to the lock position
2. Disconnect the TPM Module harness connector.
3. Ignition on, engine not running.
4. Using a 12-volt test light connected to ground, check (A913) Fused B(+) circuit in the TPM Module harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Go to step 4

No

- Repair the (A913) Fused B(+) circuit for high resistance.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

4. (Z911) GROUND CIRCUIT OPEN OR HIGH RESISTANCE

MODULE-
TIRE
PRESSURE

1. Turn the ignition off to the lock position
2. Using a 12-volt test light connected to 12-volts, check the (Z911) Ground circuit in the TPM Module harness connector.

NOTE: **The test light must illuminate brightly. Compare the brightness to that of a direct connection to the battery.**

Does the test light illuminate brightly?

Yes

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Repair the (Z911) Ground circuit for high resistance.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

B2199-17-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

- **When Monitored:**

Continuously.

Set Conditions

- **Set Condition:**

Any time the Tire Pressure Monitoring (TPM) Module senses voltage input above 16.0 volts for over 20ms, this code will set.

Possible Causes

Possible CauseS
HIGH VOLTAGE ENGINE DTC TIRE PRESSURE MODULE (TPM)

Diagnostic Test

1. CHECK POWERTRAIN CONTROL MODULE (PCM) DTCs

1. With the scan tool, read PCM DTCs.

Are there any ENGINE DTCs present?

Yes

- Refer to **DTC-Based Diagnostics/MODULE, Powertrain Control (PCM) - Diagnosis and Testing** and perform the appropriate diagnostic procedure.

No

- Go to step 2

2. TEST FOR INTERMITTENT CONDITION

1. With the scan tool, record and erase DTCs.
2. Start the engine and run for two minutes.
3. With the scan tool, read DTCs.

Does the scan tool display: B219917-BATTERY VOLTAGE - CIRCUIT VOLTAGE ABOVE THRESHOLD?

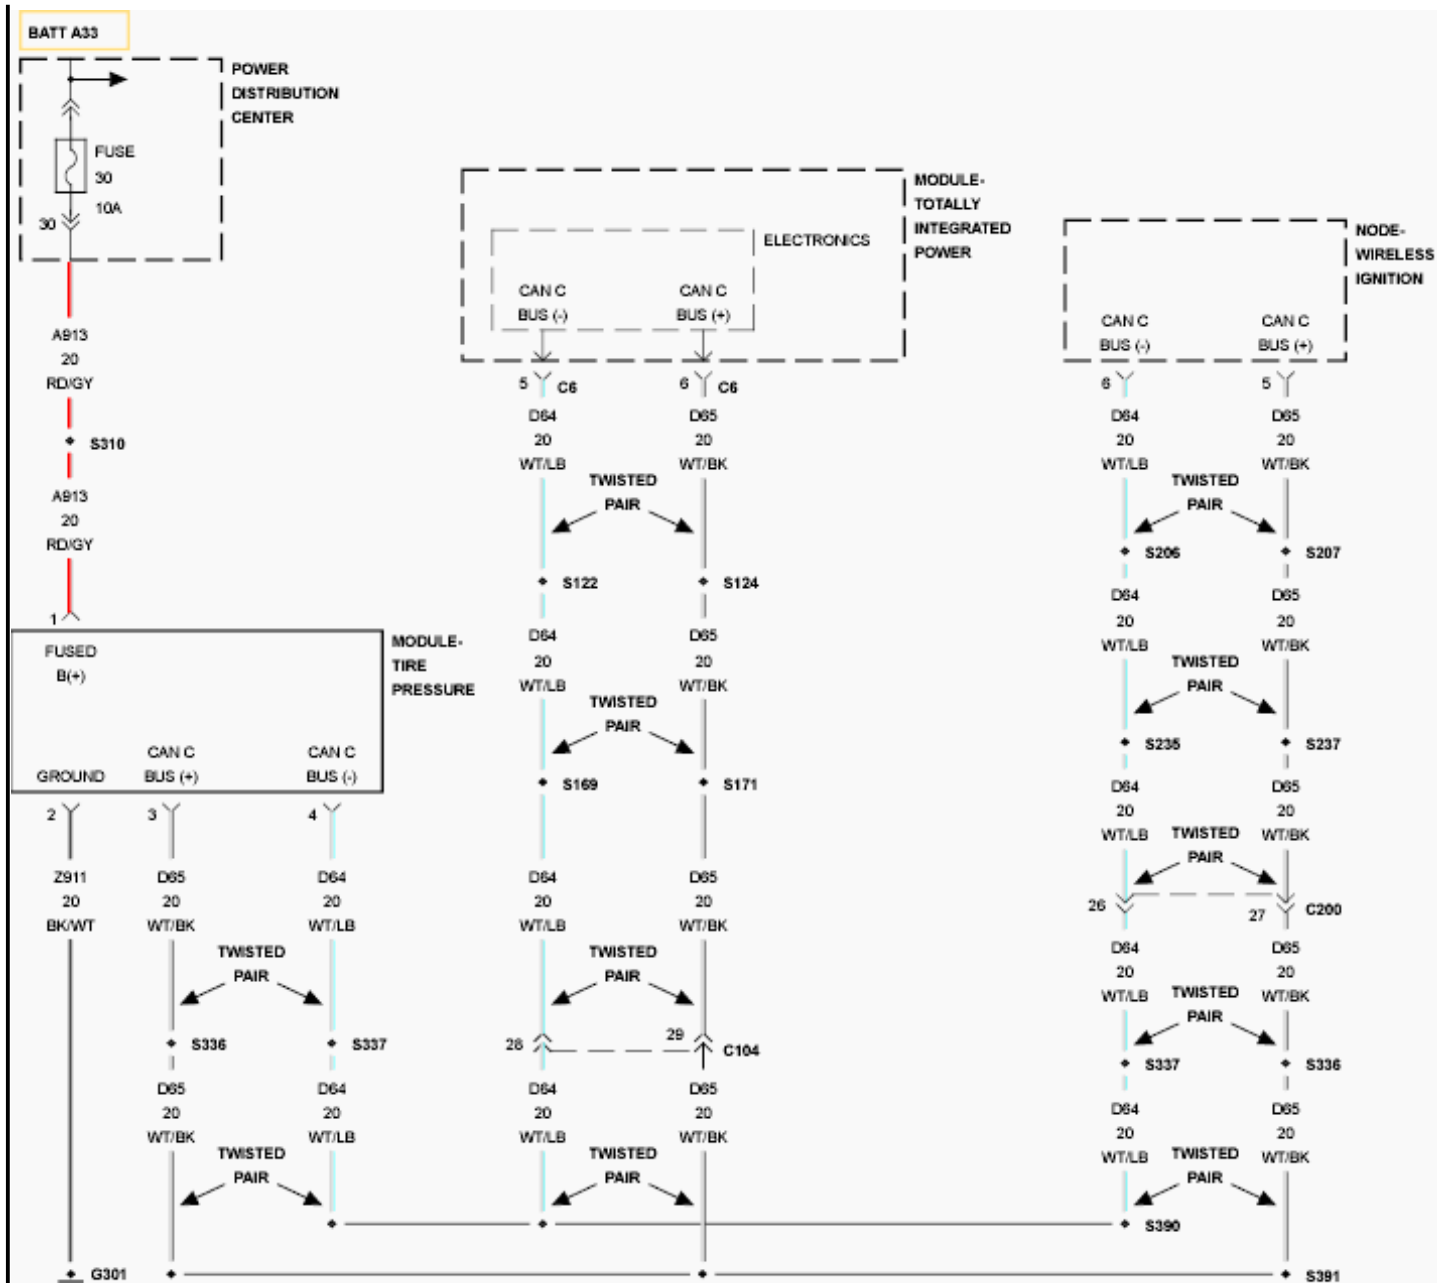

Yes

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with service information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

B21DD-84-SYSTEM VOLTAGE - SIGNAL VOLTAGE BELOW ALLOWABLE RANGE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

- **When Monitored:**

Continuously.

Set Conditions

- **Set Condition:**

Anytime the Tire Pressure Monitoring (TPM) Module senses voltage input below 8.0 volts for over 20 ms, this code will set.

Possible Causes

Possible CauseS

C0077-00-LOW TIRE PRESSURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

- **When Monitored:**

Continuously while driving.

Set Conditions

- **Set Condition:**

A low pressure condition will exist when the tire pressure falls below or is equal to the low pressure threshold value as specified for the vehicle.

Possible Causes

Possible Causes
INCORRECT TIRE PRESSURE INCORRECT PLACARD VALUES TIRE PRESSURE MONITORING (TPM) SENSOR TIRE PRESSURE MONITORING (TPM) MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

Note if any the following conditions are present:

- Low Tire Pressure DTCs.
- TPM Sensor Internal fault.
- Spare tire is not equipped with a TPM Sensor and is currently on the vehicle. Repair the tire and install it back on the vehicle.

NOTE: **Before beginning diagnostic procedure, verify that tire pressures are correct.**

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTCs.
3. With the scan tool, erase TPM Module DTCs.
4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
5. With the scan tool, select View DTCs in the TPM Module.

Is the DTC status Active at this time?

Yes

- Go to step 2

No

- Go to step 7

2. LOW TIRE PRESSURE

NOTE: **Some vehicles will not receive TPM Sensor data when the vehicle is stationary. The vehicle will need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.**

1. Verify that all tire pressures are to the recommended cold inflation tire pressure specifications.
2. With the scan tool, clear DTCs in the TPM Module.
3. With the scan tool, select View DTCs in the TPM Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Go to step 3

No

- Test Complete.

- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

3. TIRE PRESSURE SENSOR

NOTE: Before continuing with any TPM diagnostic test, use the scan tool and read the "Tire Placard Pressure - Front" and "Tire Placard Pressure - Rear" under "Data Display" in the TPM. Confirm that the values match the Tire Inflation Pressure (Placard) label located on the driver's side B-Pillar. If the incorrect Placard Values have been programmed in the TPM, use the scan tool and read the "Tire Placard Pressure - Front" and "Tire Placard Pressure - Rear" under "Data Display" in the Totally Integrated Power Module (TIPM). If the Placard values are incorrect in the TIPM, select the TIPM, then under "Miscellaneous Functions", select "Update Pressure Threshold" and follow the procedure in the scan tool. Enter the placard pressure value as seen on the Tire Inflation Pressure (Placard) label. Repeat step #2.

NOTE: The following tests are used to locate the TPM Sensor that is setting the low pressure fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You **MUST** locate the TPM Sensor that set the fault before continuing.

1. With the scan tool, select View Data Display in the TPM Module and find the compensated tire pressure values located under each of the TPM Sensor Identification locations.

Are any of the compensated tire pressure values below the Placard Value?

Yes

- Go to step 4

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

4. TPM-RKE ANALYZER

Is there a TPM-RKE Analyzer (9936) available?

Yes

- Go to step 5

No

- Go to step 6

5. TIRE PRESSURE SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER

NOTE: The following procedure is used to locate the TPM Sensor that is setting the sensor internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You **MUST** locate the correct TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

NOTE: If the TPM sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM sensors and repeat this step.

NOTE: Always be certain to select proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM sensor. If the incorrect vehicle line and/or model year is selected, the TPM sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer to scan each TPM sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM sensors, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each non-responsive wheel.
2. Replace the TPM sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the Tire Pressure Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.
3. With the scan tool, select Data Display for the TPM.
4. Check to see if the Sensor IDs match what is programmed into the TPM.

Has the Tire Pressure Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) in accordance with the Service Information.

Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- Replace the TPM Module in accordance with the Service Information.

Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

6. TPM SENSOR INTERNAL FAULT SET

NOTE: Some vehicles will not receive TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait Two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the sensor in question has been identified

Has the TPM Sensor been located?

Yes

- Install the TPM Sensor(s) in accordance with the Service Information.

Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Replace the TPM Module in accordance with the Service Information.

Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

7. INTERMITTENT TIRE PRESSURE SENSOR DTC

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the TPM.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTCs in the TPM.

Does the DTC reset or is the status Active for this DTC?

Yes

- Repair as necessary.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

C1501-96-TIRE PRESSURE SENSOR 1 - INTERNAL COMPONENT FAILURE

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The Tire Pressure Monitoring (TPM) Sensor actively monitors the air pressure, air temperature inside the tire, the direction of the tire rotation and the internal battery status. Each sensor has a unique ID code. The TPM Sensor transmits the data at regular intervals via an encoded signal to a receiver circuit located in the Tire Pressure Monitoring (TPM) Module.

Monitor Conditions

- **When Monitored:**

With vehicle speed greater than 24 km/h (15 mph).

Set Conditions

- **Set Condition:**

The TPM Module will monitor the signals from the four active road tire TPM Sensors. A loss of signal error is detected if data is not received or cannot be accurately decoded over 16 consecutive blocks or maximum of 20 minutes when the vehicle speed is above 24 km/h (15 mph). An internal sensor hardware error condition will be set when an error in the shock sensor, pressure sensor, or temperature sensor is detected. The Tire Pressure Monitoring Telltale Lamp will flash on and off for 75 seconds then remain on solid when a system fault is detected.

Possible Causes

Possible Causes
AFTERMARKET TIRES/WHEELS INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC TIRE PRESSURE MONITORING (TPM) SENSOR TIRE PRESSURE MONITORING (TPM) MODULE

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: Before beginning diagnostic procedure, verify that the tire pressures are correct.

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTCs.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, erase TPM Module DTCs.
5. With the scan tool, select View DTCs in the TPM Module.

Is the DTC status Active at this time?

Yes

- Go to step 2

No

- Go to step 8

2. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE

1. Turn the ignition on.
2. With the scan tool, select Data Display for the TPM Module and locate the following:
 - Tire 1 Pressure Sensor HW Fault
 - Tire 1 Pressure Sensor Missing ID
 - Tire 1 Temperature Sensor HW Fault
 - Tire 1 Temperature Sensor SW O/U
 - Tire 1 Acceleration Sensor HW Fault
 - Tire 1 Loss of Signal from Pressure Sensor

Do any of the above faults read "Set"?

Yes

- Go to step 3

No

- Go to step 7

3. TPM-RKE ANALYZER (9936)

Is there a TPM-RKE Analyzer available?

Yes

- Go to step 4

No

- Go to step 7

4. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC

NOTE: This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer Tool verify the correct TPM Sensor is on the vehicle.

Is the correct TPM Sensor installed on the vehicle?

Yes

- Go to step 5

No

- Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

5. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER

NOTE: The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You **MUST** locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer tool to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer tool. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
2. Replace the TPM Sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the TPM Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Perform TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.
3. With the scan tool, select Data Display for the TPM Module.
4. Check to see if the Sensor IDs match what is programmed into the TPM Module.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- Go to step 6

6. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer Tool to verify the TPM Sensor IDs match what is programmed into the TPM Module. The TPM Sensor Identifications are located under "Data Display" for the TPM Module.

Do the TPM Sensor IDs match what is stored in the TPM Module?

Yes

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- Test complete.

- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

7. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

8. INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Tire Pressure Monitoring (TPM) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTCs in the Tire Pressure Monitoring (TPM) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

- **Set Condition:**

The TPM Module will monitor the signals from the four active road tire TPM Sensors. A loss of signal error is detected if data is not received or cannot be accurately decoded over 16 consecutive blocks or maximum of 20 minutes when the vehicle speed is above 24 km/h (15 mph). An internal sensor hardware error condition will be set when an error in the shock sensor, pressure sensor, or temperature sensor is detected. The Tire Pressure Monitoring Telltale Lamp will flash on and off for 75 seconds then remain on solid when a system fault is detected.

Possible Causes

Possible Causes
AFTERMARKET TIRES/WHEELS
INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: Before beginning diagnostic procedure, verify that tire pressures are correct.

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTCs.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) up to 20 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, erase TPM Module DTCs.
5. With the scan tool, select View DTCs in the TPM Module.

Is the DTC status Active at this time?

Yes

- Go to step 2

No

- Go to step 8

2. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE

1. Turn the ignition on.
2. With the scan tool, select Data Display for the TPM Module and locate the following:
 - Tire 4 Pressure Sensor HW Fault
 - Tire 4 Pressure Sensor Missing ID
 - Tire 4 Temperature Sensor HW Fault
 - Tire 4 Temperature Sensor SW O/U
 - Tire 4 Acceleration Sensor HW Fault
 - Tire 4 Loss of Signal from Pressure Sensor

Do any of the above faults read "Set"?

Yes

- Go to step 3

No

- Go to step 7

3. TPM/RKE ANALYZER 9936

Is there a TPM-RKE Analyzer 9936 available?

Yes

- Go to step 4

No

- Go to step 7

4. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL DTC

NOTE: This fault can be set if the incorrect or no TPM Sensor is installed on the vehicle. If the spare tire is currently installed on the vehicle, and it is not equipped with a TPM Sensor, this DTC can be set. Replace the spare with a TPM Sensor equipped wheel and tire assembly. Test drive the vehicle. If the DTC resets, continue with the diagnostic procedure.

1. Perform a visual inspection to verify that all road wheels are equipped with a TPM Sensor.
2. With the TPM-RKE Analyzer 9936 verify the correct TPM Sensor is on the vehicle.

Is the correct TPM Sensor installed on the vehicle?

Yes

- Go to step 5

No

- Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

5. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET USING TPM-RKE ANALYZER

NOTE: The following procedure is used to locate the TPM Sensor that is setting the internal fault. If the tires have been rotated, the TPM Sensor is no longer in sequence from the factory. Faults are linked to the TPM Sensor IDs. You **MUST** locate the TPM Sensor that set the fault before continuing. Use the following method below at every tire location.

NOTE: If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.

NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the TPM Sensor. If the incorrect vehicle line and/or model year is selected, the TPM Sensor will not respond to the tool.

1. Use a TPM-RKE Analyzer to scan each TPM Sensor for a response, and store in the proper location in the TPM-RKE Analyzer. If you receive no response from any of the TPM Sensors, check to make sure that the TPM-RKE Analyzer is set correctly and repeat the process on each non-responsive wheel.
2. Replace the TPM Sensor if the results show a "Damaged Accel", "Damaged Temp", "Damaged Press", "H/W fail", "S/W fail" or the TPM Sensor does not respond after repeated attempts. Install the correct Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information. Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.
3. With the scan tool, select Data Display for the TPM Module.
4. Check to see if the Sensor IDs match what is programmed into the TPM Module.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- Go to step 6

6. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT - MISMATCHED ID

NOTE: **If the TPM Sensor IDs do not match, it may be necessary to move the vehicle to a location away from other TPM Sensors and repeat this step.**

1. Use a TPM-RKE Analyzer to verify the TPM Sensor IDs match what is programmed into the TPM Module. The TPM Sensor Identifications are located under "Data Display" for the TPM Module.

Do the TPM Sensor IDs match what is stored in the TPM Module?

Yes

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- Test complete.

- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

7. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT SET

NOTE: Some vehicles will not receive the TPM Sensor data when the vehicle is stationary. The vehicle may need to be driven at speeds greater than 24 km/h (15 mph) for about a minute in order to receive TPM Sensor data.

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Look for a tire location with a non-responsive TPM Sensor ID.
3. Repeat this test on each wheel on the vehicle until the TPM Sensor in question has been identified.

Has the TPM Sensor been located?

Yes

- Install the Tire Pressure Monitoring (TPM) Sensor in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

8. INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Tire Pressure Monitoring (TPM) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTCs in the Tire Pressure Monitoring (TPM) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Return to the beginning of this test and perform the diagnostic procedure as necessary.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

C151C-00-TIRE PRESSURE SENSORS MISSING

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

When installing a new Tire Pressure Monitoring (TPM) Module, the module is programed with universal IDs for the Tire Pressure Monitoring (TPM) Sensors. The TPM Module must be programmed with the correct TPM Sensor ID's.

Monitor Conditions

- **When Monitored:**

During vehicle TPM Sensor ID locate process.

Set Conditions

- **Set Condition:**

When installing a new Tire Pressure Monitoring (TPM) Module.

Possible Causes

Possible Causes
INCORRECT TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)
TIRE PRESSURE MONITORING (TPM) SENSOR
TIRE PRESSURE MONITORING (TPM) MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: Before beginning diagnostic procedure, verify that tire pressures are correct.

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTCs.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM data and allow for the system to update.

4. With the scan tool, erase TPM Module DTCs.
5. With the scan tool, select View DTCs in the Tire Pressure Module (TPM).

Is the DTC status Active at this time?

Yes

- Go to step 2

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

2. TPM-RKE ANALYZER (9936)

Is there a TPM-RKE Analyzer available?

Yes

- Go to step 3

No

- Go to step 4

3. WITH TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)

NOTE: Always be certain to select the proper vehicle line and model year when using this tool, as the tool will automatically use the correct protocol to attempt to read the Sensor. If the incorrect vehicle line and/or model year is selected, the Sensor will not respond to the tool.

NOTE: If you receive no response from any of the tire pressure sensors, check to make sure that the TPM-RKE Analyzer is set correctly, and repeat the process on each of the non-responsive wheel(s)

1. Use a TPM-RKE Analyzer to scan each TPM Sensor for an ID, store in the proper location in the TPM-RKE Analyzer.
2. Use a TPM-RKE Analyzer to upload the correct IDs and proper locations in the scan tool.
3. With the scan tool, select the TIPM Module under "Miscellaneous Functions", follow the procedure for uploading TPM Sensor IDs.
4. With the scan tool, erase TPM Module DTCs.
5. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM data and allow for the system to update.

6. With the scan tool, check to see if the TPM Module IDs match what is programmed into the TIPM Module.

Do the TPM IDs match?

Yes

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information.

Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

4. WITHOUT TPM-RKE TOOL CHECK TIRE PRESSURE MONITORING (TPM) SENSOR ID(S)

1. Starting with the left front wheel, deflate the tire to 20 PSI, wait two minutes, and check the scan tool for changes to any compensated tire pressure values.
2. Repeat the above step on each wheel of the vehicle.
3. With the scan tool, erase TPM Module DTCs.
4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM data and allow for the system to update.
5. With the scan tool, check to see if the TPM IDs are programmed into the TPM Module.

Are the TPM Sensor IDs in the TPM Module?

Yes

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information.

Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

C151D-00-TIRE PRESSURE SENSOR LOCATION UNDETERMINED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The vehicle Tire Pressure Monitoring (TPM) Sensor locate process occurs after the vehicle is stationary for more than 20 min. The TPM system will determine the sensor positions while driving at speeds above 24 km/h (15 mph). This process can take up to 20 min to determine TPM Sensor positions.

Monitor Conditions

- **When Monitored:**

During vehicle TPM Sensor locate process.

Set Conditions

- **Set Condition:**

Must fail multiple vehicle TPM Sensor locate processes if localization fails due to Left/Right fail or Front/Rear fail or if the TPM Module is new and has never attempted localization. If missing TPM Sensors are present on first drive, C151D will set to show that the TPM Sensor location cannot be determined/guaranteed (cannot revert to last known good locations).

Possible Causes

Possible Causes
TIRE PRESSURE MONITORING (TPM) MODULE

Diagnostic Test

1. VERIFY DTC IS ACTIVE

NOTE: The DTC C151D should not exist on its own. If any other DTCs are present, refer to the appropriate diagnostic procedure in this information first before continuing.

NOTE: If a new TPM Module was installed, the vehicle must remain stationary for 20 minutes before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTCs.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM Sensor data and allow for the system to update.

4. With the scan tool, erase TPM Module DTCs.
5. With the scan tool, select View DTCs in the TPM Module.

Is DTC C151D Active on its own at this time?

Yes

- Install a new TPM Module in accordance with the Service Information.

Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

C1580-00-LEFT/RIGHT SIDE TIRE PRESSURE SENSOR LOCATION UNDETERMINED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The vehicle Tire Pressure Monitoring (TPM) Sensor locate process occurs after the vehicle remains stationary for 20 minutes. The Tire Pressure Monitoring (TPM) Module will determine the TPM Sensor positions. The TPM Sensors themselves determine which side of the vehicle they are located on.

Monitor Conditions

- **When Monitored:**

During vehicle TPM Sensor locate process.

Set Conditions

- **Set Condition:**

Must fail multiple vehicle TPM sensor locate processes if localization fails due to Left/Right fail or if the TPM module is new and has never attempted localization.

Possible Causes

Possible Causes

TIRE PRESSURE MONITORING (TPM) SENSOR TIRE PRESSURE MONITORING (TPM) MODULE
--

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: **The vehicle must remain stationary for 20 minutes before proceeding with this diagnostic procedure.**

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTCs.
3. With the scan tool, erase TPM Module DTCs.
4. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 20 minutes in order to receive TPM Sensor data and allow for the system to update.
5. With the scan tool, select View DTCs in the TPM Module.

Is the DTC status Active at this time?

Yes

- Go to step 2

No

- Go to step 3

2. TIRE PRESSURE MONITORING (TPM) SENSOR INTERNAL FAULT ACTIVE

1. Turn the ignition on.
2. With the scan tool, select Data Display for the TPM Module and locate the following for each TPM Sensor:
 - Tire Pressure Sensor HW Fault
 - Tire Temperature Sensor HW Fault
 - Tire Acceleration Sensor HW Fault

3. INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Tire Pressure Monitoring (TPM) Module.
4. Have the vehicle remain stationary for 20 minutes.
5. With the scan tool, select View DTCs in the Tire Pressure Monitoring (TPM) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure**.

C1581-00-FRONT/REAR TIRE PRESSURE SENSOR LOCATION UNDETERMINED

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Theory Of Operation

The vehicle Tire Pressure Monitoring (TPM) Sensor locate process occurs after the vehicle remains stationary for 20 minutes. The Tire Pressure Monitoring (TPM) Module will determine the Tire Pressure Monitoring (TPM) Sensor positions. The TPM Module measures the signal strength of each TPM sensor and determines if the are in the front or rear.

Monitor Conditions

- **When Monitored:**

During vehicle TPM Sensor locate process.

Set Conditions

- **Set Condition:**

Must fail multiple vehicle TPM sensor locate processes if localization fails due to Front/Rear fail or if the TPM module is new and has never attempted localization.

Possible Causes

Possible Causes
TIRE PRESSURE MONITORING (TPM) MODULE HARNESS
INCORRECT TIRE PRESSURE MONITORING (TPM) MODULE INSTALLATION
TIRE PRESSURE MONITORING (TPM) MODULE

Diagnostic Test

1. DTC STATUS IS ACTIVE

NOTE: The vehicle must remain stationary for 20 minutes before proceeding with this diagnostic procedure.

1. Turn the ignition on.
2. With the scan tool, read and record TPM Module DTCs.
3. Test drive the vehicle at a speed greater than 24 km/h (15 mph) for 10 minutes in order to receive TPM Sensor data and allow for the system to update.
4. With the scan tool, erase TPM Module DTCs.
5. With the scan tool, select View DTCs in the TPM Module.

Is the DTC status Active at this time?

Yes

- Go To 2

No

- Go To 3

2. TIRE PRESSURE MONITORING (TPM) MODULE INTERFERENCE

NOTE: Interference may occur if the TPM Module is installed incorrectly or the TPM harness is not fastened properly to the body.

1. Turn the ignition off.

Verify the following:

- Aftermarket devices are installed or in the vehicle.
- The TPM Module harness is damaged or is routed incorrectly.
- The TPM Module is installed incorrectly.

3. INTERMITTENT TIRE PRESSURE MONITORING (TPM) SENSOR DTC

1. The conditions necessary to set this DTC are not present at this time.
2. Perform any Technical Service Bulletins that may apply to this condition.
3. With the scan tool, clear DTCs in the Tire Pressure Monitoring (TPM) Module.
4. Test drive the vehicle for a minimum of 20 minutes with vehicle speed greater than 24 km/h (15 mph).
5. With the scan tool, select View DTCs in the Tire Pressure Monitoring (TPM) Module.

Does the DTC reset or is the status Active for this DTC?

Yes

- Install a new Tire Pressure Monitoring (TPM) Module in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- Test complete.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

C2209-00-TIRE PRESSURE MONITOR INTERNAL

Monitor Conditions

- **When Monitored:**

Ignition on. The Tire Pressure Monitoring (TPM) Module monitors its internal microprocessors for correct operation.

Set Conditions

- **Set Condition:**

If the Tire Pressure Module detects an internal fault, the DTC is set.

Possible Causes

Possible Causes
TIRE PRESSURE MONITORING (TPM) MODULE - INTERNAL FAULT

Diagnostic Test

1. TPM INTERNAL FAILURE DTC PRESENT

1. Turn the ignition on.
2. With the scan tool, read DTCs.
3. With the scan tool, erase DTCs.
4. Turn the ignition off.
5. Turn the ignition on.
6. With the scan tool, read DTCs.

Does the scan tool display TIRE PRESSURE MODULE INTERNAL FAILURE?

Yes

- Replace the Tire Pressure Monitoring (TPM) Module in accordance with the Service Information.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

No

- The conditions that caused this code to set are not present at this time. Using the wiring diagram/schematic as a guide, inspect the wiring and connectors.
- Perform the TPM VERIFICATION TEST. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Standard Procedure.**

U0001-00-CAN C BUS

Additional Wiring

For complete wiring diagrams refer to **SYSTEM WIRING DIAGRAMS** .

Monitor Conditions

- **When Monitored:**

With the ignition on, battery voltage between 9 and 16 volts, and engine run time greater than Three seconds.

Set Conditions

- **Set Condition:**

The Tire Pressure Monitoring (TPM) Module does not receive any Can C bus messages for a specific amount of time. One trip fault.

Possible Causes

Is this DTC active?

Yes

- Refer to DTC-Based Diagnostics/MODULE, Totally Integrated Power (TIPM) - Diagnosis and Testing and perform the U0168-Lost Communication with Vehicle Security Control Module (WIN) diagnostic procedure.

No

- Refer to Non-DTC Diagnostics/Communication - Diagnosis and Testing and perform the Stored Lost Communication DTCs diagnostic procedure.

STANDARD PROCEDURE

TPM VERIFICATION

Additional Wiring

For complete wiring diagrams refer to SYSTEM WIRING DIAGRAMS .

Diagnostic Test

1. TIRE PRESSURE MONITORING (TPM) MODULE

Was the TPM Module replaced during the test procedure?

Yes

- Go to step 2

No

- Go to step 3

2. PLACARD PRESSURE VALUES

1. Reconnect the previously removed and/or disconnected components and connectors.

2. With the scan tool, select "Miscellaneous Functions" in the Totally Integrated Power Module (TIPM). Then select the desired procedure and follow the display on the scan tool.
3. Program the Placard Pressure Values into the Totally Integrated Power Module (TIPM).
4. Go To "Tire Pressure Module (TPM)", select "Data Display", read "Tire Placard Pressure - Front" and "Tire Placard Pressure - Rear" and confirm the values match the Tire Inflation Pressure (Placard) label. Also, go into the Totally Integrated Power Module (TIPM), select Data Display and read "Tire Placard Pressure - Front" and "Tire Placard Pressure - Rear" to confirm the values were programmed correctly. If the Placard values are incorrect in the TIPM or TPM Module, select the Totally Integrated Power Module (TIPM) then under "Miscellaneous Functions", select "Update Pressure Threshold" and enter the placard pressure value as seen on the Tire Inflation Pressure (Placard) label.
5. With the scan tool, erase all DTCs. Perform five ignition key cycles, leaving the key on for at least 90 seconds per cycle.
6. With the scan tool, read TPM Module DTCs.

Are there any DTCs present?

Yes

- Repair not complete, perform the appropriate diagnostic procedure.

No

- Go to step 3

3. TPM SENSOR REPLACEMENT

NOTE: If a TPM-RKE Tool is not available, let the vehicle sit stationary for more than 20 minutes, and then proceed to step #4 below.

1. Using an updated TPM-RKE Analyzer Tool, select TPM Functions, then enter the Model Year and the Body Style of the vehicle, and for the Trigger Selection select PARK SENSOR.
2. Scan each TPM Sensor at each road wheel, and store each TPM Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, RIGHT REAR, and SPARE TIRE (if equipped)).
3. Connect the TPM-RKE Analyzer Tool to the scan tool, and then follow the programming steps outlined in the diagnostic scan tool for "Program Tire Pressure Sensor ID w/ TPM Tool" under "MISC" for the TPM.
4. Drive the vehicle for a minimum of 20 minutes while maintaining a continuous speed above 24 km/h (15 mph).
5. With the scan tool, read TPM DTCs.

Are there any TPM DTCs present?

Yes

- Perform the appropriate diagnostic procedure. See **DTC-Based Diagnostics/MODULE, Tire Pressure (TPM) - Diagnosis and Testing**.

No

- Repair complete.

GENERAL INFORMATION

Vehicle Quick Reference - Challenger

Body

Component	Fluid, Lubricant, and Genuine Part
Hinges: Door AND Hood	Mopar® Engine Oil
Latches: Door, Hood/Safety Catch	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Seat Regulator AND Track	Mopar® Multi-Purpose Lube NLGI Grade 2 EP, GC-LB
Lock Cylinders	Mopar® Lock Cylinder Lube

FLUID TYPES

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

Only lubricants bearing designations defined by the following organization should be used to service a Chrysler vehicle:

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- European Automobile Manufacturers Association (ACEA)

API QUALITY CLASSIFICATION

9400-9

Fig. 1: API Symbol
Courtesy of CHRYSLER LLC

This symbol on the front of an oil container means that the oil has been certified by the American Petroleum Institute (API) to meet all the lubrication requirements specified by Chrysler.

GEAR LUBRICANTS

SAE ratings also apply to multigrade gear lubricants. In addition, API classification defines the lubricant's usage, such as API GL-5 and SAE 75W-90.

AUTOMATIC TRANSMISSION FLUID

NOTE: Refer to Service Procedures in this group for fluid level checking procedures.

Mopar® ATF +4, Automatic Transmission Fluid is the recommended fluid for Chrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

Mopar® ATF +4, Automatic Transmission Fluid when new is red in color. The ATF is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, the ATF will begin to look darker in color and may eventually become brown. **This is normal.** ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

FLUID ADDITIVES

Chrysler strongly recommends against the addition of any fluids to the transmission, other than those automatic transmission fluids listed above. Exceptions to this policy are the use of special dyes to aid

in detecting fluid leaks.

Various "special" additives and supplements exist that claim to improve shift feel and/or quality. These additives and others also claim to improve converter clutch operation and inhibit overheating, oxidation, varnish, and sludge. These claims have not been supported to the satisfaction of Chrysler and these additives **must not be used**. The use of transmission "sealers" should also be avoided, since they may adversely affect the integrity of transmission seals.

TRANSFER CASE

Recommended lubricant for the MS140 transfer case is Mopar® Transfer Case Lubricant - LX.

ENGINE OIL

WARNING: New or used engine oil can be irritating to the skin. Avoid prolonged or repeated skin contact with engine oil. Contaminants in used engine oil, caused by internal combustion, can be hazardous to your health. Thoroughly wash exposed skin with soap and water. Do not wash skin with gasoline, diesel fuel, thinner, or solvents, health problems can result. Do not pollute, dispose of used engine oil properly. Contact your dealer or government agency for location of collection center in your area.

When service is required, Chrysler recommends that only Mopar® brand parts, lubricants and chemicals be used. Mopar® provides the best engineered products for servicing Chrysler vehicles.

Only lubricants bearing designations defined by the following organization should be used.

- Society of Automotive Engineers (SAE)
- American Petroleum Institute (API)
- National Lubricating Grease Institute (NLGI)
- Association des Constructeurs Europeens d' Automobiles (European Automobile Manufacturers Association) (ACEA)

API SERVICE GRADE CERTIFIED

9400-9

Fig. 2: API Symbol
Courtesy of CHRYSLER LLC

Use an engine oil that is API Certified. Mopar® provides engine oils, meeting Material Standard MS-6395, that meet or exceed this requirement.

SAE VISCOSITY

Vehicles with 5.7L engines equipped with Multiple Displacement System (MDS) must use SAE 5W-20 oil. Failure to do so may result in improper operation of the Multiple Displacement System (MDS). Refer to Multi Displacement System under Starting and Operating for details. Refer to the engine oil filler cap for the recommended engine oil viscosity for each vehicle. An SAE viscosity grade is used to specify the viscosity of engine oil. Use only engine oils with multiple viscosities such as 5W-20 or 5W-30. These are specified with a dual SAE viscosity grade which indicates the cold-to-hot temperature viscosity range.

NOTE: For 6.1L only Use API rated SL/CF full synthetic engine oil, such as Mobil 1® is recommended. Use the correct SAE grade meeting Chrysler Material Standard MS-10725.

ACEA Categories

For countries that use the ACEA European Oil Categories for Service Fill Oils, use engine oils that meet the requirements of ACEA A1/B1, A2/B2, or A3/B3.

ENERGY CONSERVING OIL

An Energy Conserving type oil is recommended for gasoline engines. The designation of ENERGY CONSERVING is located on the label of an engine oil container.

CONTAINER IDENTIFICATION

9400-9

Fig. 3: API Symbol
Courtesy of CHRYSLER LLC

Standard engine oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the front label of engine oil plastic bottles and the top of engine oil cans.

This symbol means that the oil has been certified by the American Petroleum Institute (API). Chrysler only recommend API Certified engine oils that meet the requirements of Material Standard MS-6395. Use Mopar® or an equivalent oil meeting the specification MS-6395.

SYNTHETIC ENGINE OILS

9400-9

Fig. 4: API Symbol

Courtesy of CHRYSLER LLC

There are a number of engine oils being promoted as either synthetic or semi-synthetic. If you chose to use such a product, use **only** those oils that meet the American Petroleum Institute (API) and SAE viscosity standard. Follow the service schedule that describes your driving type.

ENGINE OIL ADDITIVES/SUPPLEMENTS

The manufacturer **does not recommend** the addition of any engine oil additives/supplements to the specified engine oil. Engine oil additives/supplements should not be used to enhance engine oil performance. Engine oil additives/supplements should not be used to extend engine oil change intervals. No additive is known to be safe for engine durability and can degrade emission components. Additives can contain undesirable materials that harm the long term durability of engines by:

- Doubling the level of Phosphorus in the engine oil. The ILSAC (International Lubricant Standard Approval Committee) GF-2 and GF-3 standards require that engine oil contain no more than 0.10% Phosphorus to protect the vehicles emissions performance. Addition of engine oil additives/supplements can poison, from the added sulfur and phosphorus, catalysts and hinder efforts to guarantee emissions performance to 80,000 miles.
- Altering the viscosity characteristics of the engine oil so that it no longer meets the requirements of the specified viscosity grade.
- Creating potential for an undesirable additive compatibility interaction in the engine crankcase. Generally it is not desirable to mix additive packages from different suppliers in the crankcase; there have been reports of low temperature engine failures caused by additive package incompatibility with such mixtures.

ENGINE COOLANT

WARNING: Antifreeze is an ethylene-glycol base coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene-glycol. Keep out of reach of children. Dispose of glycol base coolant properly, contact your dealer or government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene-Glycol based coolants is not recommended, as they provide less freeze protection and less corrosion protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to

the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene-glycol base coolant with organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% ethylene-glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Mixing of coolants other than specified (non-HOAT or other HOAT) may result in engine damage that may not be covered under the new vehicle warranty, and decreased corrosion protection.

COOLANT PERFORMANCE

The required ethylene-glycol and water mixture depends upon climate and vehicle operating conditions. The coolant performance of various mixtures follows:

Pure Water- Water can absorb more heat than a mixture of water and ethylene-glycol. This is for purpose of heat transfer only. Water also freezes at a higher temperature and allows corrosion.

100 percent Ethylene-Glycol - The corrosion inhibiting additives in ethylene-glycol need the presence of water to dissolve. Without water, additives form deposits in system. These act as insulation causing temperature to rise to as high as 149°C (300°F). This temperature is hot enough to melt plastic. The increased temperature can result in severe engine damage. In addition, 100 percent ethylene-glycol freezes at -22°C (-8°F).

50/50 Ethylene-Glycol and Water - Is the recommended mixture, it provides protection against freezing to -37°C (-34°F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. If percentage is lower, engine parts may be eroded by cavitation. Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7°C (-90°F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because specific heat of antifreeze is lower than that of water.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from a container which has been left open. An open container of brake fluid will absorb moisture from the air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

POWER STEERING FLUID

The recommended fluid for the power steering system is Mopar® Power Steering fluid + 4 or Mopar® ATF+4 Automatic Transmission Fluid. Both Fluids have the same material standard specifications (MS-9602).

Mopar® ATF+4 (and Mopar® Power Steering fluid + 4), when new, is red in color. ATF+4 is dyed red so it can be identified from other fluids used in the vehicle such as engine oil or antifreeze. The red color is not permanent and is not an indicator of fluid condition. As the vehicle is driven, ATF+4 will begin to look darker in color and may eventually become brown. **THIS IS NORMAL** . ATF+4 also has a unique odor that may change with age. Consequently, odor and color cannot be used to indicate the fluid condition or the need for a fluid change.

The power steering system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the fluid level may be checked periodically. Check the fluid level anytime there is a system noise or fluid leak suspected. Refer to **Steering/Pump/FLUID - Standard Procedure**

A/C REFRIGERANT

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a nontoxic, nonflammable, clear and colorless liquefied gas.

CAUTION: R-134a refrigerant is not compatible with R-12 refrigerant in an A/C system. Even a small amount of R-12 refrigerant added to an R-134a refrigerant system will cause A/C compressor failure.

The A/C refrigerant system is filled-for-life at the factory and requires no regular maintenance. Although not required at specific intervals, the charge level should be checked if system performance deteriorates or if a noise or leak is suspected. Refer to **Heating and Air Conditioning - Diagnosis and Testing** .

DESCRIPTION

The fluid check/fill points and lubrication locations are located in each applicable Sections.

OPERATION

AUTOMATIC TRANSMISSION FLUID

The automatic transmission fluid is selected based upon several qualities. The fluid must provide a high level of protection for the internal components by providing a lubricating film between adjacent metal components. The fluid must also be thermally stable so that it can maintain a consistent viscosity through a large temperature range. If the viscosity stays constant through the temperature range of operation, transmission operation and shift feel will remain consistent. Transmission fluid must also be a good conductor of heat. The fluid must absorb heat from the internal transmission components and transfer that heat to the transmission case.

SPECIFICATIONS

FLUIDS, LUBRICANTS AND GENUINE PARTS

ENGINE

Description	Type	Part Number	Capacities	
			U.S.	Metric
Cooling System				
<-- Engine Coolant (3.5L Engine)	MOPAR® Antifreeze/Coolant 5 Year/100,000 Mile Formula HOAT (Hybrid Organic Additive Technology)	1 Gallon - 05066386AA	11.1 Quarts	10.5 Liters

Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.

FUSE LOCATIONS AND TYPES**SPECIFICATIONS****FUSES/INTEGRATED POWER MODULE (IPM)****Integrated Power Module (IPM)**

The Integrated Power Module (IPM) is located in the engine compartment. This module contains fuses and relays.

CAUTION:

- When installing the integrated power module cover, it is important to ensure the cover is properly positioned and fully latched. Failure to do so may allow water to get into the integrated power module and possibly result in an electrical system failure.
- When replacing a blown fuse, it is important to use only a fuse having the correct amperage rating. The use of a fuse with a rating

other than indicated may result in a dangerous electrical system overload. If a properly rated fuse continues to blow, it indicates a problem in the circuit that must be corrected.

* Cavities 11, 12, and 13 contain self-resetting fuses (circuit breakers) that are only serviceable by an authorized dealer. The Cluster (without power memory seat), the Driver Seat Switch (with power memory seat), and the Memory Module (if equipped) are fused by the 25 amp circuit breaker in Cavity 11. The Passenger Seat Switch is fused by the 25 amp circuit breaker in Cavity 12. The Door Modules (except base), the Driver Door Lock Switch (base), the Driver Express Power Window Switch (if equipped), and the Passenger Door Lock Switch (base) are fused by the 25 amp circuit breaker in Cavity 13. If you experience temporary or permanent loss of these systems, see your authorized dealer for service.

HOISTING

STANDARD PROCEDURE

HOISTING

Fig. 8: Challenger Lifting Points
Courtesy of CHRYSLER LLC

- 1 - DRIVE ON HOIST
- 2 - FLOOR JACK, VEHICLE EMERGENCY JACK
- 3 - FRAME CONTACT LIFT (SINGLE POST)
- 3 - CHASSIS LIFT (DUAL LIFT)
- 3 - OUTBOARD LIFT (DUAL LIFT)
- 3 - FLOOR JACK

Refer to Owner's Manual provided with vehicle for proper emergency jacking procedures.

WARNING: The hoisting and jack lifting points provided are for a complete vehicle. When the engine or rear suspension is removed from a vehicle, the center of gravity is altered making some hoisting conditions unstable. Properly support or secure vehicle to hoisting device when these conditions exist. Failure to follow these instructions may result in serious or fatal injury.

CAUTION: Do not position hoisting device on any suspension component, including the front or rear suspension crossmembers. Do not hoist on the front and rear bumpers, the lower radiator crossmember, or the front engine mount.

Do not attempt to raise one entire side of the vehicle by placing a floor jack midway between the front and rear wheels. This practice may result in permanent damage to the body.

When properly positioned, a floor jack can be used to lift the vehicle and support the raised vehicle with jack stands.

A floor jack or any lifting device must never be used on any part of the underbody other than the described areas.

JUMP STARTING

STANDARD PROCEDURE

JUMP STARTING

WARNING: Review all safety precautions and warnings in the battery system section of the service manual. Refer to Electrical/Battery System/BATTERY - Standard Procedure

- Take care to avoid the radiator cooling fan whenever the hood is raised. It can start anytime the ignition switch is ON. You can be hurt by the fan.
- Do not attempt to push or tow your vehicle to get it started. Vehicles equipped with an automatic transmission cannot be started this way. Unburned fuel could enter the catalytic converter and once the engine has started, ignite and damage the converter and vehicle. If the vehicle has a discharged battery, booster cables may be used to obtain a start from another vehicle. This type of start can be dangerous if done improperly, so follow this procedure carefully.
- Battery fluid is a corrosive acid solution; do not allow battery fluid to contact eyes, skin, or clothing. Don't lean over battery when attaching clamps or allow the clamps to touch each other. If acid splashes in eyes or on skin, flush contaminated area immediately with large quantities of water.
- A battery generates hydrogen gas, which is flammable and explosive. Keep flame or spark away from the vent holes.
- Do not use a booster battery or any other booster source with an output that exceeds 12 Volts.
- The battery in this vehicle has a vent hose that should not be disconnected and should only be replaced with a battery of the same type (vented).

Failure to follow these instructions may result in serious or fatal injury.

CAUTION: When using another vehicle as a booster, do not allow vehicles to touch. Electrical systems can be damaged on either vehicle.

NOTE: The battery is stored under an access cover in the trunk. Remote battery

terminals are located in the engine compartment for jump starting.

TO JUMP START A DISABLED VEHICLE:

Fig. 9: Remote Jump-Start Battery(+) Attachment Point
Courtesy of CHRYSLER LLC

1. Wear eye protection and remove any metal jewelry, such as watchbands or bracelets, that might make an inadvertent electrical contact.
2. When boost is provided by a battery in another vehicle, park that vehicle within booster cable reach, but do not allow the vehicles to touch one another.
3. Set the parking brake, place the automatic transmission in PARK, and turn the ignition switch to the LOCK position on both vehicles.
4. Turn off the heater, radio, and all unnecessary electrical loads.
5. Connect one end of the jumper cable to the remote jump-start positive battery post (+) in the engine compartment. Connect the other end of the same cable to the positive terminal of the booster battery. Refer to the following illustration for jump-starting connections.
6. Connect the other cable, first to the negative terminal of the booster battery and then to the engine ground (-) of the vehicle with the discharged battery. Make sure you have a good contact on the engine ground. Refer to the following illustration for jump-starting connections.
7. Start the engine in the vehicle that has the booster battery. Let the engine idle a few minutes. Then, start the engine in the vehicle with the discharged battery.

NOTE: **Refer to Electrical/Battery System - Standard Procedure if the ESP/BAS light (in the instrument cluster) remains on continuously after starting the engine of the vehicle with the discharged battery.**

8. When removing the jumper cables, reverse the above sequence exactly. Be careful of the moving belts and fan.

WARNING:

- You should not try to start your vehicle by pushing or towing.
- Do not connect the cable to the negative post of the discharged battery. The resulting electrical spark could cause the battery to explode.
- During cold weather when temperatures are below the freezing point, electrolyte in a discharged battery may freeze. Do not attempt jump-starting because the battery could rupture or explode. The battery temperature must be brought above the freezing point before attempting jump-start.
- Failure to follow these instructions may result in serious or fatal injury.

MAINTENANCE SCHEDULES

INSPECTION

5 YEAR INSPECTION - LIFETIME POWERTRAIN WARRANTY

The following steps outline the dealer inspection procedure required every 5 years for vehicles covered under the terms of the Lifetime Powertrain Warranty. Refer to the appropriate warranty information for additional terms and coverages applicable to the Lifetime Powertrain Warranty.

1. Lift the vehicle on a suitable hoist.
2. Check all Powertrain components for leaks or physical damage. Note any concerns.
3. Lower the vehicle and check the level and condition of the engine oil.
4. Connect a diagnostic scan tool and check for any Diagnostic Trouble Codes (DTC).

DESCRIPTION

MAINTENANCE SCHEDULES - SRT8 - EXPORT - MIDDLE EAST

Oil Change Indicator System

The oil change indicator system will remind you that it is time to take your vehicle in for scheduled maintenance.

On Electronic Vehicle Information Center (EVIC) equipped vehicles "Oil Change Required" will be displayed in the EVIC and a single chime will sound, indicating that an oil change is necessary.

The oil change indicator message will illuminate approximately 7,000 miles (11 200 km) after the most recent oil change was performed. Have your vehicle serviced as soon as possible, within 500 miles (800 km). However, an earlier oil change at 3,000 miles (5 000 km) may be required if the vehicle is operated under "Severe Duty Conditions" later in this section.

NOTE:

- The oil change indicator message will not monitor the time since the last

oil change. Change your vehicles oil if it has been 6 months since your last oil change even if the oil change indicator message is NOT illuminated.

- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 7,500 miles (12 000 km) or 6 months, whichever comes first.**

Oil Change Indicator- Reset

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate depending upon your personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

At Each Stop for Fuel

- Check the engine oil level. Refer to "Engine Oil" under "Maintenance Procedures" in Section 7.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering, and transmission, and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

Required Maintenance Intervals

WARNING: You can be badly injured working on or around a motor vehicle. Perform only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

135000	216000	108	<ul style="list-style-type: none"> • Change the engine oil and engine oil filter.** • Rotate tires. • If you are using your vehicle in dusty or off-road conditions, inspect the engine air cleaner filter, and replace if necessary. • Replace the air conditioning filter. • Inspect the brake linings, and replace if necessary. • Inspect the CV joints. • Inspect the exhaust system. • Change the rear axle fluid if using your vehicle for any of the following: police, taxi, fleet, or frequent trailer towing.

			<ul style="list-style-type: none"> • Inspect the front suspension, tie rod ends and boot seals, and replace if necessary. • Change the manual transmission fluid (if equipped) if using your vehicle for any of the following: Most of your driving is at sustained high speeds during hot weather, above 90°F (32°C), driving in dusty conditions, or stop and go driving.
142500	228000	114	<ul style="list-style-type: none"> • Change the engine oil and engine oil filter.** • Rotate tires.
150000	240000	120	<ul style="list-style-type: none"> • Change the engine oil and engine oil filter.** • Rotate tires. • Replace the engine air cleaner filter. • Adjust parking brake on vehicles equipped with four-wheel disc brakes. • Replace the air conditioning filter. • Inspect the rear axle fluid. • Inspect the brake linings, and replace if necessary. • Inspect the manual transmission fluid (if equipped), add as necessary.

** Change the engine oil and engine oil filter at every 3,000 miles (5 000 km) or 3 months if using your vehicle under any of the following severe duty conditions:

- Stop and go driving.
- Driving in dusty conditions.
- Short trips of less than 10 miles (16 km).
- Trailer towing.
- Taxi, police, or delivery service (commercial service).
- Off-road or desert operation.

**** This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

MAINTENANCE SCHEDULES - DOMESTIC

Oil Change Indicator System

The oil change indicator system reminds you that it is time to take your vehicle in for scheduled maintenance.

On the Electronic Vehicle Information Center (EVIC) equipped vehicles "Oil Change Required" is displayed in the EVIC and a single chime sounds indicating that an oil change is necessary.

On non-EVIC equipped vehicles "Change Oil" flashes in the instrument cluster odometer and a single chime sounds indicating that an oil change is necessary.

Based on engine operating conditions the oil change indicator message illuminates. This means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 805 km (500 miles).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change the vehicle oil if it has been six months since your last oil change even if the oil change indicator message is not illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 10,000 km (6,000 miles) or six months, whichever comes first.**

Oil Change Indicator- Reset

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate depending upon your personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

At Each Stop for Fuel

- Check the engine oil level. Refer to "engine Oil" under "Maintenance Procedures" in Section 7.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering, and transmission, and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

WARNING: You can be badly injured working on or around a motor vehicle. Perform only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic. Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

			boot seals; replace if necessary. <ul style="list-style-type: none"> • Change the manual transmission fluid (if equipped) if using your vehicle for any of the following: Most of your driving is at sustained high speeds during hot weather, above 32°C (90°F), driving in dusty conditions, or stop and go driving.
150000	250000	150	<ul style="list-style-type: none"> • Change the engine oil and engine oil filter. • Rotate the tires. • Replace the engine air cleaner filter. • Replace the spark plugs (5.7L engine). • Adjust parking brake on vehicles equipped with four-wheel disc brakes.

MAINTENANCE SCHEDULES - SRT8

Oil Change Indicator System

The oil change indicator system reminds you that it is time to take your vehicle in for scheduled maintenance.

On the Electronic Vehicle Information Center (EVIC) equipped vehicles "Oil Change Required" is displayed in the EVIC and a single chime sounds indicating that an oil change is necessary.

On non-EVIC equipped vehicles "Change Oil" flashes in the instrument cluster odometer and a single chime sounds indicating that an oil change is necessary.

Based on engine operating conditions the oil change indicator message illuminates. This means that service is required for your vehicle. Have your vehicle serviced as soon as possible, within the next 805 km (500 miles).

NOTE:

- **The oil change indicator message will not monitor the time since the last oil change. Change the vehicle oil if it has been six months since your last oil change even if the oil change indicator message is not illuminated.**
- **Change your engine oil more often if you drive your vehicle off-road for an extended period of time.**
- **Under no circumstances should oil change intervals exceed 10,000 km (6,000 miles) or six months, whichever comes first.**

Oil Change Indicator- Reset

The vehicle is equipped with an engine oil change indicator system. The "Oil Change Required" message flashes in the EVIC display for approximately ten seconds after a single chime has sounded, to indicate the next scheduled oil change interval. The engine oil change indicator system is duty cycle based, which means the engine oil change interval may fluctuate depending upon your

personal driving style.

Unless reset, this message continues to display each time you turn the ignition switch to the ON/RUN position. To turn off the message temporarily, press and release the Menu button. To reset the oil change indicator system (after performing the scheduled maintenance) perform the following procedure:

1. Turn the ignition switch to the "ON" position. Do not start the engine.
2. Fully press the accelerator pedal slowly three times within ten seconds.
3. Turn the ignition switch to the "LOCK" position.

NOTE: If the indicator message illuminates when you start the vehicle, the oil change indicator system did not reset. If necessary, repeat this procedure.

At Each Stop for Fuel

- Check the engine oil level. Refer to "Engine Oil" under "Maintenance Procedures" in Section 7.
- Check the windshield washer solvent and add if required.

Once a Month

- Check tire pressure and look for unusual wear or damage.
- Inspect the battery, and clean and tighten the terminals as required.
- Check the fluid levels of coolant reservoir, brake master cylinder, power steering, and transmission, and add as needed.
- Check all lights and other electrical items for correct operation.

At Each Oil Change

- Change the engine oil filter.
- Inspect the brake hoses and lines.

CAUTION: Failure to perform the required maintenance items may result in damage to the vehicle.

Required Maintenance Intervals

* This maintenance is recommended by the manufacturer to the owner, but is not required to maintain emissions warranty.

WARNING: You can be badly injured working on or around a motor vehicle. Perform only that service work for which you have the knowledge and the right equipment. If you have any doubt about your ability to perform a service job, take your vehicle to a competent mechanic. Failure to follow these instructions may result in possible serious or fatal injury.

TOWING

SPECIFICATIONS

STANDARD PROCEDURE - RECREATIONAL TOWING (BEHIND MOTORHOME, ETC.)

Recreational towing of this vehicle is not recommended.

TRAILER TOWING

Trailer towing with this vehicle is not recommended.

STANDARD PROCEDURE

STANDARD PROCEDURE - TOWING

WARNINGS AND CAUTIONS

WARNING: Do not allow towing attachment devices to contact the fuel tank or lines, fuel leak can result.

Do not lift or tow vehicle by front or rear bumper.

Do not go under a lifted vehicle if not supported properly on safety stands.

Do not allow passengers to ride in a towed vehicle.

Use a safety chain that is independent from the towing attachment device.

CAUTION: Do not damage brake lines, exhaust system, shock absorbers, sway bars, or any other under vehicle components when attaching towing device to vehicle.

Do not secure vehicle to towing device by the use of front or rear suspension or steering components.

Remove or secure loose or protruding objects from a damaged vehicle before towing.

Refer to state and local rules and regulations before towing a vehicle.

Do not allow weight of towed vehicle to bear on lower fascia, air dams, or spoilers.

RECOMMENDED TOWING EQUIPMENT

9100-17

Fig. 10: Recommended Towing Devices
Courtesy of CHRYSLER LLC

1 - WHEEL LIFT 2 - FLAT BED CARRIER
--

- RWD vehicles, a flat bed towing device is recommended.
- AWD vehicles, a flat bed towing device is recommended.

CAUTION:

- **Do not attempt to tow this vehicle from the front with sling type towing equipment. Damage to the front fascia and air dams will result.**
- **The only approved method of towing is with a flat bed truck.**
- **Do not tow the vehicle from the rear. Damage to the rear sheet metal, liftgate and fascia will occur.**
- **Do not push or tow this vehicle with another vehicle as damage to the bumper fascia and transmission may result.**

GROUND CLEARANCE

CAUTION: If vehicle is towed with wheels removed, install lug nuts to retain brake drums or rotors.

be sure the has at least 100 mm (4 in.) ground clearance. If minimum ground clearance cannot be reached, use a towing dolly. If a flat bed device is used, the approach angle should not exceed 15 degrees.

If using a wheel lift towing device, the disabled vehicle should be raised until the lifted wheels are a minimum 100 mm (4 in.) from the ground. Be sure there is at least 100 mm (4 in.) clearance between the tail pipe and the ground. If necessary, remove the wheels from the front end of the vehicle and lower the front end closer to the ground, to increase the ground clearance at the rear of the vehicle. Install lug nuts on wheel attaching studs to retain brake rotors.

LOCKED VEHICLE TOWING

When a locked vehicle must be towed with the front wheels on the ground, use a towing dolly or flat bed hauler.

FLAT BED TOWING TIE DOWNS

CAUTION: Do not tie vehicle down by attaching chains or cables to suspension components or engine mounts, damage to vehicle can result.

The vehicle can be tied to a flat bed device using the pair of front transportation slots on the bottom

surface of the rails, behind the front wheels. The rear transportation slots are on the bottom of the left bumper extension and in the bracket extending inboard of the right bumper extension.

WITHOUT THE IGNITION KEY

Special care must be taken when the vehicle is towed with the ignition in the LOCK position. The only approved method of towing with out the ignition key is with a flat bed truck. Proper towing equipment is necessary to prevent damage to the vehicle.

TOWING THIS VEHICLE BEHIND ANOTHER VEHICLE (Flat towing with all four wheels on the ground)

Your vehicle may be towed under the following conditions: The gear selector must be in NEUTRAL, the distance to be traveled must not exceed 48 km (30) miles, and the towing speed must not exceed 48 km/h (30 mph). Exceeding these towing limits may cause a transmission geartrain failure. If the transmission is not operative, or if the vehicle is to be towed more than 48 km (30) miles, the vehicle must be transported using a flat bed or the drive shaft disconnected at the rear axle drive flange.

TOWING THIS VEHICLE BEHIND ANOTHER VEHICLE WITH A TOW DOLLEY

The manufacture **does not recommend** that you tow this vehicle on a tow dolley. Vehicle damage may occur.

ACCESSORIES AND EQUIPMENT

Vehicle Theft Security - Service Information - Challenger

DESCRIPTION

DESCRIPTION

VEHICLE THEFT SECURITY SYSTEM

The Vehicle Theft Security System is a function of the Wireless Ignition Module (WIN) is available in two different configurations.

The WIN system provides perimeter vehicle protection by monitoring the vehicle doors, the ignition switch, and the hood. If unauthorized vehicle use or tampering is detected, these systems respond by pulsing the vehicle horn as an audible deterrent and flashing certain exterior lamps as a visual deterrent.

The WIN includes the following major components, which are described in further detail elsewhere in this service information:

- **Door Ajar Switches** - Integral to the door latch mechanism of each front and rear door.
- **Ignition Switch** - Integral part of the WIN module, can not be serviced.
- **Instrument Cluster** - The Instrument Cluster is known as the Cab Compartment Node (CCN). The CCN is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description** .
- **Siren** - An alarm siren is located behind the left front wheelhouse splash shield, outboard of the left front frame rail. A single fastener secures the mounting bracket to the tight end of the front crossmember of vehicles built for sale in certain export markets where it is required equipment.

OPERATION

OPERATION

The Instrument Cluster, referred to as the Cab Compartment Node (CCN), is used to control and integrate many of the functions and features included in the Vehicle Theft Security System (VTSS). In the VTSS, the CCN receives inputs indicating the status of the door ajar switches, the liftgate ajar switch and the ignition switch. The CCN processes the information from all of these inputs, internally controls the security indicator as appropriate, and sends electronic messages to the Integrated Power Module (IPM) over the Controller Area Network (CAN) data bus. The FCM internally controls the output to the hazard warning lamps and sends a control output to energize or de-energize the horn relay as appropriate.

The following are paragraphs describing the operation of each of the VTSS features.

ENABLING

VTSS should be learned of the vehicle configuration message from the FCM when the EMIC/CCN gets replaced.

ARMING

Passive arming of the VTSS occurs when the vehicle is exited with the key removed from the ignition switch, the headlamps turned off, and the doors are locked while they are open using the power door lock switch. Active arming occurs when the Lock button on the Remote Keyless Entry (RKE) transmitter is pressed to lock the vehicle. For active arming to occur, the doors must be closed and the ignition switch must be in the off position when the RKE transmitter Lock button is pressed. The power door lock switch will not function if the key is in the ignition switch or the headlamps are turned on with the driver side front door open.

Pre-arming of the VTSS is initiated when a door or the liftgate is open, when the vehicle is locked using a power door lock switch, or when the RKE transmitter Lock button is pressed. Pre-arming will not occur if the key is in the ignition switch or the headlamps are turned on with the driver side front door open. When the VTSS is pre-armed, the arming sequence is delayed until all of the doors and the liftgate have been closed. The VTSS will remain in the Pre-Armed mode for up to 16 seconds after all doors and the liftgate have been closed.

Once the VTSS begins the passive or active arming sequence, the security indicator in the instrument cluster will flash rapidly for about 17 seconds, indicating VTSS arming is in progress. If the ignition switch is turned to the ON position, a door or the liftgate opened, or unlocked by any means, or the RKE Panic button is pressed during the 16 second arming process, the security indicator stops flashing and the arming process aborts. Once the 16 second arming sequence is successfully completed, the security indicator flashes at a slower rate, indicating the VTSS is armed.

DISARMING

Active disarming of the VTSS occurs when the vehicle is unlocked by pressing the Unlock button of the RKE transmitter. Once the alarm has been activated, either disarming method deactivates the alarm. Pressing the Panic button on the RKE transmitter will **not** disarm the VTSS.

POWER-UP MODE

When the armed VTSS senses the battery has been disconnected and reconnected, it enters its power-up mode. In power-up mode the alarm system remains armed following a battery failure or disconnect. If the VTSS was armed prior to a battery disconnect or failure, the technician or vehicle operator has to actively or passively disarm the alarm system after the battery is reconnected. The power-up mode also applies if the battery goes dead while the system is armed, and battery jump-starting is attempted. The VTSS is armed until the technician or vehicle operator has actively or passively disarmed the alarm system. If the VTSS is in the disarmed mode prior to a battery disconnect or failure, it will remain disarmed after the battery is reconnected or replaced, or if jump-starting is attempted.

TAMPER ALERT

The VTSS tamper alert feature will sound the horn three times upon disarming, if the alarm was

triggered and has since timed-out (about 18 minutes) or if the battery has been disconnected and reconnected. This feature alerts the vehicle operator the VTSS alarm was activated while the vehicle was unattended.

STANDARD PROCEDURE

SENTRY KEY TRANSPONDER PROGRAMMING

All Sentry Key FOB with Integrated Keys (FOBIKs) included with the vehicle are pre-programmed to work with the Wireless Ignition Module when it is shipped from the factory. The Wireless Ignition Node (WIN) may be programmed to recognize up to a total of eight Sentry Keys. When programming a blank Sentry Key FOBIK, the integrated valet key must be cut to match the door lock cylinder in the vehicle for which it will be used. Once the additional or new key has been cut, the WIN must be programmed to recognize it as a valid FOBIK. There are two possible methods to program the WIN to recognize a new or additional valid FOBIK, the Secured Access Method and the Customer Learn Method. Following are the details of these two programming methods.

SECURED ACCESS METHOD

The Secured Access method applies to all vehicles. This method requires the use of a diagnostic scan tool. This method will also require that you have access to the unique four-digit PIN code that was assigned to the original WIN. The PIN code **must** be used to enter the Secured Access Mode in the WIN. This PIN number may be obtained from the vehicle owner, from the original vehicle invoice, or from the Chrysler Customer Center. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules - Standard Procedure** .

CUSTOMER LEARN METHOD

NOTE: **The Customer Learn feature is only available on domestic vehicles, or those vehicles which have a U.S. country code designator. This programming method also requires access to at least two valid Sentry Key FOBIKs. If two valid Sentry Key FOBIKs are not available, or if the vehicle does not have a U.S. country code designator, the Secured Access Method MUST be used to program new or additional valid keys to the WIN.**

The Customer Learn programming method procedures are as follows:

1. Obtain the blank Sentry Key FOBIK(s) that are to be programmed as valid for the vehicle. Cut the blank integrated valet key(s) to match the door lock cylinder mechanical key codes.
2. Insert one of the two valid Sentry Key FOBIKs into the ignition switch and turn the ignition switch to the ON position.
3. After the ignition switch has been in the ON position for longer than 3 seconds, but no more than 15 seconds, cycle the ignition switch back to the OFF position. Replace the first valid Sentry Key FOBIK in the ignition switch with the second valid Sentry Key FOBIK and turn the ignition switch back to the ON position. The second valid FOBIK must be inserted into the ignition switch within 15 seconds of removing the first valid FOBIK.

4. About 10 seconds after the completion of 3, the security indicator in the instrument cluster will start to flash and a single audible chime will sound to indicate that the system has entered the Customer Learn programming mode.
5. Within 60 seconds of entering the Customer Learn programming mode, turn the ignition switch to the OFF position. Replace the valid Sentry Key FOB with a new Sentry Key FOB with a blank transponder and turn the ignition switch back to the ON position.
6. About 10 seconds after the completion of 5, a single audible chime will sound and the security indicator will stop flashing, stay ON solid for 3 seconds, then turn OFF to indicate that the new Sentry Key FOB blank transponder has been successfully programmed. The SKIS will immediately exit the Customer Learn programming mode. After the ignition is cycled the vehicle may be started using the newly programmed valid Sentry Key FOB.

Each of these steps must be repeated and completed in their entirety for each additional Sentry Key FOB that is to be programmed. If the above steps are not completed in the given sequence, or within the allotted time, the SKIS will exit the Customer Learn programming mode and the programming will be unsuccessful. The WIN will also automatically exit the Customer Learn programming mode if it sees a Sentry Key FOB with a non-blank transponder when it should see a blank, if it has already programmed 8 valid Sentry Key FOBs, or if the ignition switch is turned to the OFF position for more than about 50 seconds.

KEY, TRANSPONDER

DESCRIPTION

DESCRIPTION

Fig. 1: Transponder Key
Courtesy of CHRYSLER LLC

The FOB has a transponder chip included on the circuit board beneath the cover of each FOB with

Integrated Key (FOBIK) (1) included with the vehicle. The FOBIK includes an integral mechanical valet key which is stored within the bottom of the FOBIK housing until it is released using the latch button (2). The valet key is cut to match the mechanical coding of the door and glove box lock cylinders. Each new replacement FOBIK must be programmed for operation of the Remote Keyless Entry (RKE) system and has a unique transponder identification code that is permanently programmed into it by the manufacturer. This identification code must be programmed into the Wireless Ignition Node (WIN).

The FOBIK transponder cannot be adjusted or repaired. If ineffective or damaged, the entire FOBIK and RKE transmitter unit must be replaced.

OPERATION

OPERATION

When the ignition switch is turned to the ON position, the Wireless Ignition Node (WIN) communicates through its antenna with the Sentry Key transponder within the FOB with Integrated Key (FOBIK) using a Low Frequency (LF) Radio Frequency (RF) signal. The WIN then listens for a LF response from the transponder through the same antenna. The Sentry Key transponder chip is within the range of the WIN transceiver antenna ring when it is inserted into the ignition switch.

The WIN determines whether a valid FOBIK is present in the ignition switch based upon the response from the transponder. If a valid FOBIK is detected, that fact is communicated by the WIN to the Powertrain Control Module (PCM) over the Controller Area Network (CAN) data bus, and the PCM allows the engine to continue running. If the PCM receives an **invalid key** message, or receives no message from the WIN over the CAN data bus, the engine will be disabled after about two seconds of operation. The Instrument Cluster, Cab Compartment Node (CCN) will also respond to the **invalid key** message on the CAN data bus by flashing the security indicator ON and OFF.

Each Key FOBIK has a unique transponder identification code permanently programmed into it by the manufacturer. Likewise, the WIN has a unique Secret Key code programmed into it by the manufacturer. When a Key FOBIK is programmed into the memory of the WIN, the WIN stores the transponder identification code from the Key FOBIK, and the Key FOBIK learns the Secret Key code from the WIN. Once the Key FOBIK learns the Secret Key code of the WIN, it is permanently stored in the memory of the transponder. Therefore, once a FOBIK has been programmed to a particular vehicle, it cannot be used on any other vehicle. See **Electrical - Vehicle Theft Security/Vehicle Theft Security - Standard Procedure**.

The WIN performs a self-test each time the ignition switch is turned to the ON position, and will store key-related fault information in the form of a Diagnostic Trouble Code (DTC) in WIN memory if a Key FOBIK transponder problem is detected. The Key FOBIK transponder chip can be diagnosed, and any stored DTC can be retrieved using a diagnostic scan tool. Refer to the appropriate diagnostic service information.

ACCESSORIES AND EQUIPMENT

Power Windows - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The power window system allows each of the door windows to be raised and lowered electrically by actuating a switch on the trim panel of each respective door. A master switch on the driver side front door trim panel, allows the driver to raise or lower each of the passenger door windows and to lock out the individual switches on the passenger doors from operation. The power window system receives battery feed through a circuit breaker in the Junction Block (JB), only when the ignition switch is in the ON position.

The power window system includes the power window switches on each door trim panel, a circuit breaker, door modules and the power window motors inside each door.

The window motors are replaced with the window regulator assembly. If the window motors require replacement, the window regulator must be replaced.

NOTE: When the glass is removed or adjusted, the motor replaced and/or the regulator is replaced, the door module must be denormalized before it can be calibrated/normalized. See Electrical - Power Systems/Power Windows - Standard Procedure.

OPERATION

OPERATION

POWER WINDOW SWITCH

The power windows are controlled by a window/lock switch on the trim panel of each front door. Switches in the driver door window/lock switch allows the driver to control the passenger windows.

The power window switch for the driver side front door window has a second detent position beyond the normal Down position, that provides an automatic one-touch window down feature.

Some vehicles may be equipped with an express closing feature (front windows only). During an express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverses travel to avoid pinching an occupant fingers. Modules in the doors are programmed to compare the position of the glass to the amount of current being used to drive up the glass.

The system also includes various features to manage the perceived forces on the glass as it travels up. If the express closing calibration is lost, the system will self-calibrate itself after the windows are moved up and down two cycles.

The power window switches control the battery and ground feeds to the power window motors. All passenger door power window switches receive their battery and ground feeds through the circuitry of the window/lock switch. When the power window lockout switch is in the Lock position, the battery feed for the individual passenger door power window switches is interrupted.

POWER WINDOW MOTOR

A permanent magnet reversible motor moves the window regulator through an integral gearbox mechanism. A positive and negative battery connection to the two motor terminals causes the motor to rotate in one direction. Reversing the current through these same two connections causes the motor to rotate in the opposite direction.

In addition, each power window motor is equipped with an integral self-resetting circuit breaker to protect the motor from overloads.

NOTE: When the glass is removed or adjusted, the motor replaced and/or the regulator is replaced, the door module must be denormalized before it can be calibrated/normalized. See Electrical - Power Systems/Power Windows - Standard Procedure.

EXPRESS DOWN WINDOW FEATURE

This feature allows you to remotely lower both front door windows at the same time. To use this feature, press and release the UNLOCK button on the RKE transmitter and then immediately press and hold the UNLOCK button until the windows lower to the desired level or until they lower completely.

DIAGNOSIS AND TESTING

POWER WINDOWS

Any diagnosis of the Power Windows system should begin with the use of scan tool. For information on the use of the scan tool, refer to the appropriate Diagnostic Service information.

For complete circuit diagrams, refer to the appropriate wiring information.

STANDARD PROCEDURE

CLEAR/RELEARN

NOTE: Make sure battery is fully charged before proceeding.

NOTE: This needs to be completed every time the window glass is adjusted/removed, motor replaced, and or regulator replaced.

CLEAR/DENORMALIZE USING A SCAN TOOL

To clear/denormalize the door module memory, using a scan tool under the Miscellaneous menu look for Denormalization Window Command/ECU reset, and follow the directions.

RELEARN/NORMALIZE USING A SCAN TOOL

To relearn/normalize the door module memory, using a scan tool under the Miscellaneous menu look for Normalization Window command, and follow the directions.

CLEAR/DENORMALIZE, RELEARN/NORMALIZE WITHOUT A SCAN TOOL

Hold up/down the window switch for at least 30 seconds until the DTC is set for stuck switch. This will clear the memory of the calibration information (CLEAR/DENORMALIZE). Proceed to relearn/normalize.

1. Put a battery charger on vehicle.
2. If equipped with express-up/express-down, reset the express-up/down module for the door window glass. The window switch on the corresponding door must be used to control the window. Do not use the master switch for the passenger window.
3. To calibrate, start by moving the window to the middle position.
4. Drive the glass to the full-up position by pulling up on the window switch to its second detent and hold the switch until the glass is fully closed. Do not release the window switch. Continue to hold the window switch up for 2 seconds after the window glass is full closed.
5. Drive the glass to the full - down position by pushing down (depress) the window switch, (second detent if equipped with express-down) until the window glass is down for 2 seconds after the window glass is fully open. Do not release the window switch. Continue to hold the window switch down for 2 seconds after the window glass is fully open.
6. Check the operation of the express-up/ express-down feature.
7. If the express up/down doesn't work, repeat step # 3, waiting for 3 seconds.
8. Check that the window glass reverses when in the express-up mode by holding a pen in the path of the glass.
9. Once the proper operation of the express-up/express-down feature has been verified, clear all Diagnostic Trouble Codes (DTC's).

MOTOR, WINDOW REGULATOR

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

1. Remove door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Removal**
2. Connect positive (+) lead from a test battery to either of the two motor terminals.
3. Connect negative (-) lead from test battery to remaining motor terminal.

4. The motor should now rotate in one direction to either move window up or down.
 - a. If window happens to already be in full UP position, and motor is connected so as to move it in UP direction, no movement will be observed.
 - b. Likewise, if motor connected to move window in DOWN direction, no movement will be observed if window is already in full DOWN position.
 - c. Reverse battery lead in 2 and 3 , and window should now move. If window does not move, replace motor.
5. If window moved completely up or down, the test leads should be reversed one more time to complete a full window travel inspection.
6. If window does not move, check to make sure that it is free.
7. The window should slide up and down freely in the glass channels. If the window does not move freely, the window lift motor will not be able to move the glass.
8. To determine if the glass slides freely, disconnect the regulator from the glass lift plate. Remove the two attaching screws, and slide the window up and down by hand.

REMOVAL

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Removal**
3. Disconnect the electrical connector.
4. Remove the mounting fasteners and remove the motor.

INSTALLATION

INSTALLATION

1. Install the window motor and install the mounting fasteners.
2. Connect the electrical connector.
3. Install the door trim panel. Refer to **Body/Door - Front/PANEL, Door Trim - Installation**
4. Connect the negative battery cable.

SWITCH, POWER WINDOW

REMOVAL

REMOVAL

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** and **Electrical - Power Systems/Power Locks/SWITCH, Lock - Removal** .

INSTALLATION

INSTALLATION

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure and Electrical - Power Systems/Power Locks/SWITCH, Lock - Installation .

ACCESSORIES AND EQUIPMENT

Wipers/Washers - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The wiper/washers system includes the following major components:

- **Front Control Module (FCM)** - This module is integral to the Integrated Power Module (IPM) and is located in the engine compartment, near the right shock tower. Refer to **Electrical - Wiring/Power Distribution - Description**.
- **Washer Nozzle** - Two washer nozzles with integral check valves are secured to the hood panel near the base of the windshield.
- **Washer Plumbing** - The plumbing for the washer system consists of nylon hoses and molded plastic fittings. The plumbing is routed within the engine compartment from the washer reservoir. The washer hose is routed across the underside of the hood panel to the washer nozzles.
- **Wiper Arms** - The two wiper arms are secured with nuts to the threaded ends of the two wiper pivot shafts, which extend through the cowl panel located near the base of the windshield.
- **Wiper Blade** - The two wiper blades are secured to the two wiper arms with an integral latch, and are parked on the glass near the bottom of the windshield when the wiper system is not in operation.
- **Wiper Module** - The wiper pivot shafts are the only visible components of the wiper module. The remainder of the module is concealed within the engine compartment beneath the cowl panel. The wiper module includes a cast aluminum wiper module bracket, two rubber-isolated wiper module mounts, one dowel on the underside of the wiper motor, the wiper motor crank arm, the two wiper drive links, the two powered wiper pivots.
- **Instrument Cluster** - The ElectroMechanical Instrument Cluster (EMIC) is also known as the Cab Compartment Node (CCN). The EMIC/CCN is located in the instrument panel above the steering column opening, directly in front of the driver. Refer to **Electrical - Instrument Cluster/Instrument Cluster - Description**.
- **Multifunction Switch** - The multifunction switch is located on the steering column, just behind the steering wheel. A control stalk that extends from the left side of the switch that is dedicated to providing all of the driver controls for the front wiper/washer systems, turn signal, and high and low beam functions. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Multifunction - Description**.
- **Washer Fluid Level Switch** - Located in a dedicated hole on the lower portion of the washer reservoir, ahead of the right front wheel house splash shield.
- **Washer Pump/Motor** - The electric washer pump/motor is located in the lower portion of the washer reservoir, ahead of the right front wheel house splash shield. The washer pump/motor provides washer fluid to the front washer system plumbing.
- **Washer Reservoir** - The washer reservoir is mounted just in front of the right front wheel splash shield. The filler neck is located in the right front corner of the engine compartment.

- **Wiper High/Low Relay** - Located in the Power Distribution Center (PDC) in the engine compartment.
- **Wiper On/Off Relay** - Located in the Power Distribution Center (PDC) in the engine compartment.

OPERATION

OPERATION

WIPER/WASHER SYSTEM

Fig. 1: Multi-Function Switch
Courtesy of CHRYSLER LLC

All wiper/washer system functions are initiated with the control knob on the end of the multifunction switch control stalk that extends from the left side of the steering column, just behind the steering wheel. Rotating the control knob on the end of the control stalk, selects the off, intermittent, auto (on models equipped with automatic wipers), low, or high front wiper system operating modes. In the intermittent mode, the control knob allows the vehicle operator to select from one of six intermittent wipe intervals. In the auto mode, the control knob allows the vehicle operator to select from one of six automatic wiper sensitivity levels. Pressing in on the end of the control stalk momentarily activates the Mist Wipe. Pressing it in all the way activates the windshield washers. In the auto mode, the sensitivity of the wipers is increased (less delay between wipes), the result is a corresponding acknowledgment wipe to let you know an adjustment has been made to the system. The multifunction switch provides hardwired resistor multiplexed inputs to the Steering Column Control Module (SCCM), for all of the wiper/washer system functions. The SCCM then sends electronic messages to the Front Control Module (FCM) over the Controller Area Network (CAN) data bus requesting the appropriate front wiper/washer system operating modes.

All wiper/washer system operation is controlled by the FCM logic circuits. That logic will only allow these systems to operate when the ignition switch is in the accessory or on positions. Battery current is directed from a B(+) fuse in the Integrated Power Module (IPM) to the wiper on/off relay, and the wiper high/low relay in the Power Distribution Center (PDC) through a fused B(+) circuit. The FCM uses low side drivers to control wiper system operation by energizing or de-energizing the wiper high/low and wiper on/off relays. The FCM uses both high side and low side drivers to control the operation of the washer pump/motor unit. The multifunction switch circuitry receives a clean ground output from the SCCM on a multifunction switch return circuit, then provides resistor multiplexed inputs to the SCCM on an intermittent wipe mux circuit to indicate the selected wiper system mode.

and on a wash/beam select mux circuit to indicate the selected washer system mode.

CONTINUOUS WIPE MODE

When the low position of the multifunction switch is selected, the SCCM sends an electronic wiper switch low message to the FCM, the FCM then energizes the wiper on/off relay. This directs battery current to the low speed brush of the wiper motor through the normally open contacts of the energized wiper on/off relay and the normally closed contacts of the de-energized wiper high/low relay causing the wipers to cycle at low speed.

When the high position of the control knob is selected, the SCCM sends an electronic wiper switch high message to the FCM, the FCM then energizes both the wiper on/off and the wiper high/low relays. This directs battery current to the high speed brush of the wiper motor through the normally open contacts of the energized wiper on/off relay and the normally open contacts of the energized wiper high/low relay, causing the wipers to cycle at high speed.

When the off position of control knob is selected, the SCCM sends an electronic wiper switch off message to the FCM. If the wiper motor was operating at high speed, the FCM immediately de-energizes the wiper high/low relay causing the wiper motor to return to low speed operation, causing one of two events to occur. The event that occurs depends on the position of the wiper blades on the windshield at the moment that the control knob off position is selected.

If the wiper blades are in the down position on the windshield when the off position is selected, the park switch that is integral to the wiper motor is closed to ground and provides a hard wired park switch sense input to the FCM. The FCM then de-energizes the wiper on/off relay and the wiper motor ceases to operate. If the wiper blades are not in the down position on the windshield at the moment the off position is selected, the park switch is an open circuit and the FCM keeps the wiper on/off relay energized, causing the wiper motor to continue running at low speed until the wiper blades are in the down position on the windshield and the park switch input to the FCM is again closed to ground.

HEADLAMPS ON WITH WIPERS MODE

The CCN provides an automatic headlamps on with wipers feature for models equipped with automatic headlamps. This is a customer programmable feature. If this feature is enabled, the headlamps turn on automatically whenever the windshield wipers are turned on, and turn off automatically when the wipers are turned off. If this feature is enabled, when the automatic wiper mode is selected, the headlamps turn on automatically only after the wipers complete a minimum of five automatic wipe cycles within about 60 seconds. The headlamps turn off automatically after four minutes elapse without any wipe cycles.

INTERMITTENT WIPE MODE

When the control knob of the multifunction switch control knob is moved to one of the intermittent interval positions, the SCCM sends an electronic wiper switch delay message to the FCM, then the FCM electronic intermittent wipe logic circuit responds by calculating the correct length of time between wiper sweeps based upon the selected delay interval input. The FCM monitors the changing state of the wiper motor park switch through a hardwired park switch sense input. This input allows

the FCM to determine the proper intervals at which to energize and de-energize the wiper on/off relay and to operate the wiper motor intermittently for one low speed cycle at a time.

The FCM logic is also programmed to provide vehicle speed sensitivity to the selected intermittent wipe delay intervals. In order to provide this feature the FCM monitors electronic vehicle speed messages from the Powertrain Control Module (PCM) and doubles the selected delay interval whenever the vehicle speed is approximately 16 km/h (10 mph) or less.

PULSE WIPE MODE

When the control knob of the multifunction switch control stalk is pressed to the momentary pulse wipe position for less than one-half second, the SCCM sends an electronic switch message to the FCM, the FCM then energizes the wiper on/off relay for one complete wipe cycle. The FCM de-energizes the relay when the state of the park switch sense changes to ground, parking the wiper blades near the base of the windshield.

WASH MODE

When the control knob of the multifunction switch control stalk is pressed to the momentary wash position for more than one-half second, the SCCM sends an electronic washer switch message to the FCM, the FCM then directs battery current and ground to the washer pump/motor unit. This causes the washer pump/motor unit to be energized for as long as the Wash switch is held closed, up to about 10 seconds, and to de-energize when the front Wash switch is released.

When the control knob is pressed to the momentary wash position while the wiper system is operating in one of the intermittent interval positions, the washer pump/motor operation is the same. However, the FCM also energizes the wiper on/off relay to override the selected delay interval and operate the wiper motor in a continuous low speed mode for as long as the control knob is held pressed, then de-energizes the relay and reverts to the selected delay mode interval several wipe cycles after the control knob is released. If the control knob is held pressed for more than 10 seconds, the FCM suspends washer pump/motor operation until the knob is released, then cycled back to the wash position, if so desired.

The headlamp washer system (if equipped) uses a separate high pressure pump attached to the windshield washer reservoir. The headlamp washer pump feeds then nozzles mounted in the front fascia of the vehicle. The nozzle bodies spray the headlamps with high pressure washer solvent when the system is activated.

To activate the headlamp washers, turn the headlamps on and press the windshield washer control knob. This operates the windshield washers and directs two, timed, high pressure sprays onto the headlamp lens.

WIPE-AFTER-WASH MODE

When the control knob of the multifunction switch control stalk is pressed to the momentary wash position for more than one-half second while the wiper system is not operating, the instrument cluster sends an electronic washer switch message to the FCM, the FCM then directs battery current and ground to the washer pump/motor unit and energizes the wiper on/off relay. This will causes the

washer pump/motor unit to be energized and operate the wiper motor in a continuous low speed mode for as long as the wash switch is held closed, up to about 10 seconds. When the control knob is released, the FCM de-energizes the washer pump/motor unit, but allows the wiper motor to operate for several additional wipe cycles before it de-energizes the wiper on/off relay and parks the wiper blades near the base of the windshield.

If the control knob is held pressed for more than 30 seconds, the FCM suspends washer pump/motor operation until the knob is released, then cycled back to the wash position. However, the wipers continue to operate for as long as the wash switch is held closed. The FCM monitors the changing state of the wiper motor park switch through a hardwired wiper park switch sense circuit input. This input allows the FCM to count the number of wipe cycles that occur after the wash switch is released, and to determine the proper interval at which to de-energize the wiper on/off relay to complete the wipe-after-wash mode cycle.

LINKAGE, WIPER ARM

DESCRIPTION

DESCRIPTION

Fig. 6: Front Wiper Module
Courtesy of CHRYSLER LLC

The wiper module is secured to the cowl plenum with screws through two rubber grommet-type insulators. The module is located in the rear of the engine compartment, concealed beneath the molded plastic cowl plenum grille panel. The ends of the pivot shafts protruding through openings in

the cowl plenum cover/grille panel are the only visible components of the wiper module. The wiper module consists of the following major components:

- **Crank Arm** - The wiper motor crank arm is a stamped steel unit with an internally splined hole on the driven end that is secured to the wiper motor output shaft with a nut. A long ball stud secures the drive end to accept the wiper linkage.
- **Linkage** - The two wiper linkage members are constructed of stamped steel. A driver side drive link consists of a plastic socket-type bushing in the left end, and a plastic sleeve-type bushing in the right end. The socket bushing is snap-fit over the pivot ball stud on the left pivot lever arm, while the sleeve bushing is fit over the longer pivot stud on the wiper motor crank arm. The passenger side drive link has a plastic socket-type bushing on each end. One end of this drive link is snap-fit over the ball stud on the right pivot lever arm, while the other end is snap-fit over the top of the driver side drive link on the ball stud of the wiper motor crank arm.
- **Motor** - The wiper motor is secured on the underside of the module bracket near the center with three screws. The wiper motor output shaft passes through a hole in the module bracket, where a nut secures the wiper motor crank arm to the motor output shaft. The two-speed permanent magnet wiper motor features an integral transmission, an internal park switch, and an internal Positive Temperature Coefficient (PTC) circuit breaker.
- **Pivots** - This module features two pivots. The two wiper pivot shafts have lever arms with ball studs at their base to accept the wiper linkage. The upper end of all three pivot shafts has a threaded stud with a tapered and serrated area just below the threads to accept the left or right wiper arm links.

The wiper module cannot be adjusted or repaired. The wiper motor is only available for separate service replacement. If any other component of the module is inoperative or damaged, the entire front wiper module unit must be replaced.

OPERATION

OPERATION

The wiper module operation is controlled by the battery current inputs received by the wiper motor through the wiper on/off and wiper high/low relays. The wiper motor speed is controlled by current flow to either the low speed or the high speed set of brushes. The park switch is a single pole, single throw, momentary switch within the wiper motor that is mechanically actuated by the wiper motor transmission components. The park switch alternately opens and closes the wiper park switch sense circuit to ground, depending upon the position of the wipers on the glass. This feature allows the motor to complete its current wipe cycle after the wiper system has been turned off, and to park the wiper blades in the lowest portion of the wipe pattern. The automatic resetting circuit breaker protects the motor from overloads.

The wiper motor crank arm, the two wiper linkage members, and the two wiper pivots mechanically convert the rotary output of the wiper motor to the back and forth wiping motion of the wiper arms and blades on the glass.

REMOVAL

REMOVAL

Fig. 7: Removing/Installing Front Wiper Arms
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the wiper arms (1) and (2). See [Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Removal](#).

Fig. 8: Removing/Installing Cowl Panel
Courtesy of CHRYSLER LLC

3. Remove the cowl panel (1). Refer to [Body/Exterior/COVER, Cowl Panel - Removal](#).

Fig. 9: Wiper Motor Electrical Connector

5. Install the cowl panel (1). Refer to **Body/Exterior/COVER, Cowl Panel - Installation** .

Fig. 16: Removing/Installing Front Wiper Arms
 Courtesy of CHRYSLER LLC

6. Install the wiper arms (1) and (2). See **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Installation**. Torque nuts to 18 N.m (150 in. lbs.).
7. Connect the battery negative cable.

MOTOR, WIPER, FRONT

REMOVAL

REMOVAL

Fig. 17: Removing/Installing Wiper Module
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the front wiper module (3). See Electrical - Wipers/Washers/Wipers/Washers/LINKAGE, Wiper Arm - Removal.

NOTE: When removing the motor from the linkage assembly, do not remove the bellcrank nut. A timing issue will arise with the cam in the motor and a new motor will be needed. The wiper motor will be shipped from Mopar® with the bellcrank already installed.

3. With the front wiper module on bench or in vise, remove the linkage using a screwdriver, flat bar, or equivalent to pry the linkage off the bellcrank.
4. Remove the two motor mounting bolts (1).

NOTE: When separating the motor from the linkage, there are two pocket nuts that may fall out. Take care to keep these and reinstall them during installation.

5. Separate the wiper motor from the wiper module/linkage.

INSTALLATION

INSTALLATION

When installing the motor onto the linkage assembly, do not remove the bellcrank. A timing issue will arise with the cam in the motor and a new motor will be needed. The wiper motor will be shipped from Mopar® with the bellcrank already installed.

Fig. 18: Pocket Nut
Courtesy of CHRYSLER LLC

1. Ensure that the pocket nuts (1) are in place in the motor before assembly.
2. If needed to install pocket nut (1), align the nut with the pocket.

Fig. 19: Pocket Nut
Courtesy of CHRYSLER LLC

3. Drop nut (1) into pocket.
4. Place wiper motor in its mounting location making sure that the pocket nuts are in place.
5. Install and tighten the mounting bolts (1).
6. Snap the wiper linkage on the ball on the bellcrank. Make sure to use Mopar® approved grease when installing.

Fig. 20: Removing/Installing Wiper Module
Courtesy of CHRYSLER LLC

7. Install the front wiper module (3). See **Electrical - Wipers/Washers/Wipers/Washers/LINKAGE, Wiper Arm - Installation**.
8. Connect the negative battery cable.

PUMP, WINDSHIELD WASHER

REMOVAL

REMOVAL

Fig. 21: Removing/Installing Washer Reservoir

Fig. 1: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

This vehicle utilizes a five-link rear suspension including the following major components:

- Camber Link (1)
- Compression Link (5)
- Spring Link (2)
- Tension Link (6)
- Toe Link (3)
- Coil Spring
- Crossmember
- Hub And Bearing
- Knuckle (4)
- Shock Absorber
- Stabilizer Bar

Service Procedures for the crossmember can be found in Frame And Bumpers Refer to **CROSSMEMBER, REAR, REMOVAL** .

SRT

Fig. 2: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown, right side similar.

The SRT rear suspension is part of an Active Damping System (ADS). The ADS includes unique shock absorbers, an Active Damping Control Module (ADCM), and three accelerometers that work together to modify the ride of the suspension over varying road conditions.

The Active Damping System (ADS) rear shock is similar to a conventional shock with the addition of a shock solenoid assembly (1) mounted on the side of its body with a three wire harness connector attached to it. The ADS shock assembly is serviced the same as a conventional shock absorber, with the addition of disconnecting the ADS harness connector (2) on the crossmember.

Service of all other rear suspension components remain the same as the standard components. When components differ, be sure to use only SRT components on SRT vehicles.

The rear knuckle for the SRT is different from the standard knuckle. Although similar in appearance and in service, the mounting bosses for the disc brake caliper have been moved downward to allow mounting of the Brembo four-piston brake caliper. Due to this change, an updated special tool is needed to remove the sleeve that retains the lower control arm ball joint to the knuckle.

The rear stabilizer bar diameter has been increased for the SRT but it is serviced in the same manner as the standard bar.

SPECIFICATIONS

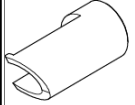

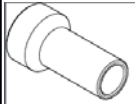

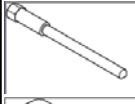

SPECIFICATIONS

--	--	--	--

DESCRIPTION	N.m	Ft. Lbs.	In. Lbs.
Brake Caliper Adapter Knuckle Bolts	115	85	-
Camber Link Crossmember Bolt	85	63	-

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING - NOISE

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

Bearings will produce noise if worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine if there is a bearing noise, or if it may be some other component, and to assist in finding the location. The following procedure, together with the **DIAGNOSTIC CHART**, should help determine the proper cause. Note that if a particular vehicle road test maneuver, steering to the right for instance, results in noise only part of the time, it is not likely a faulty bearing. Bearing noises are not typically intermittent.

NOTE: Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease seepage from the bearing is considered normal and should not require replacement of the wheel bearing. Wheel bearings are designed to last the life of the vehicle and require no type of periodic maintenance. To diagnose the hub, measure hub runout

Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING .

DIAGNOSTIC PROCEDURE:

1. Perform drive evaluation. Find a smooth level road surface void of traffic or obstructions. Turn off any accessories which may cause background noise. Evaluate for noise at 50 km/h (30 mph) and 100 km/h (60 mph) and with vehicle in neutral to eliminate potential drivetrain noises. With vehicle at a constant speed, steer back and forth to left and right (approximately 45 degree steering input each way). This will

load and unload the bearings and may change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at higher speeds.

2. Drive evaluation results: Noise increase when turning right may indicate a problem with the left bearing. Noise increase when turning left may indicate a problem with the right bearing.
3. Put vehicle up on hoist. Grab the tire by pushing in on the top center and pulling out on the bottom center to check for excessive movement in the bearing.
4. Check for potential rubbing on rotating components, such as rotor splash shields, heat shields touching propshaft or halfshaft, wheel well liners contacting tire, wheel cover on wheel, etc. Any cyclic noise (once per wheel revolution for example) is not likely a wheel bearing fault.
5. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **ROTOR, BRAKE, DIAGNOSIS AND TESTING** .
6. Rotate the wheel hub, checking for resistance or roughness.
7. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub & bearing will require replacement. Do not attempt to disassemble the bearing for repair.
8. Rotate the wheel hub, utilize Chassis Ears (or equivalent) to check for noise.
9. If none of the above checks indicate a bearing failure, refer to the **DIAGNOSTIC CHART** for other possible causes.

DIAGNOSTIC CHART - HUB & BEARING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
FRONT END WHINE ON TURNS	1. Low Power Steering Fluid Level (if applicable) 2. Worn Tires and/or Incorrect Wheel Alignment 3. Defective Wheel Bearing 4. Wrong Power Steering Fluid (if applicable)	1. Fill power steering fluid reservoir to proper level, check for leaks (make sure all air is bled from system fluid) 2. Replace Tires, Check And Reset Wheel Alignment 3. Replace Wheel Bearing 4. Replace With Correct Power Steering Fluid
FRONT END GROWL OR GRINDING ON TURNS	1. Loose Wheel Lug Nuts 2. Engine Mount Grounding Against Frame Or Body Of Vehicle 3. Worn Tires and/or Incorrect Wheel Alignment 4. Defective Wheel	1. Verify Wheel Lug Nut Torque 2. Check For Engine Mount Hitting Frame Rail And Reposition Engine As Required 3. Replace Tires, Check and Reset Wheel Alignment

	Bearing 5. Worn or Broken C/V Joint 6. Engine Not Centered, Causing Axle Half Shaft to Bottom Out	4. Replace Wheel Bearing 5. Replace C/V Joint 6. Center the Engine
POPPING/CLICKING/SNAPPING DURING ACCELERATION AFTER DRIVE-TO-REVERSE SHIFT, REVERSE-TO-DRIVE SHIFT OR WHILE TURNING	1. Insufficient Hub Nut Torque 2. Insufficient Grease on Mating Surface of Axle Half Shaft Outer C/V Joint to Wheel Hub/Bearing, or Worn/Damaged Gasket	1. Torque Hub Nut to Spec 2. Separate Half Shaft From Hub and Bearing and Wipe Mating Surfaces Clean. Apply Light Coating of Wheel Bearing Grease to C/V Joint Surface and Reassemble, or Replace Gasket. Torque Hub Nut to Spec
WHINE/HUM/ROAR WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Worn Tires and/or Incorrect Wheel Alignment 2. Defective Wheel Bearing	1. Replace Tires and Reset Wheel Alignment 2. Replace Wheel Bearing
GROWL OR GRINDING WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Engine Mount Grinding Against Frame or Body 2. Defective Wheel Bearing 3. Worn or Broken C/V Joint	1. Check and Reposition Engine as Required 2. Replace Wheel Bearing 3. Replace C/V Joint

REMOVAL

NON SRT

Fig. 3: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 4: Identifying Hub Nut

Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the half shaft (2).

Fig. 5: Rear Caliper Adapter, Knuckle & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

4. Remove two bolts (1) securing disc brake caliper adapter (3) to knuckle (2).
5. Remove disc brake caliper and adapter (3) from knuckle as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

Fig. 6: Rear Brake Rotor, Hub & Clips
 Courtesy of CHRYSLER GROUP, LLC

6. Remove any clips (2) retaining brake rotor (3) to wheel mounting studs.
7. Slide brake rotor (3) off hub and bearing (1).

Fig. 7: Hub & Bearing, Mounting Bolts & Half Shaft
 Courtesy of CHRYSLER GROUP, LLC

1 - HUB AND BEARING
2 - MOUNTING

BOLTS
3 - HALF
SHAFT (IF
EQUIPPED)

8. Loosen each hub and bearing mounting bolt (2) a turn or two at a time while pulling outward on hub and bearing to avoid bolt contact with half shaft outer joint. Once removed from threads in hub and bearing (but not knuckle), allow bolts to stay in and protrude through knuckle and brake support plate to keep brake support plate in place when hub and bearing is removed.
9. Slide hub and bearing off knuckle and half shaft.

SRT

Fig. 8: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 9: Identifying Hub Nut
 Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the half shaft (2).

Fig. 10: Pushing Back Pistons In Bore
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

4. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
5. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 11: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 12: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the lower and upper caliper mounting bolts (1).
8. Remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

Fig. 13: Brake Rotor, Hub & Clips
Courtesy of CHRYSLER GROUP, LLC

9. Remove any clips (3) retaining brake rotor (2) to wheel mounting studs.
10. Slide brake rotor (2) off hub and bearing (1).

Fig. 14: Identifying Hub Nut

Courtesy of CHRYSLER GROUP, LLC

11. Push inward on end of half shaft (2) until C/V joints bottom. This is necessary to give as much access to hub and bearing mounting bolts as possible.

Fig. 15: Hub And Bearing Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

- NOTE:** It is important to keep suspension jacked up as requested in to ease access to lower hub and bearing mounting bolts. Refer to step 6.
- NOTE:** Use a 3/8 inch drive wobble extension along with a Torx® socket to access and remove two top and lower front mounting bolt. Use a standard 3/8 inch drive universal joint along with a Torx® socket to access and remove lower rear mounting bolt.
12. Loosen each (of the four) hub and bearing mounting bolt a turn or two at a time while pulling outward on hub and bearing to avoid bolt contact with half shaft outer joint. Once removed from threads in hub and bearing (but not knuckle), allow bolts to stay in and protrude through knuckle and parking brake adapter to keep brake adapter in place while hub and bearing is off vehicle.
 13. Slide hub and bearing out of knuckle and off half shaft.

INSTALLATION

NON SRT

Fig. 16: Halfshaft Isolation Washer

Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

1. Position hub and bearing bolts through rear of knuckle and parking brake support just enough to hold support in place as hub and bearing is installed.
2. Slide hub and bearing onto half shaft. Place hub and bearing through brake support, onto knuckle, lining up mounting bolt holes with bolts.

Fig. 17: Hub & Bearing, Mounting Bolts & Half Shaft
 Courtesy of CHRYSLER GROUP, LLC

1 - HUB AND BEARING 2 - MOUNTING BOLTS 3 - HALF SHAFT (IF EQUIPPED)
--

3. Install four bolts (2) fastening hub and bearing in place. Tighten mounting bolts to 68 N.m (50 ft. lbs.).

Fig. 18: Rear Brake Rotor, Hub & Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect disc brake pads and parking brake shoes before brake rotor installation. Refer to PADS, BRAKE, INSPECTION .**

4. Install brake rotor (3) over wheel mounting studs and onto hub (1).

Fig. 19: Rear Caliper Adapter, Knuckle & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install disc brake caliper and adapter assembly (3) over brake rotor.
6. Install mounting bolts (1) securing caliper adapter (3) to knuckle (2). Tighten bolts to 115 N.m (85 ft. lbs.).

Fig. 20: Identifying Hub Nut
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

7. Install hub nut (1) on end of half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).
8. Verify proper adjustment of the parking brake shoes and adjust as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .

Fig. 21: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

9. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
10. Lower vehicle.
11. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

Fig. 22: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

12. Check and adjust brake fluid level in reservoir (1) as necessary.
13. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

SRT

Fig. 23: Halfshaft Isolation Washer

Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer (1) is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

Fig. 24: Hub And Mounting Bolts, Knuckle & Adapter

Courtesy of CHRYSLER GROUP, LLC

NOTE: To help upon installation, make sure that hub and bearing mounting bolts (1) extend through knuckle (3) and parking brake adapter (2) to hold adapter in place during hub and bearing installation.

1. Position hub and bearing mounting bolts (1) through rear of knuckle (3) and parking brake adapter (2) just enough to hold adapter in place.

81663075

Fig. 25: Hub And Bearing Bolt Hole Pattern
Courtesy of CHRYSLER GROUP, LLC

NOTE: Hub and bearing mounting bolt holes are not evenly spaced. Upper mounting holes (2) are not as far apart as lower mounting holes (1). Make note of this before installing hub and bearing.

2. Slide hub and bearing onto half shaft. Insert hub and bearing through parking brake adapter and knuckle, lining up mounting bolt holes with bolts.

Fig. 26: Hub And Bearing Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure suspension is jacked up as requested during removal to ease access to lower hub and bearing mounting bolts.

NOTE: Use a 3/8 inch drive wobble extension along with a Torx® socket to slip past half shaft outer C/V joint and install two top and lower front mounting bolts. Use a standard 3/8 inch drive universal joint along with a Torx® socket to install lower rear mounting bolt.

3. Carefully start all four mounting bolts into hub and bearing. Using a cross pattern, tighten each hub and bearing mounting bolt a turn or two at a time, slowly drawing hub and bearing into mounted position. Periodically, push in on end of half shaft to give as much room as possible for tools on mounting bolts. Tighten mounting bolts to 68 N.m (50 ft. lbs.).

8136a480

Fig. 27: Brake Rotor, Hub & Clips
 Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect disc brake pads and parking brake shoes before brake rotor installation. Refer to PADS, BRAKE, INSPECTION .**

4. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.
5. Install brake rotor (2) over studs on hub and bearing (1).

815bb19b

Fig. 28: Rear Caliper Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

6. Slide caliper with pads (2) over brake rotor and align with knuckle.

7. Install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.).
8. Remove jack from under spring link.

Fig. 29: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

9. Install hub nut (1) on end of half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).
10. Verify proper adjustment of the parking brake shoes and adjust as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .

Fig. 30: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

11. Install tire and wheel assembly (1). Refer to **INSTALLATION** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.).
12. Lower vehicle.
13. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

Fig. 31: Reservoir Fluid Level Markings
 Courtesy of CHRYSLER GROUP, LLC

14. Check and adjust brake fluid level in reservoir (1) as necessary.
15. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake

pads.

KNUCKLE, REAR

REMOVAL

NON SRT

Fig. 32: Rear Wheel Speed Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Unclip wheel speed sensor cable at rear brake rotor shield (1).
3. Remove screw (2) fastening sensor head (3) to rear knuckle.
4. Remove wheel speed sensor head from knuckle.
5. Access and remove rear hub and bearing. Refer to **HUB AND BEARING, REMOVAL**.
6. Remove parking brake shoes. Refer to **SHOES, PARKING BRAKE, REMOVAL** .

810c7a8e

18. Remove bolt fastening toe link (3) to knuckle (4).
19. Remove nut and bolt fastening stabilizer link to knuckle (4).
20. Remove nut and bolt fastening tension link (6) to knuckle (4).
21. Remove nut and bolt fastening camber link (1) to knuckle (4).
22. Remove knuckle (4).
23. Remove hub mounting bolts from knuckle.

INSTALLATION

NON SRT

Fig. 48: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Install four hub mounting bolts through knuckle from inboard side allowing ends to protrude from opposite side.
2. Position knuckle on vehicle and install bolt and nut fastening camber link (1) to knuckle (4) as shown. **Do not tighten bolt at this time.**
3. Install bolt and nut fastening tension link (6) to knuckle (4) as shown. **Do not tighten bolt at this time.**
4. Install bolt and nut fastening stabilizer link to knuckle (4). **Do not tighten bolt at this time.**
5. Install bolt fastening toe link (3) to knuckle (4). **Do not tighten bolt at this time.**
6. Install bolt and nut fastening compression link (5) to knuckle (4). **Do not tighten bolt at this time.**

NOTE: If a new knuckle sleeve is not installed in knuckle, perform step 7 through 11.

813c976b

Fig. 49: Rear Knuckle Sleeve Remover/Installer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

7. Place NEW knuckle sleeve (2) onto special tool #9361-7, Screw, Installation (1), and slide it up to Bolt's head.

813c00c9

Fig. 50: Installing Knuckle Sleeve
 Courtesy of CHRYSLER GROUP, LLC

8. Starting from knuckle forward end, slide special tool #9361-7, Screw, Installation (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
9. Install thrust bearing and nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
10. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
11. Remove special tool.

Fig. 51: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
13. Remove under-hoist utility jack or jack stand from under spring link.

Fig. 52: Parking Brake Cable & Screw
 Courtesy of CHRYSLER GROUP, LLC

14. Insert end of cable (1) through rear knuckle (3) and install mounting screw (2). Tighten screw to 8 N.m (71 in. lbs.).
15. Install parking brake shoe support over hub and bearing mounting screws and onto face of knuckle.

Fig. 53: Removing/Installing Actuator
 Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR 2 - CABLE END

16. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
17. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION**.

Fig. 54: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

18. Install hub and bearing as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION**.

Fig. 55: Rear Wheel Speed Sensor & Screw
 Courtesy of CHRYSLER GROUP, LLC

19. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
20. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
21. Install sensor cable at rear brake rotor shield (1).
22. Lower vehicle.
23. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
24. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

Fig. 56: Rear Suspension Components
 Courtesy of CHRYSLER GROUP, LLC

25. Tighten fasteners at knuckle (vehicle at curb height) as follows:

- Camber Link (1) - 98 N.m (72 ft. lbs.).
- Compression Link (5) - 81 N.m (60 ft. lbs.).
- Stabilizer Link - 61 N.m (45 ft. lbs.).
- Tension Link (6) - 98 N.m (72 ft. lbs.).
- Toe Link (3) - 95 N.m (70 ft. lbs.).

26. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SRT

Fig. 57: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Install four hub mounting bolts through knuckle from inboard side allowing ends to protrude from opposite side.
2. Position knuckle on vehicle and install bolt and nut fastening camber link (1) to knuckle (4) as shown. **Do not tighten bolt at this time.**
3. Install bolt and nut fastening tension link (6) to knuckle (4) as shown. **Do not tighten bolt at this time.**
4. Install bolt and nut fastening stabilizer link to knuckle (4). **Do not tighten bolt at this time.**
5. Install bolt fastening toe link (3) to knuckle (4). **Do not tighten bolt at this time.**
6. Install bolt and nut fastening compression link (5) to knuckle (4). **Do not tighten bolt at this time.**

NOTE: If a new knuckle sleeve is not installed in knuckle, perform step 7 through 11.

813ce76b

Fig. 58: Rear Knuckle Sleeve Remover/Installer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

7. Place NEW knuckle sleeve (2) onto special tool #9361-12, Installer, Bushing (1), and slide it up to Bolt head.

813ccc9

Fig. 59: Installing Knuckle Sleeve
 Courtesy of CHRYSLER GROUP, LLC

8. Starting from knuckle forward end, slide special tool #9361-12, Installer, Bushing (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
9. Install Installation Thrust Bearing (around 3/8 inch thick) and special flange nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
10. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
11. Remove special tool.

Fig. 60: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
13. Remove under-hoist utility jack or jack stand from under spring link.

Fig. 61: Parking Brake Cable & Screw
 Courtesy of CHRYSLER GROUP, LLC

14. Insert end of cable (1) through rear knuckle (3) and install mounting screw (2). Tighten screw to 8 N.m (71 in. lbs.).
15. Install parking brake shoe support over hub and bearing mounting screws and onto face of knuckle.

Fig. 62: Removing/Installing Actuator
 Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR 2 - CABLE END

16. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
17. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION**.

Fig. 63: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

18. Install hub and bearing as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION**.

Fig. 64: Rear Wheel Speed Sensor & Screw
 Courtesy of CHRYSLER GROUP, LLC

19. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
20. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
21. Install sensor cable at rear brake rotor shield (1).
22. Lower vehicle.
23. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
24. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

Fig. 65: Rear Suspension Components
 Courtesy of CHRYSLER GROUP, LLC

25. Tighten fasteners at knuckle (vehicle at curb height) as follows:

- Camber Link (1) - 98 N.m (72 ft. lbs.).
- Compression Link (5) - 81 N.m (60 ft. lbs.).
- Stabilizer Link - 61 N.m (45 ft. lbs.).
- Tension Link (6) - 98 N.m (72 ft. lbs.).
- Toe Link (3) - 95 N.m (70 ft. lbs.).

26. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, CAMBER

REMOVAL

REMOVAL

Fig. 66: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 67: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform the following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust:
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

81326804

Fig. 68: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

8132349c

Fig. 69: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

Fig. 70: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 71: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. Lower jack just enough to allow top of shock absorber to clear body flange.

Fig. 72: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

Fig. 73: Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (2) mounting link to knuckle (3).
13. Remove nut and bolt (2) mounting link to crossmember (1).
14. Remove link.

INSTALLATION

INSTALLATION

Fig. 74: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing link (1), ensure the following to avoid mis-installation:

- Heavier, thicker end goes toward crossmember.
- Fore-or-aft bow faces forward (curves around coil spring).
- Up-or-down bow faces downward.

Fig. 75: Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Place link in bracket on crossmember (1). Install bolt and nut (2) at crossmember (1) as shown. **Do not**

tighten bolt at this time.

2. Install bolt and nut (2) mounting link to knuckle (3) as shown. **Do not tighten bolt at this time.**

Fig. 76: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

Fig. 77: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

Fig. 78: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

Fig. 79: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 80: Measuring Tension Link Clearance
 Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

Fig. 81: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 82: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 83: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

12. If removed, install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 84: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

13. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

Fig. 85: Camber Link, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

14. Tighten camber link fasteners (2) to:
 - Bolt at crossmember - 85 N.m (63 ft. lbs.).
 - Bolt nut at knuckle - 98 N.m (72 ft. lbs.).

Fig. 86: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

15. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

Fig. 87: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

16. Raise vehicle and remove jack stands (3).

Fig. 88: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) Refer to **INSTALLATION** .
18. Lower vehicle.
19. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, COMPRESSION

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 89: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 90: Compression Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

3. Remove bolt and nut (2) mounting link (3) at knuckle.
4. Remove bolt and nut (1) mounting link (3) at crossmember.
5. Remove link (3).

INSTALLATION

INSTALLATION

Fig. 91: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: Although the compression link is different end-to-end, there is no top and bottom.

1. Position link and install bolt and nut (1) mounting link (3) at crossmember. **Do not tighten bolt at this time.**
2. Install bolt and nut (2) mounting link (3) at knuckle. **Do not tighten bolt at this time.**

Fig. 92: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

3. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
4. Lower vehicle.
5. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access link fasteners.
6. Tighten compression link fasteners to:
 - Bolt at crossmember - 85 N.m (63 ft. lbs.).
 - Bolt at knuckle - 81 N.m (60 ft. lbs.).
7. Perform wheel alignment Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

LINK, SPRING

REMOVAL

NON SRT

Fig. 93: Headlamp Leveling Sensor

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle Refer to **HOISTING, STANDARD PROCEDURE**.
2. Access and remove rear spring. Refer to **SPRING(S), REMOVAL**.
3. If servicing right spring link, disconnect headlamp leveling sensor (1) link at spring link (3), if equipped.

Fig. 94: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

4. Remove spring link-to-knuckle nut and bolt (2).

Fig. 95: Cutting Threads Through Bushing
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to use Tap Guide (2) when tapping sleeve in knuckle to help keep Plug Tap (1) straight during use or damage to Tap may occur.

5. Place Guide (special tool #9361-2, Tap Guide) (2) against sleeve (3) in knuckle to keep special tool

#9361-1, Tap, Plug M16 X 2.0 (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

8130e535

Fig. 96: Rear Knuckle Sleeve Remover/Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

NOTE: When installing thrust bearing on Remover, be sure to place hardened side against nut. Place bearing outer cage against stationary component.

6. Assemble special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit as shown.

- (1) special tool #9361-3, Screw, Forcing
- (2) Nut
- (3) Spherical Washer
- (4) Thrust Bearing
- (5) special tool #9361-4, Cup, Bushing

Fig. 97: Removing Knuckle Sleeve
 Courtesy of CHRYSLER GROUP, LLC

7. Thread special tool #9361-3, Screw, Forcing (1) into tapped knuckle sleeve.
8. Rotate Nut down, matching Sleeve angled end with angled face of knuckle.
9. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

Fig. 98: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

10. Remove bolt and nut (1) fastening spring link (4) to crossmember.
11. Remove spring link (4).

SRT

1. Access and remove rear brake rotor on side of repair. Refer to **ROTOR, BRAKE, REMOVAL** .
2. Access and remove rear spring on side of repair. Refer to **SPRING(S), REMOVAL**.

Fig. 99: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Remove spring link-to-knuckle nut and bolt (2).

Fig. 100: Cutting Threads Through Bushing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It important to use Tap Guide (2) when tapping sleeve in knuckle to help keep Plug Tap (1) straight during use or damage to Tap may occur.

4. Place special tool #9361-11, Guide, Tap (2) against sleeve (3) in knuckle to keep special tool #9361-1, Tap, Plug M16 X 2.0 (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

815e1469

Fig. 101: Rear Knuckle Sleeve Remover/Installer Kit
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

5. Assemble special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit as shown.
 - (1) special tool #9361-3, Screw, Forcing
 - (2) Nut
 - (3) Thrust Bearing
 - (4) Spherical Washer
 - (5) special tool #9361-9, Cup, Remover, Left Side (Left Side - Shown in figure)
 - (5) special tool #9361-10, Cup, Remover, Right Side (Right Side)

NOTE: When installing thrust bearing (3) on Remover, be sure to place hardened side against nut (2). Place bearing outer cage against stationary component.

NOTE: It is important to use appropriate Sleeve (special tool #9361-9, Cup, Remover, Left Side or special tool #9361-10, Cup, Remover, Right Side) on Remover to provide proper Tool-to-Knuckle contact.

Fig. 102: Removing Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

6. Thread special tool #9361-3, Screw, Forcing (2) into tapped knuckle sleeve.
7. Rotate Nut down, matching Sleeve (special tool #9361-9, Cup, Remover, Left Side or special tool #9361-10, Cup, Remover, Right Side) angled end with angled face of knuckle (1). **Make sure foot on Sleeve (3) is inserted behind machined brake caliper mounting boss.**
8. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

Fig. 103: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

9. Remove bolt and nut (1) fastening spring link (4) to crossmember.
10. Remove spring link (4).

INSTALLATION

NON SRT

Fig. 104: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

1. Guide ball joint end of spring link (4) into mounting pocket of knuckle, then swing opposite end up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

813ce76b

Fig. 105: Rear Knuckle Sleeve Remover/Installer

Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

2. Place NEW knuckle sleeve (2) onto special tool #9361-7, Screw, Installation (1), and slide it up to Bolt head.

Fig. 106: Installing Knuckle Sleeve
 Courtesy of CHRYSLER GROUP, LLC

3. Starting from knuckle forward end, slide special tool #9361-7, Screw, Installation (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
4. Install thrust bearing and nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
5. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
6. Remove special tool.

Fig. 107: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

7. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 142 N.m (105 ft. lbs.).

Fig. 108: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

8. Export Only - If servicing right spring link, connect headlamp leveling sensor (1) link at spring link (3).
9. Install rear spring as well as all components necessary to access it. Refer to **SPRING(S), INSTALLATION**.
10. Lower vehicle.
11. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.
12. Tighten spring link bolt at crossmember to 108 N.m (80 ft. lbs.).
13. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SRT

Fig. 109: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

1. Guide ball joint end of spring link (4) into mounting pocket of knuckle, then swing opposite end up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

813ce76b

Fig. 110: Rear Knuckle Sleeve Remover/Installer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

2. Place NEW knuckle sleeve (2) onto special tool #9361-12, Installer, Bushing (1), and slide it up to Bolt head.

Fig. 111: Installing Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

3. Starting from knuckle forward end, slide special tool #9361-12, Installer, Bushing (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
4. Install Installation Thrust Bearing (around 3/8 inch thick) and special flange nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
5. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
6. Remove special tool.

Fig. 112: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
8. Install rear spring and all components necessary to access it, except rear tire and wheel assembly on side of repair Refer to **SPRING(S), INSTALLATION**.
9. Install rear brake rotor and components necessary to access it Refer to **ROTOR, BRAKE, INSTALLATION**.
10. Lower vehicle.
11. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
12. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.
13. Tighten spring link bolt at crossmember to 108 N.m (80 ft. lbs.).
14. Tighten shock absorber lower mounting bolt nut to 72 N.m (53 ft. lbs.).
15. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

LINK, TENSION

REMOVAL

REMOVAL

Fig. 113: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 114: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .

4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform the following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

Fig. 115: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 116: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

Fig. 117: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 118: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important **NOT** to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. Lower jack just enough to allow top of shock absorber to clear body flange.

Fig. 119: Isolators, Coil Spring, Shock Absorber & Crossmember
 Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

Fig. 120: Camber Link, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (4) mounting link to knuckle (3).
13. Remove nut and bolt (4) mounting link to crossmember (1).

14. Remove link.

INSTALLATION

INSTALLATION

Fig. 121: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing tension link, although link (6) is same end-to-end, make sure that center bow is facing downward.

Fig. 122: Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Place link in bracket on crossmember (1). Install bolt and nut (4) at crossmember (1) as shown. **Do not tighten bolt at this time.**
2. Install bolt and nut (4) mounting link to knuckle (3) as shown. **Do not tighten bolt at this time.**

Fig. 123: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

Fig. 124: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

Fig. 125: Shock Absorber & Upper Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

Fig. 126: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 127: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

Fig. 128: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 129: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 130: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. If removed, install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 131: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

13. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

Fig. 132: Camber Link, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

14. Tighten tension link fasteners (4) to:
 - Bolt nut at crossmember - 85 N.m (63 ft. lbs.).
 - Bolt at knuckle - 98 N.m (72 ft. lbs.).

Fig. 133: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

15. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

Fig. 134: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

16. Raise vehicle and remove jack stands (3).

Fig. 135: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) Refer to **INSTALLATION** .
18. Lower vehicle.
19. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, TOE

REMOVAL

LEFT LINK

Fig. 136: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 137: Filler Tube Assembly

Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .

4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust.
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

Fig. 138: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place.

Fig. 139: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 140: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important **NOT** to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

8. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

9. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow toe link mounting bolt at crossmember.

Fig. 141: Wheel Speed Sensor Cable
 Courtesy of CHRYSLER GROUP, LLC

10. If equipped, remove wheel speed sensor cable (2) from toe link.

Fig. 142: Rear Toe Adjustment Bolt Nut
 Courtesy of CHRYSLER GROUP, LLC

11. While holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

813cc05d

Fig. 143: Toe Link, Mounting Bolt & Cam Bolt
 Courtesy of CHRYSLER GROUP, LLC

12. Slide cam bolt (2) rearward out of crossmember and link (1).
13. Remove mounting bolt (3) and nut at knuckle.
14. Remove toe link (1).

RIGHT LINK

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

81385065

Fig. 144: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 145: Wheel Speed Sensor Cable
Courtesy of CHRYSLER GROUP, LLC

3. If equipped, remove wheel speed sensor cable (2) from toe link.

Fig. 146: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

4. While holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

Fig. 147: Toe Link, Mounting Bolt & Cam Bolt
 Courtesy of CHRYSLER GROUP, LLC

5. Slide cam bolt (2) rearward out of crossmember and link (1).
6. Remove mounting bolt (3) and nut at knuckle.
7. Remove toe link (1).

INSTALLATION

LEFT LINK

Fig. 148: Toe Link, Mounting Bolt & Cam Bolt
 Courtesy of CHRYSLER GROUP, LLC

1. Slide crossmember end of toe link (1) into box bracket on crossmember. Slide cam bolt (2) through bracket and link from rear.
2. Install bolt (3) and nut securing link to knuckle. **Do not tighten bolt at this time.**

Fig. 149: Rear Toe Adjustment Bolt Nut
Courtesy of CHRYSLER GROUP, LLC

3. While holding toe adjustment cam bolt from rotating (cam facing upward), Install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten nut at this time.**

Fig. 150: Wheel Speed Sensor Cable
Courtesy of CHRYSLER GROUP, LLC

4. If equipped, attach wheel speed sensor cable (2) to toe link.

Fig. 151: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and lower end of shock absorber (4) into mounted positions.
6. When lower shock mounting bolt holes line up install bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 152: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Continue to raise crossmember in not already in mounted position, then install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 153: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

Fig. 154: Rear Crossmember Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 155: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 156: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 157: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

13. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
14. Lower vehicle.
15. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

Fig. 158: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

Fig. 159: Toe Link, Mounting Bolt & Cam Bolt
Courtesy of CHRYSLER GROUP, LLC

17. Tighten toe link (1) fasteners to:
- Nut at crossmember - 108 N.m (80 ft. lbs.) (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.).
 - Bolt at knuckle - 95 N.m (70 ft. lbs.).
18. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

RIGHT LINK

Fig. 160: Toe Link, Mounting Bolt & Cam Bolt

Courtesy of CHRYSLER GROUP, LLC

1. Slide crossmember end of toe link (1) into box bracket on crossmember. Slide cam bolt (2) through bracket and link from rear of vehicle.
2. Install bolt (3) and nut securing link to knuckle. **Do not tighten bolt at this time.**

Fig. 161: Rear Toe Adjustment Bolt Nut

Courtesy of CHRYSLER GROUP, LLC

3. While holding toe adjustment cam bolt from rotating (cam facing upward), install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten nut at this time.**

Fig. 162: Wheel Speed Sensor Cable

Courtesy of CHRYSLER GROUP, LLC

4. If equipped, Attach wheel speed sensor cable (2) to toe link.
5. Raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 163: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
7. Lower vehicle.
8. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

Fig. 164: Toe Link, Mounting Bolt & Cam Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Tighten toe link (1) fasteners to:
 - Nut at crossmember - 108 N.m (80 ft. lbs.) (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.).
 - Bolt at knuckle - 95 N.m (70 ft. lbs.).
10. Perform wheel alignment Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SHOCK ABSORBER, SUSPENSION

DESCRIPTION

NON SRT

813cfo8e

Fig. 165: Nivomat Load-Leveling Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

Non SRT vehicles have standard gas-charged shock absorbers for the rear suspension.

SRT

3564023

Fig. 166: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown, right side similar.

This vehicle has Active Damping System (ADS) shock absorbers for the rear suspension. The ADS shock absorbers are serviced the same as conventional shocks, except the ADS connector (2) must be removed from the harness connector (3). It is important to pay close attention to which direction the shock solenoid assembly

(1) is pointing when removing and installing ADS shocks.

REMOVAL

NON SRT

Fig. 167: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Position under-hoist utility jack or jack stand under outer spring link adding just enough support to keep suspension from going into full-rebound when shock absorber mounting bolts are removed.

Fig. 168: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 169: Shock Absorber & Upper Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

5. Remove shock absorber (1) upper mounting bolts (2).
6. Remove shock absorber (4).

SRT

Fig. 170: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Position under-hoist utility jack or jack stand under outer spring link adding just enough support to keep suspension from going into full-rebound when shock absorber mounting bolts are removed.

Fig. 171: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown, right side similar.

4. Disconnect the Active Damping System (ADS) shock connector (2) from the harness connector (3).

Fig. 172: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown, left side similar.

5. Remove lower mounting bolt (2) and nut (3) securing shock absorber (1) to knuckle.

Fig. 173: Shock Absorber & Upper Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

6. Remove shock absorber upper mounting bolts (2).
7. Remove shock absorber (4).

INSTALLATION

NON SRT

Fig. 174: Isolators, Coil Spring, Shock Absorber & Crossmember
 Courtesy of CHRYSLER GROUP, LLC

1. Insert lower end of shock absorber (3) into well of spring link (4).

Fig. 175: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

2. Raise upper end of shock absorber (4) up into mounted position on body (1) and install upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

Fig. 176: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

3. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**
4. Remove under-hoist utility jack or jack stand from under spring link.

Fig. 177: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

5. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
6. Lower vehicle.
7. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting

bolt.

Fig. 178: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

8. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

SRT

1. Insert lower end of shock absorber (1) into well of spring link.

8132349c

Fig. 180: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

2. Raise upper end of shock absorber (4) up into mounted position on body (1) and install upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

3553160

Fig. 181: Lower Mounting Bolt, Nut & Shock Absorber
 Courtesy of CHRYSLER GROUP, LLC

3. Install lower shock mounting bolt (2) and nut (3). **Do not tighten at this time.**
4. Remove under-hoist utility jack or jack stand from under spring link.

Fig. 182: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

5. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
6. Lower vehicle.
7. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting bolt.

Fig. 183: Shock Solenoid Assembly & ADS Harness Connector
 Courtesy of CHRYSLER GROUP, LLC

8. Connect the Active Damping System (ADS) connector (2) from the ADS shock (1) to the harness connector (3).

Fig. 184: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

9. Tighten shock absorber lower mounting nut (3) to 72 N.m (53 ft. lbs.).

SPRING(S)

REMOVAL

REMOVAL

Fig. 185: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 186: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side shock absorber, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual exhaust or if servicing right side on vehicle with single exhaust:
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

81326804

Fig. 187: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

8132349c

Fig. 188: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

Fig. 189: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 190: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. Lower jack just enough to allow top of shock absorber to clear body flange.

Fig. 191: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).
12. Disconnect brake hose at bracket mounted to body to allow to avoid overextending hose, damaging it, during following step.
13. Slowly lower jack until crossmember is low enough to remove coil spring. **Do not lower jack any further than necessary to remove spring.**
14. Remove coil spring and isolators (1, 2 and 5).

INSTALLATION

INSTALLATION

Fig. 192: Isolators, Coil Spring, Shock Absorber & Crossmember
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear coil springs are interchangeable.

1. Install upper (1) and lower (5) isolators on coil spring (2).

Fig. 193: Matching Spring Isolator To Spring Link
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

2. Install coil spring with isolators into spring pocket of spring link (1) fitting lower isolator (2) to shape of pocket, then align top of spring with body mount.

Fig. 194: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

Fig. 195: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

Fig. 196: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

Fig. 197: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 198: Measuring Tension Link Clearance
 Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

Fig. 199: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

81326804

Fig. 200: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

8133d888

Fig. 201: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

12. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 202: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

13. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) Refer to **INSTALLATION**.
14. Lower vehicle.
15. Position vehicle on alignment rack/drive-on lift. Raise lift as necessary to access lower mounting bolt.

Fig. 203: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

STABILIZER BAR, REAR SUSPENSION

REMOVAL

REMOVAL

81330050

Fig. 204: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

81386065

Fig. 205: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).
4. Remove rear exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .

Fig. 206: Axle Flange, Rubber Coupler & Index Marks
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

Fig. 207: Propeller Shaft Coupler & Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Remove three (four if equipped with 215 MM axle) propeller shaft coupler-to-axle flange bolts and nuts.

Fig. 208: Supporting Propeller Shaft
 Courtesy of CHRYSLER GROUP, LLC

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown.

Fig. 209: Parking Brake Cable Components
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

Fig. 210: Front Parking Brake Cable & Equalizer
 Courtesy of CHRYSLER GROUP, LLC

9. Remove front parking brake cable (3) from equalizer (2).

Fig. 211: Front Parking Brake Cable, Rear Crossmember Front Flange & Screw
 Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3).

Fig. 212: Rear Brake Caliper, Adapter & Guide Pin Bolts
 Courtesy of CHRYSLER GROUP, LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
 - b. Remove brake caliper (1) from brake adapter (3) and pads.
 - c. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

Fig. 213: Pushing Back Pistons In Bore
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 214: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 215: Rear Caliper Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
17. If equipped with SRT8 disc brakes, remove jack from under spring link.

Fig. 216: Releasing Wheel Speed Sensor Connector
 Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

Fig. 217: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

Fig. 218: Left/Right Rear Wheel Speed Sensor Cable & Routing Clip
Courtesy of CHRYSLER GROUP, LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

Fig. 219: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 220: Marking Location Of Crossmember Mount To Body
 Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER

BUSHING FLANGE

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

Fig. 221: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

23. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 222: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .

Fig. 223: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow

propeller shaft removal from rear axle differential. **Do not lower jack any further than necessary.** Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.

27. Continue to lower jack until crossmember is at a comfortable working level to access stabilizer bar fasteners.

Fig. 224: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

28. On each end, remove bolt (3) and nut fastening stabilizer bar (4) to stabilizer link (2).
29. Remove bolts (1) fastening each stabilizer bar isolator retainer to crossmember.
30. Remove stabilizer bar (4) with isolators and retainers.
31. Remove retainers from isolators.
32. Remove isolators from stabilizer bar utilizing slits in bushings.

INSTALLATION

INSTALLATION

Fig. 225: Rear Stabilizer Bar Mounting
 Courtesy of CHRYSLER GROUP, LLC

1. Install isolators on stabilizer bar utilizing slits in bushings. Install each isolator so its slit faces forward and flat side is positioned toward crossmember once installed.
2. Install retainers on isolators.
3. Install stabilizer bar (4) with isolators and retainers on crossmember.
4. Install isolator retainer mounting bolts (1). **Do not tighten at this time.**
5. Install bolt (3) and nut fastening stabilizer bar ends to each stabilizer links (2). **Do not tighten at this time.**
6. Tighten isolator retainer mounting bolts (1) to 61 N.m (45 ft. lbs.).

Fig. 226: Isolators, Coil Spring, Shock Absorber & Crossmember

Courtesy of CHRYSLER GROUP, LLC

7. Remove coil springs (2) with isolators (1 and 5) from spring links (4).
8. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft onto rear axle differential flange and align shocks with pockets in spring links.

Fig. 227: Rear Crossmember Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

9. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

Fig. 228: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

10. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

11. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 229: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

12. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
13. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 230: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

14. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
15. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

Fig. 231: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

16. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

17. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 232: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

18. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
19. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 233: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

20. Raise left side of crossmember (1) into mounted position. Install left side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 234: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

Fig. 235: Measuring Tension Link Clearance
 Courtesy of CHRYSLER GROUP, LLC

22. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

Fig. 236: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

23. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 237: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

24. Remove jack (3) from under rear axle differential.

Fig. 238: Supporting Propeller Shaft
Courtesy of CHRYSLER GROUP, LLC

25. Remove bungee cord (1) supporting propeller shaft (2).

8131b7b6

Fig. 239: Propeller Shaft Coupler & Rear Axle Flange
 Courtesy of CHRYSLER GROUP, LLC

26. Align propeller shaft index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N.m (60 ft. lbs.).

8133d888

Fig. 240: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

27. Install fuel filler tube Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 241: Left/Right Rear Wheel Speed Sensor Cable & Routing Clip
 Courtesy of CHRYSLER GROUP, LLC

28. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

Fig. 242: Sensor Connection To Body Connector
 Courtesy of CHRYSLER GROUP, LLC

29. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
30. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

Fig. 243: Rear Brake Caliper, Adapter & Guide Pin Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

NOTE: Before installing caliper guide pin bolts, clean guide pin bolt threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

31. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
 - b. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
 - c. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.).
 - d. Make sure brake hose is properly routed and will not come in contact with suspension components.
32. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. Refer to **SPRING(S), REMOVAL**.

Fig. 244: Rear Caliper Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

33. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
34. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.).
35. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

Fig. 245: Front Parking Brake Cable, Rear Crossmember Front Flange & Screw
 Courtesy of CHRYSLER GROUP, LLC

36. Insert routing front parking brake cable bracket locating pin in front flange of crossmember (3), then

install screw (2) fastening cable (1) routing bracket to rear crossmember.

Fig. 246: Front Parking Brake Cable & Equalizer
Courtesy of CHRYSLER GROUP, LLC

37. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential.

Fig. 247: Parking Brake Cables At Rear Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

38. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

Fig. 248: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

39. Install rear exhaust system (2) (dual-outlet exhaust shown in figure). Refer to **MUFFLER, EXHAUST, INSTALLATION**.

Fig. 249: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

40. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
41. Lower vehicle until rear wheels are just above floor level.
42. Apply parking brake lever. Release lever, then reapply.
43. Check to make sure rear wheels will not rotate with lever applied.
44. Lower vehicle.

8133bb50

Fig. 250: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

45. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
46. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
47. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

Fig. 251: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

48. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).

Fig. 252: Rear Stabilizer Bar Mounting
 Courtesy of CHRYSLER GROUP, LLC

49. Tighten stabilizer link fasteners (3) to 61 N.m (45 ft. lbs.).
50. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance. Refer to step 22. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

Tires & Wheels - Service Information - Challenger

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE AND WHEEL VIBRATION

Tire and wheel imbalance, runout and tire road force variation can cause vehicles to exhibit steering wheel vibration and/or seat vibration.

VISUAL INSPECTION

Visual inspection of the vehicle is recommended prior to road testing or performing any other procedure. Raise and support the vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Inspect for the following:

- Verify correct (OEM) wheel and tire, as well as presence of wheel weights.
- Inspect tires and wheels for damage, mud packing and unusual wear; correct as necessary.
- Check and adjust tire air pressure to the pressure listed on the label attached to the driver's door opening.

ROAD TEST

NOTE: If a Noise & Vibration Analyzer is available, use it to diagnosis the issue during the road test.

NOTE: If the vehicle has been sitting for an extended period of time it is recommended to drive to warm the tires. This process could eliminate flat spots that can cause vibration.

Road test vehicle on a smooth road **at and near the designated speed** where legal speed limits allow. Lightly place hands on steering wheel at the 10:00 and 2:00 positions and observe for:

- Steering wheel oscillation: clockwise/counterclockwise
- Steering wheel high frequency movement: rapid vibration up and down
- Seat high frequency movement: rapid vibration up and down

To rule out vibrations due to brakes or powertrain:

- Lightly apply brakes at the designated speed; if vibration occurs or is enhanced, vibration is likely due to a brake concern.
- Shift transmission into neutral while vibration is occurring; if vibration is eliminated, vibration is likely due to a powertrain concern. Refer to the appropriate powertrain service information.

TIRE/WHEEL BALANCE AND ROAD FORCE VARIATION

NOTE: If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.

Balance the tire and wheel assemblies as necessary, and if wheel balance equipment is capable, also test for tire and wheel runout and road force variation following the wheel balancer manufacturer's instructions and using the information listed in Tire And Wheel Balance. Refer to **STANDARD PROCEDURE**. Repeat the road test above to verify the vibration is repaired.

STANDARD PROCEDURE

TIRE AND WHEEL BALANCE

NOTE: Always verify the wheel and tire balance before removing any wheel weights. If assembly is within specification and weights are not corroded or loose, do not remove weights. The process of removing and adding weight could damage wheel protective coating.

NOTE: Balance and road force variation equipment must be calibrated and maintained per equipment manufacturer's specifications.

NOTE: If a tire sealant & inflator kit was used to temporarily repair small punctures then the tire must be removed from wheel and all the sealant must be removed with a water damped cloth before repairing & balancing the assembly.

NOTE: Some wheels may not have an outer flange. Apply adhesive weights on midplane surface to balance.

Fig. 1: Balancing Wheels Using Cone/Collet
Courtesy of CHRYSLER GROUP, LLC

NOTE: Use of the proper collet will prevent potential damage to the Chrome Clad wheels.

NOTE: Balance equipment could read an incorrect balance result when measuring Chrome Clad wheels. This is caused by the equipments mounting cone/collet contacting the cladding or the cone/collet is not balanced. A dual-taper collet (1) type wheel centering tool is recommended as opposed to a high-taper cone (2) type wheel centering tool. Always use the manufacturer's recommended balance equipment.

- Dual-taper collet type (1)
- High-taper cone type (2)
- Possible obstruction (3)
- May not seat properly (4)
- No obstruction (5)
- Properly seated (6)

NOTE: If wheel balance equipment is capable of testing tire road force variation and the tire/wheel assemblies are within specification, place the tires with the greater road force variation on the rear of the vehicle.

Fig. 2: Dynamic Balancing
Courtesy of CHRYSLER GROUP, LLC

For dynamic balancing (**recommended**), the balance equipment is designed to indicate the location and amount of weight to be applied to both the inner and outer rim flanges (2).

Fig. 3: Static Balancing

Courtesy of CHRYSLER GROUP, LLC

For static balancing (**not recommended**), find the location of the heavy spot causing the imbalance (1). Counter balance the wheel directly opposite the heavy spot. Determine weight required to counterbalance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (3) at the predetermined spots.

Aluminum wheels use a different type wheel weight than steel wheels. Be sure to use the correct wheel weight for the wheel type.

Always verify the balance. When using off-vehicle equipment, remount the tire and wheel assembly 180 degrees on the balancer spindle and recheck balance. Balance variation from one spot to the other should not be more than 0.125 (?) ounce. If variation is more than 0.125 ounce, balancing equipment could be malfunctioning or the wrong collet/cone may have been used.

If difficult to balance, break down the tire and wheel assembly and check for loose debris inside the tire. Prior to disassembly, mark (index) the tire at the valve stem. Use this mark in order to remount the tire in its original orientation with respect to the wheel.

TIRE AND WHEEL ROTATION

The following information covers recommended tire rotation practices. For Tire And Wheel Removal and Installation procedures. Refer to **INSTALLATION** or **REMOVAL**.

THREE-SEASON TIRE EQUIPPED

Fig. 4: Three-Season Tire Rotation Pattern
 Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with Three-Season tires (Goodyear F1 Supercar) do not allow for normal tire rotation due to different size tires front-to-rear. These tires have a non-directional asymmetrical tread pattern allowing the tire and wheel assemblies to be switched side-to-side on the same axle.

ALL-SEASON TIRE EQUIPPED

Fig. 5: Rotating Tires
 Courtesy of CHRYSLER GROUP, LLC

Vehicles equipped with All-Season tires (Goodyear Eagle RS-A) use the suggested method of tire rotation that is shown in the graphic. Other rotation methods can be used, but they will not provide all the tire longevity benefits.

REMOVAL

TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

1. Raise vehicle so tire and wheel assembly clears ground level.

Fig. 6: Center Cap Removal Notch
Courtesy of CHRYSLER GROUP, LLC

2. If vehicle is equipped with wheel center caps covering wheel nuts, remove cap with appropriate removal tool utilizing notch formed into wheel (2) near valve stem (1). Use care not to damage wheel coating.

Fig. 7: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Remove five wheel mounting (lug) nuts (3) from studs.
4. Remove tire and wheel assembly (1) from hub.

TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

Fig. 8: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle so tire and wheel assembly clears ground level.

CAUTION: When removing the wheel cover, do not pry the wheel cover from the wheel. This can result in damage to the wheel cover. The wheel cover is attached using the wheel mounting nuts.

2. Remove five wheel mounting (lug) nuts (3) from studs.
3. Remove wheel cover (2) using care not to let tire and wheel assembly (1) fall off vehicle.
4. Remove tire and wheel assembly (1) from hub.

INSTALLATION

TIRE AND WHEEL ASSEMBLY (ALUMINUM WHEEL)

WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.

NOTE: Never use oil or grease on studs or wheel mounting (lug) nuts.

Fig. 9: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Clean wheel mounting surfaces, removing any build-up of corrosion. It is important to have good metal-to-metal contact between wheel and vehicle.
2. Position tire and wheel assembly (1) on wheel mounting studs using hub pilot as guide. Place and hold wheel flush up against mounting surface.

NOTE: Always use the original (OEM) style wheel mounting (lug) nuts. Do not use replacement parts of lesser quality or substitute design.

3. Loosely install all five wheel mounting (lug) nuts (3).

Fig. 10: Tightening Sequence - Aluminum Wheel

Courtesy of CHRYSLER GROUP, LLC

4. Lightly snug all wheel mounting nuts, then progressively tighten them in proper sequence shown in illustration. Tighten wheel mounting nuts to 150 N.m (110 ft. lbs.).

Fig. 11: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

5. If applicable, install wheel center cap (4).
6. Lower vehicle.

TIRE AND WHEEL ASSEMBLY (STEEL WHEEL)

WARNING: Installing wheels without good metal-to-metal contact with the mounting surface could cause loosening of the wheel mounting (lug) nuts. This could adversely affect the safety and handling of the vehicle.

NOTE: Never use oil or grease on studs or wheel mounting nuts.

Fig. 12: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Clean wheel mounting surfaces, removing any corrosion build-up. It is important to have good metal-to-metal contact between wheel and vehicle.
2. Position tire and wheel assembly (1) on wheel mounting studs using hub pilot as guide. Place and hold wheel flush up against mounting surface.

Fig. 13: Valve Stem, Nuts, Hub And Wheel

Courtesy of CHRYSLER GROUP, LLC

- | |
|-------------------|
| 1 - VALVE
STEM |
| 2 - NUTS |
| 3 - HUB |
| 4 - WHEEL |

NOTE: Wheel mounting nuts must be installed on the studs as shown (2) in the illustration, to allow proper installation of the wheel cover.

3. Using valve stem as an index placed at 12 o'clock position (1), install and **lightly tighten** two wheel mounting nuts on studs located at 2 O'clock and 10 O'clock positions as shown (2) in the illustration.

Fig. 14: Installing Cover Over Two Nuts
Courtesy of CHRYSLER GROUP, LLC

4. Place wheel cover (3) on wheel in the following fashion:
 - a. Align valve notch in wheel cover with valve stem on wheel (2).
 - b. At same time, align two holes in wheel cover having retaining tabs (1) with two installed wheel nuts.
 - c. Press in on center of wheel cover until wheel cover retaining tabs (1) push past and engage rear of previously installed wheel mounting nuts. This will hold wheel cover in place.

Fig. 15: Three Nuts Retaining Cover/Wheel
 Courtesy of CHRYSLER GROUP, LLC

5. Install and **lightly tighten** three remaining wheel mounting nuts (3) securing wheel cover in place.

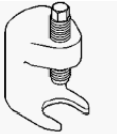

Fig. 16: Wheel Nut Tightening Sequence
 Courtesy of CHRYSLER GROUP, LLC

6. Progressively tighten all five wheel mounting nuts in proper sequence. Tighten wheel mounting nuts to 150 N.m (110 ft. lbs.)
7. Lower vehicle.

TIRE PRESSURE MONITORING

DESCRIPTION

BASE

The Base TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole, a central receiver module (Wireless Ignition Node (WIN)), and an indicator lamp.

The receiver circuit for the TPM system is integrated into the WIN. For non-remote start vehicles, the antenna is internal to the WIN. For factory installed remote start vehicles, the antenna is external to the WIN. The WIN can also include the Remote Keyless Entry (RKE) receiver, Remote Start (if equipped) and the Sentry Key Immobilizer (SKIM) receiver. All receivers share a number of common components. The WIN decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the WIN will send a request to the module that controls the indicator lamp (and the text display if equipped with the Premium system) via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime".

The WIN will store all warning and fault conditions, placard pressure values and low-pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted.

The WIN will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication. All other data values transmitted from each active wheel sensor (not the spare tire) shall be stored in the WIN memory.

The WIN automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

NOTE: A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is

updated (for up to 20 minutes).

NOTE: **Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.**

PREMIUM

The Premium TPM system consists of tire pressure monitoring sensors attached to each road wheel through the valve stem mounting hole and a TPM module. The receiver circuit for the TPM system is mounted in the right rear wheel well. The TPM module is fixed to a metal bracket mounted to the inner wheel well located behind the splash shield. The TPM module decodes the RF signals transmitted by each of the vehicle's tire pressure sensors. The decoded information is used to determine if "warning" or "fault" conditions exist within the TPM system.

Upon detection of a warning or fault condition, the TPM module will send a request to the module that controls the indicator lamp and the text display via the vehicle bus system to illuminate or flash the indicator lamp. Also, upon detection of a warning or fault condition, the electronic display will send a request to sound the "chime".

The TPM module will store all warning and fault conditions, placard pressure values and low pressure threshold values (lamp ON and OFF) in memory that can be accessed through diagnostic communication. If new sensors are introduced to the vehicle, the data stored for the sensor being replaced will be deleted once the new sensor ID has been learned.

The TPM module will store all wheel sensor ID's and locations and faults in memory that can be accessed through diagnostic communication.

The TPM module automatically learns and stores the sensor IDs while driving "within 20 minutes continuously above 15 mph (24 km/h)" after a sensor has been replaced. The learning sequence will initiate when the vehicle has been stopped for more than 20 minutes.

NOTE: **A new sensor ID can also be programmed directly into the WIN or TPM module by using a RKE-TPM Analyzer in conjunction with a Scan Tool. Once the new sensor ID has been programmed, the vehicle will need to be driven above 15 mph until the fault is no longer active (lamp extinguishes) and display is updated (for up to 20 minutes).**

NOTE: **Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.**

OPERATION

OPERATION

TIRE PRESSURE MONITORING

The Tire Pressure Monitoring (TPM) system is designed to operate without loss of function for all OEM tire construction for this vehicle. Sensors, mounted to each road wheel as part of the valve stem, transmit an RF

signal indicating their individual pressure to a receiver located in the TPM module. These transmissions occur approximately once every minute at speeds over 15 mph (24 km/h). For more information on sensors. Refer to **SENSOR, TIRE PRESSURE MONITORING (TPM), OPERATION.**

If the TPM module detects that the tire pressure in any road tire is going low, beyond the Low Pressure (lamp) ON threshold (see placard table below), a chime will sound and the indicator lamp will turn on. In addition to the chime and lamp, a graphic display of the pressure value(s) and position of the low tire(s) will flash in the Electronic Vehicle Information Center (EVIC). Once pressure in the suspect tire(s) raises above the Low Pressure (lamp) OFF Threshold (see placard table below), and the TPM module receives a valid transmission from the sensor, the lamp will go out. If a system fault is detected due to a missing sensor signal, in addition to a chime and a indicator lamp flashing, a "Check TPM System" text message will be displayed in the instrument cluster, and the tire pressure graphic display will have "- -" in place of the pressure value. After the flash sequence, the TPM indicator lamp will remain illuminated. The system will return to normal once the TPM module receives a valid transmission from that sensor location. If a system fault is detected, the indicator lamp will flash on/off for 75 seconds and then remain on solid.

If the TPM module detects a warning or fault condition at ignition key ON it will wait approximately ten seconds before sending the first request to illuminate the indicator lamp. This will assure that the display module has concluded its bulb check period. The display module will request a chime once per ignition cycle when a "warning" or "fault" condition is detected. A "warning" or "fault" condition will remain enabled until the problem causing the condition is corrected and reset.

The TPM module shall continuously monitor for the receipt of tire pressure RF message transmissions from the wheel sensors during the ignition key ON cycle. The wheel sensor IDs and the location of each sensor (e.g. Tire 1, Tire 2 etc.) are learned by the TPM control module using signal strength and direction of wheel rotation as received by the TPM module from each of the sensors, and updates the graphic display when necessary or during a service procedure, as required.

The TPM System will continue to warn the driver of low tire pressure as long as the condition exists, and will not turn off the indicator lamp until the tire pressure is at or above the Low Pressure (lamp) OFF threshold (see placard table below). The system will automatically update and the TPM indicator lamp will turn off once the updated tire pressures have been received.

Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will decrease. Tire pressure should always be set based on cold inflation tire pressure (placard pressure). This is defined as the tire pressure after a vehicle has not been driven for more than 3 hours (and in outside ambient temperature). The tire pressure will also increase as the vehicle is driven? this is normal and there should be no adjustment for this increased pressure. For a system fault, the system will return to normal once the TPM module receives a valid transmission from that sensor location.

TPM THRESHOLD PRESSURES

NOTE: To determine the pressure thresholds for a vehicle, refer to the Tire Inflation Pressure (Placard) Label found on the Driver B-pillar, then apply the placard pressure to the following table.

TPM THRESHOLD PRESSURES

Placard Pressure (Cold) (PSI)	Low Pressure ON Threshold (PSI)	Low Pressure OFF Threshold (PSI)
28	22	26
29	23	27
30	24	28
31	25	29
32	25	29
33	26	30
34	27	31
35	28	32

65	52	62
70	56	67
75	60	72
80	64	77

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - TIRE PRESSURE MONITORING

When diagnosing a tire pressure issue, first check the Tire Pressure Monitoring (TPM) indicator lamp in the instrument cluster during ignition key ON. From the OFF position, turn the key to ON and check the TPM indicator lamp to observe one of the following:

- If after 10 seconds the indicator lamp is illuminating continuously (not flashing), proceed to LOW PRESSURE below.

- If after 10 seconds the indicator lamp flashes on/off for 75 seconds, then remains on solid, there is a system fault detected. Proceed to SYSTEM FAULT below.

LOW PRESSURE

NOTE: Tire pressure may increase from 2 to 6 psi (14 to 41 kPa) during normal driving conditions. Do NOT reduce this normal pressure build up.

NOTE: Tire pressure will vary with temperature by about 1 psi (6.9 kPa) for every 12°F (6.5°C). This means that when the outside temperature decreases, the tire pressure will also decrease. Tire pressure should always be set based on cold inflation tire pressure. For details, refer to TIRES, STANDARD PROCEDURE.

Check air pressure as necessary in all tires using a known accurate air gauge and adjust to the specification listed on the Tire Inflation Pressure Label (Placard) provided with the vehicle (usually applied to the driver side B-pillar). After adjusting air pressure in a tire on the vehicle, the vehicle needs to be driven for approximately two minutes above 15 mph for the message or indicator lamp to go out.

If air pressure in any tire is low, inspect **all** the tires for leaks. A water "dunk tank" or other water test may be used to check for a leak around the sensor as long as any water at the valve core is removed once the procedure is completed. The water can be easily expelled from the core area by pushing in on the core for several seconds, allowing escaping air to drive out any moisture. Reinflate the tire as necessary. Always make sure the original (special) valve stem cap is securely installed to keep moisture out of the sensor.

If the indicator lamp is still ON continuously, refer to the appropriate diagnostic information.

SYSTEM FAULT

If a system fault is detected, a chime will sound and the TPM indicator (telltale) lamp will flash for 75 seconds, then remain on solid. For vehicles with the Premium TPM Systems, a "CHECK TPM SYSTEM" message will appear in the Electronic Vehicle Information Center (EVIC), followed by a graphic display. A system fault can occur by many reasons, including the following:

- Signal interference due to electronic devices or driving next to facilities emitting the same radio frequencies as the TPM sensors
- Installing some form of aftermarket window tinting that affects radio wave signals
- Accumulation of snow or ice around the wheels or wheel housings
- Using tire chains on the vehicle
- Using wheels not equipped with TPM sensors

Refer to the appropriate diagnostic information.

MODULE, TIRE PRESSURE MONITORING (TPM)

DESCRIPTION

DESCRIPTION

The Tire Pressure Monitor (TPM) module is a stand-alone receiver used to perform all TPM functionality in a Premium TPM System on this vehicle. The TPM is located in the right rear wheel well behind the splash shield and is mounted to the wheel house inner flange with a bracket. The TPM uses information transmitted from each of the sensors as well as the difference in the strength of the signal received to determine the location of each of the sensors. The TPM then transmits the required information directly to the CCN in order to update the lamp, chime and display as required.

OPERATION

OPERATION

The Tire Pressure Monitor (TPM) receives information from each of the sensors in the form of RF signals. The information contained in each of the transmissions provides all the information necessary for the TPM to determine the pressure in each tire as well as the position of the sensor. This autolocating process only happens in the first 10 minutes of any drive cycle while traveling at speeds above 15 mph (24 km/h) (The autolocating process will start again only if the vehicle has been shut off for approximately 20 minutes or longer).

REMOVAL

REMOVAL

1. Remove wheelhouse splash shield. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, REMOVAL** or **SHIELD, SPLASH, REAR WHEELHOUSE, REMOVAL** .

309488

Fig. 17: TPM Module, Connector, Seam Flange And Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

2. Disconnect wiring harness connector (3) at the Tire Pressure Monitoring (TPM) Module (2).
3. Remove mounting nuts (1), then remove TPM module (2) from body seam flange (4).

INSTALLATION

INSTALLATION

309488

Fig. 18: TPM Module, Connector, Seam Flange And Mounting Nuts
Courtesy of CHRYSLER GROUP, LLC

1. Position the Tire Pressure Monitoring (TPM) Module (2) on body seam flange (4) and install mounting nuts (1).
2. Connect wiring harness connector (3) at TPM Module (2).
3. Install wheelhouse splash shield and all components removed to access it. Refer to **SHIELD, SPLASH, FRONT WHEELHOUSE, INSTALLATION** or **SHIELD, SPLASH, REAR WHEELHOUSE, INSTALLATION**.
4. Perform one of the following to make the system learn the new sensor ID.
 - a. Use the TPM-RKE Analyzer 9936, with the Scan Tool to program the TPM Module with the tire pressure sensor ID. This is part of the TPM Verification Diagnostic Test. Refer to **STANDARD PROCEDURE**.
 - b. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 20 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Verification Diagnostic Test. Refer to **STANDARD PROCEDURE**.

SENSOR, TIRE PRESSURE MONITORING (TPM)

CAUTION

CAUTION

CAUTION: The use of tire sealants is not recommended for vehicles equipped with the Tire Pressure Monitoring system. Tire sealants may clog tire pressure sensors.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for

the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: It is not recommended to install a tire pressure sensor in an aftermarket wheel. Use tire pressure sensors in original style factory wheels only.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

DESCRIPTION

NON SRT8

2494727

Fig. 19: Tire Pressure Monitoring Sensor Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: Replace the valve stem assembly and tire pressure sensor mounting screw with each tire change.

One tire pressure sensor (1) is mounted to a valve stem (2) specifically designed for mounting the pressure sensor (1) in each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor (1) must be replaced. The TPM system operates on a 433 MHz radio frequency. The tire pressure sensor valve stem (2) looks similar to a standard valve stem with the tire mounted on the wheel. To visually identify a tire pressure sensor/valve stem, the valve stem cap (3) is longer than a standard valve stem.

NOTE: This vehicle uses the 433 MHz TPM sensor. Although 315 MHz and 433 MHz sensors are identical in size and shape, they are not interchangeable. Always make sure the correct sensor is being used. A RKE-TPM Analyzer can be used to determine the sensor's frequency without having to dismount the tire.

The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel. (This could cause sealing and system performance issues.)

The serviceable components of the tire pressure sensor are:

- Tire pressure sensor (1), including all components below
- Valve stem (2), including screw (4), core and cap (3)
- Valve stem core (not shown)
- Valve stem cap (3)

The valve stem caps and cores used are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

SRT8

900313

Fig. 20: Sensor Mounting - Exploded View
Courtesy of CHRYSLER GROUP, LLC

On vehicles equipped with Tire Pressure Monitoring (TPM), one tire pressure sensor (6) is mounted to each wheel in place of the traditional tire valve stem. Each sensor has an internal battery that lasts up to 10 years. The battery is not serviceable. At the time of battery failure, the sensor must be replaced.

301766

Fig. 21: Tire Pressure Monitoring Sensor
Courtesy of CHRYSLER GROUP, LLC

The TPM system operates on a 433 MHz radio frequency. The 433 MHz sensors (1) can be easily identified by the part number.

CAUTION: Although additional sensors operating at 433 MHz sensors are available and are used in other applications, they are not interchangeable. Always make sure the correct sensor is being used and be sure to replace the sensor with the correct part number.

NOTE: Once mounted inside a tire and wheel assembly you are not able to visually see the difference between this sensor and other 315 MHz and 433 MHz sensors. At that point, the TPM/RKE Analyzer 9936, with the Scan Tool may be used to identify the sensor frequency or the tire can be dismounted allowing visual inspection of the sensor body and part number.

The TPM sensors are designed for original style factory wheels. It is not recommended to install a tire pressure sensor in an aftermarket wheel (This could cause sealing and system performance issues). **Do not attempt to install a tire pressure sensor in an aftermarket wheel. If aftermarket wheels are installed and do not**

contain tire pressure sensors, the system will not function properly and the driver will be continuously notified of a system malfunction.

2 - SEAL
3 - NUT (WITH PRESSED-IN WASHER)
4 - CAP (WITH SEAL)
5 - SECTIONAL CUTAWAY OF WHEEL
6 - TPM SENSOR |
|---|

The serviceable components of the tire pressure sensor are:

- Sensor-To-Wheel Seal (2) and Metal Washer (1)
- Valve Stem Cap (4)
- Valve Stem Core
- Valve Stem Nut (with pressed-in washer) (3)

NOTE: Any time a sensor is installed on a wheel, a new Sensor-To-Wheel Seal (2), Metal Washer (1) and Valve Stem Nut (3) must be installed to ensure air tight sealing. A service kit is available.

The valve stem caps and cores are specifically designed for the tire pressure monitoring sensors. Although similar to standard valve stem caps and cores, they are different. The valve stem cap has a special seal inside to keep moisture and corrosion out. The valve stem core has a special nickel coating to protect from corrosion.

OPERATION

OPERATION

CAUTION: The TPMS has been optimized for the original equipment tires and wheels. TPMS pressures have been established for the tire size equipped on your vehicle. Undesirable system operation or sensor damage may result when using replacement equipment that is not of the same size, type, and/or style. Aftermarket wheels can cause sensor damage. Do not use aftermarket tire sealants or balance beads if your vehicle is equipped with a TPMS, as damage to the sensors may result.

CAUTION: After inspecting or adjusting the tire pressure always reinstall the valve stem cap. This will prevent moisture and dirt from entering the valve stem, which could damage the Tire Pressure Monitoring Sensor.

CAUTION: Tire pressure sensor valve stem caps and cores are specially designed for the sensors. Due to risk of corrosion, do not use a standard valve stem cap or core in a tire pressure sensor in place of the original equipment style sensor cap and core.

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

NOTE: TPM thresholds have been established for the original tire size equipped on the vehicle. Use original size tires only to maintain system accuracy.

The battery operated tire pressure sensor is both a transmitter and a receiver. The TPM sensor can be forced to transmit if using a special tool such as a TPM-RKE Analyzer. The TPM-RKE Analyzer has the ability to change the sensor mode and to diagnose a faulty TPM sensor. Using a TPM-RKE Analyzer can take up to a minute to force a transmission from a sensor.

Each sensor's (transmitter) broadcast is uniquely coded so that the module can monitor the state of each of the sensors on the four rotating road wheels. The module can automatically learn and store the sensor's ID while driving "within 10 minutes continuously above 15 m.p.h. (24 Km/h)" after a sensor has been replaced. The vehicle must be stationary for more than 20 minutes in order to initiate the learning sequence.

The sensor IDs can also be programmed using the TPM-RKE Analyzer Tool. Scan each TPM sensor at each road wheel, and store each Sensor ID in the correct location. (LEFT FRONT, LEFT REAR, RIGHT FRONT, and RIGHT REAR) Connect the TPM-RKE Analyzer Tool to the Scan Tool. Then follow the programming steps outlined in the diagnostic Scan Tool for "Program Tire Pressure Sensor ID w/ TPM Tool".

REMOVAL

NON SRT8

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove tire and wheel assembly.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

Fig. 23: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
 - a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
 - b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem $\pm 10^\circ$, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

Fig. 24: Valve Stem Retainer Screw, Sensor & Valve Stem

Courtesy of CHRYSLER GROUP, LLC

4. Remove the sensor to valve stem retainer screw (3) and remove the sensor (1) from the valve stem (2).
5. Remove the valve stem (2) from the wheel (4).

SRT8

1. Raise and support vehicle.
2. Remove tire and wheel assembly.

CAUTION: The cap used on this valve stem contains an O-ring seal to prevent contamination and moisture from entering the valve stem. Do not substitute a regular valve stem cap in its place.

CAUTION: The valve stem used on this vehicle is made of aluminum and the core is nickel plated brass. The original valve stem core must be reinstalled and not substituted with a valve stem core made of a different material. This is required to prevent corrosion in the valve stem caused by the different metals.

Fig. 25: Start Mount/Dismount Tool Within 10 Degrees Of Valve Stem
Courtesy of CHRYSLER GROUP, LLC

3. Dismount tire from wheel following tire changer manufacturers instructions while paying special attention to the following to avoid damaging the pressure sensor:
 - a. When breaking the tire bead loose from the wheel rim, avoid using the Bead Breaker in the area of the sensor (1). That includes both outer and inner beads of the tire.
 - b. When preparing to dismount the tire from the wheel, carefully insert the mounting/dismounting tool 280° from the valve stem $\pm 10^\circ$, then proceed to dismount the tire from the wheel. Use this process on both outer and inner tire beads.

Fig. 26: Sensor Mounting To Wheel
Courtesy of CHRYSLER GROUP, LLC

4. Remove sensor nut (3) retaining sensor to wheel. While removing nut, hold pressure against rear of metal valve stem to keep valve stem from pushing rearward, damaging antenna strap.
5. Remove sensor (1) from wheel (2).

INSTALLATION

NON SRT8

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem. If replacing a valve stem only (using the existing tire pressure sensor), the new valve stem will include a new tire pressure sensor mounting screw. Always use a new mounting screw when attaching a sensor to a valve stem.

Fig. 27: Valve Stem Retainer Screw, Sensor & Valve Stem
Courtesy of CHRYSLER GROUP, LLC

CAUTION: Any time a sensor is to be reinstalled in a wheel, a new valve stem assembly must be installed to ensure air tight sealing.

1. Wipe area clean around sensor/valve stem mounting hole in wheel (4). Make sure surface of wheel is not damaged.

NOTE: A new valve stem is pre-lubricated for proper installation with a standard tool.

NOTE: If replacing tire pressure sensor, a new valve stem will be pre-mounted to the sensor as an assembly. Verify that the sensor is positioned properly before seating the valve stem.

2. Insert valve stem (2) through wheel (4) and pull through to seat with standard valve stem installation tool.

2494727

Fig. 28: Tire Pressure Monitoring Sensor Components

Courtesy of CHRYSLER GROUP, LLC

3. If replacing the valve stem (2) only (using the existing tire pressure sensor), verify that the flat sides of the brass extension on the bottom of the valve stem (2) are at a 90 degree angle with the wheel. Position the pressure sensor (1) over the brass extension, install the retainer screw (4) and tighten to 1.4 N.m (12 in. lbs.).
4. Mount tire on wheel following tire changer manufacturers instructions, paying special attention to the following to avoid damaging tire pressure sensor:

1433873

Fig. 29: Mounting Tire Using Rotating Wheel Machine

Courtesy of CHRYSLER GROUP, LLC

- a. Rotating Wheel Tire Changers - Once the wheel is mounted to the changer, position the sensor valve stem (2) approximately 280° from the head of the changer (located at 1) in a clockwise direction before rotating the wheel (also in a clockwise direction) to mount the tire. Use this

procedure on both the outer and inner tire beads.

Make sure the sensor is clear of the lower bead breaker area (3) to avoid damaging the sensor when the breaker rises. Rotate the tool (2) in a counterclockwise direction to mount the tire. Use this procedure on both the outer and inner tire beads.

1 - VALVE STEM 2 - INSTALLATION END OF MOUNTING/DISMOUNTING TOOL 3 - BEAD BREAKER (KEEP CLEAR OF SENSOR)

- c. Adjust air pressure to that listed on Tire Inflation Pressure Label (Placard) provided with vehicle (usually applied to driver's side B-pillar). Make sure **original style** valve stem cap is securely installed to keep moisture out of sensor.
- d. Install tire and wheel assembly on vehicle.
- e. Remove the support and lower the vehicle.
- f. Perform one of the following to make the system learn the new sensor ID.
- g. Use the TPM-RKE Analyzer, 9936, with the Scan Tool to program the WIN with the tire pressure sensor ID. This is part of the TPM Verification Diagnostic Test. Refer to **STANDARD PROCEDURE**.

- h. Once the vehicle has remained stationary for more than 20 minutes, drive vehicle for a minimum of 10 minutes while maintaining a continuous speed above 15 mph (24 km/h). During this time, the system will learn the new sensor ID. This is part of the TPM Diagnostic Verification Test. Refer to **STANDARD PROCEDURE** .

NOTE: If a sensor cannot be trained, refer to appropriate diagnostic information.

TIRES

DESCRIPTION

TIRE

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain, in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe application of brakes
- High-speed driving
- Taking turns at excessive speeds
- Striking curbs and other obstacles
- Operating vehicle with over or under inflated tire pressures

Radial ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread-life potential.

TIRE IDENTIFICATION

Tire type, size, load index and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the TIRE IDENTIFICATION chart to decipher the code. For example purposes, the tire size P225/60 R 16 97 T is used in the chart. An All Season type tire will also have either M + S, M AND S or M - S (indicating mud and snow traction) imprinted on the side wall. An Extra or Light Load marking "XL" or "LL" may also be listed on the sidewall. The absence of an "XL" or "LL" marking infers a standard load tire.

TIRE IDENTIFICATION

Reading Tire Codes		
P	TIRE TYPE (Not present on all tires)	P - Passenger
		T - Temporary
		C - Commercial

		LT - Light Truck
225	SECTIONAL WIDTH	SHOWN IN MILLIMETERS

16	WHEEL DIAMETER	SHOWN IN INCHES
97	LOAD INDEX	**
T	SPEED RATING	**

Fig. 37: Tire Aspect Ratio

Courtesy of CHRYSLER GROUP, LLC

- 1 - SECTIONAL WIDTH
2 - SECTIONAL HEIGHT

NOTE: * Height (2) ÷ Width (1) = Aspect Ratio.

NOTE: ** Consult the tire manufacturer regarding any questions on tire specifications or capabilities.

TIRE CHAINS

Refer to the Owner's Manual supplied with the vehicle to determine whether the use of tire chains is permitted on this vehicle.

TIRE - SRT8

There is no spare tire available with this vehicle. It is equipped with the TIREFIT tire repair kit to be used to repair small punctures in the tire as necessary. For additional information, refer to the Owner's Manual.

There are two different tire types available for the SRT8 vehicle. A standard Three-Season tire and an optional All-Season tire. Both tires have a non-directional asymmetrical tread pattern.

NOTE: The Three-Season tire size differs front-to-rear on the vehicle. Because of this size difference, normal tire rotation is not applicable. The All-Season tire and wheel combination may be rotated. Refer to STANDARD PROCEDURE.

THREE-SEASON TIRE

DESCRIPTION	SPECIFICATION
Manufacturer	Goodyear
Model	Eagle F1 Supercar
Size - Front	245/45ZR20
Size - Rear	255/45ZR20

ALL-SEASON TIRE

DESCRIPTION	SPECIFICATION
Manufacturer	Goodyear
Model	Eagle RS-A
Size	245/45ZR20

REPLACEMENT TIRES

WARNING: Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure.

WARNING: In order to maintain the speed capability of the vehicle, replacement tires must have speed ratings equal to or higher than those fitted to the vehicle as original equipment. If tires with lower speed ratings are fitted, the vehicle's handling may be affected and the speed capability of the vehicle may be lowered to the maximum speed capability of the replacement tires. To avoid an accident resulting in severe or fatal injury, consult the tire manufacturer in regards to maximum speed ratings.

It is recommended that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The original equipment tires provide a proper combination of many characteristics such as:

- Ride
- Noise
- Handling
- Durability

- Tread life
- Traction
- Rolling resistance
- Speed capability

The use of tires smaller than the minimum tire size approved for the vehicle can result in tire overloading and failure.

Use tires that have the approved load rating for the vehicle and never overload them. Failure to equip the vehicle with tires having adequate speed capability can result in sudden tire failure and loss of vehicle control.

The use of oversize tires may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

SPARE TIRE

A compact (temporary) spare tire and wheel assembly is standard equipment on most models of this vehicle. A full-size spare is not available on most models.

SRT vehicles and select Export vehicles are equipped with the TIREFIT tire repair kit as standard equipment in place of a spare tire. It is to be used to repair small punctures in the tire as necessary. A compact spare tire is optional on select Export Vehicles. For additional information, refer to the Owner's Manual.

The spare tire and wheel diameters and wheel offsets match those of the road wheels on the vehicle.

The compact (temporary) spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity, then reinstalled. Do not exceed speeds of 80 km/h (50 mph) when using the compact (temporary) spare tire and wheel assembly. Refer to the Owner's Manual for complete details.

DIAGNOSIS AND TESTING

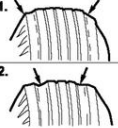

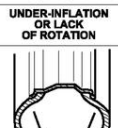

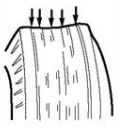

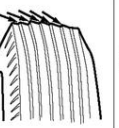

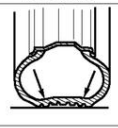

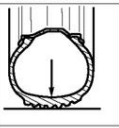

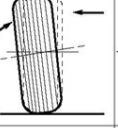

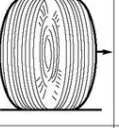

TIRE NOISE

Unusual tire noise can be associated with tire and wheel vibration or irregular tire wear. For vibration issues, refer to **DIAGNOSIS AND TESTING**. For irregular tire wear issues. Refer to **TIRES, DIAGNOSIS AND TESTING**.

TIRE/VEHICLE LEAD

Refer to **WHEEL ALIGNMENT, DIAGNOSIS AND TESTING** .

TIRE WEAR PATTERNS

* HAVE TIRE INSPECTED FOR FUTURE USE.

812014d7

Fig. 38: Identifying Tire Wear Patterns
Courtesy of CHRYSLER GROUP, LLC

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other.

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread.

TREAD WEAR INDICATORS

Fig. 39: Identifying Tread Wear Indicators
Courtesy of CHRYSLER GROUP, LLC

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (3).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

STANDARD PROCEDURE

TIRE INFLATION PRESSURES

The specified tire pressures have been chosen to provide safe operation, vehicle stability, and a smooth ride. The proper tire pressure specification can be found on the Tire And Loading Information Label provided with the vehicle (usually on the driver's door opening or B-pillar).

A quality air pressure gauge is recommended to check tire air pressure. Tire pressure should be checked cold once per month. Check tire pressure more frequently when the weather temperature varies widely. Tire pressure will decrease when the outdoor temperature drops. After checking the air pressure, replace valve cap finger tight.

Inflation pressures specified on the Tire Inflation Pressure Label are always the cold inflation pressure of the tire. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours, or the vehicle is driven less than one mile after being inoperative for 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. Do not reduce this normal pressure buildup.

Improper inflation can cause:

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- The vehicle to drift.

WARNING: Over or Under inflated tires can affect vehicle handling. The tire can fail suddenly, resulting in loss of vehicle control.

Fig. 40: Under Inflation

Courtesy of CHRYSLER GROUP, LLC

Under inflation causes rapid shoulder wear, tire flexing, and can result in tire failure (1).

Fig. 41: Over Inflation

Courtesy of CHRYSLER GROUP, LLC

Over inflation causes rapid center wear and loss of the tire's ability to cushion shocks (1).

TIRE LEAK REPAIRING

Fig. 42: Identifying Tire Repair Area

Courtesy of CHRYSLER GROUP, LLC

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect or puncture, is in the tread area (1). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before attempting to dismount the tire from the wheel. **Use a lubricant such as a mild soap solution when dismounting or mounting tire.** Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and progressively tighten the 5 wheel nuts to a torque of 150 N.m (110 ft. lbs.).

WHEELS

DESCRIPTION

DESCRIPTION

Fig. 43: Identifying Wheel/Rim Design
Courtesy of CHRYSLER GROUP, LLC

All vehicles use either steel or cast aluminum drop center wheels. The original equipment wheels are designed for proper operation at all loads up to the specified maximum vehicle capacity.

Every wheel has raised sections between the rim flanges (1) and drop well (3) called safety humps (2). In case of air loss, these raised sections help hold the tire in position on the wheel until the vehicle can be brought to a safe stop. When being installed on the wheel, initial inflation of the tire forces the tire bead over these raised sections into place.

The wheel studs and nuts are designed for specific wheel applications and must be replaced with equivalent parts. Do not use replacement parts of lesser quality or of a substitute design. All aluminum and steel wheels have wheel stud nuts with an enlarged nose. This enlarged nose is necessary to ensure proper retention of the wheels.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - WHEEL INSPECTION

Inspect wheels for:

- Excessive runout

- Dents, cracks or irregular bends
- Damaged wheel stud (lug) holes
- Air Leaks

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged, an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: Failure to use equivalent replacement wheels may adversely affect the safety and handling of the vehicle.

WARNING: Replacement with used wheels is not recommended. The service history of the wheel may have included severe treatment or very high mileage. The rim could fail without warning.

WARNING: Chrysler LLC does not recommend that customers use "reconditioned" wheels (wheels that have been damaged and repaired) because they can result in a sudden catastrophic wheel failure which could cause loss of control and result in injury or death. For clarification:

- Cosmetic refinishing for the purpose of repairing a superficial flaw is an acceptable procedure providing it is limited to paint or clear coat only, the wheel is not modified in any way, and there is no exposure to paint curing heat over 200 degrees Fahrenheit (93 degrees Celsius).
- Damaged wheels are those which have been bent, broken, cracked or sustained some other physical damage which may have compromised the wheel structure.
- Repaired indicates that the wheel has been modified through bending, welding, heating, straightening, or material removal to rectify damage.
- Re-plating of chrome plated wheels is not an acceptable procedure nor is chrome plating of original equipment painted or polished wheels, as this may alter mechanical properties and affect fatigue life.

CLEANING

CLEANING

All wheels and wheel trim, especially aluminum and chrome plated, should be cleaned regularly using mild soap and water to maintain their luster and to prevent corrosion. Wash them with the same soap solution recommended for the body of the vehicle.

When cleaning extremely dirty wheels, care must be taken in the selection of tire and wheel cleaning chemicals and equipment to prevent damage to the wheels. Mopar® Tire and Wheel Cleaner, Mopar® Wheel Treatment or Mopar® Chrome Cleaner is recommended. Any of the "DO NOT USE" items listed below can damage wheels and wheel trim.

DO NOT USE:

- Any abrasive cleaner
- Any abrasive cleaning pad (such as steel wool) or abrasive brush
- Any cleaner that contains an acid which can react with and discolor the chrome surface. **Many wheel cleaners contain acids that can harm the wheel surface.**
- Oven cleaner
- A car wash that uses carbide-tipped wheel cleaning brushes or acidic solutions.

STUD, WHEEL, FRONT

REMOVAL

REMOVAL

NOTE: Before proceeding, refer to CAUTION and WARNING .

CAUTION: Wheel mounting studs **MUST NOT** be hammered out of hub flange of hub and bearing assembly. If a stud is removed by hammering it out, damage to hub and bearing assembly will occur leading to premature bearing failure.

1. Raise and support vehicle. Refer to HOISTING, STANDARD PROCEDURE .
2. Remove front wheel and tire assembly. Refer to REMOVAL.
3. Access and remove front brake rotor. Refer to ROTOR, BRAKE, REMOVAL .

3. Install parking brake shoe adjuster (1) between upper and lower parking brake shoes. Position end of adjuster with star wheel upward. Once in place, slide upper shoe downward against adjuster mounting slot, taking up any slack between two pieces.
4. Using appropriate tools, install spring (3) at adjuster.

Fig. 50: Measuring Parking Brake Drum Diameter
 Courtesy of CHRYSLER GROUP, LLC

NOTE: When measuring brake drum diameter, diameter should be measured in center of shoe contact surface area.

5. Using Brake Shoe Gauge (special tool #C-3919, Gauge, Brake Shoes), or equivalent, measure inside diameter of parking brake drum portion of rotor.

Fig. 51: Measuring Parking Brake Shoes
 Courtesy of CHRYSLER GROUP, LLC

1 - BRAKE SHOE GAUGE 2 - ADJUSTER STAR WHEEL
--

6. Place Gauge (1) over parking brake shoes at widest point.
7. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge. This will give a good preliminary adjustment of parking brake shoes, before a final adjustment is made at end of this procedure.
8. Install brake rotor and components removed to access it. Refer to **ROTOR, BRAKE, INSTALLATION** .
9. Install wheel and tire assembly. Refer to **INSTALLATION**. Tighten wheel mounting (lug) nuts in proper sequence to 150 N.m (110 ft. lbs.).
10. Adjust parking brake shoes. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
11. Lower vehicle.
12. Road test vehicle to ensure proper operation of the brakes.

2013 SUSPENSION

Rear Suspension - Challenger

DESCRIPTION

NON SRT

Fig. 1: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

This vehicle utilizes a five-link rear suspension including the following major components:

- Camber Link (1)
- Compression Link (5)
- Spring Link (2)
- Tension Link (6)
- Toe Link (3)
- Coil Spring
- Crossmember
- Hub And Bearing
- Knuckle (4)
- Shock Absorber
- Stabilizer Bar

Service Procedures for the crossmember can be found in Frame And Bumpers Refer to **CROSSMEMBER, REAR, REMOVAL** .

SRT

Fig. 2: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown, right side similar.

The SRT rear suspension is part of an Active Damping System (ADS). The ADS includes unique shock absorbers, an Active Damping Control Module (ADCM), and three accelerometers that work together to modify the ride of the suspension over varying road conditions.

The Active Damping System (ADS) rear shock is similar to a conventional shock with the addition of a shock solenoid assembly (1) mounted on the side of its body with a three wire harness connector attached to it. The ADS shock assembly is serviced the same as a conventional shock absorber, with the addition of disconnecting the ADS harness connector (2) on the crossmember.

Service of all other rear suspension components remain the same as the standard components. When components differ, be sure to use only SRT components on SRT vehicles.

The rear knuckle for the SRT is different from the standard knuckle. Although similar in appearance and in service, the mounting bosses for the disc brake caliper have been moved downward to allow mounting of the Brembo four-piston brake caliper. Due to this change, an updated special tool is needed to remove the sleeve that retains the lower control arm ball joint to the knuckle.

The rear stabilizer bar diameter has been increased for the SRT but it is serviced in the same manner as the standard bar.

HUB AND BEARING

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - HUB AND BEARING - NOISE

NOTE: The wheel bearing is designed to last for the life of the vehicle and requires no type of periodic maintenance.

Bearings will produce noise if worn or damaged. The noise will generally change when the bearings are loaded. A road test of the vehicle is normally required to determine if there is a bearing noise, or if it may be some other component, and to assist in finding the location. The following procedure, together with the **DIAGNOSTIC CHART**, should help determine the proper cause. Note that if a particular vehicle road test maneuver, steering to the right for instance, results in noise only part of the time, it is not likely a faulty bearing. Bearing noises are not typically intermittent.

NOTE: Damaged bearing seals and the resulting excessive grease loss may also require bearing replacement. Moderate grease seepage from the bearing is considered normal and should not require replacement of the wheel bearing. Wheel bearings are designed to last the life of the vehicle and require no type of periodic maintenance. To diagnose the hub, measure hub runout

Refer to ROTOR, BRAKE, DIAGNOSIS AND TESTING .

DIAGNOSTIC PROCEDURE:

1. Perform drive evaluation. Find a smooth level road surface void of traffic or obstructions. Turn off any accessories which may cause background noise. Evaluate for noise at 50 km/h (30 mph) and 100 km/h (60 mph) and with vehicle in neutral to eliminate potential drivetrain noises. With vehicle at a constant speed, steer back and forth to left and right (approximately 45 degree steering input each way). This will

load and unload the bearings and may change the noise level. When bearing damage is slight, the noise is sometimes noticeable at lower speeds and at other times is more noticeable at higher speeds.

2. Drive evaluation results: Noise increase when turning right may indicate a problem with the left bearing. Noise increase when turning left may indicate a problem with the right bearing.
3. Put vehicle up on hoist. Grab the tire by pushing in on the top center and pulling out on the bottom center to check for excessive movement in the bearing.
4. Check for potential rubbing on rotating components, such as rotor splash shields, heat shields touching propshaft or halfshaft, wheel well liners contacting tire, wheel cover on wheel, etc. Any cyclic noise (once per wheel revolution for example) is not likely a wheel bearing fault.
5. Remove the wheel and tire assembly, disc brake caliper and brake rotor. Refer to **ROTOR, BRAKE, DIAGNOSIS AND TESTING** .
6. Rotate the wheel hub, checking for resistance or roughness.
7. Any roughness or resistance to rotation may indicate dirt intrusion or a failed hub bearing. If the bearing exhibits any of these conditions, the hub & bearing will require replacement. Do not attempt to disassemble the bearing for repair.
8. Rotate the wheel hub, utilize Chassis Ears (or equivalent) to check for noise.
9. If none of the above checks indicate a bearing failure, refer to the **DIAGNOSTIC CHART** for other possible causes.

DIAGNOSTIC CHART - HUB & BEARING

CONDITION	POSSIBLE CAUSES	POTENTIAL CORRECTIONS
FRONT END WHINE ON TURNS	1. Low Power Steering Fluid Level (if applicable) 2. Worn Tires and/or Incorrect Wheel Alignment 3. Defective Wheel Bearing 4. Wrong Power Steering Fluid (if applicable)	1. Fill power steering fluid reservoir to proper level, check for leaks (make sure all air is bled from system fluid) 2. Replace Tires, Check And Reset Wheel Alignment 3. Replace Wheel Bearing 4. Replace With Correct Power Steering Fluid
FRONT END GROWL OR GRINDING ON TURNS	1. Loose Wheel Lug Nuts 2. Engine Mount Grounding Against Frame Or Body Of Vehicle 3. Worn Tires and/or Incorrect Wheel Alignment 4. Defective Wheel	1. Verify Wheel Lug Nut Torque 2. Check For Engine Mount Hitting Frame Rail And Reposition Engine As Required 3. Replace Tires, Check and Reset Wheel Alignment

	Bearing 5. Worn or Broken C/V Joint 6. Engine Not Centered, Causing Axle Half Shaft to Bottom Out	4. Replace Wheel Bearing 5. Replace C/V Joint 6. Center the Engine
POPPING/CLICKING/SNAPPING DURING ACCELERATION AFTER DRIVE-TO-REVERSE SHIFT, REVERSE-TO-DRIVE SHIFT OR WHILE TURNING	1. Insufficient Hub Nut Torque 2. Insufficient Grease on Mating Surface of Axle Half Shaft Outer C/V Joint to Wheel Hub/Bearing, or Worn/Damaged Gasket	1. Torque Hub Nut to Spec 2. Separate Half Shaft From Hub and Bearing and Wipe Mating Surfaces Clean. Apply Light Coating of Wheel Bearing Grease to C/V Joint Surface and Reassemble, or Replace Gasket. Torque Hub Nut to Spec
WHINE/HUM/ROAR WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Worn Tires and/or Incorrect Wheel Alignment 2. Defective Wheel Bearing	1. Replace Tires and Reset Wheel Alignment 2. Replace Wheel Bearing
GROWL OR GRINDING WITH VEHICLE GOING STRAIGHT AT A CONSTANT SPEED	1. Engine Mount Grinding Against Frame or Body 2. Defective Wheel Bearing 3. Worn or Broken C/V Joint	1. Check and Reposition Engine as Required 2. Replace Wheel Bearing 3. Replace C/V Joint

REMOVAL

NON SRT

Fig. 3: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 4: Identifying Hub Nut

Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the half shaft (2).

Fig. 5: Rear Caliper Adapter, Knuckle & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed, by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

4. Remove two bolts (1) securing disc brake caliper adapter (3) to knuckle (2).
5. Remove disc brake caliper and adapter (3) from knuckle as an assembly. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

Fig. 6: Rear Brake Rotor, Hub & Clips
 Courtesy of CHRYSLER GROUP, LLC

6. Remove any clips (2) retaining brake rotor (3) to wheel mounting studs.
7. Slide brake rotor (3) off hub and bearing (1).

Fig. 7: Hub & Bearing, Mounting Bolts & Half Shaft
 Courtesy of CHRYSLER GROUP, LLC

1 - HUB AND BEARING
2 - MOUNTING

BOLTS
3 - HALF
SHAFT (IF
EQUIPPED)

8. Loosen each hub and bearing mounting bolt (2) a turn or two at a time while pulling outward on hub and bearing to avoid bolt contact with half shaft outer joint. Once removed from threads in hub and bearing (but not knuckle), allow bolts to stay in and protrude through knuckle and brake support plate to keep brake support plate in place when hub and bearing is removed.
9. Slide hub and bearing off knuckle and half shaft.

SRT

Fig. 8: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 9: Identifying Hub Nut
 Courtesy of CHRYSLER GROUP, LLC

3. While a helper applies brakes to keep hub from rotating, remove hub nut (1) from the half shaft (2).

Fig. 10: Pushing Back Pistons In Bore
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

4. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
5. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 11: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

6. Support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 12: Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

7. Remove the lower and upper caliper mounting bolts (1).
8. Remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

Fig. 13: Brake Rotor, Hub & Clips
Courtesy of CHRYSLER GROUP, LLC

9. Remove any clips (3) retaining brake rotor (2) to wheel mounting studs.
10. Slide brake rotor (2) off hub and bearing (1).

Fig. 14: Identifying Hub Nut

Courtesy of CHRYSLER GROUP, LLC

11. Push inward on end of half shaft (2) until C/V joints bottom. This is necessary to give as much access to hub and bearing mounting bolts as possible.

Fig. 15: Hub And Bearing Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

- NOTE:** It is important to keep suspension jacked up as requested in to ease access to lower hub and bearing mounting bolts. Refer to step 6.
- NOTE:** Use a 3/8 inch drive wobble extension along with a Torx® socket to access and remove two top and lower front mounting bolt. Use a standard 3/8 inch drive universal joint along with a Torx® socket to access and remove lower rear mounting bolt.
12. Loosen each (of the four) hub and bearing mounting bolt a turn or two at a time while pulling outward on hub and bearing to avoid bolt contact with half shaft outer joint. Once removed from threads in hub and bearing (but not knuckle), allow bolts to stay in and protrude through knuckle and parking brake adapter to keep brake adapter in place while hub and bearing is off vehicle.
 13. Slide hub and bearing out of knuckle and off half shaft.

INSTALLATION

NON SRT

Fig. 16: Halfshaft Isolation Washer

Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

1. Position hub and bearing bolts through rear of knuckle and parking brake support just enough to hold support in place as hub and bearing is installed.
2. Slide hub and bearing onto half shaft. Place hub and bearing through brake support, onto knuckle, lining up mounting bolt holes with bolts.

Fig. 17: Hub & Bearing, Mounting Bolts & Half Shaft
 Courtesy of CHRYSLER GROUP, LLC

1 - HUB AND BEARING 2 - MOUNTING BOLTS 3 - HALF SHAFT (IF EQUIPPED)
--

3. Install four bolts (2) fastening hub and bearing in place. Tighten mounting bolts to 68 N.m (50 ft. lbs.).

Fig. 18: Rear Brake Rotor, Hub & Clips
Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect disc brake pads and parking brake shoes before brake rotor installation. Refer to PADS, BRAKE, INSPECTION .**

4. Install brake rotor (3) over wheel mounting studs and onto hub (1).

Fig. 19: Rear Caliper Adapter, Knuckle & Bolts
Courtesy of CHRYSLER GROUP, LLC

5. Install disc brake caliper and adapter assembly (3) over brake rotor.
6. Install mounting bolts (1) securing caliper adapter (3) to knuckle (2). Tighten bolts to 115 N.m (85 ft. lbs.).

Fig. 20: Identifying Hub Nut
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

7. Install hub nut (1) on end of half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).
8. Verify proper adjustment of the parking brake shoes and adjust as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .

Fig. 21: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

9. Install tire and wheel assembly (1). Refer to **INSTALLATION** .
10. Lower vehicle.
11. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

Fig. 22: Reservoir Fluid Level Markings
Courtesy of CHRYSLER GROUP, LLC

12. Check and adjust brake fluid level in reservoir (1) as necessary.
13. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

SRT

Fig. 23: Halfshaft Isolation Washer

Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer (1) is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

Fig. 24: Hub And Mounting Bolts, Knuckle & Adapter

Courtesy of CHRYSLER GROUP, LLC

NOTE: To help upon installation, make sure that hub and bearing mounting bolts (1) extend through knuckle (3) and parking brake adapter (2) to hold adapter in place during hub and bearing installation.

1. Position hub and bearing mounting bolts (1) through rear of knuckle (3) and parking brake adapter (2) just enough to hold adapter in place.

81663075

Fig. 25: Hub And Bearing Bolt Hole Pattern
Courtesy of CHRYSLER GROUP, LLC

NOTE: Hub and bearing mounting bolt holes are not evenly spaced. Upper mounting holes (2) are not as far apart as lower mounting holes (1). Make note of this before installing hub and bearing.

2. Slide hub and bearing onto half shaft. Insert hub and bearing through parking brake adapter and knuckle, lining up mounting bolt holes with bolts.

Fig. 26: Hub And Bearing Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: Make sure suspension is jacked up as requested during removal to ease access to lower hub and bearing mounting bolts.

NOTE: Use a 3/8 inch drive wobble extension along with a Torx® socket to slip past half shaft outer C/V joint and install two top and lower front mounting bolts. Use a standard 3/8 inch drive universal joint along with a Torx® socket to install lower rear mounting bolt.

3. Carefully start all four mounting bolts into hub and bearing. Using a cross pattern, tighten each hub and bearing mounting bolt a turn or two at a time, slowly drawing hub and bearing into mounted position. Periodically, push in on end of half shaft to give as much room as possible for tools on mounting bolts. Tighten mounting bolts to 68 N.m (50 ft. lbs.).

8136a480

Fig. 27: Brake Rotor, Hub & Clips
 Courtesy of CHRYSLER GROUP, LLC

NOTE: **Inspect disc brake pads and parking brake shoes before brake rotor installation. Refer to PADS, BRAKE, INSPECTION .**

4. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.
5. Install brake rotor (2) over studs on hub and bearing (1).

815bb19b

Fig. 28: Rear Caliper Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

6. Slide caliper with pads (2) over brake rotor and align with knuckle.

7. Install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.).
8. Remove jack from under spring link.

Fig. 29: Identifying Hub Nut
Courtesy of CHRYSLER GROUP, LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

9. Install hub nut (1) on end of half shaft (2). While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).
10. Verify proper adjustment of the parking brake shoes and adjust as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .

Fig. 30: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

11. Install tire and wheel assembly (1). Refer to **INSTALLATION** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.).
12. Lower vehicle.
13. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

Fig. 31: Reservoir Fluid Level Markings
 Courtesy of CHRYSLER GROUP, LLC

14. Check and adjust brake fluid level in reservoir (1) as necessary.
15. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake

pads.

KNUCKLE, REAR

REMOVAL

NON SRT

Fig. 32: Rear Wheel Speed Sensor & Screw
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Unclip wheel speed sensor cable at rear brake rotor shield (1).
3. Remove screw (2) fastening sensor head (3) to rear knuckle.
4. Remove wheel speed sensor head from knuckle.
5. Access and remove rear hub and bearing. Refer to **HUB AND BEARING, REMOVAL**.
6. Remove parking brake shoes. Refer to **SHOES, PARKING BRAKE, REMOVAL** .

Fig. 33: Removing/Installing Actuator
 Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR 2 - CABLE END

7. If not removed, remove parking brake shoe actuator lever (1) from end of cable (2).
8. Remove shoe support from knuckle.

Fig. 34: Parking Brake Cable & Screw
 Courtesy of CHRYSLER GROUP, LLC

9. Remove parking brake cable screw (2) at knuckle (3) and pull cable (1) out of knuckle.

10. Position under-hoist utility jack or jack stand under spring link. Raise jack head to contact spring link at shock mount secure in place.

Fig. 35: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

11. Remove spring link-to-knuckle nut and bolt (2).

Fig. 36: Cutting Threads Through Bushing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to use Tap Guide (2) when tapping sleeve in knuckle to help keep Plug Tap (1) straight during use or damage to Tap may

occur.

12. Place special tool #9361-2, Tap Guide (2) against sleeve (3) in knuckle to keep special tool #9361-1, Tap, Plug M16 X 2.0 (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

813ce535

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

13. Assemble special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, as shown.
 - (1) special tool #9361-3, Screw, Forcing
 - (2) Nut
 - (3) Thrust Bearing
 - (4) Spherical Washer
 - (5) special tool #9361-9, Cup, Remover, Left Side (Left Side - Shown in figure)
 - (5) special tool #9361-10, Cup, Remover, Right Side (Right Side)

NOTE: When installing thrust bearing (3) on Remover, be sure to place hardened side against nut (2). Place bearing outer cage against stationary component.

NOTE: It is important to use appropriate Sleeve (special tool #9361-9, Cup, Remover, Left Side or special tool #9361-10, Cup, Remover, Right Side) on

Remover to provide proper Tool-to-Knuckle contact.

Fig. 46: Removing Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

14. Thread special tool #9361-3, Screw, Forcing (2) into tapped knuckle sleeve.
15. Rotate Nut down, matching Sleeve (special tool #9361-9, Cup, Remover, Left Side) or special tool #9361-10, Cup, Remover, Right Side) angled end with angled face of knuckle (1). **Make sure foot on Sleeve (3) is inserted behind machined brake caliper mounting boss.**
16. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

Fig. 47: Rear Suspension Components

Courtesy of CHRYSLER GROUP, LLC

17. Remove bolt and nut fastening compression link (5) to knuckle (4).
18. Remove bolt fastening toe link (3) to knuckle (4).
19. Remove nut and bolt fastening stabilizer link to knuckle (4).
20. Remove nut and bolt fastening tension link (6) to knuckle (4).
21. Remove nut and bolt fastening camber link (1) to knuckle (4).
22. Remove knuckle (4).
23. Remove hub mounting bolts from knuckle.

INSTALLATION

NON SRT

Fig. 48: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Install four hub mounting bolts through knuckle from inboard side allowing ends to protrude from opposite side.
2. Position knuckle on vehicle and install bolt and nut fastening camber link (1) to knuckle (4) as shown. **Do not tighten bolt at this time.**
3. Install bolt and nut fastening tension link (6) to knuckle (4) as shown. **Do not tighten bolt at this time.**
4. Install bolt and nut fastening stabilizer link to knuckle (4). **Do not tighten bolt at this time.**
5. Install bolt fastening toe link (3) to knuckle (4). **Do not tighten bolt at this time.**
6. Install bolt and nut fastening compression link (5) to knuckle (4). **Do not tighten bolt at this time.**

NOTE: If a new knuckle sleeve is not installed in knuckle, perform step 7 through 11.

813ce76b

Fig. 49: Rear Knuckle Sleeve Remover/Installer
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

7. Place NEW knuckle sleeve (2) onto special tool #9361-7, Screw, Installation (1), and slide it up to Bolt's head.

813ccc9

Fig. 50: Installing Knuckle Sleeve
 Courtesy of CHRYSLER GROUP, LLC

8. Starting from knuckle forward end, slide special tool #9361-7, Screw, Installation (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
9. Install thrust bearing and nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
10. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
11. Remove special tool.

Fig. 51: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
13. Remove under-hoist utility jack or jack stand from under spring link.

Fig. 52: Parking Brake Cable & Screw
 Courtesy of CHRYSLER GROUP, LLC

14. Insert end of cable (1) through rear knuckle (3) and install mounting screw (2). Tighten screw to 8 N.m (71 in. lbs.).
15. Install parking brake shoe support over hub and bearing mounting screws and onto face of knuckle.

Fig. 53: Removing/Installing Actuator
 Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR 2 - CABLE END

16. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
17. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION**.

Fig. 54: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

18. Install hub and bearing as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION**.

Fig. 55: Rear Wheel Speed Sensor & Screw
 Courtesy of CHRYSLER GROUP, LLC

19. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
20. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
21. Install sensor cable at rear brake rotor shield (1).
22. Lower vehicle.
23. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
24. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

Fig. 56: Rear Suspension Components
 Courtesy of CHRYSLER GROUP, LLC

25. Tighten fasteners at knuckle (vehicle at curb height) as follows:

- Camber Link (1) - 98 N.m (72 ft. lbs.).
- Compression Link (5) - 81 N.m (60 ft. lbs.).
- Stabilizer Link - 61 N.m (45 ft. lbs.).
- Tension Link (6) - 98 N.m (72 ft. lbs.).
- Toe Link (3) - 95 N.m (70 ft. lbs.).

26. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SRT

Fig. 57: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

1. Install four hub mounting bolts through knuckle from inboard side allowing ends to protrude from opposite side.
2. Position knuckle on vehicle and install bolt and nut fastening camber link (1) to knuckle (4) as shown. **Do not tighten bolt at this time.**
3. Install bolt and nut fastening tension link (6) to knuckle (4) as shown. **Do not tighten bolt at this time.**
4. Install bolt and nut fastening stabilizer link to knuckle (4). **Do not tighten bolt at this time.**
5. Install bolt fastening toe link (3) to knuckle (4). **Do not tighten bolt at this time.**
6. Install bolt and nut fastening compression link (5) to knuckle (4). **Do not tighten bolt at this time.**

NOTE: If a new knuckle sleeve is not installed in knuckle, perform step 7 through 11.

813ce76b

Fig. 58: Rear Knuckle Sleeve Remover/Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

7. Place NEW knuckle sleeve (2) onto special tool #9361-12, Installer, Bushing (1), and slide it up to Bolt head.

813ccc9

Fig. 59: Installing Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

8. Starting from knuckle forward end, slide special tool #9361-12, Installer, Bushing (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
9. Install Installation Thrust Bearing (around 3/8 inch thick) and special flange nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
10. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
11. Remove special tool.

Fig. 60: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

12. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
13. Remove under-hoist utility jack or jack stand from under spring link.

Fig. 61: Parking Brake Cable & Screw
 Courtesy of CHRYSLER GROUP, LLC

14. Insert end of cable (1) through rear knuckle (3) and install mounting screw (2). Tighten screw to 8 N.m (71 in. lbs.).
15. Install parking brake shoe support over hub and bearing mounting screws and onto face of knuckle.

Fig. 62: Removing/Installing Actuator
 Courtesy of CHRYSLER GROUP, LLC

1 - PARKING BRAKE SHOE ACTUATOR 2 - CABLE END

16. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
17. Install parking brake shoes as well as all components necessary to access them. Refer to **SHOES, PARKING BRAKE, INSTALLATION**.

Fig. 63: Halfshaft Isolation Washer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing hub and bearing on end of axle half shaft, ensure isolation washer is present on end of half shaft. Inspect washer making sure it is not worn or damaged. Washer can be installed in either direction on shaft.

18. Install hub and bearing as well as all components necessary to access it. Refer to **HUB AND BEARING, INSTALLATION**.

Fig. 64: Rear Wheel Speed Sensor & Screw
 Courtesy of CHRYSLER GROUP, LLC

19. Insert wheel speed sensor head (3) into mounting hole in rear of knuckle.
20. Install screw (2) fastening sensor head (3) to rear knuckle. Tighten Screw to 11 N.m (97 in. lbs.).
21. Install sensor cable at rear brake rotor shield (1).
22. Lower vehicle.
23. Adjust parking brake shoes as necessary. Refer to **SHOES, PARKING BRAKE, ADJUSTMENTS** .
24. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

Fig. 65: Rear Suspension Components
 Courtesy of CHRYSLER GROUP, LLC

25. Tighten fasteners at knuckle (vehicle at curb height) as follows:

- Camber Link (1) - 98 N.m (72 ft. lbs.).
- Compression Link (5) - 81 N.m (60 ft. lbs.).
- Stabilizer Link - 61 N.m (45 ft. lbs.).
- Tension Link (6) - 98 N.m (72 ft. lbs.).
- Toe Link (3) - 95 N.m (70 ft. lbs.).

26. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, CAMBER

REMOVAL

REMOVAL

Fig. 66: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 67: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform the following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust:
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

81326804

Fig. 68: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

8132349c

Fig. 69: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

Fig. 70: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 71: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. Lower jack just enough to allow top of shock absorber to clear body flange.

Fig. 72: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

Fig. 73: Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (2) mounting link to knuckle (3).
13. Remove nut and bolt (2) mounting link to crossmember (1).
14. Remove link.

INSTALLATION

INSTALLATION

Fig. 74: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing link (1), ensure the following to avoid mis-installation:

- Heavier, thicker end goes toward crossmember.
- Fore-or-aft bow faces forward (curves around coil spring).
- Up-or-down bow faces downward.

Fig. 75: Camber Link, Nuts & Bolts
Courtesy of CHRYSLER GROUP, LLC

1. Place link in bracket on crossmember (1). Install bolt and nut (2) at crossmember (1) as shown. **Do not**

tighten bolt at this time.

2. Install bolt and nut (2) mounting link to knuckle (3) as shown. **Do not tighten bolt at this time.**

Fig. 76: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

Fig. 77: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

Fig. 78: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

Fig. 79: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 80: Measuring Tension Link Clearance
 Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

Fig. 81: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

81326804

Fig. 82: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

8133d888

Fig. 83: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

12. If removed, install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 84: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

13. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

Fig. 85: Camber Link, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

14. Tighten camber link fasteners (2) to:
 - Bolt at crossmember - 85 N.m (63 ft. lbs.).
 - Bolt nut at knuckle - 98 N.m (72 ft. lbs.).

Fig. 86: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

15. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

Fig. 87: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

16. Raise vehicle and remove jack stands (3).

Fig. 88: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) Refer to **INSTALLATION** .
18. Lower vehicle.
19. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, COMPRESSION

REMOVAL

REMOVAL

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

Fig. 89: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

2. Remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 90: Compression Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

3. Remove bolt and nut (2) mounting link (3) at knuckle.
4. Remove bolt and nut (1) mounting link (3) at crossmember.
5. Remove link (3).

INSTALLATION

INSTALLATION

Fig. 91: Compression Link Mounting
Courtesy of CHRYSLER GROUP, LLC

NOTE: Although the compression link is different end-to-end, there is no top and bottom.

1. Position link and install bolt and nut (1) mounting link (3) at crossmember. **Do not tighten bolt at this time.**
2. Install bolt and nut (2) mounting link (3) at knuckle. **Do not tighten bolt at this time.**

Fig. 92: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

3. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
4. Lower vehicle.
5. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access link fasteners.
6. Tighten compression link fasteners to:
 - Bolt at crossmember - 85 N.m (63 ft. lbs.).
 - Bolt at knuckle - 81 N.m (60 ft. lbs.).
7. Perform wheel alignment Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

LINK, SPRING

REMOVAL

NON SRT

Fig. 93: Headlamp Leveling Sensor

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle Refer to **HOISTING, STANDARD PROCEDURE**.
2. Access and remove rear spring. Refer to **SPRING(S), REMOVAL**.
3. If servicing right spring link, disconnect headlamp leveling sensor (1) link at spring link (3), if equipped.

Fig. 94: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

4. Remove spring link-to-knuckle nut and bolt (2).

Fig. 95: Cutting Threads Through Bushing
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: It is important to use Tap Guide (2) when tapping sleeve in knuckle to help keep Plug Tap (1) straight during use or damage to Tap may occur.

5. Place Guide (special tool #9361-2, Tap Guide) (2) against sleeve (3) in knuckle to keep special tool

#9361-1, Tap, Plug M16 X 2.0 (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

8130e535

Fig. 96: Rear Knuckle Sleeve Remover/Installer
Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

NOTE: When installing thrust bearing on Remover, be sure to place hardened side against nut. Place bearing outer cage against stationary component.

6. Assemble special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit as shown.

- (1) special tool #9361-3, Screw, Forcing
- (2) Nut
- (3) Spherical Washer
- (4) Thrust Bearing
- (5) special tool #9361-4, Cup, Bushing

Fig. 97: Removing Knuckle Sleeve
 Courtesy of CHRYSLER GROUP, LLC

7. Thread special tool #9361-3, Screw, Forcing (1) into tapped knuckle sleeve.
8. Rotate Nut down, matching Sleeve angled end with angled face of knuckle.
9. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

Fig. 98: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

10. Remove bolt and nut (1) fastening spring link (4) to crossmember.
11. Remove spring link (4).

SRT

1. Access and remove rear brake rotor on side of repair. Refer to **ROTOR, BRAKE, REMOVAL** .
2. Access and remove rear spring on side of repair. Refer to **SPRING(S), REMOVAL**.

Fig. 99: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

3. Remove spring link-to-knuckle nut and bolt (2).

Fig. 100: Cutting Threads Through Bushing
Courtesy of CHRYSLER GROUP, LLC

CAUTION: It important to use Tap Guide (2) when tapping sleeve in knuckle to help keep Plug Tap (1) straight during use or damage to Tap may occur.

4. Place special tool #9361-11, Guide, Tap (2) against sleeve (3) in knuckle to keep special tool #9361-1, Tap, Plug M16 X 2.0 (1) straight. Using Tap with an appropriate handle, cut threads approximately halfway through bushing (or about six complete threads). **It is important to back tap out, clean out burrs and lubricate Tap often during process.**

815e1469

Fig. 101: Rear Knuckle Sleeve Remover/Installer Kit

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

5. Assemble special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit as shown.
 - (1) special tool #9361-3, Screw, Forcing
 - (2) Nut
 - (3) Thrust Bearing
 - (4) Spherical Washer
 - (5) special tool #9361-9, Cup, Remover, Left Side (Left Side - Shown in figure)
 - (5) special tool #9361-10, Cup, Remover, Right Side (Right Side)

NOTE: When installing thrust bearing (3) on Remover, be sure to place hardened side against nut (2). Place bearing outer cage against stationary component.

NOTE: It is important to use appropriate Sleeve (special tool #9361-9, Cup, Remover, Left Side or special tool #9361-10, Cup, Remover, Right Side) on Remover to provide proper Tool-to-Knuckle contact.

Fig. 102: Removing Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

6. Thread special tool #9361-3, Screw, Forcing (2) into tapped knuckle sleeve.
7. Rotate Nut down, matching Sleeve (special tool #9361-9, Cup, Remover, Left Side or special tool #9361-10, Cup, Remover, Right Side) angled end with angled face of knuckle (1). **Make sure foot on Sleeve (3) is inserted behind machined brake caliper mounting boss.**
8. Continue to rotate Nut until knuckle sleeve is removed from knuckle. **Discard knuckle sleeve; replace it with new upon installation.**

9. Remove bolt and nut (1) fastening spring link (4) to crossmember.
10. Remove spring link (4).

INSTALLATION

NON SRT

Fig. 104: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

1. Guide ball joint end of spring link (4) into mounting pocket of knuckle, then swing opposite end up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

813ce76b

Fig. 105: Rear Knuckle Sleeve Remover/Installer

Courtesy of CHRYSLER GROUP, LLC

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

2. Place NEW knuckle sleeve (2) onto special tool #9361-7, Screw, Installation (1), and slide it up to Bolt head.

Fig. 106: Installing Knuckle Sleeve
 Courtesy of CHRYSLER GROUP, LLC

3. Starting from knuckle forward end, slide special tool #9361-7, Screw, Installation (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
4. Install thrust bearing and nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
5. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
6. Remove special tool.

Fig. 107: Spring Link Mounting
 Courtesy of CHRYSLER GROUP, LLC

7. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 142 N.m (105 ft. lbs.).

Fig. 108: Headlamp Leveling Sensor
Courtesy of CHRYSLER GROUP, LLC

8. Export Only - If servicing right spring link, connect headlamp leveling sensor (1) link at spring link (3).
9. Install rear spring as well as all components necessary to access it. Refer to **SPRING(S), INSTALLATION**.
10. Lower vehicle.
11. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.
12. Tighten spring link bolt at crossmember to 108 N.m (80 ft. lbs.).
13. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SRT

Fig. 109: Spring Link Mounting

NOTE: Prior to using special tool #9361A, Rear Knuckle Sleeve Remover/Installer Kit, lubricate bolt (1) threads to provide ease of use and promote tool longevity.

2. Place NEW knuckle sleeve (2) onto special tool #9361-12, Installer, Bushing (1), and slide it up to Bolt head.

Fig. 111: Installing Knuckle Sleeve
Courtesy of CHRYSLER GROUP, LLC

3. Starting from knuckle forward end, slide special tool #9361-12, Installer, Bushing (1) with sleeve (5) through knuckle (2) and spring link ball joint (3).
4. Install Installation Thrust Bearing (around 3/8 inch thick) and special flange nut (4) on end of Bolt. **When installing thrust bearing on Installer, be sure to place hardened side against nut. Place bearing outer cage against stationary component.**
5. While holding Bolt head (1) stationary, rotate Nut (4) (using hand tools) installing sleeve in knuckle. Install sleeve until Nut stops turning. **Do not overtighten Nut.**
6. Remove special tool.

Fig. 112: Spring Link Mounting
Courtesy of CHRYSLER GROUP, LLC

7. Install spring link-to-knuckle bolt (2) front-to-rear through knuckle and link, then install nut. While holding bolt head stationary, tighten nut to 138 N.m (102 ft. lbs.).
8. Install rear spring and all components necessary to access it, except rear tire and wheel assembly on side of repair Refer to **SPRING(S), INSTALLATION**.
9. Install rear brake rotor and components necessary to access it Refer to **ROTOR, BRAKE, INSTALLATION**.
10. Lower vehicle.
11. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
12. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.
13. Tighten spring link bolt at crossmember to 108 N.m (80 ft. lbs.).
14. Tighten shock absorber lower mounting bolt nut to 72 N.m (53 ft. lbs.).
15. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.

LINK, TENSION

REMOVAL

REMOVAL

Fig. 113: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 114: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .

4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform the following if vehicle is equipped with dual-exhaust or are servicing right side on vehicle with single exhaust.
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

Fig. 115: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 116: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

Fig. 117: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 118: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important **NOT** to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. Lower jack just enough to allow top of shock absorber to clear body flange.

Fig. 119: Isolators, Coil Spring, Shock Absorber & Crossmember
 Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).

Fig. 120: Camber Link, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Do not lower repair-side of crossmember any further than necessary to gain access to link mounting bolts at crossmember.

12. Remove nut and bolt (4) mounting link to knuckle (3).
13. Remove nut and bolt (4) mounting link to crossmember (1).

14. Remove link.

INSTALLATION

INSTALLATION

Fig. 121: Rear Suspension Components
Courtesy of CHRYSLER GROUP, LLC

NOTE: When installing tension link, although link (6) is same end-to-end, make sure that center bow is facing downward.

Fig. 122: Camber Link, Nuts & Bolts

Courtesy of CHRYSLER GROUP, LLC

1. Place link in bracket on crossmember (1). Install bolt and nut (4) at crossmember (1) as shown. **Do not tighten bolt at this time.**
2. Install bolt and nut (4) mounting link to knuckle (3) as shown. **Do not tighten bolt at this time.**

Fig. 123: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

Fig. 124: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

Fig. 125: Shock Absorber & Upper Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

Fig. 126: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 127: Measuring Tension Link Clearance
Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

Fig. 128: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 129: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 130: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. If removed, install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 131: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

13. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

Fig. 132: Camber Link, Nuts & Bolts
 Courtesy of CHRYSLER GROUP, LLC

14. Tighten tension link fasteners (4) to:
 - Bolt nut at crossmember - 85 N.m (63 ft. lbs.).
 - Bolt at knuckle - 98 N.m (72 ft. lbs.).

Fig. 133: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

15. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

Fig. 134: Jack Stand Under Control Arm
 Courtesy of CHRYSLER GROUP, LLC

16. Raise vehicle and remove jack stands (3).

Fig. 135: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

17. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) Refer to **INSTALLATION** .
18. Lower vehicle.
19. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

LINK, TOE

REMOVAL

LEFT LINK

Fig. 136: Tire And Wheel Mounting

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 137: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .

4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual-exhaust.
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

Fig. 138: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place.

Fig. 139: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 140: Rear Crossmember Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important **NOT** to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

8. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

9. **Slowly** lower jack allowing repair-side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow toe link mounting bolt at crossmember.

Fig. 141: Wheel Speed Sensor Cable
 Courtesy of CHRYSLER GROUP, LLC

10. If equipped, remove wheel speed sensor cable (2) from toe link.

Fig. 142: Rear Toe Adjustment Bolt Nut
 Courtesy of CHRYSLER GROUP, LLC

11. While holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 155: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 156: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

12. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 157: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

13. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION** .
14. Lower vehicle.
15. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

Fig. 158: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

Fig. 159: Toe Link, Mounting Bolt & Cam Bolt
Courtesy of CHRYSLER GROUP, LLC

17. Tighten toe link (1) fasteners to:
- Nut at crossmember - 108 N.m (80 ft. lbs.) (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.).
 - Bolt at knuckle - 95 N.m (70 ft. lbs.).
18. Perform wheel alignment. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

RIGHT LINK

Fig. 160: Toe Link, Mounting Bolt & Cam Bolt

Courtesy of CHRYSLER GROUP, LLC

1. Slide crossmember end of toe link (1) into box bracket on crossmember. Slide cam bolt (2) through bracket and link from rear of vehicle.
2. Install bolt (3) and nut securing link to knuckle. **Do not tighten bolt at this time.**

Fig. 161: Rear Toe Adjustment Bolt Nut

Courtesy of CHRYSLER GROUP, LLC

3. While holding toe adjustment cam bolt from rotating (cam facing upward), install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten nut at this time.**

Fig. 162: Wheel Speed Sensor Cable

Courtesy of CHRYSLER GROUP, LLC

4. If equipped, Attach wheel speed sensor cable (2) to toe link.
5. Raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

Fig. 163: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
7. Lower vehicle.
8. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

Fig. 164: Toe Link, Mounting Bolt & Cam Bolt
Courtesy of CHRYSLER GROUP, LLC

9. Tighten toe link (1) fasteners to:
 - Nut at crossmember - 108 N.m (80 ft. lbs.) (This nut may be tightened after rear wheel alignment toe is set. Do not tighten from bolt head end.).
 - Bolt at knuckle - 95 N.m (70 ft. lbs.).
10. Perform wheel alignment Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE** .

SHOCK ABSORBER, SUSPENSION

DESCRIPTION

NON SRT

813cfo8e

Fig. 165: Nivomat Load-Leveling Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

Non SRT vehicles have standard gas-charged shock absorbers for the rear suspension.

SRT

3564023

Fig. 166: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown, right side similar.

This vehicle has Active Damping System (ADS) shock absorbers for the rear suspension. The ADS shock absorbers are serviced the same as conventional shocks, except the ADS connector (2) must be removed from the harness connector (3). It is important to pay close attention to which direction the shock solenoid assembly

(1) is pointing when removing and installing ADS shocks.

REMOVAL

NON SRT

Fig. 167: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Position under-hoist utility jack or jack stand under outer spring link adding just enough support to keep suspension from going into full-rebound when shock absorber mounting bolts are removed.

Fig. 168: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 169: Shock Absorber & Upper Mounting Screws
Courtesy of CHRYSLER GROUP, LLC

5. Remove shock absorber (1) upper mounting bolts (2).
6. Remove shock absorber (4).

SRT

Fig. 170: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .
2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Position under-hoist utility jack or jack stand under outer spring link adding just enough support to keep suspension from going into full-rebound when shock absorber mounting bolts are removed.

Fig. 171: Shock Solenoid Assembly & ADS Harness Connector
Courtesy of CHRYSLER GROUP, LLC

NOTE: Left side shown, right side similar.

4. Disconnect the Active Damping System (ADS) shock connector (2) from the harness connector (3).

Fig. 172: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

NOTE: Right side shown, left side similar.

5. Remove lower mounting bolt (2) and nut (3) securing shock absorber (1) to knuckle.

Fig. 173: Shock Absorber & Upper Mounting Screws

 Courtesy of CHRYSLER GROUP, LLC

3. Install lower shock mounting bolt (2) and nut (3). **Do not tighten at this time.**
4. Remove under-hoist utility jack or jack stand from under spring link.

Fig. 182: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

5. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
6. Lower vehicle.
7. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access lower mounting bolt.

Fig. 183: Shock Solenoid Assembly & ADS Harness Connector
 Courtesy of CHRYSLER GROUP, LLC

8. Connect the Active Damping System (ADS) connector (2) from the ADS shock (1) to the harness connector (3).

Fig. 184: Lower Mounting Bolt, Nut & Shock Absorber
Courtesy of CHRYSLER GROUP, LLC

9. Tighten shock absorber lower mounting nut (3) to 72 N.m (53 ft. lbs.).

SPRING(S)

REMOVAL

REMOVAL

Fig. 185: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

1. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

2. On both sides of vehicle, remove wheel mounting nuts (3), then rear tire and wheel assembly (1).

Fig. 186: Filler Tube Assembly
Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

3. If servicing left side shock absorber, remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .
4. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.
5. Perform following if vehicle is equipped with dual exhaust or if servicing right side on vehicle with single exhaust:
 - a. Position under-hoist utility jack or stand several inches below exhaust at muffler.
 - b. Disconnect exhaust isolators at muffler and resonators hangers.
 - c. Lower exhaust down to rest upon top of jack or stand placed below muffler.

81326804

Fig. 187: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

6. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

8132349c

Fig. 188: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

7. Remove shock absorber (1) upper mounting screws (2).

Fig. 189: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

8. Remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 190: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When removing crossmember mounting bolts (2 and 3) it is important NOT to loosen or remove crossmember mounting bolts on opposite side of vehicle. Doing so will require rear wheel alignment following reinstallation to ensure proper thrust angle.

9. Remove both front and rear crossmember mounting bolts (2 and 3) on repair-side of vehicle.

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember (1) any further than necessary to remove shock absorber.

10. **Slowly** lower jack allowing repair-side of crossmember to drop. Lower jack just enough to allow top of shock absorber to clear body flange.

Fig. 191: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

11. Remove shock absorber (3) by tipping top outward and lifting lower end out of pocket in spring link (4).
12. Disconnect brake hose at bracket mounted to body to allow to avoid overextending hose, damaging it, during following step.
13. Slowly lower jack until crossmember is low enough to remove coil spring. **Do not lower jack any further than necessary to remove spring.**
14. Remove coil spring and isolators (1, 2 and 5).

INSTALLATION

INSTALLATION

Fig. 192: Isolators, Coil Spring, Shock Absorber & Crossmember
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear coil springs are interchangeable.

1. Install upper (1) and lower (5) isolators on coil spring (2).

Fig. 193: Matching Spring Isolator To Spring Link
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

2. Install coil spring with isolators into spring pocket of spring link (1) fitting lower isolator (2) to shape of pocket, then align top of spring with body mount.

Fig. 194: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

3. Install shock absorber (3) by setting lower end into pocket in spring link (4), then tipping top inward until aligned with upper mounting holes.

Fig. 195: Shock Absorber Lower Mounting Bolt & Nut
Courtesy of CHRYSLER GROUP, LLC

4. Install lower shock mounting bolt and nut. **Do not tighten at this time.**

Fig. 196: Shock Absorber & Upper Mounting Screws
 Courtesy of CHRYSLER GROUP, LLC

5. Carefully raise jack, guiding coil spring and upper end of shock absorber (4) into mounted positions.
6. Install shock absorber upper mounting screws (2). Tighten upper mounting screws to 52 N.m (38 ft. lbs.).

Fig. 197: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Rear crossmember mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Install crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 198: Measuring Tension Link Clearance
 Courtesy of CHRYSLER GROUP, LLC

8. Measure distance (1) between from tension link (2) to body weld flange (3) directly in front of it, just outboard of front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Measure opposite side to be sure it also maintains minimum 12 mm distance.

Fig. 199: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

9. Tighten all crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

81326804

Fig. 200: Supporting Rear Axle Differential
 Courtesy of CHRYSLER GROUP, LLC

10. Remove jack (3) from under rear axle differential.
11. If previously lowered, raise rear exhaust back to mounted position and connect exhaust isolators at muffler and resonators hangers. Remove jack or stand below exhaust muffler.

8133d888

Fig. 201: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

12. Install fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 202: Tire And Wheel Mounting
 Courtesy of CHRYSLER GROUP, LLC

13. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) Refer to **INSTALLATION**.
14. Lower vehicle.
15. Position vehicle on alignment rack/drive-on lift. Raise lift as necessary to access lower mounting bolt.

Fig. 203: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

16. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

STABILIZER BAR, REAR SUSPENSION

REMOVAL

REMOVAL

81330050

Fig. 204: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **HOISTING, STANDARD PROCEDURE** .

81386065

Fig. 205: Tire And Wheel Mounting

Courtesy of CHRYSLER GROUP, LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).
4. Remove rear exhaust system. Refer to **MUFFLER, EXHAUST, REMOVAL** .

Fig. 206: Axle Flange, Rubber Coupler & Index Marks
Courtesy of CHRYSLER GROUP, LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

Fig. 207: Propeller Shaft Coupler & Rear Axle Flange
Courtesy of CHRYSLER GROUP, LLC

6. Remove three (four if equipped with 215 MM axle) propeller shaft coupler-to-axle flange bolts and nuts.

Fig. 208: Supporting Propeller Shaft
 Courtesy of CHRYSLER GROUP, LLC

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown.

Fig. 209: Parking Brake Cable Components
 Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

Fig. 210: Front Parking Brake Cable & Equalizer
 Courtesy of CHRYSLER GROUP, LLC

9. Remove front parking brake cable (3) from equalizer (2).

Fig. 211: Front Parking Brake Cable, Rear Crossmember Front Flange & Screw
 Courtesy of CHRYSLER GROUP, LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3).

Fig. 212: Rear Brake Caliper, Adapter & Guide Pin Bolts
 Courtesy of CHRYSLER GROUP, LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
 - b. Remove brake caliper (1) from brake adapter (3) and pads.
 - c. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

Fig. 213: Pushing Back Pistons In Bore
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 214: Accessing Rear Caliper Mounting Bolts
Courtesy of CHRYSLER GROUP, LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 215: Rear Caliper Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
17. If equipped with SRT8 disc brakes, remove jack from under spring link.

Fig. 216: Releasing Wheel Speed Sensor Connector
 Courtesy of CHRYSLER GROUP, LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

Fig. 217: Sensor Connection To Body Connector
Courtesy of CHRYSLER GROUP, LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

Fig. 218: Left/Right Rear Wheel Speed Sensor Cable & Routing Clip
Courtesy of CHRYSLER GROUP, LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

Fig. 219: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 220: Marking Location Of Crossmember Mount To Body
 Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER

BUSHING FLANGE

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

81326804

Fig. 221: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

23. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 222: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to **TUBE, FUEL TANK FILLER, REMOVAL** .

Fig. 223: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow

propeller shaft removal from rear axle differential. **Do not lower jack any further than necessary.** Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.

27. Continue to lower jack until crossmember is at a comfortable working level to access stabilizer bar fasteners.

Fig. 224: Rear Stabilizer Bar Mounting
Courtesy of CHRYSLER GROUP, LLC

28. On each end, remove bolt (3) and nut fastening stabilizer bar (4) to stabilizer link (2).
29. Remove bolts (1) fastening each stabilizer bar isolator retainer to crossmember.
30. Remove stabilizer bar (4) with isolators and retainers.
31. Remove retainers from isolators.
32. Remove isolators from stabilizer bar utilizing slits in bushings.

INSTALLATION

INSTALLATION

Fig. 225: Rear Stabilizer Bar Mounting
 Courtesy of CHRYSLER GROUP, LLC

1. Install isolators on stabilizer bar utilizing slits in bushings. Install each isolator so its slit faces forward and flat side is positioned toward crossmember once installed.
2. Install retainers on isolators.
3. Install stabilizer bar (4) with isolators and retainers on crossmember.
4. Install isolator retainer mounting bolts (1). **Do not tighten at this time.**
5. Install bolt (3) and nut fastening stabilizer bar ends to each stabilizer links (2). **Do not tighten at this time.**
6. Tighten isolator retainer mounting bolts (1) to 61 N.m (45 ft. lbs.).

Fig. 226: Isolators, Coil Spring, Shock Absorber & Crossmember

Courtesy of CHRYSLER GROUP, LLC

7. Remove coil springs (2) with isolators (1 and 5) from spring links (4).
8. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft onto rear axle differential flange and align shocks with pockets in spring links.

Fig. 227: Rear Crossmember Mounting Bolts

Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

9. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

Fig. 228: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

10. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

11. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 229: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

12. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
13. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 230: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

14. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
15. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

Fig. 231: Isolators, Coil Spring, Shock Absorber & Crossmember
Courtesy of CHRYSLER GROUP, LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

16. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) Installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

17. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 232: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

18. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
19. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 233: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

20. Raise left side of crossmember (1) into mounted position. Install left side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 234: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER GROUP, LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

Fig. 235: Measuring Tension Link Clearance
 Courtesy of CHRYSLER GROUP, LLC

22. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

Fig. 236: Rear Crossmember Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

23. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 237: Supporting Rear Axle Differential
Courtesy of CHRYSLER GROUP, LLC

24. Remove jack (3) from under rear axle differential.

Fig. 238: Supporting Propeller Shaft
Courtesy of CHRYSLER GROUP, LLC

25. Remove bungee cord (1) supporting propeller shaft (2).

8131b7b6

Fig. 239: Propeller Shaft Coupler & Rear Axle Flange
 Courtesy of CHRYSLER GROUP, LLC

26. Align propeller shaft index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N.m (60 ft. lbs.).

8133d888

Fig. 240: Filler Tube Assembly
 Courtesy of CHRYSLER GROUP, LLC

27. Install fuel filler tube Refer to **TUBE, FUEL TANK FILLER, INSTALLATION** .

Fig. 241: Left/Right Rear Wheel Speed Sensor Cable & Routing Clip
 Courtesy of CHRYSLER GROUP, LLC

28. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

Fig. 242: Sensor Connection To Body Connector
 Courtesy of CHRYSLER GROUP, LLC

29. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
30. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

Fig. 243: Rear Brake Caliper, Adapter & Guide Pin Bolts
 Courtesy of CHRYSLER GROUP, LLC

CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

NOTE: Before installing caliper guide pin bolts, clean guide pin bolt threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

31. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
 - b. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
 - c. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.).
 - d. Make sure brake hose is properly routed and will not come in contact with suspension components.
32. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. Refer to **SPRING(S), REMOVAL**.

Fig. 244: Rear Caliper Mounting Bolts
 Courtesy of CHRYSLER GROUP, LLC

33. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
34. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.).
35. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

Fig. 245: Front Parking Brake Cable, Rear Crossmember Front Flange & Screw
 Courtesy of CHRYSLER GROUP, LLC

36. Insert routing front parking brake cable bracket locating pin in front flange of crossmember (3), then

install screw (2) fastening cable (1) routing bracket to rear crossmember.

Fig. 246: Front Parking Brake Cable & Equalizer
Courtesy of CHRYSLER GROUP, LLC

37. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential.

Fig. 247: Parking Brake Cables At Rear Crossmember
Courtesy of CHRYSLER GROUP, LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

38. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

Fig. 248: Identifying Clamps & Rear Exhaust System
Courtesy of CHRYSLER GROUP, LLC

39. Install rear exhaust system (2) (dual-outlet exhaust shown in figure). Refer to **MUFFLER, EXHAUST, INSTALLATION**.

Fig. 249: Tire And Wheel Mounting
Courtesy of CHRYSLER GROUP, LLC

40. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **INSTALLATION**.
41. Lower vehicle until rear wheels are just above floor level.
42. Apply parking brake lever. Release lever, then reapply.
43. Check to make sure rear wheels will not rotate with lever applied.
44. Lower vehicle.

8133bb50

Fig. 250: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER GROUP, LLC

45. Connect battery negative cable (2) to battery post. It is important that this is performed properly.
46. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
47. Position vehicle on alignment rack/drive-on hoist. Raise vehicle as necessary to access mounting bolts.

Fig. 251: Shock Absorber Lower Mounting Bolt & Nut
 Courtesy of CHRYSLER GROUP, LLC

48. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).

Fig. 252: Rear Stabilizer Bar Mounting
 Courtesy of CHRYSLER GROUP, LLC

49. Tighten stabilizer link fasteners (3) to 61 N.m (45 ft. lbs.).
50. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance. Refer to step 22. Refer to **WHEEL ALIGNMENT, STANDARD PROCEDURE**.
