- 10 - TORQUE CONVERTER IN PORT
- 11 - COOLER OUT PORT
- 12 - TORQUE CONVERTER OUT PORT

When the adapter plates 10007 (1&2) are placed over the ports, proper operation of the transmission clutches can be verified. Air-pressure testing can be used to check transmission clutch operation. The test can be conducted with the transmission either in the vehicle (where applicable) or on the work bench, as a final check.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission.

- | |
|---------------------------------|
| 1 - AIR ADAPTER PLATE 10007 - 2 |
| 2 - AIR ADAPTER PLATE 10007 - 1 |

NOTE: The air supply which is used must be free of moisture and dirt. Use a pressure of 30 psi to test clutch operation.

NOTE: When checking the K1 clutch , air must pass through numerous passages to reach the clutch it's self, therefore only a slight application will be noted.

1. Remove the oil pan.
2. Remove the valve body (electrohydraulic unit). See Transmission and Transfer Case/Automatic - NAG1/UNIT, Electrohydraulic Control - Removal
3. Using the existing valve body (electrohydraulic unit) mounting bolts attach the Air Adapter Plates 10007 (1&2). Tighten the bolt to 8 N.m (71 in. lbs.).
4. Apply 30 psi of air pressure to each port

If the clutch is functioning, a soft thump will be heard as the clutch is applied. The clutch application can also be felt by touching the appropriate element while applying air pressure. As the air pressure is released, the clutch should also release.

AUTOMATIC TRANSMISSION

CONDITION	POSSIBLE CAUSES	CORRECTION
		1. Check for latest

Harsh N-D Engagement or Harsh N-R Engagement	1. Transmission adaptation/calibration.	level TCM software. Perform the TCM adaptation procedure. Refer to <u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure</u> .
	2. Transmission in limp-home mode.	2. Check TCM for DTCs. Repair as needed.
	3. Driveline lash/movement.	3. Check engine mounts, transmission mount, driveshaft couplings, rear crossmember mounts, axle mounts and axle lash.
	4. Converter clutch or lock up control valve malfunction.	4. Perform converter clutch diagnostics test. Inspect valve body for stuck or sticky lock up control valve. If valve motion is free, replace lock up solenoid and retest.
	5. Valve Body Malfunction.	5. Inspect valve body for stuck or sticky regulator valve.
	6. Clutch or planetary component damage.	6. Remove, disassemble and repair transmission as necessary.
	7. Water in Trans.	7. Perform TSB, recommend to split and clean VB if heavily contaminated.
		1. Check for latest

**DELAYED N-D
OR N-R
ENGAGEMENT**

1. Transmission adaptation/calibration.	level TCM software. Perform the TCM adaptation procedure. Refer to <u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure</u> .
2. Torque converter fluid drain back, delayed soft engagement.	2. If vehicle moves normally after 3 seconds of shifting into gear, no repair is necessary. If longer, inspect pump for worn bushing.
3. Fluid Level Low.	3. Check and adjust fluid level. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure</u>
4. Filter plugged.	4. Check TC out pressure, if < 10psi, check for plugged filter. Replace if needed.
5. Filter damaged or missing, missing o-ring.	5. Check for damaged/missing filter or cut/missing o-ring.
6. Valve Body Malfunction.	6. Inspect valve body for stuck/sticky regulator valve or shift group valves.
7. Oil pump gears worn/damaged.	7. Inspect pump for damage or excessive clearances. Replace if needed.

**NO DRIVE OR
REVERSE
ENGAGEMENT
(vehicle will not
move)**

1. Misadjusted/damaged shift cable.	1. Inspect shift system. Adjust and/or replace worn/damaged parts.
2. Fluid level low.	2. Check and adjust fluid level. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure</u>
3. Filter plugged.	3. Check TC out pressure, if < 10psi, check for plugged filter. Replace if needed.
4. Filter damaged or missing, missing filter o-ring.	4. Check for damaged/missing filter or cut/missing o-ring.
5 Hydraulic system- Low/no line pressure.	5. Remove Electrohydraulic Unit. Inspect or sticky/stuck regulator valve. If valve motion is free, replace line pressure solenoid and retest. If condition still exists check for worn/damaged pump. Replace pump assembly if needed.
6. TCM in Limp Mode	6. Clear codes and reset.
7. Stuck Pressure Regulator Valve	7. Split Electrohydraulic Unit t and inspect pressure regulator valve. Remove debris if present. Be certain all shift valves are free, if

		any valve can't be freed replace Electrohydraulic Unit.
	8. Broken Weld at Front Annulus	8. Replace Hard Parts as Necessary.
	9. Broken Input Shaft Weld	9. Replace Hard Parts as Necessary.
	10. Defective T/C	10. Replace T/C, make sure filter is not clogged.
	11. Broken Output Shaft Weld	11. Replace parts as necessary
	12. Broken/Missing Rear Annulus Weld.	12. Replace parts as necessary.
	13. Unseated Rear Annulus Gear snap ring.	13. Properly install or replace snap ring.
	14. Valves not returned to their home position.	14. Split Electrohydraulic Unit and inspect 3-4 command valve as well as all other valves, being certain they move freely and are free of debris.
SHUDDER GARAGE SHIFT R-D OR D-R	1. Transmission adaptation/calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to <u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure</u> .
	2. Customer applying throttle while shift is in progress.	2. Instruct customer to wait until shift is complete prior to applying throttle.
		1. Check for latest level TCM software.

HARSH ROLLING GARAGE SHIFT R-D OR D-R	1. Transmission adaptation/calibration.	Perform the TCM adaptation procedure. Refer to <u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure</u> .
	2. Customer shifting into desired range with vehicle motion.	2. Instruct customer to only shift into the desired range with the vehicle stopped and the service brake applied.
	3. Transmission in limp-home mode.	3. Check TCM for DTCs. Repair as needed.
ENGINE STALLS	1. TCC Solenoid Wire in Harness.	1. Inspect for and repair any short, ground, or open.
	2. TCC Solenoid Defective, Bent Terminals or Debris Shorting Terminals.	2. Check for codes, refer to Diagnostic and testing.
	3. Debris sticking the TCC Solenoid Open.	3. Remove the TCC Solenoid and try to blow air through it. No air should flow. If air flows freely, replace the TCC Solenoid.
	4. TCC LU Control Valve Stuck.	4. Split the Electrohydraulic Unit and inspect the TCC LU valve for any debris. Remove debris if present. If valve can't be freed replace Electrohydraulic Unit.
		1. Perform converter clutch diagnostics

ENGINE STALLS WHEN TRANSMISSION IS SHIFTED INTO R OR D.	1. Converter clutch or lock up control valve malfunction.	test. Inspect valve body for stuck or sticky lock up control valve. If valve motion is free, replace lock up solenoid and retest.
	2. Defective torque converter.	2. Replace torque converter.
CLUNK/CLICK NOISE DURING GARAGE SHIFT FROM R-D OR D-R	1. Stick-slip condition between output flange and output shaft nut upon torque reversal from R to D or D to R. Click on first launch.	1. Replace output flange and nut.
HARSH UPSHIFT OR DOWNSHIFT	1. Transmission adaptation/calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to <u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure</u> .
	2. Electrohydraulic Unit malfunction.	2. Inspect valve body for sticky/stuck valves. Repair as needed. If valve motion is free, replace shift pressure solenoid and line pressure solenoid and retest.
	3. Damaged or misbuilt clutch.	3. Remove, disassemble and repair transmission as needed.
		1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to

EMCC SHUDDER AND/OR ROUGH SHIFTS	1. Transmission adaptation/calibration.	<u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .</u>
	2. Fluid condition, contamination or wrong type.	2. Change fluid per service information procedures. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure.</u>
	3. Electrohydraulic Unit malfunction.	3. Remove Electrohydraulic Unit. Inspect for sticky/stuck lock up control valve. If valve motion is free, replace the lock up solenoid and retest.
	4. Defective torque converter.	4. Replace torque converter.
GRATING OR SCRAPING NOISE PROPORTIONAL TO ENGINE SPEED	1. Torque converter bolts contacting dust shield.	1. Dust shield bent. Replace if needed. Torque converter bolt backed out. Replace with new bolt and torque to proper level.
	2. Damaged/broken drive plate.	2. Inspect driveplate. Replace if needed.
GRATING OR SCRAPING NOISE PROPORTIONAL TO TRANSMISSION OUTPUT SPEED	1. Driveshaft or rear axle noise.	1. Check driveshaft, center bearing and axle for noise or contact with other components.
	2. Transmission output bearing noise.	2. Replace output bearing and retest.
	3. Internal	3. Remove, disassemble and

	transmission damage.	repair transmission as needed.
HIGH PITCHED WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid level low.	1. Check and adjust fluid level. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure.</u>
	2. Transmission in limp-home mode.	2. Check TCM for DTCs. Repair as needed.
	3. Filter plugged.	3. Check TC out pressure, if < 10psi, check for plugged filter. Replace if needed.
	4. Filter damaged or missing.	4. Check for damaged/missing filter or cut/missing o-ring.
	5. Oil pump bushing worn/ damaged.	5. Visually inspect for worn or damaged pump bushing. Replace pump assembly if needed.
	6. Oil pump gears worn/ damaged.	6. Inspect for worn or damaged pump gears. Replace pump assembly if needed.
NOISE ONLY IN 1ST OR 5TH GEAR	1. Broken Tab on K1/K2 Thrust bearing.	1. Replace K1/K2 Thrust bearing.
FLARES ON THE 1 - 2 SHIFT	1. Failed F1 ORC. See <u>Transmission and Transfer Case/Automatic - NAG1/CLUTCH - Operation.</u>	1. Replace F1 ORC, B1 Retainer and K1 Retainer.
		2. Split Electrohydraulic Unit and inspect 1-2/4-5 valves.

	2. Stuck 1-2 / 4-5 valve.	Remove debris if present. If valve can't be freed replace Electrohydraulic Unit.
BUMPSHIFT ON 2-1 DOWNSHIFT	1. K1 belleville retainer snap ring.	1. K1 Belleville retainer snap rings may become unseated. Disassemble trans and re-seat snap ring. Verify there are no stuck 1-2/4-5 shift valves in the Electrohydraulic unit prior to removing the trans.
FLARES ON THE 2-3 SHIFT	1.K2 Piston Bottomed Out.	1. Replace Input Shaft Assembly. This issue can be verified by making immediate repeated shifts between 2nd and 3rd. If the flare is eliminated on subsequent shifts to 3rd, It is likely that this is the issue.
	2. Failed F2 ORC. See <u>Transmission and Transfer Case/Automatic - NAG1/CLUTCH - Operation.</u>	2. Replace F2 ORC, Rear Sun Gear and Front Sun Gear
	3. Stuck 2-3 Valves.	3. Split Electrohydraulic Unit and inspect 2-3 valves. Remove debris if present. If valve can't be freed replace Electrohydraulic Unit.
	4. K2 Clutch Slipping.	4. Inspect and if damaged replace K2 Clutch Discs and

		Seals.
	5. 2-3 Shift Pressure Valve Spring Deformed.	5. It is possible that when the steel cover plate was screwed to the Electrohydraulic Unit, the spring was pinched thus deforming the bore and sticking the valve. Remove the Electrohydraulic Unit and remove the steel plate covering the 2-3 shift pressure valve. If the valve can't be freely removed from the bore, the spring was pinched and the Electrohydraulic Unit requires replacement.
	6. B1 bushing missing.	6. Replace B1 retainer and input shaft.
SLIPS ON 2-3 UPSHIFT	1. Transmission adaptation/calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to <u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure</u> .
	2. Fluid level low.	2. Check and adjust fluid level. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure</u> .

	3. Filter damaged or missing.	3. Check for damaged/missing filter or cut/missing o-ring.
	4. Valve body malfunction.	4. Check for sticky/stuck 2-3 shift pressure valve or regulator valve.
	5. F2 or B2 clutch damaged.	5. Disassemble transmission, inspect for damaged F2 or B2 clutch. Repair as needed.
FLARE OR NEUTRALS ON THE 3-4 / 4-3 SHIFT	1. Debris sticking the 3-4 Holding Valve or Debris Sticking the 3-4 Shift Pressure Valve	1. Split Electrohydraulic Unit and remove the 3-4 Shift Pressure and 3-4 Holding Valves. Flush the valves and bores with a solvent such as mineral spirits. (Note: Debris can be a very small sliver unnoticeable unless flushing onto filter paper.) Only if the valve can not be freed should the Electrohydraulic Unit be replaced.
	3. Two Plastic Check Balls in one pocket.	3. Split the Electrohydraulic Unit and inspect and verify that there is only one plastic check ball in each of the 4 pockets. If there are two in any pocket, remove one and re-assemble.
SLIPS, BANGS INTO GEAR,		1. Disassemble the transmission, remove the pump and gears from the bell housing. Inspect the pump gear face

DELAYED ENGAGEMENT, VENT TUBE LEAK	1. Casting Void in the Bell Housing.	in the bell housing for a 3/16" diameter void between the pump suction and drainback circuits. If void is present, replace the bell housing.
SLIPS ON 3-4 UPSHIFT	1. Transmission adaptation/calibration.	1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to <u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure</u> .
	2. Fluid level low.	2. Check and adjust fluid level. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure</u> .
	3. Filter damaged or missing.	3. Check for damaged/missing filter or cut/missing o-ring.
	4. Valve body malfunction.	4. Check for sticky/stuck 3 - 4 shift pressure valve or regulator valve.
	5. K3 or B2 clutch damaged.	5. Disassemble transmission, inspect for damaged K3 or B2 clutch. Repair as needed.
		1. Check for latest level TCM software. Perform the TCM adaptation procedure. Refer to

SLIPS ON 4-5 UPSHIFT	1. Transmission adaptation/calibration.	<u>Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .</u>
	2. Fluid level low.	2. Check and adjust fluid level. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure.</u>
	3. Filter damaged or missing.	3. Check for damaged/missing filter or cut/missing o-ring.
	4. Electrohydraulic Unit malfunction.	4. Check for sticky/stuck 1 -2/4- 5 shift pressure valve or regulator valve.
	5. B1 or K1 clutch damaged.	5. Disassemble transmission, inspect for damaged B1 or K1 clutch. Repair as needed.
IN-GEAR SHUDDER ON HEAVY ACCELERATION	1. Fluid level low.	1. Check and adjust fluid level. See <u>Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure.</u>
	2. Filter damaged or missing.	2. Check for damaged/missing filter or cut/missing o-ring.
NO DRIVE ENGAGEMENT	1. Customer shifting into N at vehicle speeds greater than 25 mph and tipping in on the throttle.	1. Instruct the customer that they should not shift into N at vehicle speeds greater 25 mph.

FOLLOWING A SHIFT TO N	2. Shift system malfunction.	2. Inspect shift system for proper adjustment or damage. Check shifter for DTCs. Repair as needed.
REVERSE GEAR POSITION BLOCKED ENGAGEMENT WHEN MOVING SHIFT LEVER FROM D POSITION	1. Customer shifting into R at vehicle speeds greater than 7 mph.	1. Instruct customer that R shifter position is blocked at vehicle speeds greater than 7 mph.
	2. Shift system malfunction.	2. Inspect shift system for proper adjustment or damage. Check shifter for DTCs. Repair as needed.
NO ENGINE CRANKING IN P OR N	1. Gearshift cable adjustment.	1. Adjust shift cable and retest.
	2. Shift system malfunction.	2. Check shifter DTCs. Inspect shift cable and lever assembly. Adjust and/or replace worn/damaged parts.
	3. Valve body malfunction.	3. Starter lockout contact malfunction. Remove valve body, replace lead frame assembly. See <u>Transmission and Transfer Case/Automatic - NAG1/CONTACT, Temperature Sensor\Park-Neutral - Operation.</u>
INCORRECT TRANSMISSION TEMPERATURE	1. Defective Trans Temp Sensor.	1. Verify proper temperature sensor operation.
	1. Loose/Corroded TCM Connector (Both C1 and C2 Connectors).	1. Disconnect, inspect, and reconnect TCM connector. Make sure to check for

SPEED SENSOR ERROR		any pushed out pins.
	2. Unlatched Electrohydraulic Unit connector.	2. Remove the Electrohydraulic Unit connector and inspect for any oil or damaged pins. (Note: There is no Electrohydraulic Unit connector pin in position #5) Re-attach the connector and insure that the locking ring tab is fully latched.
	3. Wires Shorted or Open.	3. Ohm the speed sensor wires to make sure there is not a short to another circuit or ground. Visually inspect for any chafing of the wires. Repair as necessary.
	4. TCM Defective.	4. After checking the wiring and connectors replace the TCM.
	1. Leak in area of bell housing.	1. Check bolt torque on internal bell housing bolts. If loose, replace fastener and torque to proper level. If bolts are to proper torque level, check pump outer seal and impeller seal. Replace if needed.
	2. Leak in area of control unit (valve body) electrical connector.	2. Check connector for damaged (cut), flattened or missing o-rings. Replace as needed.
		3. Check for proper torque on oil pan

FLUID LEAK

3. Leak in area of pan gasket.	clamps. Check for mis-positioned or rolled gasket. Repair as needed.
4. Leak in area of park guide plug.	4. Remove park guide plug. Check for damaged (cut) or missing o-ring. If o-ring is in good condition, install new plug.
5. Leak in area of shift lever.	5. Check for damaged shift lever seal or damaged lever. Repair as needed.
6. Leak in area of output flange.	6. Check for worn/damaged slinger seal and output seal. Visually inspect output flange seal surface for damage. Repair as needed.
7. Leak in area of transmission vent.	7. Check fluid level for overfill condition. Adjust as needed. If fluid level is within specification, ride check vehicle. Monitor transmission temperature. If high operating temperatures are observed, fluid may be contaminated or cooling system malfunctioning. Change fluid per service information procedures. Refer to cooling system diagnostics if needed.
	8. Inspect fill tube cap for proper

	8. Leak in area of transmission fill tube.	installation. Inspect fill tube grommet between case and fill tube for leakage. Repair as needed.	
--	--	---	--

AUTOMATIC TRANSMISSION - GENERAL CONDITIONS

CAUTION: Before attempting any repair on a NAG1 automatic transmission, check for Diagnostic Trouble Codes with the appropriate scan tool.

Transmission malfunctions may be caused by these general conditions:

- Poor engine performance.
- Improper adjustments.
- Hydraulic malfunctions.
- Mechanical malfunctions.
- Electronic malfunctions.
- Transfer case performance (if equipped).

Diagnosis of these problems should always begin by checking the easily accessible variables: fluid level and condition, gearshift cable adjustment. Then perform a road test to determine if the problem has been corrected or if more diagnosis is necessary.

PRELIMINARY

Two basic procedures are required to help diagnose the transmission. One procedure is for vehicles that are drivable and an alternate procedure for disabled vehicles that will not back up or move forward.

VEHICLE IS DRIVABLE

1. Check for transmission fault codes using the appropriate scan tool.
2. Adjust the gearshift cable if complaint was based on delayed, erratic, or harsh shifts.
3. Road test and note how the transmission upshifts, downshifts, and engages.
4. Check fluid level and condition.

VEHICLE IS DISABLED

1. Check for a broken or disconnected gearshift cable.
2. Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.
3. Check fluid level and condition.
4. Check shifter linkage: Is the cable connected to the lever at the transmission and does the lever

move with gear change on the console shifter? If no movement, repair shift cable and or shifter.

5. With shifter in PARK, attempt to rotate the drive shaft(s) to make sure the transmission output shaft coupler/flange is secure.
6. Check the transfer case operation (if equipped).
7. Raise and support the vehicle on safety stands. With the transmission in PARK, start the engine and allow to idle for several minutes. Shift the transmission into gear and note the following:
 - a. If the propeller shaft turns but wheels do not, problem is with the differential or axle shafts.
 - b. If the propeller shaft does not turn and the transmission is noisy, stop the engine. Remove the oil pan and check for debris. If the pan is clear, remove the transmission and check for damaged driveplate, converter, oil pump, or input shaft.
 - c. If the propeller shaft does not turn and the transmission is not noisy, perform the hydraulic-pressure test to determine if problem is hydraulic or mechanical.
8. Air pressure test the B1, K3, and B2 clutch circuits. See **Transmission and Transfer Case/Automatic - NAG1 - Diagnosis and Testing**.
9. Check the Transmission Control Module (TCM) wiring, valve body, and solenoids. (Utilize fault codes to diagnose if available).
10. Remove the oil pan and check filter presence and condition (not plugged and seated).
11. If debris is found in the pan, tear down the transmission and inspect all hard parts (front annulus gear, gear to retainer and, input shaft, etc.) and clutches. If the hard parts do not show signs of damage, replace the torque converter and filter.
12. Remove the valve body, disassemble, and inspect the line pressure regulating valve for being stuck, clean and remove debris.
13. Check the pump rotor for failed inner lugs that are driven by the damper hub.

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that all diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, overrunning clutch, or line pressure problems.

A slipping clutch can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch Application chart **CLUTCH APPLICATION** provides a basis for analyzing road test results.

CLUTCH APPLICATION

STANDARD PROCEDURE

ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transmission case and valve body can be repaired by the use of Heli-Coils™, or equivalent. This repair consists of drilling out the worn-out damaged threads. The hole is tapped with a special Heli-Coil tap, or equivalent, and a Heli-Coil insert, or equivalent, is installed into the hole. This brings the hole back to its original thread size.

Heli-Coil™, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL

3.5L REMOVAL

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .

| 1 - TRANSMISSION OIL COOLER LINES |
| 2 - COOLER LINE FITTINGS |
| 3 - SUPPORT CLAMPS |

18. Disconnect transmission fluid cooler lines (1) at transmission fittings (2) and clips (3).
19. Disconnect the transmission vent hose from the transmission.

Fig. 46: Removing/Installing Trans Mount Bolts
Courtesy of CHRYSLER LLC

20. Raise transmission slightly with service jack to relieve load on crossmember and supports.
21. Remove bolts (2) securing rear support and cushion (3) to transmission crossmember (1).
22. Remove bolts attaching crossmember (1) to frame and remove crossmember.

Fig. 47: Removing/Installing Transmission To Oil Pan Bolts

Courtesy of CHRYSLER LLC

1 - BOLTS
2 - ENGINE OIL PAN
3 - TRANSMISSION

23. Remove the bolts (1) holding the engine oil pan (2) to the transmission (3).

Fig. 48: Identifying Transmission, Engine & Fasteners
Courtesy of CHRYSLER LLC

1 - ENGINE
2 - BOLTS
3 - TRANSMISSION

24. Remove all remaining bolts (2) securing the transmission (3) to the engine block (1).
25. While removing the fill tube from the transmission case, carefully work transmission and torque converter assembly rearward off engine block dowels.
26. Hold torque converter in place during transmission removal.
27. Lower transmission and remove assembly from under the vehicle.
28. To remove torque converter, carefully slide torque converter out of the transmission.

DISASSEMBLY

DISASSEMBLY

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .

NOTE: Tag all clutch pack assemblies, as they are removed for reassembly identification.

80e3f7ca

Fig. 49: Remove/Install Torque Converter
Courtesy of CHRYSLER LLC

1. Remove the torque converter (1) from the converter housing (2).

810afafc

Fig. 50: Checking Input Shaft End Play
Courtesy of CHRYSLER LLC

2. Place transmission in a vertical position.
3. Measure input shaft end play as follows:
 - a. Attach Adapter 8266-18 (2) to Handle 8266-8 (1).
 - b. Attach dial indicator C-3339A (3)
 - c. Install the assembled tools onto the input shaft of the transmission and tighten the retaining screw on Adapter 8266-18 to secure tool to the input shaft.
 - d. Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
 - e. Move the input shaft in and out. Record the maximum travel for assembly reference.

Fig. 51: Remove/Install Electrohydraulic Unit
Courtesy of CHRYSLER LLC

4. Loosen adapter plug bolt (9) and remove from the adapter plug (10) from the transmission housing.
5. Detach oil pan (5).
6. Remove oil filter (4).
7. Unscrew Torx® socket bolts (3) and remove electrohydraulic unit (2).
8. Air check the transmission. See **Transmission and Transfer Case/Automatic - NAG1 - Diagnosis and Testing.**

Fig. 52: Remove/Install Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER LLC

9. Place the transmission in PARK.
10. Remove the propeller shaft flange nut using a 30 mm 12 point socket. Hold the propeller shaft flange securely while removing the nut.
11. Remove the propeller shaft flange.
12. Remove the transmission rear oil seal with a suitable slide hammer and screw.
13. Remove the transmission output shaft washer. Be sure to tag the washer since it is very similar to the geartrain end-play shim and they must not be interchanged.
14. Remove the retaining clip (1) that secures the transmission rear output shaft bearing to the transmission case.

Fig. 53: Position Remover 9082A On Bearing
Courtesy of CHRYSLER LLC

15. Position Bearing Remover 9082A (1) to the transmission case (2) and over the inner race of the output shaft bearing (3).

Fig. 54: Slide Remover 9082A Collar Downward
Courtesy of CHRYSLER LLC

NOTE: Due to production variations in the bearing, it may not be possible to slide the collar fully downward. It is only necessary to slide the collar down far enough that the fingers securely grasp the inner bearing race.

16. Slide the collar (3) downward over the fingers (4) on Bearing Remover 9082A (1)

Fig. 55: Remove Output Shaft Bearing
Courtesy of CHRYSLER LLC

17. Using Bearing Remover 9082A (1), remove the output shaft bearing (3) from the transmission case (2).
18. Remove the geartrain end-play shim from the output shaft. Be sure to tag the shim since it is very similar to the output shaft washer and they must not be interchanged.

Fig. 56: Remove/Install K1, K2, and K3 Clutches
 Courtesy of CHRYSLER LLC

1 - DRIVING CLUTCH K1	5 - THRUST WASHER
2 - SUN GEAR OF FRONT PLANETARY GEAR SET	6 - FRONT PLANETARY GEAR SET, DRIVING CLUTCH K2, AND INPUT SHAFT
3 - DRIVING CLUTCH K3, OUTPUT SHAFT, AND CENTER AND REAR PLANETARY GEAR SETS	7 - SEALING RINGS
4 - THRUST NEEDLE BEARING	
BEARING	

19. Remove the bolts holding the transmission housing to the converter housing from inside the converter housing.
20. Stand the transmission upright on the converter housing.
21. Remove the remaining bolts holding the transmission housing to the converter housing.
22. Remove the transmission housing from the converter housing.
23. Remove output shaft with center and rear gear set and clutch K3 (3).
24. Remove thrust needle bearing (4) and thrust washer (5).
25. Remove input shaft with clutch K2 and front gear set (6).
26. Remove clutch K1 (1).

Fig. 57: Remove/Install Holding Clutch B1 and Oil Pump
 Courtesy of CHRYSLER LLC

1 - BOLTS - M6X32	4 - BOLTS - M8X35
2 - CONVERTER HOUSING	5 - HOLDING CLUTCH B1
3 - INTERMEDIATE PLATE	6 - OIL PUMP

27. Unscrew Torx® socket bolts (4) and remove oil pump (6). Screw two opposed bolts into the oil pump housing and press the oil pump out of the converter housing by applying light blows with a plastic hammer.
28. Remove and discard the torque converter hub seal and the oil pump outer o-ring seal from the oil pump.
29. Unscrew Torx® socket bolts (1) and remove multiple-disc holding clutch B1 (5) from converter housing. Screw two opposed bolts into the multiple-disc holding clutch B1 (5) and separate from the converter housing by applying light blows with a plastic hammer.
30. Detach intermediate plate (3) from converter housing (2).

80a3f7ce

Fig. 58: Remove/Install B2, B3, & Parking Gear
 Courtesy of CHRYSLER LLC

1 - SNAP-RING	5 - PARK GEAR
2 - HOLDING CLUTCH B3 DISCS	6 - TRANSMISSION HOUSING
3 - SPRING WASHER	7 - BOLTS - M8X60
4 - HOLDING CLUTCH B2	

31. Remove multiple-disc pack B3 (2) and spring washer (3) by removing snap-ring (1) in transmission housing. To facilitate removal of the snap-ring (1), compress the multiple-disc pack B3 (2). Note which clutch disc is removed just prior to the spring washer (3) for reassembly. If the clutch discs are re-used, this disc must be returned to its original position on top of the spring washer.
32. Unscrew Torx® socket bolts (7).
33. Remove multiple-disc holding clutch B2 (4) from transmission housing. The externally toothed disc carrier for multiple-disc holding clutch B2 is also the piston for multiple-disc holding clutch B3.
34. Remove parking lock gear (5).

CLEANING

CLEANING

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF +4, Automatic Transmission Fluid, during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: **Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.**

INSPECTION

INSPECTION

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil® thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

ASSEMBLY

ASSEMBLY

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure .

81c44261

1. During assembly, install the thrust and roller bearings in the orientation shown in illustration.

80e3f7ce

Fig. 60: Remove/Install B2, B3, & Parking Gear
Courtesy of CHRYSLER LLC

1 - SNAP-RING	5 - PARK GEAR
2 - HOLDING CLUTCH B3 DISCS	6 - TRANSMISSION HOUSING
3 - SPRING WASHER	7 - BOLTS - M8X60
4 - HOLDING CLUTCH B2	

2. Insert parking lock gear (5).
3. Install multiple-disc holding clutch B2 (4) in transmission housing (6).
4. Screw in both Torx® socket bolts (7). Tighten the bolts to 16 N.m (141 in.lbs.).

Fig. 61: Measure B3 Clutch Clearance
Courtesy of CHRYSLER LLC

1 - OUTER DISC - 6.5 MM (0.256 IN.)	5 - PISTON
2 - OUTER DISCS - 1.8 MM (0.071 IN.)	6 - FRICTION DISCS
3 - OUTER DISCS - 1.8 MM (0.071 IN.)	7 - SNAP-RING
4 - SPRING WASHER	8 - B3 DISC CARRIER

NOTE: During the measurement the snap ring (7) must contact the upper bearing surface of the groove in the outer multiple-disc carrier (8).

NOTE: Pay attention to sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the spring washer (4) to its original location. Place new friction multiple-discs in ATF fluid for one hour before installing.

CAUTION: Apply only light pressure (less than 10 N (3 lbs.) of force) to the clutch pack when measuring the clutch clearance with the feeler gauge. Applying excessive force to the clutch will give an incorrect reading and lead to a transmission failure.

5. Insert and measure spring washer (4) and multiple-disc pack B3 (2, 6).
 - a. Put multiple-discs for multiple-disc holding clutch B3 together in the sequence shown in the illustration and insert individually.
 - b. Using a feeler gauge, determine the play "L" at three points between the snap ring (7) and outer multiple-disc (1). B3 clutch clearance should be 1.0-1.4 mm (0.039-0.055 in.). Adjust the clearance as necessary.
 - c. Adjust with snap-ring (7), if necessary. Snap-rings are available in thicknesses of 3.2 mm

(0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), 4.1 mm (0.162 in.), 4.4 mm (0.173 in.), and 4.7 mm (0.185 in.).

Fig. 62: Check K1 Feed Hole
Courtesy of CHRYSLER LLC

6. Check that the K1 clutch feed hole (1) in the inner hub of clutch B1 is free before installing clutch B1.

Fig. 63: Remove/Install Holding Clutch B1 and Oil Pump
Courtesy of CHRYSLER LLC

1 - BOLTS - M6X32

4 - BOLTS - M8X35

2 - CONVERTER HOUSING	5 - HOLDING CLUTCH B1
3 - INTERMEDIATE PLATE	6 - OIL PUMP

7. Place intermediate plate (3) on converter housing (2) and align.

NOTE: **The intermediate plate can generally be used several times. The plate must not be coated with additional sealant**

8. Install the holding clutch B1 (5) onto the converter housing and intermediate plate. Installed position of clutch B1 in relation to converter housing is specified by a plain dowel pin in clutch B1 (arrow in illustration).
9. Install the bolts to hold clutch B1 (5) to the converter housing.
10. Securely tighten multiple-disc holding clutch B1 (5) on converter housing (2) to 10 N.m (89 in.lbs.).

Fig. 64: Remove/Install Oil Pump Seals
Courtesy of CHRYSLER LLC

11. Install new inner oil seal (1) into the oil pump using Seal Installer 8902A.
12. Install new outer oil seal (2) onto the oil pump.

80e315da

Fig. 65: Remove/Install K1, K2, and K3 Clutches
Courtesy of CHRYSLER LLC

1 - DRIVING CLUTCH K1	5 - THRUST WASHER
2 - SUN GEAR OF FRONT PLANETARY GEAR SET	6 - FRONT PLANETARY GEAR SET, DRIVING CLUTCH K2, AND INPUT SHAFT
3 - DRIVING CLUTCH K3, OUTPUT SHAFT, AND CENTER AND REAR PLANETARY GEAR SETS	7 - SEALING RINGS
4 - THRUST NEEDLE BEARING	

13. Install oil pump (6) and securely tighten. Tighten the oil pump bolts to 20 N.m (177 in.lbs.).
14. Using grease, insert sealing rings (7) in the groove so that the joint remains together.
15. Install the K1 (1) clutch onto the B1 clutch.
16. Install input shaft with clutch K2 (6) and front gear set (1).
17. Install front washer (5) and thrust needle bearing (4).

NOTE: Insure that the pinion gears are fully seated in the Rear Annulus (Hollow) Gear. If 50% of the pinion gear splines protrude, the Rear Annulus Gear was installed upside down in the K2 Clutch Retainer.

18. Install output shaft with center and rear gear set and clutch K3 (3).

Fig. 66: Measuring From Transmission Housing -To- Park Gear
 Courtesy of CHRYSLER LLC

19. Using grease, install both Teflon rings in the groove at the rear of the output shaft so that the joint stays together.
20. Mount transmission housing on converter housing.
21. Screw in Torx® socket bolts through the transmission housing into the converter housing. Tighten the bolts to 20 N.m (177 in.lbs.).

NOTE: **Verify that there are no nicks or other irregularities in the surface of the transmission case that will cause an inaccurate measurement.**

22. Measure end-play between park pawl gear and grooved ball bearing in order to select the proper geartrain end-play shim.
23. Place Gauge Bar 6311 (1) on transmission housing. Using a depth gauge, measure from the gauge bar to the parking lock gear (2).

Fig. 67: Measuring From Transmission Housing -To- Rear Bearing Contact Surface

Courtesy of CHRYSLER LLC

24. Using a depth gauge, measure from Gauge Bar 6311 (1) to the contact surface of the output shaft bearing (2) in the transmission housing.
25. Subtract the first figure from the second figure to determine the current end-play of the transmission. Select a shim or a combination of two shims such that the end-play will be 0.3-0.5 mm (0.012-0.020 in.). Shims are available in thicknesses of 0.2 mm (0.008 in.), 0.3 mm (0.012 in.), 0.4 mm (0.016 in.), and 0.5 mm (0.020 in.).
26. Install the selected end-play shim.

Fig. 68: Install Output Shaft Bearing
Courtesy of CHRYSLER LLC

27. Screw in Torx® socket bolts through the converter housing into the transmission housing. Tighten the bolts to 20 N.m (177 in.lbs.).

NOTE: **The closed side of the plastic cage must point towards the parking lock gear.**

28. Install output shaft bearing (2) in rear transmission case (3) using Bearing Installer 9287 (1)

Fig. 69: Remove/Install Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER LLC

29. Install the retaining ring (1) that secure the output shaft bearing (2). Ensure that the retaining ring is seated correctly in the groove.
30. Check that there is no play between the bearing and the retaining ring using feeler gauge.
31. There must be no play between the retaining ring and the bearing. If the ring cannot be installed, a thinner ring must be used. If there is play between the ring and the bearing, a thicker ring must be installed. Retaining rings are available in thicknesses of 2.0 mm (0.079 in.), 2.1 mm (0.083 in.), and 2.2 mm (0.087 in.).

Fig. 70: Checking Input Shaft End Play
Courtesy of CHRYSLER LLC

32. Rotate the transmission so that the bellhousing is pointed upward and be sure that the output shaft is allowed to move freely.
33. Measure input shaft end-play.

NOTE: If end-play is incorrect, transmission is incorrectly assembled, or the geartrain end-play shim is incorrect. The geartrain end-play shim is selective.

NOTE: If necessary, a combination of shims can be used to achieve the required end-play.

- a. Attach Adapter 8266-18 (2) to Handle 8266-8 (1).
- b. Attach dial indicator C-3339A (3).
- c. Install the assembled tools onto the input shaft of the transmission. Tighten the retaining screw on Adapter 8266-18 to secure it to the input shaft.
- d. Position the dial indicator plunger against a flat spot on the oil pump and zero the dial indicator.
- e. Move input shaft in and out and record reading. End play should be 0.3-0.5 mm (0.012-0.020 in.). Adjust as necessary.

Fig. 71: Install Output Shaft Seal
Courtesy of CHRYSLER LLC

NOTE: The output shaft shim should be 0.3 mm (0.012 in.). If a 0.3 mm (0.012 in.) shim is not available, use a 0.2 mm (0.008 in.) 0.4 mm (0.016 in.) or 0.5 mm (.020 in.) shim.

34. Install the output shaft shim onto the output shaft.
35. Install a new transmission rear seal into the transmission case (2) with Seal Installer 8902A (1).

Fig. 72: Align Staking Tool 9078
Courtesy of CHRYSLER LLC

36. Place the transmission in PARK.
37. Inspect the seal protector on the rear of the output shaft flange. Replace the seal protector if damaged. the seal protector can be removed using a suitable pry tool and installed with a suitable tube style tool.
38. Install the propeller shaft flange (1) onto the output shaft and install an new flange nut. Tighten the flange nut using a 30 mm 12 point socket to 200 N.m (147.5 ft.lbs.).
39. Place the Staking Tool 9078 (2) and Driver Handle C-4171 onto the output shaft.
40. Rotate Staking Tool 9078 until the alignment pin (3) engages the output shaft notch (4).

Fig. 73: Stake Output Shaft Nut
Courtesy of CHRYSLER LLC

41. Press downward on Staking Tool 9078 (1) until the staking pin (3) contacts the output shaft nut flange (2).
42. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely

staked to the output shaft.

Fig. 74: Remove/Install Electrohydraulic Unit
Courtesy of CHRYSLER LLC

43. Install electrohydraulic unit (2). Tighten the bolts (3) to 8 N.m (71 in.lbs.).
44. Install oil filter (4).
45. Install oil pan (5). Tighten the bolts (7) to 8 N.m (71 in.lbs.).
46. Install the adapter plug (10). Tighten the bolt (9) to 2.5 N.m (22 in. lbs.).

Fig. 75: Remove/Install Torque Converter
Courtesy of CHRYSLER LLC

47. Position the torque converter (1) to the converter housing (2). Align torque converter to the transmission input shaft and oil pump drive and carefully install the converter.

INSTALLATION

3.5L INSTALLATION

NOTE: Check torque converter hub and hub drive flats for sharp edges burrs, scratches, or nicks. Polish the hub and flats with 800/1000 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

NOTE: If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.

1. Lubricate oil pump seal lip with transmission fluid.

Fig. 76: Torque Converter Installation Depth
Courtesy of CHRYSLER LLC

1 - TORQUE CONVERTER 2 - TRANSMISSION HOUSING
--

2. Place torque converter (1) in position in transmission (2).

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale and straightedge (A). Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged.
Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.
9. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.

Fig. 77: Identifying Transmission, Engine & Fasteners
 Courtesy of CHRYSLER LLC

10. Raise transmission (3) and align the torque converter with the drive plate and the transmission converter housing with the engine block (1).
11. Move transmission forward. Then raise, lower, or tilt transmission to align the converter housing with the engine block dowels.
12. While installing the fill tube into the transmission case, carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
13. Install two torque converter housing bolts (2) to attach the transmission to the engine.
14. Install the remaining torque converter housing to engine bolts (2). Tighten to 39 N.m (29 ft.lbs.).
15. Install the fill tube bolt at the transmission case. Tighten the bolt to 12 N.m (105 lbs in.).

- | |
|----------------------------|
| 1 - TORQUE CONVERTER BOLTS |
|----------------------------|

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

17. Install all torque converter-to-driveplate bolts (1) by hand.
18. Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 42 N.m (31 ft. lbs.).

28. Align and connect the propeller shaft (1). Refer to **Differential and Driveline/Propeller Shaft - Installation** .

Fig. 87: Removing/Installing Trans Mount Bolts
Courtesy of CHRYSLER LLC

29. Install rear support (3) to transmission. Tighten bolts to 47 N.m (35 ft.lbs.)
30. Install rear transmission crossmember (1). Tighten crossmember to frame bolts to 68 N.m (50 ft.lbs.).
31. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts (2) to 47 N.m (35 ft.lbs.).
32. Install exhaust components.
33. Install any necessary splash shields.
34. Adjust gearshift cable if necessary.
35. Lower vehicle.
36. Connect negative battery cable.
37. Fill the transmission with the appropriate transmission fluid. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** according to the standard procedure. See **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure**.

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure**.

38. Verify proper operation.

INSTALLATION

NOTE: Check torque converter hub and hub drive flats for sharp edges burrs,

scratches, or nicks. Polish the hub and flats with 800/1000 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

NOTE: If a replacement transmission is being installed, transfer any components necessary, such as the manual shift lever and shift cable bracket, from the original transmission onto the replacement transmission.

1. Lubricate oil pump seal lip with transmission fluid.

Fig. 88: Torque Converter Installation Depth
Courtesy of CHRYSLER LLC

1 - TORQUE CONVERTER 2 - TRANSMISSION HOUSING
--

2. Place torque converter (1) in position in transmission (2).

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.
5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale and straightedge (A). Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.

Fig. 89: Identifying Transmission, Engine & Fasteners
Courtesy of CHRYSLER LLC

1 - ENGINE 2 - BOLTS 3 - TRANSMISSION

8. Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged.
Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.
9. Apply a light coating of Mopar® High Temp Grease to the torque converter hub pocket in the rear pocket of the engine's crankshaft.
10. Raise transmission (3) and align the torque converter with the drive plate and the transmission converter housing with the engine block (1).
11. Move transmission forward. Then raise, lower, or tilt transmission to align the converter housing with the engine block dowels.
12. While installing the fill tube into the transmission case, carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft. Verify that no wires, or the transmission vent hose, have become trapped between the engine block and the transmission.
13. Install two torque converter housing bolts (2) to attach the transmission to the engine.
14. Install the remaining torque converter housing to engine bolts (2). Tighten to 39 N.m (29 ft.lbs.).
15. Install the fill tube bolt at the transmission case. Tighten the bolt to 12 N.m (105 lbs in.).

- | |
|----------------------------|
| 1 - TORQUE CONVERTER BOLTS |
|----------------------------|

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

17. Install all torque converter-to-driveplate bolts (1) by hand.
18. Verify that the torque converter is pulled flush to the driveplate. Tighten bolts to 42 N.m (31 ft. lbs.).

Fig. 92: TORQUE CONVERTER TO FLEX PLATE BOLTS

28. Align and connect the propeller shaft (1). Refer to **Differential and Driveline/Propeller Shaft - Installation** .

Fig. 99: Removing/Installing Trans Mount Bolts
Courtesy of CHRYSLER LLC

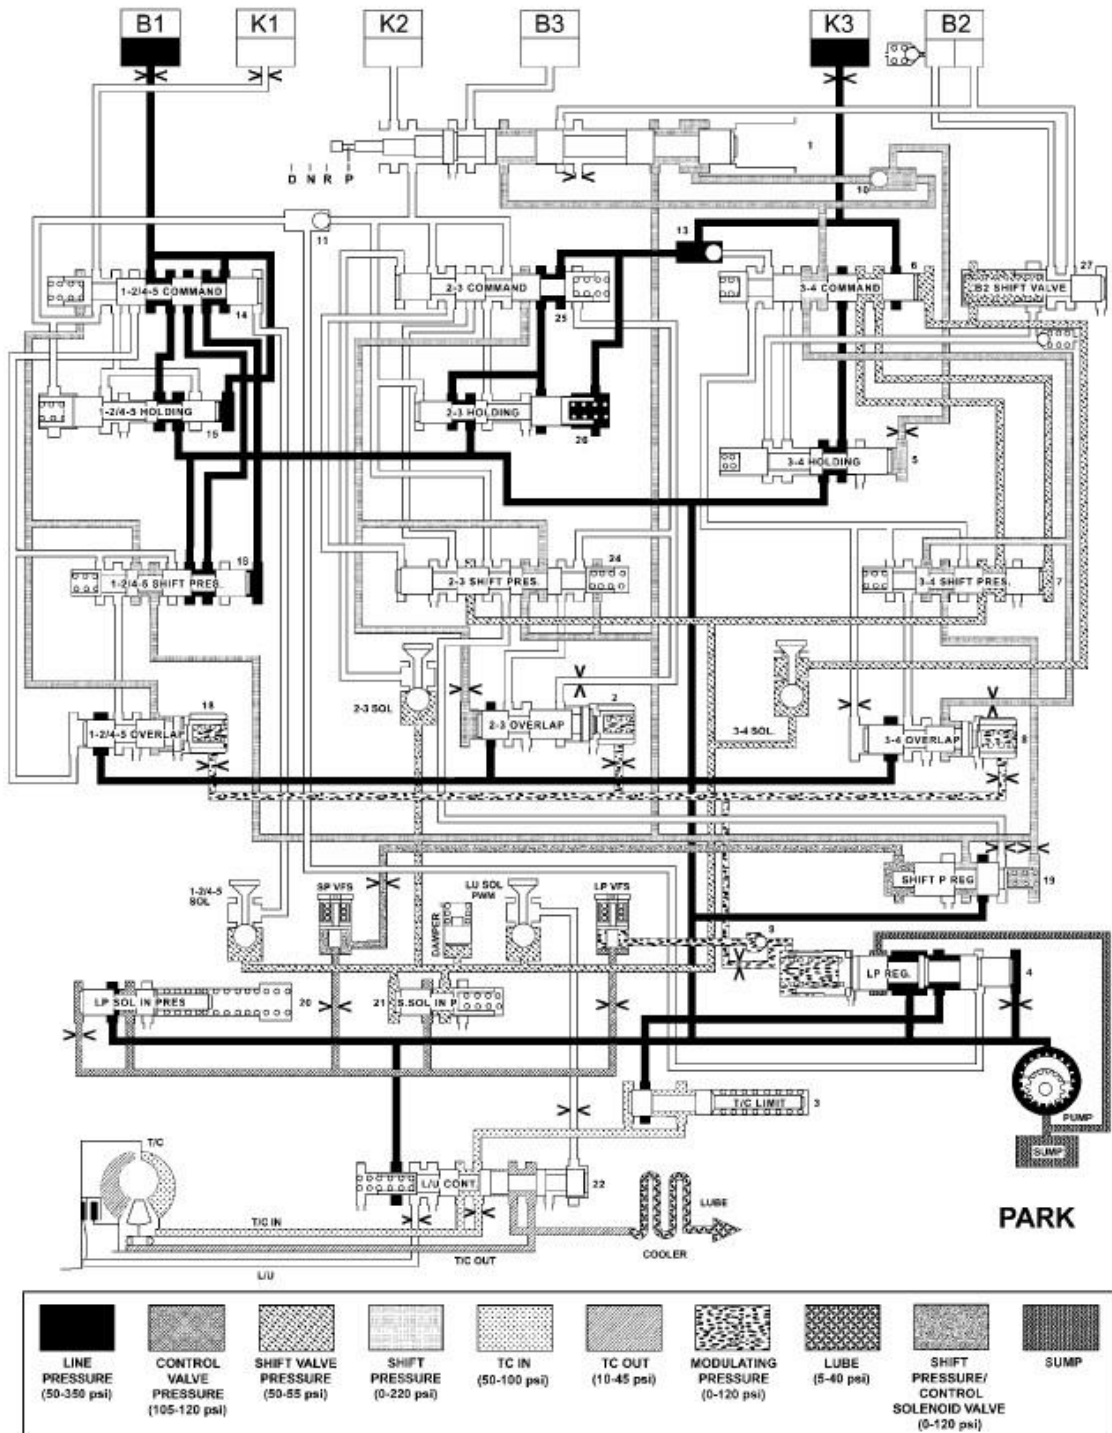

29. Install rear support (3) to transmission. Tighten bolts to 47 N.m (35 ft.lbs.)
30. Install rear transmission crossmember (1). Tighten crossmember to frame bolts to 68 N.m (50 ft.lbs.).
31. Lower transmission onto crossmember and install bolts attaching transmission mount to crossmember. Tighten clevis bracket to crossmember bolts (2) to 47 N.m (35 ft.lbs.).
32. Install exhaust components.
33. Install any necessary splash shields.
34. Adjust gearshift cable if necessary.
35. Lower vehicle.
36. Connect negative battery cable.
37. Fill the transmission with the appropriate transmission fluid. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** according to the standard procedure. See **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure**.

NOTE: If the transmission is being reconditioned (clutch/seal replacement) or replaced, it is necessary to perform the TCM Adaptation Procedure using the scan tool. Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure** .

38. Verify proper operation.

BEARING, OUTPUT SHAFT

REMOVAL

REMOVAL

Fig. 135: Remove/Install Rear Output Shaft Retaining Ring
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - RETAINING RING
2 - OUTPUT SHAFT BEARING |
|--|

1. Raise and support vehicle.
2. Remove the propeller shaft. Refer to **Differential and Driveline/Propeller Shaft - Removal** .
3. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.
4. Remove the nut, with a 30 mm 12 point socket, holding the propeller shaft flange to the output shaft and remove the flange.
5. Remove the transmission rear oil seal with a suitable slide hammer and screw.
6. Remove the transmission output shaft washer. Be sure to tag the washer since it is very similar to the geartrain end-play shim and they must not be interchanged.
7. Remove the transmission rear output shaft bearing retaining ring (1) .

- | |
|---------------------------|
| 1 - BEARING REMOVER 9082A |
| 2 - TRANSMISSION CASE |
| 3 - COLLAR |
| 4 - FINGERS |

NOTE: Due to production variations in the bearing, it may not be possible to slide the collar fully downward. It is only necessary to slide the collar down far enough that the fingers securely grasp the inner bearing race.

9. Slide the collar (3) on the Bearing Remover 9082A (1) downward over the fingers (3) of the tool.

Fig. 138: Remove Output Shaft Bearing
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - BEARING REMOVER 9082A
2 - TRANSMISSION CASE
3 - OUTPUT SHAFT BEARING |
|--|

CAUTION: Verify that the geartrain end-play shim has remained on the output shaft and against the park gear. The shim may be adhered to the bearing inner race. Retrieve the shim from the bearing and install over the output shaft and against the park gear.

10. Remove the output shaft bearing (3) .

INSTALLATION

INSTALLATION

NOTE: The output shaft shim should be 0.3 mm (0.012 in.). If a 0.3 mm (0.012 in.) shim is not available, use a 0.2 mm (0.008 in.) 0.4 mm (0.016 in.) or 0.5 mm (.020 in.) shim.

Fig. 139: Install Output Shaft Bearing
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - BEARING INSTALLER 9287
2 - BEARING
3 - TRANSMISSION CASE |
|--|

CAUTION: Verify that the geartrain end-play shim is properly installed over the output shaft and against the park gear.

1. Install output shaft bearing in the rear transmission housing. Using Bearing Installer 9287 (1) , install the output shaft bearing (2) into the transmission housing. **The closed side of the plastic cage must point towards the parking lock gear.**

Fig. 140: Remove/Install Rear Output Shaft Retaining Ring
 Courtesy of CHRYSLER LLC

- | |
|--------------------|
| 1 - RETAINING RING |
|--------------------|

2 - OUTPUT SHAFT BEARING

2. Install the retaining ring (1) . Ensure that the retaining ring is seated correctly in the groove.
3. Check that there is no play between the bearing and the retaining ring using feeler gauge.
4. There must be no play between the retaining ring and the bearing. If the ring cannot be installed, a thinner ring must be used. If there is play between the ring and the bearing, a thicker ring must be installed. Retaining rings are available in thicknesses of 2.0 mm (0.079 in.), 2.1 mm (0.083 in.), and 2.2 mm (0.087 in.).
5. Install the output shaft washer onto the output shaft.

Fig. 141: Installing Output Shaft Seal
Courtesy of CHRYSLER LLC

1 - SEAL INSTALLER 8902A 2 - TRANSMISSION CASE

6. Install a new transmission rear seal into the transmission case with Seal Installer 8902A (1) .
7. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.
8. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut, with a 30 mm 12 point socket, to 200 N.m (147.5 ft.lbs.).

Fig. 142: Align Staking Tool 9078

Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - STAKING TOOL 9078
2 - PROPELLER FLANGE
3 - STAKING PIN |
|--|

11. Press downward on the staking tool (1) until the staking pin (3) contacts the output shaft nut flange (2) .
12. Strike the Driver handle C-4171 with a suitable hammer until the output shaft nut is securely staked to the output shaft.
13. Install the propeller shaft. Refer to **Differential and Driveline/Propeller Shaft - Installation** .

CABLE, PARK LOCK

DESCRIPTION

DESCRIPTION

The Park Lock Cable is no longer used. The ignition lock out is controlled by means of a Gated Park Switch (electronic micro switch) located in the shifter assembly.

CABLE, SHIFT

DIAGNOSIS AND TESTING

GEARSHIFT CABLE

1. The floor shifter lever and gate positions should be in alignment with all transmission PARK, NEUTRAL, and gear detent positions.
2. Engine starts must be possible with floor shift lever in PARK or NEUTRAL gate positions only. Engine starts must not be possible in any other gear position.
3. With floor shift lever handle push-button not depressed and lever in:
 - a. PARK position - Apply forward force on center of handle and remove pressure. Engine starts must be possible.
 - b. PARK position - Apply rearward force on center of handle and remove pressure. Engine starts must be possible.
 - c. NEUTRAL position - Normal position. Engine starts must be possible.
 - d. NEUTRAL position - Engine running and brakes applied, apply forward force on center of shift handle. Transmission shall not be able to shift from NEUTRAL to REVERSE.

REMOVAL

REMOVAL

1. Shift transmission into PARK.
2. Raise vehicle.

Fig. 144: Identifying Gearshift Cable, Eyelet & Manual Shift Lever
 Courtesy of CHRYSLER LLC

3. Remove the gearshift cable retaining clip (4) (if equipped).
4. Disconnect the gearshift cable (1) from the shift lever (3), and remove cable from bracket (2).
5. Lower the vehicle.
6. Remove the floor console. Refer to **Body/Interior/CONSOLE, Floor - Removal** as necessary to access the shift mechanism and cables.
7. If necessary, remove the bolts holding the shield, covering the gearshift and park lock cables, to the floorpan and remove the shield.

|---|
| 1 - GEARSHIFT CABLE
2 - HEATER HOSES
3 - TRANSMISSION |
|---|

6. From under the hood, route the gearshift cable (1) forward of the air conditioning lines and the heater hoses (2) and toward the transmission (3) manual lever.
7. Raise vehicle.
8. Verify that the transmission is in the PARK position by trying to rotate the propeller shaft. If the propeller shaft rotates, move the transmission manual shift lever to the full rearward position and turn the propeller shaft until the PARK system is engaged.

Fig. 150: Identifying Gearshift Cable, Eyelet & Manual Shift Lever
 Courtesy of CHRYSLER LLC

9. Route the gearshift cable (1) through the mounting bracket (2).
10. Engage the gearshift cable (1) eyelet onto the transmission manual shift lever (3).
11. Install the gearshift cable retaining clip (4) (if equipped).
12. Lower vehicle.
13. Verify that the shifter is in the PARK position.

- | |
|--|
| 1 - GEARSHIFT CABLE
2 - CABLE RETAINER AND NOTCH
3 - SHIFTER ASSEMBLY PIN
4 - SHIFT LEVER |
|--|

5 - ADJUSTMENT BOLT

14. Tighten the adjustment screw (5) to 7 N.m (65 in.lbs.).
15. Verify correct shifter operation.
16. If necessary, install the shield, covering the gearshift and park lock cables, to the floorpan and install the bolts to hold the shield to the floorpan.
17. Install the floor console. Refer to **Body/Interior/CONSOLE, Floor - Installation** , lower instrument panel components. Refer to **Body/Instrument Panel/BEZEL, Instrument Panel - Installation** and dash panel insulation pad as necessary.

ADJUSTMENTS

ADJUSTMENTS - GEARSHIFT CABLE

Check adjustment by starting the engine in PARK and NEUTRAL. Adjustment is CORRECT if the engine starts only in these positions. Adjustment is INCORRECT if the engine starts in one but not both positions. If the engine starts in any position other than PARK or NEUTRAL, or if the engine will not start at all, the park/neutral position contact may be faulty.

Fig. 152: Gearshift Cable at Shifter Assembly

|------------------------------|
| 1 - GEARSHIFT CABLE |
| 2 - CABLE RETAINER AND NOTCH |
| 3 - SHIFTER ASSEMBLY PIN |
| 4 - SHIFT LEVER |
| 5 - ADJUSTMENT BOLT |

1. Shift transmission into PARK.
2. Remove floor console as necessary for access to the shift cable adjustment. Refer to **Body/Interior/CONSOLE, Floor - Removal** .

3. Loosen the shift cable adjustment screw (5) .
4. Raise vehicle.
5. Unsnap cable eyelet from transmission shift lever.
6. Verify transmission shift lever is in PARK detent by moving lever fully rearward. Last rearward detent is PARK position.
7. Verify positive engagement of transmission park lock by attempting to rotate propeller shaft. Shaft will not rotate when park lock is engaged.
8. Snap cable eyelet onto transmission shift lever.

4. Insert disc spring (2) in the outer multiple-disc carrier. Observe the disc spring (2) installation position. The lugs of the disc spring (2) washer must align with the 3 raised pads (arrow in illustration) of the B1 multiple-disc carrier (1). The cone of the spring washer must point downwards.

Fig. 158: Measure B1 Clutch Clearance
Courtesy of CHRYSLER LLC

1 - PRESSING TOOL 8901A 2 - B1 CLUTCH OUTER CARRIER
--

5. Insert the multiple-disc pack (6) in the outer multiple-disc carrier and measure the clutch clearance.

NOTE: Pay attention to the sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the disc spring (5) to its original location.

CAUTION: When working with double sided friction discs, an externally lugged steel plate is installed first, followed by a friction disc, and continuing on until all the required discs are installed. When working with single sided friction discs, an externally lugged disc is installed first, followed by an internally lugged disc, and continuing on until all the required discs are installed. All single sided discs are installed with the friction side up.

NOTE: Place new friction multiple-discs in ATF fluid for one hour before installing.

6. Measure B1 clutch clearance by mounting Pressing Tool 8901A (1) on outer multiple disc.
7. Using a lever press, compress pressing tool to the upper most line marked 1200 N (the marking

ring is still visible, see small arrow in illustration).

12. Using a feeler gauge, determine the play "L" at three points between the snap-ring (8) and outer multiple-disc (7).
13. The correct clutch clearance is 1.9-2.3 mm (0.075-0.091 in.) for the four friction disc versions and 2.0-2.4 mm (0.079-0.095 in.) for the five disc versions.
14. Adjust with snap-ring (8), if necessary. Snap-rings are available in thicknesses of 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), 3.5 mm (0.138 in.), 3.8 mm (0.150 in.), and 4.1 mm (0.162 in.).

FREEWHEELING CLUTCH IDENTIFICATION

DESCRIPTION

DESCRIPTION

80e309a9

Fig. 169: Freewheeling Clutch
Courtesy of CHRYSLER LLC

- 1 - ROTATION DIRECTION "A"
- 2 - ROTATION DIRECTION "B"
- 3 - LOCKING ELEMENTS
- 4 - OUTER RACE
- 5 - FRONT OR REAR SUN GEAR
- 6 - LOCKING ELEMENT CAGE
- 7 - INNER RACE

Freewheeling clutches are installed in the front planetary gear set between the sun gear and the stator shaft, and in the rear planetary gear set between the sun gear and the intermediate shaft.

The freewheel consists of an outer race (4), an inner race (7), a number of locking elements (3) and a cage (6) for these locking elements.

OPERATION

OPERATION

80e309a9

Fig. 170: Freewheeling Clutch
Courtesy of CHRYSLER LLC

- 1 - ROTATION DIRECTION "A"
- 2 - ROTATION DIRECTION "B"
- 3 - LOCKING ELEMENTS
- 4 - OUTER RACE
- 5 - FRONT OR REAR SUN GEAR
- 6 - LOCKING ELEMENT CAGE
- 7 - INNER RACE

The freewheeling clutch optimizes individual gearshifts. They lock individual elements of a planetary gear set together or against the transmission housing in one direction of rotation to allow the torque to be transmitted.

If the inner race (7) of the freewheeling clutch is locked and the outer race (4) turns counter-clockwise (1), the locking elements (3) adopt a diagonal position on account of their special contours, allowing the freewheel function. The inner race (4) slides under the locking elements (3) with minimal friction. If the rotation of the outer race (4) changes to clockwise (2), the locking elements (3) stand up and lock the outer and inner races (4, 7) together.

10 - CENTER PLANETARY GEARSET	21 - INPUT SHAFT

PLANETARY CARRIER

11 - CENTER PLANETARY GEARSET
ANNULUS GEAR

Three multi-plate input clutches (1, 2, 5), the front, middle and rear multi-plate clutches K1 (1), K2 (2), and K3 (5), are located in the planetary gear sets in the transmission housing.

A multi-plate input clutch consists of a number of internally toothed discs (4) on an internally toothed disc carrier and externally toothed discs (3) on an externally toothed disc carrier.

OPERATION

OPERATION

Fig. 175: Input Clutches
Courtesy of CHRYSLER LLC

1 - K1 CLUTCH	12 - CENTER PLANETARY GEARSET SUN GEAR

4 - INTERNALLY TOOTHED DISC	15 - FRONT PLANETARY GEARSET PLANETARY CARRIER
5 - K3 CLUTCH	16 - FRONT PLANETARY GEARSET ANNULUS GEAR
6 - K3 CLUTCH EXTERNALLY TOOTHED	17 - FRONT PLANETARY GEARSET SUN

DISC CARRIER	GEAR
7 - K3 CLUTCH PISTON	18 - K1 CLUTCH INTERNALLY TOOTHED DISC CARRIER
8 - K3 CLUTCH INTERNALLY TOOTHED DISC CARRIER	19 - K1 CLUTCH EXTERNALLY TOOTHED DISC CARRIER
9 - REAR PLANETARY GEARSET SUN GEAR	20 - K1 CLUTCH PISTON
10 - CENTER PLANETARY GEARSET PLANETARY CARRIER	21 - INPUT SHAFT
11 - CENTER PLANETARY GEARSET ANNULUS GEAR	

The input clutches produce a non-positive locking connection between two elements of a planetary gear set or between one element from each of two planetary gear sets in order to transmit the drive torque.

If the piston (20) on multi-plate clutch K1 (1) is subjected to oil pressure, it presses the internal and external discs of the disc set together. The sun gear (17) is locked with the planetary carrier (15) via the externally toothed disc carrier (19) and the internally toothed disc carrier (18). The front planetary gear set is thus locked and turns as a closed unit.

If the multi-plate clutch K2 (2) is actuated via the piston (14), the piston compresses the disc set. The annulus gear (16) of the front planetary gear set is locked with the annulus gear (11) of the center planetary gear set via the externally toothed disc carrier (13) and the center planetary carrier (10) on which the internally toothed discs are seated. Annulus gear (16) and annulus gear (11) turn at the same speed as the input shaft (21)

If the multi-plate clutch K3 (5) is actuated via the piston (7), the piston compresses the disc set. The sun gear (12) of the center planetary gear set is locked with the sun gear (9) of the rear planetary gear set via the externally toothed disc carrier (6) and the internally toothed disc carrier (8). Sun gear (12) and sun gear (9) turn at the same speed.

8 - THRUST WASHER	18 - HOLLOW GEAR
9 - PISTON	19 - SNAP-RING
10 - DISC SPRING	-

1. Remove snap-ring (19) from the K1 inner multiple-disc carrier with integrated front gear set (2) and take off hollow gear (18).
2. Remove input shaft with clutch K2 (5) .
3. Remove needle thrust bearing (3).
4. Remove snap-ring (17) from K2 outer multiple-disc carrier.
5. Take out multiple-disc pack (16). Note which clutch disc is removed just prior to the disc spring (14) for reassembly. If the clutch discs are re-used, this disc must be returned to its original position on top of the disc spring.
6. Take out disc spring (14) .

4 - SNAP-RING	9 - MULTI-USE SPRING COMPRESSOR 8900

5 - SPRING PLATE

1. Install piston (6) in the outer multiple-disc carrier (8). Check sealing ring (7), replace if necessary. The rounded off edges of the sealing ring must point outwards.
2. Insert the spring plate (5). Insert the spring plate with the curvature towards the piston.
3. Mount the Multi-use Spring Compressor 8900 (9) on the spring plate and clamp until the snap-ring groove is exposed.
4. Insert snap-ring (4). The collar of the snap-ring must point towards the multiple-disc pack.

CAUTION: When working with double sided friction discs, an externally lugged steel plate is installed first, followed by a friction disc, and continuing on until all the required discs are installed. When working with single sided friction discs, an externally lugged disc is installed first, followed by an internally lugged disc, and continuing on until all the required discs are installed. All single sided discs are installed with the friction side up.

NOTE: Pay attention to the sequence of discs. If the original clutch discs are reused, be sure to return the disc identified on disassembly as belonging on top of the disk spring (3) to its original location.

NOTE: Place new friction multiple-discs in ATF fluid for one hour before installing.

5. Install disk spring (3) and multiple-disc pack (2) in outer multiple-disc carrier (8).
6. Insert snap-ring (1).

13. For transmissions using single sided friction discs, use a feeler gauge to determine the play "L" at three points between the snap-ring (7) and outer multiple-disc (2).
14. During the measurement the snap-ring (7) must contact the upper bearing surface of the groove in the outer multiple-disc carrier.
15. The correct clutch clearance for transmissions with single sided friction discs is 2.3-2.7 mm (0.091-0.106 in.) for six friction disc versions, 2.4-2.8 mm (0.095-0.110 in.) for eight disc versions, and 2.5-2.9 mm (0.099-0.114 in.) for ten disc versions.
16. Adjust with snap-ring (7), if necessary. Snap-rings are available in thicknesses of 2.0 mm (0.079 in.), 2.3 mm (0.091 in.), 2.6 mm (0.102 in.), 2.9 mm (0.114 in.), 3.2 mm (0.126 in.), and 3.5 mm (0.138 in.).

CONTACT, TEMPERATURE SENSOR\PAK-NEUTRAL

DESCRIPTION

PARK/NEUTRAL CONTACT

81159fc8

Fig. 195: Identifying Park-Neutral Switch
Courtesy of CHRYSLER LLC

The park/neutral contact (4) is located in the shell of the electric control unit and is fixed to the conductor tracks.

Its purpose is to recognize selector valve and selector lever positions "P" and "N". The park/neutral contact consists of:

- the plunger (2).
- the permanent magnet (3).
- the dry-reed contact (4).

TRANSMISSION TEMPERATURE SENSOR

81159fd9

Fig. 196: Identifying Transmission Temperature Sensor
Courtesy of CHRYSLER LLC

The transmission oil temperature sensor (1) is located in the shell of the electric valve control unit and is fixed to the conductor tracks.

Its purpose is to measure the temperature of the transmission oil and pass the temperature to the TCM as an input signal. It is a temperature-dependent resistor (PTC).

OPERATION

PARK/NEUTRAL CONTACT

81159fc8

Fig. 197: Identifying Park-Neutral Switch
Courtesy of CHRYSLER LLC

In selector lever positions "P" and "N" the park/neutral contact (4) is actuated by a cam track which is located on the detent plate. The permanent magnet (3) is moved away from the dry-reed contact (4). The dry-reed contact (4) is opened. The TCM receives an electric signal. The circuit to the starter in the selector lever positions "P" and "N" is closed.

OPERATION - TRANSMISSION TEMPERATURE SENSOR

81159fd9

Fig. 198: Identifying Transmission Temperature Sensor
Courtesy of CHRYSLER LLC

The temperature of the transmission oil has a considerable effect on the shifting time and therefore

the shift quality. By measuring the oil temperature, shift operations can be optimized in all temperature ranges. The transmission oil temperature sensor (1) is switched in series with the park/neutral contact. The temperature signal is transferred to the TCM only when the dry-reed contact of the park/neutral contact is closed in REVERSE or a forward gear position.

Refer to the Transmission Temperature Sensor Specifications table for the relationship between transmission temperature, sensor voltage, and sensor resistance.

FLUID AND FILTER

DESCRIPTION

DESCRIPTION

Fig. 199: Fluid Level Control
Courtesy of CHRYSLER LLC

1 - GEARSET CHAMBER

- 2 - OIL GALLERY
- 3 - SHELL OF ELECTROHYDRAULIC UNIT
- 4 - ELECTROHYDRAULIC UNIT
- 5 - FLOAT
- 6 - OPENING

The oil level control is located on the electrohydraulic unit (4) and consists of the float (5) which is integrated into the electrohydraulic unit. The float is positioned to plug the opening (6) between the oil gallery (2) and gearset chamber (1) so that the rotating gearsets do not splash about in oil as the oil level rises. The oil level control reduces power loss and prevents oil from being thrown out of the transmission housing at high oil temperatures.

OPERATION

OPERATION

Fig. 200: Fluid Level Control
Courtesy of CHRYSLER LLC

- 1 - GEARSET CHAMBER
- 2 - OIL GALLERY
- 3 - SHELL OF ELECTROHYDRAULIC UNIT
- 4 - ELECTROHYDRAULIC UNIT
- 5 - FLOAT
- 6 - OPENING

With low oil levels, the lubricating oil which flows constantly out of the gearset, flows back to oil gallery (2) through the opening (6). If the oil level rises, the oil presses the float (5) against the housing opening (6). The float (5) therefore separates the oil gallery (2) from the gearset chamber (1). The lubricating oil which continues to flow out of the gearsets is thrown against the housing wall, incorporated by the rotating parts and flows back into the oil gallery (2) through the upper opening (arrow in illustration).

DIAGNOSIS AND TESTING

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation, and varnish buildup which interferes with valve and clutch operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has three primary causes.

1. Internal clutch slippage, usually caused by low line pressure, inadequate clutch apply pressure, or clutch seal failure.
2. A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged oil cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.
3. Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to replace contaminated converter after repair

The use of non-recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation.

Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission, an overhaul is necessary.

The torque converter should be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

STANDARD PROCEDURE

CHECK OIL LEVEL

1. Verify the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.

WARNING: There is a risk of accident from vehicle starting off by itself when engine running. There is a risk of injury from contusions and burns if you insert your hands into the engine when it is started or when it is running. Secure vehicle to prevent it from moving off by itself. Wear properly fastened and close-fitting work clothes. Do not touch hot or rotating parts.

3. Actuate the service brake. Start the engine and let it run at idle speed in selector lever position "P".
4. Shift through the transmission modes several times with the vehicle stationary and the engine idling.
5. Warm up the transmission and wait at least two minutes. Check the oil level with the engine running. Push the Oil Dipstick 9336A into the transmission fill tube until the dipstick tip contacts the oil pan. Pull out the oil dipstick and read the oil level. Repeat if necessary.

NOTE: The dipstick protrudes from the fill tube when installed.

1427348

Fig. 201: NAG1 TRANSMISSION FILL GRAPH
Courtesy of CHRYSLER LLC

6. Check the transmission oil temperature using the appropriate scan tool.

NOTE: **The true transmission oil temperature can only be read by a scan tool with the transmission in REVERSE or any forward gear position. See Transmission and Transfer Case/Automatic - NAG1/CONTACT, Temperature Sensor/Park-Neutral - Operation.**

7. The transmission Oil Dipstick 9336A has indicator marks every 10 mm. With the transmission in PARK, determine the height of the oil level on the dipstick. Using the height, the transmission temperature and the transmission fluid graph, determine if the transmission oil level is correct.
8. Add or remove the oil as necessary and recheck the oil level.
9. Once the oil level is correct, install the dipstick tube cap.

TRANSMISSION FILL

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

1. Verify that the vehicle is parked on a level surface.
2. Remove the dipstick tube cap.
3. Add following initial quantity of Mopar® ATF +4, Automatic Transmission Fluid, to the transmission:

- a. If only fluid and filter were changed, add **5.0 L (10.6pts.)** of transmission fluid to transmission.
 - b. If the transmission was completely overhauled or the torque converter was replaced or drained, add **7.7 L (16.3 pts.)** of transmission fluid to transmission.
4. Check the transmission fluid. See **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure** and adjust as required.

FLUID/FILTER SERVICE

Fig. 202: Fluid/Filter Service Points
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OIL FILTER
2 - OIL PAN GASKET
3 - OIL PAN
4 - RETAINER
5 - BOLT |
|---|

1. Run the engine until the transmission oil reaches operating temperature.
2. Raise and support vehicle.
3. Remove the bolts (5) and retainers (4) holding the oil pan to the transmission.
4. Remove the transmission oil pan (3) and gasket (2) from the transmission.
5. Remove the transmission oil filter (1) and o-ring from the electrohydraulic control unit.
6. Clean the inside of the oil pan (3) of any debris. Inspect the oil pan gasket (2) and replace if necessary.
7. Install a new oil filter (1) and o-ring into the electrohydraulic control unit.
8. Install the oil pan (3) and gasket (2) onto the transmission.
9. Install the oil pan bolts (5) and retainers (4). Torque the bolts to 8 N.m (70 in.lbs.).
10. Lower the vehicle and add 5.0 L (10.6 pts.) of transmission fluid to the transmission.

11. Check the oil level. See Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure.

PLANETARY GEARTRAIN IDENTIFICATION

DESCRIPTION

DESCRIPTION

Fig. 203: Planetary Geartrain
Courtesy of CHRYSLER LLC

- | |
|----------------------------|
| 1 - ANNULUS GEAR |
| 2 - PLANETARY PINION GEARS |
| 3 - SUN GEAR |
| 4 - PLANETARY CARRIER |

Three planetary gear sets are used to produce the different gear ratios. These are located in the mechanical part of the transmission as the front, middle and rear planetary gear sets.

OPERATION

OPERATION

Fig. 204: Planetary Geartrain
Courtesy of CHRYSLER LLC

- | |
|----------------------------|
| 1 - ANNULUS GEAR |
| 2 - PLANETARY PINION GEARS |
| 3 - SUN GEAR |
| 4 - PLANETARY CARRIER |

The annulus gear (1) and sun gear (3) elements of a planetary gear system are alternately driven and braked by the actuating elements of the multi-plate clutch and multiple-disc brake. The planetary pinion gears (2) can turn on the internal gearing of the annulus gear (1) and on the external gearing of the sun gear (3). This allows for a variety of gear ratios and the reversal of the rotation direction without the need for moving gear wheels or shift collars. When two components of the planetary gear set are locked together, the planetary gear set is locked and turns as a closed unit.

The torque and engine speed are converted according to the lever ratios and the ratio of the number of teeth on the driven gears to that on the drive gears, and is referred to as the gear ratio. The overall ratio of a number of planetary gear sets connected in series is obtained by multiplying the partial ratios.

DISASSEMBLY

DISASSEMBLY

5 - RETAINING RING
6 - OUTPUT SHAFT WITH CENTER PLANETARY CARRIER |
|--|

NOTE: During the test, apply a contact force by hand to K3 in the direction of the arrow in illustration.

- Inspect axial play between shim (10) and retaining ring (11). Check axial play "S" between shim (10) and retaining ring (1) using a feeler gauge. Clearance should be 0.15-0.6 mm (0.006-0.024 in.). Shims are available in thicknesses of 3.0 mm (0.118 in.), 3.4 mm (0.134 in.), and 3.7 mm (0.146 in.). Adjust as necessary

HOLDING CLUTCHES

DESCRIPTION

DESCRIPTION

Fig. 208: Holding Clutches
 Courtesy of CHRYSLER LLC

1 - B1 CLUTCH	10 - CENTER PLANETARY GEARSET ANNULUS GEAR
2 - EXTERNALLY TOOTHED DISC	11 - CENTER PLANETARY GEARSET PINION GEARS
3 - INTERNALLY TOOTHED DISC	12 - CENTER PLANETARY GEARSET SUN GEAR
4 - B3 CLUTCH	13 - FRONT PLANETARY GEARSET PINION GEARS
5 - B2 CLUTCH	14 - FRONT PLANETARY GEARSET SUN GEAR
6 - B3 CLUTCH PISTON	15 - B1 CLUTCH INTERNALLY TOOTHED DISC CARRIER
7 - B2 CLUTCH PISTON	16 - B1 CLUTCH PISTON
8 - B2 CLUTCH INTERNALLY TOOTHED DISC CARRIER	17 - B1 CLUTCH EXTERNALLY TOOTHED DISC CARRIER
9 - REAR PLANETARY GEARSET PLANETARY CARRIER	

Three multiple-disc holding clutches, the front, B1 (1), middle, B3 (4), and rear multiple disc clutches, B2 (5), are located in the planetary gear sets in the transmission housing.

A multiple-disc holding clutch consists of a number of internally toothed discs (3) on an internally toothed disc carrier and externally toothed discs (2) on an externally toothed disc carrier, which is rigidly connected to the transmission housing.

OPERATION

OPERATION

Fig. 209: Holding Clutches

1 - B1 CLUTCH	10 - CENTER PLANETARY GEARSET ANNULUS GEAR
2 - EXTERNALLY TOOTHED DISC	11 - CENTER PLANETARY GEARSET PINION GEARS
3 - INTERNALLY TOOTHED DISC	12 - CENTER PLANETARY GEARSET SUN GEAR
4 - B3 CLUTCH	13 - FRONT PLANETARY GEARSET PINION GEARS
5 - B2 CLUTCH	14 - FRONT PLANETARY GEARSET SUN GEAR
6 - B3 CLUTCH PISTON	15 - B1 CLUTCH INTERNALLY TOOTHED DISC CARRIER
7 - B2 CLUTCH PISTON	16 - B1 CLUTCH PISTON
8 - B2 CLUTCH INTERNALLY TOOTHED DISC CARRIER	17 - B1 CLUTCH EXTERNALLY TOOTHED DISC CARRIER
9 - REAR PLANETARY GEARSET PLANETARY CARRIER	

The holding clutches connect the annulus gear, sun gear, or planetary carrier of a planetary gear set against the transmission housing in order to transmit the drive torque.

If the piston (16) on multiple-disc holding clutch B1 (1) is subjected to oil pressure, it presses the internal (3) and external discs (2) of the disc set together. The internally toothed disc carrier (15) locks the sun gear (14) against the housing. The planetary pinion gears (13) turn on the sun gear (14).

If the multiple-disc holding clutch B2 (5) is actuated via the piston (7), the piston compresses the disc set. The internally toothed disc carrier (8) locks the sun gear (12) against the housing. The planetary pinion gears (11) turn on the sun gear (12).

If the multiple-disc holding clutch B3 (4) is actuated via the piston (6), the planetary carrier (9) and the annulus gear (10) are locked. When the multiple-disc brake B3 (4) is actuated, the direction of rotation is reversed.

MECHANISM, BRAKE TRANSMISSION SHIFT INTERLOCK

DESCRIPTION

DESCRIPTION

NOTE: Some shifter assemblies may have a small external trim cover to actuate the Brake Transmission Shifter/Ignition Interlock (BTSI).

Fig. 210: Brake Transmission Shifter/Ignition Interlock (BTSI) Override
Courtesy of CHRYSLER LLC

1 - SHIFTER ASSEMBLY
2 - BTSI OVERRIDE

Fig. 211: NAG1 BTSI
Courtesy of CHRYSLER LLC

The Brake Transmission Shifter/Ignition Interlock (BTSI) is an electronically operated system that prevents the transmission gear shifter from being moved out of PARK without the proper driver inputs. The system contains a solenoid that is integral to the shifter assembly. The solenoid permits shifter movement out of PARK when the brake is depressed and prevents shifter movement into REVERSE unless a shift into REVERSE is permitted.

A BTSI override (2) is provided on the side of the shifter mechanism (1) to allow the vehicle to be shifted out of PARK in the event of an electrical failure.

OPERATION

OPERATION

8111a2ba

Fig. 212: Ignition Key/Switch Positions
Courtesy of CHRYSLER LLC

- 1 - LOCK
- 2 - ACC
- 3 - ON
- 4 - START

The Brake Transmission Shifter/Ignition Interlock (BTSI) is engaged whenever the ignition switch is in the LOCK (1) position. An additional electrically activated feature will prevent shifting out of the PARK position unless the brake pedal is depressed at least one-half inch. A solenoid in the shifter assembly is energized when the ignition is in the ON position and the brake pedal is depressed. When the key is in the ON position and the brake pedal is depressed, the shifter is unlocked and will move into any position. The interlock system also prevents the ignition switch from being turned to the LOCK position, unless the shifter is in the gated PARK position.

The following chart describes the normal operation of the Brake Transmission Shift Interlock (BTSI) system. If the "expected response" differs from the vehicle's response, then system repair and/or adjustment is necessary.

ACTION	EXPECTED RESPONSE
1. Turn key to the "ACC" position and depress brake pedal.	1. Shifter CAN be shifted out of park.
2. Turn key to the "ON" position, with foot off of brake pedal.	2. Shifter CANNOT be shifted out of park.
3. Turn key to the "ON" position and depress the brake pedal.	3. Shifter CAN be shifted out of park.
4. Leave shifter in any gear, except "PARK", and try to return key to the "LOCK" position.	4. Key cannot be returned to the "LOCK" position.

5. Return shifter to "PARK" and try to remove the key.	5. Key can be removed (after returning to "LOCK" position).
6. With the key removed, and the brake depressed, try to shift out of "PARK".	6. Shifter cannot be shifted out of "PARK".
NOTE: Any failure to meet these expected responses requires system adjustment or repair.	

BTSI Override

NOTE: Some shifter assemblies may have a small external trim cover to actuate the Brake Transmission Shifter/Ignition Interlock (BTSI).

Fig. 213: Brake Transmission Shifter/Ignition Interlock (BTSI) Override
Courtesy of CHRYSLER LLC

In the event of an electrical failure, the vehicle can be shifted out of PARK by using the following procedure.

81d4702a

Fig. 214: CUBBY BIN LINER
 Courtesy of CHRYSLER LLC

1. Turn the key to the ACC or ON position.
2. Remove the liner to the cubby bin to the right side of the shifter.

81d46f7e

Fig. 215: NAG1 BTSI
 Courtesy of CHRYSLER LLC

3. Depress the BTSI override (2) on the side of the shifter assembly (1).

4. While the override is depressed, move the shifter out of the PARK position.
5. Return the cubby bin liner to its original location.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING - BRAKE TRANSMISSION SHIFT INTERLOCK

SYSTEM VERIFICATION

1. Verify that the key can only be removed in the PARK position
2. When the shift lever is in PARK, the ignition key cylinder should rotate freely from ACC to LOCK. When the shifter is in any other gear or neutral position, the ignition key cylinder should not rotate to the LOCK position.
3. Shifting out of PARK should not be possible when the ignition key cylinder is in the ACC position and the brake pedal is not depressed.
4. Shifting out of PARK should not be possible while applying normal force on the shift lever and ignition key cylinder is in the ACC, ON, or START positions unless the foot brake pedal is depressed approximately 1/2 inch (12mm).
5. Shifting out of PARK should not be possible when the ignition key cylinder is in the LOCK position, regardless of the brake pedal position.
6. Shifting between any gears, NEUTRAL or into PARK may be done without depressing foot brake pedal with ignition switch in ACC, ON, or START positions.

PUMP, TRANSMISSION OIL

DESCRIPTION

DESCRIPTION

80e2c8f4

Fig. 216: Oil Pump
Courtesy of CHRYSLER LLC

- 1 - CRESCENT
- 2 - OIL PUMP
- 3 - EXTERNAL GEAR
- 4 - INTERNAL GEAR
- 5 - INLET CHAMBER
- 6 - PRESSURE CHAMBER

The oil pump (2) (crescent-type pump) is installed in the bellhousing behind the torque converter and is driven by the drive flange of the torque converter. The pump creates the oil pressure required for the hydraulic procedures.

OPERATION

OPERATION

80e2c8f4

Fig. 217: Oil Pump
Courtesy of CHRYSLER LLC

- 1 - CRESCENT
- 2 - OIL PUMP
- 3 - EXTERNAL GEAR
- 4 - INTERNAL GEAR
- 5 - INLET CHAMBER
- 6 - PRESSURE CHAMBER

When the engine is running, the oil is pumped through the inlet chamber (5) along the upper and lower side of the crescent (1) to the pressure chamber (6) of the housing. The meshing of the teeth prevents oil flowing from the delivery side to the intake side. An external gear (3) is eccentrically mounted in the pump housing. The external gear is driven by the internal gear (4) which is connected to the torque converter hub.

DISASSEMBLY

DISASSEMBLY

Fig. 218: Oil Pump Gears

- | |
|--|
| 1 - INNER OIL SEAL
2 - OUTER OIL SEAL |
|--|

2. Remove the inner oil pump seal (1) .
3. Replace the outer oil pump O-ring (2) .

CLEANING

CLEANING

Clean pump and support components with solvent and dry them with compressed air.

INSPECTION

INSPECTION

Before measuring any oil pump components, perform a thorough visual inspection of all the components. If any sign of scoring, scratches, or other damage is seen, replace the oil pump as an assembly.

SIDE CLEARANCE

Fig. 220: Checking Oil Pump Side Clearance
Courtesy of CHRYSLER LLC

- | |
|------------------------------------|
| 1 - FLAT PLATE
2 - FEELER GAUGE |
|------------------------------------|

Side clearance is the difference between the thickness of the pump gears and the depth of the pocket in the pump housing. Side clearance can be measured by laying a flat plate (1) across the mounting face of the pump housing, and measuring the distance between the plate and the gears with a feeler gauge (2).

Acceptable side clearance:

- Inner gear: 0.064 mm (0.0025 in) max
- Outer gear: 0.069 mm (0.0027 in) max

TIP CLEARANCE

Fig. 221: Oil Pump Tip Clearance
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - MEASURE 37MM FROM THE CORNER OF CRESCENT
2 - TIGHT MESH HERE
3 - MEASURE TIP CLEARANCE HERE |
|---|

Tip clearance is the difference between the tip diameters of the gear teeth and the corresponding diameters of the pocket in the pump housing.

Tip clearance for the inner gear can be checked by moving the inner gear into tight mesh (2) with the outer gear as shown in illustration. Clearance between the ID of the crescent feature of the housing and the OD of the teeth of the inner gear (3) should then be measured at a point 37 mm (1.45 in.) from the corner of the crescent (1) feature, as shown in illustration below.

Acceptable tip clearance for inner gear:

- 0.85 mm (0.033 in) max

|------------------------|
| 1 - WATER SHIELD |
| 2 - WATER SHIELD BOLTS |

7. Install the water shield (1) and water shield bolts (2) (if equipped).
8. Tighten the water shield bolts to 12 N.m (9 ft.lbs).
9. Lower vehicle to check and fill transmission as necessary.

SEAL, OUTPUT SHAFT

REMOVAL

REMOVAL

1. Remove the propeller shaft. Refer to **Differential and Driveline/Propeller Shaft - Removal** . Move propeller shaft to the right and tie up.
2. Verify that the transmission is in PARK in order to prepare for the removal of the output shaft nut.

NOTE: **When removing the propeller shaft flange be certain the shim remains on the output shaft.**

3. Remove the nut, with a 30 mm 12 point socket, holding the propeller shaft flange to the output shaft and remove the flange.

4. Remove the output shaft seal with suitable screw and slide hammer.

INSTALLATION

INSTALLATION

Fig. 230: Installing Output Shaft Seal
Courtesy of CHRYSLER LLC

1 - SEAL INSTALLER 8902A 2 - TRANSMISSION CASE

1. Position the new output shaft seal over the output shaft and against the transmission case.
2. Use Seal Installer 8902A (1) to install the seal.
3. Verify that the transmission is in PARK in order to prepare for the installation of the output shaft nut.

NOTE: When installing the propeller shaft flange be certain the shim remained on the output shaft.

4. Install the propeller shaft flange onto the output shaft and install an new flange nut. Tighten the flange nut, with a 30 mm 12 point socket, to 200 N.m (147.5 ft.lbs.).

- 6 - N2 SPEED SENSOR
- 7 - SPRING
- 8 - N3 SPEED SENSOR
- 9 - EXCITER RING
- 10 - DRIVING CLUTCH K1 EXTERNALLY TOOTHED DISC

The speed sensors, N2 and N3, (6, 8) are fixed to the shell of the electrohydraulic control unit's lead frame via contact blades. The speed sensors are pressed against the transmission housing (2) by a spring (7) which is held against the valve housing of the shift plate (5). This ensures a defined distance between the speed sensors and the exciter ring (4).

OPERATION

OPERATION

- 7 - SPRING
- 8 - N3 SPEED SENSOR

9 - EXCITER RING

10 - DRIVING CLUTCH K1 EXTERNALLY TOOTHED DISC

Signals from the speed sensors, N2 and N3, (6, 8) are recorded in the transmission control module (TCM), together with the wheel and engine speeds and other information, and are processed into an input signal for electronic control.

Speed sensor N2 (6) records the speed of the front planetary rear annulus assembly (10). Speed sensor N3 (8) records the speed of the K1 clutch (3).

RELATIVE SPEED SENSOR READINGS - NAG 1 TRANSMISSION

Fig. 237: Input Speed Sensors

Courtesy of CHRYSLER LLC

- 1 - DRIVING CLUTCH K1
- 2 - TRANSMISSION HOUSING
- 3 - DRIVING CLUTCH K1 INTERNALLY TOOTHED DISC
- 4 - EXCITER RING
- 5 - VALVE HOUSING OF SHIFT PLATE
- 6 - N2 SPEED SENSOR
- 7 - SPRING
- 8 - N3 SPEED SENSOR
- 9 - EXCITER RING
- 10 - DRIVING CLUTCH K1 EXTERNALLY TOOTHED DISC

There are several things to note regarding the function of the N2 and N3 speed sensors.

- K1 clutch (N3 speed sensor) will show no rotation whenever the B1 Brake is applied. N3 = Zero in 1st, 5th and Reverse.
- With the vehicle moving forward or reverse, N2 speed sensor reading will be greater than zero

in all gears

- Whenever the K1 clutch is applied (2nd, 3rd, and 4th) N2 will be equal to N3.
- There is no speed sensor internal to the transmission that directly measures input shaft speed. However, when K1 is applied N2 equals input shaft/turbine speed.
- The engine speed is fed to the TCM via can bus thus providing impeller speed.
- There is no speed sensor internal to the transmission that directly measures output shaft speed. ABS wheel sensors provide output shaft speed.
- K1 clutch (N3 speed sensor) will show no rotation whenever the B1 Brake is applied. N3 is equal to zero in 1st, 5th and Reverse gears.
- With the vehicle moving forward or reverse, N2 speed sensor reading will be greater than zero in all gears.
- Whenever the K1 clutch is applied (2nd, 3rd, and 4th) N2 will be equal to N3.
- There is no speed sensor internal to the transmission that directly measures input shaft speed. However, when K1 is applied N2 equals input shaft/turbine speed.
- The engine speed is fed to the TCM via the vehicle's communication bus thus providing impeller speed.
- There is no speed sensor internal to the transmission that directly measures output shaft speed. ABS wheel sensors provide output shaft speed.

NOTE: N2 sensor, N3 sensor, output shaft speed sensor are speeds relative to the input shaft turbine speed.

GEAR	INPUT SHAFT/TURBINE SPEED	N2 SENSOR	N3 SENSOR	OUTPUT SHAFT SPEED	OVERALL RATIO
1ST	1.0000	0.6081	0.0000	0.2782	3.59
2ND	1.0000	1.0000	1.0000	0.4574	2.19
3RD	1.0000	1.0000	1.0000	0.7115	1.41
4TH	1.0000	1.0000	1.0000	1.0000	1.00
5TH	1.0000	0.6081	0.0000	1.2035	0.83
REVERSE (S)	1.0000	0.6081	0.0000	-0.3157	-3.17

Based on the preceding chart, it appears that N3 sensor is redundant and provides no additional information. However, the TCM needs to know Input Shaft/Turbine speed. Since the N2 sensor is not directly tied to the Input Shaft, the N3 sensor is required to inform the TCM to divide the N2 value by 0.6081 or 1.0000 to calculate actual Turbine speed.

SHIFTER, TRANSMISSION

DESCRIPTION

DESCRIPTION

Fig. 238: NAG1 BTSI
Courtesy of CHRYSLER LLC

The automatic transmission is operated with the help of a shift lever assembly (SLA) (1) located in the floor console. There are four positions to which the selection lever can be shifted: P, R, N, D. In addition, the selector lever can be moved sideways (+/-) in position "D" to adjust the shift range.

All selector lever positions, as well as selected shift ranges in position "D", are identified by the SLA. The information is then sent to the transmission control module (TCM) via an electrical connection. At the same time, the selector lever positions "P", "R", "N" and "D" are transmitted by a shift cable to the selector shaft in the transmission.

The SLA is comprised of the following functions:

- **Key lock:** Depending on the selector lever position, the ignition cylinder is locked/unlocked, i.e., the ignition key can be removed only if the selector lever is in position "P". An electronic micro switch in the shifter assembly is used to perform this function.
- **Park lock:** The selector lever is not released from position "P" until the brake pedal has been applied and the ignition key is in the ON" position. Shift lock is controlled by the ignition module in conjunction with the brake switch and a locking solenoid in the SLA. As soon as the brake pedal is applied firmly, the locking solenoid is energized and retracted to unlock the selector lever. If the selector lever cannot be moved out of position "P" due to a malfunction, the shift lock function can be overridden (2).
- **Reverse inhibitor:** As soon as the vehicle speed exceeds approximately 4-7 mph, it is no longer possible to move the selector lever from position "N" to position "R". The reverse inhibit functionality is controlled by the same solenoid as the park lock. As the vehicle accelerates past the calibrated speed threshold, the solenoid is energized to block the sideways motion of the shift lever necessary to move from NEUTRAL to REVERSE. The reverse inhibit is not released until the vehicle speed falls below approximately 4-7 mph and the shifter is moved out of the "D"

shifter position.

OPERATION

OPERATION

With the selector lever in position "D", the transmission control module (TCM) automatically shifts the gears that are best-suited to the current operating situation. This means that shifting of gears is continuously adjusted to current driving and operating conditions in line with the selected shift range and the accelerator pedal position. Starting off is always performed in 1st gear.

The selector lever positions are determined by a sensor assembly internal to the shift lever assembly (SLA). The sensor assembly identifies the various positions of the SLA according to the following table.

Shift Lever Position	Bit 0	Bit 1	Bit 2	Bit 3
Default	0	0	0	0
"D"	1	0	1	0
"N"	0	1	1	0
"R"	1	1	1	0
"P"	0	0	0	1
"+"	1	0	0	1
"-"	0	1	0	1
"ND"	1	1	0	1
"RN"	0	0	1	1
"PR"	1	0	1	1
Implausible	1	1	1	1

NOTE: There are currently two different software functions out for "AutoStick" most cars use the upper gear limit functionality as described, but some cars (SRT and RT) use more of a 'gear hold' functionality. These vehicles are able to toggle between 1-2-3-4-5-D when you do the + / - shifts and will not downshift automatically, these systems "hold the gear"

The permissible shifter positions and transmission operating ranges are:

- P = Parking lock and engine starting.
- R = Reverse.
- N = Neutral and engine starting (no power is transmitted to the axles).
- D = The shift range includes all forward gears.

The shift range can be adjusted to the current operating conditions by tipping the selector lever to the left-hand side (" - ") or the right-hand side (" + ") when in position "D". If the shift range is limited, the

display in the instrument cluster indicates the selected shift range and not the currently engaged gear.

- 4= Shift range is limited to gears 1 to 4.
- 3= Shift range is limited to gears 1 to 3.
- 2= Shift range is limited to gears 1 to 2.
- 1= Shift range is limited to the 1st gear.

Tipping the shift lever will have the following results:

- **Tipping the selector lever toward "-" one time after another:** The shift range is reduced in descending sequence by one gear each time, i.e., from D - 4 - 3 - 2 - 1. If the selected limitation of the shift range would result in a downshift causing excessive engine speed, the shifting is not executed and the engaged gear as well as the shift range remain unchanged. This is to prevent the engine from overspeeding. Engine retardation is low with the selector lever in position "D". To make use of the full braking power of the engine, "manual" downshifting by tipping the lever towards the left-hand side is recommended. If this has been done, subsequent upshifting must be carried out manually as well.
- **Tipping the selector lever toward "-" and holding it in this position:** The currently engaged gear in range "D" is indicated in the instrument cluster display and the shift range is limited to this gear.
- **Tipping the selector lever toward "+" one time after another:** The shift range is increased by one gear each time and the increased shift range is displayed in the instrument cluster; possibly, the transmission upshifts to a faster gear.
- **Tipping the selector lever toward "+" several times:** The shift range is increased by one gear each time the lever is tipped until the shift range ends up in "D".
- **Tipping the selector lever toward "+" and holding it in this position:** The shift range is extended immediately to "D", shift ranges are indicated in ascending sequence; possibly, the transmission upshifts to a faster gear due to the extension of the shift range.

REMOVAL

REMOVAL

Fig. 239: Gearshift Cable at Shifter Assembly
Courtesy of CHRYSLER LLC

- 1 - GEARSHIFT CABLE
- 2 - CABLE RETAINER AND NOTCH
- 3 - SHIFTER ASSEMBLY PIN
- 4 - SHIFT LEVER

12. Verify correct shifter, park lock, and BTSI operation.
13. Install any console parts removed for access to shift lever assembly and shift cables. Refer to **Body/Interior/CONSOLE, Floor - Installation** .

SOLENOID, TRANSMISSION

DESCRIPTION

DESCRIPTION

The typical electrical solenoid used in automotive applications is a linear actuator. It is a device that produces motion in a straight line. This straight line motion can be either forward or backward in direction, and short or long distance.

A solenoid is an electromechanical device that uses a magnetic force to perform work. It consists of a coil of wire, wrapped around a magnetic core made from steel or iron, and a spring loaded, movable plunger, which performs the work, or straight line motion. The shift valves (solenoids) are On-Off solenoids and are powered up by the TCM with a 12-volt power source and are internally grounded in the transmission. The Torque Converter Clutch (TCC) and Pressure Control (PC) solenoids are also powered up by the TCM and internally grounded in the transmission but are pulse with modulated (PWM). PWM measurable voltage varies depending on percentage of modulation requested by the TCM.

The solenoids used in transmission applications are attached to valves which can be classified as **normally open** or **normally closed** . The **normally open** solenoid valve is defined as a valve which allows hydraulic flow when no current or voltage is applied to the solenoid. The **normally closed** solenoid valve is defined as a valve which does not allow hydraulic flow when no current or voltage is applied to the solenoid. These valves perform hydraulic control functions for the transmission and must therefore be durable and tolerant of dirt particles. For these reasons, the valves have hardened steel poppets and ball valves. The solenoids operate the valves directly, which means that the solenoids must have very high outputs to close the valves against the sizable flow areas and line pressures found in current transmissions. Fast response time is also necessary to ensure accurate control of the transmission.

The strength of the magnetic field is the primary force that determines the speed of operation in a particular solenoid design. A stronger magnetic field will cause the plunger to move at a greater speed than a weaker one. There are basically two ways to increase the force of the magnetic field:

1. Increase the amount of current applied to the coil or

2. Increase the number of turns of wire in the coil.

The most common practice is to increase the number of turns by using thin wire that can completely fill the available space within the solenoid housing. The strength of the spring and the length of the plunger also contribute to the response speed possible by a particular solenoid design.

A solenoid can also be described by the method by which it is controlled. Some of the possibilities include variable force, pulse-width modulated, constant ON, or duty cycle. The variable force and pulse-width modulated versions utilize similar methods to control the current flow through the solenoid to position the solenoid plunger at a desired position somewhere between full ON and full OFF. The constant ON and duty cycled versions control the voltage across the solenoid to allow either full flow or no flow through the solenoid's valve.

UPSHIFT/DOWNSHIFT SOLENOID VALVES

Fig. 247: Upshift/Downshift Solenoid Valves

Its purpose is to control the shift pressure depending on the continuously changing operating conditions, such as load and gear change.

The shift pressure regulating solenoid valve (1) has an interference fit and is sealed off to the valve body of the shift plate (4) by a seal (arrow in illustration). The contact springs (2) at the solenoid valve engage in a slot in the conductor tracks (3). The force of the contact springs (2) ensures secure contacts.

OPERATION

OPERATION

NOTE: A scan tool can only display a estimated pressure based on the current fed to the solenoid. Therefore if there's a stuck Line Pressure Regulating valve and the transmission has insufficient pressure, the scan tool will still display estimated MOD and Shift pressures because the solenoids are being fed the correct amount of current.

The solenoids are fed a 12-volt source from the TCM (Transmission Control Module). When an electrical current is applied to the solenoid coil, a magnetic field is created which produces an attraction to the plunger, causing the plunger to move and work against the spring pressure and the load applied by the fluid the valve is controlling. The plunger is normally directly attached to the valve which it is to operate. When the current is removed from the coil, the attraction is removed and the plunger will return to its original position due to spring pressure.

The plunger is made of a conductive material and accomplishes this movement by providing a path for the magnetic field to flow. By keeping the air gap between the plunger and the coil to the minimum necessary to allow free movement of the plunger, the magnetic field is maximized.

UPSHIFT/DOWNSHIFT SOLENOID VALVES

- 6 - O-RING
- 7 - CONDUCTOR TRACK
- 8 - CONTACT SPRING

If a solenoid valve (1) is actuated by the TCM, it opens and guides the control pressure (p-SV) to the assigned command valve. The solenoid valve remains actuated and therefore open until the shifting process is complete. The shift pressure (p-SV) to the command valve is reduced to zero as soon as the power supply to the solenoid valve is interrupted.

MODULATING PRESSURE CONTROL SOLENOID VALVE

- 4 - INPUT SHAFT
- 5 - STATOR SHAFT
- 6 - TURBINE DAMPER

CAUTION: The torque converter must be replaced if a transmission failure resulted in large amounts of metal or fiber contamination in the fluid.

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission. The torque converter consists of an outer shell with an internal turbine (1), a stator (3), an overrunning clutch, an impeller (2), and an electronically applied converter clutch. The converter clutch provides reduced engine speed and greater fuel economy when engaged. Clutch engagement also provides reduced transmission fluid temperatures. The converter clutch engages in third through fifth gears. The torque converter hub drives the transmission oil (fluid) pump.

A turbine damper (6) has been added for some applications to help improve vehicle noise, vibration, and harshness (NVH) characteristics.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

IMPELLER

Courtesy of CHRYSLER LLC

1 - ENGINE FLEXPLATE	4 - ENGINE ROTATION
2 - OIL FLOW FROM IMPELLER SECTION INTO TURBINE SECTION	5 - ENGINE ROTATION
3 - IMPELLER VANES AND COVER ARE INTEGRAL	

The impeller (3) is an integral part of the converter housing. The impeller consists of curved blades placed radially along the inside of the housing on the transmission side of the converter. As the converter housing is rotated by the engine, so is the impeller, because they are one and the same and are the driving members of the system.

TURBINE

Courtesy of CHRYSLER LLC

1 - TURBINE VANE	4 - PORTION OF TORQUE CONVERTER COVER
2 - ENGINE ROTATION	5 - ENGINE ROTATION
3 - INPUT SHAFT	6 - OIL FLOW WITHIN TURBINE SECTION

The turbine (1) is the output, or driven, member of the converter. The turbine is mounted within the housing opposite the impeller, but is not attached to the housing. The input shaft is inserted through the center of the impeller and splined into the turbine. The design of the turbine is similar to the impeller, except the blades of the turbine are curved in the opposite direction.

STATOR

- 1 - STATOR
- 2 - IMPELLER
- 3 - FLUID FLOW
- 4 - TURBINE

The stator (1) is located between the impeller (2) and turbine (4) within the torque converter case . The stator contains a freewheeling clutch, which allows the stator to rotate only in a clockwise direction. When the stator is locked against the freewheeling clutch, the torque multiplication feature of the torque converter is operational.

TORQUE CONVERTER CLUTCH (TCC)

Fig. 260: Torque Converter Lock-up Clutch

- 2 - IMPELLER
- 3 - STATOR
- 4 - INPUT SHAFT
- 5 - STATOR SHAFT
- 6 - PISTON
- 7 - COVER SHELL
- 8 - INTERNALLY TOOTHED DISC CARRIER
- 9 - CLUTCH PLATE SET
- 10 - EXTERNALLY TOOTHED DISC CARRIER
- 11 - TURBINE DAMPER

The TCC (9) was installed to improve the efficiency of the torque converter that is lost to the slippage of the fluid coupling. Although the fluid coupling provides smooth, shock-free power transfer, it is natural for all fluid couplings to slip. If the impeller and turbine were mechanically locked together, a zero slippage condition could be obtained. A hydraulic piston with friction material was added to the turbine assembly to provide this mechanical lock-up.

In order to reduce heat build-up in the transmission and buffer the powertrain against torsional vibrations, the TCM can duty cycle the torque converter lock-up solenoid to achieve a smooth application of the torque converter clutch. This function, referred to as Electronically Modulated Converter Clutch (EMCC) can occur at various times depending on the following variables:

- Shift lever position
- Current gear range
- Transmission fluid temperature
- Engine coolant temperature
- Input speed
- Throttle angle
- Engine speed

OPERATION

OPERATION

Fig. 261: Torque Converter
Courtesy of CHRYSLER LLC

- 1 - TURBINE
- 2 - IMPELLER
- 3 - STATOR
- 4 - INPUT SHAFT
- 5 - STATOR SHAFT
- 6 - TURBINE DAMPER

The converter impeller (driving member) (2) , which is integral to the converter housing and bolted to the engine drive plate, rotates at engine speed. The converter turbine (driven member) (1), which reacts from fluid pressure generated by the impeller, rotates and turns the transmission input shaft (4).

TURBINE

As the fluid that was put into motion by the impeller blades strikes the blades of the turbine, some of the energy and rotational force is transferred into the turbine and the input shaft. This causes both of them (turbine and input shaft) to rotate in a clockwise direction following the impeller. As the fluid is leaving the trailing edges of the turbine's blades it continues in a "hindering" direction back toward the impeller. If the fluid is not redirected before it strikes the impeller, it will strike the impeller in such a direction that it would tend to slow it down.

STATOR

Fig. 262: Stator Operation
 Courtesy of CHRYSLER LLC

- 1 - DIRECTION STATOR WILL FREE WHEEL DUE TO OIL PUSHING ON BACKSIDE OF VANES
- 2 - FRONT OF ENGINE
- 3 - INCREASED ANGLE AS OIL STRIKES VANES
- 4 - DIRECTION STATOR IS LOCKED UP DUE TO OIL PUSHING AGAINST STATOR VANES

Torque multiplication is achieved by locking the stator's over-running clutch to its shaft. Under stall

conditions (the turbine is stationary), the oil leaving the turbine blades strikes the face of the stator blades and tries to rotate them in a counterclockwise direction. When this happens the over-running clutch of the stator locks and holds the stator from rotating. With the stator locked, the oil strikes the stator blades and is redirected into a "helping" direction before it enters the impeller. This circulation of oil from impeller to turbine, turbine to stator, and stator to impeller, can produce a maximum torque multiplication of about 2.0:1. As the turbine begins to match the speed of the impeller, the fluid that was hitting the stator in such a way as to cause it to lock-up is no longer doing so. In this condition of operation, the stator begins to free wheel and the converter acts as a fluid coupling.

TORQUE CONVERTER CLUTCH (TCC)

Fig. 263: Torque Converter Lock-up Clutch
Courtesy of CHRYSLER LLC

- 1 - TURBINE
- 2 - IMPELLER
- 3 - STATOR
- 4 - INPUT SHAFT
- 5 - STATOR SHAFT
- 6 - PISTON
- 7 - COVER SHELL
- 8 - INTERNALLY TOOTHED DISC CARRIER
- 9 - CLUTCH PLATE SET
- 10 - EXTERNALLY TOOTHED DISC CARRIER
- 11 - TURBINE DAMPER

In a standard torque converter, the impeller (2) and turbine (1) are rotating at about the same speed

and the stator (3) is freewheeling, providing no torque multiplication. By applying the turbine's piston and friction material (9) , a total converter engagement can be obtained. The result of this engagement is a direct 1:1 mechanical link between the engine and the transmission.

The clutch can be engaged in second, third, fourth, and fifth gear ranges.

The TCM controls the torque converter by way of internal logic software. The programming of the software provides the TCM with control over the torque converter solenoid. There are four output logic states that can be applied as follows:

- No EMCC
- Partial EMCC
- Full EMCC
- Gradual-to-no EMCC

NO EMCC

Under No EMCC conditions, the TCC Solenoid is OFF. There are several conditions that can result in NO EMCC operations. No EMCC can be initiated due to a fault in the transmission or because the TCM does not see the need for EMCC under current driving conditions.

PARTIAL EMCC

Partial EMCC operation modulates the TCC Solenoid (duty cycle) to obtain partial torque converter clutch application. Partial EMCC operation is maintained until Full EMCC is called for and actuated. During Partial EMCC some slip does occur. Partial EMCC will usually occur at low speeds, low load and light throttle situations.

FULL EMCC

During Full EMCC operation, the TCM increases the TCC Solenoid duty cycle to full ON after Partial EMCC control brings the engine speed within the desired slip range of transmission input speed relative to engine RPM.

GRADUAL-TO-NO EMCC

This operation is to soften the change from Full or Partial EMCC to No EMCC. This is done at mid-throttle by decreasing the TCC Solenoid duty cycle.

REMOVAL

REMOVAL

1. Remove transmission and torque converter from vehicle. See **Transmission and Transfer Case/Automatic - NAG1 - Removal**
2. Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition. The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

3. Pull the torque converter forward until the center hub clears the oil pump seal.
4. Separate the torque converter from the transmission.

INSTALLATION

INSTALLATION

Fig. 264: Torque Converter Installation Depth
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - TORQUE CONVERTER
2 - TRANSMISSION HOUSING |
|--|

Check converter hub and drive flats for sharp edges, burrs, scratches, or nicks. Polish the hub and flats with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

1. Lubricate oil pump seal lip with transmission fluid.
2. Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or converter hub while inserting torque converter into the front of the transmission.

3. Align torque converter to oil pump seal opening.
4. Insert torque converter hub into oil pump.

5. While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.
6. Check converter seating with a scale and straightedge . Surface of converter lugs should be at least 19 mm (3/4 in.) to rear of straightedge when converter is fully seated.
7. If necessary, temporarily secure converter with C-clamp attached to the converter housing.
8. Install the transmission in the vehicle.
9. Fill the transmission with the recommended fluid.

The electrohydraulic control unit comprises the shift plate (13) made from light alloy for the hydraulic control and an electrical control unit (12). The electrical control unit (12) comprises of a supporting body made of plastic, into which the electrical components (1 - 11) are assembled. The supporting body is mounted on the shift plate (13) and screwed to it.

Strip conductors inserted into the supporting body make the connection between the electrical components and a plug connector. The connection to the wiring harness on the vehicle and the transmission control module (TCM) is produced via this 13-pin plug connector with a bayonet lock.

The electric valve control unit (7) consists of a plastic shell which houses the RPM sensors (1,12), regulating solenoid valves (3, 4), solenoid valves (5, 6, 10), the TCC solenoid valve (11), the park/neutral contact (9), and the transmission oil temperature sensor (8). Conductor tracks integrated into the shell connect the electric components to a plug connection (2). This 13-pin plug connection (2) establishes the connection to the vehicle-side cable harness and to the transmission control module (TCM). With the exception of the solenoid valves, all other electric components are fixed to the conductor tracks.

HYDRAULIC CONTROL UNIT

Working Pressure (Line Pressure or Operating Pressure) (p-A)

The working pressure provides the pressure supply to the hydraulic control and the transmission shift elements. It is the highest hydraulic pressure in the entire hydraulic system. The working pressure is regulated at the working pressure regulating valve in relation to the load and gear. All other pressures required for the transmission control are derived from the working pressure.

Lubrication Pressure (p-Sm)

At the working pressure regulating valve surplus oil is diverted to the lubrication pressure regulating valve, from where it is used in regulated amounts to lubricate and cool the mechanical transmission components and the torque converter. Furthermore, the lubrication pressure (p-Sm) is also used to limit the pressure in the torque converter.

Shift Pressure (p-S)

The shift pressure is determined by the shift pressure regulating solenoid valve and the shift pressure regulating valve. The shift pressure:

- Regulates the pressure in the activating shift element during the shift phase.
- Determines together with the modulating pressure the pressure reduction at the deactivating shift element as regulated by the overlap regulating valve.
- Initializes 2nd gear in limp-home mode.

Modulating Pressure (p-Mod)

The modulating pressure influences the size of the working pressure and determines together with the shift pressure the pressure regulated at the overlap regulating valve. The modulating pressure is regulated at the modulating pressure regulating solenoid valve, which is under regulating valve pressure. The modulating pressure is variable and relative to the engine load.

Regulating Valve/Control Valve Pressure (p-RV)

The regulating valve pressure is regulated at the regulating valve pressure regulating valve in relation to the working pressure (p-A) up to a maximum pressure of 8 bar (116 psi). It supplies the modulating pressure regulating solenoid valve, the shift pressure regulating solenoid valve and the shift valve pressure regulating valve.

Shift Valve Pressure (p-SV)

The shift valve pressure (p-SV) is derived from the regulating valve pressure (p-RV), is regulated at the shift valve pressure regulating valve and is then present at the:

- 1-2 and 4-5 shift solenoid valve.
- 3-4 shift solenoid valve.
- 2-3 shift solenoid valve.
- Torque converter lockup solenoid valve.
- 3-4 and 2-3 shift pressure shift valve.

The shift valve pressure (p-SV) controls the command valves via the upshift/downshift solenoid valves.

Overlap Pressure (p-U)

The overlap pressure controls the shift component pressure reduction during a shift phase. The pressure in a shift element as it disengages is controlled during the shift phase depending on engine load (modulating pressure) and the pressure in the shift element as it engages. The adjusted pressure is inversely proportional to the transmission capability of the shift element being engaged (controlled overlap).

- 1 - N3 SPEED SENSOR
- 2 - PLUG CONNECTOR
- 3 - MODULATING PRESSURE REGULATING SOLENOID
- 4 - SHIFT PRESSURE REGULATING SOLENOID
- 5 - 1-2/4-5 SHIFT SOLENOID
- 6 - 3-4 SHIFT SOLENOID
- 7 - ELECTRICAL CONTROL UNIT
- 8 - TRANSMISSION TEMPERATURE SENSOR
- 9 - STARTER INTERLOCK CONTACT
- 10 - 2-3 SHIFT SOLENOID
- 11 - TORQUE CONVERTER LOCK-UP SOLENOID
- 12 - N2 SPEED SENSOR

Signals from the transmission control module (TCM) are converted into hydraulic functions in the electric valve control unit (7). The RPM sensors (1, 12), starter interlock contact (9), and transmission oil temperature sensor (8) of the electric valve control unit (7) supply the TCM with input signals. The solenoid valves are controlled by the TCM and trigger the hydraulic functions.

HYDRAULIC CONTROL UNIT

Working Pressure Regulating Valve (Line Pressure or Operating Pressure)

Fig. 278: Working Pressure Regulating Valve
Courtesy of CHRYSLER LLC

- 1 - PRESSURE FROM K1/K2
- 2 - END FACE
- 3 - ANNULAR SURFACE
- 4 - WORKING PRESSURE REGULATING VALVE

The working pressure ($p-A$) is regulated at the working pressure regulating valve (4) in relation to load (modulating pressure, $p-Mod$) and gear (K1 or K2 pressure) (1). The spring in the working pressure regulating valve sets a minimum pressure level (basic pressure).

Torque Converter Lockup Clutch Regulating Valve

80e32135

Fig. 279: Torque Converter Lockup Clutch Regulating Valve
Courtesy of CHRYSLER LLC

- 1 - TORQUE CONVERTER LOCK-UP CLUTCH
- 2 - TORQUE CONVERTER OUTPUT
- 3 - TORQUE CONVERTER INPUT
- 4 - LUBRICATION
- 5 - TORQUE CONVERTER LOCK-UP SOLENOID
- 6 - TORQUE CONVERTER LOCK-UP CLUTCH REGULATING VALVE
- 7 - OIL COOLER
- 8 - LINE PRESSURE REGULATING VALVE
- 9 - OIL PUMP

The torque converter lockup clutch regulating valve (6) regulates the torque converter lock-up clutch working pressure ($p\text{-TCC}$) in relation to the torque converter clutch control pressure ($p\text{-S/TCC}$). According to the size of the working pressure ($p\text{-A}$), the torque converter lockup clutch is either Engaged, Disengaged, or Slipping. When the regulating valve (6) is in the lower position, lubricating oil flows through the torque converter and oil cooler (7) into the transmission (torque converter lockup clutch unpressurized). In its regulating position (slipping, torque converter lockup clutch pressurized), a reduced volume of lubricating oil flows through the annular passage bypassing the torque converter and passing direct through the oil cooler into the transmission. The rest of the lubricating oil is directed via the throttle "a" into the torque converter in order to cool the torque converter lockup clutch.

Overlap Regulating Valve

Fig. 280: Overlap Regulating Valve
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - OVERLAP REGULATING VALVE
2 - ANNULAR SURFACE ON OVERLAP REGULATING VALVE |
|---|

During the shift phase the pressure in the deactivating shift actuator is regulated in relation to the engine load (modulating pressure, p-Mod) and the pressure in the activating actuator. The regulated pressure is inversely proportional to the transfer capacity of the activating shift actuator (regulated overlap).

Command Valve

Fig. 281: Command Valve
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - HOLDING CLUTCH B1
2 - DRIVING CLUTCH K1
3 - 1-2/4-5 COMMAND VALVE |
|---|

When the end face is unpressurized (stationary phase), the working pressure ($p-A$) is directed to the actuated shift element. If the end face of the command valve is subjected to the shift valve pressure ($p-SV$) (shift phase), then the shift pressure ($p-S$) is switched to the activating element and the overlap pressure ($p-U$) is switched to the deactivating element.

Shift Valve Holding Pressure

80e33c95

Fig. 282: Shift Valve Holding Pressure
Courtesy of CHRYSLER LLC

1 - HOLDING PRESSURE SHIFT VALVE

The holding pressure shift valve (1) is actuated by the pressures present at the end face in the actuators and a spring. It assigns the working pressure ($p-A$) to the actuator with the higher pressure (taking into account the spring force and the effective surface area). The other element of the shift group is then unpressurized. The valve switches over only during the shift phase and only at a certain pressure ratio between the overlap pressure ($p-U$) and the shift pressure ($p-S$).

Shift Pressure Shift Valve

80e330de

Fig. 283: Shift Pressure Shift Valve

Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - 1-2/4-5 COMMAND VALVE
2 - DRIVING CLUTCH K1
3 - HOLDING CLUTCH B1
4 - 1-2/4-5 SHIFT PRESSURE SHIFT VALVE |
|---|

When the multiple-disc brake B1 (3) is activated, the working pressure ($p-A$) is applied to the end face of the 1-2 / 4-5 shift pressure shift valve (4) via the command valve (1). Its shift state is maintained during the shift phase by substituting the shift element pressure acting on its end face (and which is variable during the shift phase) with a corresponding constant pressure. When the multi-plate clutch K1 (2) is activated, the end face of the shift valve is unpressurized during the stationary and shift phases, so the shift state is maintained during the shift phase in this case too.

Lubrication Pressure Regulating Valve

80e33d95

Fig. 284: Lubrication Pressure Regulating Valve
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - LUBRICATION PRESSURE REGULATING VALVE |
|---|

At the working pressure regulating valve surplus oil is diverted to the lubrication pressure regulating valve (1), from where the lubrication pressure ($p-Sm$) is used in regulated amounts to supply the transmission lubrication system including the torque converter.

Shift Pressure Regulating Valve

80e33db3

Fig. 285: Shift Pressure Regulating Valve
Courtesy of CHRYSLER LLC

1 - SHIFT PRESSURE REGULATING VALVE

The shift pressure is determined by the shift pressure regulating solenoid valve and the shift pressure regulating valve (1). In addition, pressure from the clutch K2 is also present at the annular surface of the shift pressure regulating valve. This reduces the shift pressure in 2nd gear.

Regulating Valve Pressure Regulating Valve

Fig. 286: Regulating Valve Pressure Regulating Valve
Courtesy of CHRYSLER LLC

1 - REGULATING VALVE PRESSURE REGULATING VALVE

The regulating valve pressure (p-RV) is set at the regulating valve pressure regulating valve (1) in relation to the working pressure (p-A) as far as the maximum pressure.

Shift Valve Pressure Regulating Valve

Fig. 287: Shift Valve Pressure Regulating Valve
Courtesy of CHRYSLER LLC

1 - SHIFT VALVE PRESSURE REGULATING VALVE

The non-constant regulating valve pressure (p-RV) is regulated to a constant shift valve pressure (p-SV) at the shift valve pressure regulating valve (1) and is used to supply the 1-2 and 4-5 / 3-4 / 2-3 solenoid valves and the torque converter lockup clutch PWM solenoid valve.

REMOVAL

REMOVAL

Fig. 288: Remove/Install Wiring Connector Plug
Courtesy of CHRYSLER LLC

1 - PLUG CONNECTOR

2 - ADAPTER PLUG

1. Move selector lever to position "P".
2. Raise vehicle.
3. Disconnect 13-pin plug connector (1) . Turn bayonet lock of the adapter plug (2) anti-clockwise.

Fig. 289: Remove/Install Electrohydraulic Unit
Courtesy of CHRYSLER LLC

- 1 - SOLENOID CAP (if equipped)
- 2 - SOLENOID CAP (if equipped)
- 3 - BOLT - M6X32
- 4 - BOLT - M6X30
- 5 - LEAF SPRING
- 6 - MODULATING PRESSURE REGULATING SOLENOID VALVE
- 7 - SHIFT PRESSURE REGULATING SOLENOID
- 8 - 3-4 SHIFT SOLENOID
- 9 - TORQUE CONVERTER LOCK-UP SOLENOID
- 10 - 1-2/4-5 SHIFT SOLENOID
- 11 - 2-3 SHIFT SOLENOID
- 12 - ELECTRICAL CONTROL UNIT
- 13 - SHIFT PLATE

1. Remove electrohydraulic unit from the vehicle. See **Transmission and Transfer Case/Automatic - NAG1/UNIT, Electrohydraulic Control - Removal**
2. Remove solenoid caps (1, 2) if equipped.
3. Unscrew Torx® socket bolts (3, 4).

NOTE: Pay attention to the different lengths of the Torx® socket bolts.

4. Remove leaf springs (5).
5. Withdraw solenoid valves (6 - 11) from shift plate (13).

NOTE: Check O-rings on solenoid valves for damage and replace if necessary.

6. Bend away retaining lug on stiffening rib on transmission oil temperature sensor.
7. Remove electrohydraulic control module (12) from the shift plate (13).

1 - PRESSURE FEED VALVE

32. Remove the pressure supply valve (1) from the valve body.

CLEANING

CLEANING

NOTE: Fine and extremely fine metallic particles have been known affect valve operation in this transmission. While these particles may be to small to see with the naked eye, they can cause flares, or momentary going into neutral, on shifts.

Clean and flush the valve housings, valves, plugs, springs, and separator plates thoroughly with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the electrical components by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

INSPECTION

INSPECTION

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only

very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced. If crocus cloth is used be certain to flush valve body thoroughly.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands**. Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

ASSEMBLY

ASSEMBLY

CAUTION: Make certain all valves and springs are assembled correctly. Failure to follow this caution may result in transmission failure.

ASSEMBLY

NAG1 VALVE BODY SPRING DIMENSION		
VALVE	SPRING FREE LENGTH	TOTAL COILS
2-3 Holding	18.8 - 19.6 mm (0.74 - 0.77 in.)	12
T/C Clutch Damper	37.5 - 38.5 mm (1.48 - 1.51 in.)	19.5
1-2 / 4-5 Overlap	20.95 - 21.65 mm (0.82 - 0.85 in.)	14.5
Shift Pressure Regulator	22.4 - 23.6 mm (0.88 - 0.93 in.)	14.5
Control Valve Pressure Regulator	79.2 - 82.4 mm (3.12 - 3.24 in.)	29
Shift Solenoid Pressure Regulating Valve	32.6 - 34.4 mm (1.28 -	15.5

	1.35 in.)	
T/C Clutch (LU) Regulator	22.8 - 23.6 mm (0.90 - 0.93 in.)	18.5
B2 Shift Valve	25.8 - 27.0 mm (1.01 - 1.06 in.)	16.5
3/4 Over Lap	21.0 - 20.4 mm (0.83 - 0.80 in.)	13
3-4 Holding, 1-2 / 4-5 Holding, 1-2 / 4-5 Shift Pressure	21.1 - 22.5 mm (0.83 - 0.88 in.)	14
3-4 Command, 3-4 Shift Pressure, 1-2 / 4-5 Command, 2-3 Shift Pressure, 2-3 Command	23.9 - 25.3 mm (0.94 - 1.00 in.)	11.5
Lubricating Pressure Regulating Valve	64.8 - 68.2 mm (2.55 - 2.68 in.)	24
2-3 Overlap	16.9 - 18.7 mm (0.66 - 0.74 in.)	13
Line Pressure Regulator	43.8 - 46.2 mm (1.72 - 1.82 in.)	13.5

NOTE: Pay great attention to cleanliness for all work on the shift plate. Fluffy cloths must not be used. Leather cloths are particularly good. After dismantling, all parts must be washed and blown out with compressed-air, noting that parts may be blown away.

80e3ee48

- | |
|--|
| 1 - SELECTOR VALVE
2 - DETENT PLATE |
|--|

1. Position the electrohydraulic unit in the transmission housing.
2. Insert selector valve (1) in driver of detent plate (2). When installing the electrohydraulic control module in the transmission housing, the plastic part of the selector valve (1) must engage in the driver of the detent plate (2).

- | |
|---------------------------|
| 1 - HEAT SHIELD |
| 2 - ELECTROHYDRAULIC UNIT |
| 3 - BOLT |
| 4 - OIL FILTER |
| 5 - OIL PAN |
| 6 - CLAMPING ELEMENT |
| 7 - BOLT |
| 8 - 13-PIN PLUG CONNECTOR |
| 9 - BOLT |
| 10 - ADAPTER PLUG |

3. Install the Torx® socket bolts (3) and torque to 8 N.m (71 in.lbs.).
4. Install a new oil filter (4) .
5. Install oil pan (5) and torque the oil pan bolts to 8 N.m (71 in.lbs.).
6. Install the adapter plug (10) into the transmission housing and tighten the bolt (9) to 2.5 N.m (22 in.lbs.).

1 - PLUG CONNECTOR 2 - ADAPTER PLUG
--

7. Check O-ring on plug connector (1) , and replace if necessary.
8. Install the plug connector (1) into the adapter plug (2). Turn bayonet lock of adapter plug (2) clockwise to connect plug connector (1).
9. Fill the transmission with the correct oil. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Specifications** using the standard procedure. See **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure**.

GENERAL INFORMATION

Trouble Shooting - Basic Procedures

* PLEASE READ THIS FIRST *

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

ACCESSORIES & ELECTRICAL

CHARGING SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC CHARGING SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Vehicle Will Not Start	
Dead battery	Check battery cells, alternator belt tension and alternator output
Loose or corroded battery connections	Check all charging system connections
Ignition circuit or switch malfunction	Check and replace as necessary
Alternator Light Stays On With Engine Running	
Loose or worn alternator drive belt	Check alternator drive tension and condition, See Belt Adjustment in TUNE-UP article in the TUNE-UP section

Loose alternator wiring connections	Check all charging system connections
Short in alternator light wiring	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Defective alternator stator or diodes	See Bench Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Alternator Light Stays Off With Ignition Switch ON	
Blown fuse	See WIRING DIAGRAMS
Defective alternator	See Testing in ALTERNATOR article
Defective indicator light bulb or socket	See Indicator Warning Lights in STANDARD INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Alternator Light Stays OFF With Ignition Switch ON	
Short in alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective rectifier bridge	See Bench Tests in ALTERNATOR article
Lights or Fuses Burn Out Frequently	
Defective alternator wiring	See On-Vehicle Tests in ALTERNATOR article
Defective regulator	See Regulator Check in ALTERNATOR article
Defective battery	Check and replace as necessary
Ammeter Gauge Shows Discharge	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in TUNE-UP article in the TUNE-UP section
Defective wiring	Check all wires and wire connections
Defective alternator or regulator	See Bench Tests and On-Vehicle Tests in ALTERNATOR article
Defective ammeter, or improper ammeter wiring connection	See Testing in STANDARD

	INSTRUMENTS in the ACCESSORIES & EQUIPMENT section
Noisy Alternator	
Loose drive pulley	Tighten drive pulley attaching nut
Loose mounting bolts	Tighten all alternator mounting bolts
Worn or dirty bearings	See Bearing Replacement ALTERNATOR article
Defective diodes or stator	See Bench Test in ALTERNATOR article
Battery Does Stay Charged	
Loose or worn drive belt	Check alternator drive belt tension and condition. See Belt Adjustment in appropriate TUNE-UP article in the TUNE-UP section
Loose or corroded battery connections	Check all charging system connections
Loose alternator connections	Check all charging system connections
Defective alternator or battery	See On-Vehicle Tests and Bench Tests in ALTERNATOR article
Add-on electrical accessories exceeding alternator capacity	Install larger alternator
Battery Overcharged-Uses Too Much Water	
Defective battery	Check alternator output and repair as necessary
Defective alternator	See On-Vehicle Test and Bench Tests in ALTERNATOR article
Excessive alternator voltage	Check alternator output and repair as necessary

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

Ignition Secondary Trouble shooting Chart

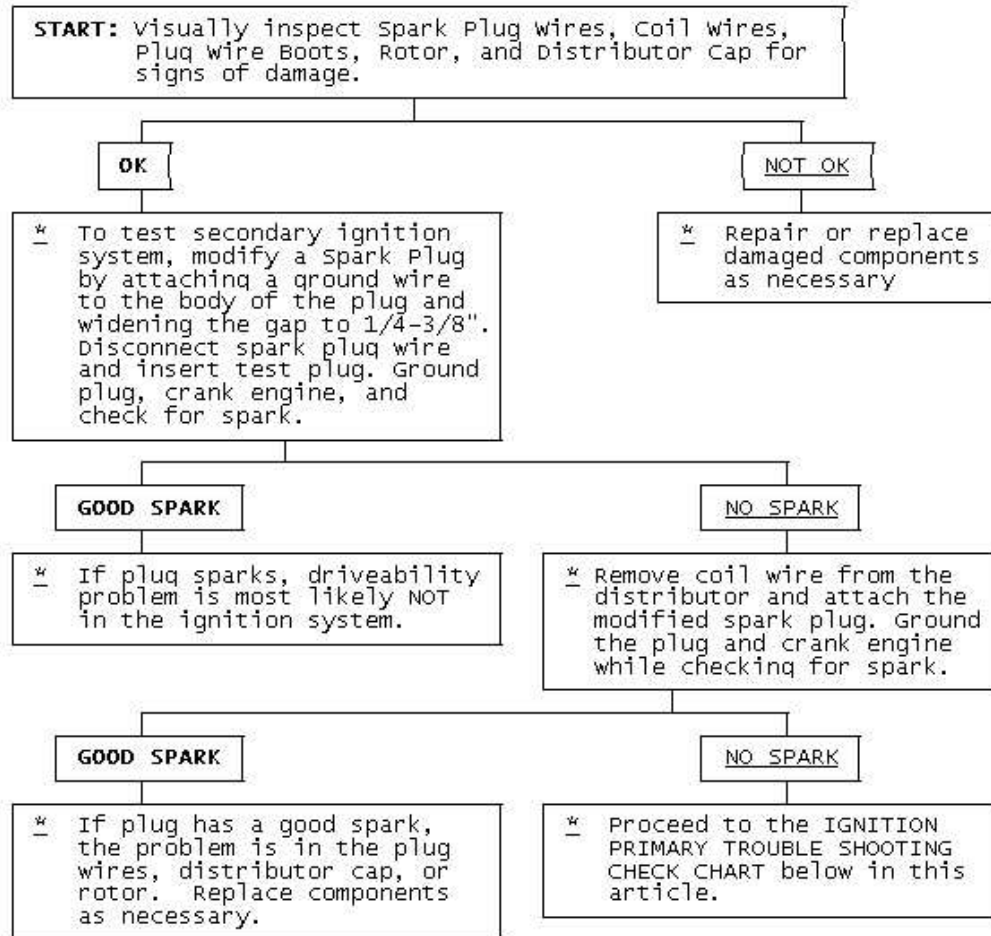

Fig. 1: Ignition Secondary Trouble Shooting Chart

Ignition Primary Trouble Shooting Chart

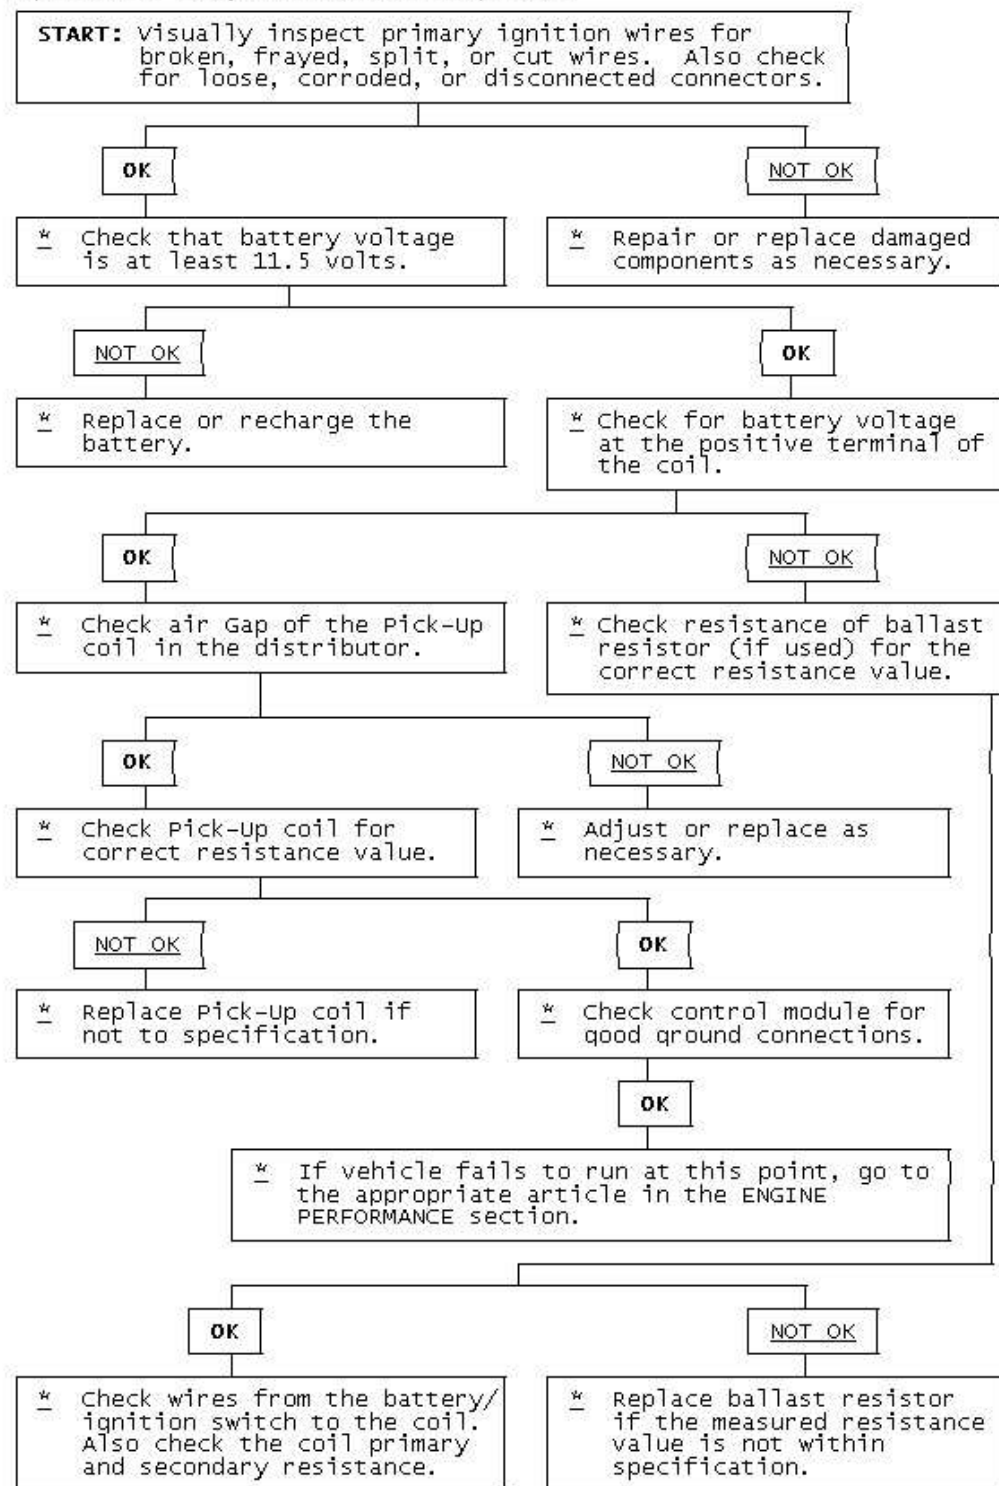

Fig. 2: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole	See STARTER article shoes
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article

Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearing	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article
Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER

	article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch	Replace ignition switch contacts sticking
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid
Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	solenoid
Low Current Draw	
Worn brushes or weak brush springs	Replace brushes or brush

	springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

AIR CONDITIONING & HEAT

AIR CONDITIONING TROUBLE SHOOTING

WARNING: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC AIR CONDITIONING TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Compressor Not Working	Compressor clutch circuit open.
.....	Compressor clutch coil inoperative.
.....	Poor clutch ground connection.
.....	Fan belts loose.
.....	Thermostatic switch inoperative.
.....	Thermostatic switch not adjusted.
.....	Ambient temperature switch open.
.....	Superheat fuse blown.
Excessive Noise or Vibration	Missing or loose mounting bolts.
.....	Bad idler pulley bearings.
.....	Fan belts not tightened correctly.
.....	Compressor clutch contacting body.
.....	Excessive system pressure.
.....	Compressor oil level low.
.....	Damaged clutch bearings.
.....	Damaged reed valves.
.....	Damaged compressor.
Insufficient or No Cooling; Compressor Working	Expansion valve inoperative.
.....	Heater control valve stuck open.

.....	Low system pressure.
.....	Blocked condenser fins.
.....	Blocked evaporator fins.
.....	Vacuum system leak.
.....	Vacuum motors inoperative.
.....	Control cables improperly adjusted.
.....	Restricted air inlet.
.....	Mode doors binding.
.....	Blower motor inoperative.
.....	Temperature above system capacity.

HEATER SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC HEATER SYSTEM TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Insufficient, Erratic, or No Heat	Low Coolant Level
.....	Incorrect thermostat.
.....	Restricted coolant flow through core.
.....	Heater hoses plugged.
.....	Misadjusted control cable.
.....	Sticking heater control valve.
.....	Vacuum hose leaking.
.....	Vacuum hose blocked.
.....	Vacuum motors inoperative.
.....	Blocked air inlet.
.....	Inoperative heater blower motor.
.....	Oil residue on heater core fins.
.....	Dirt on heater core fins.
Too Much Heat	Improperly adjusted cables.
.....	Sticking heater control valve.
.....	No vacuum to heater control valve.
.....	Temperature door stuck open.
Air Flow Changes During Acceleration	Vacuum system leak.
.....	Bad check valve or reservoir.
Air From Defroster At All Times	Vacuum system leak.

.....	Improperly adjusted control cables.
.....	Inoperative vacuum motor.
Blower Does Not Operate Correctly	Blown fuse.
.....	Blower motor windings open.
.....	Resistors burned out.
.....	Motor ground connection loose.
.....	Wiring harness connections loose.
.....	Blower motor switch inoperative.
.....	Blower relay inoperative.
.....	Fan binding or foreign object in housing.
.....	Fan blades broken or bent.

BRAKES

BRAKE SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BRAKE SYSTEM TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Brakes Pull Left or Right	
Incorrect tire pressure	Inflate tires to proper pressure
Front end out of alignment	See WHEEL ALIGNMENT
Mismatched tires	Check tires sizes
Restricted brake lines or hoses	Check hose routing
Loose or malfunctioning caliper	See DISC BRAKES or BRAKE SYSTEM
Bent shoe or oily linings	See DRUM BRAKES or BRAKE SYSTEM
Malfunctioning rear brakes	See DRUM, DISC BRAKES or BRAKE SYSTEM
Loose suspension parts	See SUSPENSION
Noises Without Brakes Applied	
Front linings worn out	Replace linings
Dust or oil on drums or rotors	See DRUM, DISC BRAKES or BRAKE SYSTEM
Noises With Brakes Applied	

Insulator on outboard shoe damaged	See DISC BRAKES or BRAKE SYSTEM
Incorrect pads or linings	Replace pads or linings
Brake Rough, Chatters or Pulsates	
Excessive lateral runout	Check rotor runout
Parallelism not to specifications	Reface or replace rotor
Wheel bearings not adjusted	See SUSPENSION
Rear drums out-of-round	Reface or replace drums
Disc pad reversed, steel against rotor	Remove and reinstall pad
Excessive Pedal Effort	
Malfunctioning power unit	See POWER BRAKES or BRAKE SYSTEM
Partial system failure	Check fluid and pipes
Worn disc pad or lining	Replace pad or lining
Caliper piston stuck or sluggish	See DISC BRAKES or BRAKE SYSTEM
Master cylinder piston stuck	See MASTER CYLINDERS or BRAKE SYSTEM
Brake fade due to incorrect pads for linings	Replace pads or linings
Linings or pads glazed	Replace pads or linings
Worn drums	Reface or replace drums
Excessive Pedal Travel	
Partial brake system failure	Check fluid and pipes
Insufficient fluid in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Air trapped in system	See BRAKE BLEEDING or BRAKE SYSTEM
Rear brakes not adjusted	See Adjustments in DRUM BRAKES or BRAKE SYSTEM
Bent shoe or lining	See DRUM BRAKES or BRAKE SYSTEM
Plugged master cylinder cap	See MASTER CYLINDERS or BRAKE SYSTEM
Improper brake fluid	Replace brake fluid
Pedal Travel Decreasing	
Compensating port plugged	See MASTER CYLINDERS or BRAKE SYSTEM
Swollen cup in master cylinder	See MASTER CYLINDERS or BRAKE SYSTEM
Master cylinder piston not returning	See MASTER CYLINDERS or BRAKE SYSTEM
Weak shoe retracting springs	See DRUM BRAKES

	BRAKE SYSTEM
Wheel cylinder piston sticking	See DRUM BRAKES or BRAKE SYSTEM
Dragging Brakes	
Master cylinder pistons not returning	See MASTER CYLINDERS BRAKE SYSTEM
Restricted brake lines or hoses	Check line routing
Incorrect parking brake adjustment	See DRUM BRAKES BRAKE SYSTEM
Parking Brake cables frozen	See DRUM BRAKES BRAKE SYSTEM
Incorrect installation of inboard disc pad	Remove and replace correctly
Power booster output rod too long	See POWER BRAKE UNITS BRAKE SYSTEM
Brake pedal not returning freely	See DISC, DRUM BRAKES BRAKE SYSTEM
Brakes Grab or Uneven Braking Action	
Malfunction of combination valve	See CONTROL VALVE or BRAKE SYSTEM
Malfunction of power brake unit	See POWER BRAKE UNITS or BRAKE SYSTEM
Binding brake pedal	See DISC, DRUM BRAKES or BRAKE SYSTEM
Pulsation or Roughness	
Uneven pad wear caused by caliper	See DISC BRAKES or BRAKE SYSTEM
Uneven rotor wear	See DISC BRAKES or BRAKE SYSTEM
Drums out-of-round	Reface or replace drums

ENGINE MECHANICAL

COOLING SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

COOLING SYSTEM TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION

Overheating	
Coolant Leak	Fill/Pressure Test System
A/C Condenser Fins Clogged	Remove/Clean Condenser
Radiator Fins Clogged	Remove/Clean Radiator
Thermostat Stuck Closed	Replace Thermostat
Clogged Cooling System Passages	Clean/Flush Cooling System
Water Pump Malfunction	Replace Water Pump
Fan Clutch Malfunction	Replace Fan Clutch
Retarded Ignition Timing	Reset Ignition Timing
Cooling Fan Malfunction	Test Cooling Fan/Circuit
Cooling Fan Motor Malfunction	Test Fan Motor
Cooling Fan Relay Malfunction	Test Fan Relay
Faulty Radiator Cap	Replace Radiator Cap
Broken/Slipping Fan Belt	Replace Fan Belt
Restricted Exhaust	Repair Exhaust System
Corrosion	
Impurities In Coolant	Clean/Flush System
Coolant Leakage	
Damaged hose	Replace Hose
Leaky Water Pump	Replace Water Pump
Damaged Radiator Seam	Replace/Repair Radiator
Leaky Thermostat Cover	Replace Thermostat Cover
Cylinder Head Problem	Check Head/Head Gasket
Leaky Freeze Plugs	Replace Freeze Plugs
Recovery System Inoperative	
Loose and/or Defective Radiator Cap	Replace Radiator Cap
Overflow Tube Clogged and/or Leaking	Repair Tube
Recovery Bottle Vent Restricted	Clean Vent
No Heater Core Flow	
Collapsed Heater Hose	Replace Heater Hose
Plugged Heater Core	Clean/Replace Heater Core
Faulty Heater Valve	Replace Heater Valve

GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC GASOLINE ENGINE - MECHANICAL TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Lopes At Idle	
Intake manifold-to-head leaks	Replace manifold gasket, See ENGINES
Blown head gasket	Replace head gasket, See ENGINES
Worn timing gears, chain or sprocket	Replace gears, chain or sprocket
Worn camshaft lobes	Replace camshaft, See ENGINES
Overheated engine	Check cooling system, See COOLING
Blocked crankcase vent valve	Remove restriction
Leaking EGR valve	Repair leak and/or replace valve
Faulty fuel pump	Replace fuel pump
Engine Has Low Power	
Leaking fuel pump	Repair leak and/or replace fuel pump
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Sticking valves or weak valve springs	Check valve train components, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Worn camshaft lobes	Replace camshaft, See ENGINES
Blown head gasket	Replace head gasket. See ENGINES.
Clutch slipping	Adjust pedal and/or replace components, See ENGINES
Engine overheating	Check cooling system, See COOLING
Auto. Trans. pressure regulator valve faulty	Replace pressure regulator valve
Auto. Trans. fluid level too low	Add fluid as necessary
Improper vacuum diverter valve operation	Replace vacuum diverter valve
Vacuum leaks	Inspect vacuum system and repair as required
Leaking piston rings	Replace piston rings, See

	ENGINES
Faulty High Speed Operation	
Low fuel pump volume	Replace fuel pump
Leaking valves or worn	Replace valves and/or springs, See ENGINES
Incorrect valve timing	Reset valve timing, See ENGINES
Intake manifold restricted	Remove restriction
Worn distributor shaft	Replace distributor
Faulty Acceleration	
Improper fuel pump stroke	Remove pump and reset pump stroke
Incorrect ignition timing	Reset ignition timing, See TUNE-UP
Leaking valves	Replace valves, See ENGINES
Worn fuel pump diaphragm or piston	Replace diaphragm or piston
Intake Backfire	
Improper ignition timing	Reset ignition timing, See TUNE-UP
Faulty accelerator pump discharge	Replace accelerator pump
Improper choke operation	Check choke and adjust as required
Defective EGR valve	Replace EGR valve
Fuel mixture too lean	Reset air/fuel mixture, See TUNE-UP
Choke valve initial clearance too large	Reset choke valve initial clearance
Exhaust Backfire	
Vacuum leak	Inspect and repair vacuum system
Faulty vacuum diverter valve	Replace vacuum diverter valve
Faulty choke operation	Check choke and adjust as required
Exhaust system leak	repair exhaust system leak
Engine Detonation	
Ignition timing too far advanced	Reset ignition timing, See TUNE-UP
Faulty ignition system	Check ignition timing, See TUNE-UP
Spark plugs loose or faulty	Retighten or replace plugs

Fuel delivery system clogged	Inspect lines, pump and filter for clog
EGR valve inoperative	Replace EGR valve
PCV system inoperative	Inspect and/or replace hoses or valve
Vacuum leaks	Check vacuum system and repair leaks
Excessive combustion chamber deposits	Remove built-up deposits
Leaking, sticking or broken valves	Inspect and/or replace valves
External Oil Leakage	
Fuel pump improperly seated or worn gasket	Remove pump, replace gasket and seat properly
Oil pan gasket broken or pan bent	Straighten pan and replace gasket
Timing chain cover gasket broken	Replace timing chain cover gasket
Rear main oil seal worn	Replace rear main oil seal
Oil pan drain plug not seated properly	Remove and reinstall drain plug
Camshaft bearing drain hole blocked	Remove restriction
Oil pressure sending switch leaking	Remove and reinstall sending switch
Excessive Oil Consumption	
Worn valve stems or guides	Replace stems or guides, See ENGINES
Valve "O" ring seals damaged	Replace "O" ring seals, See ENGINES
Plugged oil drain back holes	Remove restrictions
Improper PCV valve operation	Replace PCV valve
Engine oil level too high	Remove excess oil
Engine oil too thin	Replace thicker oil
Valve stem oil deflectors damaged	Replace oil deflectors
Incorrect piston rings	Replace piston rings, See ENGINES
Piston ring gaps not staggered	Reinstall piston rings, See ENGINES
Insufficient piston ring tension	Replace rings, See ENGINES
Piston ring grooves or oil return slots clogged	Replace piston rings, See ENGINES
Piston rings sticking in grooves	Replace piston rings, See ENGINES

Piston ring grooves excessively worn	Replace piston and rings, See ENGINES
Compression rings installed upside down	Replace compression rings correctly, See ENGINES
Worn or scored cylinder walls	Rebore cylinders or replace block
Mismatched oil ring expander and rail	Replace oil ring expander and rail, See ENGINES
Intake gasket dowels too long	Replace intake gasket dowels
Excessive main or connecting rod bearing clearance	Replace main or connecting rod bearings, See ENGINES
No Oil Pressure	
Low oil level	Add oil to proper level
Oil pressure sender or gauge broken	Replace sender or gauge
Oil pump malfunction	Remove and overhaul oil pump, See ENGINES
Oil pressure relief valve sticking	Remove and reinstall valve
Oil pump passages blocked	Overhaul oil pump, See ENGINES
Oil pickup screen or tube blocked	Remove restriction
Loose oil inlet tube	Tighten oil inlet tube
Loose camshaft bearings	Replace camshaft bearings, See ENGINES
Internal leakage at oil passages	Replace block or cylinder head
Low Oil Pressure	
Low engine oil level	Add oil to proper level
Engine oil too thin	Remove and replace with thicker oil
Excessive oil pump clearance	Reduce oil pump clearance, See ENGINES
Oil pickup tube or screen blocked	Remove restrictions
Main, rod or cam bearing clearance excessive	Replace bearing to reduce clearance, See ENGINES
High Oil Pressure	
Improper grade of oil	Replace with proper oil
Oil pressure relief valve stuck closed	Eliminate binding
Oil pressure sender or gauge faulty	Replace sender or gauge
Noisy Main Bearings	
Inadequate oil supply	Check oil delivery to main bearings

Excessive main bearing clearance	Replace main bearings, See ENGINES
Excessive crankshaft end play	Replace crankshaft, See ENGINES
Loose flywheel or torque converter	Tighten attaching bolts
Loose or damaged vibration damper	Tighten or replace vibration damper
Crankshaft journals out-of-round	Re-grind crankshaft journals
Excessive belt tension	Loosen belt tension
Noisy Connecting Rods	
Excessive bearing clearance or missing bearing	Replace bearing, See ENGINES
Crankshaft rod journal out-of-round	Re-grind crankshaft journal
Misaligned connecting rod or cap	Remove rod or cap and realign
Incorrectly tightened rod bolts	Remove and re-tighten rod bolts
Noisy Pistons and Rings	
Excessive piston-to-bore clearance	Install larger pistons, See ENGINES
Bore tapered or out-of-round	Rebore block
Piston ring broken	Replace piston rings, See ENGINES
Piston pin loose or seized	Replace piston pin, See ENGINES
Connecting rods misaligned	Realign connecting rods
Ring side clearance too loose or tight	Replace with larger or smaller rings
Carbon build-up on piston	Remove carbon
Noisy Valve Train	
Worn or bent push rods	Replace push rods, See ENGINES
Worn rocker arms or bridged pivots	Replace push rods, See ENGINES
Dirt or chips in valve lifters	Remove lifters and remove dirt/chips
Excessive valve lifter leak-down	Replace valve lifters, See ENGINES
Valve lifter face worn	Replace valve lifters, See ENGINES
Broken or cocked valve springs	Replace or reposition springs

Too much valve stem-to-guide clearance	Replace valve guides, See ENGINES
Valve bent	Replace valve, See ENGINES
Loose rocker arms	Retighten rocker arms, See ENGINES
Excessive valve seat run-out	Reface valve seats, See ENGINES
Missing valve lock	Install new valve lock
Excessively worn camshaft lobes	Replace camshaft, See ENGINES
Plugged valve lifter oil holes	Eliminate restriction or replace lifter
Faulty valve lifter check ball	Replace lifter check ball, See ENGINES
Rocker arm nut installed upside down	Remove and reinstall correctly
Valve lifter incorrect for engine	Remove and replace valve lifters
Faulty push rod seat or lifter plunger	Replace plunger or push rod
Noisy Valves	
Improper valve lash	Re-adjust valve lash, See ENGINES
Worn or dirty valve lifters	Clean and/or replace lifters
Worn valve guides	Replace valve guides, See ENGINES
Excessive valve seat or face run-out	Reface seats or valve face
Worn camshaft lobes	Replace camshaft, See ENGINES
Loose rocker arm studs	Re-tighten rocker arm studs, See ENGINES
Bent push rods	Replace push rods, See ENGINES
Broken valve springs	Replace valve springs, See ENGINES
Burned, Sticking or Broken Valves	
Weak valve springs or warped valves	Replace valves and/or springs, See ENGINES
Improper lifter clearance	Re-adjust clearance or replace lifters
Worn guides or improper guide clearance	Replace valve guides, See ENGINES

Out-of-round valve seats or improper seat width	Re-grind valve seats
Gum deposits on valve stems, seats or guide	Remove deposits
Improper spark timing	Re-adjust spark timing
Broken Pistons/Rings	
Undersize pistons	Replace with larger pistons, See ENGINES
Wrong piston rings	Replace with correct rings, See ENGINES
Out-of-round cylinder bore	Re-bore cylinder bore
Improper connecting rod alignment	Remove and realign connecting rods
Excessively worn ring grooves	Replace pistons, See ENGINES
Improperly assembled piston pins	Re-assemble pin-to-piston, See ENGINES
Insufficient ring gap clearance	Install new rings, See ENGINES
Engine overheating	Check cooling system
Incorrect ignition timing	Re-adjust ignition timing, See TUNE-UP
Excessive Exhaust Noise	
Leaks at manifold to head, or to pipe	Replace manifold or pipe gasket
Exhaust manifold cracked or broken	Replace exhaust manifold, See ENGINES

ENGINE PERFORMANCE

CARBURETOR TROUBLE SHOOTING:

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC COLD START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Choke not closing	Check choke operation, see FUEL SYSTEMS
Choke linkage bent	Check linkage, see FUEL SYSTEM

Engine Starts, Then Dies

Choke vacuum kick setting too wide	Check setting and adjust see, FUEL SYSTEMS
Fast idle RPM too low	Reset RPM to specification, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Vacuum leak	Inspect vacuum system for leaks
Low fuel pump outlet	Repair or replace pump, see FUEL SYSTEMS
Low carburetor fuel level	Check float setting see FUEL SYSTEM

Engine Quits Under Load

Choke vacuum kick setting incorrect	Reset vacuum kick setting, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEM
Incorrect hot fast idle speed RPM	Reset fast idle RPM, see TUNE-UP

Engine Starts, Runs Up, Then Idles, Slowly With Black Smoke

Choke vacuum kick set too narrow	Reset vacuum kick, see FUEL SYSTEMS
Fast idle cam index incorrect	Reset fast idle cam index, see FUEL SYSTEMS
Hot fast idle RPM too low	Reset fast idle RPM, see TUNE-UP

BASIC HOT START SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	
Engine flooded	Allow fuel to evaporate

BASIC COLD ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Stalls in Gear	
Choke vacuum kick setting incorrect	Reset choke vacuum kick, see FUEL SYSTEMS
Fast idle RPM incorrect	Reset fast idle RPM, see TUNE-UP
Fast idle cam index incorrect	Reset fast idle cam see FUEL SYSTEMS

Acceleration Sag or Stall	
Defective choke control switch	Replace choke control switch
Choke vacuum kick setting incorrect	Reset choke vacuum kick see, FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, FUEL SYSTEMS
Accelerator pump defective	Repair or replace pump see FUEL SYSTEMS
Secondary throttles not closed	Inspect lockout adjustment, see FUEL SYSTEMS
Sag or Stall After Warmup	
Defective choke control switch	Replace choke control switch, see FUEL SYSTEMS
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Float level incorrect (too low)	Adjust float level, see FUEL SYSTEMS
Backfiring & Black Smoke	
Plugged heat crossover system	Remove restriction

BASIC WARM ENGINE DRIVEABILITY SYMPTOMS TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Hesitation With Small Amount of Gas Pedal Movement	
Vacuum leak	Inspect vacuum lines
Accelerator pump weak or inoperable	Replace pump, see FUEL SYSTEMS
Float level setting too low	Reset float level, see, FUEL SYSTEMS
Metering rods sticking or binding	Inspect and/or replace rods, see FUEL SYSTEMS
Carburetor idle or transfer system plugged	Inspect system and remove restriction
Frozen or binding heated air inlet	Inspect heated air door for binding
Hesitation With Heavy Gas Pedal Movement	
Defective accelerator pump	Replace pump, see FUEL SYSTEMS
Metering rod carrier sticking or binding	Remove restriction
Large vacuum leak	Inspect vacuum system and repair leak
Float level setting too low	Reset float level, see FUEL

	SYSTEMS
Defective fuel pump, lines or filter	Inspect pump, lines and filter
Air door setting incorrect	Adjust air door setting, see FUEL

DIESEL ENGINE TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

NOTE: Diesel engines mechanical diagnosis is the same as gasoline engines for items such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.

BASIC DIESEL ENGINE TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Crank	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Bad starter connections or bad starter	Check connections and/or replace starter
Engine Cranks Slowly, Won't Start	
Bad battery connections or dead batteries	Check connections and/or replace batteries
Engine oil too heavy	Replace engine oil
Engine Cranks Normally, But Will Not Start	
Glow plugs not functioning	Check glow plug system, see FUEL SYSTEMS
Glow plug control not functioning	Check controller, see FUEL SYSTEMS
Fuel not injected into cylinders	Check fuel injectors, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Fuel filter blocked	Replace fuel filter
Fuel tank filter blocked	Replace fuel tank filter
Fuel pump not operating	Check pump operation and/or replace pump
Fuel return system blocked	Inspect system and remove restriction

No voltage to fuel solenoid	Check solenoid and connections
Incorrect or contaminated fuel	Replace fuel
Incorrect injection pump timing	Re-adjust pump timing, see FUEL SYSTEMS
Low compression	Check valves, pistons, rings, see ENGINES
Injection pump malfunction	Inspect and/or replace injection pump
Engine Starts, Won't Idle	
Incorrect slow idle adjustment	Reset idle adjustment, see TUNE-UP
Fast idle solenoid malfunctioning	Check solenoid and connections
Fuel return system blocked	Check system and remove restrictions
Glow plugs go off too soon	See glow plug diagnosis in FUEL SYSTEMS
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
No fuel to injection pump	Check fuel delivery system
Incorrect or contaminated fuel	Replace fuel
Low compression	Check valves, piston, rings, see ENGINES
Injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Fuel solenoid closes in RUN position	Check solenoid and connections
Engines Starts/Idles Rough W/out Smoke or Noise	
Incorrect slow idle adjustment	Reset slow idle, see TUNE-UP
Injection line fuel leaks	Check lines and connections
Fuel return system blocked	Check lines and connections
Air in fuel system	Bleed air from system
Incorrect or contaminated fuel	Replace fuel
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engines Starts and Idles Rough W/out Smoke or Noise, But Clears After Warm-Up	
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Engine not fully broken in	Put more miles on engine

Air in system	Bleed air from system
Injector nozzle malfunction	Check nozzles, see FUEL SYSTEMS
Engine Idles Correctly, Misfires Above Idle	
Blocked fuel filter	Replace fuel filter
Injection pump timing incorrect	Reset pump timing, see FUEL SYSTEMS
Incorrect or contaminated fuel	Replace fuel
Engine Won't Return To Idle	
Fast idle adjustment incorrect	Reset fast idle, see TUNE-UP
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
External linkage binding	Check linkage and remove binding
Fuel Leaks On Ground	
Loose or broken fuel line	Check lines and connections
Internal injection pump seal leak	Replace injection pump, see FUEL SYSTEMS
Cylinder Knocking Noise	
Injector nozzles sticking open	Test injectors, see FUEL SYSTEMS
Very low nozzle opening pressure	Test injectors and/or replace
Loss of Engine Power	
Restricted air intake	Remove restriction
EGR valve malfunction	Replace EGR valve
Blocked or damaged exhaust system	Remove restriction and/or replace components
Blocked fuel tank filter	Replace filter
Restricted fuel filter	Remove restriction and/or replace filter
Block vent in gas cap	Remove restriction and/or replace cap
Tank-to-injection pump fuel supply blocked	Check fuel lines and connections
Blocked fuel return system	Remove restriction
Incorrect or contaminated fuel	Replace fuel
Blocked injector nozzles	Check nozzle for blockage, see FUEL SYSTEMS
Low compression	Check valves, rings, pistons, see ENGINES

Loud Engine Noise With Black Smoke

Basic timing incorrect	Reset timing, see FUEL SYSTEMS
EGR valve malfunction	Replace EGR valve
Internal injection pump malfunction	Replace injection pump, see FUEL SYSTEMS
Incorrect injector pump housing pressure	Check pressure, see FUEL SYSTEMS

Engine Overheating

Cooling system leaks	Check cooling system and repair leaks
Belt slipping or damaged	Check tension and/or replace belt
Thermostat stuck closed	Remove and replace thermostat, see ENGINE COOLING
Head gasket leaking	Replace head gasket

Oil Light on at Idle

Low oil pump pressure	Check oil pump operation, see ENGINES
Oil cooler or line restricted	Remove restriction and/or replace cooler

Engine Won't Shut Off

Injector pump fuel solenoid does not return fuel valve to OFF position	Remove and check solenoid and replace if needed
--	---

VACUUM PUMP DIAGNOSIS

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

FUEL INJECTION TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC FUEL INJECTION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start (Crankes Normally)	
Cold start valve inoperative	Test valve and circuit
Poor connection;vacuum or wiring	Check vacuum and electrical connections
Contaminated fuel	Test fuel for water or alcohol
Defective fuel pump relay or circuit	Test relay and wiring
Battery too low	Charge and test battery
Low fuel pressure	Test pressure regulator and fuel pump, check for restricted lines and filters
No distributor reference pulses	Repair ignition system as necessary
Open coolant temperature sensor circuit	Test sensor and wiring
Shorted W.O.T. switch in T.P.S.	Disconnect W.O.T. switch, engine should start
Defective ECM	Replace ECM
Fuel tank residual pressure valve leaks	Test for fuel pressure drop after shut down
Hard Starting	
Disconnected hot air tube to air cleaner	Reconnect tube and test control valve
Defective Idle Air Control (IAC) valve	Test valve operation and circuit
Shorted, open or misadjusted T.P.S.	Test and adjust or replace T.P.S.
EGR valve open	Test EGR valve and control circuit
Poor Oxygen sensor signal	Test for shorted or circuit
Incorrect mixture from PCV system	Test PCV for flow, check sealing of oil filter cap
Poor High Speed Operation	
Low fuel pump volume	Faulty pump or restricted fuel lines or filters
Poor MAP sensor signal	Test MAP sensor, vacuum hose and wiring
Poor Oxygen sensor signal	Test for shorted or open sensor or circuit
Open coolant temperature sensor circuit	Test sensor and wiring
Faulty ignition operation	Check wires for cracks or poor con- nections, test

	secondary voltage with oscilloscope
Contaminated fuel	Test fuel for water or alcohol
Intermittent ECM ground	Test ECM ground connection for resistance
Restricted air cleaner	Replace air cleaner
Restricted exhaust system	Test for exhaust manifold back pressure
Poor MAF sensor signal	Check leakage between sensor and manifold
Poor VSS signal	If tester for ALCL hook-up is available check that VSS reading matches speedometer
Ping or Knock on Acceleration	
Poor Knock sensor signal	Test for shorted or open sensor or circuit
Poor Baro sensor signal	Test for shorted or open sensor or circuit
Improper ignition timing	See VEHICLE EMISSION CONTROL LABEL (where applicable)
Check for engine overheating problems	Low coolant, loose belts or electric cooling fan inoperative

NOTE: For additional electronic fuel injection trouble shooting information, see the appropriate article in the **ENGINE PERFORMANCE** section (not all vehicles have Computer Engine Control articles). Information is provided there for diagnosing fuel system problems on vehicles with electronic fuel injection.

IGNITION SYSTEM TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

Ignition Secondary Trouble shooting Chart

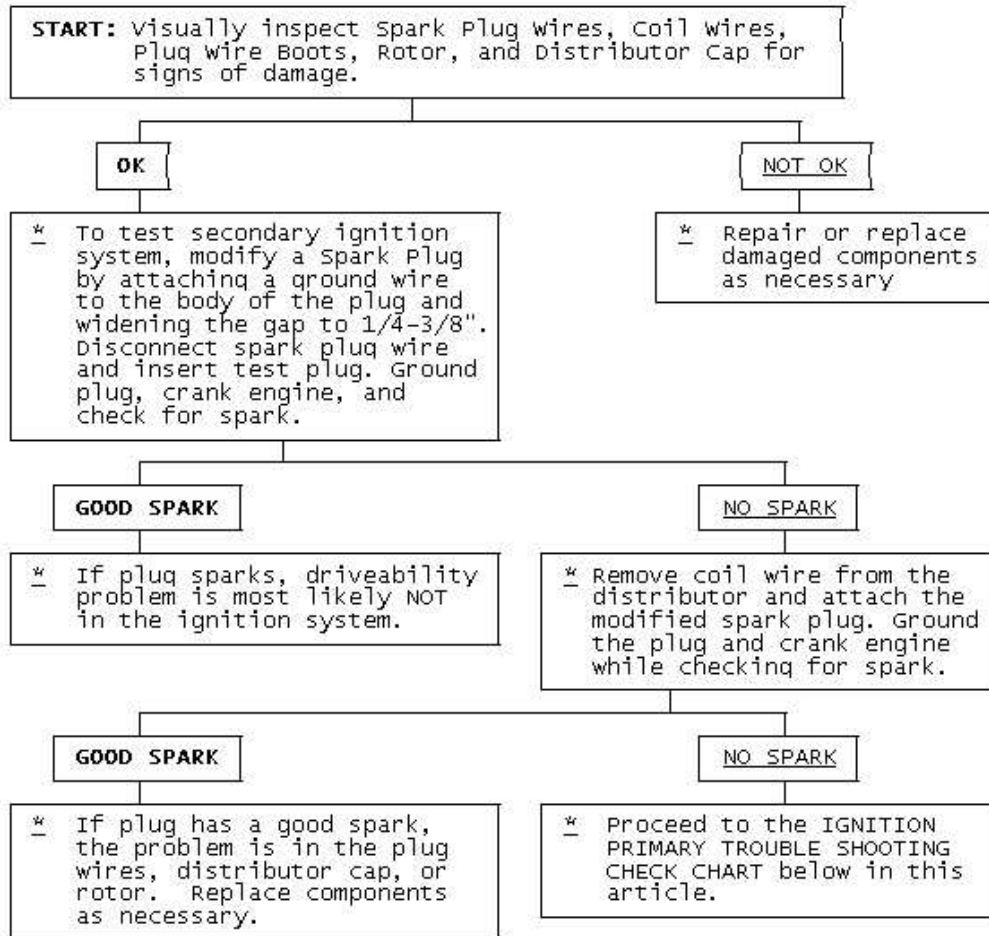

Fig. 3: Ignition Secondary Trouble Shooting Chart

Ignition Primary Trouble Shooting Chart

Fig. 4: Ignition Primary Trouble Shooting Chart

STARTER TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC STARTER TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Starter Fails to Operate	
Dead battery or bad connections between starter and battery	Check battery charge and all wires and connections to starter
Ignition switch faulty or misadjusted	Adjust or replace ignition switch
Open circuit between starter switch ignition terminal on starter relay	Check and repair wires and connections as necessary
Starter relay or starter defective	See Testing in STARTER article
Open solenoid pull-in wire	See Testing in STARTER article
Starter Does Not Operate and Headlights Dim	
Weak battery or dead cell	Charge or replace battery as necessary
Loose or corroded battery connections	Check that battery connections are clean and tight
Internal ground in starter windings	See Testing in STARTER article
Grounded starter fields	See Testing in STARTERS
Armature rubbing on pole shoes	See STARTER article
Starter Turns but Engine Does Not Rotate	
Starter clutch slipping	See STARTER article
Broken clutch housing	See STARTER article
Pinion shaft rusted or dry	See STARTER article
Engine basic timing incorrect	See Ignition Timing in TUNE-UP article
Broken teeth on engine flywheel	Replace flywheel and check for starter pinion

	gear damage
Starter Will Not Crank Engine	
Faulty overrunning clutch	See STARTER article
Broken clutch housing	See STARTER article
Broken flywheel teeth	Replace flywheel and check for starter pinion gear damage
Armature shaft sheared or reduction gear teeth stripped	See STARTER article
Weak battery	Charge or replace battery as necessary
Faulty solenoid	See On-Vehicle Tests in STARTER article
Poor grounds	Check all ground connections for tight and clean connections
Ignition switch faulty or misadjusted	Adjust or replace ignition switch as necessary
Starter Cranks Engine Slowly	
Battery weak or defective	Charge or replace battery as necessary
Engine overheated	See ENGINE COOLING SYSTEM article
Engine oil too heavy	Check that proper viscosity oil is used
Poor battery-to-starter connections	Check that all between battery and starter are clean and tight
Current draw too low or too high	See Bench Tests in STARTER article
Bent armature, loose pole shoes screws or worn bearings	See STARTER article
Burned solenoid contacts	Replace solenoid
Faulty starter	Replace starter
Starter Engages Engine Only Momentarily	
Engine timing too far advanced	See Ignition Timing in TUNE-UP article
Overrunning clutch not engaging properly	Replace overrunning clutch. See STARTER article
Broken starter clutch	See STARTER article
Broken teeth on engine flywheel	Replace flywheel and check starter pinion gear for damage
Weak drive assembly thrust spring	See STARTER article

Weak hold-in coil	See Bench Tests in STARTER article
Starter Drive Will Not Engage	
Defective point assembly	See Testing in STARTER article
Poor point assembly ground	See Testing in STARTER article
Defective pull-in coil	Replace starter solenoid
Starter Relay Does Not Close	
Dead battery	Charge or replace battery as necessary
Faulty wiring	Check all wiring and connections leading to relay
Neutral safety switch faulty	Replace neutral safety switch
Starter relay faulty	Replace starter relay
Starter Drive Will Not Disengage	
Starter motor loose on mountings	Tighten starter attach bolts
Worn drive end bushing	See STARTER article
Damaged engine flywheel teeth	Replace flywheel and starter pinion gear for damage
Drive yolk return spring broken or missing	Replace return spring
Faulty ignition switch	Replace ignition switch
Insufficient clearance between winding leads to solenoid terminal and main contact in solenoid	Replace starter solenoid
Starter clutch not disengaging	Replace starter clutch
Ignition starter switch contacts sticking	Replace ignition switch
Starter Relay Operates but Solenoid Does Not	
Faulty solenoid switch, switch connections or relay	Check all wiring between relay and solenoid or replace relay or solenoid as necessary
Broken lead or loose soldered connections	Repair wire or wire connections as necessary
Solenoid Plunger Vibrates When Switch is Engaged	
Weak battery	Charge or replace battery as necessary
Solenoid contacts corroded	Clean contacts or replace solenoid
Faulty wiring	Check all wiring leading to solenoid

Broken connections inside switch cover	Repair connections or replace solenoid
Open hold-in wire	Replace solenoid
Low Current Draw	
Worn brushes or weak	Replace brushes or brush springs as necessary
High Pitched Whine During Cranking Before Engine Fires but Engine Fires and Cranks Normally	
Distance too great between starter pinion and flywheel	Align starter or check that correct starter and flywheel are being used
High Pitched Whine After Engine Fires With Key released. Engine Fires and Cranks Normally	
Distance too small between starter pinion and flywheel	Flywheel runout contributes to the intermittent nature

TUNE-UP TROUBLE SHOOTING - GAS ENGINE VEHICLES

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC SPARK PLUG TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Normal Spark Plug Condition	
Light Tan or Gray deposits	No Action
Electrode not burned or fouled	No Action
Gap tolerance not changed	No Action
Cold Fouling or Carbon Deposits	
Overrich air/fuel mixture	Adjust air/fuel mixture, see ENGINE PERFORMANCE section
Faulty choke	Replace choke assembly, see ENGINE PERFORMANCE section
Clogged air filter	Clean and/or replace air filter
Incorrect idle speed or dirty carburetor	Reset idle speed and/ or clean carburetor
Faulty ignition wires	Replace ignition wiring
Prolonged operation at idle	Shut engine off during long idle

Sticking valves or worn valve guide seals	Check valve train
Wet Fouling or Oil Deposits	
Worn rings and pistons	Install new rings and pistons
Excessive cylinder wear	Rebore or replace block
Excessive valve guide clearance	Worn or loose bearing
Gap Bridged	
Deposits in combustion chamber becoming fused to electrode	Clean combustion chamber of deposits
Blistered Electrode	
Engine overheating	Check cooling system
Wrong type of fuel	Replace with correct fuel
Loose spark plugs	Retighten spark plugs
Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Pre-Ignition or Melted Electrodes	
Incorrect type of fuel	Replace with correct fuel
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Burned valves	Replace valves
Engine Overheating	Check cooling system
Wrong type of spark plug, too hot	Replace with correct spark plug, see ENGINE PERFORMANCE
Chipped Insulators	
Severe detonation	Check for over-advanced timing or combustion
Improper gapping procedure	Re-gap spark plugs
Rust Colored Deposits	
Additives in unleaded fuel	Try different fuel brand
Water In Combustion Chamber	
Blown head gasket or cracked head	Repair or replace head or head gasket

NOTE: Before diagnosing an electronic ignition system, ensure that all wiring is connected properly between distributor, wiring connector and spark plugs. Ignition problem will show up either as: Engine Will Not Start or Engine Runs Rough.

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS

CONDITION & POSSIBLE CAUSE	CORRECTION
Engine Won't Start	

Open circuit between distributor and bulkhead connector	Repair circuit
Open circuit between bulkhead connector and ignition switch	Repair circuit
Open circuit between ignition switch and starter solenoid	Repair circuit
Engine Runs Rough	
Fuel lines leaking or clogged	Tighten fitting, remove restriction
Initial timing incorrect	Reset ignition timing see ENGINE PERFORMANCE
Centrifugal advance malfunction	Repair distributor advance
Defective spark plugs or wiring	Replace plugs or plug wiring
Component Failure	
Spark arc-over on cap, rotor or coil	Replace cap, rotor or or coil
Defective pick-up coil	Replace pick-up coil
Defective ignition coil	Replace ignition coil
Defective vacuum unit	Replace vacuum unit
Defective control module	Replace control module

BASIC ELECTRONIC IGNITION TROUBLE SHOOTING CHARTS - USING OSCILLOSCOPE PATTERNS

CONDITION & POSSIBLE CAUSE	CORRECTION
Firing Voltage Lines are the Same, but Abnormally High	
Retarded ignition timing	Reset ignition timing, see ENGINE PERFORMANCE section
Fuel mixture too lean	Readjust carburetor, see ENGINE PERFORMANCE
High resistance in coil wire	Replace coil wire
Corrosion in coil tower terminal	Clean and/or replace coil
Corrosion in distributor coil terminal	Clean and/or replace distributor cap
Firing Voltage Lines are the Same but Abnormally Low	
Fuel mixture too rich	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in coil wire causing arcing	Replace coil wire
Cracked coil tower causing arcing	Replace coil
Low coil output	Replace coil
Low engine compression	Determine cause and repair
One or More, But Not All Firing Voltage Lines are Higher Than Others	
Carburetor idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
EGR valve stuck open	Clean and/or replace valve

High resistance in spark plug wires	Replace spark plug wires
Cracked or broken spark plug insulator	Replace spark plugs
Intake vacuum leak	Repair leak
Defective spark plugs	Replace spark plugs
Corroded spark plug terminals	Replace spark plugs
One or More, But Not All Firing Voltage Lines Are Lower Than Others	
Curb idle mixture not balanced	Readjust carburetor, see ENGINE PERFORMANCE
Breaks in plug wires	Replace plug wires causing arcing
Cracked coil tower causing arcing	Replace coil
Low compression	Determine cause and repair
Defective spark plugs	Replace spark plugs
Corroded spark plugs	Replace spark plugs
Cylinders Not Firing	
Cracked distributor cap terminals	Replace distributor cap
Shorted spark plug wire	Determine cause and repair
Mechanical problem in engine	Determine cause and repair
Defective spark plugs	Replace spark plugs
Spark plugs fouled	Replace spark plugs

BASIC DRIVEABILITY PROBLEMS TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Hard Starting	
Binding carburetor linkage	Eliminate binding
Binding choke linkage	Eliminate binding
Binding choke piston	Eliminate binding
Restricted choke vacuum	Check vacuum lines for blockage
Worn or dirty needle valve and seat	Clean carburetor, see ENGINE PERFORMANCE
Float sticking	Readjust or replace float see the ENGINE PERFORMANCE section
Incorrect choke adjustment	Reset choke adjustment see ENGINE PERFORMANCE
Defective coil	Replace coil
Improper spark plug gap	Regap spark plugs
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Detonation	

Over-advanced ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective spark plugs	Replace spark plugs
Fuel lines clogged	Clean fuel lines
EGR system malfunction	Check and repair EGR system
PCV system malfunction	Repair PCV system
Vacuum leaks	Check and repair vacuum system
Loose fan belts	Tighten or replace fan belts, see ENGINE PERFORMANCE
Restricted airflow	Remove restriction
Vacuum advance malfunction	Check distributor operation
Dieseling	
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate blinding
Binding choke linkage or fast idle cam	Eliminate binding
Defective idle solenoid	Replace idle solenoid see ENGINE PERFORMANCE
Improper base idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Incorrect idle mixture setting	Reset idle mixture, see ENGINE PERFORMANCE
Faulty Acceleration	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Engine cold and choke too lean	Adjust choke and allow engine to warm-up
Defective spark plugs	Replace spark plugs
Defective coil	Replace coil
Faulty Low Speed Operation	
Clogged idle transfer slots	Clean idle transfer slots, see FUEL
Restricted idle air bleeds and passages	Disassemble and clean carburetor, see FUEL
Clogged air cleaner	Replace air filter
Defective spark plugs	Replace spark plugs
Defective ignition wires	Replace ignition wire see ENGINE PERFORMANCE
Defective distributor cap	Replace distributor cap

Faulty High Speed Operation

Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Defective distributor centrifugal advance	Replace advance mechanism
Defective distributor vacuum advance	Replace advance unit
Incorrect spark plugs or plug gap	Check gap and/or replace spark plugs
Faulty choke operation	Check choke and repair as required
Clogged vacuum passages	Remove restrictions
Improper size or clogged main jet	Check jet size and clean, see FUEL
Restricted air cleaner	Check filter and replace as necessary
Defective distributor cap, rotor or coil	Replace cap, rotor or coil

Misfire at All Speeds

Defective spark plugs	Replace spark plugs
Defective spark plug wires	Replace spark plug wires
Defective distributor cap, rotor, or coil	Replace cap, rotor, or coil
Cracked or broken vacuum hoses	Replace vacuum hoses
Vacuum leaks	Repair vacuum leaks
Fuel lines clogged	Remove restriction

Hesitation

Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair Vacuum leaks
Binding carburetor linkage	Eliminate binding
Binding throttle linkage	Eliminate binding
Binding choke linkage or fast idle cam	Eliminate binding
Improper float setting	Readjust float setting, see FUEL
Cracked or broken ignition wires	Replace ignition wires

Rough Idle, Missing or Stalling

Incorrect curb idle or fast idle speed	Reset idle speed, see see ENGINE PERFORMANCE
Incorrect basic timing	Reset ignition timing see ENGINE PERFORMANCE
Improper idle mixture adjustment	Reset idle mixture, see ENGINE PERFORMANCE
Improper feedback system operation	Check feedback system see ENGINE PERFORMANCE

Incorrect spark plug gap	Reset spark plug gap, see ENGINE PERFORMANCE
Moisture in ignition components	Dry components
Loose or broken ignition wires	Replace ignition wires
Damaged distributor cap or or rotor	Replace distributor cap or rotor
Faulty ignition coil	Replace ignition coil
Fuel filter clogged or worn	Replace fuel filter
Damaged idle mixture screw	Replace idle mixture screw, see FUEL
Improper fast idle cam adjustment	Reset fast idle cam adjustment, see TUNE- see ENGINE PERFORMANCE
Improper EGR valve operation	Replace EGR valve
Faulty PCV valve air flow	Replace PCV valve
Choke binding or improper choke setting	Reset choke or eliminate binding
Vacuum leak	Repair vacuum leak
Improper float bowl fuel level	Reset float adjustment, see FUEL
Clogged air bleed or idle passages	Clean carburetor passages, see FUEL
Clogged or worn air cleaner filter	Replace air filter
Faulty choke vacuum diaphragm	Replace diaphragm, see ENGINE PERFORMANCE
Exhaust manifold heat valve inoperative	Replace heat valve
Improper distributor spark advance	Check distributor operation
Leaking valves or valve components	Check and repair valvetrain
Improper carburetor mounting	Remove and remount carburetor
Excessive play in distributor shaft	Replace distributor
Loose or corroded wiring connections	Repair or replace as required
Engine Surges	
Improper PCV valve airflow	Replace PCV valve
Vacuum leaks	Repair vacuum leaks
Clogged air bleeds	Remove restriction
EGR valve malfunction	Replace EGR valve
Restricted air cleaner filter	Replace air filter
Cracked or broken vacuum hoses	Replace vacuum hoses
Cracked or broken ignition wires	Replace ignition wires
Vacuum advance malfunction	Check unit and replace as

	necessary
Defective or fouled spark plugs	Replace spark plugs
Ping or Spark Knock	
Incorrect ignition timing	Reset ignition timing see ENGINE PERFORMANCE
Distributor centrifugal or vacuum advance malfunction	Check operation and replace as necessary
Carburetor setting too lean	Readjust mixture setting, see ENGINE PERFORMANCE
Vacuum leak	Eliminate vacuum leak
EGR valve malfunction	Replace EGR valve
Poor Gasoline Mileage	
Cracked or broken vacuum	Replace vacuum hoses hoses
Vacuum leaks	Repair vacuum leaks
Defective ignition wires	Replace wires
Incorrect choke setting	Readjust setting, see ENGINE PERFORMANCE
Defective vacuum advance	Replace vacuum advance
Defective spark plugs	Replace spark plugs
Binding carburetor power piston	Eliminate binding
Dirt in carburetor jets	Clean and/or replace jets
Incorrect float adjustment	Readjust float setting, see FUEL
Defective power valve	Replace power valve, see ENGINE PERFORMANCE
Incorrect idle speed	Readjust idle speed
Engine Stalls	
Improper float level	Readjust float level
Leaking needle valve and seat	Replace needle valve and seat
Vacuum leaks	Eliminate vacuum leaks

VACUUM PUMP - DIESEL TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

NOTE: Diesel engines mechanical diagnosis is the same as gasoline engines for items

such as noisy valves, bearings, pistons, etc. The following trouble shooting covers only items pertaining to diesel engines.

VACUUM PUMP (DIESEL) TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Excessive Noise	
Loose pump-to-drive assembly screws	Tighten screws
Loose tube on pump assembly	Tighten tube
Valves not functioning properly	Replace valves
Oil Leakage	
Loose end plug	Tighten end plug
Bad seal crimp	Remove and re-crimp seal

MANUAL TRANSMISSION

MANUAL TRANSMISSION TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

MANUAL TRANSMISSION/TRANSAXLE TROUBLE SHOOTING

Condition	Possible Cause
Noisy In Forward Gears	Low gear oil level, Loose bell housing bolts, Worn bearings or gears
Clunk On Deceleration (FWD Only)	Loose engine mounts, Worn inboard CV joints, Worn differential pinion shaft, Side gear hub counterbore in case worn oversize
Gear Clash When Shifting Forward Gears	Clutch Out Of Adjustment, Shift linkage damaged or out of adjustment, Gears or synchronizers damaged, Low gear oil level
Transmission Noisy When Moving (RWD Only) Quiet In Neutral With Clutch Engaged	Worn rear outputshaft bearing
Gear Rattle	Worn bearings, Wrong gear oil, Low gear oil, Worn gears
Steady Ticking At Idle (Increases With RPM)	Broken tooth on gear
Gear Clash When Shifting Forward Gears	Worn or broken synchronizers
Loud Whine In Reverse	Normal condition ⁽¹⁾
Noise When Stepping On Clutch	Bad release bearing, Worn pilot bearing
Ticking Or Screeching As Clutch Is Engaged	Faulty release bearing, Uneven pressure plate

	fingers
Click Or Snap When Clutch Is Engaged	Worn clutch fork, Worn or broken front bearing retainer
Transmission Shifts Hard	Clutch not releasing, Shift mechanism binding, Clutch installed backwards
Will Not Shift Into One Gear, Shifts Into All Others	Bent shift fork, Worn detent balls
Locked Into Gear, Cannot Shift	Clutch adjustment, Worn detent balls
Transmission Jumps Out Of Gear	Pilot bearing worn, Bent shift fork, Worn gear teeth or face, Excessive gear train end play, Worn synchronizers, Missing detent ball spring, Shift mechanism worn or out of adjustment, Engine or transmission mount bolts loose or out of adjustment, Transmission not aligned
Shift Lever Rattle	Worn shift lever or detents, Worn shift forks, Worn synchronizers sleeve
Shift Lever Hops Under Acceleration	Worn engine or transmission mounts
(1) Most units use spur cut gears in reverse and are noisy	

POWERTRAIN

CLUTCH TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC CLUTCH TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Chattering or Grabbing	
Incorrect clutch adjustment	Adjust clutch
Oil, grease or glaze on facings	Disassemble and clean or replace
Loose "U" joint flange	See DRIVE AXLES article
Worn input shaft spline	Replace input shaft
Binding pressure plate	Replace pressure plate
Binding release lever	See CLUTCH article
Binding clutch disc hub	Replace clutch disc
Unequal pressure plate contact	Replace worn/misaligned components
Loose/bent clutch disc	Replace clutch disc

Incorrect transmission alignment	Realign transmission
Worn pressure plate, disc or flywheel	Replace damaged components
Broken or weak pressure springs	Replace pressure plate
Sticking clutch pedal	Lubricate clutch pedal & linkage
Incorrect clutch disc facing	Replace clutch disc
Engine loose in chassis	Tighten all mounting bolts
Failure to Release	
Oil or grease on clutch facings	Clean or replace clutch disc
Incorrect release lever or pedal adjustment	See CLUTCH article
Worn or broken clutch facings	Replace clutch disc
Bent clutch disc or pressure plate	Replace damaged components
Clutch disc hub binding on input shaft	Clean or replace clutch disc and/or input shaft
Binding pilot bearing	Replace pilot bearing
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Binding clutch cable	See CLUTCH article
Defective clutch master	Replace master cylinder
Defective clutch slave	Replace slave cylinder
Air in hydraulic system	Bleed hydraulic system
Rattling	
Weak or broken release lever spring	Replace spring and check alignment
Damaged pressure plate	Replace pressure plate
Broken clutch return spring	Replace return spring
Worn splines on clutch disc or input shaft	Replace clutch disc and/or input shaft
Worn clutch release bearing	Replace release bearing
Dry or worn pilot bearing	Lubricate or replace pilot bearing
Unequal release lever contact	Align or replace release lever
Incorrect pedal free play	Adjust free play
Warped or damaged clutch disc	Replace damaged components
Slipping	
Pressure springs worn or	Replace pressure plate
Oily, greasy or worn facings	Clean or replace clutch disc
Incorrect clutch alignment	Realign clutch assembly

Warped clutch disc or pressure plate	Replace damaged components
Binding release levers or clutch pedal	Lubricate and/or replace release components
Squeaking	
Worn or damaged release	Replace release bearing
Dry or worn pilot or release bearing	Lubricate or replace assembly
Pilot bearing turning in crankshaft	Replace pilot bearing and/or crankshaft
Worn input shaft bearing	Replace bearing and seal
Incorrect transmission alignment	Realign transmission
Dry release fork between pivot	Lubricate release fork and pivot
Heavy and/or Stiff Pedal	
Sticking release bearing sleeve	Replace release bearing and/or sleeve
Dry or binding clutch pedal hub	Lubricate and align components
Floor mat interference with pedal	Lay mat flat in proper area
Dry or binding ball/fork pivots	Lubricate and align components
Faulty clutch cable	Replace clutch cable
Noisy Clutch Pedal	
Faulty interlock switch	Replace interlock switch
Self-adjuster ratchet noise	Lubricate or replace self-adjuster
Speed control interlock switch	Lubricate or replace interlock switch
Clutch Pedal Sticks Down	
Binding clutch cable	See CLUTCH article
Springs weak in pressure plate	Replace pressure plate
Binding in clutch linkage	Lubricate and free linkage
Noisy	
Dry release bearing	Lubricate or replace release bearing
Dry or worn pilot bearing	Lubricate or replace bearing
Worn input shaft bearing	Replace bearing
Transmission Click	
Weak springs in pressure	Replace pressure plate plate
Release fork loose on ball stud	Replace release fork and/or ball stud
Oil on clutch disc damper	Replace clutch disc

Broken spring in slave cylinder	Replace slave cylinder
---------------------------------	------------------------

DRIVE AXLE - NOISE DIAGNOSIS

Unrelated Noises

Some driveline trouble symptoms are also common to the engine, transmission, wheel bearings, tires, and other parts of the vehicle. Ensure cause of trouble actually is in the drive axle before adjusting, repairing, or replacing any of its parts.

Non-Drive Axle Noises

A few conditions can sound just like drive axle noise and have to be considered in pre-diagnosis. The 4 most common noises are exhaust, tires, CV/universal joints and wheel trim rings.

In certain conditions, the pitch of the exhaust gases may be gear whine. At other times, it may be mistaken for a wheel bearing rumble.

Tires, especially radial and snow, can have a high-pitched tread whine or roar, similar to gear noise. Also, some non-standard tires with an unusual tread construction may emit a roar or whine.

Defective CV/universal joints may cause clicking noises or excessive driveline play that can be improperly diagnosed as drive axle problems.

Trim and moldings also can cause a whistling or whining noise. Ensure none of these components are causing the noise before disassembling the drive axle.

Gear Noise

A "howling" or "whining" noise from the ring and pinion gear can be caused by an improper gear pattern, gear damage, or improper bearing preload. It can occur at various speeds and driving conditions, or it can be continuous.

Before disassembling axle to diagnose and correct gear noise, be sure that tires, exhaust, and vehicle trim have been checked as possible causes.

Chuckle

This is a particular rattling noise that sounds like a stick against the spokes of a spinning bicycle wheel. It occurs while decelerating from 40 MPH and usually can be heard until vehicle comes to a complete stop. The frequency varies with the speed of the vehicle.

A chuckle that occurs on the driving phase is usually caused by excessive clearance due to differential gear wear, or by a damaged tooth on the coast side of the pinion or ring gear. Even a very small tooth nick or a ridge on the edge of a gear tooth is enough to cause the noise.

This condition can be corrected simply by cleaning the gear tooth nick or ridge with a small grinding

wheel. If either gear is damaged or scored badly, the gear set must be replaced. If metal has broken loose, the carrier and housing must be cleaned to remove particles that could cause damage.

Knock

This is very similar to a chuckle, though it may be louder, and occur on acceleration or deceleration. Knock can be caused by a gear tooth that is damaged on the drive side of the ring and pinion gears. Ring gear bolts that are hitting the carrier casting can cause knock. Knock can also be due to excessive end play in the axle shafts.

Clunk

Clunk is a metallic noise heard when an automatic transmission is engaged in Reverse or Drive, or when throttle is applied or released. It is caused by backlash somewhere in the driveline, but not necessarily in the axle. To determine whether driveline clunk is caused by the axle, check the total axle backlash as follows:

1. Raise vehicle on a frame or twinpost hoist so that drive wheels are free. Clamp a bar between axle companion flange and a part of the frame or body so that flange cannot move.
2. On conventional drive axles, lock the left wheel to keep it from turning. On all models, turn the right wheel slowly until it is felt to be in Drive condition. Hold a chalk marker on side of tire about 12" from center of wheel. Turn wheel in the opposite direction until it is again felt to be in Drive condition.
3. Measure the length of the chalk mark, which is the total axle backlash. If backlash is one inch or less, drive axle is not the source of clunk noise.

Bearing Whine

Bearing whine is a high-pitched sound similar to a whistle. It is usually caused by malfunctioning pinion bearings. Pinion bearings operate at drive shaft speed. Roller wheel bearings may whine in a similar manner if they run completely dry of lubricant. Bearing noise will occur at all driving speeds. This distinguishes it from gear whine, which usually comes and goes as speed changes.

Bearing Rumble

Bearing rumble sounds like marbles being tumbled. It is usually caused by a malfunctioning wheel bearing. The lower pitch is because the wheel bearing turns at only about 1/3 of drive shaft speed.

Chatter On Turns

This is a condition where the entire front or rear of vehicle vibrates when vehicle is moving. The vibration is plainly felt as well as heard. Extra differential thrust washers installed during axle repair can cause a condition of partial lock-up that creates this chatter.

Axle Shaft Noise

Axle shaft noise is similar to gear noise and pinion bearing whine. Axle shaft bearing noise will normally distinguish itself from gear noise by occurring in all driving modes (Drive, cruise, coast and

float), and will persist with transmission in Neutral while vehicle is moving at problem speed.

If vehicle displays this noise condition, remove suspect parts, replace wheel seals and install a new set of bearings. Re-evaluate vehicle for noise before removing any internal components.

Vibration

Vibration is a high-frequency trembling, shaking or grinding condition (felt or heard) that may be constant or variable in level and can occur during the total operating speed range of the vehicle.

The types of vibrations that can be felt in the vehicle can be divided into 3 main groups:

- Vibrations of various unbalanced rotating parts of the vehicle.
- Resonance vibrations of the body and frame structures caused by rotating of unbalanced parts.
- Tip-in moans of resonance vibrations from stressed engine or exhaust system mounts or driveline flexing modes.

DRIVE AXLE - RWD TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing. For definitions of listed noises or sounds, see **DRIVE AXLE - NOISE DIAGNOSIS** under **POWERTRAIN**.

DRIVE AXLE (RWD) TROUBLE SHOOTING

CONDITION & POSSIBLE CAUSE	CORRECTION
Knocking or Clunking	
Differential Side Gear Clearance	Check Clearance
Worn Pinion Shaft	Replace Pinion Shaft
Axle Shaft End Play	Check End Play
Missing Gear Teeth	Check Differential/Replace Gear
Wrong Axle Backlash	Check Backlash
Misaligned Driveline	Realign Driveline
Clinking During Engagement	
Side Gear Clearance	Check Clearance
Ring and Pinion Backlash	Check Backlash
Worn/Loose Pinion Shaft	Replace Shaft/Bearing
Bad "U" Joint	Replace "U" Joint
Sticking Slip Yoke	Lube Slip Yoke

Broken Rear Axle Mount	Replace Mount
Loose Drive Shaft Flange	Check Flange
Click/Chatter On Turns	
Differential Side Gear Clearance	Check Clearance
Wrong Turn On Plates ⁽¹⁾	Replace Clutch Plates
Wrong Differential Lubricant ⁽¹⁾	Change Lubricant
Knock Or Click	
Flat Spot on Rear Wheel Bearing	Replace Wheel Bearing
Low Vibration At All Speeds	
Faulty Wheel Bearing	Replace Wheel Bearing
Faulty "U" Joint	Replace "U" Joint
Faulty Drive Shaft	Balance Drive Shaft
Faulty Companion Flange	Replace Flange
Faulty Slip Yoke Flange	Replace Flange
(1) Limited slip differential only.	

FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC FWD AXLE SHAFTS & CV JOINTS TROUBLE SHOOTING CHART

CONDITION	POSSIBLE CAUSE
Grease Leaks	CV boot torn or cracked
Clicking Noise on Cornering	Damaged outer CV
Clunk Noise on Acceleration	Damaged inner CV
Vibration or Shudder on Acceleration	Sticking, damaged or worn CV Misalignment or spring height

STEERING & SUSPENSION

MANUAL STEERING GEAR TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC MANUAL STEERING GEAR TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise in Rack and Pinion	
Rack and pinion mounting bracket loose	Tighten all mounting bolts
Lack of/or incorrect lubricant	Correct as necessary
Steering gear mounting bolts loose	Tighten all mounting bolts
Excessive Play	
Front wheel bearing improperly adjusted	See FRONT SUSPENSION article
Loose or worn steering linkage	See STEERING LINKAGE article
Loose or worn steering gear shift	See MANUAL STEERING GEAR article
Steering arm loose on gear shaft	See MANUAL STEERING GEAR article
Steering gear housing bolts loose	Tighten all mounting bolts
Steering gear adjustment too loose	See MANUAL STEERING GEAR article
Steering arms loose on knuckles	Tighten and check steering linkage
Rack and pinion mounting loose	Tighten all mounting bolts
Rack and pinion out of adjustment	See adjustment in STEERING article
Tie rod end loose	Tighten and check steering linkage
Excessive Pitman shaft-to-ball nut lash	Repair as necessary
Poor Returnability	
Lack of lubricant in ball joint or linkage	Lubricate and service systems
Binding in linkage or ball joints	See STEERING LINKAGE and SUSPENSION article
Improper front end alignment	See WHEEL ALIGNMENT article
Improper tire pressure	Inflate to proper pressure
Tie rod binding	Inflate to proper pressure
Shaft seal rubbing shaft	See STEERING COLUMN article
Excessive Vertical Motion	
Improper tire pressure	Inflate to proper pressure
Tires, wheels or rotors out of balance	Balance tires then check wheels and rotors
Worn or faulty shock absorbers	Check and replace if necessary

Loose tie rod ends or steering	Tighten or replace if necessary
Loose or worn wheel bearings	See SUSPENSION article
Steering Pulls to One Side	
Improper tire pressure	Inflate to proper pressure
Front tires are different sizes	Rotate or replace if necessary
Wheel bearings not adjusted properly	See FRONT SUSPENSION article
Bent or broken suspension components	See FRONT SUSPENSION article
Improper wheel alignment	See WHEEL ALIGNMENT article
Brakes dragging	See BRAKES article
Instability	
Low or uneven tire pressure	Inflate to proper pressure
Loose or worn wheel bearings	See FRONT SUSPENSION article
Loose or worn idler arm bushing	See FRONT SUSPENSION article
Loose or worn strut bushings	See FRONT SUSPENSION article
Incorrect front wheel alignment	See WHEEL ALIGNMENT article
Steering gear not centered	See MANUAL STEERING GEARS article
Springs or shock	Check and replace if necessary
Improper cross shaft	See MANUAL STEERING GEARS article

POWER STEERING TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC POWER STEERING TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Rattle or Chucking Noise	
Pressure hoses touching engine parts	Adjust to proper clearance

Loose Pitman shaft	Adjust or replace if necessary
Tie rods ends or Pitman arm loose	Tighten and check system
Rack and pinion mounts loose	Tighten all mounting bolts
Free play in worm gear	See POWER STEERING GEAR article
Loose sector shaft or thrust bearing adjustment	See POWER STEERING GEAR
Free play in pot coupling	See STEERING COLUMN article
Worn shaft serrations	See STEERING COLUMN article
Growl in Steering Pump	
Excessive pressure in hoses	Restricted hoses, see POWER STEERING GEAR article
Scored pressure plates	See POWER STEERING GEAR article
Scored thrust plates or rotor	See POWER STEERING GEAR article
Extreme wear of cam ring	See POWER STEERING GEAR article
Rattle in Steering Pump	
Vanes not installed	See POWER STEERING PUMP article
Vanes sticking in rotor	See POWER STEERING PUMP article
Swish noise in Pump	
Defective flow control valve	See POWER STEERING PUMP article
Groan in Steering Pump	
Air in fluid	See POWER STEERING PUMP article
Poor pressure hose connection	Tighten and check, replace if necessary
Squawk When Turning	
Damper "O" ring on valve spool cut	See POWER STEERING PUMP article
Moan or Whine in Pump	
Pump shaft bearing scored	Replace bearing and fluid
Air in fluid or fluid level low	See POWER STEERING PUMP article
Hose or column grounded	Check and replace if

	necessary
Cover "O" ring missing or damaged	See POWER STEERING PUMP article
Valve cover baffle missing or damaged	See POWER STEERING PUMP article
Interference of components in pump	See POWER STEERING PUMP article
Loose or poor bracket alignment	Correct or replace if necessary
Hissing When Parking	
Internal leakage in steering gear	Check valved assembly first
Chirp in Steering Pump	
Loose or worn power steering belt	Adjust or replace if necessary
Buzzing When Not Steering	
Noisy pump	See POWER STEERING PUMP article
Free play in steering shaft bearing	See STEERING COLUMN article
Bearing loose on shaft serrations	See STEERING COLUMN article
Clicking Noise in Pump	
Pump slippers too long	See POWER STEERING PUMP article
Broken slipper springs	See POWER STEERING PUMP article
Excessive wear or nicked rotors	See POWER STEERING PUMP article
Damaged cam contour	See POWER STEERING PUMP article
Poor Return of Wheel	
Wheel rubbing against turn signal	See STEERING COLUMN SWITCHES article
Flange rubbing steering gear adjuster	See STEERING COLUMN article
Tight or frozen steering shaft bearing	See STEERING COLUMN article
Steering gear out of adjustment	See POWER STEERING GEAR article
Sticking or plugged spool valve	See POWER STEERING PUMP article
Improper front end alignment	See WHEEL ALIGNMENT

	article
Wheel bearings worn or loose	See FRONT SUSPENSION article
Ties rods or ball joints binding	Check and replace if necessary
Intermediate shaft joints binding	See STEERING COLUMN article
Kinked pressure hoses	Correct or replace if necessary
Loose housing head spanner nut	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Sector shaft adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Worm thrust bearing adjusted too tight	See ADJUSTMENTS in POWER STEERING GEAR article
Reaction ring sticking in cylinder	See POWER STEERING GEAR article
Reaction ring sticking in housing head	See POWER STEERING GEAR article
Steering pump internal leakage	See POWER STEERING PUMP article
Steering gear-to-column misalignment	See STEERING COLUMN article
Lack of lubrication in linkage	Service front suspension
Lack of lubrication in ball joints	Service front suspension
Increased Effort When Turning Wheel Fast Foaming, Milky Power Steering Fluid, Low Fluid Level or Low Pressure	
High internal pump leakage	See POWER STEERING PUMP article
Power steering pump belt slipping	Adjust or replace if necessary
Low fluid level	Check and fill to proper level
Engine idle speed too low	Adjust to correct setting
Air in pump fluid system	See POWER STEERING PUMP article
Pump output low	See POWER STEERING PUMP article
Steering gear malfunctioning	See POWER STEERING GEAR article

Wheel Surges or Jerks

Low fluid level	Check and fill to proper level
Loose fan belt	Adjust or replace if necessary
Insufficient pump pressure	See POWER STEERING PUMP article
Sticky flow control valve	See POWER STEERING PUMP article
Linkage hitting oil pan at full turn	Replace bent components

Kick Back or Free Play

Air in pump fluid system	See POWER STEERING PUMP article
Worn poppet valve in steering gear	See POWER STEERING PUMP article
Excessive over center lash	See POWER STEERING GEAR article
Thrust bearing out of adjustment	See POWER STEERING GEAR article
Free play in pot coupling	See POWER STEERING PUMP article
Steering gear coupling loose on shaft	See POWER STEERING PUMP article
Steering disc mounting bolts loose	Tighten or replace if necessary
Coupling loose on worm shaft	Tighten or replace if necessary
Improper sector shaft adjustment	See POWER STEERING GEAR article
Excessive worm piston side play	See POWER STEERING GEAR article
Damaged valve lever	See POWER STEERING GEAR article
Universal joint loose	Tighten or replace if necessary
Defective rotary valve	See POWER STEERING GEAR article

No Power When Parking

Sticking flow control valve	See POWER STEERING PUMP article
Insufficient pump pressure output	See POWER STEERING PUMP article
Excessive internal pump leakage	See POWER STEERING PUMP article

Excessive internal gear leakage	See POWER STEERING PUMP article
Flange rubs against gear adjust plug	See STEERING COLUMN article
Loose pump belt	Adjust or replace if necessary
Low fluid level	Check and add proper amount of fluid
Engine idle too low	Adjust to correct setting
Steering gear-to-column misaligned	See STEERING COLUMN article
No Power, Left Turn	
Left turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Left turn reaction seal damaged/missing	See POWER STEERING GEAR article
Cylinder head "O" ring damaged	See POWER STEERING PUMP article
No Power, Right Turns	
Column pot coupling bottomed	See STEERING COLUMN article
Right turn reaction seal "O" ring worn	See POWER STEERING GEAR article
Right turn reaction seal damaged	See POWER STEERING GEAR article
Internal leakage through piston end plug	See POWER STEERING GEAR article
Internal leakage through side plugs	See POWER STEERING GEAR article
Lack of Effort in Turning	
Left and/or right reaction seal sticking in cylinder head	Replace, see POWER STEERING GEAR article
Wanders to One Side	
Front end alignment incorrect	See WHEEL ALIGNMENT article
Unbalanced steering gear valve	See POWER STEERING GEAR article
Low Pressure Due to Steering Pump	
Flow control valve stuck or inoperative	See POWER STEERING PUMP article
Pressure plate not flat against cam ring	See POWER STEERING PUMP article
Extreme wear of cam ring	Replace and check

	adjustments
Scored plate, thrust plate or rotor	See POWER STEERING PUMP article
Vanes not installed properly	See POWER STEERING PUMP article
Vanes sticking in rotor slots	See POWER STEERING PUMP article
Cracked/broken thrust or pressure plate	See POWER STEERING PUMP article

STEERING COLUMN TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC STEERING COLUMN TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Noise in Steering	
Coupling pulled apart	See STEERING COLUMNS article
Column not correctly aligned	See STEERING COLUMNS article
Broken lower joint	Replace joint
Horn contact ring not	See STEERING COLUMN article
Bearing not lubricated	See STEERING COLUMN article
Shaft snap ring not properly seated	Reseat or replace snap ring
Plastic spherical joint not lubricated	See STEERING COLUMN article
Shroud or housing loose	Tighten holding screws
Lock plate retaining ring not seated	See STEERING COLUMN article
Loose sight shield	Tighten holding screws
High Steering Shaft Effort	
Column assembly misaligned	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Tight steering universal joint	See STEERING COLUMN article

High Shift Effort	
Column is out of alignment	See STEERING COLUMN article
Improperly installed dust shield	Adjust or replace
Seals or bearings not lubricated	See STEERING COLUMNS article
Mounting bracket screws too long	Replace with new shorter screws
Burrs on shift tube	Remove burrs or replace tube
Lower bowl bearing assembled wrong	See STEERING COLUMN article
Shift tube bent or broken	Replace as necessary
Improper adjustment of shift levers	See STEERING COLUMN article
Improper Trans. Shifting	
Sheared shift tube joint	Replace as necessary
Sheared lower shaft lever	Replace as necessary
Improper shift lever adjustment	See STEERING COLUMN article
Improper gate plate adjustment	See STEERING COLUMN article
Excess Play in Column	
Instrument panel bracket bolts loose	Tighten bolts and check bracket
Broken weld nut on jacket	See STEERING COLUMN article
Instrument bracket capsule sheared	See STEERING COLUMN article
Column bracket/jacket bolts loose	Tighten bolts and check bracket
Steering Locks in Gear	
Release lever mechanism	See STEERING COLUMN article

SUSPENSION TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC SUSPENSION TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Front End Noise	
Loose or worn wheel	See Wheel Bearing Adjustment in SUSPENSION
Worn shocks or shock mountings	Replace struts or strut mountings
Worn struts or strut mountings	Replace struts or strut mountings
Loose or worn lower control arm	See SUSPENSION
Loose steering gear-to-frame bolts	See STEERING
Worn control arm bushings	See SUSPENSION
Ball joints not lubricated	Lubricate ball joints & see Ball Joint Checking in SUSPENSION
Front Wheel Shake, Shimmy, or Vibration	
Tires or wheels out of balance	Check tire balance
Incorrect wheel alignment	See WHEEL ALIGNMENT
Drive shaft unbalanced	Check drive shaft balance
Loose or worn wheel bearings	See WHEEL ALIGNMENT
Loose or worn tie rod ends	See SUSPENSION
Worn upper ball joints	See Ball Joint Checking in SUSPENSION
Worn shock absorbers	Replace shock absorbers
Worn strut bushings	Replace strut bushings
Car Pulls to One Side	
Mismatched or uneven tires	Check tire condition
Broken or sagging springs	See SUSPENSION
Loose or worn strut bushings	See SUSPENSION
Improper wheel alignment	See WHEEL ALIGNMENT
Improper rear axle alignment	Check rear axle alignment
Power steering gear unbalanced	See STEERING
Front brakes dragging	See BRAKES
Abnormal Tire Wear	
Unbalanced tires	Check tire balance & rotation
Sagging or broken springs	See SUSPENSION
Incorrect front end alignment	See WHEEL ALIGNMENT
Faulty shock absorbers	Replace shock absorbers
Scuffed Tires	
Toe-In incorrect	See WHEEL ALIGNMENT
Suspension arm bent or twisted	See appropriate

	SUSPENSION article
Springs Bottom or Sag	
Bent or broken springs	See SUSPENSION
Leaking or worn shock absorbers	Replace shock absorbers
Frame misalignment	Check frame for damage
Spring Noises	
Loose "U" Bolts	See SUSPENSION
Loose or worn bushings	See SUSPENSION
Worn or missing interliners	See SUSPENSION
Shock Absorber Noise	
Loose shock mountings	Check & tighten mountings
Worn bushings	Replace bushings
Air in system	Bleed air from system
Undercoating on shocks	Remove undercoating
Car Leans or Sways on Corners	
Loose stabilizer bar	See SUSPENSION
Faulty shocks or mountings	Replace shocks or mountings
Broken or sagging springs	See SUSPENSION
Shock Absorbers Leaking	
Worn seals or reservoir tube crimped	See SUSPENSION
Broken Springs	
Loose "U" bolts	See SUSPENSION
Inoperative shock absorbers	Replace shock absorbers

WHEEL ALIGNMENT TROUBLE SHOOTING

NOTE: This is **GENERAL** information. This article is not intended to be specific to any unique situation or individual vehicle configuration. The purpose of this Trouble Shooting information is to provide a list of common causes to problem symptoms. For model-specific Trouble Shooting, refer to **SUBJECT**, **DIAGNOSTIC**, or **TESTING** articles available in the section(s) you are accessing.

BASIC WHEEL ALIGNMENT TROUBLE SHOOTING CHART

CONDITION & POSSIBLE CAUSE	CORRECTION
Premature Tire Wear	
Improper tire inflation	Check tire pressure
Front alignment out of tolerance	See ALIGNMENT SPECS in WHEEL ALIGNMENT section
Suspension components worn	See SUSPENSION section
Steering system components worn	See STEERING section

Improper standing height	See WHEEL ALIGNMENT
Uneven or sagging springs	See SUSPENSION section
Bent wheel	See WHEEL ALIGNMENT
Improper torsion bar adjustment	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARING ADJ. in SUSPENSION section
Worn or defective shock	Replace shock absorbers
Tires out of balance	Check tire balance
Pulls to One Side	
Improper tire inflation	Check tire pressure
Brake dragging	See BRAKE section
Mismatched tires	See WHEEL ALIGNMENT
Broken or sagging spring	See SUSPENSION section
Broken torsion bar	See SUSPENSION section
Power steering valve not centered	See STEERING section
Front alignment out of tolerance	See WHEEL ALIGNMENT section
Defective wheel bearing	See WHEEL BEARINGS in SUSPENSION section
Uneven sway bar links	See SUSPENSION section
Frame bent	Check for frame damage
Steering system bushing worn	See STEERING section
Hard Steering	
Idle arm bushing too tight	See STEERING LINKAGE in STEERING section
Ball joint tight or seized	See SUSPENSION section
Steering linkage too tight	See STEERING LINKAGE in STEERING section
Power steering fluid low	Add proper amount of fluid
Power steering drive belt loose	See STEERING section
Power steering pump defective	See STEERING section
Steering gear out of adjustment	See STEERING section
Incorrect wheel alignment	See WHEEL ALIGNMENT
Damaged steering gear	See STEERING section
Damaged suspension	See SUSPENSION section
Bent steering knuckle or supports	See SUSPENSION section
Vehicle "Wanders"	
Strut rod or control arm bushing worn	See SUSPENSION section
Loose or worn wheel bearings	See WHEEL BEARINGS in SUSPENSION section
Improper tire inflation	Check tire pressure

Stabilizer bar missing or defective	See SUSPENSION section
Wheel alignment out of tolerance	See Adjustment in WHEEL ALIGNMENT section
Broken spring	See SUSPENSION section
Defective shock absorber	Replace shock absorbers
Worn steering & suspension components	See SUSPENSION section
Front End Shimmy	
Tire out of balance/round	Check tire balance
Excessive wheel runout	See WHEEL ALIGNMENT
Insufficient or improper caster	See WHEEL ALIGNMENT section
Worn suspension or steering components	See SUSPENSION section
Defective shock absorbers	Replace shock absorber
Wheel bearings worn or loose	See WHEEL BEARING ADJ. in SUSPENSION section
Power steering reaction Bracket loose	See STEERING section
Steering gear box (rack) mounting loose	See STEERING section
Steering gear adjustment loose	See STEERING section
Worn spherical joints	See SUSPENSION section
Toe-In Not Adjustable	
Lower control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Camber Not Adjustable	
Control arm bent	See SUSPENSION section
Frame bent	Check frame for damage
Hub & bearing not seated properly	See SUSPENSION section

ELECTRICAL

Battery System - Challenger

DESCRIPTION

DESCRIPTION

This vehicle is equipped with a single 12-volt battery located in the rear floor area near the spare tire. The battery system for this vehicle covers the following related components:

Fig. 1: Locating Battery
Courtesy of CHRYSLER LLC

- **Battery** - The storage battery provides a reliable means of storing a renewable source of electrical energy within the vehicle.
- **Battery Cables** - The battery cables connect the positive and negatively charged battery terminal posts to the vehicle electrical system.
- **Battery Holddown** - The battery holddown hardware secures the battery in the battery tray.
- **Battery Retention Strap** - The battery retention strap securely holds the battery in place in the event of a rear impact collision.
- **Battery Tray** - The battery tray provides a secure mounting location in the vehicle for the battery and an anchor point for the battery holddown hardware.

For battery system maintenance schedules. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description** . Refer to **Vehicle Quick Reference/Jump Starting - Standard Procedure** for the proper jump starting procedure. The battery must be fully-charged before any battery system diagnosis or testing procedures can be performed.

OPERATION

OPERATION

The battery system is designed to provide a safe, efficient, reliable and mobile means of delivering and storing electrical energy. This electrical energy is required to operate the engine starting system, as well as many of the other vehicle accessory systems for limited durations while the engine or charging system are not operating. The battery system is also designed to provide a reserve of electrical energy to supplement the charging system for short durations while the engine is running and the electrical current demands of the vehicle exceed the output of the charging system. In addition to delivering, and storing electrical energy for the vehicle, the battery system serves as a capacitor and voltage stabilizer for the vehicle electrical system. It absorbs most abnormal or transient voltages caused by the switching of any of the electrical components or circuits in the vehicle.

DIAGNOSIS AND TESTING

BATTERY SYSTEM

The battery, starting, and charging systems in the vehicle operate with one another and must be tested as a complete system. In order for the engine to start and the battery to maintain its charge properly, all of the components that are used in these systems must perform within specifications. It is important that the battery, starting, and charging systems be thoroughly tested and inspected any time a battery needs to be charged or replaced. The cause of abnormal battery discharge, overcharging or early battery failure must be diagnosed and corrected before a battery is replaced and before a vehicle is returned to service. The service information for these systems has been separated within this service manual to make it easier to locate the specific information you are seeking. However, when attempting to diagnose any of these systems, it is important that you keep their interdependency in mind.

The diagnostic procedures used for the battery, starting, and charging systems include the most basic conventional diagnostic methods, to the more sophisticated On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM). Use of an induction-type milliammeter, a volt/ohmmeter, a battery charger, a carbon pile rheostat (load tester) and a 12-volt test lamp may be required. All OBD-sensed systems are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for any inoperative system it detects. Refer to **Engine - Diagnosis and Testing** for the proper charging system on-board diagnostic test procedures.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery system tester is designed to help the dealership technicians diagnose the cause of a defective battery. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure** for directions on using the Micro 420 battery tester.

BATTERY SYSTEM DIAGNOSIS		
CONDITION	POSSIBLE CAUSES	CORRECTION

THE BATTERY SEEMS WEAK OR DEAD WHEN ATTEMPTING TO START THE ENGINE.

1. The electrical system ignition-off draw is excessive.
2. The charging system is faulty.
3. The battery is discharged.
4. The battery terminal connections are loose or corroded.
5. The battery has an incorrect size or rating for this vehicle.
6. The battery is faulty.
7. The starting system is faulty.
8. The battery is physically damaged.

1. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure** for the proper test procedures. Repair the excessive ignition-off draw, as required.
2. Determine if the charging system is performing to specifications. Repair the faulty charging system, as required.
3. Determine the battery state-of-charge using the Micro 420 battery tester. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure**. Charge the faulty battery as required.
4. See **Electrical - Engine Systems/Battery System/CABLES, Battery - Diagnosis and Testing**. Clean and tighten the battery terminal connections, as required.
5. See **Electrical - Engine Systems/Battery System - Specifications** for the proper size and rating. Replace an incorrect battery, as required.
6. Determine the battery cranking capacity using the Micro 420 battery tester. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure**. Replace the faulty battery, as required.
7. Determine if the starting system is performing to specifications. Repair the faulty starting system, as required.
8. Inspect the battery for loose terminal posts or a cracked and leaking case. Replace the damaged battery, as required.

THE BATTERY STATE OF CHARGE CANNOT BE MAINTAINED.

1. The battery has an incorrect size or rating for this vehicle.
2. The battery terminal connections are loose or corroded.

1. See **Electrical - Engine Systems/Battery System - Specifications** for the proper size and rating. Replace an incorrect battery, as required.
2. See **Electrical - Engine Systems/Battery System/CABLES, Battery - Diagnosis and Testing**. Clean and tighten the battery terminal connections, as required.

	<p>3. The electrical system ignition-off draw is excessive.</p> <p>4. The battery is faulty.</p> <p>5. The starting system is faulty.</p> <p>6. The charging system is faulty.</p> <p>7. Electrical loads exceed the output of the charging system.</p> <p>8. Slow driving or prolonged idling with high-amperage draw systems in use.</p>	<p>3. See <u>Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure</u> for the proper test procedures. Repair the faulty electrical system, as required.</p> <p>4. Test the battery using the Micro 420 battery tester. See <u>Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure</u>. Replace the faulty battery, as required.</p> <p>5. Determine if the starting system is performing to specifications. Repair the faulty starting system, as required.</p> <p>6. Determine if the charging system is performing to specifications. Repair the faulty charging system, as required.</p> <p>7. Inspect the vehicle for aftermarket electrical equipment which might cause excessive electrical loads.</p> <p>8. Advise the vehicle operator, as required.</p>
THE BATTERY WILL NOT ACCEPT A CHARGE.	1. The battery is faulty.	1. Test the battery using the Micro 420 battery tester. See <u>Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure</u> . Replace the faulty battery, as required.

STANDARD PROCEDURE

BATTERY RECONNECTION

NOTE: This reconnection procedure is to be performed anytime the battery has been disconnected.

8133b050

Fig. 2: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER LLC

1. Connect the battery negative cable (2) to the battery post and tighten the clamp nut.
2. Install the rear compartment floor trim panel.

CAUTION: Once the battery has been connected, review and perform the following information as applicable.

AUTO UP FRONT WINDOW

If the vehicle is equipped with the auto-up front window feature, once the battery is reconnected the door module needs to be calibrated. The door module requires calibration anytime the battery or door module has been disconnected for any length of time. To calibrate, perform the following:

1. Turn the Ignition to the Run position.
2. Regardless of current window position, move the driver side front window upward until the window stalls in the full up position. Allow the window motor to stall for at least 2 seconds before releasing the switch.
3. Move the driver side front window downward until the window stalls in the full down position. Allow the window motor to stall for at least 2 seconds before releasing the switch.
4. Move the driver side front window upward until the window stalls in the full up position. Allow the window motor to stall for at least 2 second before releasing the switch.
5. Repeat steps 2 - 4 for the passenger side front window.
6. Verify the windows are properly calibrated by operating the express down and up features on the windows. Repeat this procedure if the calibration failed. If unable to properly calibrate after the second attempt, check the Driver's Door Module (DDM) and Passenger's Door Module (PDM) for Diagnostic Trouble Codes (DTCs) and correct as required.

ELECTRONIC STABILITY PROGRAM (ESP)

If the vehicle is equipped with ESP, once the battery is reconnected, the Steering Angle Sensor (SAS) within the Antilock Brake Module (ABM) needs to be calibrated. The SAS requires calibration (initialization) using the scan tool anytime the battery or an ABS (ESP) component has been disconnected for any length of time. **If the SAS is not calibrated following battery reconnection, the ESP/BAS indicator lamp will flash continuously with no DTCs.**

To calibrate (initialize), perform the following:

1. Position the front wheels straight ahead and center the steering wheel.
2. Connect the scan tool to the vehicle.
3. Follow the directions on the scan tool.

CLEANING

CLEANING

The following information details the recommended cleaning procedures for the battery and related components. In addition to the maintenance schedules found in this service information. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description** it is recommended that these procedures be performed any time the battery or related components must be removed for vehicle service.

Fig. 3: Cleaning Battery Cable Terminal Clamps
Courtesy of CHRYSLER LLC

1. Clean the battery cable terminal clamps (2) of all corrosion. Remove any corrosion using a wire brush or cleaning tool (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.
2. Clean the battery tray and battery holddown hardware using a stiff bristle parts cleaning brush and a sodium bicarbonate (baking soda) and warm water cleaning solution.

Fig. 4: Cleaning Outside Of Battery Case
Courtesy of CHRYSLER LLC

3. If the removed battery is to be reinstalled, clean the outside of the battery case and the top cover (3) with a sodium bicarbonate (baking soda) and warm water cleaning solution (2) using a stiff bristle parts cleaning brush (1) to remove any acid film. Rinse the battery with clean water. Ensure that the cleaning solution does not enter the battery cells through the vent holes. If the battery is being replaced. See **Electrical - Engine Systems/Battery System - Specifications** for the factory-installed battery specifications. Confirm that the replacement battery is the correct size and has the correct ratings for the vehicle.

80accf12

Fig. 5: Cleaning Battery Terminal Post Using Terminal Cleaner

4. Clean any corrosion from the battery terminals with a wire brush or terminal cleaner (1), and a sodium bicarbonate (baking soda) and warm water cleaning solution.

INSPECTION

INSPECTION

The following information details the recommended inspection procedures for the battery and related components. In addition to the maintenance schedules. Refer to **Vehicle Quick Reference/Maintenance Schedules - Description** , it is recommended that these procedures be performed any time the battery or related components are removed for vehicle service.

1. Inspect the battery cable terminals for damage. Replace any battery cable that has a damaged or deformed terminal.
2. Inspect the battery tray and battery holddown hardware for damage. Replace any damaged parts.
3. Inspect the battery case for cracks or other damage that could result in electrolyte leaks. Also, check the battery terminals for looseness. Batteries with damaged cases or loose terminals must be replaced.
4. Inspect the battery built-in test indicator sight glass (if equipped) for an indication of the battery condition. If the battery is discharged, charge as required. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure**.

SPECIFICATIONS

BATTERY

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating, or Ampere-Hours (AH) rating, can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. Battery sizes and ratings are discussed in more detail below.

- **Group Size** - The outside dimensions and terminal placement of the battery conform to standards established by the Battery Council International (BCI). Each battery is assigned a BCI Group Size number to help identify a correct -sized replacement.
- **Cold Cranking Amperage** - The Cold Cranking Amperage (CCA) rating specifies how much current (in amperes) the battery can deliver for 30 seconds at -18°C (0°F). Terminal voltage must not fall below 7.2 volts during or after the 30 second discharge period. The CCA required is generally higher as engine displacement increases, depending upon the starter current draw requirements.
- **Reserve Capacity** - The Reserve Capacity (RC) rating specifies the time (in minutes) it takes for battery terminal voltage to fall below 10.5 volts, at a discharge rate of 25 amperes. RC is determined with the battery fully-charged at 26.7°C (80° F). This rating estimates how long the battery might last after a charging system failure, under minimum electrical load.
- **Ampere-Hours** - The Ampere-Hours (AH) rating specifies the current (in amperes) that a battery can deliver steadily for 20 hours, with the voltage in the battery not falling below 10.5 volts. This rating is sometimes identified as the 20-hour discharge rating.

BATTERY CLASSIFICATIONS AND RATINGS				
BCI Group Size Classification	Cold Cranking Amperage	Reserve Capacity	Ampere - Hours	Load Test Amperage
H7	625	140 Minutes	80	250

BATTERY

DESCRIPTION

DESCRIPTION

Fig. 7: Battery Components
Courtesy of CHRYSLER LLC

This vehicle is equipped with a single, 12-volt, maintenance-free battery located in the rear floor area near the spare tire. The battery is comprised of the following components:

- Positive Post (1)
- Vent (2)
- Cell Cap (3)
- Vent (4)
- Cell Cap (5)
- Vent (6)
- Negative Post (7)
- Indicator Eye (8) if equipped
- Electrolyte Level (9)
- Plate Groups (10)
- Maintenance Free Battery assembly (11)

This battery is designed to provide a safe, efficient and reliable means of storing electrical energy in a chemical form. This means of energy storage allows the battery to produce the electrical energy required to operate the engine starting system, as well as to operate many of the other vehicle accessory systems for limited durations while the engine or charging system are not operating. The battery is made up of six individual cells that are connected in series. Each cell contains positively charged plate groups that are connected with lead straps to the positive terminal post, and negatively charged plate groups that are connected with lead straps to the negative terminal post. Each plate consists of a stiff mesh framework or grid coated with lead dioxide (positive plate) or sponge lead (negative plate). Insulators or plate separators made of a non-conductive material are inserted between the positive and negative plates to prevent them from contacting or shorting against one another. These dissimilar metal plates are submerged in a sulfuric acid and water solution called an electrolyte.

The battery Group Size number, the Cold Cranking Amperage (CCA) rating, and the Reserve Capacity (RC) rating or Ampere-Hours (AH) rating can be found on the original equipment battery label. Be certain that a replacement battery has the correct Group Size number, as well as CCA, and RC or AH ratings that equal or exceed the original equipment specification for the vehicle being serviced. See **Electrical - Engine Systems/Battery System - Specifications** for the proper factory-installed battery specifications.

OPERATION

OPERATION

The battery is designed to store electrical energy in a chemical form. When an electrical load is applied to the terminals of the battery, an electrochemical reaction occurs. This reaction causes the battery to discharge electrical current from its terminals. As the battery discharges, a gradual chemical change takes place within each cell. The sulfuric acid in the electrolyte combines with the plate materials, causing both plates to slowly change to lead sulfate. At the same time, oxygen from the positive plate material combines with hydrogen from the sulfuric acid, causing the electrolyte to become mainly water. The chemical changes within the battery are caused by the movement of excess or free electrons between the positive and negative plate groups. This movement of electrons produces a flow of electrical current through the load device attached to the battery terminals.

As the plate materials become more similar chemically, and the electrolyte becomes less acid, the voltage potential of each cell is reduced. However, by charging the battery with a voltage higher than that of the battery itself, the battery discharging process is reversed. Charging the battery gradually changes the sulfated lead plates back into sponge lead and lead dioxide, and the water back into sulfuric acid. This action restores the difference in the electron charges deposited on the plates, and the voltage potential of the battery cells. For a battery to remain useful, it must be able to produce high-amperage current over an extended period. A battery must also be able to accept a charge, so that its voltage potential may be restored.

The battery is vented to release excess hydrogen gas that is created when the battery is being charged or discharged. However, even with these vents, hydrogen gas can collect in or around the battery. If hydrogen gas is exposed to flame or sparks, it may ignite. If the electrolyte level is low, the battery may arc internally and explode. If the battery cell caps cannot be removed, the battery must be replaced if the electrolyte level becomes low.

DIAGNOSIS AND TESTING

BATTERY

The battery must be completely charged and the terminals should be properly cleaned and inspected before diagnostic procedures are performed. See **Electrical - Engine Systems/Battery System - Cleaning** and see **Electrical - Engine Systems/Battery System - Inspection** for the proper battery cleaning and inspection procedures. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure** for the proper battery charging procedures.

MICRO 420 BATTERY TESTER

The Micro 420 automotive battery tester is designed to help the dealership technicians diagnose the cause of an inoperative battery. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure** for instructions on the use of the Micro 420 battery tester.

WARNING: If the battery shows signs of freezing, leaking or loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and possible vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

A battery that will not accept a charge is inoperative, and must be replaced. Further testing is not required. A fully-charged battery must be load tested to determine its cranking capacity. A battery that is fully-charged, but does not pass the load test, is inoperative and must be replaced.

NOTE: Completely discharged batteries may take several hours to accept a charge. Refer to Standard Procedure for the proper battery charging procedures.

STANDARD PROCEDURE

BATTERY CHARGING

Battery charging is the means by which the battery can be restored to its full voltage potential. A battery is fully-charged when:

- Micro 420 electrical system tester indicates battery is OK.
- All of the battery cells are gassing freely during battery charging.
- Open-circuit voltage of the battery is 12.65 volts or above.

WARNING: Never exceed twenty amperes when charging a cold (-1°C [30°F] or lower) battery. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: If the battery shows signs of freezing, leaking, loose posts, do not test, assist-boost, or charge. The battery may arc internally and explode. Personal injury and/or vehicle damage may result.

WARNING: Explosive hydrogen gas forms in and around the battery. Do not smoke, use flame, or create sparks near the battery. Personal injury and/or vehicle damage may result.

WARNING: The battery contains sulfuric acid, which is poisonous and caustic. Avoid contact with the skin, eyes, or clothing. In the event of contact, flush with water and call a physician immediately. Keep out of the reach of children.

WARNING: If the battery is equipped with removable cell caps, be certain that each of the cell caps is in place and tight before the battery is returned to service. Personal injury and possible vehicle damage may result from loose or missing cell caps.

CAUTION: Always disconnect and isolate the battery negative cable before charging a battery. Do not exceed sixteen volts while charging a battery. Damage to the vehicle electrical system components may result.

CAUTION: Battery electrolyte will bubble inside the battery case during normal battery charging. Electrolyte boiling or being discharged from the battery vents indicates a battery overcharging condition. Immediately reduce the charging rate or turn off the charger to evaluate the battery condition. Damage to the battery may result from overcharging.

CAUTION: The battery should not be hot to the touch. If the battery feels hot to the touch, turn off the charger and let the battery cool before continuing the charging operation. Damage to the battery may result.

After the battery has been charged to 12.65 volts or greater, perform a load test to determine the battery cranking capacity. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure** for the proper battery load test procedures. If the battery will endure a load test, return the battery to service. If the battery will not endure a load test, it is inoperative and must be replaced.

Clean and inspect the battery holddown, tray, terminals, posts, and top before completing battery service. See **Electrical - Engine Systems/Battery System - Cleaning** and see **Electrical - Engine Systems/Battery System - Inspection** for the proper battery system cleaning and inspection procedures.

CHARGING A COMPLETELY DISCHARGED BATTERY

The following procedure should be used to recharge a completely discharged battery. Unless this procedure is properly followed, a good battery may be needlessly replaced.

1. Measure the voltage at the battery posts with a voltmeter, accurate to 1/10 (0.10) volt. If the reading is below ten volts, the battery charging current will be low. It could take some time before the battery accepts a current greater than a few milliamperes. Such low current may not be detectable on the ammeters built into many battery chargers.
2. Disconnect and isolate the battery negative cable. Connect the battery charger leads. Some battery chargers are equipped with polarity-sensing circuitry. This circuitry protects the battery charger and the battery from being damaged if they are improperly connected. If the battery state-of-charge is too low for the polarity-sensing circuitry to detect, the battery charger will not operate. This makes it appear that the battery will not accept charging current. See the instructions provided by the manufacturer of the battery charger for details on how to bypass the polarity-sensing circuitry.
3. Battery chargers vary in the amount of voltage and current they provide. The amount of time required for a battery to accept measurable charging current at various voltages is shown in the CHARGE RATE chart. If the charging current is still not measurable at the end of the charging time, the battery is inoperative and must be replaced. If the charging current is measurable during the charging time, the battery may be good and the charging should be completed in the normal manner.

CHARGE RATE	
Voltage	Hours
16.0 volts maximum	up to 4 hours
14.0 to 15.9 volts	up to 8 hours
13.9 volts or less	up to 16 hours

CHARGING TIME REQUIRED

The time required to charge a battery will vary, depending upon the following factors:

- **Battery Capacity** - A completely discharged heavy-duty battery requires twice the charging time of a small capacity battery.
- **Temperature** - A longer time will be needed to charge a battery at -18°C (0°F) than at 27°C (80° F). When a fast battery charger is connected to a cold battery, the current accepted by the battery will be very low at first. As the battery warms, it will accept a higher charging current rate (amperage).
- **Charger Capacity** - A battery charger that supplies only five amperes will require a longer charging time. A battery charger that supplies twenty amperes or more will require a shorter charging time.
- **State-Of-Charge** - A completely discharged battery requires more charging time than a partially discharged battery. Electrolyte is nearly pure water in a completely discharged battery. At first, the charging current (amperage) will be low. As the battery charges, the specific gravity of the electrolyte will gradually rise.

The BATTERY CHARGING TIME chart gives an indication of the time required to charge a typical battery at room temperature based upon the battery state-of-charge and the charger capacity.

BATTERY CHARGING TIME			
Charging Amperage	5 Amps	10 Amps	20 Amps
Open Circuit Voltage	Hours Charging @ 21° C (70° F)		
12.25 to 12.49	6 hours	3 hours	1.5 hours
12.00 to 12.24	10 hours	5 hours	2.5 hours
10.00 to 11.99	14 hours	7 hours	3.5 hours
Below 10.00	18 hours	9 hours	4.5 hours

USING MICRO 420 BATTERY TESTER

Fig. 8: Micro 420 Battery Tester
Courtesy of CHRYSLER LLC

Always use the Micro 420 Instruction Service Information that was supplied with the tester as a reference. If the Instruction Service Information is not available the following procedure can be used:

WARNING: Always wear appropriate eye protection and use extreme caution when working with batteries.

BATTERY TESTING

1. If testing the battery OUT-OF-VEHICLE, clean the battery terminals with a wire brush before testing. See **Electrical - Engine Systems/Battery System - Cleaning**.
2. If testing the battery IN-THE-VEHICLE, make certain all of the vehicle accessory loads are OFF, including the ignition. **The preferred test position is at the battery terminals**. If the battery is not accessible, you may test using both the positive and negative jumper posts. Select TESTING AT JUMPER POST when connecting to that location.
3. Connect the tester to the battery or jumper posts, the red clamp to positive (+) and the black clamp to negative (-).

NOTE: Multiple batteries connected in parallel must have the ground cable disconnected to perform a battery test. Failure to disconnect may result in false battery test readings.

4. Using the ARROW key select **in** or **out** of vehicle testing and press ENTER to make a selection.
5. If not selected, choose the Cold Cranking Amp (CCA) battery rating. Or select the appropriate

battery rating for your area (see menu). The tester will then run its self programmed test of the battery and display the results. Refer to the BATTERY TEST RESULTS chart noted below.

CAUTION: If REPLACE BATTERY is the result of the test, this may mean a poor connection between the vehicle's cables and battery exists. After disconnecting the vehicle's battery cables from the battery, retest the battery using the OUT-OF-VEHICLE test before replacing.

6. While viewing the battery test result, press the CODE button and the tester will prompt you for the last 4 digits of the VIN. Use the UP/DOWN arrow buttons to scroll to the correct character; then press ENTER to select and move to the next digit. Then press the ENTER button to view the SERVICE CODE. Pressing the CODE button a second time will return you to the test results.

BATTERY TEST RESULTS	
GOOD BATTERY	Return to service
GOOD - RECHARGE	Fully charge battery and return to service
CHARGE AND RETEST	Fully charge battery and retest battery
REPLACE BATTERY	Replace the battery and retest complete system
BAD-CELL REPLACE	Replace the battery and retest complete system

OPEN-CIRCUIT VOLTAGE TEST

A battery open-circuit voltage (no load) test will show the approximate state-of-charge of a battery. This test can be used in place of the hydrometer test when a hydrometer is not available, or for maintenance-free batteries with non-removable cell caps.

Before proceeding with this test, completely charge the battery. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure**.

1. Before measuring the open-circuit voltage, the surface charge must be removed from the battery. Turn on the headlamps for fifteen seconds, then allow up to five minutes for the battery voltage to stabilize.
2. Disconnect and isolate both battery cables, negative cable first.

898A-7

Fig. 9: Voltmeter
Courtesy of CHRYSLER LLC

3. Using a voltmeter connected to the battery posts, measure the open-circuit voltage.

See the OPEN-CIRCUIT VOLTAGE chart. This voltage reading will indicate the battery state-of-charge, but will not reveal its cranking capacity. If a battery has an open-circuit voltage reading of 12.4 volts or greater, it may be load tested to reveal its cranking capacity. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure**.

OPEN CIRCUIT VOLTAGE	
Open Circuit Voltage	Charge Percentage
11.7 volts or less	0%
12.0 volts	25%
12.3 volts	50%
12.6 volts	75%
12.8 volts or more	100%

IGNITION-OFF DRAW TEST

The term Ignition-Off Draw (IOD) identifies a normal condition where power is being drained from the battery with the ignition switch in the Off position. A normal vehicle electrical system will draw from five to thirty-five milliamperes (0.005 to 0.035 ampere) with the ignition switch in the Off position, and all non-ignition controlled circuits in proper working order. Up to thirty-five milliamperes are needed to enable the memory functions for the Powertrain Control Module (PCM), digital clock, electronically tuned radio, and other modules which may vary with the vehicle equipment.

A vehicle that has not been operated for approximately twenty days, may discharge the battery to an inadequate level. When a vehicle will not be used for twenty days or more (stored), remove the IOD fuse from the Junction Block (JB). This will reduce battery discharging.

Excessive IOD can be caused by:

- Electrical items left on.

- Inoperative or improperly adjusted switches.
- Inoperative or shorted electronic modules and components.
- An internally shorted generator.
- Intermittent shorts in the wiring.

If the IOD is over thirty-five milliamperes, the problem must be found and corrected before replacing a battery. In most cases, the battery can be charged and returned to service after the excessive IOD condition has been corrected.

1. Verify that all electrical accessories are off. Turn off all lamps, remove the ignition key, and close all doors. If the vehicle is equipped with an illuminated entry system or an electronically tuned radio, allow the electronic timer function of these systems to automatically shut off (time out). This may take up to three minutes. See the ELECTRONIC MODULE IGNITION-OFF DRAW chart for more information.

ELECTRONIC MODULE IGNITION-OFF DRAW (IOD)			
Module	Time Out? (If Yes, Interval And Wake-Up Input)	IOD	IOD After Time Out
Radio	No	1 to 3 milliamperes	N/A
Audio Power Amplifier	No	up to 1 milliampere	N/A
Central Timer Module (CTM)	No	4.75 milliamperes (max.)	N/A
Powertrain Control Module (PCM)	No	0.95 milliampere	N/A
ElectroMechanical Instrument Cluster (EMIC)	No	0.44 milliampere	N/A
Combination Flasher	No	0.08 milliampere	N/A

2. Determine that the underhood lamp is operating properly, then disconnect the lamp wire harness connector or remove the lamp bulb.
3. Disconnect the battery negative cable.
4. Set an electronic digital multi-meter to its highest amperage scale. Connect the multi-meter between the disconnected battery negative cable terminal clamp and the battery negative terminal post. Make sure that the doors remain closed so that the illuminated entry system is not activated. The multi-meter amperage reading may remain high for up to three minutes, or may not give any reading at all while set in the highest amperage scale, depending upon the

electrical equipment in the vehicle. The multi-meter leads must be securely clamped to the battery negative cable terminal clamp and the battery negative terminal post. If continuity between the battery negative terminal post and the negative cable terminal clamp is lost during any part of the IOD test, the electronic timer function will be activated and all of the tests will have to be repeated.

5. After about three minutes, the high-amperage IOD reading on the multi-meter should become very low or nonexistent, depending upon the electrical equipment in the vehicle. If the amperage reading remains high, remove and replace each fuse or circuit breaker in the Power Distribution Center (PDC) and then in the Junction Block (JB), one at a time until the amperage reading becomes very low, or nonexistent. Refer to **SYSTEM WIRING DIAGRAMS** for complete PDC and JB fuse, circuit breaker, and circuit identification. This will isolate each circuit and identify the circuit that is the source of the high-amperage IOD. If the amperage reading remains high after removing and replacing each fuse and circuit breaker, disconnect the wire harness from the generator. If the amperage reading now becomes very low or nonexistent, diagnose and repair the Charging System as necessary. After the high-amperage IOD has been corrected, switch the multi-meter to progressively lower amperage scales and, if necessary, repeat the fuse and circuit breaker remove-and-replace process to identify and correct all sources of excessive IOD. It is now safe to select the lowest milliamperage scale of the multi-meter to check the low-amperage IOD.

CAUTION: Do not open any doors, or turn on any electrical accessories with the lowest milliamperage scale selected, or the multi-meter may be damaged.

6. Observe the multi-meter reading. The low-amperage IOD should not exceed thirty-five milliamperes (0.035 ampere). If the current draw exceeds thirty-five milliamperes, isolate each circuit using the fuse and circuit breaker remove-and-replace process in 5. The multi-meter reading will drop to within the acceptable limit when the source of the excessive current draw is disconnected. Repair this circuit as required; whether a wiring short, incorrect switch adjustment, or an inoperative component is the cause.

REMOVAL

REMOVAL

WARNING: A SUITABLE PAIR OF HEAVY DUTY RUBBER GLOVES AND SAFETY GLASSES SHOULD BE WORN WHEN REMOVING OR SERVICING A BATTERY.

WARNING: REMOVE METALLIC JEWELRY TO AVOID INJURY BY ACCIDENTAL ARCING OF BATTERY CURRENT.

1. Make sure ignition switch is in OFF position and all accessories are turned OFF.
2. Remove the rear compartment floor, trim panel to gain access to the battery.

8133bb50

Fig. 10: Disconnecting/Connecting Battery Cables
 Courtesy of CHRYSLER LLC

3. Disconnect the battery negative cable (2) from the battery terminal.
4. Disconnect the battery positive cable (1) from the battery terminal.
5. Unlatch the battery retention strap (4).

8133bb6e

7. Install the rear compartment floor trim panel.

CABLES, BATTERY

DESCRIPTION

DESCRIPTION

81330050

Fig. 17: Disconnecting/Connecting Battery Cables
Courtesy of CHRYSLER LLC

The battery cables (1) and (2) are large gauge, stranded copper wires sheathed within a heavy plastic or synthetic rubber insulating jacket. The wire used in the battery cables combines excellent flexibility and reliability with high electrical current carrying capacity. The battery cables feature a stamped brass clamping type female battery terminal crimped onto one end of the battery cable wire and then solder-dipped. A square headed pinch-bolt and hex nut are installed at the open end of the female battery terminal clamp. Large eyelet type terminals are crimped onto the opposite end of the battery cable wire and then solder-dipped. The battery positive cable wires (1) have a red insulating jacket to provide visual identification and feature a larger female battery terminal clamp to allow connection to the larger battery positive terminal post. The battery negative cable wires (2) have a black insulating jacket and a smaller female battery terminal clamp.

The battery cables cannot be repaired and, if damaged or faulty they must be replaced. Both the battery positive and negative cables are available for service replacement only as a unit with the battery wire harness, which may include portions of the wiring circuits for the generator and other components on some models. Refer to **SYSTEM WIRING DIAGRAMS** for the location of the proper battery cable wire harness diagrams. The wiring information also includes proper wire and connector repair procedures, further details on wire harness routing and retention, as well as pin-out and location views for the various wire harness connectors, splices and grounds.

OPERATION

OPERATION

The battery cables connect the battery terminal posts to the vehicle electrical system. These cables also provide a path back to the battery for electrical current generated by the charging system for restoring the voltage potential of the battery. The female battery terminal clamps on the ends of the battery cable wires provide a strong and reliable connection of the battery cable to the battery terminal posts. The terminal pinch bolts allow the female terminal clamps to be tightened around the

male terminal posts on the top of the battery. The eyelet terminals secured to the opposite ends of the battery cable wires from the female battery terminal clamps provide secure and reliable connection of the battery cables to the vehicle electrical system.

DIAGNOSIS AND TESTING

BATTERY CABLES

A voltage drop test will determine if there is excessive resistance in the battery cable terminal connections or the battery cable. If excessive resistance is found in the battery cable connections, the connection point should be disassembled, cleaned of all corrosion or foreign material, then reassembled. Following reassembly, check the voltage drop for the battery cable connection and the battery cable again to confirm repair.

When performing the voltage drop test, it is important to remember that the voltage drop is giving an indication of the resistance between the two points at which the voltmeter probes are attached.

EXAMPLE: When testing the resistance of the battery positive cable, touch the voltmeter leads to the battery positive cable terminal clamp and to the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud. If you probe the battery positive terminal post and the battery positive cable eyelet terminal at the starter solenoid B(+) terminal stud, you are reading the combined voltage drop in the battery positive cable terminal clamp-to-terminal post connection and the battery positive cable.

VOLTAGE DROP TEST

The following operation will require a voltmeter accurate to 1/10 (0.10) volt. Before performing this test, be certain that the following procedures are accomplished:

- The battery is fully-charged. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure** for the proper battery charging procedure.
- The battery has successfully passed a load test. See **Electrical - Engine Systems/Battery System/BATTERY - Standard Procedure** for the proper load test procedure.
- Fully engage the parking brake.
- If the vehicle is equipped with an automatic transmission, place the gearshift selector lever in the Park position. If the vehicle is equipped with a manual transmission, place the gearshift selector lever in the Neutral position and block the clutch pedal in the fully depressed position.
- Verify that all lamps and accessories are turned off.
- To prevent the engine from starting, remove the Automatic Shut Down (ASD) relay. The ASD relay is located in the Intraged Power Module (IPM), in the engine compartment. See the fuse and relay layout label affixed to the underside of the IPM cover for ASD relay identification and location.

Fig. 18: Connecting Voltmeter To Battery Terminal Post
Courtesy of CHRYSLER LLC

1. Remove the spare tire cover to gain access to the battery. Connect the positive lead of the voltmeter to the battery negative terminal post. Connect the negative lead of the voltmeter to the battery negative cable terminal clamp. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery negative cable terminal clamp and the battery negative terminal post.

Fig. 19: Connecting Voltmeter To Battery Terminal Post
Courtesy of CHRYSLER LLC

2. Connect the positive lead of the voltmeter to the battery positive terminal post. Connect the negative lead of the voltmeter to the battery positive cable terminal clamp. Rotate and hold the

ignition switch in the Start position. Observe the voltmeter. If voltage is detected, correct the poor connection between the battery positive cable terminal clamp and the battery positive terminal post.

Fig. 20: Measuring Battery (-) And Ground
Courtesy of CHRYSLER LLC

3. Using a suitable jumper wire, connect the voltmeter to measure between the battery negative cable terminal clamp and a good clean ground on the engine block. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the transmission housing. Repeat the test. If the reading is still above 0.2 volt, perform 4 and 5.

Fig. 21: Measuring Between Battery (-) Clamp And Battery (-) Cable Eyelet Terminal
Courtesy of CHRYSLER LLC

4. Connect the voltmeter to measure between the battery negative cable terminal clamp and the battery negative cable eyelet terminal connection at the vehicle body. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the vehicle body. Repeat the test. If the reading is still above 0.2 volt, replace the battery rear negative cable. See **Electrical - Engine Systems/Battery System/CABLES, Battery - Removal**.

Fig. 22: Measuring Between Battery (-) Cable Eyelet And Right Front Strut Tower
 Courtesy of CHRYSLER LLC

Fig. 23: Measuring Between Battery (-) Cable Eyelet And Transmission Housing
 Courtesy of CHRYSLER LLC

5. Connect the voltmeter to measure between the battery negative cable eyelet terminal connection at the right front strut tower and the battery negative cable eyelet terminal

connection at the transmission housing. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery negative cable eyelet terminal connection at the right front strut tower. Repeat the test. If the reading is still above 0.2 volt, replace the battery front negative cable. See **Electrical - Engine Systems/Battery System/CABLES, Battery - Removal**.

6. Using a suitable jumper wire, connect the voltmeter to measure between the battery positive cable terminal clamp and the starter solenoid B(+) terminal stud. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable eyelet terminal connection at the starter solenoid B(+) terminal stud. Repeat the test. If the reading is still above 0.2 volt, perform 7 and 8.

8133da07

Inside Terminal Connection
Courtesy of CHRYSLER LLC

8. Remove the right front carpet to gain access to the battery positive cable bulkhead inside terminal. Connect the voltmeter to measure between the battery positive cable terminal clamp and the battery positive cable bulkhead inside terminal connection. Rotate and hold the ignition switch in the Start position. Observe the voltmeter. If the reading is above 0.2 volt, clean and tighten the battery positive cable bulkhead inside terminal connection. Repeat the test. If the reading is still above 0.2 volt, replace the battery rear positive cable. See **Electrical - Engine Systems/Battery System/CABLES, Battery - Removal**.

REMOVAL

REMOVAL

NEGATIVE - ENGINE COMPARTMENT

Fig. 27: Fastener Securing Negative Battery Cable To Right Front Strut Tower
Courtesy of CHRYSLER LLC

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable.
4. Remove the fastener securing the battery negative cable to the right front strut tower.

Fig. 28: Fastener Securing Negative Battery Cable To Transmission Housing
 Courtesy of CHRYSLER LLC

5. Raise vehicle on hoist. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .
6. Remove the fastener securing the battery negative cable to the transmission housing.
7. One at a time, remove the battery cable retaining pushpins, fasteners and routing clips until the cable is free from the vehicle.
8. Remove the battery cable from the engine compartment.

NEGATIVE - REAR COMPARTMENT

Fig. 29: Battery System Components And PDC Cover
 Courtesy of CHRYSLER LLC

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable (3).
4. Remove the fastener (4) securing the battery negative cable to the body.
5. Remove the cable from the vehicle.

POSITIVE - BATTERY TO BULKHEAD

Fig. 30: Battery System Components And PDC Cover

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable (3).
4. Disconnect the battery positive cable (1).

Fig. 31: Power Distribution Center
Courtesy of CHRYSLER LLC

5. Remove the Power Distribution Center (PDC) cover (2).
6. Remove the battery positive cable to rear PDC fastener (3).

Fig. 32: Routing Clips
Courtesy of CHRYSLER LLC

7. One at a time, free the battery positive cable from the routing clips located in the rear compartment area.
8. Remove the right, front seat. Refer to **Body/Seats/SEAT - Removal**.
9. Remove the right, rear seat cushion. Pull upward at forward edge of each retainer loop of the

rear seat cushion to disengage retainer loops from cups in floor.

10. Remove the right cowl trim panel. Refer to **Body/Interior/PANEL, Cowl Trim - Removal**.
11. Remove the right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Removal**.
12. Position carpet aside to gain access to the battery positive cable.

Fig. 33: Routing Clips
Courtesy of CHRYSLER LLC

13. One at a time, free the battery positive cable from the routing clips located in the rear seat area.

Fig. 34: Bulkhead Fastener
Courtesy of CHRYSLER LLC

14. Position the bulkhead insulator aside to gain access to the battery positive cable bulkhead fastener.
15. Remove the battery positive cable to bulkhead fastener.

Fig. 35: Battery Positive Cable
Courtesy of CHRYSLER LLC

16. Remove the battery positive cable from the vehicle making note of the cable routing under the floor cross members.

POSITIVE - ENGINE COMPARTMENT

Fig. 36: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

1. Turn the ignition switch to the Off position. Be certain that all electrical accessories are turned off.
2. Remove the spare tire cover to gain access to the battery.
3. Disconnect and isolate the battery negative cable (3).
4. Raise vehicle on hoist. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

5. Remove the right front wheelhouse splash shield to gain access to the battery positive cable bulkhead outside terminal. Refer to **Body/Exterior/SHIELD, Splash - Removal** .

Fig. 37: Bulkhead Fastener
Courtesy of CHRYSLER LLC

6. Remove the battery positive cable to bulkhead fastener.

Fig. 38: Battery Positive Cable
Courtesy of CHRYSLER LLC

7. Remove the battery positive cable from the routing clip located at the back of the starter.
8. Remove the battery positive cable to starter fastener.

Fig. 39: Battery Positive Cable
Courtesy of CHRYSLER LLC

9. Remove the battery positive cable from the vehicle making note of the cable routing.

INSTALLATION

INSTALLATION

NEGATIVE - ENGINE COMPARTMENT

Fig. 40: Fastener Securing Negative Battery Cable To Transmission Housing
Courtesy of CHRYSLER LLC

1. Position the battery negative cable in the engine compartment.
2. Raise the vehicle on hoist. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.
3. Install the fastener securing the battery negative cable to the transmission housing. Tighten the bolt to 11 N.m (8 ft. lbs.).
4. One at a time, install the battery cable retaining pushpins, fasteners and routing clips until the cable is installed exactly where it was in the vehicle.
5. Lower the vehicle.

Fig. 41: Fastener Securing Negative Battery Cable To Right Front Strut Tower
Courtesy of CHRYSLER LLC

6. Install the fastener securing the battery negative cable to the right front strut tower.
7. Connect the battery negative cable. Follow the battery connection procedure. See **Electrical - Engine Systems/Battery System - Standard Procedure**
8. Install the spare tire cover.

NEGATIVE - REAR COMPARTMENT

813422cd

Fig. 42: Battery System Components And PDC Cover
 Courtesy of CHRYSLER LLC

1. Position the battery negative cable in the vehicle.
2. Install the fastener (4) securing the battery negative cable to the body.
3. Connect the battery negative cable (3). Follow the battery connection procedure. See **Electrical - Engine Systems/Battery System - Standard Procedure**
4. Install the spare tire cover.

POSITIVE - BATTERY TO BULKHEAD

81344c80

Fig. 43: Battery Positive Cable
 Courtesy of CHRYSLER LLC

1. Position the battery positive cable in the vehicle taking care to route the cable under the floor cross members.

Fig. 44: Bulkhead Fastener
Courtesy of CHRYSLER LLC

2. Position the bulkhead insulator aside to gain access to the battery positive cable bulkhead fastener.
3. Install the battery positive cable to bulkhead fastener.
4. Position the bulkhead insulator back to the normal position.

Fig. 45: Routing Clips
Courtesy of CHRYSLER LLC

5. One at a time, secure the battery positive cable to the routing clips located in the rear seat area.

Fig. 46: Routing Clips
 Courtesy of CHRYSLER LLC

6. One at a time, secure the battery positive cable to the routing clips located in the rear compartment area.
7. Position the carpet back to the normal position.
8. Install the right quarter trim panel. Refer to **Body/Interior/PANEL, Quarter Trim - Installation** .
9. Install the right cowl trim panel. Refer to **Body/Interior/PANEL, Cowl Trim - Installation** .
10. Install the right, rear seat cushion. Engage retainer loops into cup on floor kick up. Push downward at forward edge at each retainer loop of the rear seat cushion to engage retainers.
11. Install the right, front seat. Refer to **Body/Seats/SEAT - Installation** .

Fig. 47: Power Distribution Center

Courtesy of CHRYSLER LLC

12. Install the battery positive cable to rear Power Distribution Center (PDC) fastener (3).

Fig. 48: Battery System Components And PDC Cover
Courtesy of CHRYSLER LLC

13. Install the PDC cover (5).
14. Connect the battery positive cable (1).
15. Connect the battery negative cable (3). Follow the battery connection procedure. See **Electrical - Engine Systems/Battery System - Standard Procedure**
16. Install the spare tire cover.

POSITIVE - ENGINE COMPARTMENT

Fig. 49: Battery Positive Cable

Courtesy of CHRYSLER LLC

1. Position the battery positive cable in the engine compartment.
2. Secure the battery positive cable to the routing clip located at the back of the starter.

Fig. 50: Battery Positive Cable
Courtesy of CHRYSLER LLC

3. Install the battery positive cable to starter fastener.

Fig. 51: Bulkhead Fastener
 Courtesy of CHRYSLER LLC

4. Install the battery positive cable to bulkhead fastener.
5. Install the right front wheelhouse splash shield. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
6. Lower the vehicle.

Fig. 52: Battery System Components And PDC Cover
 Courtesy of CHRYSLER LLC

7. Connect the battery negative cable (3). Follow the battery connection procedure. See **Electrical - Engine Systems/Battery System - Standard Procedure**
8. Install the spare tire cover.

RETAINER, BATTERY

REMOVAL

REMOVAL

Fig. 53: Battery Hold Down Clamp
Courtesy of CHRYSLER LLC

1. Verify that the ignition switch and all accessories are OFF.
2. Remove the rear compartment floor, trim panel to gain access to the battery.
3. Disconnect and isolate the battery negative cable.
4. Remove the bolt from the battery holddown and remove the holddown.

INSTALLATION

INSTALLATION

Fig. 54: Battery Hold Down Clamp
 Courtesy of CHRYSLER LLC

1. Install the battery holddown clamp and bolt. Tighten the bolt to 4 N.m (35 in. lbs.).
2. Connect the battery negative cable. Follow the battery reconnection procedure. See **Electrical - Engine Systems/Battery System - Standard Procedure**
3. Install the rear compartment floor trim panel.

TRAY, BATTERY

REMOVAL

REMOVAL

1. Remove the battery. See **Electrical - Engine Systems/Battery System/BATTERY - Removal**.

Fig. 55: Removing/Installing Power Distribution Center
Courtesy of CHRYSLER LLC

2. Using a small flat bladed tool, gently release the two mounting tabs that secure the Power Distribution Center (PDC) to the battery tray. Position the PDC aside.

Fig. 56: Removing/Installing Battery Tray
Courtesy of CHRYSLER LLC

3. Remove the battery tray mounting fasteners and remove the battery tray from the vehicle.

INSTALLATION

INSTALLATION

Fig. 57: Removing/Installing Battery Tray
 Courtesy of CHRYSLER LLC

1. Position the battery tray in the vehicle and install the mounting fasteners.

Fig. 58: Removing/Installing Power Distribution Center
 Courtesy of CHRYSLER LLC

2. Position the Power Distribution Center (PDC) onto the battery tray mounting tabs. Gently apply downward pressure on the PDC until it snaps into place.
3. Install the battery. See **Electrical - Engine Systems/Battery System/BATTERY - Installation**.

ACCESSORIES AND EQUIPMENT

Body - Challenger

DESCRIPTION

DESCRIPTION - VEHICLE IDENTIFICATION

Throughout this service information, references to the Chrysler Corporation vehicle family identification code are used when describing a procedure that is unique to that vehicle. If a procedure is common to all vehicles covered in this service information, no reference will be made to a vehicle family code.

WARNING

SAFETY PRECAUTIONS AND WARNINGS

WARNING: Use an Occupational Safety and Health Administration (OSHA) approved breathing filter when spraying paint or solvents in a confined area. Failure to do so may result in serious or fatal injury.

Avoid prolonged skin contact with petroleum or alcohol - based cleaning solvents. Failure to do so may result in serious or fatal injury.

Do not stand under a hoisted vehicle that is not properly supported on safety stands. Failure to do so may result in serious or fatal injury.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Failure to do so may result in damage to the vehicle.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions may result.

Always have a fire extinguisher ready for use when welding.

Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Failure to do so may result in damage to the electrical system.

Do not use abrasive chemicals, compounds or harsh alkaline based cleaning solvents on painted or upholstered surfaces. Failure to do so may result in damage to the vehicle surfaces.

Do not hammer or pound on plastic trim panel when servicing interior trim.

Failure to do so may result in damage to the trim panels.

DIAGNOSIS AND TESTING

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate service information for proper procedures.

WATER LEAK TESTS

WARNING: Do not use electric shop lights or tools in water test area. Personal injury can result.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

- If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.
- If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.
- If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high cross winds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, go to the appropriate service information for proper procedures.

ROAD TESTING WIND NOISE

1. Drive the vehicle to verify the general location of the wind noise.
2. Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

STANDARD PROCEDURE

BODY LUBRICATION

Lubrication Requirements

Locks and all body pivot points, including such items as seat tracks, door hinge pivot points and rollers, liftgate, tailgate, sliding doors and hood hinges, should be lubricated periodically with a lithium based grease such as Mopar® Spray White Lube to ensure quiet, easy operation and to protect against rust and wear. Prior to the application of any lubricant, wipe the parts clean, to remove dust and grit. After lubricating, excess oil and grease should be removed. Particular attention should also be given to hood latching components to make sure they function properly. When performing other underhood services, clean and lubricate the hood latch release mechanism and safety catch.

The external lock cylinders should be lubricated twice a year, preferably in the fall and spring. Apply a small amount of a high quality lubricant such as Mopar® Lock Cylinder Lubricant directly into the lock cylinder.

Lubricant Application

Door Lock Cylinders

1. Apply a small amount of lubricant directly into the lock cylinder.
2. Apply a small amount of lubricant to the key.
3. Insert key into lock cylinder and cycle the mechanism from the locked to the unlocked position.

NOTE: Do not add more lubricant.

4. Cycle the lock cylinder mechanism several times to allow the lubricant to flow throughout the cylinder.
5. Wipe all lubricant from exterior of lock cylinder and key.

All Other Body Mechanisms

1. Clean component as described above.
2. Apply specified lubricant to all pivoting and sliding contact areas of component.

Lubricant Usage

Engine Oil

- door hinges - hinge pin and pivot contact areas
- hood hinges - pivot points
- liftgate hinges

Mopar® Spray White Lube or Equivalent

- door check straps
- liftgate latches
- liftgate prop pivots
- ash receiver
- fuel filler door remote control latch mechanism
- parking brake mechanism
- sliding seat tracks
- liftgate latch

Mopar® Multipurpose Grease or Equivalent

- all other hood mechanisms

Mopar® Lock Cylinder Lubricant or Equivalent

- door lock cylinders
- liftgate lock cylinder

BUZZ, SQUEAKS AND RATTLES

Buzz, Squeaks and Rattles (BSR's) may be caused by any one or more of the following and may be corrected as indicated:

- Loose fasteners should be tightened to specifications.
- Damaged or missing clips should be replaced.
- Damaged trim panels should be replaced.
- Incorrectly installed trim panels should be reinstalled properly.

Many BSR complaints such as loose trim, can be serviced using various tapes or lubricants. Tapes including foam, flock and anti-squeak, can be used to eliminate noises caused by metal, plastic and vinyl components. Long life lubricants and greases can also be used on a variety of components. Refer to the **BUZZ, SQUEAKS AND RATTLES** table for materials and usage.

BUZZ, SQUEAKS AND RATTLES

ITEM	FEATURES	APPLICATIONS	SERVICE TEMP
ITCH AND SQUEAK TAPE	An abrasion resistant material thin enough to conform to most irregular surfaces. Stops most itches and squeaks.	Between metal and metal, metal and plastic, metal and vinyl, vinyl and plastic. Interior. Examples: Trim panels and bezels.	-40° to 107° C (-40° to 225° F)
BLACK NYLON FLOCK	Nylon Flock with an aggressive acrylic adhesive. Provides for cushioning and compression fit, also isolates components. Water-resistant.	Between metal and metal, metal and plastic, vinyl and plastic. Examples: Pull cups, bezels, clips, ducts, top cover to glass, cowl panel.	-40° to 82° C (-40° to 180° F)
HIGH DENSITY URETHANE FOAM	Tear resistant, highly resilient and durable.	Between metal and metal, metal and plastic. Water-resistant. Examples: I/P, heavy metal rattles, isolating brackets.	-40° to 82° C (-40° to 180° F)
OPEN CELL FOAM TAPE	Soft foam conforms to irregular surfaces.	Wire harness and connector wrap. Examples: Seals, gasket, wiring, heat ducts.	-40° to 82° C (-40° to 180° F)
CLOSED CELL LOW DENSITY FOAM TAPE	Soft, conformable. Water-resistant.	Wherever bulk is needed. Prevents closing flutters and rattles when applied to door watershed. Examples: Door, I/P.	-40° to 82° C (-40° to 180° F)
NYE® GREASE 880	Long life.	Suspensions. Examples: Strut bushings, sway bars.	-40° to 200° C (-40° to 390° F)
KRYTOX® OIL	Long life. Will not dry out or harm plastics or rubber.	When access is not possible, oil will migrate to condition. Vinyl, rubber,	-34° to 205° C (-30° to 400° F)

		plastic, metal. Examples: Convertible top bushings, pull cups trim panel inserts.	
KRYTOX® GREASE	Long life. Will not dry out or harm plastics or rubber.	Vinyl, rubber, plastic, metal, glass. Examples: Weather-strips, backlite and windshield moldings.	-34° to 205° C (-30° to 400° F)

HEAT STAKING

1. Remove trim panel.
2. Bend or move the trim panel components at the heat staked joints. Observe the heat staked locations and/or component seams for looseness.
3. Heat stake the components.
 - a. If the heat staked or component seam location is loose, hold the two components tightly together and using a soldering gun with a flat tip, melt the material securing the components together. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
 - b. If the heat staked material is broken or missing, use a hot glue gun to apply new material to the area to be repaired. The panels that are being heat staked must be held together while the applying the glue. Once the new material is in place, it may be necessary to use a soldering gun to melt the newly applied material. Do not over heat the affected area, damage to the exterior of the trim panel may occur.
4. Allow the repaired area to cool and verify the repair.
5. Install trim panel.

PLASTIC BODY PANEL REPAIR

There are many different types of plastics used in today's automotive environment. We group plastics in three different categories: Rigid, Semi-Rigid, and Flexible. Any of these plastics may require the use of an adhesion promoter for repair. These types of plastic are used extensively on Chrysler Motors vehicles. Always follow repair material manufacturer's plastic identification and repair procedures.

Rigid Plastics:

Examples of rigid plastic use: Fascias, Hoods, Doors, and other Body Panels, which include SMC, ABS, and Polycarbonates.

Semi-Rigid Plastics:

Examples of semi-rigid plastic use: Interior Panels, Under Hood Panels, and other Body Trim Panels.

Flexible Plastics:

Examples of flexible plastic use: Fascias, Body Moldings, and upper and lower Fascia Covers.

Repair Procedure:

The repair procedure for all three categories of plastics is basically the same. The one difference is the material used for the repair. The materials must be specific for each substrate, rigid repair material for rigid plastic repair, semi-rigid repair material for semi-rigid plastic repair and flexible repair material for flexible plastic repair.

Adhesion Promoter/Surface Modifier:

Adhesion Promoters/Surface Modifiers are required for certain plastics. All three categories may have plastics that require the use of adhesion promoter/surface modifiers. Always follow repair material manufacturer's plastic identification and repair procedures.

SAFETY PRECAUTION AND WARNINGS

WARNING:

- **Eye protection should be used when servicing components. Personal injury can result.**
- **Use an OSHA approved breathing mask when mixing epoxy, grinding, and spraying paint or solvents in a confined area. Personal injury can result.**
- **Avoid prolonged skin contact with resin, petroleum, or alcohol based solvents. Personal injury can result.**
- **Do not venture under a hoisted vehicle that is not properly supported on safety stands. Personal injury can result.**

NOTE:

- **When holes must be drilled or cut in body panels, verify locations of internal body components and electrical wiring. Damage to vehicle can result.**
- **Do not use abrasive chemicals or compounds on undamaged painted surfaces around repair areas. Damage to finish can result.**

RIGID, SEMI-RIGID, AND FLEXIBLE PLASTIC PARTS TYPES

CODE	FAMILY NAME	COMMON TRADE NAME	TYPICAL APPLICATION
ASA	ACRYLONITRILE STYRENE ACRYLITE	LURAN S	CONSOLES, GRILLES
ABS	ACRYLONITRILE BUTADIENE STYRENE	TERLURAN	"A" PILLARS, CONSOLES, GRILLES
ABS/PC	ABS/PC ALLOY	PULSE, PROLOY, BAYBLEND	DOORS, INSTRUMENT PANELS
ABS/PVC	ABS/PV ALLOY	PROLOY, PULSE, LUSTRAN, CYCLOVIN	DOOR PANELS, GRILLES, TRIM

BMC	BULK MOLDING COMPOUND	BMC	FENDER EXTENSIONS
EMA	EHTYLENE METHYL ACRYLATE/IONOMER	SURLYN, EMA, IONOMER	BUMPER GUARDS, PADS
METTON	METTON	METTON	GRILLES, KICK PANELS, RUNNING BOARDS
MPPO	MODIFIED POLYPHENYLENE OXIDE	MPPO	SPOILER ASSEMBLY
PA	POLYAMID	ZYTEL, VYDYNE, PA, MINLON	FENDERS, QUARTER PANELS
PET	THERMOPLASTIC POLYESTER	RYNITE	TRIM
PBT/PPO	PBT/PPO ALLOY	GERMAX	CLADDINGS
PBTP	POLYBUTYLENE THEREPHTHALATE	PBT, PBTP, POCAN, VALOX	WHEEL COVERS, FENDERS, GRILLES

PANEL SECTIONING

Fig. 1: Panel Sectioning
Courtesy of CHRYSLER LLC

- 1 - EXISTING PANEL
- 2 - NEW PANEL
- 3 - PANEL ADHESIVE
- 4 - BONDING STRIP

If it is required to section a large panel for a plastic repair, it will be necessary to reinforce the panel. To bond two plastic panels together, a reinforcement must overlap both panels. The panels must be "V'd" at a 20 degree angle. The area to be reinforced should be washed, then sanded. Be sure to wipe off any excess soap and water when finished. Lightly sand or abrade the plastic with an abrasive pad or sandpaper. Blow off any dust with compressed air or wipe with a clean dry rag.

When bonding plastic panels, follow repair material manufacturers recommendations. Be sure that enough adhesive has been applied to allow squeeze out and to fill the full bond line. Once the pieces have been brought together, do not move them until the adhesive is cured. The assembly can be held together with clamps, rivets, etc. A faster cure can be obtained by heating with a heat lamp or heat gun. After the parts have been bonded and have had time to cure, rough sand the seam and apply the final adhesive filler to the area being repaired. Smooth the filler with a spreader, wooden tongue depressor, or squeegee. For fine texturing, a small amount of water can be applied to the filler surface while smoothing. The cured filler can be sanded as necessary and, as a final step, cleanup can be done with soapy water. Wipe the surface clean with a dry cloth allowing time for the panel to dry before moving on with the repair.

PANEL REINFORCEMENT

Fig. 2: Softened Edges
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - SOFTENED EDGES
2 - PANEL ADHESIVE
3 - BONDING STRIP |
|---|

Structural repair procedures for rigid panels with large cracks and holes will require a reinforcement backing. Reinforcements can be made with several applications of glass cloth saturated with structural adhesive. Semi-rigid or flexible repair materials should be used for semi-rigid or flexible backing reinforcement and open meshed fiberglass dry wall tape can be used to form a reinforcement. The dry wall tape allows the resin to penetrate through and make a good bond between the panel and the adhesive. Structurally, the more dry wall tape used, the stronger the repair.

Fig. 3: Panel Reinforcement
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - PANEL ADHESIVE
2 - REINFORCEMENT |
|---|

Another kind of repair that can be done to repair large cracks and holes is to use a scrap piece of similar plastic and bond with structural adhesive. The reinforcement should cover the entire break and should have a generous amount of overlap on either side of the cracked or broken area.

Fig. 4: Beveling Angle - 20 Degree
Courtesy of CHRYSLER LLC

When repairing plastic, the damaged area is first "V'd" out, or beveled. Large bonding areas are desirable when repairing plastic because small repairs are less likely to hold permanently. Beveling the area around a crack at a 20° angle will increase the bonding surface for a repair. It is recommended that sharp edges be avoided because the joint may show through after the panel is refinished.

Fig. 5: Fiberglass Tape
Courtesy of CHRYSLER LLC

- Panel repair for both flexible and rigid panels are basically the same. The primary difference between flexible panel repair and rigid panel repair is in the adhesive materials used.
- The technician should first decide what needs to be done when working on any type of body panel. One should determine if it is possible to return the damage part to its original strength and appearance without exceeding the value of the replacement part.
- When plastic repairs are required, it is recommended that the part be left on the vehicle when ever possible. That will save time, and the panel will remain stationary during the repair. Misalignment can cause stress in the repair areas and can result in future failure.

VISUAL INSPECTION

Fig. 6: Damage Component
Courtesy of CHRYSLER LLC

1 - PUNCTURE

Composite materials can mask the severity of an accident. Adhesive bond lines, interior structure of the doors, and steel structures need to be inspected carefully to get a true damage assessment. Close inspection may require partial removal of interior trim or inner panels.

Identify the type of repair: Puncture or Crack - Damage that has penetrated completely through the panel. Damage is confined to one general area; a panel section is not required. However, a backer panel, open fiberglass tape, or matted material must be bonded from behind.

PANEL SURFACE PREPARATION

If a body panel has been punctured, cracked, or crushed, the damaged area must be removed from the panel to achieve a successful repair. All spider web cracks leading away from a damaged area must be stopped or removed. To stop a running crack in a panel, drill a 6 mm (0.250 in.) hole at the end of the crack farthest away from the damage. If spider web cracks can not be stopped, the panel would require replacement. The surfaces around the damaged area should be stripped of paint and freed from wax and oil. Scuff surfaces around repair area with 360 grit wet/dry sandpaper, or equivalent, to assure adhesion of repair materials.

PATCHING PANELS

Fig. 7: Damaged Panel Cutout And Patch
 Courtesy of CHRYSLER LLC

- 1 - CUTOUT
- 2 - DAMAGED BODY PANEL
- 3 - 4 MM (0.160 IN.) HOLES
- 4 - PATCH CUT TO SIZE

A panel that has extensive puncture type damage can be repaired by cutting out the damaged material. Use a suitable reciprocating saw or cut off wheel to remove the section of the panel that is damaged. The piece cut out can be used as a template to shape the new patch. It is not necessary to have access to the back of the panel to install a patch. Bevel edges of cutout at 20° to expose a larger bonding area on the outer side. This will allow for an increased reinforcement areas.

PANEL PATCH FABRICATIONS

Fig. 8: Fabricated Panel
 Courtesy of CHRYSLER LLC

- 1 - STRUCTURAL ADHESIVE
- 2 - FIBERGLASS CLOTH OR FIBERGLASS MESH TAPE

- | |
|--|
| 3 - WIDTH OF V-GROOVE
4 - WAXED PAPER |
|--|

A patch can be fabricated from any rigid fiberglass panel that has comparable contour with the repair area. Lift gates and fenders can be used to supply patch material. If existing material is not available or compatible, a patch can be constructed with adhesive and reinforcement mesh (dry wall tape). Perform the following operation if required:

1. Cover waxed paper or plastic with adhesive backed nylon mesh (dry wall tape) larger than the patch required.
2. Tape waxed paper or plastic sheet with mesh to a surface that has a compatible contour to the repair area.
3. Apply a liberal coat of adhesive over the reinforcement mesh. If necessary apply a second or third coat of adhesive and mesh after first coat has cured. The thickness of the patch should be the same as the repair area.
4. After patch has cured, peel waxed paper or plastic from the back of the patch.
5. If desired, a thin film coat of adhesive can be applied to the back of the patch to cover mesh for added strength.

PANEL PATCH INSTALLATION

Fig. 9: Secure Support Squares To Body Panel
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - SUPPORT SQUARES
2 - SCREWS
3 - DAMAGED BODY PANEL |
|---|

1. Make a paper or cardboard pattern the size and shape of the cutout hole in the panel.
2. Trim 3 mm (0.125 in.) from edges of pattern so patch will have a gap between connecting surfaces.

3. Using the pattern as a guide, cut the patch to size.
4. Cut scrap pieces of patch material into 50 mm (2 in.) squares to use as patch supports to sustain the patch in the cutout.
5. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) in from edge of cutout hole.
6. Drill 4 mm (0.160 in.) holes 13 mm (0.5 in.) away from edge of patch across from holes drilled around cutout.
7. Drill 3 mm (0.125 in.) holes in the support squares 13 mm (0.5 in.) from the edge in the center of one side.
8. Scuff the backside of the body panel around the cutout hole with a scuff pad or sandpaper.
9. Mix enough adhesive to cover one side of all support squares.
10. Apply adhesive to cover one side of all support squares.
11. Using number 8 sheet metal screws, secure support squares to back side of body panel with adhesive sandwiched between the panel and squares.

Fig. 10: Position Patch In Cutout And Align
Courtesy of CHRYSLER LLC

1 - CUTOUT 2 - SUPPORT SQUARES

12. Position patch in cutout against support squares and adjust patch until the gap is equal along all sides.
13. Drill 3 mm (0.125 in.) holes in the support squares through the pre-drilled holes in the patch.

Fig. 11: Apply Adhesive To Support Squares

|---|
| 1 - APPLICATOR
2 - SUPPORT SQUARES
3 - ADHESIVE |
|---|

14. Apply a coat of adhesive to the exposed ends of the support squares.

Fig. 12: Installing Screws
 Courtesy of CHRYSLER LLC

- | |
|----------------------|
| 1 - PATCH
2 - GAP |
|----------------------|

15. Install screws to hold the patch to support squares. Tighten screws until patch surface is flush with panel surface.
16. Allow adhesive to cure, and remove all screws.

Fig. 13: Grind Surface
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - PATCH
2 - GAP
3 - DISC GRINDER |
|--|

- Using a 125 mm (5 in.) 24 grit disc grinder, grind a 50 mm (2 in.) to 75 mm (3 in.) wide and 2 mm (0.080 in.) deep path across the gaps around the patch. With compressed air, blow dust from around patch.

Fig. 14: Cover Gaps With Mesh
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - GROUND DOWN AREA
2 - PATCH
3 - MESH |
|---|

- Apply adhesive backed nylon mesh (dry wall tape) over gaps around patch.

19. Mix enough adhesive to cover the entire patch area.

Fig. 15: Cover Mesh With Adhesive
Courtesy of CHRYSLER LLC

- 1 - ADHESIVE

2 - MESH

3 - PATCH

4 - SPREADER

20. Apply adhesive over the mesh around patch, and smooth epoxy with a wide spreader to reduce finish grinding. Use two to three layers of mesh and adhesive to create a stronger repair.

PATCHED PANEL SURFACING

After patch panel is installed, the patch area can be finished using the same methods as finishing other types of body panels. If mesh material is exposed in the patched area, grind surface down, and apply a coat of high quality rigid plastic body filler. Prime, block sand, and paint as required.

DECKLID/HATCH/LIFTGATE/TAILGATE

BUMPER

Removal

REMOVAL

89096

Fig. 219: Fascia Overslam Bumper
Courtesy of CHRYSLER LLC

1. Open the decklid.
2. Remove the overslam bumper (1) from the rear fascia flange that extends over the deck opening lower panel.
3. Remove the bumper from the vehicle.

Installation

INSTALLATION

89096

Fig. 220: Fascia Overslam Bumper
Courtesy of CHRYSLER LLC

1. Install the overslam bumper (1) to the rear fascia flange that extends over the deck opening lower panel.
2. Close the decklid.

DECKLID

Removal

REMOVAL

Fig. 221: Deck Lid
Courtesy of CHRYSLER LLC

1. Open the decklid.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the connector (2) of the body wire harness take out for the decklid (1) from the latch connector receptacle (3).
4. Remove the wire harness from the decklid.

Fig. 222: Deck Lid

Courtesy of CHRYSLER LLC

5. Mark both upper hinge bracket (3) locations on the decklid inner panel (1) to aid in installation.
6. With the aid of an assistant, support the decklid while removing the two fasteners (2) that secure each upper hinge bracket to the decklid.
7. Remove the decklid from the vehicle.

Installation

INSTALLATION

Fig. 223: Deck Lid
Courtesy of CHRYSLER LLC

1. With the aid of an assistant, support and position the decklid (1) to the two upper hinge brackets (3) on the vehicle.
2. Install and tighten the two screws (2) that secure each upper hinge bracket to the decklid. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Install the wire harness to the decklid.

Fig. 224: Deck Lid
Courtesy of CHRYSLER LLC

4. Connect the connector (2) of the body wire harness (1) to the latch connector receptacle (3).
5. Connect the battery negative cable.
6. Close the decklid.
7. Adjust the decklid hinge positions and upper overslam bumpers as necessary to achieve proper spacing and operation.

HINGE

Removal

REMOVAL

Fig. 225: Deck Lid
 Courtesy of CHRYSLER LLC

1. Open and support the deck lid (1) with a suitable prop or block.
2. Remove the support cylinder from the deck lid hinge. See **Body/Decklid/Hatch/Liftgate/Tailgate/PROP, Gas - Removal**.
3. Mark the upper hinge bracket (3) location on the deck lid inner panel to aid reinstallation.
4. Remove the fasteners (2) that secure the hinge to the deck lid.

Fig. 226: Hinge
 Courtesy of CHRYSLER LLC

5. Mark the lower hinge bracket (1) location on the deck lid opening drain trough to aid

reinstallation.

6. Remove the fasteners (2) that secure the hinge to the drain trough.
7. Remove the deck lid hinge from the vehicle.

Installation

INSTALLATION

Fig. 227: Hinge
Courtesy of CHRYSLER LLC

1. Position the lower bracket of the decklid hinge (1) to the drain trough on the vehicle.
2. Install and tighten the fasteners (2) that secure the hinge to the drain trough. Tighten to 28 N.m (21 ft. lbs.).

Fig. 228: Deck Lid
Courtesy of CHRYSLER LLC

3. Position the decklid (1) to the upper hinge bracket (3) on the vehicle.
4. Install and tighten the fasteners (2) that secure the hinge to the decklid. Tighten to 28 N.m (21 ft. lbs.).
5. Install the support cylinder onto the decklid hinge. See **Body/Decklid/Hatch/Liftgate/Tailgate/PROP. Gas - Installation.**
6. Remove the fixture being used to support the decklid for service and close the decklid.
7. Adjust the decklid hinge position as necessary to achieve proper spacing and operation.

LATCH

Removal

REMOVAL

99484

Fig. 229: Decklid Latch
Courtesy of CHRYSLER LLC

1. Open the decklid.
2. Disconnect and isolate the battery negative cable.
3. Disconnect the connector of the body wire harness take out for the decklid from the latch connector.
4. Remove the fasteners (2) that secure the latch (1) to the inside of the decklid (3).
5. Remove the latch from the inside of the decklid.

Installation

INSTALLATION

99484

Fig. 230: Decklid Latch
Courtesy of CHRYSLER LLC

1. Position the latch (1) to the inside of the decklid (3).
2. Install the fasteners (2) that secure the latch to the inside of the decklid. Tighten to 8 N.m (71 in. lbs.).
3. Connect the connector of the body wire harness take out for the decklid to the latch connector.
4. Connect the battery negative cable. Follow the battery reconnection procedure. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure**
5. Close the decklid.

PROP, GAS

Removal

REMOVAL

8070308

Fig. 231: Decklid Gas Prop (Support Cylinder)
Courtesy of CHRYSLER LLC

1. Open and support the decklid with a suitable prop or block.

WARNING: During service lift the ball socket end retaining clip only far enough to release the socket from the ball stud. Excessive prying or removal of the clip may result in improper clip spring tension. Improper clip tension may result in the support cylinder separating from the ball stud causing sudden, unexpected loss of decklid support. Failure to do so may result in serious or fatal injury.

2. Insert a small flat-bladed tool (3) into the notch on the outer face of one ball socket end (1) of the support cylinder and carefully pry the retaining clip (2) outward while pulling the ball socket away from the ball stud (4) on the decklid hinge.
3. Release the retaining clip to its installed position.
4. Repeat 2 and 3 for the opposite end of the support cylinder.

Fig. 232: Removing/Installing Decklid Support Cylinder
 Courtesy of CHRYSLER LLC

5. Remove the support cylinder (1) from the decklid hinge (2).

Installation

INSTALLATION

Fig. 233: Removing/Installing Decklid Support Cylinder
 Courtesy of CHRYSLER LLC

1. Position the ball socket on the cylinder end of the support cylinder (1) to the ball stud on the upper bracket of the decklid hinge (2).

2. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
3. Position the ball socket on the rod end of the support cylinder to the ball stud on the lower bracket of the decklid hinge.
4. Using hand pressure, press the ball socket onto the ball stud until the retainer clip snaps into place.
5. Inspect to be certain that the retaining clip on each of the support cylinder ball socket ends is fully seated.
6. Remove the support prop or block and close the decklid.

STRIKER, LATCH

Removal

REMOVAL

Fig. 234: Latch Striker
Courtesy of CHRYSLER LLC

1. Open the decklid.
2. Remove the trunk rear trim panel. See **Body/Interior/PANEL, Trunk Trim - Removal**
3. Mark the decklid latch striker (2) location on the inside of the deck opening lower panel to aid reinstallation.
4. Remove the fasteners (1) that secure the latch striker to the inside of the deck opening lower panel (3).
5. Remove the latch striker from the vehicle.

Installation

INSTALLATION

Fig. 235: Latch Striker
Courtesy of CHRYSLER LLC

1. Position the decklid latch striker (2) to the inside of the deck opening lower panel (3).
2. Install the fasteners (1) that secure the latch striker to the deck opening lower panel. Tighten to 28 N.m (21 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper deck lid latch operation.
4. Install the trunk rear trim panel. See **Body/Interior/PANEL, Trunk Trim - Installation**
5. Close the decklid.

DOOR - FRONT

DESCRIPTION

DESCRIPTION

81267ef8

Fig. 236: Push Pin Fastener
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - OPEN POSITION
2 - LOCK POSITION
3 - RELEASE POSITION |
|--|

1. The push pin fastener is in the open position (1) when the center pin is pull outward approximately 2 mm. Then the push pin fastener is ready to be used.
2. To install push pin place it into position, and push the center pin in flush with the head of the push pin to lock it into position (2).
3. To remove the push pin fastener, push the center pin inward approximately 2 mm to release push pin fastener (3).

CYLINDER, DOOR LOCK

Removal

REMOVAL

1. Remove the handle from the outside of the driver side front door. See **Body/Door - Front/HANDLE - Removal**.
2. Using hand pressure, push on the face of the lock cylinder until it pops out of the cavity in the back of the door handle.

Installation

INSTALLATION

1. Insert the lock cylinder into the cavity on the back of the door handle.
2. Align the lock cylinder in the handle by engaging the tab on the outer circumference of the cylinder in the slot of the tab on the wall of the handle cavity.

3. Install the handle onto the outside of the driver side front door. See **Body/Door - Front/HANDLE - Installation**.

DOOR

Removal

REMOVAL

Fig. 237: Door Wire Harness Boot & Connector
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Open the front door.
3. Disengage the front door wire harness boot and connector (1) from the outside of the lower A-pillar.
4. Carefully pull the door wire harness boot and connector out from the A-pillar far enough to access and disconnect the body wire harness connector(s) (1).
5. Open the door to the full open position.
6. Support the door with a suitable lifting device.

Fig. 238: Door Hinge Bracket
 Courtesy of CHRYSLER LLC

7. Remove the screw (1) from both the upper and lower front door hinges that secures the door hinge bracket (3) to the body hinge bracket (2).
8. While still supporting the door, close the door to the intermediate detent position (one detent from the full open position).

Fig. 239: Upper & Lower Hinge Pins & Pivots
 Courtesy of CHRYSLER LLC

9. Raise the front door (2) upward far enough to disengage the upper and lower hinge pins (3) from the pivots (1) on the upper and lower body hinge brackets.

10. Remove the front door from the vehicle.

Installation

INSTALLATION

Fig. 240: Upper & Lower Hinge Pins & Pivots
Courtesy of CHRYSLER LLC

1. Support the front door (2) with a suitable lifting device.
2. Position the door with the upper and lower hinge pins (3) aligned over the pivots (1) on the upper and lower body hinge brackets.
3. Lower the door far enough to engage the hinge pins into the pivot holes.
4. While still supporting the door, open the door to the full open position.

Fig. 241: Door Hinge Bracket
Courtesy of CHRYSLER LLC

5. Align the holes in the upper and lower front door hinge brackets (3) with those in the body hinge brackets (2).
6. Install and tighten the fastener (1) into both the upper and lower front door hinge to secure the door hinge brackets to the body hinge brackets. Tighten the fasteners to 42 N.m (31 ft. lbs.).
7. Remove the lifting device supporting the door.

Fig. 242: Door Wire Harness Boot & Connector
Courtesy of CHRYSLER LLC

8. Carefully pull the body wire harness connector(s) (1) out from the A-pillar far enough to

reconnect them to the door wire harness boot and connector (2).

9. Engage the front door wire harness boot and connector into the wiring clearance hole on the outside of the lower A-pillar.
10. Reconnect the battery negative cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

11. Adjust the door hinge positions as necessary to achieve proper door spacing and operation.

Adjustments

ADJUSTMENT

- NOTE:**
- Door adjustment measurements should be taken from stationary or welded body panels like the roof, rocker or quarter panels.
 - During adjustment procedures, it is recommended that all the hinge fasteners be loosened except for the upper most fasteners. Adjustments can be made using the upper bolts to hold the door with final torque of the fasteners occurring after correct door positioning is achieved.
 - A suitable body sealant should be used when removing or moving the hinges.

FORE/AFT

Fig. 243: Hinge Bracket
Courtesy of CHRYSLER LLC

NOTE: Fore/aft (lateral) door adjustment is done by loosening the hinge to the hinge pillar fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the upper and lower (2) hinge to hinge pillar fasteners (1). See Body/Door - Front/HINGE, Door - Removal
3. Adjust the door to the correct position. See Body/Body Structure/Gap and Flush - Specifications
4. Tighten the upper most hinge bolt to hinge pillar to 30 N.m (22 ft. lbs.).
5. Tighten the lower most hinge bolt to hinge pillar to 30 N.m (22 ft. lbs.).
6. Tighten the remaining hinge to hinge pillar bolts to 30 N.m (22 ft. lbs.).

UP/DOWN

Fig. 244: Door Latch Striker
Courtesy of CHRYSLER LLC

NOTE: Up/down door adjustment is done by loosening either the hinge to the hinge pillar fasteners or the hinge to door fasteners and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (1). See Body/Door - Front/STRIKER, Door Latch - Removal

Fig. 245: Hinge Bracket
 Courtesy of CHRYSLER LLC

3. If necessary, loosen the hinge to hinge pillar fasteners (1). See **Body/Door - Front/HINGE, Door - Removal**

Fig. 246: Door Hinge
 Courtesy of CHRYSLER LLC

4. If necessary, loosen the hinge to door fasteners (1). See **Body/Door - Front/DOOR - Removal**
5. Adjust the door to the correct position. See **Body/Body Structure/Gap and Flush - Specifications**
6. Tighten the door to hinges fasteners to 28 N.m (21 ft. lbs.).

Fig. 247: Hinge Bracket
Courtesy of CHRYSLER LLC

7. Tighten the upper most hinge bolt (1) to hinge pillar to 30 N.m (22 ft. lbs.).
8. Tighten the lower most hinge bolt (4) to hinge pillar to 30 N.m (22 ft. lbs.).
9. Tighten the remaining hinge to hinge pillar bolts to 30 N.m (22 ft. lbs.).

Fig. 248: Door Latch Striker
Courtesy of CHRYSLER LLC

10. Tighten the latch striker bolts (1) 33 N.m (24 ft. lbs.). See **Body/Door - Front/STRIKER, Door Latch - Installation**

IN/OUT

Fig. 249: Door Latch Striker
Courtesy of CHRYSLER LLC

NOTE: In/out door adjustment is done by loosening the hinge to door fasteners one hinge at a time and moving the door to the correct position.

1. Support the door with a suitable lifting device.
2. Loosen the latch striker bolts (2). See **Body/Door - Front/STRIKER, Door Latch - Removal**

Fig. 250: Door Hinge
Courtesy of CHRYSLER LLC

3. Loosen the hinge to door fasteners (1). See **Body/Door - Front/DOOR - Removal**
4. Adjust the door to the correct position. See **Body/Body Structure/Gap and Flush -**

Specifications

5. Tighten the door to hinges fasteners to 28 N.m (21 ft. lbs.).

Fig. 251: Door Latch Striker
Courtesy of CHRYSLER LLC

6. Tighten the latch striker bolts (2) to 33 N.m (24 ft. lbs.). See **Body/Door - Front/STRIKER, Door Latch - Installation**

GLASS, DOOR

Removal

REMOVAL

Fig. 252: Removing/Installing Front Door Glass
Courtesy of CHRYSLER LLC

1. Remove the trim panel from the inside of the front door. See **Body/Door - Front/PANEL, Door Trim - Removal**.
2. Remove the inner belt weatherstrip from the front door.
3. Remove the watershield from the inside of the front door. See **Body/Door - Front/WATERSHIELD - Removal**.
4. Adjust the front door glass (1) position up or down as required for access to the two window regulator glass clamps.
5. Remove the door glass fasteners (2).
6. Carefully lift the glass up and out of the door.

Installation

INSTALLATION

Fig. 253: Removing/Installing Front Door Glass
Courtesy of CHRYSLER LLC

1. From the outside of the front door, insert the glass (1) into the top of the door shell and load the glass into the door.
2. Install the door glass fasteners (2). Tighten to 10 N.m (89 in. lbs.).
3. Install the watershield onto the inside of the front door. See **Body/Door - Front/WATERSHIELD - Installation**.
4. Install the inner belt weatherstrip onto the front door.
5. Install the trim panel onto the inside of the front door. See **Body/Door - Front/PANEL, Door Trim - Installation**.

Adjustments

ADJUSTMENTS

2470218

Fig. 254: Front Door Glass Adjustments
Courtesy of CHRYSLER LLC

- | |
|---|
| <p>1 - DOOR GLASS
2 - REGULATOR GLASS ATTACHEMENT FASTENERS
3 - JACK SCREWS</p> |
|---|

NOTE: All measurements are in millimeters.

1. Check and adjust the door if necessary. See **Body/Door - Front/DOOR - Adjustments**
2. Remove the door trim panel and watershield to gain access to the regulator mechanism. See **Body/Door - Front/WATERSHIELD - Removal**

NOTE: Partially loosening the glass attachment fasteners (2) allows the glass to stay in place while the glass is being adjusted. If the fasteners are too loose, the glass will lose all position adjustments completely.

3. With the glass (1) in the full up position, partially loosen the regulator glass clamp fasteners (2).

2491254

Fig. 255: Door Glass Alignment
Courtesy of CHRYSLER LLC

- 1 - SEAL ENGAGEMENT 7.5 mm +/- 2.0 mm
- 2 - DOOR GLASS TO QUARTER GLASS FLUSH 0 mm - 3.0 mm
- 3 - DOOR GLASS TO QUARTER GLASS GAP 6.0 mm +/- 2.0 mm
- 4 - DOOR GLASS TO QUARTER GLASS PARALLEL WITHIN 2.0 mm

4. Place a piece of tape onto the glass and mark a line 7.5 mm (0.30 in.) minimum down from the upper edge in the three places shown in illustration (1).
5. From the outside of the vehicle, with the door closed, use a suction cup or equivalent and simultaneously slide the glass to achieve the three minimum glass engagement tape marks (1) and the door glass to quarter glass gap (3) and parallel measurements (4).

2491270

Fig. 256: Door Glass Alignment
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - DOOR GLASS
2 - SASH SEAL
3 - OBSERVED BELT LINE PRE-LOAD 6.0 mm
4 - LIFT PLATE PIVOT
5 - BELT LINE |
|--|

NOTE: It is sometimes helpful to snug or unsnug the rear glass attach fastener during this process.

NOTE: The jack screws work for minor crosscar adjustments and should only be used if there is a minimal adjustment crosscar required.

- Open the door and then carefully close the door until the B-pillar top of glass (1) just touches the quarter glass sash seal (2) and check the B-pillar glass to sash seal gap near the belt line (3). This gap (3) should be adjusted to 6 mm (0.24 in.) to put a cross car pre-load on the door glass. To adjust the gap open the door and push the top edge of the glass inboard or outboard as needed. Close the door and re-check the gap as needed. Check that the door glass to quarter glass is flush to +3 mm (0.11 in.) overflush.

2470218

Fig. 257: Front Door Glass Adjustments
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - DOOR GLASS
2 - REGULATOR GLASS ATTACHEMENT FASTENERS
3 - JACK SCREWS |
|--|

7. Tighten the regulator glass clamp fasteners (2) to 10 N.m (89 in. lbs.).
8. From inside the vehicle with the door closed, run the glass full down and then jog it upwards to insure the door glass does not scissor and travel inboard of the quarter glass sash seal or crush the seal and dislodge it from the retainer. If the door glass travels inboard of the sash seal, you will need to reduce the door glass pre-load.
9. From outside the vehicle , open and close the door and make sure the A-pillar section of the glass travels properly into the A-pillar seal. If the door glass crushes or pinches the A-pillar seal, the door glass will need more preload and/or shifted rearward.
10. Install the watershield and trim panel. See **Body/Door - Front/WATERSHIELD - Installation**

HANDLE, EXTERIOR

Removal

REMOVAL

Fig. 258: Removing/Installing Exterior Door Handle
Courtesy of CHRYSLER LLC

1. Remove the trim panel. See **Body/Door - Front/PANEL, Door Trim - Removal**.
2. Remove the speaker. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Removal**.
3. Remove the watershield. See **Body/Door - Front/WATERSHIELD - Removal**.
4. Disengage the plastic clip that secures the end of the latch release link (3) to the exterior door handle (2) and remove the latch release link from the handle.
5. For the driver side handle only, disengage the plastic clip that secures the end of the lock actuator link (4) to the lock cylinder and remove the link from the lock cylinder.
6. Remove the mounting fasteners from the exterior door handle (1).
7. Remove the handle from the outside of the door.

Installation

INSTALLATION

Fig. 259: Removing/Installing Exterior Door Handle
Courtesy of CHRYSLER LLC

1. Position the exterior handle to the door.
2. Install the exterior handle mounting fasteners (1). Tighten to 5 N.m (44 in. lbs.).
3. For the driver side handle only, install the lock cylinder link (4) and engage the plastic link retainer.
4. Install the door handle release link (3) and engage the plastic link retainer.
5. Install the watershield. See **Body/Door - Front/WATERSHIELD - Installation**.
6. Install the speaker. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Installation**
7. Install the trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation**.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure**

HINGE, DOOR

Removal

REMOVAL

Fig. 260: Hinge Bracket
 Courtesy of CHRYSLER LLC

1. Remove the front door from the vehicle. See **Body/Door - Front/DOOR - Removal**.
2. Mark the upper or lower hinge bracket (2) location on the outside of the lower A-pillar to aid installation.
3. Remove the fasteners (1) that secure the hinge bracket to the outside of the lower A-pillar.
4. Remove the hinge bracket from the A-pillar.

Fig. 261: Door Hinge
 Courtesy of CHRYSLER LLC

5. Mark the upper (1) or lower (4) door hinge location on the hinge face of the front door (2) to aid

installation.

6. Remove the fastener (5) that secures the hinge to the door.
7. Remove the nut (3) that secures the hinge to the stud on the door.
8. Remove the upper or lower hinge from the hinge face of the door.

Installation

INSTALLATION

Fig. 262: Door Hinge
Courtesy of CHRYSLER LLC

1. Position the upper (1) or lower (4) hinge to the hinge face of the front door.
2. Install and tighten the nut (3) that secures the hinge to the stud on the door. Tighten the nut to 28 N.m (21 ft. lbs.).
3. Install and tighten the fastener (5) that secures the hinge to the door. Tighten the fastener to 28 N.m (21 ft. lbs.).

Fig. 263: Hinge Bracket
 Courtesy of CHRYSLER LLC

4. Position the upper or lower hinge bracket (2) onto the outside of the lower A-pillar.
5. Install and tighten the fasteners (1) that secure the hinge bracket to the outside of the lower A-pillar. Tighten the fasteners to 30 N.m (22 ft. lbs.).
6. Install the front door onto the vehicle. See **Body/Door - Front/DOOR - Installation.**

LATCH, DOOR

Removal

REMOVAL

Fig. 264: Removing/Installing Door Latch
Courtesy of CHRYSLER LLC

1. Remove front door trim panel. See **Body/Door - Front/PANEL, Door Trim - Removal**.
2. Remove the door speaker. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Removal**
3. Remove the watershield. See **Body/Door - Front/WATERSHIELD - Removal**.
4. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the interior door latch lock link (2) to the latch lever and disengage the link from the latch (1).
5. Remove the interior door latch lock link and knob unit from the front door.
6. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the interior door handle latch release link (5) to the latch lever and disengage the link from the latch.
7. Reach into the back of the door shell to unsnap the plastic clip that secures the end of the exterior door handle latch release link to the latch lever and disengage the link from the latch.
8. For the driver side front door only, reach into the back of the door shell to unsnap the plastic clip that secures the end of the lock cylinder lock actuator link to the latch lever and disengage the link from the latch.
9. Remove the three fasteners that secure the latch to the outer latch face of the front door.
10. Disconnect the electrical connectors (3 and 4).
11. Remove the latch from the interior of the door shell.

Installation

INSTALLATION

89693

Fig. 265: Removing/Installing Door Latch
Courtesy of CHRYSLER LLC

1. Connect the door wire harness connectors (3 and 4) to the door latch (1).
2. Position the latch to the latch face on the interior of the front door shell.
3. Install and tighten the three fasteners that secure the latch to the outer latch face of the front door. Tighten the fasteners to 12 N.m (106 in. lbs.).
4. For the driver side front door only, reach into the back of the door shell to engage the lock cylinder actuator link to the latch lever and snap the plastic clip over the link to secure it to the latch.
5. Reach into the back of the door shell to engage the exterior door handle latch release link to the latch lever and snap the plastic clip over the link to secure it to the latch.
6. Reach into the back of the door shell to engage the end of the interior door handle latch release link (5) to the latch lever and snap the plastic clip over the link to secure it to the latch.
7. Position the interior door latch lock link (2) and knob unit into the front door.
8. Reach into the back of the door shell to engage the end of the interior door latch lock link to the latch lever and snap the plastic clip over the link to secure it to the latch.
9. Install the watershield. See **Body/Door - Front/WATERSHIELD - Installation**.
10. Install the speaker. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Installation**
11. Install the trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation**.
12. Using a wrench inserted through the access slot on the outer latch face of the front door shell, loosen the hex socket latch release adjusting screw on the latch.
13. Cycle the door outside latch release handle through its full travel two or three times.
14. Tighten the adjusting screw.

MOLDING

Removal

REMOVAL

Fig. 266: Door Trim Panel
 Courtesy of CHRYSLER LLC

NOTE: Challenger shown in illustration, 300/Charger similar.

1. Disconnect and isolate the negative battery cable.
2. Remove the front door trim panel. See **Body/Door - Front/PANEL, Door Trim - Removal.**

Fig. 267: Removing Staples From Belt Line Molding
 Courtesy of CHRYSLER LLC

3. Using a suitable tool remove the staples from the belt line molding at the top of the trim panel.
4. Remove the belt line molding.

REMOVAL

MOLDING-INNER BELT

Fig. 268: Removing/Installing Inner Belt Molding - Door
Courtesy of CHRYSLER LLC

1. Remove the door trim panel as necessary. See **Body/Door - Front/PANEL, Door Trim - Removal**
2. From the front of the inner belt molding, carefully pry up on the molding and work towards the rear of the door.
3. Remove the inner belt molding (1) from the top of the door (2).

MOLDING-OUTER BELT

Fig. 269: Removing/Installing Outer Belt Molding - Door
 Courtesy of CHRYSLER LLC

1. Remove the door trim panel as necessary. See **Body/Door - Front/PANEL, Door Trim - Removal**
2. From the front of the outer belt molding (1), carefully pry up on the molding and work towards the rear of the door.
3. Carefully remove the outer belt molding from the flange (2) at the rear of the door.
4. Remove the outer belt molding from the top of the door.

Installation

INSTALLATION

2615642

Fig. 270: Positioning Belt Line Molding
Courtesy of CHRYSLER LLC

NOTE: Challenger shown in illustration, 300/Charger similar.

1. Install the belt line molding with longer lip (1) towards the inside of the door trim panel (2).
2. Install the new belt line molding.
3. Push the belt line molding all the way down to prevent it from becoming wavy.

Fig. 271: Identifying Location Of Staples On Belt Line Molding
Courtesy of CHRYSLER LLC

NOTE: If the staple is not seated correctly, remove the staple and retry.

4. Staple every three inches and at each end of the belt line molding.

813698e3

Fig. 272: Door Trim Panel
Courtesy of CHRYSLER LLC

5. Instal the front door trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation.**
6. Connect and install the negative battery cable.

INSTALLATION

MOLDING-INNER BELT

90146

Fig. 273: Removing/Installing Inner Belt Molding - Door
Courtesy of CHRYSLER LLC

1. Starting from the rear of the door, install the belt molding (1) to the door (2).

2. Continue to firmly press down and install the molding, working towards the front of the door.
3. Install the door trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation**

MOLDING-OUTER BELT

Fig. 274: Removing/Installing Outer Belt Molding - Door
Courtesy of CHRYSLER LLC

1. Starting from the rear of the door, install the outer belt molding (1) to the door flange (2) by firmly pressing down on the molding.
2. Continue to firmly press down and install the molding, working towards the front of the door.
3. Install the door trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation**

PANEL, DOOR TRIM

Removal

REMOVAL

Fig. 275: Removing/Installing Door Trim Panel
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .
2. Unsnap and fold back the screw cap behind the interior handle and remove the screw (1).
3. Unsnap and fold back the screw cap below the trim panel (2) pull handle to access and remove the screw (3).
4. Remove the screws (4) that secure the trim panel to the inside of the door.

Fig. 276: Location Of Door Trim Panel Fasteners
 Courtesy of CHRYSLER LLC

5. Remove the push pins (1) that secure the trim panel (2) to the door.
6. Carefully pull the bottom of the trim panel out and pull up on the panel to remove the door lock.
7. Disconnect all cables and connectors.
8. Remove the trim panel from the vehicle.

Installation

INSTALLATION

90562

Fig. 277: Location Of Door Trim Panel Fasteners
Courtesy of CHRYSLER LLC

1. Position the top of the door trim panel (2) to the door, ensuring the door lock is inserted through the door trim panel.
2. Connect the electrical connectors and door latch cable to the door trim panel.
3. Firmly seat the top of the door trim panel in position and seat the trim panel to the door from the top to bottom.
4. Install the pushpin fasteners (1) to the door trim panel.

Fig. 278: Removing/Installing Door Trim Panel
Courtesy of CHRYSLER LLC

5. Install the screws (4) to the outer edge of the door trim panel (2).
6. Install the screw (3) to the inside pull handle and close the plastic cover.
7. Install the screw (1) to the inside of the interior door handle and close the plastic cover.
8. Connect the battery negative cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to Electrical - Engine Systems/Battery System - Standard Procedure

REGULATOR, WINDOW

Removal

REMOVAL

108367

Fig. 279: Removing/Installing Window Glass At Regulator
Courtesy of CHRYSLER LLC

1. Remove the trim panel. See **Body/Door - Front/PANEL, Door Trim - Removal**.
2. Remove the speaker. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Removal**
3. Remove the watershield. See **Body/Door - Front/WATERSHIELD - Removal**.
4. Adjust the front door glass position up or down as required for access to the two window regulator glass clamps.
5. Loosen the screw in each of the glass clamps far enough to release the glass.
6. Lift the glass out of the regulator clamps and into its full up position, then tape the glass securely into place.
7. Remove the power window motor fasteners (1) and disengage the motor bracket from the door.
8. Remove the window regulator mounting fasteners (2).
9. Disconnect the electrical connectors.

Fig. 280: Removing/Installing Window Regulator
 Courtesy of CHRYSLER LLC

10. Carefully remove the regulator (1) through the large access hole (2) at the rear of the door.

Installation

INSTALLATION

Fig. 281: Removing/Installing Window Regulator
 Courtesy of CHRYSLER LLC

1. Load the regulator (1) into the door through the large access hole (2) at the rear of the door.

108367

Fig. 282: Removing/Installing Window Glass At Regulator
Courtesy of CHRYSLER LLC

2. Position the regulator in place and install the regulator mounting fasteners (2). Tighten the screws to 10 N.m (89 in. lbs.).
3. Align the power window motor and install mounting fasteners (1). Tighten the screws to 10 N.m (89 in. lbs.).
4. Remove the tape securing the door glass in its full up position, then lower the glass to engage it into the two window regulator glass clamps.
5. Using the regulator, lower the glass far enough to access the two window regulator glass clamp screws.
6. Tighten the screw in each of the glass clamps. Tighten the screws to 10 N.m (89 in. lbs.).
7. Install the watershield onto the inside of the front door. See **Body/Door - Front/WATERSHIELD - Installation**.
8. Install the speaker onto the inside of the front door. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Installation**
9. Install the trim panel onto the inside of the front door. See **Body/Door - Front/PANEL, Door Trim - Installation**.

STRIKER, DOOR LATCH

Removal

REMOVAL

1. Open the front door.
2. Mark the front door latch striker location on the face of the outer B-pillar to aid reinstallation.
3. Remove the two screws that secure the striker to the B-pillar.

4. Remove the striker from the B-pillar.

Installation

INSTALLATION

1. Position the front door latch striker on the face of the outer B-pillar.
2. Install and tighten the two screws that secure the striker to the B-pillar. Tighten the screws to 33 N.m (24 ft. lbs.).
3. Adjust the latch striker position as necessary to achieve proper door spacing and latch operation.

WATERSHIELD

Removal

REMOVAL

90597

Fig. 283: Door Trim Panel Watershield
Courtesy of CHRYSLER LLC

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Remove the trim panel from the front door (1). See Body/Door - Front/PANEL, Door Trim -

Removal.

2. Remove the watershield (2) from the door.

Installation

INSTALLATION

Fig. 284: Door Trim Panel Watershield
Courtesy of CHRYSLER LLC

CAUTION: Do not allow the watershield or adhesive to become contaminated with dirt or other foreign substances.

Do not damage the watershield during removal and installation.

If the watershield becomes contaminated or damaged, replace the watershield.

1. Install the water shield (2) to the door (1).
2. Apply firm and even pressure to the adhesive bead along the remaining edges of the watershield to seal it to the inside of the door. Be certain that the watershield is sealed to the inside of the door.
3. Install the door trim panel. See **Body/Door - Front/PANEL, Door Trim - Installation.**

EXTERIOR

BELLY PAN

Removal

1. Raise and support the vehicle.
2. Remove the fasteners that secure the front belly pan to the front fascia.
3. Remove the fasteners (2) that secure the front belly pan (1) to the underside of the vehicle.
4. Remove the push pins that connect the front belly pan to the front splash shields.
5. Remove the front belly pan from the underside of the vehicle.

813530c9

Fig. 286: Rear Belly Pan
Courtesy of CHRYSLER LLC

6. Remove the fasteners (1) that secure the rear belly pan (2) to the underside of the vehicle.
7. Remove the rear belly pan from the underside of the vehicle.

Installation

INSTALLATION

NOTE: During installation, ensure rear belly pan is shingled underneath front belly pan. Failure to do so may result in damage to belly pan.

813530c9

Fig. 287: Rear Belly Pan
Courtesy of CHRYSLER LLC

1. Position the rear belly pan (2) to the underside of the vehicle.
2. Install the fasteners (1) that secure the rear belly pan to the underside of the vehicle.

109149

Fig. 288: Removing/Installing Front Belly Pan
Courtesy of CHRYSLER LLC

3. Position the front belly pan (1) to the underside of the vehicle.
4. Install the fasteners (2) that secure the front belly pan to the underside of the vehicle.
5. Install the fasteners that secure the front belly pan to the front fascia.
6. Install the push pins that connect the front belly pan to the front splash shields.
7. Lower the vehicle.

CLADDING, BODY

Removal

REMOVAL

813768b0

Fig. 289: Body Side Cladding
 Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the wheels from the side of the vehicle being serviced. Refer to **Tires and Wheels - Removal**.
3. Remove the pop rivets (2 and 5) from the front fender (1) and rear quarter panel (6).
4. Remove the rear body side cladding (4) by disengaging the cladding retaining clips from the rocker panel (7).
5. Remove the front body side cladding (3) by disengaging the retaining clip from the front fender.

Installation

INSTALLATION

Fig. 290: Body Side Cladding
Courtesy of CHRYSLER LLC

1. Position the front body side cladding (3) to the front fender (1).
2. Engaging the front cladding retaining clip to the front fender.
3. Position the rear body side cladding (4) to the rocker panel (6).
4. Engaging the rear cladding retaining clips to the rocker panel.
5. Install the pop rivets (2 and 5).
6. Install the wheels. Refer to **Tires and Wheels - Installation** .
7. Lower the vehicle.

COVER, COWL PANEL

Removal

REMOVAL

Fig. 291: Cowl Panel 1
Courtesy of CHRYSLER LLC

1. Remove the two push pins (2) that secure the front cowl top panel (1) to the right rear corner of the engine compartment
2. Remove the front cowl top panel.

Fig. 292: Cowl Panel 2
Courtesy of CHRYSLER LLC

3. Remove the windshield wiper arms. Refer to **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Removal** .
4. Remove the push-pin (2) that secures each end of the cowl top panel (1) to each front fender

(7).

5. Disengage the two 1/4-turn fasteners (3) that secure the cowl top panel to the dash panel (5).
6. Remove the six push-pins (4) that secure the cowl top panel to the strut tower support (6).
7. Disengage the integral retaining clips that secure the cowl top panel to the dash panel and remove the cowl panel from the engine compartment.

Installation

INSTALLATION

Fig. 293: Cowl Panel 2
Courtesy of CHRYSLER LLC

1. Position the cowl top panel (1) into the engine compartment.
2. Engage the integral retaining clips that secure the cowl top panel to the dash panel (5).
3. Install the six push-pins (4) that secure the cowl top panel to the strut tower support (6).
4. Engage the 1/4-turn fasteners (3) that secure cowl top panel to the dash panel.
5. Install the push-pin (2) that secures each end of the cowl top panel to each front fender (7).
6. Install the windshield wiper arms. Refer to **Electrical - Wipers/Washers/Wipers/Washers/ARM, Wiper - Installation** .

Fig. 294: Cowl Panel 1
 Courtesy of CHRYSLER LLC

7. Position the front cowl top panel (1) to the right rear corner of the engine compartment.
8. Install the two push-pins (2) that secure the front cowl top panel.

CROSSMEMBER, HEADLAMP MOUNTING

Removal

REMOVAL

Fig. 295: Headlamp Attaching Screws
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Removal** .
3. Remove the headlamp units (1). Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Removal** .

Fig. 296: Horn Mounting
Courtesy of CHRYSLER LLC

4. Disconnect the headlamp wire harness from the horns.
5. Remove the bolts that secure the horns to the headlamp mounting crossmember and remove the horns.

Fig. 297: Removing/Installing Hood Latch
Courtesy of CHRYSLER LLC

6. Mark the location of the hood latch (2) on the front of the headlamp mounting crossmember (1) to aid in reinstallation.
7. Remove the two bolts (3) that secure the hood latch to the headlamp mounting crossmember and position the hood latch and cable out of the way.

8136a312

Fig. 298: Radiator Mounting Bracket
 Courtesy of CHRYSLER LLC

8. Remove the bolts (2) that secure the radiator mounting brackets (1) to the headlamp mounting crossmember.

813600ac

Fig. 299: Headlamp Mounting Crossmember
 Courtesy of CHRYSLER LLC

NOTE: Mark the location of the headlamp mounting crossmember to the other body components prior to removal of the crossmember to aid in reinstallation.

9. Mark the location of the headlamp mounting crossmember (1) to the front fenders.
10. Remove the bolts (2 and 3) that secure the headlamp mounting crossmember to the front fenders.
11. Remove the bolts (4) that secure the headlamp mounting crossmember to the front frame rails (5).
12. Remove the headlamp mounting crossmember from the engine compartment.

Installation

INSTALLATION

813b00ac

Fig. 300: Headlamp Mounting Crossmember
Courtesy of CHRYSLER LLC

NOTE: The Vehicle Emission Control Information (VECI) label(s) must be in place for the life of the vehicle. When replacing the component in which the VECI label is adhered, a new VECI label must also be adhered to the new component.

1. Position the headlamp mounting crossmember (1) into the engine compartment.
2. Loosely install the bolts (2 and 3) that secure the headlamp mounting crossmember to the front fenders.
3. Loosely install the bolts (4) that secure the headlamp mounting crossmember to the front frame rails (5).
4. Align the headlamp mounting crossmember using the alignment marks previously indicated and tighten all of the retaining bolts to 28 N.m (21 ft. lbs.).

Fig. 301: Radiator Mounting Bracket
Courtesy of CHRYSLER LLC

5. Install the bolts (2) that secure the radiator mounting bracket (1) to the headlamp mounting crossmember. Tighten the bolts to 5 N.m (45 in. lbs.).

Fig. 302: Removing/Installing Hood Latch
Courtesy of CHRYSLER LLC

6. Position the latch (2) to the front of the crossmember (1).
7. Loosely install the two bolts (3) that secure the hood latch to the headlamp mounting crossmember.
8. Align the hood latch using the alignment marks previously indicated and tighten the hood latch bolts to 28 N.m (21 ft. lbs.).

Fig. 303: Horn Mounting
Courtesy of CHRYSLER LLC

9. Install the horns onto the headlamp mounting crossmember. Tighten the bolts to 28 N.m (21 ft. lbs.).
10. Connect the headlamp wire harness to the horns.

Fig. 304: Headlamp Attaching Screws
Courtesy of CHRYSLER LLC

11. Install the headlamp units (1). Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Installation**
12. Install the front fascia. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation** .
13. Reconnect the negative battery cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure**

14. Carefully close the hood and verify hood latch and panel alignment. Adjust as necessary.

GRILLE

Removal

REMOVAL

2093667

Fig. 305: Upper & Lower Grille Inserts
Courtesy of CHRYSLER LLC

1. Remove the front fascia from the vehicle. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Removal** .
2. If required, remove the retainers that secure the lower grille insert (2) to the fascia.
3. Carefully remove the lower insert from the fascia.
4. If required, remove the retainers that secure the upper grille insert assembly (1) to the fascia.
5. Carefully remove the assembly from the fascia.

Installation

INSTALLATION

2093667

Fig. 306: Upper & Lower Grille Inserts
Courtesy of CHRYSLER LLC

1. Place the upper grille assembly (1) into position to the fascia.
2. Install the retainers that secure the assembly to the fascia.
3. Place the lower grille insert (2) into position to the fascia.
4. Install the retainers that secure the lower grille insert to the fascia.
5. Install the front fascia to the vehicle. Refer to **Frame and Bumpers/Bumpers/FASCIA, Front - Installation** .

MIRROR, OUTSIDE REARVIEW

Removal

REMOVAL

1. Disconnect and isolate the negative battery cable.
2. Remove the door trim panel. See **Body/Door - Front/PANEL, Door Trim - Removal**.
3. Remove the water shield.
4. Disconnect the door wire harness connector from the mirror electrical connector.
5. Remove the three nuts that secure the outside rearview mirror to the front door.
6. Remove the outside rearview mirror from the front door.

Installation

INSTALLATION

1. Position the outside rearview mirror to the front door.
2. Install the three nuts that secure the mirror to the front door. Tighten the nuts to 7 N.m (62 in. lbs.).
3. Connect the door wire harness connector to the mirror electrical connector.
4. Install the water shield.
5. Install the trim panel to the inside of the front door. See **Body/Door - Front/PANEL, Door Trim - Installation**.
6. Reconnect the negative battery cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure**

MIRROR, OUTSIDE REARVIEW, GLASS

Removal

REMOVAL

WARNING: Always wear eye and hand protection when servicing the mirror glass. Failure to observe these warnings may result in personal injury from broken glass.

Fig. 307: Removing Glass-Outside Rearview Mirror
Courtesy of CHRYSLER LLC

1. Position the mirror glass (1) so that it is facing in toward the vehicle as far as possible.
2. Disconnect and isolate the negative battery cable.
3. Using a trim stick C-4755 or equivalent flat bladed tool (2), release the two outer mirror glass holder retaining clips from the mirror motor by inserting the trim stick between the mirror glass holder and the mirror motor.

Fig. 308: Mirror Glass Retaining Clips
Courtesy of CHRYSLER LLC

4. Carefully pull/pry the outside edges of the mirror glass holder (1) away from the mirror motor (2) to disengage the remaining six mirror glass retaining clips (3) from the mirror motor.
5. Separate the mirror glass holder from the mirror motor and disconnect the mirror wire harness from the heated glass electrical connector, if equipped.

Installation

INSTALLATION

Fig. 309: Mirror Glass Retaining Clips
Courtesy of CHRYSLER LLC

1. Connect the mirror wire harness to the heated glass electrical connector, if equipped.
2. Position the mirror glass holder (1) to the mirror assembly and align the eight mirror glass retaining clips (3) to the mirror motor (2).

Fig. 310: Glass- Outside Rearview Mirror - Install
Courtesy of CHRYSLER LLC

NOTE: Pressure must be applied equally over the center portion of the mirror glass to fully engage the mirror glass retaining clips to the mirror motor.

3. Using one hand, carefully push the mirror glass holder (1) onto the mirror motor, while at the same time supporting the mirror housing (2) from the backside with the other hand. Firmly push on the mirror glass holder until all eight mirror glass retaining clips are fully engaged.
4. Verify retention of the mirror glass holder by gently pulling outward on the glass.
5. Reconnect the negative battery cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to Electrical - Engine Systems/Battery System - Standard Procedure

SHIELD, SPLASH, FRONT WHEELHOUSE

Removal

REMOVAL

Fig. 311: Removing/Installing Front Wheelhouse Splash Shield
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the wheel from the side of the vehicle being serviced. Refer to **Tires and Wheels - Removal**.
3. Remove the push-pins (2) that secure the front wheelhouse shield (1) to the body.
4. Remove the plastic rivets from the splash shield and discard.
5. Remove the front wheelhouse shield from the vehicle.

Installation

INSTALLATION

Fig. 312: Removing/Installing Front Wheelhouse Splash Shield
Courtesy of CHRYSLER LLC

1. Position the front wheelhouse shield (1) into the front fenderwell.
2. Install the push-pin (2) that secure the front wheelhouse shield to the body.
3. Install the new plastic rivets to the splash shield.
4. Install the front wheel. Refer to **Tires and Wheels - Installation** .
5. Lower the vehicle.

SHIELD, SPLASH, REAR WHEELHOUSE

Removal

REMOVAL

Fig. 313: Removing/Installing Rear Wheelhouse Splash Shield
Courtesy of CHRYSLER LLC

1. Raise and support the vehicle.
2. Remove the rear wheel from the side of the vehicle being serviced. Refer to **Tires and Wheels - Removal** .
3. Remove the push-pins (1) that secure the rear wheelhouse shield (2) to the body.
4. Remove the plastic rivets from the splash shield and discard.
5. Remove the rear wheelhouse shield from the vehicle.

Installation

INSTALLATION

Fig. 314: Removing/Installing Rear Wheelhouse Splash Shield
Courtesy of CHRYSLER LLC

1. Position the rear splash shield (2) into the rear wheelhouse.
2. Install the push-pins (1) that secure the rear wheelhouse shield to the body.
3. Install the new plastic rivets to the splash shield.
4. Install the rear wheel. Refer to **Tires and Wheels - Installation** .
5. Lower the vehicle.

TRIM, COWL EXTENSION

Removal

REMOVAL

Fig. 315: Cowl Trim Extension
Courtesy of CHRYSLER LLC

1. Insert special tool C-4755 (from the outside in the direction of arrow 2) under the middle of the trim extension (2).
2. Slide trim stick up to the upper spring clip retainer, and pry to disengage clip.
3. Slide the trim stick down to the lower spring clip retainer, and pry to disengage clip.

Installation

INSTALLATION

Fig. 316: Cowl Trim Extension
Courtesy of CHRYSLER LLC

1. Place trim extension (2) against cowl (1) and align spring clips with holes on cowl.
2. Tap trim extension on to cowl (1) ensuring trim extension (2) is properly seated.

HOOD

BEZEL, HOOD

Removal

REMOVAL

Fig. 317: Removing/Installing Hood Bezel
Courtesy of CHRYSLER LLC

1. Using trim stick C-4755 or equivalent, release tabs securing bezel (1) to hood (2).
2. Remove bezel.

Installation

INSTALLATION

Fig. 318: Removing/Installing Hood Bezel
 Courtesy of CHRYSLER LLC

1. Insert top of hood bezel (1) to hood (2).
2. Insert bottom of hood bezel to hood ensuring bezel clips fasten.

BUMPER, HOOD

Removal

REMOVAL

Fig. 319: Hood Adjuster Bumpers
 Courtesy of CHRYSLER LLC

1. Open and support the hood.

2. Unscrew the hood adjustment bumper(s) (1) from the mounting hole(s) in the top of the headlamp mounting crossmember (2).
3. Remove the adjustment bumper(s) from the vehicle.

Installation

INSTALLATION

Fig. 320: Hood Adjuster Bumpers
Courtesy of CHRYSLER LLC

1. Install the hood adjustment bumper(s) (1) into the mounting hole(s) located in the top of the headlamp mounting crossmember (2).
2. Adjust the adjustment bumper(s) in or out of the crossmember as necessary to achieve proper hood alignment.

CABLE, HOOD RELEASE

Removal

REMOVAL

Fig. 321: Latch Release Cable
 Courtesy of CHRYSLER LLC

1. Remove the hood latch (2) from the vehicle. See **Body/Hood/LATCH, Hood - Removal**.
2. Remove the left headlamp unit from the vehicle. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Removal**
3. Disengage the hood latch release cable from the integral routing clips on the headlamp mounting crossmember and the routing clips (1) along the left side of the engine compartment.

Fig. 322: Hood Latch Release Handle
 Courtesy of CHRYSLER LLC

4. From the passenger compartment, remove the closeout panel from beneath the left side of the

instrument panel. See **Body/Instrument Panel/PANEL, Silencer - Removal**.

5. Unseat the hood latch release cable grommet (1) from the dash panel.
6. Remove the two screws (4) that secure the hood latch release handle (3) to the lower instrument panel reinforcement (2).
7. Remove the hood latch release handle and cable through the passenger compartment of the vehicle.

Installation

INSTALLATION

Fig. 323: Hood Latch Release Handle
Courtesy of CHRYSLER LLC

1. Position the hood latch release handle and cable (3) under the left side of the instrument panel in the passenger compartment of the vehicle.
2. Thread the cable through the appropriate hole in the dash panel far enough to seat the cable grommet (1) into the hole.
3. Position the hood latch release handle to the lower instrument panel reinforcement (2).
4. Install and tighten the two screws (4) that secure the handle to the reinforcement. Tighten the screws to 5 N.m (45 in. lbs.).
5. Reinstall the closeout panel beneath the left side of the instrument panel. See **Body/Instrument Panel/PANEL, Silencer - Installation**.

Fig. 324: Latch Release Cable
Courtesy of CHRYSLER LLC

6. Route the hood latch release cable from the dash panel along the left side of the engine compartment to the center of the headlamp mounting crossmember as shown in illustration.
7. Fully engage the cable into the integral routing clips on the headlamp mounting crossmember and the routing clips (1) along the left side of the engine compartment.
8. Reinstall the left headlamp unit to the vehicle. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/UNIT, Front Lamp - Installation**
9. Reinstall the hood latch (2) to the vehicle. See **Body/Hood/LATCH, Hood - Installation**.

HINGE, HOOD

Removal

REMOVAL

Fig. 325: Hood Hinge

Courtesy of CHRYSLER LLC

1. Open and support the hood (2) with a suitable prop or block.
2. If the vehicle is so equipped, disconnect the upper end of the gas support cylinder from the upper bracket of the hood hinge (3).
3. Mark the location of the hood hinge upper bracket on the hood (2) inner panel to aid reinstallation.
4. Remove the two screws (1) that secure the hinge to the hood.
5. Mark the hinge lower bracket location on the inside of the front fender ledge (5) to aid reinstallation.
6. Remove the two screws (4) that secure the hinge to the fender.
7. Remove the hood hinge from the vehicle.

Installation

INSTALLATION

Fig. 326: Hood Hinge
Courtesy of CHRYSLER LLC

1. Position the lower bracket of the hood hinge (3) to the inside of the front fender ledge (5) on the vehicle.
2. Install and tighten the two screws (4) that secure the hinge to the fender. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Position the hood panel (2) to the upper hinge bracket on the vehicle.
4. Install and tighten the two screws (2) that secure the hinge to the hood. Tighten the screws to 28 N.m (21 ft. lbs.).
5. If the vehicle is so equipped, reinstall the upper end of the gas support cylinder to the upper hinge bracket.
6. Remove the fixture being used to support the hood for service and close the hood.
7. Adjust the hood hinge position as necessary to achieve proper spacing and operation.

HOOD

Removal

REMOVAL

Fig. 327: Upper Hinge Bracket
Courtesy of CHRYSLER LLC

1. Open and support the hood (2).
2. Disconnect the washer supply hose between the body and the two washer nozzles on the underside of the hood.
3. Mark both upper hinge bracket (3) locations on the hood inner panel to aid reinstallation.
4. With the aid of an assistant, support the hood while removing the two screws (1) that secure each upper hinge bracket to the hood.
5. Remove the hood from the vehicle.

Installation

INSTALLATION

Fig. 328: Upper Hinge Bracket
Courtesy of CHRYSLER LLC

1. With the aid of an assistant, support and position the hood panel (2) to the two upper hinge brackets (3) on the vehicle.
2. Install and tighten the two screws (1) that secure each upper hinge bracket to the hood. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Reconnect the washer supply hose between the body and the two washer nozzles on the underside of the hood.
4. Close the hood.
5. Adjust the hood hinge positions and the hood adjuster bumpers as necessary to achieve proper spacing and operation.

LATCH, HOOD

Removal

REMOVAL

Fig. 329: Removing/Installing Hood Latch
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Unsnap the left underhood appearance cover from the headlamp mounting crossmember.
3. Disengage the interlocking feature on the inboard end of the left underhood appearance cover from the inboard end of the right cover and remove it from the vehicle.
4. Unsnap the right underhood appearance cover from the headlamp mounting crossmember and remove it from the vehicle.
5. Mark the location of the hood latch (2) on the front of the headlamp mounting crossmember (1) to aid reinstallation.
6. Remove the two screws (3) that secure the latch to the front of the crossmember.

Fig. 330: Hood Latch Release Cable
Courtesy of CHRYSLER LLC

7. Pull the latch (1) away from the front of the crossmember far enough to access and disengage the hood latch release cable housing from the latch and the cable ball end (2) from the latch lever.
8. Remove the hood latch from the vehicle.

Installation

INSTALLATION

Fig. 331: Hood Latch Release Cable
Courtesy of CHRYSLER LLC

1. Position the hood latch (1) close enough to the front of the headlamp mounting crossmember to access and engage the hood latch release cable ball end (2) to the latch lever and the cable housing to the latch.

Fig. 332: Removing/Installing Hood Latch
Courtesy of CHRYSLER LLC

2. Position the latch (2) to the front of the crossmember (1).
3. Install and tighten the two screws (3) that secure the latch to the crossmember. Tighten the screws to 28 N.m (21 ft. lbs.).
4. Adjust the latch position as necessary to achieve proper hood latch operation.
5. Position the right underhood appearance cover to the headlamp mounting crossmember.
6. Using hand pressure, press the right appearance cover downward until each of the integral clips snaps into the receptacles in the headlamp mounting crossmember.
7. Engage the interlocking feature on the inboard end of the left appearance cover with the inboard

end of the right cover and position it to the headlamp mounting crossmember.

8. Using hand pressure, press the left appearance cover downward until each of the integral clips snaps into the receptacles in the headlamp mounting crossmember.
9. Reconnect the battery negative cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to Electrical - Engine Systems/Battery System - Standard Procedure

ROD, HOOD PROP

Removal

REMOVAL

813a5944

Fig. 333: Hood Prop Rod
Courtesy of CHRYSLER LLC

1. Open and support the hood.
2. Remove the blind rivet (1) that secures the hood prop rod (2) pivot bracket to the right side of the headlamp mounting crossmember (3).
3. Disengage the prop rod from the rod clip (4) on the left side of the headlamp mounting crossmember.
4. Remove the hood prop rod from the vehicle.

Installation

INSTALLATION

Fig. 334: Hood Prop Rod
Courtesy of CHRYSLER LLC

1. Position the hood prop rod (2) pivot bracket to the right side of the headlamp mounting crossmember (3).
2. Secure the pivot bracket to the headlamp mounting crossmember with a new blind rivet (1).
3. Engage the prop rod into the rod clip (4) on the left side of the headlamp mounting crossmember.
4. Close the hood.

STRIKER, HOOD

Removal

REMOVAL

Fig. 335: Removing/Installing Hood Latch Striker
Courtesy of CHRYSLER LLC

1. Open and support the hood (3).
2. Remove the two screws (2) that secure the latch striker (1) to the hood inner reinforcement.
3. Remove the striker from the vehicle.

Installation

INSTALLATION

Fig. 336: Removing/Installing Hood Latch Striker
Courtesy of CHRYSLER LLC

1. Position the latch striker (1) to the underside of the hood (3).
2. Install and tighten the two screws (2) that secure the striker to the hood inner reinforcement. Tighten the screws to 28 N.m (21 ft. lbs.).
3. Close the hood.

INSTRUMENT PANEL

BEZEL, INSTRUMENT CLUSTER

Removal

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Remove the steering column opening cover. See **Body/Instrument Panel/COVER, Steering Column Opening - Removal**.
3. Remove the cluster bezel mounting fastener.
4. Using Trim Stick C-4755 or equivalent, carefully remove the cluster bezel.

Installation

INSTALLATION

1. Install the cluster bezel and firmly seat into position.
2. Install the cluster bezel mounting fastener.
3. Install the steering column opening cover. See **Body/Instrument Panel/COVER, Steering Column Opening - Installation.**

BEZEL, INSTRUMENT PANEL, CENTER

Removal

REMOVAL

Fig. 337: Instrument Panel Cover & Center Bezel
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Using trim stick C-4755 or equivalent, remove the center bezel (2) from the instrument panel (1) by releasing the snapretainers from the instrument panel.
3. Disconnect the electrical connectors.
4. Remove the center bezel from the vehicle.

Installation

INSTALLATION

88012

Fig. 338: Instrument Panel Cover & Center Bezel
 Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Position the center bezel (2) near the instrument panel (1).
3. Connect the electrical connectors.
4. Install the center bezel onto the instrument panel and carefully push on the outside edges of the center bezel to fully seat the snap clip retainers.

COVER, INSTRUMENT PANEL

Removal

REMOVAL

88012

Fig. 339: Instrument Panel Cover & Center Bezel
 Courtesy of CHRYSLER LLC

1. Remove the instrument panel from the vehicle. See **Body/Instrument Panel/PANEL, Instrument - Removal**
2. Remove the headlamp switch.
3. Remove the Wireless Ignition Node (WIN). Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Removal** .
4. Remove the instrument panel speakers. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Removal** .
5. Using Trim Stick C-4755 or equivalent, remove the center bezel (2) from the instrument panel (1) by releasing the snap retainers from the instrument panel.
6. Disconnect the electrical connectors and remove the center bezel from the vehicle.
7. Remove the radio. Refer to **Electrical - Audio and Video/Audio and Video/RADIO - Removal** .

Fig. 340: Glove Box Opening Front Fasteners
Courtesy of CHRYSLER LLC

8. Remove the passenger airbag. Refer to **Restraints/AIR BAG, Passenger - Removal** .
9. Disconnect the light sensor and remove.
10. Remove the glove box opening front fasteners (1).

Fig. 341: Top Cover End Fasteners
Courtesy of CHRYSLER LLC

11. Remove left and right top cover fasteners (1).

Fig. 342: Center Stack Lower Mounting Fasteners
Courtesy of CHRYSLER LLC

12. Remove the lower mounting fasteners (1) located in the center stack.

Fig. 343: Center Stack Upper Mounting Fasteners
 Courtesy of CHRYSLER LLC

13. Remove the upper mounting fasteners (1) located in the center stack.

Fig. 344: Cluster Opening Mounting Fasteners
 Courtesy of CHRYSLER LLC

14. Remove the mounting fasteners (1) located in the cluster opening.
15. Remove the fasteners securing the HVAC ducts to the top cover.
16. Remove the remaining fasteners.
17. Remove the wire harness from the instrument panel.
18. Separate the top cover from the instrument panel frame.

Installation

INSTALLATION

Fig. 345: Cluster Opening Mounting Fasteners
 Courtesy of CHRYSLER LLC

1. Position the top cover to the instrument panel frame.
2. Install the wire harness to the instrument panel.
3. Install the fasteners securing the HVAC ducts to the top cover.
4. Install the mounting fasteners (1) located in the cluster opening.

Fig. 346: Center Stack Upper Mounting Fasteners
 Courtesy of CHRYSLER LLC

5. Install the upper mounting fasteners (1) located in the center stack.

Fig. 347: Center Stack Lower Mounting Fasteners
 Courtesy of CHRYSLER LLC

6. Install the lower mounting fasteners (1) located in the center stack.

Fig. 348: Top Cover End Fasteners
 Courtesy of CHRYSLER LLC

7. Install the left and right top cover fasteners (1).

Fig. 349: Glove Box Opening Front Fasteners
 Courtesy of CHRYSLER LLC

8. Install the glove box opening front fasteners (1).
9. Install the remaining fasteners.
10. Install the passenger airbag. Refer to **Restraints/AIR BAG, Passenger - Installation**
11. Connect the light sensor and install.

Fig. 350: Instrument Panel Cover & Center Bezel
 Courtesy of CHRYSLER LLC

12. Install the radio. Refer to **Electrical - Audio and Video/Audio and Video/RADIO - Installation**.
13. Connect the electrical connectors and install the center bezel. See **Body/Instrument Panel/BEZEL, Instrument Panel - Installation**

14. Install the instrument panel speakers. Refer to **Electrical - Audio and Video/Audio and Video/SPEAKER - Installation** .
15. Install the Wireless Ignition Node (WIN). Refer to **Electrical - Electronic Control Modules/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Installation** .
16. Install the headlamp switch.
17. Install the instrument panel to the vehicle. See **Body/Instrument Panel/PANEL, Instrument - Installation**

COVER, STEERING COLUMN OPENING

Removal

REMOVAL

Fig. 351: Reinforcement I/P Steering Column
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the screws that secure the steering column cover to the instrument panel.
3. Pull the steering column cover rearward at the top and right side of the cover to release the snap retainers from the instrument panel.
4. Disconnect the wire harness connector from the trunk release switch, if equipped.
5. If required, remove the screws (3) that secures the instrument panel steering column cover reinforcement (1) to the bracket (2) and remove the reinforcement from the vehicle.

Installation

INSTALLATION

Fig. 352: Reinforcement I/P Steering Column
 Courtesy of CHRYSLER LLC

1. If removed, position the instrument panel steering column cover reinforcement (1) onto the bracket (2).
2. Install the screws (3) that secure the instrument panel steering column cover reinforcement to the bracket. Tighten the screws securely.

Fig. 353: Steering Column Cover
 Courtesy of CHRYSLER LLC

3. Position the steering column cover (1) into the vehicle.
4. Connect the release cable (4) to the emergency brake release handle (5).
5. Connect the wire harness connector (3) to the trunk release switch, if equipped.
6. Install the steering column cover onto the instrument panel and carefully push on the top and right side of the cover to fully seat the snap clip retainers into the instrument panel.
7. Install the screws (2 and 6) that secure the steering column cover (1) to the instrument panel. Tighten the screws securely.
8. Connect the negative battery cable.

NOTE: For vehicles equipped with the optional Automatic Express Up power window feature, recalibration of this feature is required whenever power to the door module is disrupted. Refer to Electrical - Engine Systems/Battery System - Standard Procedure

CYLINDER, GLOVE BOX LOCK

Removal

REMOVAL

Fig. 354: Lock-Glove Box Removal No. 1
Courtesy of CHRYSLER LLC

1. Remove the glove box latch (1) from the glove box door and place it on a workbench. See Body/Instrument Panel/LATCH, Glove Box Door - Removal.
2. Insert the ignition key (2) into the glove box lock cylinder (3) and rotate the ignition key 90 degrees clockwise.

Fig. 355: Lock-Glove Box Removal No. 2
 Courtesy of CHRYSLER LLC

3. Using a small pointed tool, press in on the lock pin (1) showing through the opening in the glove box latch housing (2) and rotate the ignition key (3) an additional 45 degrees clockwise.

Fig. 356: Lock-Glove Box Removal No. 3
 Courtesy of CHRYSLER LLC

4. Pull the ignition key (1) and the glove box lock cylinder (2) out of the glove box latch (3) as an assembly.

813700ed

Fig. 357: Removing/Installing Tumblers-Glove Box Lock
 Courtesy of CHRYSLER LLC

NOTE: For reinstallation purposes, when removing the tumblers from the glove box lock, be sure to make note of the location of each tumbler within the lock cylinder.

5. If required, remove the tumblers (1) and the springs (2) from the glove box lock cylinder (3). Note the location of each tumbler within the lock.

Installation

INSTALLATION

813700ed

Fig. 358: Removing/Installing Tumblers-Glove Box Lock
Courtesy of CHRYSLER LLC

NOTE: Be sure to install each tumble into their correct location within the lock cylinder.

1. If removed, install the springs (2) and the tumblers (1) into the glove box lock cylinder (3) in the order in which they were removed.

8137055b

Fig. 359: Lock-Glove Box Installing No. 1
Courtesy of CHRYSLER LLC

2. Install the ignition key (1) and the glove box lock cylinder (2) into the glove box latch (3) as an assembly.

8137055a

Fig. 360: Lock-Glove Box Installing No. 2
Courtesy of CHRYSLER LLC

3. Rotate the ignition key (1) counterclockwise until the lock cylinder (2) is fully retained in the glove box latch (3).
4. Install the glove box latch onto the glove box door. See **Body/Instrument Panel/LATCH, Glove Box Door - Installation**.

GLOVE BOX, INSTRUMENT PANEL

Removal

REMOVAL

Fig. 361: Removing/Installing Bin-Glove Box
Courtesy of CHRYSLER LLC

1. Open the glove box bin (1).
2. Push in on both sides of glove box bin to disengage the glove box stops (2) and lower the bin.
3. Pivot the glove box bin downward and disengage the glove box hinge hooks (3) from the instrument panel hinge brackets (4) located at each end of the bin.

Fig. 362: Bin-Glove Box Support Strap
Courtesy of CHRYSLER LLC

4. Turn the glove box bin (1) sideways and remove the support strap and retainer assembly (2) from the outboard end of the bin.
5. Remove the glove box bin from the vehicle.

Installation

INSTALLATION

Fig. 363: Bin-Glove Box Support Strap
Courtesy of CHRYSLER LLC

1. Position the glove box bin (1) into the vehicle.
2. Turn the glove box bin sideways and install the support strap and retainer assembly (2) onto the outboard end of the bin.

Fig. 364: Removing/Installing Bin-Glove Box
Courtesy of CHRYSLER LLC

3. Engage the glove box bin hinge hooks (3) onto the instrument panel hinge brackets (4) located at each end of the glove box bin (1) and pivot the bin upward.
4. To engage the glove box stops (2), push inward on both sides of the glove box bin and pivot the glove box into the instrument panel.
5. Close the glove box bin.

GRILLE, DEFROSTER

Removal

REMOVAL

66325

Fig. 365: Removing/Installing Defroster Grille
Courtesy of CHRYSLER LLC

1. Using Trim Stick C-4755 or equivalent, gently pry between the instrument panel top cover and the rear of the defroster grille (1) to release the snap clip retainers (2) that secure the defroster grille.
2. Carefully pull the defroster grille rearward disengaging the front spring clips.
3. Remove the defroster grille from the vehicle.

Installation

INSTALLATION

66325

Fig. 366: Removing/Installing Defroster Grille
Courtesy of CHRYSLER LLC

1. Position the defroster grille (1) onto the top of the instrument panel.
2. Position the defroster grille front spring clips and gently press down on the rear of the defroster grille to engage the clips.
3. Carefully push down on the defroster grille to fully seat the snap clip retainers (2) into the instrument panel top cover.

LATCH, GLOVE BOX DOOR

Removal

REMOVAL

Fig. 367: Removing/Installing Glove Box Door Latch
 Courtesy of CHRYSLER LLC

1. Open the glove box.
2. Remove the two screws (2) that secure the latch assembly (3) to the glove box door (1) and remove the latch assembly.
3. If required, remove the glove box lock cylinder from the latch. See **Body/Instrument Panel/CYLINDER, Glove Box Lock - Removal**.

Installation

INSTALLATION

Fig. 368: Removing/Installing Glove Box Door Latch

Courtesy of CHRYSLER LLC

1. If removed, install the glove box lock cylinder into the latch. See **Body/Instrument Panel/CYLINDER, Glove Box Lock - Installation**.
2. Install the latch assembly (3) into the glove box door (1).
3. Install the two screws (2) that secure the latch assembly to the glove box door. Tighten the screws firmly.
4. Close the glove box.

PANEL, INSTRUMENT

Removal

REMOVAL

WARNING: Disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the Supplemental Restraint System (SRS). Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

WARNING: Never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment and serious or fatal injury.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

Fig. 369: Steering Column Cover
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. Disconnect and isolate the negative battery cable.
3. Raise and support the vehicle.
4. Disconnect the steering column from the steering coupling. Refer to **Steering/Column/COUPLING, Steering Column - Removal**
5. Lower the vehicle.
6. Remove steering column as necessary. Refer to **Steering/Column - Removal** .
7. Remove the glove box. See **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal**
8. Remove the left and right side instrument panel silencers. See **Body/Instrument Panel/PANEL, Silencer - Removal**.
9. Remove the screws (2 and 6) that secure the steering column cover (1) to the instrument panel.
10. Disconnect the electrical connector (3) from the trunk release switch.
11. Disconnect the hood release cable (4) from the hood release handle (5) and remove the steering column cover from the vehicle.

18893

Fig. 370: Steering Column Cover Reinforcement
 Courtesy of CHRYSLER LLC

12. Remove the screws (1) that secure the instrument panel steering column cover reinforcement (2) to the bracket and remove the reinforcement from the vehicle.

8131ac65

Fig. 371: Wiring Connections Left Side I/P
 Courtesy of CHRYSLER LLC

13. Disconnect the body wire harness connectors (1 and 3) from the instrument panel wire harness connectors.
14. Disconnect the body wire harness connectors (2 and 4) from the transmission control module.
15. Remove the center floor console. See **Body/Interior/CONSOLE, Floor - Removal**.

Fig. 372: Connections Right Side I/P
 Courtesy of CHRYSLER LLC

16. Disconnect the antenna coax (1) from the instrument panel coax extension.
17. Disconnect the wire harness connectors (2, 4, 5 and 6) from the instrument panel wire harness connectors (3).

Fig. 373: I/P To Headliner Connectors
 Courtesy of CHRYSLER LLC

18. Remove the A-pillar trim panels. See **Body/Interior/PANEL, A-Pillar Trim - Removal**

19. Disconnect the wire harness connectors (1 and 2) located on the A-pillars.

Fig. 374: I/P Attaching Screws
Courtesy of CHRYSLER LLC

20. Remove the end caps from the left and right side of the instrument panel to access the instrument panel side support bolts (1) and remove the bolts.
21. Remove the defroster grille to access the instrument panel top retaining bolts (2) and remove the bolts. See **Body/Instrument Panel/GRILLE, Defroster - Removal**.
22. Remove the bolts (3) that secure the bottom of the instrument panel.

8131db21

Fig. 375: Position I/P Into Body
Courtesy of CHRYSLER LLC

23. Lift the instrument panel assembly (2) off of the supports (1 and 5). Guide the steering column end (4) through the opening in the dash panel (3) and remove the instrument panel through the passenger door.

8131db07

Fig. 376: I/P Spring Nuts To Cowl
Courtesy of CHRYSLER LLC

24. If required, remove the spring nuts (1) from the dash panel.

Installation

INSTALLATION

WARNING: Disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, Occupant Classification System (OCS), seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the Supplemental Restraint System (SRS). Failure to take the proper precautions could result in accidental airbag deployment and serious or fatal injury.

WARNING: Never strike or drop the Occupant Restraint Controller (ORC), as it can damage the impact sensor or affect its calibration. The occupant restraint controller contains the impact sensor, which enables the system to deploy the supplemental restraints. If an airbag control module is accidentally dropped during service, the module must be scrapped and replaced with a new unit. Failure to observe this warning could result in accidental, incomplete, or improper supplemental restraint deployment and serious or fatal injury.

CAUTION: On vehicles equipped with the Occupant Classification System (OCS), never replace both the Occupant Restraint Controller (ORC) and the Occupant Classification Module (OCM) at the same time. If both require replacement, replace one. Then perform the supplemental restraint verification test before replacing the other. Both the ORC and the OCM store OCS calibration data, which they transfer to one another when one of them is replaced. If both are replaced at the same time, an irreversible fault will be set in both modules.

8131db07

Fig. 377: I/P Spring Nuts To Cowl
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions.
2. If required, install new spring nuts (1) into the dash panel.

8131db21

Fig. 378: Position I/P Into Body
Courtesy of CHRYSLER LLC

3. Position the instrument panel assembly (2) into the vehicle through the drivers side door. Guide the steering column end (4) through the opening in the dash panel (3) and install the instrument

panel onto the supports (1 and 5).

Fig. 379: I/P Attaching Screws
Courtesy of CHRYSLER LLC

4. Loosely install all the bolts that secure the instrument panel to the body. Tighten the bolts in the following order:
 - Top of instrument panel (2) to 8 N.m (70 in. lbs.).
 - Side support bolts (1) to 27 N.m (20 ft. lbs.).
 - Bottom of instrument panel (3) to 6 N.m (53 in. lbs.).
5. Install the end caps to the left and right side of the instrument panel.
6. Install the defroster grille to the top of the instrument panel. See **Body/Instrument Panel/GRILLE, Defroster - Installation**.

8131ac51

Fig. 380: I/P To Headliner Connectors
Courtesy of CHRYSLER LLC

7. Connect the wire harness connectors (1 and 2) located on the A-pillars.
8. Install the A-pillar trim panels. See **Body/Interior/PANEL, A-Pillar Trim - Installation**

8131ac8e

Fig. 381: Connections Right Side I/P
Courtesy of CHRYSLER LLC

9. Connect the wire harness connectors (2, 4, 5 and 6) to the instrument panel wire harness connector (3).

10. Connect the antenna coax (1) to the instrument panel coax extension.
11. Install the center floor console. See **Body/Interior/CONSOLE, Floor - Installation**.

Fig. 382: Wiring Connections Left Side I/P
Courtesy of CHRYSLER LLC

12. Connect the body wire harness connectors (2 and 4) to the transmission control module.
13. Connect the body wire harness connectors (1 and 3) to the instrument panel wire harness connectors.
14. Install steering column as necessary. Refer to **Steering/Column - Installation** .

Fig. 383: Steering Column Cover Reinforcement
Courtesy of CHRYSLER LLC

15. Position the instrument panel steering column cover reinforcement (2) onto the bracket.
16. Install the screws (1) that secure the instrument panel steering column cover reinforcement to the bracket. Tighten the screws securely.

Fig. 384: Steering Column Cover
Courtesy of CHRYSLER LLC

17. Position the steering column cover (1) into the vehicle.
18. Connect the hood release cable (4) to the hood release handle (5).
19. Connect the wire harness connector (3) to the trunk release switch.
20. Install the screws (2 and 6) that secure the steering column cover (1) to the instrument panel. Tighten the screws securely.
21. Install the left and right side instrument panel silencers. See **Body/Instrument Panel/PANEL, Silencer - Installation**
22. Install the glove box. See **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Installation**
23. Raise and support the vehicle.
24. Connect the steering column to the steering coupling. Refer to **Steering/Column/COUPLING, Steering Column - Installation** .
25. Lower the vehicle.

PANEL, SILENCER

Removal

REMOVAL

DRIVER SIDE

Fig. 385: Left I/P Closeout Panel
Courtesy of CHRYSLER LLC

1. Remove the two pushpins (4) that secure the instrument panel silencer (1) to the instrument panel bracket (2).
2. Pull the instrument panel silencer rearward to disengage it from the brackets (3) located near the dash panel.
3. Remove the instrument panel silencer from the vehicle.

PASSENGER SIDE

Fig. 386: Right I/P Closeout Panel
Courtesy of CHRYSLER LLC

1. Remove the two pushpins (3) that secure the instrument panel silencer (2) to the instrument panel.
2. Pull the instrument panel silencer rearward to disengage it from the brackets (1) located near the dash panel.
3. Remove the instrument panel silencer from the vehicle.

Installation

INSTALLATION

DRIVER SIDE

Fig. 387: Left I/P Closeout Panel
Courtesy of CHRYSLER LLC

1. Position the instrument panel silencer (1) into the vehicle.
2. Install the instrument panel silencer above the brackets (3) located near the dash panel.
3. Install the two push-pins (4) that secure the instrument panel silencer to the instrument panel bracket (2).

PASSENGER SIDE

Fig. 388: Right I/P Closeout Panel
Courtesy of CHRYSLER LLC

1. Position the instrument panel silencer (2) into the vehicle.
2. Install the instrument panel silencer above the brackets (1) located near the dash panel.
3. Install the two push-pins (3) that secure the instrument panel silencer to the instrument panel.

STRIKER, GLOVE BOX DOOR LATCH

Removal

REMOVAL

Fig. 389: Removing/Installing Striker-Latch-Glove Box
Courtesy of CHRYSLER LLC

1. Open the glove box door (1).
2. Remove the two screws (2) that secure the glove box latch striker (3) to the instrument panel (4).
3. Remove the glove box latch striker from the instrument panel.

Installation

INSTALLATION

Fig. 390: Removing/Installing Striker-Latch-Glove Box
 Courtesy of CHRYSLER LLC

1. Position the glove box latch striker (3) onto the instrument panel (4).
2. Install the two screws (2) that secure the glove box latch striker onto the instrument panel. Tighten the screws securely.
3. Close glove box door (1).

INTERIOR

CARPET

Removal

REMOVAL

1. Remove the driver and passenger front seats from the vehicle. See **Body/Seats/SEAT - Removal**.
2. Remove the center console from the front floor panel transmission tunnel. See **Body/Interior/CONSOLE, Floor - Removal**.
3. Remove the rear seat cushion from the vehicle. See **Body/Seats/COVER, Seat Cushion - Removal**.
4. Remove the lower quarter trim panel. See **Body/Interior/PANEL, Quarter Trim - Removal**.
5. Remove the sill plates.
6. Remove the push-pin fasteners that secure the rear carpet.
7. Lift the rear carpet from the floor panel far enough to extract the body wire harness take outs and connectors through the appropriate slits in the carpeting.
8. Remove the rear carpet from the vehicle.

FRONT

Fig. 391: Removing/Installing Center Console
Courtesy of CHRYSLER LLC

NOTE: The front carpet consists of two individual carpets, one for the driver side and one for the passenger side. These carpets can be removed from and installed into the vehicle individually.

1. Remove the driver and/or passenger front seat from the vehicle as appropriate. See **Body/Seats/SEAT - Removal**.
2. Remove the center console from the front floor panel transmission tunnel. See **Body/Interior/CONSOLE, Floor - Removal**.
3. Remove the trim from the driver or passenger side lower cowl side inner panel as appropriate. See **Body/Interior/PANEL, Cowl Trim - Removal**.
4. Remove the two push-pin fasteners (1) that secure the outboard edge of the front carpet (3) to the front door opening sill.
5. On the driver side only, remove the push-pin fastener (2) that secures the front carpet to the cowl side inner panel above the foot rest.

Fig. 392: Front Carpet Push-Pin Fastener (Driverside Only)
Courtesy of CHRYSLER LLC

6. On the driver side only, remove the push-pin fastener (3) that secures the inboard edge of the front carpet (1) to the transmission shifter bracket (2).
7. Remove the front carpet from the floor panel.

Installation

INSTALLATION

1. Position the rear carpet into the vehicle.
2. Pull the body wire harness take outs and connectors through the appropriate slits in the rear carpet.
3. Fit the rear carpet to the floor panel.
4. Install the push-pin fasteners that secure the rear carpet.
5. Install the sill plates.
6. Install the lower quarter trim panel. See **Body/Interior/PANEL, Quarter Trim - Installation**.
7. Install the rear seat cushion. See **Body/Seats/COVER, Seat Cushion - Installation**.
8. Install the center console. See **Body/Interior/CONSOLE, Floor - Installation**.
9. Install the driver and passenger front seats. See **Body/Seats/SEAT - Installation**.

FRONT

Fig. 393: Removing/Installing Center Console
 Courtesy of CHRYSLER LLC

NOTE: The front carpet consists of two individual carpets, one for the driver side and one for the passenger side. These carpets can be removed from and installed into the vehicle individually.

1. Position and fit the front carpet (3) onto the floor panel. Be certain that the rear of the front carpet is fitted over the floor panel front crossmember and butts up against the front of the rear carpet without interference with the rear floor air duct opening. Be certain that the front of the front carpet is fitted to the dash panel without interference with the steering column, the accelerator or the heater and air conditioner unit. On the driver side only, be certain the slit (4) on the inboard edge of the carpet is engaged around the left instrument panel support bracket (5) on the top of the floor panel transmission tunnel.
2. Install the two push-pin fasteners (1) that secure the outboard edge of the front carpet to the front door opening sill.
3. On the driver side only, install the push-pin fastener (2) that secures the front carpet to the cowl side inner panel above the foot rest.

Fig. 394: Front Carpet Push-Pin Fastener (Driverside Only)
Courtesy of CHRYSLER LLC

4. On the driver side only, install the push-pin fastener (3) that secures the inboard edge of the front carpet (1) to the transmission shifter bracket (2).
5. Reinstall the trim onto the driver or passenger side lower cowl side inner panel as appropriate. See **Body/Interior/PANEL, Cowl Trim - Installation**.
6. Reinstall the center console onto the front floor panel transmission tunnel. See **Body/Interior/CONSOLE, Floor - Installation**.
7. Reinstall the driver and/or passenger front seat into the vehicle as appropriate. See **Body/Seats/SEAT - Installation**.

CONSOLE, FLOOR

Removal

REMOVAL

1. Apply the parking brake.
2. Turn the ignition switch to the On position, apply the service brakes and place the gear selector lever into the Neutral position.
3. Turn the ignition switch to the Off position and release the service brakes.
4. Disconnect and isolate the battery negative cable.

Fig. 395: Separate Retaining Ring From Shifter Knob
 Courtesy of CHRYSLER LLC

5. Using a small flat bladed tool or equivalent, separate the retaining ring (1) and slide down the shifter shaft.

Fig. 396: Removing Shifter Knob
 Courtesy of CHRYSLER LLC

6. Pull up on the shifter knob (1) and remove from the shifter shaft (2).

142405

Fig. 397: Removing/Installing Console Shifter Bezel
Courtesy of CHRYSLER LLC

7. Remove the shifter bezel and shifter boot.
8. Open the lid of the console rear bin and remove the mat from the rear bin.
9. Using a trim stick, unsnap the console bezel (1) from the console.
10. Disconnect the electrical connectors (2).

8137F191

Fig. 398: Removing/Installing Center Floor Console
Courtesy of CHRYSLER LLC

11. Remove the fasteners (2) from the rear bin that secure the console to the floor panel

transmission tunnel.

12. Remove the fasteners (3) that secure the front of the console to the instrument panel.
13. Slide the console rearward and disconnect the electrical connectors.
14. Remove the floor console from the vehicle.

Installation

INSTALLATION

Fig. 399: Removing/Installing Center Floor Console
Courtesy of CHRYSLER LLC

1. Position the floor console into the vehicle and connect the electrical connectors.
2. Install the fasteners (3) at the front of the center console. Tighten the screws to 3 N.m (27 in. lbs.).
3. Install the fasteners (2) into the rear bin. Tighten the bolts to 5 N.m (44 in. lbs.).

142405

Fig. 400: Removing/Installing Console Shifter Bezel
 Courtesy of CHRYSLER LLC

4. Position the console shifter bezel (1) into the vehicle.
5. Connect the electrical connectors.
6. Position the mat (5) into the console rear bin.
7. Install the shifter boot and bezel.

2438056

Fig. 401: Installing Shift Knob
 Courtesy of CHRYSLER LLC

8. Place the gear selector lever into the Park position.
9. Slide the retaining ring over the shifter shaft (2) and slide the shift knob (1) onto the shaft (2) and slide down into place fully.

Fig. 402: Seating Retaining Ring Up Onto Shifter Knob
Courtesy of CHRYSLER LLC

10. Seat the retaining ring (2) up onto the shifter knob (2) and seat fully.
11. Connect the battery negative cable.

FOOT REST, FLOOR, FRONT

Removal

REMOVAL

Fig. 403: Front Floor Foot Rest
Courtesy of CHRYSLER LLC

1. Remove the trim from the driver side lower cowl side inner panel. See **Body/Interior/PANEL, Cowl Trim - Removal**.
2. Remove the three push-pin fasteners that secure the driver side front carpet to the cowl side inner panel and the front door opening sill.
3. Pull the front floor carpet up and away from the foot rest (1) far enough to access and remove the nut (2) that secures the foot rest to the weld stud (5) on the front floor panel.
4. Lift the base of the foot rest upward far enough to disengage the tab (3) at the top of the foot rest from the slot (4) in the dash panel.
5. Remove the foot rest from the vehicle.

Installation

INSTALLATION

Fig. 404: Front Floor Foot Rest
Courtesy of CHRYSLER LLC

1. Pull the outboard edge of the driver side front floor carpet up and away from the floor far enough to position the foot rest (1) between the front floor panel and the carpet.
2. Engage the tab (3) at the top of the foot rest into the slot (4) in the dash panel.
3. Position the hole at the base of the foot rest over the weld stud (5) on the front floor panel.
4. Install and tighten the nut (2) that secures the foot rest to the weld stud. Tighten the nut to 16 N.m (12 ft. lbs.).
5. Reposition the driver side front carpet to the cowl side inner panel and the front door opening sill and secure with three push-pin fasteners.
6. Reinstall the trim onto the driver side lower cowl side inner panel. See **Body/Interior/PANEL, Cowl Trim - Installation**.

HEADLINER

Removal

REMOVAL

NOTE: Do not remove the headliner from the vehicle unless replacing with a new headliner.

142447

Fig. 405: Removing/Installing Headliner
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove A-pillar trim panels. See **Body/Interior/PANEL, A-Pillar Trim - Removal**.
3. Disengage the headliner wire harnesses from the retainers on each inner A-pillar and disconnect the connectors from the body wire harness connectors near the base of each A-pillar.
4. Remove the upper quarter trim panels. See **Body/Interior/PANEL, Quarter Trim - Removal**.
5. Remove the rear header trim panel.
6. If equipped, remove the overhead console from the center of the headliner near the windshield header. Refer to **Electrical - Message Systems/Overhead Console - Removal**.
7. If equipped, disconnect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout(s) and connector(s) of the headliner wire harness from the connector receptacle(s) on the back (windshield side) of the inside rear view mirror housing.
8. Remove both sun visors and both visor receptacles from the headliner near the windshield header.
9. Remove both grab handle/coat hook/rear dome/reading lamp units from the headliner at the inner rear roof side rails.
10. If equipped, remove the trim welt from the headliner sunroof opening.
11. Recline both front seat backs.
12. Remove the passenger door. See **Body/Door - Front/DOOR - Removal**.

13. Carefully pull the headliner downward at the windshield header far enough to disengage the spring clip retainers.
14. Carefully pull the headliner downward at the inner rear roof side rails far enough to disengage the spring clip retainers.
15. Carefully pull the headliner downward near the center of the rear roof header far enough to disengage the rear spring clip retainer.
16. Disconnect the electrical connectors.
17. Carefully remove the headliner through the passenger door opening.

Installation

INSTALLATION

142447

Fig. 406: Removing/Installing Headliner
Courtesy of CHRYSLER LLC

1. Carefully insert the headliner (1) through the passenger door opening.
2. Position the headliner into position.
3. Connect the electrical connectors.
4. Firmly press the headliner into position ensuring the spring clip retainers engage.
5. If equipped, install the trim welt onto the headliner sunroof opening.
6. Install both grab handle/coat hook/rear dome/reading lamp units into the headliner at the inner rear roof side rails.

7. Install both sun visors and both visor receptacles onto the headliner near the windshield header.
8. If equipped, connect the electrochromic (automatic dimming) and/or the telematic (hands-free phone) mirror takeout and connector of the headliner wire harness to the connector receptacle (s) on the back (windshield side) of the inside rear view mirror housing.
9. If equipped, install the overhead console to the center of the headliner near the windshield header. Refer to **Electrical - Message Systems/Overhead Console - Installation**.
10. Install the upper quarter trim panel. See **Body/Interior/PANEL, Quarter Trim - Installation**.
11. Connect the electrical connectors at the A-pillars.
12. Install A-pillar trim panels. See **Body/Interior/PANEL, A-Pillar Trim - Installation**.
13. Install the passenger door and adjust as necessary. See **Body/Door - Front/DOOR - Installation**.
14. Connect the battery negative cable.

MIRROR, REARVIEW

Removal

REMOVAL

Fig. 407: Inside Rearview Mirror
Courtesy of CHRYSLER LLC

1. If the vehicle is equipped with either the electrochromic (automatic dimming) or the telematic (hands-free phone) mirror option, disconnect and isolate the battery negative cable.
2. If the vehicle is so equipped, disconnect the electrochromic mirror takeout and connector (1) and/or the telematic mirror takeout and connector (2) of the headliner wire harness from the connector receptacle on the back (windshield side) of the mirror housing (3).

Fig. 408: Removing/Installing Inside Rearview Mirror
Courtesy of CHRYSLER LLC

3. Remove the set screw (3) that secures the rear view mirror (2) to the support bracket/button (1) on the inside of the windshield glass.
4. Slide the rear view mirror upward far enough to disengage it from the support bracket/button.

Installation

MIRROR

Fig. 409: Removing/Installing Inside Rearview Mirror
Courtesy of CHRYSLER LLC

1. Position and slide the rear view mirror (2) downward over the support bracket/button (1) on the inside of the windshield glass.
2. Install and tighten the set screw (3) that secures the rear view mirror to the support bracket/button. Tighten the screw to 2 N.m (17 in. lbs.).

Fig. 410: Inside Rearview Mirror
Courtesy of CHRYSLER LLC

3. If the vehicle is so equipped, route the electrochromic (automatic dimming) mirror takeout and connector (1) and/or the telematic (hands-free phone) mirror takeout and connector (2) of the headliner wire harness to the left of the mirror support bracket and reconnect it to the connector receptacle on the back (windshield side) of the mirror housing (3).
4. If the vehicle is equipped with either the electrochromic or the telematic mirror option, reconnect the battery negative cable.

SUPPORT BRACKET

NOTE: The rear view mirror support bracket (or button) is permanently bonded to the inside of the windshield glass. If the bracket should become separated from the glass, it may be re-bonded using the following procedure. This procedure requires the use of a Rear View Mirror Adhesive kit that is available through Mopar® in single application packages that include a two-part adhesive and an accelerant with applicator.

1. Mark the proper position for the mirror bracket on the outside of the windshield glass with a wax pencil. The residual adhesive on the inside of the glass from the prior mirror bracket installation can be used as a guide.
2. Clean the bracket contact area on the inside of the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
3. Sand the bonding surface (the smaller side) of the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
4. Apply accelerant to the bonding surface of the bracket according to the following instructions:
 - Crush the accelerant vial to saturate the felt applicator.

- Remove the paper sleeve.
 - Apply accelerant to the bonding surface of the bracket.
 - Allow the accelerant to dry for five minutes.
 - Do not touch the bracket bonding surface after the accelerant has been applied.
5. Apply adhesive accelerant to the bracket contact area on the inside of the windshield glass. Allow the accelerant to dry for one minute. Do not touch the bracket contact area of the glass after the accelerant has been applied.
 6. Install the bracket according to the following instructions:
 - Apply one drop of adhesive at the center of the bracket contact area on the inside of the windshield glass.
 - Apply an even coat of adhesive to the bonding surface of the bracket.
 - Align the bracket with the marked position on the windshield glass.
 - Press and hold the bracket in place for at least one minute.

NOTE: **Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.**

7. Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
8. Allow the adhesive to cure for an additional 8-10 minutes before reinstalling the mirror.

PANEL, A-PILLAR TRIM

Removal

REMOVAL

Fig. 411: Removing/Installing A-Pillar Trim Panel
Courtesy of CHRYSLER LLC

1. Using a trim stick or another suitable wide flat-bladed tool, carefully pry the upper end of the A-pillar trim (2) rearward from the inside of the A-pillar far enough to disengage the two spring clip retainers that secure the trim to the slots in the pillar.
2. Disconnect the A-pillar tether from the body side A-pillar (1).
3. Disengage the base of the A-pillar trim from the end of the instrument panel top cover.
4. Remove the A-pillar trim from the vehicle.

Installation

INSTALLATION

Fig. 412: Removing/Installing A-Pillar Trim Panel
Courtesy of CHRYSLER LLC

1. Position the A-pillar trim (2) and connect the tether to the body side A-pillar (1) mounting bracket.
2. Engage the base of the A-pillar trim to the end of the instrument panel top cover.
3. Align the two spring clip retainers on the trim with the slots in the inner A-pillar.
4. Using hand pressure, press firmly and evenly forward on the trim over each of the spring clip locations until the retainers snap into place.

PANEL, COWL TRIM

Removal

UPPER

Fig. 413: Removing Upper Cowl Trim Panel - Lower Retaining Clip
Courtesy of CHRYSLER LLC

1. Using trim tool C-4829A or equivalent (3), directly below the lower retaining clip (2), release the clip.

2416642

Fig. 414: Removing Upper Cowl Trim Panel - Upper Retaining Clip
Courtesy of CHRYSLER LLC

2. Using trim tool C-4829A or equivalent (3), directly below the upper retaining clip (2), release the clip and remove the upper cowl trim panel (1).

LOWER

142392

Fig. 415: Removing/Installing Lower Cowl Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the upper cowl trim from the front of the front door opening. See **Body/Interior/PANEL, Cowl Trim - Removal**.
2. Remove the sill plate, as neccassary.
3. Remove the pushpin retainer (3) at the rear of the cowl trim panel (1).
4. Using a trim stick or equilavent, carefully pry the cowl trim far enough to disengage the spring clip retainers.
5. Remove the cowl trim from the vehicle.

Installation

UPPER

Fig. 416: Upper Cowl Trim
 Courtesy of CHRYSLER LLC

1. Position the upper cowl trim (2) to the cowl (1) at the front of the front door opening and the lower cowl trim (3).
2. Align the two spring clip retainers on the trim with the slots in the cowl.
3. Using hand pressure, press firmly and evenly downward on the trim over each of the spring clip locations until the retainers snap into place.

LOWER

Fig. 417: Removing/Installing Lower Cowl Trim Panel
 Courtesy of CHRYSLER LLC

1. Install the cowl trim (1) to the vehicle.
2. Engage the spring clip retainers.
3. Install the push pin (3) at the rear of the cowl trim panel.
4. Install the sill plate.
5. Install the upper cowl trim to the front of the front door opening. See **Body/Interior/PANEL, Cowl Trim - Installation.**

PANEL, QUARTER TRIM

Removal

REMOVAL

QUARTER TRIM - UPPER

Fig. 418: Removing/Installing Quarter Window Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the lower quarter trim panel. **QUARTER TRIM - LOWER**
2. Remove the mounting fasteners (4).
3. Carefully pry the upper quarter trim panel (2) disengaging the spring slip retainers.
4. Remove the rear seat belt anchor.
5. Route the seat belt (3) through the upper quarter trim panel.
6. Remove the upper quarter trim panel from the vehicle.

QUARTER TRIM - LOWER

142558

Fig. 419: Removing/Installing Lower Quarter Trim Panel
Courtesy of CHRYSLER LLC

1. Remove the sill plate by carefully prying up and disengaging the retainers.
2. Remove the lower seat belt anchor.
3. Remove the fasteners (1 and 4).
4. Remove the seat belt opening cover (3).
5. Carefully pry the lower quarter trim panel (2) disengaging the retainers.
6. Route the seat belt through the opening in the trim panel and remove the lower quarter trim panel from the vehicle.

Installation

INSTALLATION

QUARTER TRIM - UPPER

142547

Fig. 420: Removing/Installing Quarter Window Trim Panel
Courtesy of CHRYSLER LLC

1. Install the upper quarter trim panel to the vehicle.
2. Route the seat belt (3) through the upper quarter trim panel.
3. Install the rear seat belt anchor.
4. Carefully seat upper quarter trim panel (2) engaging the spring slip retainers.
5. Install the mounting fasteners (4).
6. Install the lower quarter trim panel. **QUARTER TRIM - LOWER**

QUARTER TRIM - LOWER

142558

Fig. 421: Removing/Installing Lower Quarter Trim Panel
Courtesy of CHRYSLER LLC

1. Route the seat belt through the opening in the trim panel and Install the lower quarter trim panel to the vehicle.
2. Carefully seat the lower quarter trim panel (2) engaging the retainers.
3. Install the seat belt opening cover (3).
4. Install the fasteners (1 and 4).
5. Install the lower seat belt anchor.
6. Install the sill plate.

PANEL, REAR SHELF

Removal

REMOVAL

Fig. 422: Rear Shelf Trim Panel
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the quarter trim panels. See **Body/Interior/PANEL, Quarter Trim - Removal**.
3. Remove the nut that secures the center rear seat belt lower anchor to the stud on the floor panel and feed the seat belt webbing back through the opening in the top of the rear shelf panel trim (2) to the retractor.
4. Remove the push-pin fastener (1) that secures the trim to the rear shelf panel (3).
5. Slide the trim forward to disengage the S-clip that secures the underside of the trim to the center of the shelf panel.

6. Remove the trim from the rear shelf panel.

Installation

INSTALLATION

Fig. 423: Rear Shelf Trim Panel
Courtesy of CHRYSLER LLC

1. Position the trim (2) onto the rear shelf panel (3).
2. Slide the rear edge of the trim rearward to engage the lens bezel of the center high-mounted stop lamp and far enough to engage the S-clip that secures the underside of the trim to the center of the shelf panel.
3. Install the push-pin fastener (1) that secures the trim to the rear shelf panel.
4. Pull the center rear seat belt lower anchor and belt webbing from the retractor through the opening in the top of the rear shelf panel trim and back down to the stud on the floor panel.
5. Install and tighten the nut that secures the seat belt lower anchor to the stud on the floor panel. Tighten the nut to 34 N.m (25 ft. lbs.).
6. Install the quarter trim panel. See **Body/Interior/PANEL, Quarter Trim - Installation.**
7. Reconnect the battery negative cable.

PANEL, TRUNK TRIM, REAR

Removal

REMOVAL

160972

Fig. 424: Removing/Installing Trunk Rear Trim Panel
 Courtesy of CHRYSLER LLC

1. Remove the four push-pin fasteners (2) that secure the trunk rear trim panel (1) to the inside of the deck opening lower panel.
2. Remove the trim panel from the vehicle.

Installation

INSTALLATION

160972

Fig. 425: Removing/Installing Trunk Rear Trim Panel
 Courtesy of CHRYSLER LLC

1. Position the trunk rear trim panel (1) to the inside of the deck opening lower panel.
2. Install the four push-pin fasteners (2) that secure the trim panel to the deck opening lower panel.

SUPPORT, VISOR

Removal

REMOVAL

1. Disengage sun visor from center support.
2. Remove mounting fasteners attaching support to roof header,
3. Remove support from vehicle.

Installation

INSTALLATION

1. Place support into position.
2. Install mounting fasteners attaching support to roof header,
3. Engage sun visor to center support.

VISOR

Removal

REMOVAL

Fig. 426: Sun Visor
Courtesy of CHRYSLER LLC

CAUTION: When removing or installing the screws (1), be certain to avoid any wiring or drain tube interference.

1. Remove the three screws (1) that secure each sun visor (2) to the roof panel and remove the visor from the headliner (3).
2. If equipped, disconnect the wire harness connector for the illuminated vanity mirror (4).

Installation

INSTALLATION

Fig. 427: Sun Visor
Courtesy of CHRYSLER LLC

CAUTION: When removing or installing the screws (1), be certain to avoid any wiring or drain tube interference.

1. If equipped, connect the wire harness connector for the illuminated vanity mirror (4).
2. Position the sun visor (2) onto the headliner (3).
3. Install the three screws (1) that secure each sun visor to the roof panel. Tighten the screws to 2.2 N.m (20 in. lbs.).

WELT, TRUNK

Removal

REMOVAL

Fig. 428: Trunk Lining
Courtesy of CHRYSLER LLC

1. Remove the spare tire cover/trunk floor carpet from over the spare tire well. See **Body/Interior/CARPET - Removal**.
2. Remove the trunk rear trim panel from the luggage compartment. See **Body/Interior/PANEL, Trunk Trim - Removal**
3. Remove the three push-pin fasteners (2) that secure the right or the left trunk side trim (1) to the appropriate locations within the luggage compartment.
4. Remove the trunk side trim from the luggage compartment.

Installation

INSTALLATION

Fig. 429: Trunk Lining
Courtesy of CHRYSLER LLC

1. Position and fit the right or the left trunk side trim (1) within the luggage compartment.
2. Install the three push-pin fasteners (2) that secure side trim to the appropriate locations within the luggage compartment.
3. Reinstall the trunk rear trim panel into the luggage compartment. See **Body/Interior/PANEL, Trunk Trim - Installation**
4. Reinstall the spare tire cover/trunk floor carpet over the spare tire well in the luggage compartment. See **Body/Interior/CARPET - Installation**.

BASECOAT/CLEARCOAT FINISH

Description

DESCRIPTION

The original equipment paint finish is a multi step process that involves cleaning, applying electro deposition (E-coat), anti-chip primer, basecoat, and clearcoat steps.

CAUTION: Do not use abrasive chemicals, abrasive compounds or harsh alkaline based cleaning solvents on the painted surfaces of a vehicle. Failure to follow this caution can result in damage to vehicle finish.

On most vehicles a two-part paint application (basecoat/clearcoat) is used. Color paint that is applied to primer is called basecoat. A clear coat paint is then applied to protect the basecoat from ultraviolet light and to provide a durable high-gloss finish.

FINESSE SANDING, BUFFING, AND POLISHING

Description

DESCRIPTION

CAUTION: Do not remove more than 0.5 mils of clearcoat finish when sanding, hand buffing or polishing. Basecoat paint must retain clearcoat for durability.

CAUTION: If the finish has been finesse sanded in the past, it cannot be repeated. Failure to follow this caution can result in damage to vehicle finish.

NOTE: Finesse sanding should only be performed by a trained automotive paint technician.

Minor acid etching, orange peel, or smudging in a clearcoat or single-stage finish can be reduced with light finesse sanding, hand buffing and polishing. Use a Paint Thickness Gauge #PR-ETG-2X or equivalent to determine clearcoat or single-stage paint thickness before and after the repair.

PAINT CODE

Description

DESCRIPTION

Exterior vehicle body colors are identified on the Vehicle Certification Label. Refer to **Vehicle Data/Vehicle Information/Vehicle Certification Label - Description** . The first digit of the paint code listed on the vehicle indicates the sequence of application, i.e.: P = primary coat, Q = secondary coat. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers.

PAINT TOUCH-UP

Description

DESCRIPTION

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use MOPAR® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat.

WARNING: Use an osha approved respirator and safety glasses when spraying paint or solvents in a confined area. Personal injury can result.

Standard Procedure

STANDARD PROCEDURE

1. Scrape loose paint and corrosion from inside scratch or chip.
2. Clean affected area with MOPAR® Tar/Road Oil Remover or equivalent, and allow to dry.
3. Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the scratch or chip without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.
4. Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.
5. On vehicles without clearcoat, the touch-up color can be lightly finesse sanded (1500 grit) and polished with rubbing compound.
6. On vehicles with clearcoat, apply clear top coat to touch-up paint with the same technique as described in 4. Allow clear top coat to dry hard. If desired, [5](#) can be performed on clear top coat.

WARNING: Avoid prolonged skin contact with petroleum or alcohol - based cleaning solvents. Personal injury can result.

SEATS, FRONT

WARNING

RESTRAINT SYSTEM

WARNING: During and following any seat belt or child restraint anchor service, carefully inspect all seat belts, buckles, mounting hardware, retractors, tether straps, and anchors for proper installation, operation, or damage. Replace any belt that is cut, frayed, or torn. Straighten any belt that is twisted. Tighten any loose fasteners. Replace any belt that has a damaged or inoperative buckle or retractor. Replace any belt that has a bent or damaged latch plate or anchor plate. Replace any child restraint anchor or the unit to which the anchor is integral that has been bent or damaged. Never attempt to repair a seat belt or child restraint component. Always replace damaged or faulty seat belt and child restraint components with the correct, new and unused replacement parts listed in the Chrysler Mopar® parts catalog. Failure to follow these instructions may result in personal injury or death.

WARNING: On vehicles equipped with airbags, disable the supplemental restraint system before attempting any steering wheel, steering column, airbag, occupant classification system, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the supplemental restraint system. Failure to take the proper precautions could result in accidental airbag deployment. Failure to follow these instructions may result in personal injury or death.

WARNING: On vehicles equipped with airbags, before performing any welding operations disconnect and isolate the battery negative (ground) cable and disconnect all wire harness connectors from the Airbag Control Module (ACM). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in personal injury or death.

WARNING: Replace all restraint system components only with parts specified in the DaimlerChrysler Mopar® parts catalog. Substitute parts may appear interchangeable, but internal differences may result in inferior occupant protection. Failure to follow these instructions may result in personal injury or death.

WARNING: The fasteners, screws, and bolts originally used for the restraint system components must never be replaced with any substitutes. These fasteners have special coatings and are specifically designed for the restraint system. Any time a new fastener is needed, replace it with the correct fasteners provided in the service package or specified in the DaimlerChrysler Mopar® parts catalog. Failure to follow these instructions may result in personal injury or death.

WARNING: On vehicles equipped with the Occupant Classification System (OCS) do not hang any after market devices from the front passengers seat back. Do not install a front drivers seat back cover with map pocket onto the passenger seat. Failure to follow these instructions may result in personal injury or death.

WARNING: The Seat Weight Sensor is a sensitive, calibrated unit and must be handled carefully. Do not drop or handle roughly. If dropped or damaged, replace with another sensor. Failure to follow these instructions may result in personal injury or death.

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in personal injury or death.

COVER, SEAT CUSHION, FRONT

Removal

REMOVAL

81269048

Fig. 430: Cushion Nuts
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Seats - Warning**.
2. Remove the seat from the vehicle. See **Body/Seats/SEAT - Removal**.
3. Remove the wiring harness from the seat pan and disconnect electrical connectors as required.
4. Remove the seat pan mounting fasteners and remove the seat cushion from the seat frame.

Fig. 431: J-Straps
Courtesy of CHRYSLER LLC

5. Disengage the J-clips and carefully remove the seat cover, cutting any hog rings and discarding.
6. Remove the foam from the seat pan, if required.

Installation

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Seats - Warning**.
2. Install the foam to the seat pan, if required.
3. Carefully install the seat cover to the seat foam installing hog rings as required.
4. Engage the seat cover J-clips.

Fig. 432: Cushion Nuts
Courtesy of CHRYSLER LLC

5. Position the seat cushion assembly onto the seat frame and install the clamps (1).
6. Connect the wire harness to the seat cushion pan, if equipped.
7. Install the bolts (2) and tighten to 10 N.m (89 in. lbs.).
8. Install the seat to the vehicle. See **Body/Seats/SEAT - Installation**.

COVER, SEAT CUSHION, FRONT

Removal

REMOVAL

Fig. 433: Lumbar And Recliner Handles & Shields
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Seats - Warning**.
2. Remove the front seat. See **Body/Seats/SEAT - Removal**.
3. Remove the lumbar and recliner handles (1).
4. Remove the screws and remove the side shields (2).

Fig. 434: Seat Belt Buckle
Courtesy of CHRYSLER LLC

5. Remove the belt buckle.

Fig. 435: Seat Back Bolts
Courtesy of CHRYSLER LLC

6. Remove the seat back bolts from both sides.

Fig. 436: Removing Head Rest
Courtesy of CHRYSLER LLC

7. Push in the buttons on both headrest sleeves, pull the headrest up and remove.

Fig. 437: Zip Strip
Courtesy of CHRYSLER LLC

8. Separate the j-straps (1 AND 2) and pull cover up to gain access to the headrest guides, cutting any hog rings and discarding.
9. Pinch both headrest guides ribs from inside the seat back frame with pliers or equivalent.
10. Strike the bottom of the sleeve with a rubber mallet or equivalent, and remove the headrest guides.
11. Remove the seat cover from the seat back.

Installation

INSTALLATION

Fig. 438: Zip Strip
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Seats - Warning**
2. Position the seat back cover over the seat back frame and install the headrest sleeves.
3. Position the seat back cushion on the frame and install the cover over the cushion installing hog rings as required.
4. Connect the j-straps (1 AND 2).

Fig. 439: Seat Back Bolts
Courtesy of CHRYSLER LLC

5. Install the seat back to the seat frame.
6. Install the seat back bolts and tighten to 40 N.m (30 ft. lbs.).

Fig. 440: Seat Belt Buckle
Courtesy of CHRYSLER LLC

7. Position the front seat belt buckle lower anchor onto the stud near the rear of the inboard seat cushion frame. Be certain the anti-rotation tab on the anchor is engaged in the clearance hole of the frame.
8. Tighten the nut to 43 N.m (32 ft. lbs.)

Fig. 441: Lumbar And Recliner Handles & Shields
Courtesy of CHRYSLER LLC

9. Install the side shields (2) and install the screws.
10. Install the lumbar and recliner handles.

SEAT BACK, FRONT

Removal

REMOVAL

Fig. 442: Lumbar And Recliner Handles & Shields
 Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Seats - Warning**
2. Remove the front seat. See **Body/Seats/SEAT - Removal**
3. Remove the lumbar and recliner handles (1).
4. Remove the screws and remove the side shields (2).

Fig. 443: Seat Belt Buckle

5. Remove the belt buckle.

Fig. 444: Seat Back Bolts
Courtesy of CHRYSLER LLC

6. Remove the seat back bolts from both sides and remove the seat back from the seat frame.

Installation

INSTALLATION

Fig. 445: Seat Back Bolts
Courtesy of CHRYSLER LLC

1. Install the seat back to the seat frame.
2. Install the seat back bolts and tighten to 40 N.m (30 ft. lbs.).

Fig. 446: Seat Belt Buckle
Courtesy of CHRYSLER LLC

3. Position the front seat belt buckle lower anchor onto the stud near the rear of the inboard seat cushion frame. Be certain the anti-rotation tab on the anchor is engaged in the clearance hole of the frame.
4. Tighten the nut to 43 N.m (32 ft. lbs.)

Fig. 447: Lumbar And Recliner Handles & Shields
Courtesy of CHRYSLER LLC

5. Install the side shields (2) and install the screws.
6. Install the lumbar and recliner handles.
7. Install the seat. See **Body/Seats/SEAT - Installation.**

SEAT, FRONT

Removal

REMOVAL

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Seats - Warning**.
2. Move the seat rearward to gain access to the front bolts.
3. Remove the front attaching bolts.
4. Move the seat forward to gain access to the rear bolts.
5. Remove the rear attaching bolts.
6. Disconnect and isolate battery negative cable.
7. Disconnect the electrical connectors.
8. Remove the seat from the vehicle.

Installation

INSTALLATION

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Seats - Warning**

WARNING: The front passenger seat must be handled carefully as well. When removing the seat, be careful when setting on floor not to drop. If dropped, the sensor may be inoperative. Failure to follow these instructions may result in serious or fatal injury.

WARNING: When the seat is on the floor, no one should sit in the front passenger seat. This uneven force may damage the sensing ability of the seat weight sensors. If sat on and damaged, the sensor may be inoperative. Failure to follow these instructions may result in serious or fatal injury.

2. Place seat into position in vehicle.
3. Connect the electrical connectors.
4. Connect battery negative cable.
5. Move the seat forward to gain access to the rear bolts.
6. Install the front seat attaching rear bolts. Tighten bolts to 65 N.m (48 ft. lbs.).
7. Move the seat rearward to gain access to the front bolts.
8. Install the front seat front attaching bolts. Tighten bolts to 65 N.m (48 ft. lbs.).
9. The supplemental restraint system verification test procedure should be performed following service of any supplemental restraint system component. Refer to **DTC-Based Diagnostics/CONTROLLER, Occupant Restraint (ORC) - Standard Procedure** .

SIDE SHIELDS, SEAT CUSHION, FRONT

Removal

REMOVAL

1. Remove the seat from vehicle. See **Body/Seats/SEAT - Removal**
2. Remove the recliner and lumbar handles as necessary.
3. Remove the seat buckle, as necessary.
4. Remove the side shield mounting fastener.
5. Carefully pry the side shield away from the seat frame, disengaging the retainers.
6. Disconnect the power seat switch connector, as necessary.
7. Remove the seat side shield from the seat frame.

Installation

INSTALLATION

1. Position the side shield to the seat frame.
2. Connect the power seat switch connector, if equipped.
3. Carefully install the side shield to the seat frame, engaging the retainers.
4. Install the mounting fastener.
5. Install the seat buckle, as necessary.
6. Install the recliner and lumbar handles, as necessary.

SEATS, REAR

COVER, SEAT BACK, REAR

Removal

REMOVAL

1. Remove the rear seat cushion. See **Body/Seats/COVER, Seat Cushion - Removal**
2. Remove the seat back. See **Body/Seats/SEAT BACK - Removal**
3. Disengage the J-clip from the seat back.
4. Unzip the seat back cover.
5. Carefully pull the seat cover off, cutting any hog rings and discarding.
6. Remove the seat cover from the seat back.

Installation

INSTALLATION

1. Install the seat cover to the seat back.
2. Carefully pull the seat cover over the seat foam, installing any hog rings as necessary.
3. Zip the seat back cover.

4. Engage the J-clip to the seat back.
5. Install the seat back. See **Body/Seats/SEAT BACK - Installation**
6. Install the rear seat cushion. See **Body/Seats/COVER, Seat Cushion - Installation**

COVER, SEAT CUSHION, REAR

Removal

REMOVAL

1. Carefully pull up on the front of the seat, disengaging the seat retainers.
2. Lift up on front of seat and pull seat cushion towards the front of the vehicle.
3. Remove the seat cushion from the vehicle.

Installation

INSTALLATION

1. Position the rear seat in the vehicle.
2. Place rear of seat cushion under the seat back.
3. Push down on the front of the seat cushion ensuring the retainers engage.

COVER, SEAT CUSHION, REAR

Removal

REMOVAL

1. Remove the seat cushion from the vehicle. See **Body/Seats/COVER, Seat Cushion - Removal**
2. Disengage the seat cover J-clips.
3. Carefully remove the seat cover, cutting any hog rings and discarding.
4. Remove seat cushion foam, if required.

Installation

INSTALLATION

1. Install seat cushion foam, if required.
2. Carefully install the seat cover, installing any hog rings as necessary.
3. Engage the seat cover J-clips.
4. Install the seat cushion to the vehicle. See **Body/Seats/COVER, Seat Cushion - Installation**

SEAT BACK, REAR

Removal

REMOVAL

1. Remove the seat cushion from the vehicle. See **Body/Seats/COVER, Seat Cushion - Removal**
2. Fold both seat backs to full down position.
3. Remove the outboard fastener on the 40 split seat back.
4. Pull the outboard side of the 40 split seat back out and slide the inboard side off from guide post.
5. Remove the 40 split seat back from the vehicle.
6. Remove the outboard and inboard mounting fasteners from the 60 split seat back.
7. Remove the 60 split seat back from the vehicle.

Installation

INSTALLATION

1. Place the 60 split seat back into position.
2. Install the inboard and outboard mounting fasteners. Tighten bolts to 65 N.m (48 ft. lbs.).
3. Place the 40 split seat back into position.
4. Install the seat back by guiding the inboard side onto the guide post attached to the 60 split seat back.
5. Install the outboard mounting fasteners. Tighten bolts to 65 N.m (48 ft. lbs.).
6. Place both seat backs in the full up position and ensure seats lock into place.
7. Install the rear seat cushion. See **Body/Seats/COVER, Seat Cushion - Installation**

STATIONARY GLASS

WARNING

WINDSHIELD SAFETY PRECAUTIONS

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly in an accident.

- urethane adhesives are applied as a system. Use glass cleaner, glass prep solvent, glass primer, pvc (vinyl) primer and pinch weld (fence) primer provided by the adhesive manufacturer. If not, structural integrity could be compromised.
- DaimlerChrysler does not recommend glass adhesive by brand. Technicians should review product labels and technical data sheets, and use only adhesives that their manufacturer's warrant will restore a vehicle to the requirements of FMVSS 212. Technicians should also ensure that primers and cleaners are compatible with the particular adhesive used.

- be sure to refer to the urethane manufacturer's directions for curing time specifications, and do not use adhesive after its expiration date.
- vapors that are emitted from the urethane adhesive or primer could cause personal injury. Use them in a well-ventilated area.
- skin contact with urethane adhesive should be avoided. Personal injury may result.
- always wear eye and hand protection when working with glass.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

BACKLITE

Removal

REMOVAL

Fig. 448: Adhesive Separation
Courtesy of CHRYSLER LLC

NOTE: Windshield removal shown in illustration, backlite similar.

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Stationary Glass - Warning.**
2. Remove quarter trim panels. See **Body/Interior/PANEL, Quarter Trim - Removal.**
3. Remove the trim panel from the rear shelf. See **Body/Interior/PANEL, Rear Shelf - Removal.**

4. Disconnect the wire connectors from rear window defogger terminals and, rear window mounted radio antenna, if equipped.

CAUTION: Be careful not to damage painted surfaces when cutting urethane around the backlight.

5. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the backlite to the backlite fence.
6. Carefully remove the backlite from the vehicle.

Installation

INSTALLATION

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the backlite. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Fig. 449: Glass Adhesive Preparation
Courtesy of CHRYSLER LLC

1. If the backlite (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

Fig. 450: Windshield Opening Preparation
 Courtesy of CHRYSLER LLC

NOTE: To prevent corrosion, do not damage paint on the backlite fence when removing original urethane.

NOTE: The backlite fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Replace any missing or damaged spacers around the perimeter of the backlite fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the backlite fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.

Fig. 451: Installing Backlite
Courtesy of CHRYSLER LLC

3. Install a new rubber seal (1) around the top and side edges of backlite (2).
4. Using an assistant, position the backlite into the backlite opening and against the backlite fence (3).
5. Verify the backlite lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the backlite.
6. Mark the backlite and fence with a grease pencil or pieces of masking tape to use as a reference for installation.
7. Using an assistant, remove the backlite from the backlite opening and place it on a suitable padded work surface.

Fig. 452: Windshield Primer
Courtesy of CHRYSLER LLC

WARNING: Do not use solvent based glass cleaners to clean the backlite before applying glass prep and primer or poor glass adhesion may result.

8. Clean the inside of the backlite with an ammonia based glass cleaner and a lint-free cloth.
9. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the backlite (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
10. Apply glass primer 25 mm (1 in.) wide around the perimeter of the backlite and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
11. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the backlite.
12. Re-prime any area that is not fully and evenly primed.

Fig. 453: WINDSHIELD OPENING PRIMER
 Courtesy of CHRYSLER LLC

13. Clean the backlite fence with an ammonia based glass cleaner and a lint-free cloth.
14. Apply pinch weld primer 15 mm (0.75 in.) wide (1) around the backlite fence (2). Allow at least three minutes drying time.
15. Using a flashlight, verify that the primer is completely and evenly installed along the backlite fence.
16. Re-prime any area that is not fully and evenly primed.

Fig. 454: WINDSHIELD ADHESIVE APPLICATION
 Courtesy of CHRYSLER LLC

CAUTION: Always apply the bead of adhesive to the backlite. Always install the backlite within 5 minutes after applying the adhesive.

NOTE: If the original urethane adhesive has been exposed for more than 12

hours, the entire adhesive area will need to be re-primed prior to installing new adhesive.

17. Apply approximately a 10 mm (0.4 in.) wide bead of adhesive (1) with a triangular nozzle approximately 6 mm (0.230 in.) from the edge of the glass (2) starting at the bottom center of the backlite.

Fig. 455: Windshield Adhesive Overlap
Courtesy of CHRYSLER LLC

18. Run the end of the adhesive bead (1) on the backlite (2) parallel to the start of the bead and smooth the ends flush.

Fig. 456: Installing Backlight
Courtesy of CHRYSLER LLC

19. Using an assistant, position the backlite (2) over the backlite opening.
20. Using the grease pencil marks or tape as reference points, align the backlite to the opening.
21. Carefully lower the backlite onto the backlite fence (3). Guide the backlite and the rubber seal (1) around the backlite into its proper location.

CAUTION: It is not possible to move the backlite after installation. The backlite should never be pressed into place by more than one person, because the backlite can break if pressed simultaneously on both sides.

22. Push the backlite inward until the backlite comes into contact with the spacers located on each side of the backlite fence.
23. Connect the wire connectors to the rear window defogger terminals and, rear window mounted radio antenna, if equipped.
24. Install the trim panel to the rear shelf. See Body/Interior/PANEL, Rear Shelf - Installation.
25. Install the quarter trim panels. See Body/Interior/PANEL, Quarter Trim - Installation.

GLASS, QUARTER

Removal

REMOVAL

161077

Fig. 457: Removing/Installing Quarter Glass

Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Stationary Glass - Warning.**
2. Remove the upper and lower quarter panel trim from the side of the vehicle being serviced. See **Body/Interior/PANEL, Quarter Trim - Removal.**
3. Using razor knife, cut urethane between the quarter glass (1) and window fence.
4. Carefully push the quarter window glass from the opening.

Installation

INSTALLATION

161077

Fig. 458: Removing/Installing Quarter Glass
Courtesy of CHRYSLER LLC

CAUTION: Roll down the left and right front door glass before installing quarter glass to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

1. Apply 6 mm (0.25 in.) wide urethane around perimeter of the quarter glass approximately 5 mm (0.2 in.) from the edge of the glass. Ensure the urethane is wrapped around the mounting studs.
2. Place the quarter glass (1) into the window opening and insert mounting studs (2) through the holes in the window fence.

3. Install the upper and lower quarter panel trims. See **Body/Interior/PANEL, Quarter Trim - Installation**.

WINDSHIELD

Description

DESCRIPTION

The windshield is attached to the window frame (fence) with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the rubber seals are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and seals from the parts supplier.

Removal

REMOVAL

Fig. 459: Adhesive Separation
Courtesy of CHRYSLER LLC

1. Before proceeding with the following repair procedure, review all warnings and cautions. See **Body/Stationary Glass - Warning**.
2. Remove the rear view mirror. See **Body/Interior/MIRROR, Rearview - Removal**.
3. Remove the cowl grille. See **Body/Exterior/COVER, Cowl Panel - Removal**

CAUTION: Be careful not to damage painted surfaces when removing moldings or cutting urethane around the windshield.

4. Remove the windshield side moldings.
5. Using an assistant and a wire-type windshield cut-out tool (1, 3 and 4), cut and separate the urethane adhesive (2) securing the windshield to the windshield fence.
6. Carefully remove the windshield from the vehicle.

Installation

INSTALLATION

WARNING: Do not operate the vehicle within 24 hours of windshield installation. It takes at least 24 hours for urethane adhesive to cure. If it is not cured, the windshield may not perform properly if the vehicle is in an accident.

CAUTION: To help prevent water leaks, partially roll down the left and right door glass before installing the windshield. This avoids pressurizing the passenger compartment if a door is slammed before the urethane is cured.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Fig. 460: Glass Adhesive Preparation
Courtesy of CHRYSLER LLC

1. If the windshield (1) is being reused, remove the as much original urethane (3) as possible from the glass surface using a razor knife (2).

Fig. 461: WINDSHIELD OPENING PREPARATION

Courtesy of CHRYSLER LLC

NOTE: To prevent corrosion, do not damage paint on windshield fence when removing original urethane.

NOTE: The windshield fence should be cleaned of most of its old urethane adhesive. A small amount of old urethane, approximately 1 mm in height should remain on the fence. Do not completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers located near the cowl at the bottom of the windshield fence should be replaced with new spacers. Replace any missing or damaged spacers around the perimeter of the windshield fence.

2. Using a razor knife (2), level the original bead of urethane (1) on the windshield fence (3) to a thickness of approximately 1 mm (0.04 in.) and remove the loose adhesive.

Fig. 462: Installing Windshield
Courtesy of CHRYSLER LLC

3. Install a new rubber seal (1) along the top of the windshield (2).
4. Using an assistant, position the windshield into the windshield opening and against the windshield fence (3).
5. Verify the windshield lays evenly against the fence at the top, bottom and sides of the opening. If not, the fence must be formed to the shape of the windshield.
6. Mark the windshield and the windshield fence with a grease pencil or pieces of masking tape to use as a reference for installation.
7. Using an assistant, remove the windshield from the windshield opening and place it on a suitable padded work surface.

Fig. 463: WINDSHIELD PRIMER
Courtesy of CHRYSLER LLC

WARNING: Do not use solvent based glass cleaners to clean the windshield before applying glass prep and primer or poor glass adhesion may result.

8. Clean the inside of the windshield with an ammonia based glass cleaner and a lint-free cloth.
9. Apply glass prep adhesion promoter 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass and wipe dry with a clean lint-free cloth until no streaks are visible.
10. Apply glass primer 25 mm (1 in.) wide (1) around the perimeter of the windshield (2) and 5 mm (0.2 in.) from the edge of the glass. Allow at least three minutes drying time.
11. Using a flashlight, verify that the primer is completely and evenly installed along the perimeter of the windshield.
12. Re-prime any area that is not fully and evenly primed.

Fig. 464: WINDSHIELD OPENING PRIMER

5 - DRAIN CHANNEL	13 - ASSEMBLY FASTENERS (12)
6 - SUNSHADE	14 - WIND DEFLECTOR
7 - LEFT SUNROOF GLASS GUIDE	15 - RIGHT SUNROOF GLASS GUIDE
8 - WIRE HARNESS	16 - WIND DEFLECTOR STRAP SCREWS (2)

The power sunroof system allows the sunroof to be opened, closed or placed in the vent position electrically by actuating a switch in the overhead console. The sunroof system receives battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active.

The sunroof glass panel tilts upward at the rear for ventilation and slides rearward under the roof when open. The panel seals flush with the roof in the closed position to eliminate wind noise. The sunroof includes a manual-sliding sunshade to cover the deep-tinted glass panel.

In addition to the standard power sunroof operation, this vehicle offers several additional features. There is an express (one-touch) opening and closing feature as well as Excessive Force Limitation (EFL). The EFL function detects obstacles trapped between the glass and the vehicle roof during a closing motion. Upon sensing an obstacle the EFL function will reverse direction of the glass to allow removal of the obstacle.

The main components of the power sunroof system are:

- The motor/module assembly
- The power sunroof glass and frame assembly
- The power sunroof switch
- The manual-sliding sunshade

OPERATION

OPERATION

This vehicle has a vent, tilt and slide power sunroof system with express (one-touch) open and closing feature. The sunroof system receives constant battery feed through a fuse in the Power Distribution Center (PDC). The sunroof will operate normally with the key in any position while the Accessory Delay system is active. If the sunroof is moving when the key is turned to the START position (crank engine), all motions stop until the key is released, then the previously requested sunroof motion will resume. The sunroof will also complete a requested motion if the Accessory Delay system goes inactive while the motion is in progress.

A combination push-button and rocker switch module mounted in the overhead console controls sunroof operation. The sunroof switch is a rocker design with a push button in the center of the two halves of the rocker. Pressing the rocker towards the front of the car commands the sunroof closed. Pressing the rocker towards the rear of the car commands the sunroof open. Pressing the center push button commands the sunroof up into the vent position (Rear of sunroof glass raises above the vehicle roof with glass still covering the sunroof opening). All switch commands operate with the glass starting in any position. for additional information. Refer to **Electrical - Power Systems/Power Top - Operation**

An electronic control system, integral to the motor/module assembly, provides the express open and close functions. Pressing the "open" or "close" end of the rocker switch moves the sunroof glass panel to the full open or full closed position, respectively. During express closing, anytime an obstacle is detected in the way of the glass, the motor will stop and reverse travel to avoid pinching an

occupant's finger, ice in the track, etc. This function is called Excessive Force Limitation (EFL). There are two methods of overriding the EFL function.

1. When three EFL events occur without the glass being allowed to fully close, the next close attempt will only move while the close switch is continuously actuated. This allows the sunroof to be forced closed if multiple close attempts fail.
2. If the sunroof close switch is continuously actuated during an EFL event, through the reversal, and during a two second wait time, then continuing to hold the close switch will cause the roof to move towards close with the EFL protection disabled. This allows the sunroof to be forced closed if it is known that a reversal will occur.

While in EFL override, the closing motion will cease if the sunroof switch is released at any time.

The motor/module is programmed to learn the speed required to drive the panel based on position and recalibrates itself as needed. If the sunroof becomes uncalibrated, it will only respond to the vent switch. If the vent switch is pressed, the glass will move toward vent; if the switch is released, all motion stops. In the event that the sunroof system becomes uncalibrated perform the sunroof position calibration procedure. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure** .

DIAGNOSIS AND TESTING

POWER TOP - SUNROOF

Any diagnosis of the power sunroof system should begin with the use of a scan tool and the proper Diagnostic Procedures Information. The scan tool can provide confirmation that the Controller Area Network (CAN) Data Bus is functional, that all of the electronic modules are sending and receiving the proper messages on the CAN Data Bus, and that the power sunroof motor is being sent the proper hard wired output by the sunroof switch.

For complete circuit diagrams, refer to the appropriate wiring information. The wiring information includes wiring diagrams, proper wire and connector repair procedures, details of wire harness routing and retention, connector pin-out information and location views for the various wire harness connectors, splices and grounds.

SUNROOF

Refer to **SUNROOF DIAGNOSIS CHART** for possible causes. Before beginning sunroof diagnostics verify that all other power accessories are in proper operating condition. If not, a common electrical problem may exist. Refer to Wiring Diagrams, in this publication for circuit, splice and component descriptions. Check the condition of the circuit protection (20 amp circuit breaker in the Junction Block). Inspect all wiring connector pins for proper engagement and continuity. Check for battery voltage at the power sunroof controller, refer to Wiring Diagrams, for circuit information. If battery voltage of more than 10 volts is detected at the controller, proceed with the following tests (the controller will not operate at less than 10 volts).

Before beginning diagnosis for wind noise or water leaks, verify that the problem was not caused by

releasing the control switch before the sunroof was fully closed. The sunroof module has a water-management system. If however, the sunroof glass is in a partial closed position, high pressure water may be forced beyond the water management system boundaries and onto the headlining.

Every time the sunroof module loses power it must be initialized. This is done by connecting power to the sunroof and moving the sunroof toward the closed position. When initialization occurs a slight "kick" in the sunroof module will be seen and heard. This is the indication that the sunroof module is initialized

SUNROOF DIAGNOSIS CHART

SYMPTOM	POSSIBLE CAUSE
Sunroof motor inoperative.	Faulty control switch. Faulty circuit ground between sunroof module, control switch, and body harness. Faulty power circuit between sunroof module, control switch, and body harness. Faulty sunroof drive motor. Faulty sunroof module.
Audible whine when switch is depressed, sunroof does not operate.	Faulty sunroof drive motor. Binding cable.
Audible clicking or ratcheting when switch is pressed, sunroof does not operate.	Broken or worn drive cable. Worn drive motor gear. Mechanisms not synchronized.
Sunroof vents and opens, but does not close.	Broken or disengaged trough guide Binding cable. Faulty circuit. Faulty control switch. Faulty sunroof module. Faulty drive motor.
Sunroof vents, but does not open.	Binding cable or mechanism. Faulty circuit. Faulty switch. Faulty sunroof module.
Sunroof does not vent	Binding cable or mechanism. Faulty circuit. Faulty control switch. Faulty sunroof module.
Sunroof water leak.	Drain tubes clogged or kinked or disconnected from the sunroof. Glass panel improperly adjusted. Faulty glass panel seal.
Gurgling sound from sunroof	Low spot in drain hose routing, allowing water to stand.
Wind noise from sunroof.	Glass panel compression to the roof opening not

	consistent. Wind deflector not deploying properly. Glass not installed or adjusted properly. Faulty glass panel seal.
Buzz, Squeak, Rattles from sunroof	Loose or broken attaching hardware. No lubrication in track. Worn or broken mechanism. Cables bunched or kinked.
Sunshade will not function or does not operate smoothly	Sunshade feet are broken. Sunshade feet are in the wrong track. Track obstructions or interference. Trim lace incorrectly installed in track.
Glass movement not consistent or glass does not operate smoothly	Glass and Track timing. Glass and Track alignment. Cables and Guide alignment.
Broken or jammed guide mechanism	Mechanism cover was not installed correctly.

WATER DRAINAGE AND WIND NOISE DIAGNOSIS

The sliding glass panel is designed to seal water entry with a snug fit between the roof and the seal. The fit can be checked by inserting a business card or equivalent, between the roof and the seal. The piece of paper should have some resistance when pulled out when the glass panel is in the closed position. The sunroof housing will drain off a minimum amount of water. Excessive wind noise could result if the gap clearances are exceeded. The sunroof glass panel may need to be adjusted. See **Body/Sunroof/GLASS, Sunroof - Adjustments**

Adequate drainage is provided by a drain trough in the sunroof housing which encircles the sliding glass panel and leads to drain hoses. If a wet headliner or other water leak complaints are encountered, before performing any adjustments, first ensure that the drainage system is not plugged or disconnected. Use a pint container to pour water into the sunroof housing drain trough. If water flow is restricted, use compressed air to blow out any material plugging the drain system. Retest system again.

To further check for a disconnected drain hose:

NOTE: Care must be taken not to fold or kink the headliner upon removal.

1. Lower headliner as necessary to gain access to sunroof housing drain tubes. See **Body/Interior/HEADLINER - Removal**
2. Repair as necessary.

CHANNEL, SUNROOF DRAIN

Removal

REMOVAL

Fig. 469: Channel Arm
Courtesy of CHRYSLER LLC

1. Remove glass panel (2). See **Body/Sunroof/GLASS, Sunroof - Removal**.
2. Separate the drain channel arms (2) from the guide mechanisms (1) one at a time.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

Fig. 470: Removing Channel
Courtesy of CHRYSLER LLC

3. Carefully slide the drain channel (1) forward to the notches (2) in the frame and remove from the vehicle.

Installation

INSTALLATION

Fig. 471: Installing Channel
Courtesy of CHRYSLER LLC

1. Carefully position the drain channel (1) into the notches (2) in the frame and slide rearward.

Fig. 472: Installing Arm
Courtesy of CHRYSLER LLC

2. Install the drain channel arms (2) into the mechanism (1) holes one at a time with the reinforcements on the inside of mechanism arms.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

3. Install the sunroof glass. See **Body/Sunroof/GLASS, Sunroof - Installation**

COVER, SUNROOF MECHANISM

Removal

REMOVAL

813ae13c

Fig. 473: Removing/Installing Mechanism Covers At Glass Panel
Courtesy of CHRYSLER LLC

1. Move the glass panel to the full closed position.
2. Slide sunshade rearward to the open position.
3. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

Fig. 474: Removing Mechanism Covers From Guide
Courtesy of CHRYSLER LLC

4. Hold both mechanism covers down and open the sunroof fully.
5. Slide the mechanism covers (1) out the front of the guide in the frame (2).

Installation

INSTALLATION

Fig. 475: Glass Fasteners
Courtesy of CHRYSLER LLC

1. With the sunroof in the open position, snap the mechanism cover into the lower guide channel.
2. Hold down each cover and close the sunroof.

3. Snap the upper portion of the cover into the retaining clips (1) on the glass panel between the locating features.

DEFLECTOR, WIND

Removal

REMOVAL

Fig. 476: Deflector Strap
Courtesy of CHRYSLER LLC

1. Open the sunroof fully.
2. Remove the strap screws (2) from the beam area release the strap (3).

Fig. 477: Wind Deflector
Courtesy of CHRYSLER LLC

3. Rotate the deflector up and remove springs (2) from the holes in the frame (1).

Installation

INSTALLATION

Fig. 478: Wind Deflector
Courtesy of CHRYSLER LLC

1. Position the deflector spring arms (2) into the holes of the frame (1).

Fig. 479: Deflector Strap
 Courtesy of CHRYSLER LLC

2. Rotate the deflector down, attach the straps (3) and install the strap screws (2) into the front beam.
3. Verify sunroof operation and alignment.

GLASS, SUNROOF

Removal

REMOVAL

Fig. 480: Removing/Installing Mechanism Covers At Glass Panel

Courtesy of CHRYSLER LLC

1. Move the glass panel (2) to the full closed position.
2. Slide sunshade rearward to the open position.
3. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

Fig. 481: Glass Fasteners
Courtesy of CHRYSLER LLC

4. Remove the glass panel screws (2).
5. Lift off glass panel and remove from vehicle.

Installation

INSTALLATION

Fig. 482: Glass Fasteners
Courtesy of CHRYSLER LLC

CAUTION: Charger sunglass seal is serviceable. 300 / Magnum seal is not serviceable.

Position glass panel on to mechanism lift arms.

CAUTION: Verify that the retaining tabs are located on the **INSIDE** of the guide mechanism arms.

1. Start the attaching screws (2).
2. Connect a 12v power supply and verify that the sunroof is in the closed position.
3. Adjust sunroof glass to fit flush with roof line. See **Body/Sunroof/GLASS, Sunroof - Adjustments**.
4. Tighten the screws to 5.5 N.m (49 in. lbs.).

8139ef3c

Fig. 483: Removing/Installing Mechanism Covers At Glass Panel
Courtesy of CHRYSLER LLC

5. Position the mechanism covers (2) over the glass tabs (1) between the locating features and seat fully.
6. Verify sunroof operation and alignment.

Adjustments

ADJUSTMENT

813aef3c

Fig. 484: Removing/Installing Mechanism Covers At Glass Panel
 Courtesy of CHRYSLER LLC

1. Move the sunshade rearward to the open position.
2. Separate the mechanism covers (2) from the tabs (1) on the glass panel.

813a30b3

Fig. 485: Glass Fasteners
 Courtesy of CHRYSLER LLC

3. Verify the sunroof glass panel is in the fully closed position.
4. Loosen the forward attaching screws (2) on each side enough to permit the front of the glass to adjust up or down.
5. Adjust the front surface of the sunroof glass panel 0.00 mm to 2 mm (0.00 in. to 0.08 in.) **below** the top surface of the roof.

6. Tighten the front glass panel attaching screws to 5.5 N.m (49 in. lbs.).
7. Loosen the rear screws (2) on each side enough to make the rear adjustment.
8. Adjust the rear surface of the sunroof glass panel 0.00 mm to 2 mm (0.00 in. to 0.08 in.) **above** the top surface of the roof.
9. Tighten the rear glass panel attaching screws to 5.5 N.m (49 in. lbs.).
10. Check for proper fit. If not OK, repeat glass panel adjustment.

6139ef3c

Fig. 486: Removing/Installing Mechanism Covers At Glass Panel
Courtesy of CHRYSLER LLC

11. Position the mechanism covers (2) over the glass tabs (1) between the locating features and seat fully.
12. Verify sunroof operation and alignment.

GUIDE, SUNROOF, GLASS

Removal

REMOVAL

Fig. 487: Channel Arm
Courtesy of CHRYSLER LLC

1. Remove the sunroof assembly. See **Body/Sunroof/SUNROOF - Removal**
2. Remove the motor. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Removal**
3. Remove the glass. See **Body/Sunroof/GLASS, Sunroof - Removal**
4. Remove the wind deflector. See **Body/Sunroof/DEFLECTOR, Wind - Removal**
5. Separate the drain channel arms (2) from the guide mechanisms (1) one at a time.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

6. Slide the drain channel rearward out of the way.

Fig. 488: Hard Stop Screw

Courtesy of CHRYSLER LLC

3. Push the guide assembly (1) and drive cable rearward past the hard stop location.
4. Install the hard stop screw (2) and push the drive cable and guide assembly (1) up against the hard stop screw (2).

5. Verify that the opposite guide assembly is also positioned up against the hard stop screw.
6. Install the wind deflector as necessary. See **Body/Sunroof/DEFLECTOR, Wind - Installation**
7. Install the motor as necessary. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Installation**

Fig. 494: Installing Arm
Courtesy of CHRYSLER LLC

8. Install the drain channel arms (2) into the mechanism (1) holes one at a time with the reinforcements on the inside of mechanism arms.

CAUTION: Do not pry the channel arms apart at the same time or you could break the drain channel.

9. Install the sunroof assembly into the vehicle. See **Body/Sunroof/SUNROOF - Installation**
10. Perform the sunroof position calibration. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure** .
11. Perform the Excessive Force Limitation (EFL) calibration. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure** .
12. Install the glass as necessary. See **Body/Sunroof/GLASS, Sunroof - Installation**
13. Adjust sunroof glass to fit flush with roof line. See **Body/Sunroof/GLASS, Sunroof - Adjustments**.
14. Verify proper operation of the power sunroof system.

MOTOR, SUNROOF

Description

DESCRIPTION

For service information refer to. Refer to **Electrical - Power Systems/Power Top - Diagnosis and Testing** .

SUNROOF

Removal

REMOVAL

Fig. 495: Electrical Connector
Courtesy of CHRYSLER LLC

WARNING: The excessive force limitation (efl) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure** calibration) for the appropriate procedure.

1. Move glass panel to the fully closed position.
2. Disconnect and isolate the battery negative cable.
3. Lower the headliner. See **Body/Interior/HEADLINER - Removal**.
4. Disconnect the sunroof wire harness electrical connector.

813adaac

Fig. 496: Connecting Drain Tubes
 Courtesy of CHRYSLER LLC

5. Disconnect the four drain tubes (1) from sunroof housing.

8101

Fig. 497: Removing/Installing Sunroof
 Courtesy of CHRYSLER LLC

6. Remove the eight fasteners (3) attaching sunroof assembly.
7. With the aid of a helper, support the sunroof and remove the fasteners (2) attaching sunroof

assembly (1) to roof panel.

8. Remove the sunroof (1) from vehicle.

Installation

INSTALLATION

8101

Fig. 498: Removing/Installing Sunroof
Courtesy of CHRYSLER LLC

WARNING: The excessive force limitation (efl) feature must be calibrated any time a sunroof motor/module is replaced with a new component. Failure to perform this procedure could result in vehicle damage and/or personal injury. Refer to Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure for the appropriate procedure.

1. Verify that glass panel is loose and slightly retracted.
2. Raise sunroof module assembly (1) and guide it carefully into position.

813a312f

Fig. 499: Tightening Sequence
Courtesy of CHRYSLER LLC

3. While supporting the sunroof assembly start the 12 attaching screws and tighten the attaching screws to 9 N.m (80 in. lbs.) using the sequence shown in illustration.

813a3114

Fig. 500: Electrical Connector
Courtesy of CHRYSLER LLC

4. Connect the electrical connector.

813adaac

Fig. 501: Connecting Drain Tubes
Courtesy of CHRYSLER LLC

5. Connect the drain tubes to the sunroof (1).
6. Adjust the sunroof glass. See **Body/Sunroof/GLASS, Sunroof - Adjustments**
7. Connect battery negative cable.
8. Install the vehicle headliner. See **Body/Interior/HEADLINER - Installation**.
9. Perform the sunroof position calibration. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure** .
10. Perform the Excessive Force Limitation (EFL) calibration. Refer to **Electrical - Power Systems/Power Top/MOTOR, Sunroof - Standard Procedure** CALIBRATION).
11. Verify proper operation of the power sunroof system.

SUNSHADE, SUNROOF

Removal

REMOVAL

Fig. 502: Removing Sunroof Sunshade No. 1
 Courtesy of CHRYSLER LLC

1. Remove the drain channel. See **Body/Sunroof/CHANNEL, Sunroof Drain - Removal.**
2. Push up the front center of the sunshade (1) to pop out the front two feet.

Fig. 503: Removing Sunroof Sunshade No. 2
 Courtesy of CHRYSLER LLC

3. Rotate the sunshade (2) so that the other feet (1) are removed from the guide track.

Installation

INSTALLATION

Fig. 504: Installing Sunroof Sunshade No. 1
Courtesy of CHRYSLER LLC

1. Verify the sunshade track is free of obstructions like the trim lace.
2. Start with sunshade (2) at an angle with one foot (1) in the track.
3. Rotate the sunshade so the other rear foot is in the track as well as the 2 other feet (3) on the same side as the first foot.

Fig. 505: Installing Sunroof Sunshade No. 2
Courtesy of CHRYSLER LLC

4. To insert the remaining two feet (2) apply force to the middle front of sunshade (3) and guide them into the track.

5. Check that all the feet are in the right track and verify sunshade operation.
6. Install the drain channel. See **Body/Sunroof/CHANNEL, Sunroof Drain - Installation**.

SWITCH, SUNROOF

Description

DESCRIPTION

For service information refer to. Refer to **Electrical - Power Systems/Power Top/SWITCH, Sunroof - Diagnosis and Testing** .

TRIM LACE, SUNROOF

Removal

REMOVAL

Fig. 506: Trim Lace
Courtesy of CHRYSLER LLC

1. Remove trim lace (2) by holding one end of the trim lace at the butt joint and pulling horizontally into the opening until lace is completely loose from the headliner/sunroof joint.

Installation

INSTALLATION

Fig. 507: Trim Lace
Courtesy of CHRYSLER LLC

1. Place butt joint of trim lace into position starting at the drivers side middle of the opening at the butt joint notch in the u-frame.
2. Push lace into position.
3. Ensure that the corner radii is fully engage.
4. Once the trim lace is attached to sunroof module using a trim stick C-4755 or equivalent, begin tucking the headliner under the lip on the trim lace working all the way around the opening. When installing a new trim lace, begin tucking the headliner under the lip as the tear cord (1) is removed working all the way around the opening.

TUBE, SUNROOF DRAIN

Removal

REMOVAL

FRONT HOSES

Fig. 508: Front Tube
 Courtesy of CHRYSLER LLC

1. Remove headliner. See **Body/Interior/HEADLINER - Removal**.
2. Disconnect the drain hose from the sunroof housing (3).
3. Separate the lower tube from the grommet in the body (4).
4. Drain any liquid from hose connection, if necessary.
5. Release the clips (2) and remove the tube (1).

REAR HOUSING HOSE

Fig. 509: Rear Tube
 Courtesy of CHRYSLER LLC

1. Remove headliner. See **Body/Interior/HEADLINER - Removal.**
2. Disconnect the drain hose from the sunroof housing (1).
3. Drain any liquid from hose connection, if necessary.
4. Release the push pin fasteners (2) and separate the lower tube from the grommet in the body (4).

Installation

INSTALLATION

FRONT HOSES

Fig. 510: Front Tube
Courtesy of CHRYSLER LLC

1. Position the lower portion through the grommet in the body (4).
2. Connect the new drain hose (1) to the sunroof housing (3) and test drainage.
3. Position the hose (1) into the support clips (2).
4. Install headliner. See **Body/Interior/HEADLINER - Installation.**

REAR HOUSING HOSE

Fig. 511: Rear Tube

Courtesy of CHRYSLER LLC

1. Install the rear hose (3) and seat the push pin fasteners (2) fully.
2. Position the lower portion through the grommet in the body (4).
3. Connect the new drain hose (3) to the sunroof housing (1) and test drainage.
4. Install headliner. See **Body/Interior/HEADLINER - Installation**.

BRAKES

Base - Service Information - Challenger

DESCRIPTION

DESCRIPTION

The base brake system consists of the following components:

- Brake pedal
- Master cylinder
- Power brake booster
- Brake tubes and hoses
- Disc brakes (front and rear)
- Brake lamp switch
- Brake fluid level sensor
- Parking brake

All brakes are power assist type through the use of a vacuum operated power brake booster.

The hydraulic brake system is front/rear split. This means the front brakes are on one hydraulic circuit from the master cylinder and the rear brakes are on the other.

Front disc brakes control the braking of the front wheels; rear braking is controlled by rear disc brakes.

This vehicle is equipped with an Antilock Brake System (ABS) with traction control and an Electronic Stability Program (ESP). This system shares most base brake hardware. All components differing from the base brake hardware are described in detail in the Antilock Brake System service information.

The parking brake on this vehicle is pedal-operated.

For more information on the description of any individual base brake component, refer to that component elsewhere in this service information. For information on the brake lamp switch. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Description** .

WARNING

WARNING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain

asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

CAUTION

CAUTION

CAUTION: Use only Mopar® brake fluid or an equivalent from a tightly sealed container. Brake fluid must conform to DOT 3 specifications. Do not use petroleum-based fluid because seal damage in the brake system will result.

CAUTION: Brake fluid will damage painted surfaces. If brake fluid is spilled on any painted surfaces, wash it off immediately with water.

CAUTION: Never use gasoline, kerosene, alcohol, motor oil, transmission fluid, or any fluid containing mineral oil to clean system components. These fluids damage rubber cups and seals.

CAUTION: During service procedures, grease or any other foreign material must be kept off the caliper assembly, brake linings, brake rotor and external surfaces of the hub.

CAUTION: Disc brake calipers are made of aluminum. They are anodized and appear black in color. When handling the calipers or brake rotors, be careful to avoid damaging them, and avoid scratching or nicking the brake pad lining.

CAUTION: Anytime the battery has been disconnected and is reconnected it is important that this be performed properly. The vehicle may be equipped with systems that require special calibration processes. Refer to Electrical - Engine Systems/Battery System - Standard Procedure

STANDARD PROCEDURE

BASE BRAKE BLEEDING

CAUTION: Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

NOTE: For bleeding the antilock brake hydraulic system. See Brakes - Standard Procedure.

NOTE: Do not pump the brake pedal at any time while having a bleeder screw open during the bleeding process. This will only increase the amount of air in the system and make additional bleeding necessary.

NOTE: Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir will allow additional air into the brake system. Check the fluid level frequently and add fluid as needed.

The following wheel circuit sequence for bleeding the brake hydraulic system should be used to ensure adequate removal of all trapped air from the brake hydraulic system.

- Right rear wheel
- Left rear wheel
- Right front wheel
- Left front wheel

NOTE: Pressure bleeding is highly recommended to bleed this brake system to ensure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

The base brake system can be bled using the pressure method or the manual method. Both methods are presented in this text.

PRESSURE BLEEDING METHOD

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

8137562

Fig. 1: Special Tool 6921
Courtesy of CHRYSLER LLC

1. Remove filler cap from the top of fluid reservoir (2) on master cylinder.
2. Install Adapter (1), Special Tool 6921, in the caps place on the reservoir (2).
3. Attach Bleeder Tank, Special Tool C-3496-B, or equivalent, to Adapter 6921 (1). Pressurize the system following the pressure bleeder manufacturer's instructions.

281609

Fig. 2: Raising Rear Bumper
Courtesy of CHRYSLER LLC

NOTE: To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).

4. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary

to add extra support stands under vehicle to support this angle.

Fig. 3: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

5. If installed, remove rubber dust caps from all four bleeder screws on calipers.
6. Starting at the first wheel circuit as listed earlier, attach a clear hose (1) to the bleeder screw at that wheel's brake caliper and feed the other end of the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

7. Open bleeder screw at least one full turn or more to obtain an adequate flow of brake fluid.
8. After 4 to 8 ounces of brake fluid has been bled through the brake hydraulic circuit, and an air-free flow (no bubbles) is maintained in the clear plastic hose (1) and jar (2), close the bleeder screw.
9. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.
10. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Re-bleed the brake system as necessary.
11. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then re-bleed base brakes. See **Brakes - Standard Procedure**.
12. Reinstall all 4 bleeder screw dust caps.
13. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

MANUAL BLEEDING METHOD

NOTE: To bleed the base brake system manually, an assistants help is required.

281609

Fig. 4: Raising Rear Bumper
Courtesy of CHRYSLER LLC

NOTE: To ensure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 10-12 inches as measured at the rear bumper (1).

1. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

81209e57

Fig. 5: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

2. Remove rubber duct caps from all 4 bleeder screws.
3. Attach a clear hose (1) to the bleeder screw at one wheel and feed the other end of the hose into a clear jar (2) containing fresh brake fluid.

4. Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

5. While the pedal is being held down, open the bleeder screw at least 1 full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue to hold the pedal all the way down.
6. Once the brake pedal has dropped, close the bleeder screw. The pedal can then be released.
7. Repeat steps One through Five until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brakes hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

8. Bleed the remaining wheel circuits in the same manner until all air is removed from the brake hydraulic system.
9. Check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the hydraulic system. Re-Bleed the brake system as necessary.
10. If equipped with antilock brakes, the hydraulic control unit may need to be bled, then Re-Bleed base brakes. See **Brakes - Standard Procedure**.
11. Reinstall all 4 bleeder screw dust caps.
12. Test drive vehicle to ensure brakes are operating properly and pedal feel is correct.

BASE BRAKE BLEEDING - SRT8

Use the following procedure to bleed the rear brake calipers of this vehicle. The front brake calipers may be bled using the same procedure as the standard model.

CAUTION: Before removing the master cylinder cover, wipe it clean to prevent dirt and other foreign matter from dropping into the master cylinder.

CAUTION: Use only Mopar® brake fluid or an equivalent from a fresh, tightly sealed container. Brake fluid must conform to DOT 3 specifications.

NOTE: For bleeding the antilock-brake hydraulic system. See Brakes - Standard Procedure.

NOTE: Do not pump the brake pedal at any time with a bleeder screw open during the bleeding process. This only increases the amount of air in the system and makes additional bleeding necessary.

NOTE: Do not allow the master cylinder reservoir to run out of brake fluid while bleeding the system. An empty reservoir allows additional air into the brake system. Check the fluid level frequently and add fluid as needed.

NOTE: Pressure bleeding is highly recommended to bleed this brake system to make sure all air is removed from system. Manual bleeding may also be used, but additional time is needed to remove all air from system.

Although the **pressure method** is recommended for bleeding the base brake system, the manual method can also be performed. Both methods are presented in this text.

PRESSURE BLEEDING METHOD

NOTE: Follow pressure bleeder manufacturer's instructions for use of pressure bleeding equipment.

81376d2

Fig. 6: Special Tool 6921
Courtesy of CHRYSLER LLC

1. Remove the filler cap from the top of the fluid reservoir (2) on the master cylinder.

2. Install Adapter (1) 6921, in the caps place on the reservoir (2).
3. Attach Bleeder Tank C-3496-B, or equivalent, to Adapter 6921 (1). Pressurize the system following the pressure bleeder manufacturer's instructions.

281609

Fig. 7: Raising Rear Bumper
Courtesy of CHRYSLER LLC

NOTE: To make sure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 254-305 mm(10-12 inches) as measured at the rear bumper (1).

4. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

NOTE: Use the following wheel circuit sequence for bleeding the brake hydraulic system to adequately remove all trapped air from the brake hydraulic system.

- Right rear wheel
- Left rear wheel
- Right front wheel
- Left front wheel

Fig. 8: Bleeding Caliper Inboard Half
 Courtesy of CHRYSLER LLC

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

Fig. 9: Bleeding Caliper Outboard Half
 Courtesy of CHRYSLER LLC

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

Fig. 10: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

REAR BRAKES

Fig. 11: Bleeding Caliper Inboard Half
Courtesy of CHRYSLER LLC

1. If installed, remove the rubber dust caps from both bleeder screws on each caliper.
2. Start at the first wheel circuit that needs to be bled (See list in above note). Attach a clear hose (3) to the inboard bleeder screw (2) at the wheels brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

3. Open the inboard bleeder screw (2) one full turn to obtain an adequate flow of brake fluid.
4. After bleeding 118-237 ml. (4-8 oz.) of brake fluid through the brake hydraulic circuit, and maintaining an air-free flow (no bubbles) is in the clear plastic hose (3) and jar (4), close the bleeder screw (2).
5. Remove the clear hose and install the bleeder screw dust cap.

Fig. 12: Bleeding Caliper Outboard Half
Courtesy of CHRYSLER LLC

6. Attach a clear hose (5) to the outboard bleeder screw (1) at the same brake caliper and feed the other end of those into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

7. Open the outboard bleeder screw (1) one full turn to obtain an adequate flow of brake fluid.
8. After bleeding 118-237 ml. (4-8 oz.) of brake fluid through the brake hydraulic circuit, and maintaining an air-free flow (no bubbles) is in the clear plastic hose (5) and jar (4), close the bleeder screw (1).
9. Remove the clear hose and install the bleeder screw dust cap.
10. Bleed the opposite rear brake wheel circuits as necessary in the same manner until all air is removed from the brake hydraulic system, then proceed to the front brakes.

FRONT BRAKES

Fig. 13: BLEED HOSE SET UP
 Courtesy of CHRYSLER LLC

1. If installed, remove the rubber dust cap from bleeder screw on each front brake caliper.
2. Start at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (1) to the bleeder screw at that wheel's brake caliper and feed the other end of the hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

3. Open bleeder screw one full turn to obtain an adequate flow of brake fluid.
4. After bleeding 118-237 ml. (4-8 oz.) of brake fluid through the brake hydraulic circuit, and maintaining an air-free flow (no bubbles) in the clear plastic hose (1) and jar (2), close the bleeder screw.
5. Install the bleeder screw dust cap.
6. Bleed the opposite front brake wheel circuit as necessary in the same manner until all air is removed from the brake hydraulic system.
7. If equipped with anti-lock brakes, and the hydraulic control unit needs to be bled, then Re-Bleed the base brakes. See **Brakes - Standard Procedure**.
8. Once all brakes are bled, check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the brake hydraulic system. Re-Bleed the brake system as necessary.
9. Test drive vehicle to make sure the brakes are operating properly and pedal feel is correct.

MANUAL BLEEDING METHOD

NOTE: To bleed the base brake system manually, an assistant's help is required.

281609

Fig. 14: Raising Rear Bumper
Courtesy of CHRYSLER LLC

NOTE: To make sure all air is bled from the ICU or junction block in a timely manner, it is recommended to raise the rear of the vehicle approximately 5° higher than the front or approximately 254-305 mm (10-12 inches) as measured at the rear bumper (1).

1. Raise and support vehicle placing rear of vehicle approximately 5° higher than the front or if measured at the rear bumper (1), approximately 10-12 inches above level. It will be necessary to add extra support stands under vehicle to support this angle.

NOTE: Use the following wheel circuit sequence for bleeding the brake hydraulic system to adequately remove all trapped air from the brake hydraulic system.

- Right rear wheel
- Left rear wheel
- Right front wheel
- Left front wheel

Fig. 15: Bleeding Caliper Inboard Half
Courtesy of CHRYSLER LLC

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This makes sure that air does not reenter the brake hydraulic system.

Fig. 16: Bleeding Caliper Outboard Half
 Courtesy of CHRYSLER LLC

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

Fig. 17: BLEED HOSE SET UP

Courtesy of CHRYSLER LLC

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This makes sure that air does not reenter the brake hydraulic system.

REAR BRAKES

Fig. 18: Bleeding Caliper Inboard Half
Courtesy of CHRYSLER LLC

1. If installed, remove the rubber dust caps from both bleeder screws on each caliper.
2. Start at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (3) to the inboard bleeder screw at that the brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.
3. Have an assistant pump the brake pedal three or four times, then hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not

opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

4. While holding down the brake pedal, open the inboard bleeder screw (2) at least one full turn. When the bleeder screw opens the brake pedal will drop all the way to the floor. Continue holding the pedal all the way down.
5. Once the brake pedal drops, close the bleeder screw. Release the pedal.
6. Repeat the previous three steps until all trapped air is removed from that wheel circuit (usually four or five times). This should pass a sufficient amount of fluid to expel all the trapped air from the brake hydraulic system. **Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level.** This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This makes sure that air does not reenter the brake hydraulic system.

7. Remove the clear hose and install the bleeder screw dust cap.

Fig. 19: Bleeding Caliper Outboard Half
Courtesy of CHRYSLER LLC

8. Attach a clear hose (5) to the outboard bleeder screw (1) at the brake caliper and feed the other end of hose into a clear jar (4) containing enough fresh brake fluid to submerge the end of the hose.
9. Have an assistant pump the brake pedal three or four times, then hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

10. While holding down the brake pedal, open the outboard bleeder screw (2) at least one full turn. When the bleeder screw opens the brake pedal drops all the way to the floor. Continue holding the pedal all the way down.
11. Once the brake pedal drops, close the bleeder screw. Release the pedal.
12. Repeat the previous three steps until all trapped air is removed from that wheel circuit (usually four or five times). This passes a sufficient amount of fluid to expel all the trapped air from the brake hydraulic system. **Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level.** This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This will ensure that air does not reenter the brake hydraulic system.

13. Remove the clear hose and install the bleeder screw dust cap.
14. Bleed the opposite rear brake wheel circuits as necessary in the same manner until all air is removed from the brake hydraulic system, then proceed to the front brakes.

FRONT BRAKES

Fig. 20: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

1. If installed, remove the rubber dust cap from the bleeder screw on each front brake caliper.

2. Start at the first wheel circuit that needs to be bled (See list in above note), attach a clear hose (1) to the bleeder screw at that the brake caliper and feed the other end of hose into a clear jar (2) containing enough fresh brake fluid to submerge the end of the hose.
3. Have an assistant pump the brake pedal three or four times and hold it down before the bleeder screw is opened.

CAUTION: Open the bleeder screw at least one full turn when instructed. Some air may be trapped in the brake lines or valves far upstream, as far as ten feet or more from the bleeder screw. If the bleeder screw is not opened sufficiently, fluid flow is restricted causing a slow, weak fluid discharge. This will NOT get all the air out. Therefore, it is essential to open the bleeder screw at least one full turn to allow a fast, large volume discharge of brake fluid.

4. While holding down the brake pedal open the bleeder screw at least one full turn. When the bleeder screw opens the brake pedal drops all the way to the floor. Continue holding the pedal all the way down.
5. Once the brake pedal drops, close the bleeder screw. Release the pedal.
6. Repeat the previous five steps until all trapped air is removed from that wheel circuit (usually four or five times). This passes a sufficient amount of fluid to expel all the trapped air from the brake hydraulic system. Be sure to monitor brake fluid level in master cylinder fluid reservoir making sure it stays at a proper level. This will ensure air does not reenter brake hydraulic system through master cylinder.

NOTE: Monitor the brake fluid level in the fluid reservoir periodically to make sure it does not go too low. This makes sure that air does not reenter the brake hydraulic system.

7. Install the bleeder screw dust cap.
8. Bleed the opposite front brake wheel circuit as necessary in the same manner until all air is removed from the brake hydraulic system.
9. If equipped with anti-lock brakes, and the hydraulic control unit needs to be bled, then Re-Bleed the base brakes. See **Brakes - Standard Procedure**.
10. Once all brakes are bled, check brake pedal travel. If pedal travel is excessive or has not improved, some air may still be trapped in the brake hydraulic system. Re-Bleed the brake system as necessary.
11. Test drive the vehicle to make sure the brakes are operating properly and pedal feel incorrect.

HYDRAULIC/MECHANICAL

DESCRIPTION

DISC BRAKES

Four-wheel disc brakes are standard on this vehicle. There are two four-wheel disc brake systems available, a standard and a premium. The standard disc brake system is referred to as "Seventeen-Inch." The premium disc brake system is referred to as "Eighteen-Inch."

Fig. 30: 17 INCH BRAKES
Courtesy of CHRYSLER LLC

"Seventeen-inch" four-wheel disc brakes (so called because they are designed to fit inside 17-inch wheels) are standard on rear-wheel drive models with V6 engines. They feature single-piston aluminum calipers (2) and vented rotors (1) in the front and single-piston aluminum calipers (4) with solid rotors (3) in the rear.

Fig. 31: 18 INCH BRAKES
Courtesy of CHRYSLER LLC

The premium system features twin-piston aluminum calipers (1) and vented rotors (2) in the front and single-piston aluminum calipers (4) with vented rotors (3) in the rear. Although the rear calipers appear the same as the 17-inch system, the rear calipers used with this system feature a wider jaw to compensate for the wider, vented brake rotors used.

Although the twin-piston caliper used is the same, Rear-Wheel-Drive (RWD) models mount the caliper to the rear (trailing end) of the knuckle.

All calipers are aluminum construction and are the low-drag type. New-technology caliper construction allows minimal drag of the pads on the discs with low clearance to the rotors to maintain maximum pedal feel and responsiveness.

All calipers are anodized, giving them an off-black appearance. This coating offers corrosion protection and a long-term neat appearance.

Phenolic pistons are used in all calipers. The premium twin caliper pistons have stainless steel caps for protection against damage due to contact with the brake pads.

All brake rotors are fully coated with Geomet™, a water-soluble, environmental friendly corrosion preventive or Zinc Dust. Both the friction surfaces and the vents are coated. During initial brake applications of a new rotor, the brake pads scrub the coating off the friction surfaces, ensuring that the remainder will be rust free. Coating the vents also ensures that there will not be a loss of heat capacity over time.

DISC BRAKES - SRT8

Fig. 32: FRONT DISC BRAKES
Courtesy of CHRYSLER LLC

The SRT8 vehicle utilizes four-wheel disc brakes. All brake calipers (2) are four-piston opposed fixed design manufactured by Brembo™.

All brake rotors (3) are the internal vented type. There are no dust shields behind the front brake rotors.

Each front brake caliper features four 42 mm pistons, two in each outer half of the caliper. The two outer halves of this caliper connect hydraulically using internal passageways. These calipers are not serviceable. Do not attempt disassembly.

Each rear brake caliper features four pistons also, two in each half of the caliper. Each half has one 28 mm and one 32 mm piston. When mounted, the smaller size (28 mm) piston is located at the top while the larger size (32 mm) piston is located at the bottom. The two halves of the caliper are connected hydraulically by means of an external brake tube located on the bottom of the caliper assembly. Each caliper half has its own bleeder screw at the top and must be bled individually when bleeding is required. These calipers are not serviceable. Do not attempt disassembly.

All SRT8 calipers mount directly to the knuckle (8). They do not use brake caliper adapters.

The SRT8 rear brake rotors have integrated parking brake drums like the standard rear disc brake system.

BOOSTER, POWER BRAKE

Removal

REMOVAL

8133b050

Fig. 33: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Move driver seat to full rearward position.
2. Disconnect and isolate negative battery cable (2).
3. Remove windshield wiper module. Refer to Electrical - Wipers/Washers/Wipers/Washers/LINKAGE, Wiper Arm - Removal .
4. Remove master cylinder. See Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Removal.

8137c132

Fig. 34: VACUUM HOSE CONNECTION

Courtesy of CHRYSLER LLC

5. Disconnect vacuum hose (3) from check valve (2) on face of booster (1). **Do not remove check valve from booster.**

Fig. 35: Brake Pedal Mounting
Courtesy of CHRYSLER LLC

6. Remove brake lamp switch. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Removal**.
7. Remove booster push rod from pin on brake pedal. (3) To do so:
 - a. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip.
 - b. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
 - c. **Discard retaining clip. It is not to be reused. Install NEW retaining clip when assembling.**
8. Slide booster push rod (3) off brake pedal pin.
9. Remove four power brake booster mounting nuts (1).
10. Slide power brake booster forward out of dash panel (2) and remove through opening between cross-brace and windshield.

Installation

INSTALLATION

NOTE: Make sure there is a NEW booster seal placed over push rod and mounting studs on rear of booster prior to installation. Failure to do so may result in a leak and possible premature failure of the brake booster.

Fig. 36: BOOSTER SEAL
 Courtesy of CHRYSLER LLC

1. Install a NEW booster seal (2) over push rod and mounting studs on rear of booster (1).

Fig. 37: Brake Pedal Mounting
 Courtesy of CHRYSLER LLC

2. Install power brake booster through opening between cross-brace and windshield. Guide booster (3) push rod and mounting studs through dash panel (2).

NOTE: Be sure to tighten all four booster mounting nuts to specifications or a vacuum leak can result.

3. Install four power brake booster mounting nuts (1). Tighten nuts to 25 N.m (18 ft. lbs.).
4. Slide booster push rod (3) onto brake pedal pin. Install NEW retaining clip securing push rod to brake pedal.
5. Install and adjust brake lamp switch. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Installation** .

Fig. 38: VACUUM HOSE CONNECTION
Courtesy of CHRYSLER LLC

6. Connect vacuum hose (3) to check valve (2) on face of booster (1). **Do not remove check valve from booster.**
7. Install master cylinder (1). See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Installation**.
8. Install windshield wiper module. Refer to **Electrical - Wipers/Washers/Wipers/Washers/LINKAGE, Wiper Arm - Installation** .

8133bb50

Fig. 39: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

9. Connect negative battery cable (2).
10. Fill and bleed brakes as necessary. See **Brakes - Standard Procedure**.

CALIPER, DISC BRAKE, FRONT SRT8

Removal

REMOVAL

NOTE: Before proceeding. See **Brakes - Warning**. See **Brakes - Caution**.

8133bb50

Fig. 40: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

Fig. 41: TIRE AND WHEEL MOUNTING

Courtesy of CHRYSLER LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 42: FLEX HOSE CONNECTION AT CALIPER
 Courtesy of CHRYSLER LLC

5. Remove banjo bolt (4) connecting flexible brake hose (5) to caliper (1). There are two sealing washers (2, 3) (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; use NEW washers upon installation.

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

Fig. 43: PUSHING BACK PISTONS IN BORE

Courtesy of CHRYSLER LLC

6. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
7. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 44: FRONT DISC BRAKES
Courtesy of CHRYSLER LLC

8. Remove caliper mounting bolts (1).
9. Remove brake caliper (2) with pads from knuckle (3) and brake rotor (3).
10. If brake pads need to be removed from caliper.

NOTE: These calipers are not serviceable. Do not attempt disassembly.

Installation

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. See Brakes/Hydraulic/Mechanical/PADS, Brake - Inspection.

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block or used brake pad (not to be reused) over pistons before installing C-clamp to avoid damaging piston.

2. If brake pads need to be installed in caliper before installation. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Installation**.

Fig. 45: FRONT DISC BRAKES
Courtesy of CHRYSLER LLC

3. Slide caliper with pads (2) over brake rotor (3) and align with knuckle (8).
4. Install caliper mounting bolts (1). Tighten bolts to 190 N.m (140 ft. lbs.) torque.

Fig. 46: FLEX HOSE CONNECTION AT CALIPER
Courtesy of CHRYSLER LLC

5. Install banjo bolt (4) attaching brake hose (5) to caliper (1). Install NEW washers (2, 3) on each

side of hose fitting as banjo bolt is placed through banjo fitting. Thread banjo bolt into caliper and tighten to 33 N.m (24 ft. lbs.) torque.

Fig. 47: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) torque. Refer to **Tires and Wheels - Installation** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

Fig. 48: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

Fig. 49: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See **Brakes - Standard Procedure**.

CAUTION: If NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications.

11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If NEW brake pads are installed, they need to be properly burnished. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Standard Procedure**.

CALIPER, DISC BRAKE, REAR

Removal

REMOVAL

NOTE: Before proceeding. See **Brakes - Warning**. See **Brakes - Caution**.

81330050

Fig. 50: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

81386065

Fig. 51: TIRE AND WHEEL MOUNTING

Courtesy of CHRYSLER LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 52: FLEX HOSE CONNECTION AT REAR CALIPER
Courtesy of CHRYSLER LLC

5. Remove banjo bolt (4) connecting flexible brake hose (3) to caliper (1). There are two sealing washers (2) (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

Fig. 53: REAR CALIPER MOUNTING
Courtesy of CHRYSLER LLC

6. While holding guide pins from turning, remove caliper guide pin bolts (2).

7. Remove brake caliper (1) from brake adapter (3) and pads.

Disassembly

DISASSEMBLY

NOTE: Before disassembling brake caliper, clean and inspect it. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Cleaning. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Inspection.

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

Fig. 54: REAR CALIPER IN VISE
Courtesy of CHRYSLER LLC

1. Drain brake fluid from caliper.
2. Mount caliper in a vise equipped with protective jaws.
3. Place a wooden block (2) (padded with approximately one-inch thickness of shop towels) in front of caliper (1) piston as shown in illustration. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out. This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

4. Apply low pressure compressed air to caliper fluid inlet in **short spurts** to ease piston out of bore.
5. Remove piston from caliper (1).

Fig. 55: REAR CALIPER DUST BOOT REMOVAL**
Courtesy of CHRYSLER LLC

CAUTION: When working on disc brake caliper, always use care and suitable tools to avoid damaging the aluminum housing.

6. Using a suitable tool (1), carefully remove dust boot (2) and discard it.

813312b5

Fig. 56: REAR CALIPER PISTON SEAL REMOVAL
 Courtesy of CHRYSLER LLC

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch bore or leave burrs on seal groove edges.

7. Using a soft tool such as a plastic trim stick (2), work piston seal (1) out of its groove in caliper piston bore. Discard used seal.

813312ba

Fig. 57: REAR CALIPER BLEEDER SCREW
 Courtesy of CHRYSLER LLC

8. Remove caliper bleeder screw (1) from caliper housing (2).

9. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
10. Inspect both piston and bore for scoring or pitting.

NOTE: It is not recommended to hone caliper bore. The anodized coating would be compromised.

Cleaning

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

Inspection

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

Assembly

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

NOTE: Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid or equivalent

when assembling brake caliper.

NOTE: Never use used or old piston seals or boots for reassembly.

Fig. 58: REAR CALIPER PISTON SEAL INSTALLATION
Courtesy of CHRYSLER LLC

1. Lubricate caliper piston, piston seal (1) and piston bore (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) in groove of caliper bore (2). Seal should be started at one area of groove and gently worked around and into the groove using only your clean fingers to seat it.

Fig. 59: INSTALL BOOT ON CALIPER PISTON
Courtesy of CHRYSLER LLC

3. Install NEW dust boot (1) on piston (2) and work boot lip into groove at top of piston. Stretch boot downward, straightening boot folds, then move boot back upward as necessary until folds snap uniformly into place.

81331520

Fig. 60: INSTALL PISTON IN REAR CALIPER
Courtesy of CHRYSLER LLC

4. Install piston (1) into caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage can be avoided.

81331521

Fig. 61: MEASURING DUST BOOT HEIGHT
Courtesy of CHRYSLER LLC

CAUTION: When installing dust boot in following step, use care not to over-install boot or damage will occur. The boot (3) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (2) of boot still showing above caliper housing.

8133152b

Fig. 62: INSTALLING DUST BOOT USING TOOL
Courtesy of CHRYSLER LLC

5. Seat dust boot (3) in caliper counterbore using Installer, Special Tool 9314, with Handle, Special Tool C-4171. Install dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

813312ba

Fig. 63: REAR CALIPER BLEEDER SCREW

Courtesy of CHRYSLER LLC

6. Install bleeder screw in correct threaded hole. Caliper housing is not side-specific, so it is important to install bleeder screw in threaded hole that will be uppermost once caliper is installed on vehicle. Tighten bleeder screw to 15 N.m (125 in. lbs.) torque.
7. Install caliper on vehicle. See **Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Installation**.

Installation

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Inspection**.

1. Completely retract caliper piston back into bore of caliper. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

Fig. 64: REAR CALIPER MOUNTING
Courtesy of CHRYSLER LLC

3. Slide caliper over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to crossthread caliper guide pin bolts (2) when they are installed.

NOTE: Before installing caliper guide pin bolts, clean guide pin bolt threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.).

Fig. 65: FLEX HOSE CONNECTION AT REAR CALIPER
Courtesy of CHRYSLER LLC

5. Install banjo bolt (4) attaching brake hose (3) to caliper (1). Install NEW washers (2) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 50 N.m (37 ft. lbs.).

Fig. 66: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **Tires and Wheels - Installation** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

Fig. 67: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

Fig. 68: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See Brakes - Standard Procedure.
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

CALIPER, DISC BRAKE, REAR SRT8

Removal

REMOVAL

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

81330050

Fig. 69: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

6. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
7. Using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 73: ACCESSING REAR CALIPER MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

8. Support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 74: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

9. Remove the lower and upper caliper mounting bolts (1).
10. Remove brake caliper (2) with pads from knuckle and brake rotor.
11. If brake pads need to be removed from caliper.

NOTE: These calipers are not serviceable. Do not attempt disassembly.

Installation

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. See Brakes/Hydraulic/Mechanical/PADS, Brake - Inspection.

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block or used brake pad (not to be reused) over piston before installing C-clamp to avoid damaging piston.
2. If brake pads need to be installed in caliper before installation. See Brakes/Hydraulic/Mechanical/PADS, Brake - Installation.

Fig. 75: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

3. Slide caliper with pads (2) over brake rotor and align with knuckle.
4. Install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
5. Remove jack from under spring link.

Fig. 76: REAR FLEX HOSE CONNECTION - SRT8
Courtesy of CHRYSLER LLC

6. Install banjo bolt (1) attaching brake hose (5) to caliper (4). Install NEW washers (2, 3) on each side of hose fitting as banjo bolt is placed through banjo fitting. Thread banjo bolt into caliper and tighten to 33 N.m (24 ft. lbs.) torque.

Fig. 77: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

7. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) torque. Refer to **Tires and Wheels - Installation** .
8. Lower vehicle.
9. Remove brake pedal holding tool.

Fig. 78: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

10. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

Fig. 79: BLEED HOSE SET UP
 Courtesy of CHRYSLER LLC

11. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See Brakes - Standard Procedure.

CAUTION: If NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications.

12. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If NEW brake pads are installed, they need to be properly burnished. See Brakes/Hydraulic/Mechanical/PADS, Brake - Standard Procedure.

CALIPER, DISC BRAKE, SINGLE PISTON

Removal

REMOVAL

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

81330050

Fig. 80: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

81386065

Fig. 81: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 82: FRONT BRAKE FLEX HOSE AT CALIPER
Courtesy of CHRYSLER LLC

5. Remove banjo bolt (6) connecting flexible brake hose (1) to caliper (5). There are two sealing washers (7) (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

Fig. 83: FRONT CALIPER MOUNTING
Courtesy of CHRYSLER LLC

6. While holding guide pins from turning, remove caliper guide pin bolts (2).

7. Remove brake caliper (1) from brake adapter (3) and pads.

Disassembly

DISASSEMBLY

NOTE: Before disassembling brake caliper, clean and inspect it. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Cleaning. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Inspection.

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such a practice.

CAUTION: Do not use excessive force when clamping caliper in vise. Excessive vise pressure will cause bore distortion.

1. Drain brake fluid from caliper.

Fig. 84: REAR CALIPER IN VISE
Courtesy of CHRYSLER LLC

2. Mount caliper in a vise equipped with protective jaws.
3. Place a wooden block (2) (padded with approximately one-inch thickness of shop towels) in front of caliper (1) piston as in illustration. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out. This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using compressed air pressure to remove piston. Do not use high pressure.

4. Apply low pressure compressed air to caliper fluid inlet in **short spurts** to ease piston out of bore.
5. Remove piston from caliper (1).

Fig. 85: REAR CALIPER DUST BOOT REMOVAL
Courtesy of CHRYSLER LLC

CAUTION: When working on disc brake caliper, always use care and suitable tools to avoid damaging the aluminum housing.

6. Using a suitable tool (1), carefully remove dust boot (2) and discard it.

813312b5

Fig. 86: REAR CALIPER PISTON SEAL REMOVAL
 Courtesy of CHRYSLER LLC

CAUTION: Do not use a screw driver or other metal tool for seal removal. Using such tools can scratch bore or leave burrs on seal groove edges.

7. Using a soft tool such as a plastic trim stick (2), work piston seal (1) out of its groove in caliper piston bore. Discard used seal.

813312ba

Fig. 87: REAR CALIPER BLEEDER SCREW
 Courtesy of CHRYSLER LLC

8. Remove caliper bleeder screw (1) from caliper housing (2).

9. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
10. Inspect both piston and bore for scoring or pitting.

NOTE: It is not recommended to hone caliper bore. The anodized coating would be compromised.

Cleaning

CLEANING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

Inspection

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

Assembly

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

NOTE: Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid or equivalent

when assembling brake caliper.

NOTE: Never use used or old piston seals or boots for reassembly.

Fig. 88: REAR CALIPER PISTON SEAL INSTALLATION
Courtesy of CHRYSLER LLC

1. Lubricate caliper piston, piston seal (1) and piston bore (2) with clean, fresh brake fluid.
2. Install NEW piston seal (1) in groove of caliper bore (2). Seal should be started at one area of groove and gently worked around and into the groove using only your clean fingers to seat it.

Fig. 89: INSTALLING BOOT ON PISTON
Courtesy of CHRYSLER LLC

3. Install NEW dust boot (1) on piston (2) and work boot lip into groove at top of piston. Stretch boot downward, straightening boot folds, then move boot back upward as necessary until folds snap uniformly into place.

81331520

Fig. 90: INSTALL PISTON IN REAR CALIPER

Courtesy of CHRYSLER LLC

4. Install piston (1) into caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage can be avoided. **The dust boot will not seat at this time. Refer to the following step.**

813a14fa

Fig. 91: INSTALL DUST BOOT USING TOOL 9315 AND C-4171

Courtesy of CHRYSLER LLC

5. Seat dust boot (3) in caliper counterbore using Installer (2), Special Tool 9315, with Handle (1), Special Tool C-4171. Install dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

813312ba

Fig. 92: REAR CALIPER BLEEDER SCREW
Courtesy of CHRYSLER LLC

6. Install bleeder screw in correct threaded hole. Caliper housing is not side-specific, so it is important to install bleeder screw in threaded hole that will be uppermost once caliper is installed on vehicle. Tighten bleeder screw to 15 N.m (125 in. lbs.) torque.
7. Install caliper on vehicle. See **Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Installation**.

Installation

INSTALLATION

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Inspection**.

1. Completely retract caliper piston back into bore of caliper. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

Fig. 93: FRONT CALIPER MOUNTING
 Courtesy of CHRYSLER LLC

3. Slide caliper over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to crossthread caliper guide pin bolts (2) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N.m (44 ft. lbs.).

Fig. 94: FRONT BRAKE FLEX HOSE AT CALIPER
 Courtesy of CHRYSLER LLC

5. Install banjo bolt (6) attaching brake hose (1) to caliper (5). Install NEW washers (7) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 50 N.m (37 ft. lbs.).

Fig. 95: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **Tires and Wheels - Installation** .
7. Lower vehicle.
8. Remove brake pedal holding tool.

Fig. 96: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

Fig. 97: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See Brakes - Standard Procedure.
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

CALIPER, DISC BRAKE, TWIN PISTON

Removal

REAR-WHEEL-DRIVE

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

81330050

Fig. 98: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Using a brake pedal holding tool, depress brake pedal past its first inch of travel and hold it in this position. Holding pedal in this position will isolate master cylinder from hydraulic brake system and will not allow brake fluid to drain out of brake fluid reservoir while brake lines are open.
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

81386065

Fig. 99: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 100: FRONT BRAKE FLEX HOSE AT CALIPER
Courtesy of CHRYSLER LLC

5. Remove banjo bolt (6) connecting flexible brake hose (1) to caliper (5). There are two sealing washers (7) (one on each side of hose fitting) that will come off when bolt is removed. Discard these washers; install NEW washers on installation.

Fig. 101: FRONT CALIPER MOUNTING
Courtesy of CHRYSLER LLC

6. While holding guide pins from turning, remove caliper guide pin bolts (2).

7. Remove brake caliper (1) from brake adapter (3) and pads.

Disassembly

DISASSEMBLY

NOTE: Before disassembling the brake caliper, clean and inspect it. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Cleaning. See Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Inspection.

WARNING: Under no condition should high pressure air ever be used to remove a piston from a caliper bore. Personal injury could result from such practice.

1. Drain brake fluid from caliper.

Fig. 102: C-CLAMP
Courtesy of CHRYSLER LLC

CAUTION: Do not use excessive force when clamping caliper (2) in vise. Caliper housing is made of aluminum. Excessive vise pressure will cause bore distortion.

2. Mount caliper (2) in vise equipped with protective jaws.
3. C-clamp (1) a block of wood (3) over one piston.

Fig. 103: PISTON
Courtesy of CHRYSLER LLC

4. Take another block of wood and pad it with one-inch thickness of shop towels. Padded block should be sized to allow piston to push out of bore far enough to be removed by hand after being loosened by air pressure, yet large enough to keep piston from coming completely out.
5. Place the padded block of wood (1) in outboard shoe side of caliper (2) in front of exposed piston (3). This will cushion and protect caliper piston during removal.

WARNING: Do not place face or hands near caliper and piston if using compressed air to remove piston. Do not use high pressure.

WARNING: Never attempt to catch piston as it leaves bore. This could result in personal injury.

CAUTION: Do not blow piston out of bore with sustained air pressure. This could result in a cracked piston. Use only short spurts of air.

6. Apply **short spurts of low pressure air** with a rubber tipped blow gun through caliper brake hose port. Use only enough air pressure to ease piston out of bore.
7. Remove piston from caliper (2).
8. Remove C-clamp and block of wood.

Fig. 104: C-CLAMP
 Courtesy of CHRYSLER LLC

9. C-clamp (1) the block of wood (3) over dust boot of first piston removed. This will seal empty piston bore.

Fig. 105: PISTON
 Courtesy of CHRYSLER LLC

10. Move padded piece of wood (1) in front of piston (2) yet to be removed.
11. Remove second piston using same procedure with **short spurts of low pressure air** .
12. Remove C-clamp and block of wood from caliper.

813ef798

Fig. 106: REMOVING DUST BOOTS
 Courtesy of CHRYSLER LLC

13. Remove piston dust boots (1) (over each bore) with an appropriate pry tool (2). **Use care not to damage aluminum housing.**

813ef7d6

Fig. 107: REMOVING PISTON SEALS
 Courtesy of CHRYSLER LLC

CAUTION: Use an appropriate tool (1) to remove piston seals (2) to avoid scratching piston bore. Do not use a screwdriver or other metal tool to remove seals.

14. Using a soft tool such as a plastic trim stick (1), remove piston seals (2) from caliper bores.

813a17ef

Fig. 108: TWIN PISTON CALIPER BLEEDER SCREW
Courtesy of CHRYSLER LLC

15. Remove caliper bleeder screw (2) from caliper housing (1).
16. Clean piston bore and drilled passage ways with alcohol or a suitable solvent. Wipe it dry using only a lint-free cloth.
17. Inspect both piston and bore for scoring or pitting.

NOTE: It is not recommended to hone caliper bore. The anodized coating would be compromised.

Cleaning

CLEANING

WARNING: Chrysler does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

To clean or flush the internal passages of the brake caliper, use fresh brake fluid or Mopar® Non-Chlorinated Brake Parts Cleaner. Never use gasoline, kerosene, alcohol, oil, transmission fluid or any fluid containing mineral oil to clean the caliper. These fluids will damage rubber cups and seals.

Inspection

INSPECTION

Inspect the disc brake caliper for the following:

- Cracked or damaged housing
- Brake fluid leaks in and around boot area
- Ruptures, brittleness or damage to the piston dust boot

If caliper fails inspection, disassemble and recondition caliper, replacing the seals and dust boots or replace caliper.

Assembly

ASSEMBLY

CAUTION: Dirt, oil, and solvents can damage caliper seals. Ensure assembly area is clean and dry.

NOTE: Always use new, clean Mopar® DOT 3 Motor Vehicle Brake Fluid when assembling brake caliper.

NOTE: Never use old or used piston seals or boots for assembly.

813b0109

Fig. 109: INSTALLING PISTON SEALS
Courtesy of CHRYSLER LLC

1. Lubricate caliper pistons, piston seals (1) and piston bores (2) with clean, fresh brake fluid.

2. Install NEW piston seal (1) into groove of each caliper piston bore (2).

NOTE: Make sure seal is fully seated and not twisted in groove.

Fig. 110: INSTALL BOOT ON CALIPER PISTON
Courtesy of CHRYSLER LLC

3. Install NEW boot (1) on each piston (2) and work boot lip into groove at top of piston. Stretch boot rearward straightening boot folds, then move boot forward as necessary until folds snap uniformly into place.

Fig. 111: INSTALLING PISTONS IN CALIPER
Courtesy of CHRYSLER LLC

4. Install each piston (1), one at a time, into its caliper piston (2) bore, pressing piston down to bottom of bore using hand-pressure. Using a piece of wood or wooden hammer handle may also suffice as long as piston and boot damage is avoided.

813b0130

Fig. 112: MEASURING DUST BOOT HEIGHTS
Courtesy of CHRYSLER LLC

CAUTION: When seating dust boots in following step, use care not to over-install boots or damage will occur. Each boot (2) will bottom in the counterbore before the top of the boot reaches the surface of the caliper. The boot will bottom with approximately 2 mm (1/16 inch) (3) of boot still showing above caliper housing.

813b011b

Fig. 113: SEATING BOOTS USING TOOLS 9315 AND C-4171
Courtesy of CHRYSLER LLC

5. Seat dust boots (3) in caliper counterbores using Installer 9315 (2) with Handle C-4171 (1). Install each dust boot until it bottoms. Do not over-seat dust boot or damage will occur.

Fig. 114: TWIN PISTON CALIPER BLEEDER SCREW
Courtesy of CHRYSLER LLC

6. Install caliper bleeder screw (2) in caliper housing (1). Tighten bleeder screw to 15 N.m (125 in. lbs.) torque.
7. Install caliper on vehicle. See **Brakes/Hydraulic/Mechanical/CALIPER, Disc Brake - Installation**.

Installation

REAR-WHEEL-DRIVE

CAUTION: Always inspect brake pads before installing disc brake caliper and replace as necessary. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Inspection**.

1. Completely retract caliper pistons back into bores of caliper. Use hand pressure or a C-clamp may also be used to retract pistons, first placing a wood block over piston before installing C-clamp to avoid damaging piston.

CAUTION: Use care when installing caliper onto disc brake adapter to avoid damaging boots on caliper guide pins.

2. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.

Fig. 115: FRONT CALIPER MOUNTING
 Courtesy of CHRYSLER LLC

3. Slide caliper over brake pads and onto caliper adapter (3).

CAUTION: Extreme caution should be taken not to crossthread caliper guide pin bolts (2) when they are installed.

4. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 60 N.m (44 ft. lbs.).

Fig. 116: FRONT BRAKE FLEX HOSE AT CALIPER
 Courtesy of CHRYSLER LLC

5. Install banjo bolt (6) attaching brake hose (1) to caliper (5). Install NEW washers (7) on each side of hose fitting as banjo bolt is placed through fitting. Thread banjo bolt into caliper and tighten to 50 N.m (37 ft. lbs.).

Fig. 117: TIRE AND WHEEL MOUNTING

Courtesy of CHRYSLER LLC

6. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **Tires and Wheels - Installation**
7. Lower vehicle.
8. Remove brake pedal holding tool.

Fig. 118: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

9. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

Fig. 119: BLEED HOSE SET UP
Courtesy of CHRYSLER LLC

10. Bleed (1) the area of repair for the brake system. **If a proper pedal is not felt during bleeding an area of repair then a base bleed system must be performed.** . See **Brakes - Standard Procedure**.
11. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes.

FLUID

Diagnosis and Testing

BRAKE FLUID CONTAMINATION

Indications of fluid contamination are swollen or deteriorated rubber parts.

Swollen rubber parts indicate the presence of petroleum in the brake fluid.

To test for contamination, put a small amount of drained brake fluid in clear glass jar. If fluid separates into layers, there is mineral oil or other fluid contamination of the brake fluid.

If brake fluid is contaminated, drain and thoroughly flush system. Replace master cylinder, proportioning valve, caliper seals, wheel cylinder seals, Antilock Brake hydraulic unit and all hydraulic fluid hoses.

Standard Procedure

BRAKE FLUID LEVEL CHECKING

Fig. 120: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

Check master cylinder reservoir fluid level a minimum of twice annually.

Fluid reservoirs (1) are marked with the words MAX and MIN to indicate proper brake fluid fill level of the master cylinder.

If necessary, add brake fluid to bring the level to the bottom of the MAX mark on the side of the master cylinder fluid reservoir (1).

Use only Mopar® brake fluid or equivalent from a sealed container. Brake fluid must conform to DOT 3 specifications. See **Brakes/Hydraulic/Mechanical/FLUID - Specifications**.

DO NOT use brake fluid with a lower boiling point, as brake failure could result during prolonged hard braking.

Use only brake fluid that was stored in a tightly-sealed container.

DO NOT use petroleum-based fluid because seal damage will result. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid etc.

Specifications

BRAKE FLUID

The brake fluid used in this vehicle must conform to DOT 3 specifications and SAE J1703 standards. No other type of brake fluid is recommended or approved for usage in the vehicle brake system. Use only Mopar® Brake Fluid DOT 3 Motor Vehicle or equivalent from a tightly sealed container.

CAUTION: Never use reclaimed brake fluid or fluid from an container which has been left open. An open container of brake fluid will absorb moisture from the

air and contaminate the fluid.

CAUTION: Never use any type of a petroleum-based fluid in the brake hydraulic system. Use of such type fluids will result in seal damage of the vehicle brake hydraulic system causing a failure of the vehicle brake system. Petroleum based fluids would be items such as engine oil, transmission fluid, power steering fluid, etc.

MASTER CYLINDER, BRAKE

Description

DESCRIPTION

Fig. 121: PRIMARY AND SECONDARY PORTS - MK25E
Courtesy of CHRYSLER LLC

The master cylinder has a cast aluminum housing with a top mounted reservoir. The dual outlet port design housing features a primary port (1) machined for 8 mm (5/16 inch) tubing and a secondary port (2) machined for 6.25 mm (1/4 in) tubing.

The master cylinder has a 27 mm bore.

Standard Procedure

MASTER CYLINDER BLEEDING

CAUTION: When clamping master cylinder in vise, only clamp master cylinder by its mounting flange. Do not clamp master cylinder piston rod, reservoir, seal or body.

1. Clamp master cylinder in a vise.

Fig. 122: BLEEDING TOOLS ON MASTER CYLINDER
Courtesy of CHRYSLER LLC

CAUTION: When installing Adapters in master cylinder, do not overtighten. Damage to master cylinder could occur.

NOTE: Bleeder Adapters 9748-1 and 9748-2 are not interchangeable. To avoid mix-up, Bleeder Adapter 9748-1 is silver while Bleeder Adapter 9748-2 is black.

2. Attach special tools for bleeding master cylinder in following fashion:
 - a. Thread Bleeder Adapter 9748-2 (3), into primary outlet port. Tighten to 14 N.m (124 in. lbs.).
 - b. Thread Bleeder Adapter 9748-1 (4), into secondary outlet port. Tighten to 14 N.m (124 in. lbs.).
 - c. Thread a Bleeder Tube 9358A-1 (2), into each Adapter. Tighten each tube to 14 N.m (124 in. lbs.). Flex each bleeder tube and place open end into mouth of fluid reservoir as far down as possible.

Fig. 123: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

NOTE: Make sure open ends of bleeder tubes stay below surface of brake fluid once reservoir is filled to proper level.

3. Fill brake fluid reservoir (1) to the MAX level with Mopar® brake fluid or equivalent conforming to DOT 3 specifications. Make sure fluid level is above tips of bleeder tubes in reservoir to ensure no air is ingested during bleeding.

Fig. 124: BLEEDING TOOLS ON MASTER CYLINDER
Courtesy of CHRYSLER LLC

4. Using a wooden dowel as a pushrod (1), slowly depress master cylinder pistons, then release pressure, allowing pistons to return to released position. Repeat several times until all air bubbles are expelled. Make sure fluid level stays above tips of bleeder tubes in reservoir while

bleeding.

5. Remove bleeder tubes (2) and adapters (3, 4) from master cylinder outlet ports, then plug outlet ports and install fill cap on reservoir.
6. Remove master cylinder from vise.
7. Install master cylinder on vehicle. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Installation**.

Removal

REMOVAL

CAUTION: Vacuum in power brake booster must be pumped down (removed) before removing master cylinder from power brake booster. This is necessary to prevent power brake booster from sucking in any contamination as master cylinder is removed. This can be done simply by pumping brake pedal, with vehicle's engine not running, until a firm feeling brake pedal is achieved.

1. With the engine not running, pump the brake pedal until a firm pedal is achieved (4-5 strokes).

8133bb50

Fig. 125: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

2. Disconnect and isolate the battery negative cable (2) from the battery post.

Fig. 126: COWL ACCESS PANEL
 Courtesy of CHRYSLER LLC

3. Remove the access panel (1) in the cowl area to expose the master cylinder (2).
4. Thoroughly clean all surfaces of the brake fluid reservoir and master cylinder. Use only Mopar® Brake Parts Cleaner or equivalent.

Fig. 127: BRAKE FLUID LEVEL SENSOR CONNECTION
 Courtesy of CHRYSLER LLC

5. Disconnect the wiring harness connector (4) from the brake fluid level sensor (2) in the master cylinder brake fluid reservoir (1).

Fig. 128: BRAKE TUBES AT MASTER CYLINDER
 Courtesy of CHRYSLER LLC

6. Disconnect the primary (3) and secondary (2) brake tubes from the master cylinder (4). Install sealing plugs in the open brake tube outlet ports.

Fig. 129: MASTER CYLINDER MOUNTING NUTS
 Courtesy of CHRYSLER LLC

CAUTION: Before removing master cylinder from power brake vacuum booster, master cylinder and vacuum booster must be thoroughly cleaned. This must be done to prevent dirt particles from falling into power brake vacuum booster. Use only Mopar® Brake Parts Cleaner or equivalent.

7. Remove the two nuts (2) attaching the master cylinder (3) to the power brake booster (1).

8. Slide the master cylinder (3) straight out of the power brake booster (1).

Fig. 130: VACUUM SEAL ON REAR OF MASTER CYLINDER
Courtesy of CHRYSLER LLC

CAUTION: Vacuum seal (1) on rear of master cylinder (2) is used to allow vacuum ability in power brake vacuum booster. Vacuum seal **MUST** be replaced whenever master cylinder is removed from power brake vacuum booster.

9. Remove the vacuum seal (1) located on the mounting flange of the master cylinder (2). The vacuum seal is removed by **carefully** pulling it off the rear of master cylinder. **Do not attempt to pry the seal off the master cylinder by inserting a sharp tool between seal and the master cylinder casting. Damage can occur.**

Disassembly

DISASSEMBLY

1. Clean master cylinder housing and brake fluid reservoir. Use only Mopar® Brake Parts Cleaner or equivalent.

1115

Fig. 131: FLUID RESERVOIR MOUNTING
Courtesy of CHRYSLER LLC

2. Remove brake fluid reservoir cap (1). Using a syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

3. Remove screw (3) fastening fluid reservoir to master cylinder housing.
4. Rock the brake fluid reservoir side-to-side while pulling up to remove it from seal grommets in master cylinder housing.

813aa592

Fig. 132: RESERVOIR SEAL GROMMETS
Courtesy of CHRYSLER LLC

5. Remove two brake fluid reservoir seal grommets (2) from master cylinder housing (1).

Assembly

ASSEMBLY

Fig. 133: RESERVOIR SEAL GROMMETS
Courtesy of CHRYSLER LLC

1. Install NEW brake fluid reservoir sealing grommets (2) in master cylinder housing (1).

Fig. 134: FLUID RESERVOIR MOUNTING
Courtesy of CHRYSLER LLC

2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly

pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets (2) or reservoir is not properly installed.

3. Install fluid reservoir mounting screw (3). Tighten screw to 28 N.m (250 in. lbs.).
4. Thoroughly bleed master cylinder before installing it on vehicle. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Standard Procedure.**

Fig. 135: VACUUM SEAL ON REAR OF MASTER CYLINDER
Courtesy of CHRYSLER LLC

5. Install master cylinder on power brake booster. Upon installation, vacuum seal (1) on rear of master cylinder must be replaced. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Installation.**

Installation

INSTALLATION

1. Thoroughly bleed master cylinder before installing it on vehicle. See **Brakes/Hydraulic/Mechanical/MASTER CYLINDER, Brake - Standard Procedure.**

Fig. 136: VACUUM SEAL ON REAR OF MASTER CYLINDER
 Courtesy of CHRYSLER LLC

CAUTION: When replacing master cylinder on vehicle, a **NEW** vacuum seal (1) **MUST** be installed on master cylinder.

2. Install new vacuum seal (1) on rear of master cylinder (2) making sure seal fits squarely in mounting groove.

Fig. 137: MASTER CYLINDER MOUNTING NUTS
 Courtesy of CHRYSLER LLC

3. Position master cylinder (3) on studs of power brake booster, aligning booster push rod with master cylinder piston.
4. Install two master cylinder mounting nuts (2). Tighten mounting nuts to 15 N.m (133 in. lbs.).

Fig. 138: BRAKE TUBES AT MASTER CYLINDER
 Courtesy of CHRYSLER LLC

5. Thread primary (3) and secondary (2) brake tubes into master cylinder primary and secondary ports. Tighten tube nuts to 20 N.m (177 in. lbs.).

 Courtesy of CHRYSLER LLC

6. Connect wiring harness connector (4) to brake fluid level sensor (2) mounted in brake fluid reservoir (1).

8133b050

Fig. 140: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

7. Connect negative battery cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

1095773

Fig. 141: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

8. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.
9. Install access panel in cowl area.

WARNING: Be certain a firm brake pedal is achieved prior to attempting vehicle operation. If a firm brake pedal cannot be achieved, bleed entire

brake hydraulic system and check for leaks. See Brakes - Standard Procedure.

10. Road test vehicle to ensure proper operation of brakes.

PADS, BRAKE

Standard Procedure

BRAKE PAD BURNISHING - SRT8

CAUTION: After installing NEW brake pads, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications.

When NEW brake pads are installed on a vehicle, this procedure must be used to correctly burnish (seat) the brake linings to the brake rotor discs.

1. Accelerate the vehicle to a steady speed of about 40 mph (65 km/h).
2. Using light brake pedal pressure, slow the vehicle from 40 mph to 0 mph in approximately 6 seconds.
3. Accelerate back up to 40 mph for approximately one minute to allow the brakes to cool down.
4. Repeat this procedure 15 to 20 times to correctly seat the brake lining material.

Removal

REAR (EXCEPT SRT8)

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure.

NOTE: Perform steps 2 through 6 on each side of the vehicle.

Fig. 142: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

Fig. 143: CALIPER GUIDE PIN AND BOLT

Courtesy of CHRYSLER LLC

3. Remove Upper caliper guide pin bolt (1). To do so, hold the guide pin (3) stationary while turning bolt.

Fig. 144: ACCESS TO REAR BRAKE PADS
Courtesy of CHRYSLER LLC

4. Rotate caliper downward (5), exposing brake pads (2 and 3). **Use care not to overextend brake hose when doing this or damage may occur.**
5. Remove inboard (2) and outboard (3) brake pads from caliper adapter (4).
6. If necessary, remove anti-rattle clips (1) from upper and lower abutments of adapter (4).

FRONT (EXCEPT SRT8)

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure.

NOTE: Perform steps 2 through 6 on each side of the vehicle.

Fig. 145: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

NOTE: In some cases, it may be necessary to retract caliper piston in its bore a small amount in order to provide sufficient clearance between shoes and rotor to easily remove caliper from knuckle. This can usually be accomplished before guide pin bolts are removed by grasping rear of caliper and pulling outward working with guide pins, thus retracting piston. Never push on piston directly as it may get damaged.

Fig. 146: CALIPER GUIDE PIN AND BOLT

Courtesy of CHRYSLER LLC

3. Remove lower caliper guide pin bolt. To do so, hold the guide pin (3) stationary while turning bolt (1).

Fig. 147: ACCESS TO FRONT PADS
Courtesy of CHRYSLER LLC

4. Rotate caliper upward (1), exposing brake pads (2 and 5). **Use care not to overextend brake hose when doing this or damage may occur.**
5. Remove inboard (2) and outboard (5) brake pads from caliper adapter (4).
6. If necessary, remove anti-rattle clips (3) from upper and lower abutments of adapter (4).

SRT8

NOTE: Review all Warnings and Cautions. See Brakes - Warning.

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure.

NOTE: Perform 2 through 8 on each side of vehicle to complete pad set removal.

Fig. 148: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 149: REMOVING LOWER SUPPORT PIN
 Courtesy of CHRYSLER LLC

3. Using hammer (4) and pin punch (3) on outboard end, tap lower brake pad support pin (2) out of caliper (1).

Fig. 150: REMOVING/INSTALLING SPRING CLIP
 Courtesy of CHRYSLER LLC

4. Remove brake pad spring clip (2) out from under the upper support pin (1) still in caliper.

Fig. 151: REMOVING UPPER SUPPORT PIN
 Courtesy of CHRYSLER LLC

5. Using pin punch (3) and hammer (4), remove upper brake pad support pin (2) in same manner used on lower support pin.

CAUTION: When pushing pistons back into caliper bores, if hand pressure is not sufficient, use only a trim stick as shown in illustration or other

suitable soft tool to do so. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor or pads.

Fig. 152: PUSHING BACK PISTONS INTO BORES
Courtesy of CHRYSLER LLC

6. Using hand pressure, pull pads back to seat caliper pistons into bores if possible. If not possible, perform the following to do this correctly without damaging the caliper, pistons, dust boots or brake rotor disc.
 - a. Place trim stick (3) between inboard brake pad and outer edge of rotor (1).
 - b. Using trim stick (3), apply pressure against the inboard brake pad until both pistons are completely bottomed in bores of inboard caliper half. Leave trim stick in place to hold pistons in place.
 - c. Place second trim stick between outboard brake pad and rotor, then repeat above step on outboard pad and pistons.

Fig. 153: BRAKE PAD REMOVAL
 Courtesy of CHRYSLER LLC

7. Remove inboard brake pad (2) through opening in caliper (1). Remove outboard brake pad in same manner.

Fig. 154: PISTON AND SEAL INSPECTION
 Courtesy of CHRYSLER LLC

8. Once brake pads are removed from caliper (1), inspect all four caliper pistons (3) and dust boots (2) for evidence of brake fluid leakage. Also inspect dust boots on all caliper pistons for any cuts, tears or heat cracks and brake pad supports (4) (if equipped) for excess wear or damage. If caliper fails inspection, it should be replaced.

Cleaning

CLEANING

WARNING: Chrysler LLC does not manufacture any vehicles or replacement parts that contain asbestos. Aftermarket products may or may not contain asbestos. Refer to aftermarket product packaging for product information.

Whether the product contains asbestos or not, dust and dirt can accumulate on brake parts during normal use. Follow practices prescribed by appropriate regulations for the handling, processing and disposing of dust and debris.

Inspection

INSPECTION

Visually inspect brake pads for uneven lining wear. Also inspect for excessive lining deterioration. Check the clearance between the tips of the wear indicators (if equipped) on the pads and the brake rotors.

If a visual inspection does not adequately determine the condition of the lining, a physical check will be necessary. To check the amount of lining wear, remove the disc brake pads from the vehicle.

9205-315

Fig. 155: Brake pad Friction Material Thickness Measurement
Courtesy of CHRYSLER LLC

1 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL THICKNESS IS TO BE MEASURED AT THE THINNEST POINT.
2 - BRAKE SHOE ASSEMBLY FRICTION MATERIAL
3 - BRAKE SHOE ASSEMBLY BACKING PLATE

Measure brake pad minimum thickness (1). Brake pads must be replaced when usable material on a

brake pad lining (2) measured at its **thinnest point** measures one millimeter (0.04 inches) or less.

If a brake pad fails inspection, replace **both** disc brake pads (inboard and outboard) at each caliper. It is also necessary to replace the pads on the opposite side of the vehicle as well as the pads failing inspection to maintain proper braking characteristics.

If the brake pad assemblies do not require replacement, be sure to reinstall the brake pads in the original position they were removed from.

NOTE: It is important to inspect both front and rear brake pads during the same inspection.

Installation

REAR (EXCEPT SRT8)

NOTE: Perform steps 1 through 7 on each side of the vehicle.

1. Completely retract caliper piston back into bore of caliper. To do so:
 - a. Remove fluid reservoir cap.
 - b. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston before installing C-clamp to avoid damaging piston.
 - c. Install fluid reservoir cap.

8135c916

Fig. 156: ACCESS TO REAR BRAKE PADS
Courtesy of CHRYSLER LLC

2. If removed, attach anti-rattle clips (1) to upper and lower abutments of adapter (4).
3. If equipped, remove the film from the brake pad double sticky isolator.

4. Install NEW inboard (2) and outboard (3) brake pads on caliper adapter (4). NEW Inboard and outboard pads are interchangeable.
5. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
6. Rotate caliper upward, aligning upper mounting boss with upper guide pin.

Fig. 157: CALIPER GUIDE PIN AND BOLT
Courtesy of CHRYSLER LLC

NOTE: Before installing caliper guide pin bolts, clean guide pin bolt threads and apply Mopar® Lock AND Seal Adhesive or equivalent.

7. Install upper caliper guide pin bolt (1). While holding guide pin (3) stationary tighten bolt to 31 N.m (23 ft. lbs.).

Fig. 158: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

8. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **Tires and Wheels - Installation**.
9. Lower vehicle.
10. Pump brake pedal several times to set pads to caliper and brake rotor.

Fig. 159: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

11. Check and adjust brake fluid level in reservoir (1). See **Brakes/Hydraulic/Mechanical/FLUID - Standard Procedure**.

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

CAUTION: A burnish procedure must be performed anytime NEW brake pads or rotors are installed on a vehicle equipped with the Police Package. This procedure is particularly important in situations where high speed pursuit is a possibility. It is recommended that the procedure be performed by the Police agency operating the vehicle so it can be performed in a safe controlled environment. This information is covered in the Police Package Owners Manual Supplement which was supplied when the vehicle was originally delivered.

12. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes. If the vehicle is equipped with the Police Package, a burnish procedure must be followed (Refer to preceding Caution).

FRONT (EXCEPT SRT8)

NOTE: Perform steps 1 through 7 on each side of the vehicle.

1. Completely retract caliper piston(s) back into bore(s) of caliper. To do so:
 - a. Remove fluid reservoir cap.
 - b. Use hand pressure or a C-clamp may be used to retract piston, first placing a wood block over piston(s) before installing C-clamp to avoid damaging piston(s).
 - c. Install fluid reservoir cap.

Fig. 160: ACCESS TO FRONT PADS
Courtesy of CHRYSLER LLC

2. If removed, attach anti-rattle clips (3) to upper and lower abutments of adapter (4).
3. If equipped, remove the film from the brake pad double sticky isolator.
4. Install NEW inboard (2) and outboard (5) brake pads on caliper adapter (4). NEW Inboard and outboard pads are interchangeable.
5. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
6. Rotate caliper downward, aligning upper mounting boss with lower guide pin.

Fig. 161: CALIPER GUIDE PIN AND BOLT
 Courtesy of CHRYSLER LLC

7. Install Upper caliper guide pin bolt (1). While holding guide pin (3) stationary tighten bolt to 60 N.m (44 ft. lbs.).

Fig. 162: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

8. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)). Refer to **Tires and Wheels - Installation**.
9. Lower vehicle.
10. Pump brake pedal several times to set pads to caliper and brake rotor.

Fig. 163: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

11. Check and adjust brake fluid level in reservoir (1). See **Brakes/Hydraulic/Mechanical/FLUID - Standard Procedure**.

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

CAUTION: A burnish procedure must be performed anytime NEW brake pads or rotors are installed on a vehicle equipped with the Police Package. This procedure is particularly important in situations where high speed pursuit is a possibility. It is recommended that the procedure be performed by the Police agency operating the vehicle so it can be performed in a safe controlled environment. This information is covered in the Police Package Owner's Manual Supplement which was supplied when the vehicle was originally delivered.

12. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake shoes. If the vehicle is equipped with the Police Package, a burnish procedure must be followed (Refer to preceding Caution).

SRT8

NOTE: Perform 1 through 11 on each side of vehicle to complete pad set installation before proceeding with 12.

1. Make sure all caliper pistons are fully seated (bottomed) in bores.

Fig. 164: BRAKE PAD INSTALLATION
Courtesy of CHRYSLER LLC

2. If equipped, remove the film from the brake pad double sticky isolator.
3. Slide NEW inboard (2) and outboard brake pads into opening (1) in disc brake caliper. **If installing rear brake pads, make sure beveled end of each pad lining is directed against the direction the rotor is rotating in when vehicle is moving forward, in other words, the rear pads need to have beveled end facing upward.**

Fig. 165: INSTALLING UPPER SUPPORT PIN
 Courtesy of CHRYSLER LLC

4. From inboard side, slide upper brake pad support pin (2) through caliper (3) and upper holes in both brake pads (1). Ensure that small end of support pin is in hole (4) in outboard half of caliper.

Fig. 166: REMOVING/INSTALLING SPRING CLIP
 Courtesy of CHRYSLER LLC

5. Install upper end of brake pad spring clip (2) under upper brake pad support pin (1).

Fig. 167: INSTALLING LOWER SUPPORT PIN
Courtesy of CHRYSLER LLC

6. Press on lower end of spring clip (5) until it touches brake rotor.
7. Slide lower brake pad support pin (2) through caliper (1) and lower holes in both brake pads (3) in the same manner the upper pin was installed. Ensure small end of support pin is in hole (4) in outboard half of caliper.
8. Release the spring clip allowing it to engage lower support pin.

Fig. 168: SEATING SUPPORT PINS
Courtesy of CHRYSLER LLC

9. From inboard side, seat upper and lower support pins (4) into caliper (3) using pin punch (1)

and hammer (2). Support pins must be driven into caliper until support pin retaining rings are locked into place.

Fig. 169: CORRECTLY ASSEMBLED PADS IN CALIPER
Courtesy of CHRYSLER LLC

10. Once support pins are fully installed into caliper, inspect assembled caliper to make sure spring clip (2) is centered in opening (1) of caliper, correctly engaging upper and lower support pins, and is resting against both brake pads (3).

Fig. 170: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

11. Install tire and wheel assembly (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.)

torque. Refer to **Tires and Wheels - Installation** .

12. Lower vehicle.
13. Pump brake pedal several times to set pads to caliper and brake rotor.

Fig. 171: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

14. Check and adjust brake fluid level in reservoir (1). See **Brakes/Hydraulic/Mechanical/FLUID - Standard Procedure**.

CAUTION: When NEW brake pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

NOTE: When NEW brake pads are installed, they must be burnished (seated) to the rotor. This must be done to ensure the proper performance of the replacement brake pads.

15. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pad linings. NEW brake pads need to be burnished properly. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Standard Procedure**.

PEDAL(S), BRAKE AND/OR ACCELERATOR

Removal

PEDAL

8133bb50

Fig. 172: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable (2) from battery post.
2. Remove driver side silencer under instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
3. Remove steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .

813aa584

Fig. 173: Brake Pedal Mounting
 Courtesy of CHRYSLER LLC

4. Remove brake lamp switch. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting -**

Exterior/SWITCH, Stop Lamp - Removal .

5. Remove booster push rod from pin on brake pedal. To do so:
 - a. Position small screwdriver between center tang on power brake booster brake pedal pin retaining clip.
 - b. Rotate screwdriver enough to allow retaining clip center tang to pass over end of brake pedal pin, then slide retaining clip off brake pedal pin.
 - c. **Discard retaining clip. It is not to be reused. Install NEW retaining clip when assembling.**
6. Slide booster push rod (3) off brake pedal pin.
7. Remove four power brake booster (3) mounting nuts (1).
8. Remove two nuts (1) fastening pedal bracket to upper dash panel (2).
9. Push power brake booster (3) forward into engine compartment as far as possible by hand. Do not force it.
10. Remove brake pedal (4).

Installation

INSTALLATION

Fig. 174: Brake Pedal Mounting
Courtesy of CHRYSLER LLC

1. Install the brake pedal assembly (4) under instrument panel and slide over booster push rod.
2. From engine compartment side, push power brake booster (3) mounting studs back through dash panel (2) and brake pedal bracket.
3. Install two upper mounting nuts (1) fastening pedal bracket to upper dash panel (2). **Do not tighten at this time.**
4. Install four power brake booster mounting nuts (1). Tighten nuts to 25 N.m (18 ft. lbs.).

5. Tighten two upper mounting nuts (1) to 25 N.m (18 ft. lbs.) torque.
6. Slide booster push rod (3) onto brake pedal pin. Install NEW retaining clip securing push rod to brake pedal.
7. Install and adjust brake lamp switch. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/SWITCH, Stop Lamp - Installation** .
8. Install steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .
9. Install driver side silencer under instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .

8133b050

Fig. 175: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

10. Connect negative battery cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .
11. Road test vehicle testing operation of brakes.

RESERVOIR, BRAKE MASTER CYLINDER

Removal

REMOVAL

Fig. 176: COWL ACCESS PANEL
 Courtesy of CHRYSLER LLC

1. Remove access panel (1) in cowl area to expose master cylinder (2).
2. Thoroughly clean all surfaces of brake fluid reservoir and master cylinder. Use only Mopar® Brake Parts Cleaner or equivalent.

Fig. 177: BRAKE FLUID LEVEL SENSOR CONNECTION
 Courtesy of CHRYSLER LLC

3. Disconnect wiring harness connector (4) from brake fluid level sensor (2) in master cylinder brake fluid reservoir (1).

1115

Fig. 178: FLUID RESERVOIR MOUNTING
Courtesy of CHRYSLER LLC

4. Remove brake fluid reservoir cap (1). Using a clean syringe or equivalent type tool, empty as much brake fluid as possible from the reservoir.

CAUTION: When removing fluid reservoir from the master cylinder, do not pry off using any type of tool. This can damage the fluid reservoir or master cylinder housing.

5. Remove screw (3) fastening fluid reservoir to master cylinder housing.
6. Rock the brake fluid reservoir side-to-side while pulling up to remove it from seal grommets in master cylinder housing.

813aa592

Fig. 179: RESERVOIR SEAL GROMMETS
Courtesy of CHRYSLER LLC

7. Remove two brake fluid reservoir seal grommets (2) from master cylinder housing (1).

Installation

INSTALLATION

813aa592

Fig. 180: RESERVOIR SEAL GROMMETS
Courtesy of CHRYSLER LLC

1. Install NEW brake fluid reservoir sealing grommets (2) in master cylinder housing (1).

1115

Fig. 181: FLUID RESERVOIR MOUNTING
Courtesy of CHRYSLER LLC

2. Lubricate reservoir mounting area with fresh clean brake fluid. Place reservoir in position over sealing grommets. Seat reservoir into sealing grommets using a rocking motion while firmly

pressing down on fluid reservoir. Once installed, make sure fluid reservoir is touching the top of both sealing grommets (2) or reservoir is not properly installed.

3. Install fluid reservoir mounting screw (3). Tighten screw to 28 N.m (250 in. lbs.) torque.

Fig. 182: BRAKE FLUID LEVEL SENSOR CONNECTION

Courtesy of CHRYSLER LLC

4. Connect wiring harness connector (4) to brake fluid level sensor (2) mounted in brake fluid reservoir (1).

Fig. 183: RESERVOIR FLUID LEVEL MARKINGS

Courtesy of CHRYSLER LLC

5. Fill master cylinder fluid reservoir (1) with clean, fresh Mopar® Brake Fluid or equivalent.
6. Install access panel in cowl area.

WARNING: Be certain a firm brake pedal is achieved prior to attempting vehicle operation. If a firm brake pedal cannot be achieved, bleed entire brake hydraulic system and check for leaks. See Brakes - Standard Procedure.

7. Road test vehicle to ensure proper operation of brakes.

ROTOR, BRAKE

Diagnosis and Testing

BRAKE ROTOR

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Excessive runout or wobble in a rotor can increase pedal travel due to piston knock-back. This increases guide pin sleeve wear due to the tendency of the caliper to follow the rotor wobble.

When diagnosing a brake noise or pulsation, the machined disc braking surface should be inspected.

BRAKING SURFACE INSPECTION

Light braking surface scoring and wear is acceptable. If heavy scoring or warping is evident, the rotor must be refaced or replaced. See Brakes/Hydraulic/Mechanical/ROTOR, Brake - Standard Procedure.

Excessive wear and scoring of the rotor can cause improper lining contact on the rotor's braking surface. If the ridges on the rotor are not removed before new brake shoes are installed, improper wear of the shoes will result.

If a vehicle has not been driven for a period of time, the rotor's braking surface will rust in the areas not covered by the brake shoes at that time. Once the vehicle is driven, noise and chatter from the disc brakes can result when the brakes are applied.

Some discoloration or wear of the rotor surface is normal and does not require resurfacing when linings are replaced. If cracks or burned spots are evident, the rotor must be replaced.

ROTOR MINIMUM THICKNESS

Fig. 184: MEASURING ROTOR THICKNESS
 Courtesy of CHRYSLER LLC

Measure rotor thickness (1) at the center of the brake shoe contact surface. Replace the rotor if it is worn below minimum thickness or if machining the rotor will cause its thickness to fall below specifications.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Fig. 185: Minimum Brake Rotor Thickness Markings (Typical)
 Courtesy of CHRYSLER LLC

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

Most minimum thickness specifications (1) are cast into the rotor's un-machined surface (2). Some

brake rotors have the minimum thickness specification located elsewhere. Refer to the following paragraph. Limits can also be found in this component's specification table. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**.

Fig. 186: MINIMUM THICKNESS MARKINGS ON ROTORS EDGE
Courtesy of CHRYSLER LLC

The minimum thickness specification is stamped into the outer diameter edge (1) (along vented end) of the disc.

ROTOR THICKNESS VARIATION

Fig. 187: MEASURING ROTOR THICKNESS
Courtesy of CHRYSLER LLC

Thickness variation in a rotor's braking surface can result in pedal pulsation, chatter and surge. This can also be caused by excessive runout in the rotor or the hub.

Rotor thickness variation measurements should be made in conjunction with measuring runout. Measure thickness of the brake rotor (2) at 12 equal points around the rotor braking surface with a micrometer (1) at a radius approximately 25 mm (1 inch) from edge of rotor. If thickness measurements vary beyond the specification listed in the specification table. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**, the rotor should be refaced or replaced. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Standard Procedure**.

ROTOR RUNOUT

Fig. 188: MEASURING ROTOR RUNOUT
Courtesy of CHRYSLER LLC

On-vehicle rotor runout is the combination of the individual runout of the hub face and the runout of the brake rotor (hub runout can be measured separately). To measure rotor runout on the vehicle:

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .
2. Remove tire and wheel assembly. Refer to **Tires and Wheels - Removal** .
3. Install standard wheel mounting nuts, flat side to rotor, on all studs (2). Progressively tighten nuts to 150 N.m (110 ft. lbs.).
4. Mount Dial Indicator C-3339A (1), with Wheel 25w, or equivalent, to knuckle. Position Dial Indicator Wheel to contact rotor braking surface approximately ten millimeters from outer edge of rotor (3).
5. Slowly rotate brake rotor checking lateral runout, marking the low and high spots. Record these measurements.
6. Check and record runout of opposite side of rotor in same fashion, marking the low and high

spots.

7. Compare runout measurement to specifications. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**.

Fig. 189: WHEEL STUD AND ROTOR INDEX MARKED
Courtesy of CHRYSLER LLC

If runout is in excess of specifications, check the lateral runout of the hub face. Before removing the rotor from the hub, place a chalk mark across both the rotor (1) and the one wheel stud (2) closest to where the high runout measurement was taken. This way, the original mounting spot of the rotor on the hub is indexed.

8. Remove the rotor from the hub. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal**.

Fig. 190: MEASURING HUB RUNOUT
Courtesy of CHRYSLER LLC

NOTE: Before measuring hub runout, clean the hub face surface with an appropriate cleaner. This provides a clean surface to get an accurate indicator reading.

9. Mount Dial Indicator C-3339A (2), to the knuckle. Position Dial Indicator stem so it contacts hub face (1) near outer diameter. Care must be taken to position stem outside of stud circle, but inside of chamfer on the hub rim.
10. Slowly rotate hub measuring runout. Hub runout should not exceed 0.01 mm (0.0004 inch). If runout exceeds this specification, the hub must be replaced. Refer to **Front Suspension/Front/HUB AND BEARING - Removal** .

8137d51d

Fig. 191: ROTOR REINDEXED ON WHEEL STUDS
 Courtesy of CHRYSLER LLC

11. If hub runout does not exceed this specification, install original rotor back on hub, aligning chalk mark on rotor (2) with a wheel mounting stud, two studs apart from original stud (1).

8137d4fd

Fig. 192: MEASURING ROTOR RUNOUT
 Courtesy of CHRYSLER LLC

12. Install standard wheel mounting nuts, flat side to rotor, on all studs (2). Progressively tighten nuts to 150 N.m (110 ft. lbs.).
13. Mount Dial Indicator (1) and re-measure runout on both sides of the brake rotor as explained in earlier steps to see if runout is now within specifications. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**.

14. If runout is still not within specifications, reface or replace brake rotor. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Standard Procedure**.

Standard Procedure

BRAKE ROTOR MACHINING

NOTE: Refacing the rotor is not required each time the brake pads are replaced, only when the need is foreseen.

Any servicing of the rotor requires extreme care to maintain the rotor within service tolerances to ensure proper brake action.

Fig. 193: On-Car Brake Lathe
Courtesy of CHRYSLER LLC

1 - ON-CAR BRAKE LATHE

If the rotor surface is deeply scored or warped, or there is a complaint of brake roughness or brake pedal pulsation, the rotor should be refaced using a hub-mounted on-car brake lathe (1), or replaced.

The use of a hub-mounted on-car brake lathe (1) is highly recommended to eliminate the possibility of excessive runout. It trues the brake rotor to the vehicle's hub and bearing.

Minimum allowable thickness is the minimum thickness to which the brake rotor machined surface may be cut.

CAUTION: Do not machine the rotor if it will cause the rotor to fall below minimum thickness.

Fig. 194: Minimum Brake Rotor Thickness Markings (Typical)
 Courtesy of CHRYSLER LLC

1 - ROTOR MINIMUM THICKNESS MARKING
2 - ROTOR

NOTE: Most brake rotors (2) have markings for minimum allowable thickness specification cast into an un-machined surface of the rotor or stamped into the hat section (1). Some brake rotors have the minimum thickness specification located elsewhere. Refer to the following paragraph. Minimum thickness specifications can also be found in this component's specification table. See Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications.

Fig. 195: MINIMUM THICKNESS MARKINGS ON ROTORS EDGE
 Courtesy of CHRYSLER LLC

NOTE: The minimum thickness specification is stamped into the outer diameter edge

(1) (along vented end) of the disc.

Before lathe installation, verify the brake rotor face and the hub adapters are free of any chips, rust, or contamination.

When mounting and using the brake lathe, strict attention to the brake lathe manufacturer's operating instructions is required.

Machine both sides of the brake rotor at the same time. Cutting both sides at the same time minimizes the possibility of a tapered or uneven cut.

When refacing a rotor, the required TIR (Total Indicator Reading) and thickness variation limits **MUST BE MAINTAINED**. Extreme care in the operation of rotor turning equipment is required. Specifications for brake rotor machining can be found in this service information specification table. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Specifications**.

Removal

FRONT

NOTE: Before proceeding. See **Brakes - Warning**. See **Brakes - Caution**.

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.
2. Remove wheel mounting nuts, then tire and wheel assembly.

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

Fig. 196: PUSHING BACK PISTONS IN BORE
 Courtesy of CHRYSLER LLC

3. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
4. Using trim stick, slowly apply pressure against brake pad (2) until both pistons on that side of caliper are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 197: FRONT DISC BRAKES
 Courtesy of CHRYSLER LLC

5. Remove caliper mounting bolts (1).
6. Remove brake caliper (2) with pads from knuckle (8) and brake rotor (3). Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
7. Remove any clips (4) retaining brake rotor (3) to wheel studs.
8. Slide brake rotor (3) off hub and bearing (7).

REAR

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure.
2. Remove wheel mounting nuts, then tire and wheel assembly.

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

Fig. 198: PUSHING BACK PISTONS IN BORE
Courtesy of CHRYSLER LLC

3. Place trim stick (4) between brake pad (2) and outer edge of rotor (3).
4. Using trim stick, slowly apply pressure against brake pad (2) until both pistons on that side of caliper are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 199: ACCESSING REAR CALIPER MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

5. Support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 200: REAR CALIPER MOUNTING - SRT8
 Courtesy of CHRYSLER LLC

6. Remove the lower and upper caliper mounting bolts (1).
7. Remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.

8136a480

Fig. 201: VENTED BRAKE ROTOR MOUNTING
Courtesy of CHRYSLER LLC

8. Remove any clips (3) retaining brake rotor (2) to wheel mounting studs.
9. Slide brake rotor (2) off hub and bearing (1).

Installation

FRONT

NOTE: Inspect brake pads before installation. See Brakes/Hydraulic/Mechanical/PADS, Brake - Inspection.

8136a480

Fig. 202: VENTED BRAKE ROTOR MOUNTING
Courtesy of CHRYSLER LLC

1. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.

Fig. 203: FRONT DISC BRAKES
Courtesy of CHRYSLER LLC

2. Install brake rotor (3) over studs on hub and bearing (7).
3. Slide caliper with pads (2) over brake rotor (3) and align with knuckle (8).
4. Install caliper mounting bolts (1). Tighten bolts to 190 N.m (140 ft. lbs.).
5. Install tire and wheel assembly. Tighten wheel mounting nuts to 150 N.m (110 ft. lbs.) torque. Refer to **Tires and Wheels - Installation** .
6. Lower vehicle.
7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

Fig. 204: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

8. Check and adjust brake fluid level in reservoir (1) as necessary.

CAUTION: If **NEW** brake rotors or pads have been installed, keep in mind that braking effectiveness might be somewhat reduced during the first brake applications following installation.

9. Road test vehicle making several stops to wear off any foreign material on brakes and to seat brake pads. If new brake pads are installed, they need to be properly burnished. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Standard Procedure**.

REAR

NOTE: Inspect brake pads and parking brake shoes before installation. See **Brakes/Hydraulic/Mechanical/PADS, Brake - Inspection**.

8136a480

Fig. 205: VENTED BRAKE ROTOR MOUNTING
 Courtesy of CHRYSLER LLC

1. Clean hub face (1) to remove any dirt or corrosion where rotor mounts.
2. Install brake rotor (2) over studs on hub and bearing (1).

815bb19b

Fig. 206: REAR CALIPER MOUNTING - SRT8
 Courtesy of CHRYSLER LLC

3. Slide caliper with pads (2) over brake rotor and align with knuckle.
4. Install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.).
5. Remove jack from under spring link.
6. Install tire and wheel assembly. Tighten wheel mounting nuts to 150 N.m (110 ft. lbs.) torque.

Refer to **Tires and Wheels - Installation** .

7. Lower vehicle.
8. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.

TUBES AND HOSES, BRAKE

Description

DESCRIPTION

The brake tubes are steel. The external surfaces of the two steel brake tubes that go from the HCU to the rear brake hoses are coated with a corrosion-resistant nylon coating.

The flex hoses used at each wheel brake are made of reinforced rubber with fittings at each end. The fitting at each brake caliper is the banjo-type and requires a special banjo bolt and copper washers.

Inspection

INSPECTION

Brake tubing should be inspected periodically for evidence of physical damage or contact with moving or hot components.

Flexible rubber hose is used at both the front and rear wheel brakes. Inspection of the flexible brake hoses should be performed whenever the brake system is serviced and every 12,000 km (7,500

miles) or 12 months, whichever comes first. Inspect hydraulic brake hoses for surface cracking, scuffing, or worn spots. If the fabric casing of the hose becomes exposed due to cracks or abrasions in the hose cover, the hose should be replaced immediately. Eventual deterioration of the hose can take place with possible burst failure. Faulty installation can cause twisting, resulting in wheel, tire, or chassis interference.

NOTE: This vehicle is equipped with more than one size (diameter) brake tube depending on location on the vehicle. If a brake tube must be replaced, always use the same size brake tubing as that being replaced. Never use under-size brake tubing.

PARKING BRAKE

DESCRIPTION

DESCRIPTION

This vehicle uses drum-in-hat style parking brakes at each rear wheel. The system is actuated using a foot-operated mechanism and three parking brake cables.

CABLE, PARKING BRAKE, FRONT

Removal

REMOVAL

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure .

Fig. 208: Parking Brake Cable
 Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) above axle differential (not shown in illustration).

Fig. 209: FRONT CABLE AND EQUALIZER

Courtesy of CHRYSLER LLC

3. Remove front cable (3) from equalizer (2).

Fig. 210: CROSSMEMBER FRONT FLANGE
Courtesy of CHRYSLER LLC

4. Remove screw (2) fastening cable (1) routing bracket to rear crossmember front flange (3).

Fig. 211: Lower Rear Wheelhouse Shield
Courtesy of CHRYSLER LLC

5. Remove nuts (1), bolt (2) and push-pins (4), securing lower rear wheelhouse shield (3) to body of vehicle. Remove lower rear wheelhouse shield.

Fig. 212: FRONT PARKING BRAKE CABLE
 Courtesy of CHRYSLER LLC

6. Remove screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).
7. Lower vehicle.
8. Remove driver door opening sill scuff plate and cowl side trim.
9. Remove clip and roll back carpet away from front cable.

Fig. 213: CABLE CONNECTOR SECURED IN FORK
 Courtesy of CHRYSLER LLC

CAUTION: Do not remove front parking brake cable from cable connector at lever without securing connector first. If not secured, cable connector will wind up inside lever assembly making it most difficult to retrieve and reconnect to front cable upon installation.

10. Using pliers, reach up inside parking brake lever assembly and pull downward on parking brake

cable connector. Secure cable connector (2) in retaining fork (1) formed into parking brake lever bracket as shown in illustration.

Fig. 214: FRONT CABLE AT LEVER CONNECTOR
Courtesy of CHRYSLER LLC

11. Disengage and remove front parking brake cable strand (1) from cable connector (2), leaving cable connector secured in retaining fork.

Fig. 215: Cable Retainer
Courtesy of CHRYSLER LLC

|-------------------------|
| 1 - CABLE RETAINER |
| 2 - 12-POINT BOX WRENCH |

12. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown in illustration to collapse retainer fingers. Pull cable from bracket.

Fig. 216: FRONT PARKING BRAKE CABLE
Courtesy of CHRYSLER LLC

13. Remove parking brake cable grommet (2) from floor pan (3).
14. Remove parking brake cable (7) through hole in floor pan.

Installation

INSTALLATION

Fig. 217: FRONT PARKING BRAKE CABLE
Courtesy of CHRYSLER LLC

1. Guide parking brake cable (7) down through hole in floor pan.
2. Install parking brake cable grommet (2) in hole of floor pan (3).

Fig. 218: FRONT CABLE AT LEVER
 Courtesy of CHRYSLER LLC

3. Guide cable strand (3) up through lever bracket and press cable housing retainer (4) into bracket allowing retainer fingers to lock cable in place.

Fig. 219: FRONT CABLE AT LEVER CONNECTOR
 Courtesy of CHRYSLER LLC

4. Connect front parking brake cable strand (1) to cable connector (2) secured in retaining fork.
5. Once front parking brake cable strand is completely seated in cable connector (2), lift cable connector out of retaining fork using pliers and slowly allow lever mechanism to take up slack in cable.
6. Lay carpet back into place and install retaining clip.

7. Install driver door opening sill scuff plate and cowl side trim.
8. Raise and support vehicle.

Fig. 220: FRONT PARKING BRAKE CABLE
 Courtesy of CHRYSLER LLC

9. Install screw (6) and routing clip (4) nuts fastening cable (7) to underside of body (3).

Fig. 221: FRONT CABLE AND EQUALIZER
 Courtesy of CHRYSLER LLC

10. Route cable above rear crossmember, then slide cable end (1) (shown in illustration with connector) and housing (3) through equalizer (2) above rear axle differential.

Fig. 222: PARKING BRAKE CABLES AT REAR CROSSMEMBER
 Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

11. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) (axle differential not shown in illustration).

Fig. 223: CROSSMEMBER FRONT FLANGE
 Courtesy of CHRYSLER LLC

12. Install screw (2) fastening cable (1) routing bracket to rear crossmember front flange (3).

Fig. 224: Lower Rear Wheelhouse Shield
Courtesy of CHRYSLER LLC

13. Position lower rear wheelhouse shield (3) onto body of vehicle. Install nuts (1), bolt (2) and push-pins (4) securing lower rear wheelhouse shield to body. Tighten nuts and bolt securely.
14. Lower vehicle until rear wheels are just above floor level.
15. Apply parking brake lever. Release lever, then reapply.
16. Check to make sure rear wheels will not rotate with lever applied.
17. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
18. Apply parking brake lever.
19. Lower vehicle.

CABLE, PARKING BRAKE, REAR

Removal

REMOVAL

NOTE: Before proceeding. See Brakes - Warning. See Brakes - Caution.

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure.

Fig. 225: Parking Brake Cable
 Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect rear parking brake cable near front cable as follows:
 - If removing left rear cable, disconnect cable (1) at equalizer (2) above rear axle differential (not shown in illustration) and rear crossmember (6).
 - If removing right rear cable, disconnect cable (4) at connector (3) above rear axle differential (not shown in illustration) and rear crossmember (6).
3. Remove parking brake shoes on side of cable service. See **Brakes/Parking Brake/SHOES, Parking Brake - Removal**.

Fig. 226: Actuator Removal/Installation

2 - CABLE END

4. Remove shoe actuator lever (1) from end of cable (2) and support.

Fig. 227: REAR CABLE ROUTING TO KNUCKLE
Courtesy of CHRYSLER LLC

5. Remove screw (4) fastening cable (2) to knuckle (3). Remove cable from knuckle.
6. Remove cable (2) from routing guide (1).

Fig. 228: CABLES AT CROSSMEMBER BRACKET
Courtesy of CHRYSLER LLC

7. Place 13 mm 12-point box wrench (4) over cable strand and completely onto cable retainer (3) as shown in illustration at crossmember bracket (1 - left) (2 - right). It may be necessary to wiggle wrench around somewhat to collapse retainer fingers. With wrench in place, pull cable from bracket.
8. Remove parking brake cable from vehicle.

Installation

INSTALLATION

Fig. 229: REAR CABLE ROUTING TO KNUCKLE
Courtesy of CHRYSLER LLC

1. Route leading end of rear parking brake cable (2) up through cable guide (1) on crossmember.

Fig. 230: CABLES AT CROSSMEMBER BRACKET
 Courtesy of CHRYSLER LLC

2. Guide cable leading end through crossmember bracket (1 - left) (2 - right) near equalizer and press cable housing retainer into bracket allowing retainer fingers to lock cable in place.

Fig. 231: REAR CABLE ROUTING TO KNUCKLE
 Courtesy of CHRYSLER LLC

3. Insert opposite end of cable (2) through rear knuckle (3) and install mounting screw (4). Tighten screw to 8 N.m (71 in. lbs.) torque.

|--|
| 1 - PARKING BRAKE SHOE ACTUATOR
2 - CABLE END |
|--|

4. Install shoe actuator lever (1) on end of parking brake cable (2). Make sure actuator lever is positioned with word "UP" facing outward.
5. Install parking brake shoes as well as all components necessary to access them. See **Brakes/Parking Brake/SHOES, Parking Brake - Installation.**

8160699c

Fig. 233: Parking Brake Cable
Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock out

parking brake lever to service parking brake components.

6. Connect rear parking brake cable at equalizer/front cable as follows:
 - If installing left rear cable, connect cable (1) at equalizer (2) above rear axle differential (not shown in illustration) and rear crossmember (6).
 - If installing right rear cable, connect cable (4) at connector (3) above rear axle differential (not shown in illustration) and rear crossmember (6).
7. Lower vehicle until rear wheels are just above floor level.
8. Apply parking brake lever. Release lever, then reapply.
9. Check to make sure rear wheels will not rotate with lever applied.
10. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
11. Adjust parking brake shoes as necessary. See **Brakes/Parking Brake/SHOES, Parking Brake - Adjustments**.
12. Lower vehicle.

LEVER, PARKING BRAKE

Removal

LEVER

NOTE: Before proceeding. See **Brakes - Warning**. See **Brakes - Caution**.

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.

Fig. 234: Parking Brake Cable

Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

2. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable.
3. Lower vehicle.
4. Remove steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Removal** .

Fig. 235: PARKING BRAKE SWITCH CONNECTOR
Courtesy of CHRYSLER LLC

5. Disconnect wiring connector (2) at parking brake switch (1).

Fig. 236: CABLE CONNECTOR SECURED IN FORK
 Courtesy of CHRYSLER LLC

CAUTION: Do not remove front parking brake cable from cable connector at lever without securing connector first. If not secured, cable connector will wind up inside lever assembly making it most difficult to retrieve and reconnect to front cable upon installation.

6. Using pliers, reach up inside parking brake lever assembly and pull downward on parking brake cable connector. Secure cable connector (2) in retaining fork (1) formed into parking brake lever bracket as shown in illustration.

Fig. 237: FRONT CABLE AT LEVER CONNECTOR
 Courtesy of CHRYSLER LLC

7. Disengage and remove front parking brake cable strand (1) from cable connector (2), leaving

cable connector secured in retaining fork.

Fig. 238: Cable Retainer
Courtesy of CHRYSLER LLC

- | |
|-------------------------|
| 1 - CABLE RETAINER |
| 2 - 12-POINT BOX WRENCH |

8. Place 13 mm 12-point box wrench (2) over cable retainer (1) at lever bracket as shown in illustration to collapse retainer fingers. Pull cable from bracket.

Fig. 239: LEVER MOUNTING
Courtesy of CHRYSLER LLC

9. Remove bolt (4) and two nuts (2) mounting parking brake lever (3) to body.
10. Remove parking brake lever (3).

Installation

INSTALLATION

Fig. 240: LEVER MOUNTING
Courtesy of CHRYSLER LLC

1. Install parking brake lever (3) over mounting studs (1).
2. Install bolt (4) and two nuts (2) mounting parking brake lever to body. Tighten bolt and nuts to 26 N.m (19 ft. lbs.).

Fig. 241: PARKING BRAKE SWITCH CONNECTOR
 Courtesy of CHRYSLER LLC

3. Connect wiring connector (2) at parking brake switch (1).

Fig. 242: FRONT CABLE AT LEVER
 Courtesy of CHRYSLER LLC

4. Guide cable strand (3) up through lever bracket and press cable housing retainer (4) into bracket allowing retainer fingers to lock cable in place.

Fig. 243: FRONT CABLE AT LEVER CONNECTOR
 Courtesy of CHRYSLER LLC

5. If original parking brake lever is being installed:
 - a. Connect front parking brake cable strand (1) to cable connector (2) secured in retaining fork.
 - b. Once front parking brake cable strand is completely seated in cable connector (2), lift cable connector out of retaining fork using pliers and slowly allow lever mechanism to take up slack in cable.

Fig. 244: FRONT CABLE AT LEVER
 Courtesy of CHRYSLER LLC

6. If NEW parking brake lever is being installed:

- a. Connect front parking brake cable strand (3) at lever connector (2).
 - b. Once front parking brake cable strand is completely seated in cable connector (2), remove pin locking out automatic tensioning spring.
7. Install steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .
8. Raise and support vehicle.

Fig. 245: PARKING BRAKE CABLES AT REAR CROSSMEMBER
 Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

9. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).
10. Lower vehicle until rear wheels are just above floor level.
11. Apply parking brake lever. Release lever to test release cable and handle. Reapply lever. While doing this, check to make sure the red indicator lamp in the cluster turns on and off properly.
12. Check to make sure rear wheels will not rotate with lever applied.
13. Release parking brake lever, then check to make sure rear wheels rotate without excessive drag.
14. Apply parking brake lever.
15. Lower vehicle.

SHOES, PARKING BRAKE

Removal

REMOVAL

NOTE: The following procedure may be used to remove shoes on either side of the vehicle.

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure .
2. Access and remove rear hub and bearing. Refer to Rear Suspension/HUB AND BEARING - Removal .

Fig. 246: Parking Brake Shoes

- 7 - HOLD-DOWN CLIPS AND PINS
- 8 - ADJUSTER

5. Install return spring (4) to lower shoe (6).
6. Install upper shoe (6) against support plate and onto shoe actuator lever.
7. Install upper brake shoe hold-down pin (7) through rear of support and upper shoe.
8. Install upper brake shoe hold-down clip (7).
9. Attach return spring (4) to upper shoe (6).
10. Install shoe adjuster (8). Place end of adjuster with star wheel upward.
11. Install parking brake shoe adjuster spring (3).

Fig. 252: Measuring Parking Brake Drum Diameter
Courtesy of CHRYSLER LLC

12. Using Brake Shoe Gauge, C-3919, or equivalent, measure inside diameter of parking brake drum portion of rotor. Set gauge.

Fig. 253: Measuring Parking Brake Shoes
Courtesy of CHRYSLER LLC

1 - BRAKE SHOE GAUGE 2 - ADJUSTER STAR WHEEL

13. Place Gauge (1) over parking brake shoes at widest point.
14. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge. This will give a good preliminary adjustment of parking brake shoes, before a final adjustment is made at end of this procedure.
15. Install hub and bearing with wheel speed sensor as well as all components necessary to access it. Refer to **Rear Suspension/HUB AND BEARING - Installation** .
16. Lower vehicle.
17. Perform final adjustment of parking brake shoes. See **Brakes/Parking Brake/SHOES, Parking Brake - Adjustments**.

Adjustments

PARKING BRAKE SHOE ADJUSTMENT

While most vehicles require only a fine adjustment of the parking brake shoes, some vehicles may require a preliminary adjustment before a fine adjustment can be made. If a preliminary adjustment must be made, refer to **PRELIMINARY ADJUSTMENT** following the fine adjustment procedure listed below.

1. Place parking brake lever in "full released" position.
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 254: Access To Shoe Adjuster Star-Wheel
Courtesy of CHRYSLER LLC

1 - ADJUSTER STAR WHEEL 2 - ACCESS HOLE
--

3. Remove plug in parking brake shoe support to access adjuster star-wheel (1).

NOTE: Through the access hole (2), rotate the adjuster star wheel (1) in the following direction to expand the shoes outward against the drum.

- Left brake - Rotate star-wheel toward rear of vehicle.
- Right brake - Rotate star-wheel toward front of vehicle.

4. Using an appropriate tool, turn adjuster star wheel (1) until wheel will not rotate (dead lock).
5. Back off adjuster six detents (teeth).
6. Rotate wheel, checking for light drag. If drag is too heavy, continue to back off adjuster one detent at a time until light drag is present. **Do not back off star-wheel more than 17 detents from wheel lock.**
7. Install access plug.
8. Adjust opposite wheel parking brake shoes using same method.
9. Lower vehicle.
10. Apply and release parking brake lever once to ensure proper operation of parking brakes.

PRELIMINARY ADJUSTMENT

1. Remove rear brake rotor. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal**.

Fig. 255: Measuring Parking Brake Drum Diameter
Courtesy of CHRYSLER LLC

2. Using Brake Shoe Gauge, Special Tool C-3919, or equivalent, measure inside diameter of parking brake drum portion of rotor. Set Gauge.

Fig. 256: Measuring Parking Brake Shoes
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - BRAKE SHOE GAUGE
2 - ADJUSTER STAR WHEEL |
|---|

3. Place Gauge (1) over parking brake shoes at widest point.
4. Using adjuster star wheel (2), adjust parking brake shoes until linings on both park brake shoes just touch jaws on gauge.
5. Install rear brake rotor. See **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Installation.**
6. Perform fine adjustment of parking brake shoes.

ACCESSORIES AND EQUIPMENT

Chime/Buzzer - Service Information - Challenger

DESCRIPTION

DESCRIPTION

CHIME WARNING SYSTEM

The chime warning system uses an electromechanical transducer and an electromechanical relay that are soldered onto the electronic circuit board inside of the Cab Compartment Node (CCN). The system provides an audible indication of various vehicle conditions that may require the attention of the vehicle operator or occupants. The CCN also includes the hardware and software necessary to serve as the electronic body control module and is sometimes referred to as the Cab Compartment Node or CCN.

The electromechanical transducer generates beep tones and chime tones, while the electromechanical relay generates click tones to emulate the sounds associated with conventional turn signal and hazard warning flasher operation. The microprocessor-based CCN utilizes electronic chime request messages received from other modules in the vehicle over the Controller Area Network (CAN) data bus along with hardwired inputs to monitor many sensors and switches throughout the vehicle. In response to those inputs, the circuitry and programming of the CCN allow it to control the audible outputs that are produced through its on-board transducer and relay.

OPERATION

OPERATION

CHIME WARNING SYSTEM

The chime warning system operates on battery voltage received through a fuse in the Junction Block (JB) on a non-switched fused B(+) circuit so that the system may operate regardless of the ignition switch position. The chime warning system also monitors the ignition switch position so that some chime features are functional only with the ignition switch in the On position, while others are functional regardless of the ignition switch position.

The chime warning system provides an audible indication to the vehicle operator or occupants under the following conditions:

- **Airbag Indicator Warning** - The Instrument Cluster also known as the Cab Compartment Node (CCN) transducer will generate one short chime when the ignition switch is in the On position, and an electronic message is received over the Controller Area Network (CAN) data bus from the Occupant Restraint Controller (ORC) requesting "Airbag" indicator illumination. This warning will only occur following completion of the "Airbag" indicator bulb test, and will only occur once during any ignition cycle.
- **Compass Mini-Trip Computer Global Reset** - The CCN transducer will generate one short

chime when the ignition switch is in the On position, and an electronic message is received over the CAN data bus from the optional Compass Mini-Trip Computer (CMTC) requesting that the CMTC average fuel economy, trip odometer and distance to empty data be reset. The CMTC monitors hard wired inputs from the U.S./Metric and Reset button switches to determine the proper reset messages to send to the CCN.

- **Door Ajar Indicator Warning** - The CCN transducer will generate one short chime when the ignition switch is in the On position, a hardwired input is received indicating that the status of any door ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Fasten Seat Belt Indicator Warning** - The CCN transducer will generate repetitive chimes at a slow rate to announce that a hardwired input from the seat belt switch indicates that the driver side front seat belt is not fastened with the ignition switch in the On position. The chime warning system also supports the enhanced seat belt reminder (beltminder) when this feature is enabled.
- **Gate Ajar Indicator Warning** - The CCN transducer will generate one short chime when the ignition switch is in the On position, a hardwired input is received indicating that the status of the liftgate ajar switch has changed, and an electronic message is received over the CAN data bus indicating that the vehicle is moving.
- **Head/Park Lamps-On Warning** - The CCN transducer will generate repetitive chimes at a fast rate to indicate that hardwired inputs from the driver door ajar switch, the headlamp switch, and the ignition switch indicate that the exterior lamps are turned On with the driver side front door opened and the ignition switch in the Off position. The chimes will continue to sound until the exterior lamps are turned Off, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Key-In-Ignition Warning** - The CCN transducer will generate repetitive chimes at a fast rate to indicate that hardwired inputs from the driver door ajar switch, the ignition switch, and the key-in ignition switch circuitry of the ignition switch indicate that the key is in the ignition lock cylinder with the driver side front door open and the ignition switch in the Off position. The chimes will continue to sound until the key is removed from the ignition lock cylinder, the driver side front door is closed, or the ignition switch is turned to the On position, whichever occurs first.
- **Low Fuel Indicator Warning** - The CCN transducer will generate one short chime when the low fuel indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Low Wash Indicator Warning** - The CCN transducer will generate one short chime when the low washer fluid indicator is illuminated by the instrument cluster circuitry. This chime will only occur once during any ignition cycle.
- **Overspeed Warning** - The CCN transducer will generate repetitive chimes at a slow rate to indicate that the vehicle speed is over a pre-programmed speed value. The CCN monitors electronic vehicle speed messages received over the CAN data bus. This feature is only enabled on an CCN that has been programmed with a Middle East Gulf Coast Country (GCC) code.
- **Park Brake Reminder** - The CCN transducer will generate one short chime to announce that the hardwired input from the park brake switch and a vehicle speed message input received over the CAN data bus indicate that the park brake is applied and the vehicle is moving. This chime will repeat each time the input conditions are met.

- **Sentry Key "Customer Learn" Mode Announcement** - The CCN transducer will generate one short chime to confirm that an electronic "Customer Learn" mode message has been received over the CAN data bus to indicate that the Sentry Key Remote Entry Module (SKREEM) is prepared for programming additional sentry key transponders. This chime feature is only active on vehicles equipped with the optional Sentry Key system, and sold in a market where "Customer Learn" programming is an allowed feature.
- **Trans Overtemp Indicator Warning** - The CCN transducer will generate repetitive chimes at a slow rate when the transmission overtemp indicator is illuminated by the instrument cluster for a high or critical transmission fluid temperature condition. This chime will repeat each time the trans overtemp indicator is cycled from Off to On.
- **Turn Signal/Hazard Warning Flasher Emulation** - The CCN relay will generate repetitive clicks at a slow rate to emulate an electromechanical flasher when the turn signal or hazard warning system are operating. The CCN relay will generate repetitive clicks at a fast rate to indicate that the right or left turn signal are operating with one or more bulbs inoperative. In either case, the clicks will continue until the turn signal and hazard warning systems are turned off.
- **Turn Signal On Warning** - The CCN transducer will generate repetitive chimes at a slow rate to indicate that a turn signal has been active continuously for 1.6 kilometers (1 mile) with the vehicle speed greater than 22 kilometers-per-hour (15 miles-per hour). Vehicles built for markets other than the United States and Canada have a revised distance threshold of 4 kilometers for this feature. The chime will continue until the turn signal input becomes inactive or until the vehicle speed message indicates that the speed is less than 22 kilometers-per-hour (15 miles-per-hour), whichever occurs first. The hazard warning flashers will not activate this chime feature.
- **Warning Indicator Announcement** - The CCN transducer will generate one short chime each time the check gauges indicator is illuminated by the instrument cluster circuitry. The check gauges indicator may be illuminated when any critical engine or transmission systems are operating outside of their normal parameters. The instrument cluster monitors electronic messages received over the CAN data bus to determine when to illuminate the check gauges indicator.

The CCN provides chime service for all available features in the chime warning system. The CCN relies upon its internal programming, numerous hardwired inputs, and electronic message inputs received from other modules over the CAN data bus network to provide the chime warning system features. The internal programming of the CCN determines the priority of each chime request input that is received, as well as the rate and duration of each chime that is to be generated.

The hardwired chime warning system inputs to the CCN may be diagnosed and tested using conventional diagnostic tools and procedures. However, conventional diagnostic methods may not prove conclusive in the diagnosis of the CCN, the CAN data bus, or the electronic messages received by the CCN from other modules. The most reliable, efficient and accurate means to diagnose the CCN, the CAN data bus, or the electronic message inputs used for the chime warning system requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

CABIN AIR FILTER

Chrysler - 300, Charger & Magnum

REMOVAL & INSTALLATION

CABIN AIR FILTER

NOTE: Manufacturer's terminology for this filter is Particulate Air Filter.

Removal

1. Remove front air inlet grille (1) from the wiper module screen (2) located under the dash panel in the engine compartment. Refer to **Fig. 1**.
2. Open the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5). Refer to **Fig. 1**.

G00431898

Fig. 1: Underhood Dash Panel Components

Courtesy of DAIMLERCHRYSLER CORPORATION

NOTE: To aid in reinstallation, note the installed position of the particulate air filter prior to removal of the filter.

G00431899

Fig. 2: Particulate Air Filter Position & Location
Courtesy of DAIMLERCHRYSLER CORPORATION

3. Remove the particulate air filter (1) from the particulate air filter housing (2) located inside of the dash panel plenum (3). Note the direction of air flow indicated by an arrow (4) on the filter. Refer to **Fig. 2**.

Installation

NOTE: The particulate air filter is labeled with "REAR OF VEHICLE" and an arrow to indicate air flow direction through the filter. Make sure to properly install the particulate air filter. Failure to properly install the filter will result in the need to replace the filter sooner than required by design.

1. Install the particulate air filter (1) into the particulate air filter housing (2) located inside of the dash panel plenum (3). Insert the particulate air filter down directly into the filter housing with the arrow (4) on the filter pointing to the rear of the vehicle. The particulate air filter is held in place by friction between the filter element and the filter housing, so no fasteners are required. Refer to **Fig. 2**.
2. Close the filter door (3) on the top of the particulate air filter housing (4) located inside of the dash panel plenum (5). Refer to **Fig. 1**.
3. Install the air inlet grille (1) onto the wiper module screen (2). Refer to **Fig. 1**.

ELECTRICAL

Charging - Service Information - Challenger

DIAGNOSIS AND TESTING

ON-BOARD DIAGNOSTIC SYSTEM

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the OBD system. Some circuits are checked continuously and some are checked only under certain conditions.

If the OBD system senses that a monitored circuit is bad, it will put a DTC into electronic memory. The DTC will stay in electronic memory as long as the circuit continues to be bad. The PCM is programmed to clear the memory after 40 good trip if the problem does not occur again.

DIAGNOSTIC TROUBLE CODES

A DTC description can be read using the scan tool. Refer to the appropriate Powertrain Diagnostic article for information.

A DTC does not identify which component in a circuit is bad. Thus, a DTC should be treated as a symptom, not as the cause for the problem. In some cases, because of the design of the diagnostic test procedure, a DTC can be the reason for another DTC to be set. Therefore, it is important that the test procedures be followed in sequence, to understand what caused a DTC to be set.

ERASING DIAGNOSTIC TROUBLE CODES

The Scan Tool must be used to erase a DTC.

The following procedures may be used to diagnose the charging system if:

- the check gauges lamp or battery lamp is illuminated with the engine running
- the voltmeter (if equipped) does not register properly
- an undercharged or overcharged battery condition occurs.

Remember that an undercharged battery is often caused by:

- accessories being left on with the engine not running
- a faulty or improperly adjusted switch that allows a lamp to stay on. Refer to **Electrical/Battery System/BATTERY - Standard Procedure**
- loose generator belt.

INSPECTION

The Powertrain Control Module (PCM) monitors critical input and output circuits of the charging system, making sure they are operational. A Diagnostic Trouble Code (DTC) is assigned to each input and output circuit monitored by the On-Board Diagnostic (OBD) system. Some charging system circuits are checked continuously, and some are checked only under certain conditions.

To perform a complete test of the charging system, refer to the appropriate Powertrain Diagnostic Procedures service manual and the scan tool. Perform the following inspections before attaching the scan tool.

1. Inspect the battery condition. Refer to **Electrical/Battery System - Diagnosis and Testing** for procedures.
2. Inspect condition of battery cable terminals, battery posts, connections at engine block, starter solenoid and relay. They should be clean and tight. Repair as required.
3. Inspect all fuses in both the fuseblock and Power Distribution Center (PDC) or IPM (if equipped) for tightness in receptacles. They should be properly installed and tight. Repair or replace as required.
4. Inspect generator mounting bolts for tightness. Replace or tighten bolts if required. Refer to **GENERATOR** for torque specifications. See **Electrical/Charging - Specifications**.
5. Inspect generator drive belt condition and tension.
6. Inspect decoupler pulley (if equipped). Ensure decoupler pulley is driving the alternator rotor.
7. Inspect automatic belt tensioner (if equipped). Refer to **COOLING** for more information.
8. Inspect generator electrical connections at generator field, battery output, and ground terminal (if equipped). Also check generator ground wire connection at engine (if equipped). They should all be clean and tight. Repair as required.

REMOVAL

3.5L

Fig. 1: GENERATOR 3.5L
Courtesy of CHRYSLER LLC

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

1. Disconnect and isolate negative battery cable at battery.
2. Remove generator drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal**.
3. Remove upper most mounting bolt (2) from generator (1).
4. Remove generator bracket bolt (3) and remove bracket (4).

81ce301

Fig. 2: ALTERNATOR ELECTRICAL CONNECTION
 Courtesy of CHRYSLER LLC

5. Unsnap plastic protective cover (3) from B+ mounting stud.
6. Remove B+ terminal mounting nut (2) and B+ terminal (1) at rear of generator.
7. Disconnect field wire electrical connector (4) by pushing on connector tab.

81e9c4b5

Fig. 3: TRANS COOLER LINE CLAMP
 Courtesy of CHRYSLER LLC

8. Raise and support vehicle.
9. Remove middle splash shield.
10. Remove bolt (1) from transmission cooler line clamp at right crossmember (3) and reposition transmission cooler line (2).

Fig. 4: GENERATOR 3.5L
 Courtesy of CHRYSLER LLC

11. Remove lower mounting bolts (2) from generator (1).
12. Remove generator from engine compartment.

5.7L

Fig. 5: Generator - 5.7L

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO

DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

1. Disconnect and isolate negative battery cable at battery.
2. Remove generator drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Removal** .
3. Remove upper generator mounting bolt (1).

Fig. 6: TRANS COOLER LINE CLAMP
Courtesy of CHRYSLER LLC

4. Raise and support vehicle.
5. Remove lower splash shield.
6. Remove bolt (1) from transmission cooler line clamp at right crossmember (3) and reposition transmission cooler line (2).

Fig. 7: GENERATOR SUPPORT BRACKET-5.7L
Courtesy of CHRYSLER LLC

7. Remove generator support bracket nut (4) and bolt (3). Remove support bracket (1).
8. Unsnap plastic insulator cap from B+ output terminal.
9. Remove B+ terminal mounting nut at rear of generator. Disconnect terminal from generator.
10. Disconnect field wire connector at rear of generator by pushing on connector tab.

Fig. 8: Generator - 5.7L
Courtesy of CHRYSLER LLC

11. Remove lower generator mounting bolt (1).
12. Remove generator from vehicle.

REMOVAL

Fig. 9: Generator - 5.7L
Courtesy of CHRYSLER LLC

WARNING: DISCONNECT NEGATIVE CABLE FROM BATTERY BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

1. Disconnect and isolate the negative battery cable at battery.
2. Remove the generator drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Removal
3. Remove the upper generator mounting bolt (1).

Fig. 10: Trans Cooler Line Clamp
Courtesy of CHRYSLER LLC

4. Raise and support the vehicle.
5. Remove the lower splash shield.
6. Remove the bolt (1) from transmission cooler line clamp at right the crossmember (3) and reposition the transmission cooler line (2).

Fig. 11: Engine Mount Heat Shield
Courtesy of CHRYSLER LLC

7. A heat shield (1) is used over the right engine mount (3). The heat shield must be removed to gain access to the generator support bracket nut. Remove the two heat shield mounting bolts (2).

Fig. 12: Generator Support Bracket - 5.7L
Courtesy of CHRYSLER LLC

8. Loosen, but do not remove the generator support bracket nut (4).
9. Remove the bolt (3).
10. Unsnap the plastic insulator cap from the B+ output terminal.
11. Remove the B+ terminal mounting nut at the rear of the generator. Disconnect the terminal from the generator.
12. Disconnect the field wire connector at the rear of the generator by pushing on the connector tab.

Fig. 13: Generator - 5.7L

13. Remove the lower generator mounting bolt (1).
14. Remove the generator from the vehicle.

INSTALLATION

3.5L

Fig. 14: GENERATOR 3.5L
Courtesy of CHRYSLER LLC

NOTE: Position generator, bracket and all bolts to engine compartment. Hand tightening all fasteners. Then torque all fasteners to specifications.

1. Position generator (1) to engine and loosely install lower mounting bolts (2).
2. Position generator bracket (4) and loosely install bracket bolt (3) and upper generator mounting bolt (2).
3. Tighten generator mounting bolts (2) to 65 N.m (48 ft. lbs.). Tighten generator bracket bolt (3) to 54 N.m (40 ft. lbs.).

81ce301

Fig. 15: ALTERNATOR ELECTRICAL CONNECTION
 Courtesy of CHRYSLER LLC

4. Connect field wire connector (4) into generator.
5. Install B+ terminal (1) and nut (2) to generator mounting stud. Tighten nut to 13 N.m (115 in. lbs.)
6. Snap plastic protective cover (3) to B+ terminal.

81e9c4b5

Fig. 16: TRANS COOLER LINE CLAMP
 Courtesy of CHRYSLER LLC

7. Position transmission cooler line (2) and install transmission cooler line clamp bolt (1) to right crossmember (3).
8. Install middle splash shield.

9. Lower vehicle.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

10. Install drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Installation .

11. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

5.7L

Fig. 17: Generator - 5.7L
Courtesy of CHRYSLER LLC

1. Position generator (2) to engine and loosely install 2 mounting bolts (1).

Fig. 18: GENERATOR SUPPORT BRACKET-5.7L
Courtesy of CHRYSLER LLC

2. Position support bracket (1) to generator and loosely install bolt (3) and nut (4).
3. Tighten generator mounting bolts to 65 N.m (48 ft. lbs.).
4. Tighten bracket nut (4) to 28 N.m (20.5 ft. lbs.).
5. Snap field wire connector into rear of generator.
6. Install B+ terminal eyelet to generator output stud. Tighten nut to 13 N.m (115 in. lbs.).

Fig. 19: TRANS COOLER LINE CLAMP
Courtesy of CHRYSLER LLC

7. Position transmission cooler line (2) and install transmission cooler line clamp bolt (1) to right crossmember (3).

8. Install lower splash shield.
9. Lower vehicle.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

10. Install generator drive belt. Refer to Cooling/Accessory Drive/BELT, Serpentine - Installation .
11. Connect the negative battery cable and tighten nut to 5 N.m (45 in. lbs.).

INSTALLATION

Fig. 20: Generator - 5.7L
Courtesy of CHRYSLER LLC

1. Position the generator (2) to the engine and loosely install the two generator mounting bolts (1).

Fig. 21: Generator Support Bracket - 5.7L
 Courtesy of CHRYSLER LLC

2. Position the support bracket (1) to the generator and loosely install the bolt (3) and the nut (4).
3. Tighten the generator mounting bolts to 65 N.m (48 ft. lbs.).
4. Tighten the bracket nut (4) to 28 N.m (21 ft. lbs.).

Fig. 22: Engine Mount Heat Shield
 Courtesy of CHRYSLER LLC

5. Install the heat shield (1) and the two heat shield mounting bolts (2).
6. Snap the field wire connector into the rear of the 'generator.
7. Install the generator B+ terminal eyelet to the generator output stud. Tighten to 13 N.m (10 ft.

lbs.).

Fig. 23: TRANS COOLER LINE CLAMP
Courtesy of CHRYSLER LLC

8. Position the transmission cooler line (2) and install the transmission cooler line bracket bolt (1) to the right crossmember (3).
9. Install the lower splash shield.
10. Lower the vehicle.

CAUTION: When installing a serpentine accessory drive belt, the belt **MUST** be routed correctly. The water pump may be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat.

11. Install the generator drive belt. Refer to **Cooling/Accessory Drive/BELT, Serpentine - Installation** .
12. Connect the negative battery cable. Follow the battery reconnection procedure. Refer to **Electrical/Battery System - Standard Procedure**

CLUTCH

Clutch - Challenger

WARNING

WARNING

WARNING: EXERCISE CARE WHEN SERVICING CLUTCH COMPONENTS. FACTORY INSTALLED CLUTCH DISCS DO NOT CONTAIN ASBESTOS FIBERS. DUST AND DIRT ON CLUTCH PARTS MAY CONTAIN ASBESTOS FIBERS FROM AFTERMARKET COMPONENTS. BREATHING EXCESSIVE CONCENTRATIONS OF THESE FIBERS CAN CAUSE SERIOUS BODILY HARM. WEAR A RESPIRATOR DURING SERVICE AND NEVER CLEAN CLUTCH COMPONENTS WITH COMPRESSED AIR OR WITH A DRY BRUSH. EITHER CLEAN THE COMPONENTS WITH A WATER DAMPENED RAGS OR USE A VACUUM CLEANER SPECIFICALLY DESIGNED FOR REMOVING ASBESTOS FIBERS AND DUST. DO NOT CREATE DUST BY SANDING A CLUTCH DISC. REPLACE THE DISC IF THE FRICTION MATERIAL IS DAMAGED OR CONTAMINATED. DISPOSE OF ALL DUST AND DIRT CONTAINING ASBESTOS FIBERS IN SEALED BAGS OR CONTAINERS. THIS WILL HELP MINIMIZE EXPOSURE TO YOURSELF AND TO OTHERS. FOLLOW ALL RECOMMENDED SAFETY PRACTICES PRESCRIBED BY THE OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION (OSHA) AND THE ENVIRONMENTAL SAFETY AGENCY (EPA), FOR THE HANDLING AND DISPOSAL OF PRODUCTS CONTAINING ASBESTOS.

DIAGNOSIS AND TESTING

CLUTCH

ROAD TEST

Road test the vehicle and inspect components to determine the clutch problem.

During a road test, drive the vehicle at normal speeds. Shift the transmission through all gear ranges and observe clutch action. If the clutch chatters, grabs, slips or does not release properly, remove and inspect the clutch components. If the problem is noise or hard shifting further diagnosis may be needed as the transmission or another driveline component may be at fault.

CLUTCH CONTAMINATION

Clutch contamination can be caused by oil, water or clutch fluid on the clutch discs and pressure plate surfaces. This will cause chatter, slip and grab. Inspect the clutch components and verify the contaminate.

Oil contamination indicates a leak at either the rear main seal or transmission input shaft causing an oil residue on the housing interior and clutch cover and flywheel. Heat buildup caused by slippage between the pressure plate, discs and flywheel can bake the oil residue onto the components. A glaze-like residue ranges in color from amber to black will be noticed.

Road splash contamination, dirt/water can enter the clutch housing due to loose bolts, housing cracks or through hydraulic line openings. Driving through deep water puddles can force water/road splash into the housing through such openings.

IMPROPER RELEASE OR CLUTCH ENGAGEMENT

Clutch release or engagement problems are caused by wear or damage to one or more clutch components.

Release problems can result in hard shifting and noise. Inspect the clutch cylinders/interconnecting line, slave cylinder, release bearing, clutch discs and pressure plate. Inspect these components for loose, worn and damaged mounting bolts or components.

Normal condensation in vehicles that are stored or out of service for long periods of time can generate enough corrosion to make the discs stick to the flywheel, or pressure plate. If this condition is experienced loosen the disc manually through the inspection plate opening if equipped.

Engagement problems can result in slip, chatter/shudder and noisy operation. Inspect the clutch discs and pressure plate for contamination, wear, misalignment and distortion.

CLUTCH MISALIGNMENT

Clutch components must be in proper alignment with the crankshaft and transmission input shaft. Misalignment caused by excessive runout or warpage of any clutch component will cause grab, chatter and improper clutch release.

PRESSURE PLATE

Check pressure plate for flatness with a straightedge. Pressure plate friction area must be flat within 0.50 mm (0.020 in.). Attaching bolt holes should be in contact with surface plate within 0.38 mm (0.015 in.). Inspect friction faces of the flywheel and pressure plate for:

- Flywheel Dowel Pin Fit
- Excessive Discoloration
- Burned Areas
- Small Cracks
- Deep Grooves
- Ridges

CLUTCH DISC

Replace clutch discs and pressure plate if discs are worn within 0.38 mm (0.015 in.) of the rivet heads. Inspect clutch discs for:

- Discoloration
- Burned Areas
- Cracks
- Worn Disc Hub Splines
- Broken Springs
- Lose Rivets
- Oil Soaked

DIAGNOSIS CHART

The DIAGNOSIS CHART describe common clutch problems, possible causes and correction.

DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
Discs facing worn out	1. Normal wear. 2. Driver frequently rides (slips) the clutch. Results in rapid overheating and wear. 3. Insufficient pressure plate diaphragm spring tension.	1. Replace pressure plate and discs. 2. Replace pressure plate and discs. 3. Replace pressure plate and discs.
Clutch disc facing contaminated with oil, grease, or clutch fluid.	1. Leak at rear main engine seal or transmission input shaft seal. 2. Excessive amount of grease applied to the input shaft splines. 3. Road splash, water entering housing. 4. Slave cylinder leaking.	1. Replace appropriate seal. 2. Remove grease and apply the correct amount of grease. 3. Replace clutch disc. Clean pressure plate and reuse if in good condition. 4. Replace hydraulic clutch linkage.
Clutch is running partially disengaged.	1. Release bearing sticking or binding and does not return to the normal running position.	1. Verify failure. Replace the release bearing and transmission front bearing retainer as necessary.
Flywheel below minimum thickness specification.	1. Improper flywheel machining. Flywheel has excessive taper or excessive material removal.	1. Replace flywheel.
Pressure plate or diaphragm	1. Rough handling. Impact	1. Replace discs and pressure

spring warped or distorted.	bent cover, spring, or disc. 2. Improper bolt tightening procedure.	plate as necessary. 2. Tighten clutch cover using proper procedure.
Facing on flywheel side of disc torn, gouged, or worn.	1. Flywheel surface scored or nicked. 2. Clutch disc sticking or binding on transmission input shaft.	1. Correct surface condition if possible. Replace flywheel, discs and pressure plate as necessary. 2. Inspect components and correct/replace as necessary.
Clutch discs facing burnt. Flywheel and pressure plate surfaces glazed.	1. Frequent operation under high loads or hard acceleration conditions. 2. Driver frequently rides (slips) clutch. Results in rapid wear and overheating of disc and cover.	1. Correct condition of flywheel and pressure plate surface. Replace discs and pressure plate. 2. Correct condition of flywheel surface. Replace clutch discs and pressure plate.
Clutch discs binds on input shaft splines.	1. Clutch discs hub splines damaged during installation. 2. Input shaft splines rough, damaged, or corroded.	1. Clean, smooth, and lubricate hub splines if possible. Replace discs and pressure plate if necessary. 2. Clean, smooth, and lubricate shaft splines if possible. Replace input shaft if necessary.
Clutch discs rusted to flywheel and/or pressure plate.	1. Clutch not used for and extended period of time (e.g. long term vehicle storage).	1. Sand rusted surfaces with 180 grit sanding paper. Replace discs, pressure plate and flywheel if necessary.
Pilot bearing seized, loose, or rollers are worn.	1. Bearing cocked during installation. 2. Bearing defective. 3. Bearing not lubricated. 4. Clutch misalignment.	1. Install and lubricate a new bearing. 2. Install and lubricate a new bearing. 3. Install and lubricate a new bearing. 4. Inspect clutch and correct as necessary. Install and lubricate a new bearing.
Clutch will not disengage properly.	1. Low clutch fluid level. 2. Clutch cover loose. 3. Clutch disc bent or distorted.	1. Replace hydraulic linkage assembly. 2. Follow proper bolt tightening procedure. 3. Replace discs and pressure plate.

	4. Pressure plate diaphragm spring bent or warped. 5. Clutch disc installed backwards. 6. Clutch master or slave cylinder failure.	4. Replace discs and pressure plate. 5. Remove and install clutch disc correctly. 6. Replace hydraulic linkage assembly.
Clutch pedal squeak.	1. Pivot pin loose. 2. Master cylinder bushing not lubricated. 3. Pedal bushings worn out or cracked.	1. Tighten pivot pin if possible. Replace clutch pedal if necessary. 2. Lubricate master cylinder bushing. 3. Replace and lubricate bushings.
Clutch master or slave cylinder plunger dragging and/or binding	1. Master or slave cylinder components worn or corroded.	1. Replace clutch hydraulic linkage assembly.
Release bearing is noisy.	1. Release bearing defective or damaged.	1. Replace release bearing.
Contact surface of release bearing damaged.	1. Pressure plate release fingers bent or distorted. 2. Release bearing defective or damaged. 3. Release bearing misaligned.	1. Replace pressure plate and release bearing. 2. Replace the release bearing. 3. Check and correct runout of clutch components. Check front bearing sleeve for damage/alignment. Repair as necessary.
Partial engagement of clutch discs. One side of disc is worn and the other side is glazed and lightly worn.	1. Clutch pressure plate position incorrect. 2. Pressure plate release fingers bent or distorted. 3. Clutch disc damaged or distorted. 4. Clutch misalignment.	1. Replace clutch discs and pressure plate. 2. Replace clutch discs and pressure plate. 3. Replace clutch discs and pressure plate 4. Check alignment and runout of flywheel, disc, pressure plate, and/or clutch housing. Correct as necessary.

STANDARD PROCEDURE

CLUTCH SYSTEM BLEED

NOTE: Be certain the clutch pedal returns to the upper most position while bleeding the clutch system.

NOTE: It may take as many as two hundred strokes of the clutch pedal to properly bleed the clutch system.

1. Check the fluid level in the brake master cylinder reservoir. If the brake fluid level is not up to the step in the reservoir, add DOT 4 brake fluid.
2. Slowly depress the clutch pedal.
 - a. If pedal feels hard in a short distance, air is present in the clutch slave cylinder.
 - b. If pedal feels spongy, air is present in the clutch master cylinder.
3. Continue checking the fluid level while depressing and releasing the clutch pedal. Depress and release the clutch pedal until an appropriate clutch pedal response and feel is achieved.

1. Raise and support the vehicle.
2. Remove the transmission (1) and place it on a workbench. Refer to **Transmission and**

Transfer Case/Manual - Removal .

3. Remove the two bolts (2) that secure the release bearing/slave cylinder (3) to the transmission and remove the release bearing/slave cylinder.

INSTALLATION

INSTALLATION

2097399

Fig. 4: View Of Clutch Release Bearing And Slave Cylinder
Courtesy of CHRYSLER LLC

1. Position the clutch release bearing/slave cylinder (3) onto input shaft.
2. Install the two bolts (2) that secure the clutch release bearing/slave cylinder to the transmission (1). Tighten the bolts to 20 N.m (15 ft. lbs.).
3. Install the transmission. Refer to **Transmission and Transfer Case/Manual - Installation** .
4. Lower the vehicle.

NOTE: While bleeding the clutch system be certain the clutch pedal returns to the most upright position. It may take as many as two hundred clutch strokes to bleed the system.

5. Bleed the clutch system. See **Clutch - Standard Procedure**.

BEARING, PILOT

REMOVAL

REMOVAL

1. Remove transmission and clutch housing. Refer to Transmission and Transfer Case/Manual - Removal .
2. Remove clutch cover and disc. See Clutch/DISC, Clutch - Removal.
3. Using a suitable blind hole puller, remove pilot bearing.

INSTALLATION

INSTALLATION

1. Clean bearing bore with solvent and wipe dry with shop towel.

80c0710d

Fig. 5: PILOT BEARING
Courtesy of CHRYSLER LLC

2. Install new bearing (1) with clutch alignment tool (2). Keep bearing straight during installation. Do not allow bearing to become cocked. Tap bearing into place until flush with edge of bearing bore. Do not recess bearing.

NOTE: Letter side of bearing (3) must face transmission.

3. Install clutch cover and disc. See Clutch/DISC, Clutch - Installation.
4. Install clutch housing and transmission. Refer to Transmission and Transfer Case/Manual - Installation .

CYLINDER, CLUTCH MASTER

REMOVAL

REMOVAL

NOTE: The clutch master cylinder and clutch starter interlock switch are serviced as an assembly.

NOTE: Place towels or rags on the floor below the clutch master cylinder to prevent brake fluid from coming into contact with the carpet.

Fig. 6: View Of Clutch Master Cylinder And Clutch Starter Interlock Switch
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the negative battery cable.
2. Remove the driver side silencer from under the instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - REMOVAL** .
3. Remove the instrument panel steering column cover and reinforcement. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - REMOVAL** .

WARNING: When removed, discard the original clutch master cylinder pushrod retainer clip. Use a new retainer clip for reassembly. Failure to install a new retainer clip may result in loss of vehicle control and serious or fatal injury.

4. Remove and discard the retainer clip (3) that secures the pushrod of the clutch master cylinder (5) to the clutch pedal lever (4).
5. Disconnect the clutch master cylinder pushrod from the clutch pedal lever.
6. Disconnect the clutch starter interlock switch harness connector (2).
7. Disconnect the brake/clutch fluid reservoir supply line (1) and plug the line to prevent excessive leakage/loss of brake fluid from the brake master cylinder reservoir.

8. Disconnect the clutch slave cylinder hydraulic line (6).
9. Remove the two nuts (7) that secure the clutch master cylinder to the clutch/brake pedal assembly and remove the clutch master cylinder.

INSTALLATION

INSTALLATION

Fig. 7: View Of Clutch Master Cylinder And Clutch Starter Interlock Switch
Courtesy of CHRYSLER LLC

1. Position the clutch master cylinder (5) onto the clutch/brake pedal assembly and install the two nuts (7). Tighten the nuts securely.
2. Connect the clutch slave cylinder hydraulic line (6).
3. Remove the previously installed plug and connect the brake/clutch fluid reservoir supply line (1).
4. Connect the clutch starter interlock switch harness connector (2).

WARNING: Always install a new clutch master cylinder pushrod retainer clip during installation of the clutch master cylinder. Failure to install a new retainer clip may result in loss of vehicle control and serious or fatal injury.

5. Connect the clutch master cylinder pushrod to the clutch pedal lever (4) and install a new retainer clip (3).
6. Install the instrument panel reinforcement and steering column cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation**.
7. Install the driver side instrument panel silencer. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation**.
8. Reconnect the negative battery cable.

NOTE: While bleeding the clutch system be certain the clutch pedal returns to the most upright position. It may take as many as two hundred clutch strokes to bleed the system.

9. Bleed the clutch system. See Clutch - Standard Procedure.

DISC, CLUTCH

DESCRIPTION

DESCRIPTION

Fig. 8: DUAL DISC CLUTCH
Courtesy of CHRYSLER LLC

The clutch is a dual disc design. One disc (1) is independent of the pressure plate, located between the pressure plate and flywheel. The second disc (2) is an internal component located between the pressure plates (3) and can not be serviced separately.

NOTE: If either clutch discs or pressure plate is worn or damaged, the independent disc and pressure plate must be replaced as an assembly.

REMOVAL

REMOVAL

Fig. 9: PRESSURE PLATE AND FLYWHEEL
Courtesy of CHRYSLER LLC

1. Remove transmission.
2. Mark pressure plate (1) and flywheel (2) for installation reference.
3. Insert Clutch Tool 10018 through the clutch discs (1) into the pilot bearing.
4. Loosen pressure plate (1) bolts evenly in a crisscross pattern. This will release spring pressure evenly and avoid pressure plate damage.
5. Remove pressure plate (1) assembly and independent disc from flywheel (2).

CLEANING

CLEANING

Clean flywheel face with crocus cloth or 400-600 grade sandpaper, then wipe surface with mineral spirits.

NOTE: If flywheel is severely scored, heat checked or warped replace flywheel.

Wipe friction surface of the pressure plate with mineral spirits.

INSTALLATION

INSTALLATION

81be5647

Fig. 10: PRESSURE PLATE ASSEMBLY
 Courtesy of CHRYSLER LLC

NOTE: If flywheel is replaced or removed apply thread sealer to the flywheel retaining bolts. This will prevent engine oil from leaking onto the clutch.

1. Insert Clutch Tool 10018 (1) into pilot bearing.
2. Install independent clutch disc over clutch tool up against flywheel.
3. Install pressure plate assembly (2) over clutch tool up against flywheel and onto the dowel pins (3).
4. If new clutch or flywheel is installed, align cover balance spot as close as possible to flywheel balance orange spot.
5. Tighten **new** pressure plate bolts a few turns at a time in a star pattern until bolts are seated. Then tighten bolts in star pattern to 75 N.m (55 ft. lbs.). Remove clutch disc alignment tool.
6. Install the transmission. Refer to **Transmission and Transfer Case/Manual - Installation** .

FLYWHEEL

DIAGNOSIS AND TESTING

FLYWHEEL

Common flywheel problems:

- Incorrect bolt tightening
- Mounting flywheel on dirty crankshaft flange

- Improper seating on crankshaft flange shoulder
- Heat warped
- Loose flywheel bolts

The flywheel should be replaced if warped or overheated. **Do not machine flywheel to correct a warped or overheated condition.**

Clean crankshaft flange and its mating surface on the flywheel before assembling. Dirt in this area could cause the flywheel to mis-align when installing.

Apply Mopar Lock AND Seal or equivalent to **new** flywheel bolts. Tighten flywheel bolts to specified torque. Over tightening bolts can distort flywheel.

REMOVAL

REMOVAL

81ba5820

Fig. 11: PRESSURE PLATE AND FLYWHEEL
 Courtesy of CHRYSLER LLC

1. Remove transmission assembly. Refer to **Transmission and Transfer Case/Manual - Removal** .
2. Remove clutch assembly (1) from flywheel (2).

81ba5851

Fig. 12: FLYWHEEL
Courtesy of CHRYSLER LLC

3. Remove flywheel (1) bolts and remove flywheel from crankshaft (2).

INSTALLATION

INSTALLATION

81ba5851

Fig. 13: FLYWHEEL

Courtesy of CHRYSLER LLC

1. Apply Mopar Lock AND Seal or equivalent to new flywheel bolts.
2. Install flywheel (1) on engine crankshaft (2) and install flywheel bolts.

Fig. 14: TORQUE PATTERN

Courtesy of CHRYSLER LLC

3. Tighten flywheel (1) bolts in sequence to 75 N.m (55 ft. lbs.).

81be582D

Fig. 15: PRESSURE PLATE AND FLYWHEEL
 Courtesy of CHRYSLER LLC

4. Install clutch assembly (1) onto the flywheel (2). Install clutch housing and transmission. Refer to Transmission and Transfer Case/Manual - Installation .

PEDAL AND PAD, CLUTCH

REMOVAL

REMOVAL

2066750

Fig. 16: Brake Booster Push Rod And Clip
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable.
2. Remove the knee bolster.
3. Remove driver side silencer under instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - REMOVAL**.
4. Remove steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - REMOVAL**.

NOTE: When removed, discard the original clip (1). Use a new clip for reassembly.

5. Remove the clip (1), and disconnect the brake booster push rod (2).

Fig. 17: STOP LAMP SWITCH AND PEDAL ROD
Courtesy of CHRYSLER LLC

6. Disconnect the stop lamp switch harness connector (1).

Fig. 18: Clutch Starter Interlock Switch Harness Connector
Courtesy of CHRYSLER LLC

7. Disconnect the clutch starter interlock switch harness connector (1).
8. Disconnect the brake/clutch fluid reservoir tube (3).
9. Disconnect the clutch hydraulic line (2).

Fig. 19: Remove/Install Clutch/Brake Pedal Assembly & Mounting Nuts
Courtesy of CHRYSLER LLC

10. Remove the clutch/brake pedal assembly mounting nuts (1) and (2), then remove the clutch/brake pedal assembly (3).

INSTALLATION

INSTALLATION

NOTE: While bleeding the clutch system be certain the clutch pedal returns to the most upright position. It may take as many as two hundred clutch strokes to bleed the system. Do not let the brake/clutch fluid reservoir to empty out while bleeding the hydraulic system.

Fig. 20: Remove/Install Clutch/Brake Pedal Assembly & Mounting Nuts
Courtesy of CHRYSLER LLC

1. Install the clutch/brake pedal assembly (3), and the clutch/brake pedal assembly mounting fasteners (1) and (2). Tighten the fasteners to to 25 N.m (19 ft.lbs.).

Fig. 21: Clutch Starter Interlock Switch Harness Connector
Courtesy of CHRYSLER LLC

2. Reconnect the clutch hydraulic line (2).
3. Reconnect the brake/clutch fluid reservoir tube (3).

4. Reconnect the clutch starter interlock switch harness connector (1).

Fig. 22: STOP LAMP SWITCH AND PEDAL ROD
Courtesy of CHRYSLER LLC

5. Reconnect the stop lamp switch harness connector (1).

Fig. 23: Brake Booster Push Rod And Clip
Courtesy of CHRYSLER LLC

NOTE: Use a new clip for reassembly.

6. Reconnect the brake booster push rod (2), and install a new clip (1).
7. If necessary bleed the hydraulic system. See Clutch - Standard Procedure.

8. Install steering column opening cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .
9. Install driver side silencer under instrument panel. Refer to **Body/Instrument Panel/PANEL, Silencer - Installation** .
10. Install the driver side knee bolster.
11. Connect negative battery cable to battery post. Refer to **Electrical/Battery System - Standard Procedure** .

SWITCH, CLUTCH STARTER INTERLOCK

REMOVAL

REMOVAL

Fig. 24: SWITCH RETAINER CLIP
Courtesy of CHRYSLER LLC

1. Remove clutch master cylinder.
2. Remove white clutch pedal position switch retaining clip (1).

Fig. 25: SWITCH REMOVAL
Courtesy of CHRYSLER LLC

3. Push clutch switch (1) up actuator rod (2) slightly. Then pull the bottom of the clutch switch (1) outward.

INSTALLATION

INSTALLATION

Fig. 26: SWITCH INSTALLATION
Courtesy of CHRYSLER LLC

1. Position plunger inside the switch (1) on the narrow section of the clutch master cylinder (2) actuation rod.
2. Place the top of the switch against the rod, then push the switch up slightly. This will compress the plunger.
3. Push the bottom of the switch against the rod.

CAUTION: Failure to follow these instruction will result in forcing the switch onto the rod and cracking the switch.

4. Install new white plastic retaining clip.
5. Install clutch master cylinder in vehicle.
6. Test clutch position switch operation.

DRIVELINE/AXLES

Differential and Driveline - Challenger

HALF SHAFT

DESCRIPTION

DESCRIPTION

The inner joints of both halfshaft assemblies are cross-groove joints and are splined to the differential side gears. The outer joints of both assemblies are Rzeppa Joints. On vehicles equipped with the limited slip Getrag differential, the halfshafts have cross-groove joints on both ends. The cross-groove joints are true constant velocity (CV) joint assemblies, allowing for the changes in halfshaft length through the jounce and rebound travel of the rear suspension.

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

VEHICLE INSPECTION

Check for grease in the vicinity of both the inboard and outboard joints. This is a sign of inner or outer joint seal boot or seal boot clamp damage.

NOISE AND/OR VIBRATION IN TURNS

A clicking noise and/or a vibration in turns could be caused by one of the following conditions:

- Damaged outer CV or inner cross-groove joint seal boot or seal boot clamps. This will result in the loss and/or contamination of the joint grease, resulting in inadequate lubrication of the joint.
- Noise may also be caused by another component of the vehicle coming in contact with the half shafts.

CLUNKING NOISE DURING ACCELERATION

This noise may be a result of one of the following conditions:

- A torn seal boot on the inner or outer joint of the half shaft assembly.
- A loose or missing clamp on the inner or outer joint of the half shaft assembly.
- A damaged or worn half shaft CV joint.

SHUDDER OR VIBRATION DURING ACCELERATION

This problem could be a result of:

- A worn or damaged half shaft inner cross-groove joint.

- Improper wheel alignment. Refer to **Front Suspension/Wheel Alignment - Standard Procedure**

VIBRATION AT HIGHWAY SPEEDS

This problem could be a result of:

- Foreign material (mud, etc.) packed on the backside of the wheel(s).
- Out of balance tires or wheels. Refer to **Tires and Wheels - Standard Procedure**
- Improper tire and/or wheel runout. Refer to **Tires and Wheels - Diagnosis and Testing**

REMOVAL

198 RII AND 215 RII AXLES

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

NOTE: Halfshaft inner and outer boots are not serviceable separately. Boot replacement requires entire shaft assembly replacement.

CAUTION: Unequal-length halfshafts are used. The right halfshaft is shorter than the left, and it is necessary to identify and tag halfshafts upon removal to ensure proper installation.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

1. With vehicle in neutral, position and raise vehicle on hoist.

Fig. 1: Rear Axle Drain Plug
 Courtesy of CHRYSLER LLC

2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to 50 N.m (37 ft.lbs.)

Fig. 2: Tire And Wheel Mounting
 Courtesy of CHRYSLER LLC

4. Remove rear exhaust system. Refer to **Exhaust System/MUFFLER, Exhaust - Removal** .
5. Remove wheel/tire assembly (1) from sides that shaft is to be removed.

G00364052

Fig. 3: Hub Nut
Courtesy of CHRYSLER LLC

6. Remove wheel hub nut (1) and discard.

G00364053

Fig. 4: Alignment Marks - Axle End Shown
Courtesy of CHRYSLER LLC

7. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

Fig. 5: Propeller Shaft At Rear Axle
Courtesy of CHRYSLER LLC

8. Remove three propeller shaft coupler-to-axle flange bolt/nuts.

G00450324

Fig. 6: Halfshaft Removal (V6 Models)
Courtesy of CHRYSLER LLC

9. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

G00450311

Fig. 7: Transmission Jack At Rear Axle
Courtesy of CHRYSLER LLC

10. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

G00358902

Fig. 8: Rear Axle Front Isolator
Courtesy of CHRYSLER LLC

11. Remove rear axle forward mount isolator (1) bolt/nut (2).

Fig. 9: Rear Axle To Crossmember Bolts
Courtesy of CHRYSLER LLC

CAUTION: Access to rear axle-to-crossmember bolts is best achieved by use of short socket and a flexible-head ratchet.

12. Remove two rear axle-to-crossmember bolts (1).

G00450310

Fig. 10: Propeller Shaft Supported
Courtesy of CHRYSLER LLC

13. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

G00450312

Fig. 11: Remove/Install Halfshaft
Courtesy of CHRYSLER LLC

CAUTION: Unequal-length halfshafts are used. The right halfshaft is shorter than the left, and it is necessary to identify and tag halfshafts upon removal to ensure proper installation.

14. Lower axle just enough to remove halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.

Fig. 12: Halfshaft Isolation Washer
Courtesy of CHRYSLER LLC

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

CAUTION: Use care while handling/storing halfshaft assembly. Damage to the slinger can result from improper handling. If slinger gets bent or damaged, straighten slinger to avoid contact with axle seal assembly.

15. Remove halfshaft from hub. Remove and inspect rubber isolation washer (1). Discard washer if rubber surfaces are worn away. Repeat on other side if necessary.

**ASSEMBLY-EXHAUST
GAS RECIRCULATION VALVE**

G00358907

Fig. 13: Axle Seal Removal
Courtesy of CHRYSLER LLC

16. Remove axle seals (2) using suitable screwdriver.

G648 REAR AXLE

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Remove the wheel(s). Refer to **Tires and Wheels - Removal** .

G00450316

Fig. 14: Hub Nut
Courtesy of CHRYSLER LLC

3. Remove wheel hub nut (1) and discard.
4. Remove the muffler. Refer to **Exhaust System/MUFFLER, Exhaust - Removal** .

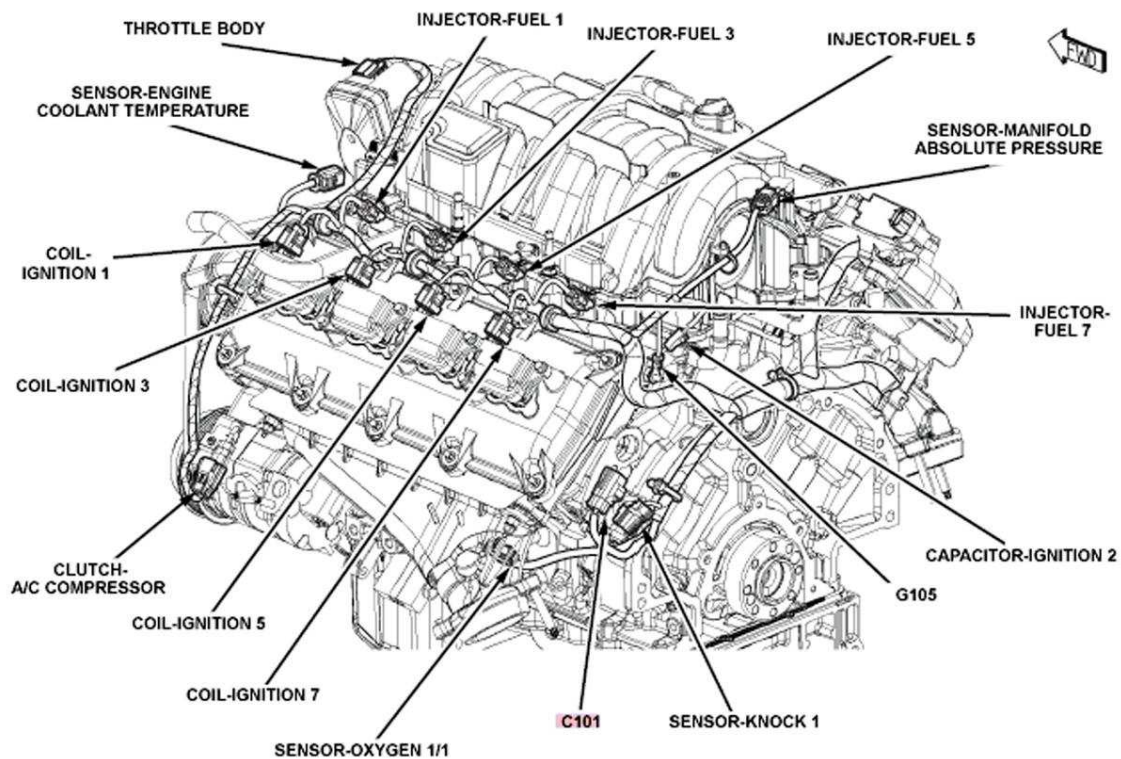

Fig. 15: Applying Alignment Index Marks To Rear Axle Flange
Courtesy of CHRYSLER LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

Fig. 16: Propeller Shaft Rear Coupler To Axle Flange
Courtesy of CHRYSLER LLC

NOTE: If re-using the propeller shaft coupler-to-axle flange fasteners, save the washers.

6. Remove three propeller shaft coupler (2) -to-axle flange (1) fasteners.

Fig. 17: Disengaging Halfshaft Using Suitable Pry Bar
Courtesy of CHRYSLER LLC

NOTE: Do not pry on the slinger (2).

7. Using suitable pry bar (1) in the location shown on illustration, partially disengage halfshaft(s) from axle assembly.

G00358913

Fig. 18: Transmission Jack At Rear Axle
Courtesy of CHRYSLER LLC

8. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

Fig. 19: Front Mount Bolt Cover
Courtesy of CHRYSLER LLC

9. Remove the front mount bolt cover (1) located at the top of the axle carrier (2).

Fig. 20: Locating Rear Axle Front Mount Bolt
Courtesy of CHRYSLER LLC

NOTE: The nut will turn free at the at the top of the axle carrier, it will need to be held with a deep socket during removal.

10. Remove rear axle front mount bolt (1) and nut (3).

G00450327

Fig. 21: Locating Right Rear Axle To Crossmember Bolts

NOTE: The rubber part of the axle isolator must face toward the cradle.

9. Install rear axle front mount isolator (3) as shown on illustration and torque fastener to 65 N.m (48 ft. lbs.).

Fig. 49: Front Mount Bolt Cover
Courtesy of CHRYSLER LLC

10. Install the front mount bolt cover (1).

Fig. 50: Transmission Jack At Rear Axle
Courtesy of CHRYSLER LLC

11. Again verify halfshaft inner joints are fully engaged to axle assembly.
12. Remove transmission jack (1).
13. If used, remove screw-type under-hoist jack stands (2).

Fig. 51: Propeller Shaft Rear Coupler To Axle Flange
 Courtesy of CHRYSLER LLC

NOTE: If re-using original fasteners, apply a patch of blue MOPAR® Lock & Seal medium strength thread locker to the propeller shaft coupler-to-axle flange fasteners. New fasteners have a thread lock patch, and do not require application of blue MOPAR® Lock & Seal medium strength thread locker.

14. Install the propeller shaft coupler-to-axle flange fasteners. Tighten the propeller shaft coupler-to-axle flange fasteners (2) to 122 N.m (89 ft. lbs.).

Fig. 52: Drain And Fill Plug
Courtesy of CHRYSLER LLC

15. Remove fill plug (2) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-90. Reinstall fill plug and torque to 35 N.m (25 ft. lbs.) torque.

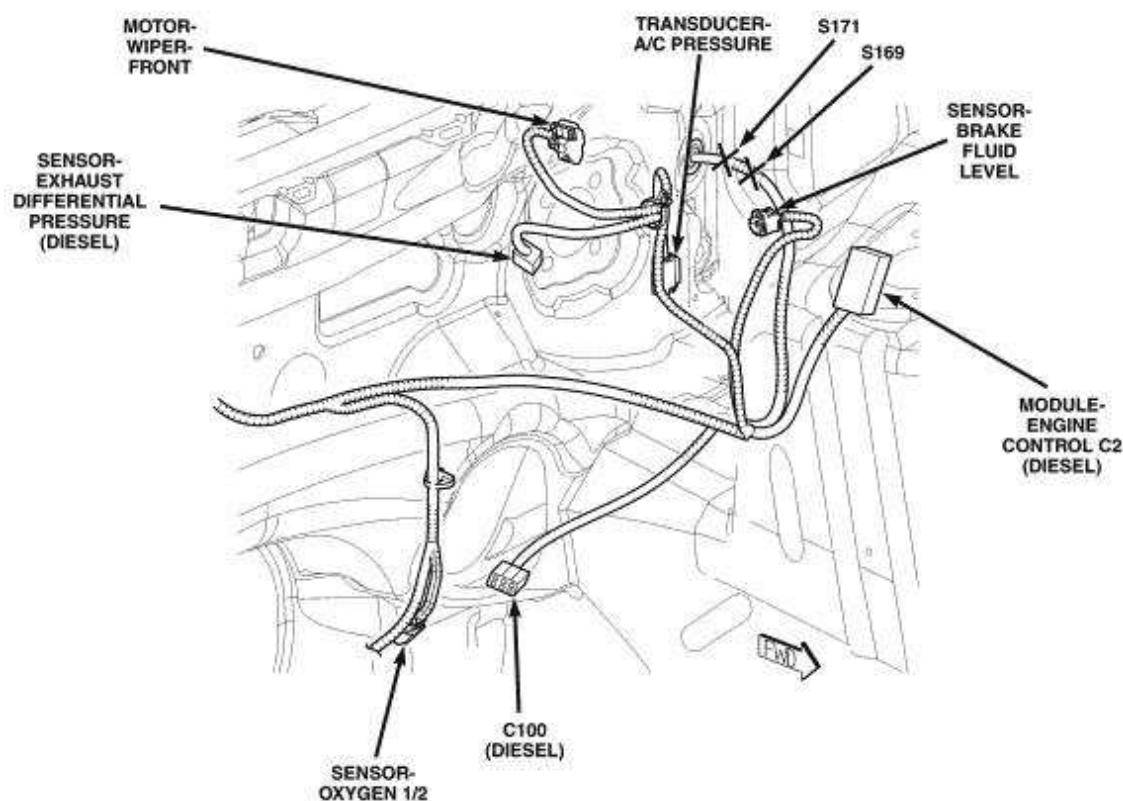

Fig. 53: Hub Nut
Courtesy of CHRYSLER LLC

16. Lower vehicle. Torque halfshaft hub nut (1) to 213 N.m (157 ft. lbs.). Install wheel center cap.
17. Install wheel(s). Refer to **Tires and Wheels - Installation**

PROPELLER SHAFT

DESCRIPTION

DESCRIPTION

WARNING: Due to propeller shaft imbalance concerns, rear propeller shaft service is limited to center support bearing and coupler replacement only. The rear segment single-cardan universal joint is not serviceable.

Rear wheel drive utilizes a "two-piece" rear propeller shaft design to transmit torque to the rear axle assembly. This two-piece design consists of:

- Rear shaft segments
- Center support bearing/bracket assembly
- Single-cardan u-joint at rear segment/bearing interface

- Rubber couplers at transmission and rear axle flanges

REMOVAL

AUTOMATIC TRANSMISSION - NON-SRT

CAUTION: Propeller shaft removal is a two-man operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

1. With vehicle in neutral, position on hoist.

Fig. 56: Applying Alignment Index Marks To Transmission & Axle Flanges
Courtesy of CHRYSLER LLC

2. Apply alignment index marks (3) on the transmission and axle flanges (2) and rubber couplers (1).

Fig. 57: Heat Shield
 Courtesy of CHRYSLER LLC

3. Remove rear exhaust system. Refer to **Exhaust System/MUFFLER, Exhaust - Removal** .
4. Remove heat shield retainers (2) and remove the heat shield (1).

Fig. 58: Propeller Shaft At Transmission
 Courtesy of CHRYSLER LLC

5. Remove propeller shaft front coupler-to-flange bolts.

Fig. 59: Propeller Shaft Rear Coupler & Rear Axle Flange

COUPLER/DAMPER SERVICE

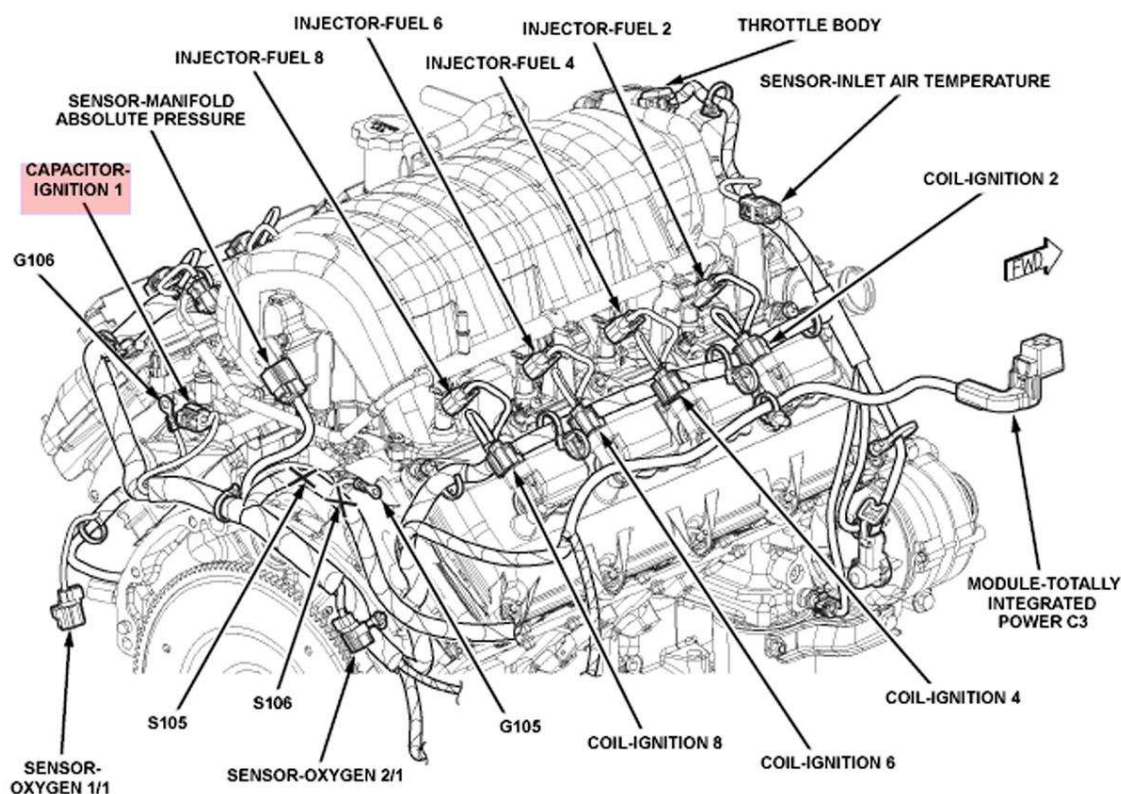

Fig. 72: Remove/Install Damper
Courtesy of CHRYSLER LLC

1. Remove three coupler-to-propeller shaft bolt/nuts. Note orientation and direction of components during disassembly. To avoid driveline vibration or damage, it is critical that all components are reinstalled in their original orientations
2. Separate coupler (1) and damper (3) (if equipped) from propeller shaft. Note orientation and direction of components during disassembly. To avoid driveline vibration or damage, it is critical that all components are reinstalled in their original orientations.

INSTALLATION

AUTOMATIC TRANSMISSION - NON-SRT

CAUTION: Propeller shaft installation is a two-man operation. Never allow propeller shaft to hang from the center bearing, or while only connected to the transmission or rear axle flanges. A helper is required. If a propeller shaft section is hung unsupported, damage may occur to the shaft, coupler, and/or center bearing from over-angulation. This may result in driveline vibrations and/or component failure.

COUPLER/DAMPER SERVICE

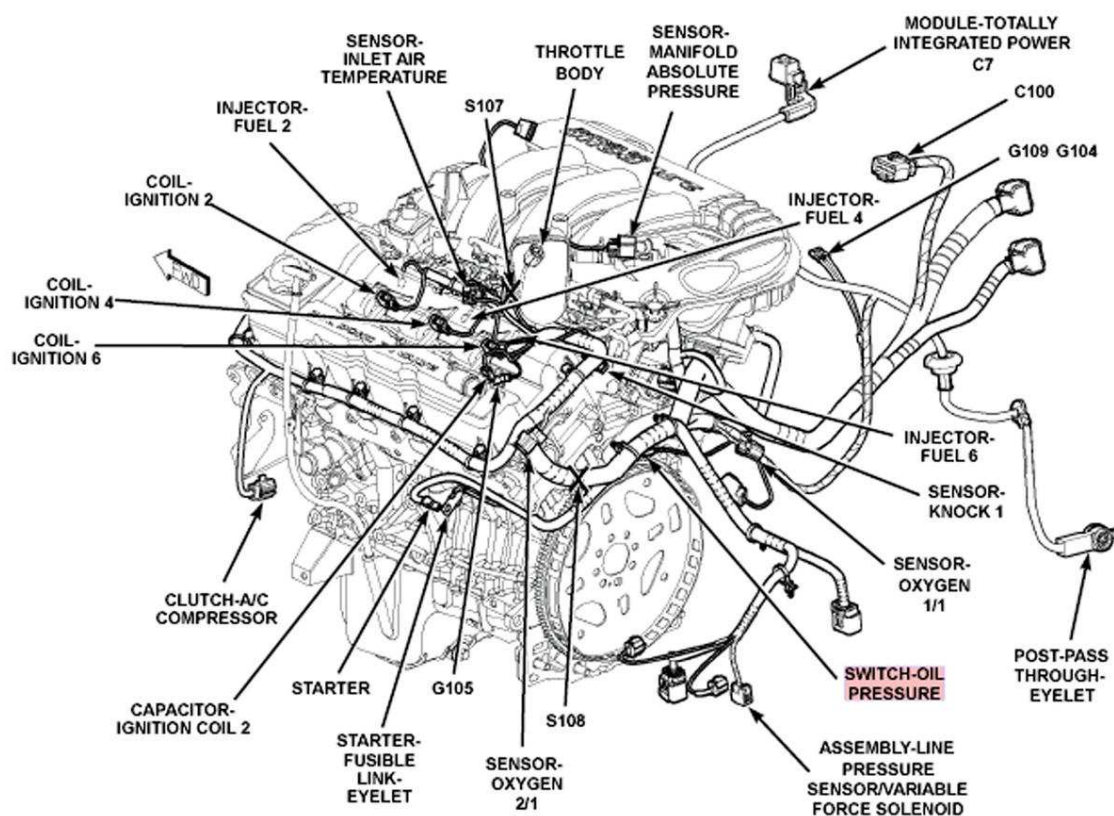

Fig. 73: Remove/Install Damper
Courtesy of CHRYSLER LLC

1. Install the coupler (1) and the damper (3) if equipped. Install three bolts with washers and nuts and torque to 68 N.m (50 ft. lbs.) torque.

Fig. 74: Propeller Shaft Rear Coupler & Rear Axle Flange
Courtesy of CHRYSLER LLC

2. Obtain a helper and install propeller shaft into position at axle. Align index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolt/nuts by hand. Do not torque at this time.

Fig. 75: Propeller Shaft At Transmission

2 - SHIM, PINION DEPTH	7 - RING, SNAP
3 - BEARING, PINION HEAD	8 - COVER, AXLE
4 - GEAR/SHAFT, PINION	9 - GEAR, RING
5 - BEARING, DIFFERENTIAL SIDE	

The 198 MM RII (Rear-Independent-Iron) axle is an independent assembly with a cast iron housing and differential. The 198 MM RII uses an open differential which is supported by two tapered roller bearings located on either side of the case. Differential bearing preload and ring gear backlash are controlled with select snap-rings located on the outside of the differential bearing cups. Pinion height is set with a select shim located under the rear pinion bearing cup.

The 198 axle is available only in all-wheel-drive (AWD) models, and in V-6 engine-equipped rear-wheel-drive (RWD) models, and is available in three gear ratios: 3.07 3.64 AND 3.90:1.

AXLE IDENTIFICATION

657996

Fig. 110: 198 Axle Identification Label
Courtesy of CHRYSLER LLC

The 198 MM axle utilizes a barcoded label (1) which is adhered to the top of the axle housing as shown on illustration. The following information is found on the identification label:

- Traceability Code (Plant Use)
- Axle Part Number
- Axle Gear Ratio

DIAGNOSIS AND TESTING

AXLE

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Axle mounts damaged, worn, or bottoming out.
- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or CV joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rearend vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- Cradle-to-body isolator worn or damaged.
- Worn or damaged rubber washer between axle hub nut and axle hub.
- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.

- Worn U-joints or CV joints.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose. 2. Faulty, brinelled wheel bearing.	1. Tighten loose nuts. 2. Replace bearing.
DIFFERENTIAL CRACKED	1. Improper differential side bearing preload. 2. Excessive ring gear backlash. 3. Vehicle overloaded.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
DIFFERENTIAL GEARS SCORED	1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire.	1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the proper fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
LOSS OF LUBRICANT	1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked axle housing. 4. Worn pinion seal. 5. Worn/scored pinion flange journal.	1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace pinion flange and seal.

	6. Axle cover not properly sealed.	6. Remove, clean, and re-seal cover.
AXLE OVERHEATING	1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing preload too high. 4. Insufficient ring gear backlash.	1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Readjust bearing pre-load. 4. Re-adjust ring gear backlash.
GEAR TEETH BROKE	1. Overloading. 2. Ice-spotted pavement. 3. Improper adjustments.	1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine remaining parts for damage. 3. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
AXLE NOISE	1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 7. Misaligned or sprung ring gear. 8. Housing not machined properly.	1. Fill axle with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing preload. 7. Measure ring gear run-out. Replace components as necessary. 8. Replace housing.

STANDARD PROCEDURE

FLUID DRAIN AND FILL

NOTE: **Note: The fluid required for use in this axle is Mopar® Synthetic Gear and Axle Lubricant 75W-140.**

658013

Fig. 111: Rear Axle Drain Plug
Courtesy of CHRYSLER LLC

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.
2. With vehicle in neutral, position and raise vehicle on hoist.
3. Remove rear axle drain plug and drain lubricant completely from the axle.
4. Install drain plug and tighten to 60 N.m (44 ft lbs).

160972

Fig. 112: Rear Axle Fill Plug
Courtesy of CHRYSLER LLC

5. Remove fill plug (1) and fill rear axle with 1.4 L (1.5 qts.) Mopar® Synthetic Gear AND Axle Lubricant 75W-140 and insure axle is filled to the bottom of the fill hole.
6. Install fill plug and tighten to 60 N.m (44 ft lbs).

REMOVAL

REMOVAL

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

212601

Fig. 113: Rear Axle Drain Plug
Courtesy of CHRYSLER LLC

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to 60 N.m (44 ft. lbs.) torque.

Fig. 114: Exhaust System
 Courtesy of CHRYSLER LLC

4. Remove rear exhaust system (2) on dual-outlet exhaust models, otherwise, lower exhaust system at rear hanger(s) to provide adequate clearance.

Fig. 115: Alignment Marks - Axle End Shown
 Courtesy of CHRYSLER LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

8133b050

Fig. 116: Propeller Shaft At Rear Axle

Courtesy of CHRYSLER LLC

12. Lower axle just enough to remove both halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.
13. Remove axle assembly from vehicle and transfer to bench.

INSTALLATION

INSTALLATION

Fig. 123: Axle Seal Installation
Courtesy of CHRYSLER LLC

1. Install new axle seal(s) (1) using Installer 9223 (2) if a new seal is required.

Fig. 124: Remove/Install Halfshaft
Courtesy of CHRYSLER LLC

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

2. Using new circlip(s), install halfshaft (1) to rear axle assembly. Use care not to damage axle seals (2). Verify proper installation by pulling outward on joint by hand.

2679761

Fig. 125: Alignment Marks - Axle End Shown
 Courtesy of CHRYSLER LLC

3. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

2679787

Fig. 126: Rear Axle To Crossmember Bolts
 Courtesy of CHRYSLER LLC

4. Install two rear axle-to-crossmember bolts (1) and torque to 220 N.m (162 ft. lbs.).

Fig. 127: Rear Axle Front Isolator
Courtesy of CHRYSLER LLC

5. Install rear axle front mount isolator (1) as shown on illustration and torque bolt/nut to 65 N.m (48 ft. lbs.).

Fig. 128: Transmission Jack At Rear Axle
Courtesy of CHRYSLER LLC

6. Again verify halfshaft inner joints are fully engaged to axle assembly.
7. Remove transmission jack (1).
8. If used, remove screw-type under-hoist jack stands (2).

8136b668

Fig. 129: Propeller Shaft At Rear Axle
Courtesy of CHRYSLER LLC

9. Torque propeller shaft coupler-to-axle flange bolt/nuts to 58 N.m (43 ft. lbs.).

2679295

Fig. 130: Rear Axle Fill Plug
Courtesy of CHRYSLER LLC

10. Using a 14mm hex, remove rear axle fill plug (1). Fill axle with 1.4L (1.5 qts.) of Mopar® 75W-140 Synthetic Gear AND Axle Lubricant. Install fill plug and torque to 60 N.m (44 ft. lbs.).

ADJUSTMENTS

PINION DEPTH

PINION DEPTH VARIANCE

2679269

Fig. 131: Identifying Numbers On Pinion Gear
 Courtesy of CHRYSLER LLC

Ring gear and pinion are supplied as matched sets. Identifying numbers for the ring gear and pinion are painted onto the pinion gear shaft and the side of the ring gear. A plus (+) number, minus (-) number or zero (0) along with the gear set sequence number (01 to 99) is on each gear. The pinion depth variance (1) is the amount the depth varies from the standard depth setting of a pinion marked with a (0). The remaining numbers (2) are the sequence number of the gear set. The standard depth provides the best gear tooth contact pattern.

2679338

Fig. 132: Identifying Pinion Shaft, Bearings & Select Shims
 Courtesy of CHRYSLER LLC

Compensation for pinion depth variance is achieved with select shims (3). The shims are sandwiched between the pinion head bearing cup (4) and axle housing.

If installing a new gear, note the depth variance number of the original and replacement pinion. Add or subtract this number from the original depth shim to compensate for the difference in the depth variances. The numbers represent deviation from the standard in thousandths of an inch. If the number is negative, add that value to the required thickness of the depth shims. If the number is positive, subtract that value from the thickness of the depth shim.

PINION GEAR DEPTH VARIANCE

Original Pinion Gear Depth Variance	Replacement Pinion Gear Depth Variance								
	-4	-3	-2	-1	0	+1	+2	+3	+4
+4	+0.008	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0
+3	+0.007	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	-0.001
+2	+0.006	+0.005	+0.004	+0.003	+0.002	+0.001	0	-0.001	-0.002
+1	+0.005	+0.004	+0.003	+0.002	+0.001	0	-0.001	-0.002	-0.003

PINION DEPTH MEASUREMENT

Pinion depth measurement is taken with the pinion head and tail bearing cups pressed into the axle housing without the shim.

Fig. 133: Pinion Head Bearing Cup Installation
Courtesy of CHRYSLER LLC

1. Press pinion head bearing cup into housing using Handle C-4171 (1) and Installer C-4310 (2).

Fig. 134: Pinion Tail Bearing Cup Installation
Courtesy of CHRYSLER LLC

2. Press pinion tail bearing cup into housing using Handle C-4171 (1) and Installer D-146 (2).

Fig. 135: L-Block, Gage Block And Bearing
Courtesy of CHRYSLER LLC

3. Assemble Pinion Height Block 6739 (3), Pinion Head Bearing Cone (1), Screw 6741 (all these can be found in a Pinion Gauge Set such as 6774), and Pinion Height Gage Block 9227 (2). Install assembly into axle housing and through bearing cups.

Fig. 136: Pinion Depth Gauge Tools - Typical
Courtesy of CHRYSLER LLC

4. Install pinion tail bearing and Cone 6740 (4). Tighten Cone 6740 by hand until 3.4 N.m (30 in. lbs.) of rotating torque is measured at Screw 6741 (5).

Fig. 137: Remove/Install Arbor Discs
Courtesy of CHRYSLER LLC

5. Install Arbor Discs 9228 (1).

2679269

Fig. 138: Remove/Install Arbor Bar
Courtesy of CHRYSLER LLC

6. Install Arbor Bar D-115-3 (1) from a Pinion Gauge Set such as 6774.

2679295

Fig. 139: Pinion Gage Setup
Courtesy of CHRYSLER LLC

7. Verify pinion depth setup is as shown on illustration.

Fig. 140: Indicator/Scooter Block Setup
Courtesy of CHRYSLER LLC

8. Install Dial Indicator 9524 (1) to Scooter Block D-115-2A (2) (from a Pinion Gauge Set such as 6774). Secure with set-screw (3).

Fig. 141: Zero Dial Indicator On L-Block
Courtesy of CHRYSLER LLC

9. Install Indicator/Block assembly to top of Pinion Height Block 6739 (1). Zero indicator on top surface.

657996

Fig. 142: Measure and Record Required Shim
Courtesy of CHRYSLER LLC

10. Slide indicator probe off of height block and onto Arbor Bar D-115-3 (2). As indicator contacts Arbor Bar (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of the arbor bar and record the highest reading.

81330050

Fig. 143: Pinion Variance And Sequence Numbers
Courtesy of CHRYSLER LLC

11. Select a shim equal to the dial indicator reading plus the drive pinion gear depth variance number (1) written on the side of the pinion shaft. For example, if the depth variance is -1, add 0.025 mm (0.001 in.) to dial indicator reading.

SIDE BEARING PRELOAD AND RING GEAR BACKLASH

DIFFERENTIAL SIDE BEARING PRELOAD MEASUREMENT/CORRECTION

NOTE: Differential side bearing preload should be measured and adjusted after the following scenarios:

- Differential case replacement
- Differential side bearing replacement
- Axle housing replacement
- Loss or replacement of side bearing snap rings

If none of these situations apply, see Ring Gear Backlash Measurement/Correction.

Fig. 144: Spreader Adapters 9226
Courtesy of CHRYSLER LLC

1. Install Spreader Adapter Plates 9226 (1) as shown on illustration

8B5442

Fig. 145: Spreader W-129-B Installed
Courtesy of CHRYSLER LLC

2. Mount axle housing to Spreader W-129-B (1).

80c4f3f1

Fig. 146: Measuring Carrier Spread
Courtesy of CHRYSLER LLC

3. Set up Dial Indicator Set C-3339A as shown on illustration to measure axle housing spread:
 - a. Clamp SP-5426 (1)
 - b. Post SP-5425-B (2)
 - c. Metric Dial Indicator 9524 (3)

80bf334d

Fig. 147: Expanding/Contracting W-129-B Spreader

Courtesy of CHRYSLER LLC

4. If differential side bearing cups and snap rings are removed at this point, skip to Step 8. Otherwise, expand spreader to spread axle housing no more than 0.30 mm (0.012 in.).

Fig. 148: Snap Ring Removal/Installation
Courtesy of CHRYSLER LLC

5. Remove both differential side bearing snap rings (1). Tag snap ring to ensure replacement to original position.

Fig. 149: Measuring Side Bearing Snap Ring
Courtesy of CHRYSLER LLC

6. Measure and record snap ring (2) thickness for later use.

Fig. 150: Expanding/Contracting W-129-B Spreader
 Courtesy of CHRYSLER LLC

7. Relax spreader (1) to relieve tension on axle housing.

Fig. 151: Snap Ring Removal/Installation
 Courtesy of CHRYSLER LLC

8. Install right (pinion) side bearing cup and snap ring (1).

142392

Fig. 152: Expanding/Contracting W-129-B Spreader
Courtesy of CHRYSLER LLC

9. Zero dial indicator.
10. Expand spreader (1) to spread axle housing no more than 0.30 mm (0.012 in.).

694898

Fig. 153: Snap Ring Removal/Installation
Courtesy of CHRYSLER LLC

11. Install left (ring gear) side bearing cup and snap ring (1).

Fig. 154: Expanding/Contracting W-129-B Spreader
Courtesy of CHRYSLER LLC

12. Relax spreader (1) to relieve tension on axle housing.

Fig. 155: Measuring Carrier Spread
Courtesy of CHRYSLER LLC

13. Measurement showing on indicator is the axle housing retained spread. Proper differential side bearing preload is achieved with an axle housing retained spread of 0.18-0.23 mm (0.007-0.009 in.).
14. If retained spread is less than 0.18 mm (0.007 in.), increase snap ring thickness at each side in equal increments.

15. If retained spread is greater than 0.23 mm (0.009 in.), decrease snap ring thickness at each side in equal increments.

RING GEAR BACKLASH MEASUREMENT/CORRECTION

NOTE: Differential Ring Gear Backlash should be measured and adjusted after the following scenarios:

- Differential side bearing replacement
- Pinion head bearing replacement
- Pinion depth (shim) adjustment
- Differential case replacement
- Axle housing replacement

NOTE: If Spreader W-129-B is installed, make sure tension on axle housing is relieved.

Fig. 156: Measuring Ring Gear Backlash
Courtesy of CHRYSLER LLC

1. Set up Dial Indicator Set C-3339A as shown on illustration to measure ring gear backlash:
 - a. Clamp SP-5426 (1)
 - b. Post SP-5425-B (2)
 - c. Metric Dial Indicator 9524 (3)
2. Rotate ring gear one direction to take up clearance to pinion. Verify indicator tip is in contact with ring gear and zero indicator. Rotate ring gear back and forth and record measurement. Ring gear backlash should be 0.13-0.18 mm (0.005-0.007 in.). Verify back lash measurement in four positions.

Fig. 157: Backlash Shim Correction
Courtesy of CHRYSLER LLC

3. If backlash measurement is less than 0.13 mm (0.005 in.), it is necessary to decrease the snap ring thickness on the ring gear (left) side, and increase the thickness on the pinion (right) side.
4. If backlash measurement is greater than 0.18 mm (0.007 in.), it is necessary to increase the snap ring thickness on the ring gear (right) side, and decrease the thickness on the pinion (left) side.

GEAR CONTACT PATTERN

Fig. 158: Gear Tooth Contact Patterns
Courtesy of CHRYSLER LLC

The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted

within specifications to achieve desired tooth contact patterns.

1. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
2. Wrap, twist, and hold a shop towel around the pinion yoke to increase the turning resistance of the pinion. This will provide a more distinct contact pattern.
3. With a boxed end wrench on a ring gear bolt, rotate the differential case one complete revolution in both directions while a load is being applied from shop towel.
4. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary. The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will squeegee the compound to the areas with the least amount of contact.

SPECIFICATIONS

SPECIFICATIONS

SPECIFICATIONS

DESCRIPTION	SPECIFICATION
Axle Ratios	3.07, 3.64, 3.90
Ring Gear Diameter	198 mm (7.8 in.)
Ring Gear Backlash	0.13-0.18 mm (0.005-0.007 in.)
Side Bearing Preload	6000-8000 N
Axle Housing Retained Spread	0.18 mm to 0.23 mm (0.007 in. to 0.009 in.)
Select Snap Ring Size	3.60-4.68 mm (0.14-0.18 in.) In 0.02mm (0.0007 in.) increments
Select Pinion Shim Size	1.40-2.50mm (0.05-0.10 in.) In 0.01mm (0.0004 in.) increments
Pinion Torque To Rotate	2.25N.m (20 in. lbs.)

Fig. 205: Bearing Removal
Courtesy of CHRYSLER LLC

3. Remove bearings (2) from the differential case (3) with Puller/Press C-293-PA (5), Adapters C-293-37 (1) and Puller Extension SP-3289 (4).

Fig. 206: Differential Mounted On Tool 9630
Courtesy of CHRYSLER LLC

4. Install the differential to Mounting Plate 9630 (2) to the differential (1) and then install the assembly into a bench vise.

Fig. 207: Roll Pin Removal
Courtesy of CHRYSLER LLC

5. Drive out pinion shaft-to-case roll pin using hammer and suitable punch.

Fig. 208: Removing Pinion Shaft
 Courtesy of CHRYSLER LLC

6. Using brass drift (2), drive out pinion shaft (1).

Fig. 209: Installing Fixture 9631 Into Differential Side Gear
 Courtesy of CHRYSLER LLC

7. Install Fixture 9631 (1) into differential side gear.

Fig. 210: Rotate Differential Gears With 9631
Courtesy of CHRYSLER LLC

8. Rotate Fixture 9631 (1) to gain access to and remove pinion gears and thrust washers.

Fig. 211: Side Gears & Thrust Washers
Courtesy of CHRYSLER LLC

9. Remove differential side gears (4) and thrust washers (5).

Assembly

ASSEMBLY

Fig. 212: Installing Side Gears With 9631
Courtesy of CHRYSLER LLC

1. Lubricate all differential components with hypoid gear lubricant.
2. Install differential side gears (2) and thrust washers to Fixtures 9631 (1) as shown in illustration.

Fig. 213: Remove/Install Pinion Gear And Washer
Courtesy of CHRYSLER LLC

3. Install differential pinion gears (1) and thrust washers into position across from each other.

Fig. 214: Rotate Differential Gears With 9631
Courtesy of CHRYSLER LLC

4. Rotate pinion gears into place using Fixture 9631 and line up gear centers with pinion shaft bore.

Fig. 215: Roll Pin Installation
Courtesy of CHRYSLER LLC

5. Using a brass hammer, drive pinion shaft (3) into differential case (1), making sure to line up roll pin bores.
6. Using suitable punch (2), drive new roll pin into position.

Fig. 216: Measure Rotating Torque
Courtesy of CHRYSLER LLC

7. Measure differential gear rotating torque as shown on illustration. Differential gear rotating torque should be 5-30 N.m (44-266 in. lbs.) Rotating torque is adjusted using select side gear thrust washers. Refer to the following chart.

Available Side Gear Thrust Washer Thicknesses	
1.25 mm (0.049 in.)	
1.30 mm (0.051 in.)	
1.35 mm (0.053 in.)	
1.40 mm (0.055 in.)	
1.45 mm (0.057 in.)	
1.50 mm (0.059 in.)	
1.55 mm (0.061 in.)	
1.60 mm (0.063 in.)	
1.65 mm (0.065 in.)	

Fig. 217: Differential Mounted On Tool 9630

1. Install selected pinion depth shim (1) into housing.

Fig. 246: Pinion Head Bearing Cup Installation
 Courtesy of CHRYSLER LLC

2. Press pinion head bearing cup into housing using Handle C-4171 (1) and Installer C-4310 (2).

Fig. 247: Pinion Tail Bearing Cup Installation
 Courtesy of CHRYSLER LLC

3. Press pinion tail bearing cup into housing using Handle C-4171 (1) and Installer D-146 (2).

Fig. 248: Pinion Head Bearing Installation
 Courtesy of CHRYSLER LLC

4. Press **new** pinion head bearing (2) onto pinion shaft using Installer C-3095-A (1).

Fig. 249: Collapsible Spacer And Washers
 Courtesy of CHRYSLER LLC

5. Install washers (2) and **new** collapsible spacer (1) to pinion shaft.

Fig. 250: Supporting Pinion Head And Carrier
 Courtesy of CHRYSLER LLC

6. Install pinion shaft (1) into housing and support on press table atop Installer 8255 (2). **Ensure pinion gear face is centered atop Installer 8255.**

Fig. 251: Pinion Tail Bearing Installation
 Courtesy of CHRYSLER LLC

7. Using Installer C-3095-A (1), press on **new** pinion tail bearing (2).

Fig. 252: Pinion Seal Installation
 Courtesy of CHRYSLER LLC

8. Install new pinion seal into position.
9. Press pinion seal into housing using Installer 9231A (1).

Fig. 253: Pinion Flange Installation
 Courtesy of CHRYSLER LLC

10. Lightly lubricate pinion flange seal with axle lubricant for flange installation.
11. Align index marks and press pinion flange (2) on using Installer C-3095-A (1).

Fig. 254: Torquing Pinion Flange Nut
Courtesy of CHRYSLER LLC

12. Install new pinion flange nut by hand.
13. Hold pinion flange with Flange Wrench C-3281 (1). Using a deep 41 mm socket, tighten pinion flange nut to an initial torque of 203 N.m (150 ft. lbs.).

Fig. 255: Measuring Turning Torque
Courtesy of CHRYSLER LLC

14. Rotate pinion flange to ensure bearing is properly seated.
15. Measure pinion rotating torque using suitable torque wrench (1). **Pinion rotating torque should be 215-245 N. cm (19-22 in. lbs.).**

16. If pinion rotating torque exceeds the specified range, the pinion shaft must be removed and the crush sleeve replaced.

Fig. 256: Torquing Pinion Flange Nut
Courtesy of CHRYSLER LLC

17. If pinion rotating torque is below the specified range, increase nut torque by 7 N.m (5 ft. lbs.) increments and recheck turning torque until rotating torque is within range.

Fig. 257: Staking Pinion Flange Nut
Courtesy of CHRYSLER LLC

18. Stake pinion flange nut (1) using hammer and suitable punch.

Fig. 258: Ring Gear Bolts
 Courtesy of CHRYSLER LLC

19. Install ring gear to differential case. Loosely install **new** ring-gear-to-differential case bolts.
20. Torque all ring gear-to-case bolts to 85 N.m (64 ft. lbs.)

Fig. 259: Removing/Installing Differential
 Courtesy of CHRYSLER LLC

21. Install differential and reassemble axle assembly. See **Differential and Driveline/Rear Axle - 198MM/CASE ASSEMBLY, Differential - Installation**

SEAL, AXLE DRIVE SHAFT

Removal

REMOVAL

Fig. 260: Removing Left Side Seal
Courtesy of CHRYSLER LLC

1. Remove halfshaft(s). See **Differential and Driveline/Half Shaft - Removal**
2. Using suitable screwdriver (1), remove axle shaft seal (2).
3. Visually inspect halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace halfshaft if necessary.

Installation

INSTALLATION

81330050

Fig. 261: Axle Seal Installation
 Courtesy of CHRYSLER LLC

1. Using Installer 9223 (2), install **NEW** axle shaft seal (1). Lubricate the inside diameter with Mopar® Gear and Axle Lubricant 75W-140 to protect seal during halfshaft installation.
2. Install halfshaft(s). See **Differential and Driveline/Half Shaft - Installation**

283667

Fig. 262: Rear Axle Fill Plug
 Courtesy of CHRYSLER LLC

3. Remove fill plug (1) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-140. Reinstall fill plug torque to 60 N.m (44 ft. lbs.) torque.

SEAL, DRIVE PINION

Removal

REMOVAL

Fig. 263: Measuring Turning Torque

- 8. Stake pinion flange nut (1) as shown on illustration.
- 9. Install rear axle assembly. See Differential and Driveline/Rear Axle - 198MM - Installation.

REAR AXLE - 215RII

DESCRIPTION

DESCRIPTION

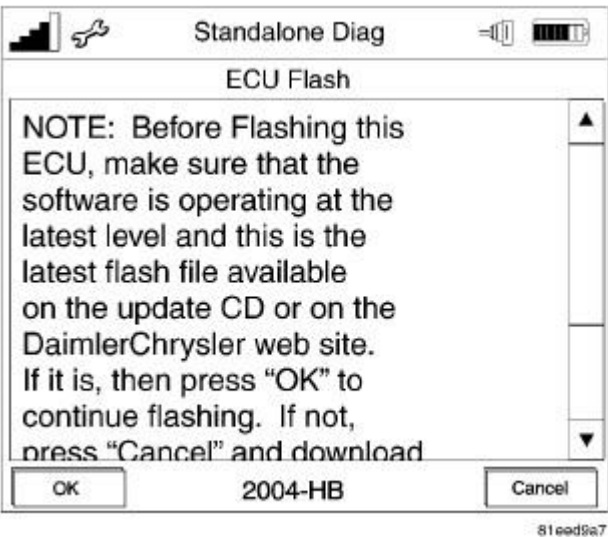

Fig. 273: Rear Axle Sectional View - 215 MM RII
Courtesy of CHRYSLER LLC

1 - BEARING, PINION TAIL	6 - DIFFERENTIAL
2 - SHIM, PINION DEPTH	7 - RING, SNAP
3 - BEARING, PINION HEAD	8 - COVER, AXLE
4 - GEAR/SHAFT, PINION	9 - GEAR, RING
5 - BEARING, DIFFERENTIAL SIDE	

The 215 MM RII (Rear-Independent-Iron) axle is an independent assembly with a cast iron housing and differential. The 215 MM RII uses an open differential which is supported by two tapered roller bearings located on either side of the case. Differential bearing preload and ring gear backlash are controlled with select snap-rings located on the outside of the differential bearing cups. Pinion height is set with a select shim located under the rear pinion bearing cup.

AXLE IDENTIFICATION

The 215 MM axle utilizes a barcoded label which is adhered to the top of the axle housing as shown on illustration. The following information is found on the identification label:

- Traceability Code (Plant Use)
- Axle Part Number
- Axle Gear Ratio

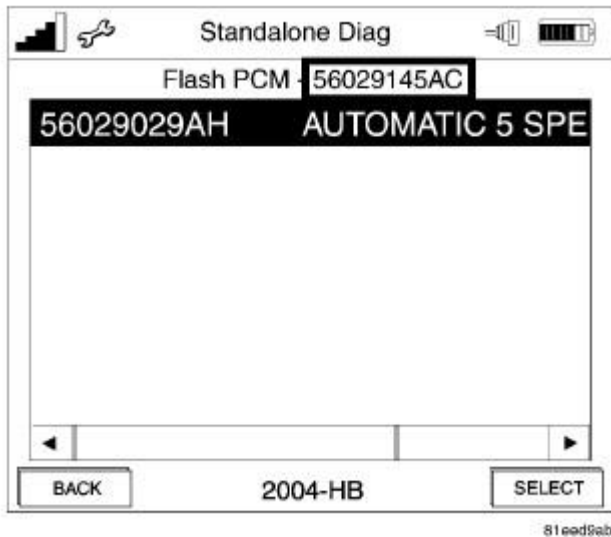

Fig. 274: Identification Tag - 215 MM Axle
 Courtesy of CHRYSLER LLC

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Axle mounts damaged, worn, or bottoming out.
- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints or CV joints.
- Loose/broken springs.
- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rearend vibration. Do not overlook engine

accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- Cradle-to-body isolator worn or damaged.
- Worn or damaged rubber washer between axle hub nut and axle hub.
- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints or CV joints.
- Worn rubber coupler between the propeller shaft and the pinion yoke.
- Washers missing from the fasteners that attach the rubber coupler to the pinion yoke.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose. 2. Faulty, brinelled wheel bearing.	1. Tighten loose nuts. 2. Replace bearing.
DIFFERENTIAL CRACKED	1. Improper differential side bearing preload. 2. Excessive ring gear backlash. 3. Vehicle overloaded.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
DIFFERENTIAL GEARS SCORED	1. Insufficient lubrication.	1. Replace scored gears. Fill differential with the correct fluid

	<ul style="list-style-type: none"> 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire. 	<ul style="list-style-type: none"> type and quantity. 2. Replace scored gears. Fill differential with the proper fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
LOSS OF LUBRICANT	<ul style="list-style-type: none"> 1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked axle housing. 4. Worn pinion seal. 5. Worn/scored pinion flange journal. 6. Axle cover not properly sealed. 	<ul style="list-style-type: none"> 1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace pinion flange and seal. 6. Remove, clean, and re-seal cover.
AXLE OVERHEATING	<ul style="list-style-type: none"> 1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing preload too high. 4. Insufficient ring gear backlash. 	<ul style="list-style-type: none"> 1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Readjust bearing pre-load. 4. Re-adjust ring gear backlash.
GEAR TEETH BROKE	<ul style="list-style-type: none"> 1. Overloading. 2. Ice-spotted pavement. 3. Improper adjustments. 	<ul style="list-style-type: none"> 1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine remaining parts for damage. 3. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
AXLE NOISE	<ul style="list-style-type: none"> 1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment. 3. Unmatched ring gear and pinion. 4. Worn teeth on ring gear and/or pinion. 5. Loose pinion bearings. 6. Loose differential bearings. 	<ul style="list-style-type: none"> 1. Fill axle with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth. 3. Replace gears with a matched ring gear and pinion. 4. Replace ring gear and pinion. 5. Adjust pinion bearing pre-load. 6. Adjust differential bearing

	7. Misaligned or sprung ring gear. 8. Housing not machined properly.	preload. 7. Measure ring gear run-out. Replace components as necessary. 8. Replace housing.
--	---	---

STANDARD PROCEDURE

FLUID DRAIN AND FILL

NOTE: **The fluid required for use in this axle is Mopar® Synthetic Gear and Axle Lubricant 75W-140.**

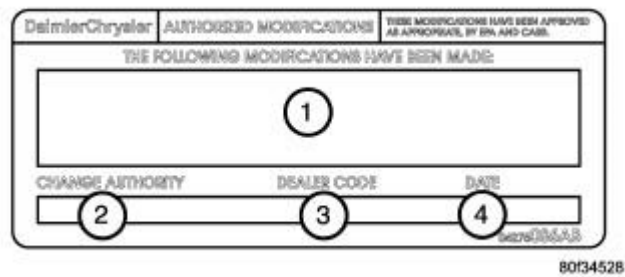

Fig. 275: Rear Axle Drain Plug
Courtesy of CHRYSLER LLC

1. Drive the vehicle until the differential lubricant is at the normal operating temperature.
2. With vehicle in neutral, position and raise vehicle on hoist.
3. Remove rear axle drain plug (1) and drain lubricant completely from the axle.
4. Install drain plug and tighten to 50 N.m (37 ft lbs).

Fig. 276: Rear Axle Fill Plug
Courtesy of CHRYSLER LLC

5. Remove fill plug (1) and fill rear axle with 1.2 L (1.3 qts.) Mopar® Synthetic Gear AND Axle Lubricant 75W-140 and insure axle is filled to the bottom of the fill hole.
6. Install fill plug and tighten to 50 N.m (37 ft lbs).

REMOVAL

REMOVAL

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

Fig. 277: Rear Axle Drain Plug
 Courtesy of CHRYSLER LLC

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Using 14mm hex, remove axle drain plug (1) and drain rear axle fluid into container suitable for fluid reuse.
3. Install drain plug (1) and torque to 50 N.m (37 ft. lbs.) torque.
4. Remove the exhaust system. Refer to **Exhaust System/MUFFLER, Exhaust - Removal** .

Fig. 278: Alignment Marks - Axle End Shown
 Courtesy of CHRYSLER LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

Fig. 279: Propeller Shaft At Rear Axle
 Courtesy of CHRYSLER LLC

6. Remove three propeller shaft coupler(1)-to-axle flange (2) bolt/nuts.

Fig. 280: Halfshaft Removal (V6 Models)
 Courtesy of CHRYSLER LLC

NOTE: Do not damage the side seal, halfshaft slinger, and halfshaft boot.

7. Using suitable screwdriver (1), partially disengage halfshaft(s) (2) from axle assembly.

Fig. 281: Transmission Jack At Rear Axle
Courtesy of CHRYSLER LLC

8. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

Fig. 282: Rear Axle Front Isolator
Courtesy of CHRYSLER LLC

9. Remove rear axle forward mount isolator (1) bolt/nut (2).

Fig. 283: Rear Axle To Crossmember Bolts
Courtesy of CHRYSLER LLC

10. Remove two rear axle-to-crossmember bolts (1).

Fig. 284: Propeller Shaft Supported
Courtesy of CHRYSLER LLC

11. Carefully lower rear axle. While lowering axle, separate propeller shaft from axle and support with suitable rope or wire (1).

Fig. 285: Remove/Install Halfshaft
Courtesy of CHRYSLER LLC

12. Lower axle just enough to remove both halfshafts one at a time. Shift axle assembly in one direction, compressing one halfshaft while removing the other (1). Use caution to protect axle seal and journal.
13. Remove axle assembly from vehicle and transfer to bench.

INSTALLATION

INSTALLATION

Fig. 286: Axle Seal Installation
Courtesy of CHRYSLER LLC

1. Install new axle seal(s) (1) using Installer 9755 (2).

Fig. 287: Remove/Install Halfshaft
Courtesy of CHRYSLER LLC

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

2. Using new circlip(s), install halfshaft (1) to rear axle assembly. Use care not to damage axle

seals (2). Verify proper installation by pulling outward on joint by hand.

Fig. 288: Alignment Marks - Axle End Shown
Courtesy of CHRYSLER LLC

NOTE: Washers must be installed between the head of the propeller shaft coupler-to-axle bolt and the rubber coupler to prevent damage and imbalance.

3. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axle bolt/nuts by hand.

Fig. 289: Rear Axle To Crossmember Bolts
Courtesy of CHRYSLER LLC

4. Install two rear axle-to-crossmember bolts (1) and torque to 220 N.m (162 ft. lbs.).

Fig. 290: Rear Axle Front Isolator
Courtesy of CHRYSLER LLC

5. Install rear axle front mount isolator (1) as shown on illustration and torque bolt/nut to 65 N.m (48 ft. lbs.).

Fig. 291: Transmission Jack At Rear Axle
Courtesy of CHRYSLER LLC

6. Again verify halfshaft inner joints are fully engaged to axle assembly.
7. Remove transmission jack (1).
8. If used, remove screw-type under-hoist jack stands (2).

Fig. 292: Propeller Shaft At Rear Axle
Courtesy of CHRYSLER LLC

9. Torque propeller shaft coupler-to-axle flange bolt/nuts to 68 N.m (50 ft. lbs.).
10. Install the exhaust system. Refer to **Exhaust System/MUFFLER, Exhaust - Installation**

Fig. 293: Rear Axle Fill Plug
Courtesy of CHRYSLER LLC

11. Using a 14mm hex, remove rear axle fill plug (1). Fill axle with 1.2L (1.3 qts.) of Mopar® 75W-140 Synthetic Gear AND Axle Lubricant. Install fill plug and torque to 50 N.m (37 ft. lbs.).
12. Lower the vehicle.

8. Stake pinion flange nut (1) as shown on illustration.
9. Install rear axle assembly. Refer to Rear Axle Installation.

REAR AXLE, G648

DIAGNOSIS AND TESTING

DIAGNOSIS AND TESTING

GEAR NOISE

Axle gear noise can be caused by insufficient lubricant, incorrect backlash, incorrect pinion depth, tooth contact, worn/damaged gears, or the carrier housing not having the proper offset and squareness.

Gear noise usually happens at a specific speed range. The noise can also occur during a specific type of driving condition. These conditions are acceleration, deceleration, coast, or constant load.

When road testing, first warm-up the axle fluid by driving the vehicle at least 5 miles and then accelerate the vehicle to the speed range where the noise is the greatest. Shift out-of-gear and coast through the peak-noise range. If the noise stops or changes greatly:

- Axle mounts damaged, worn, or bottoming out.
- Check for insufficient lubricant.
- Incorrect ring gear backlash.
- Gear damage.

Differential side gears and pinions can be checked by turning the vehicle. They usually do not cause noise during straight-ahead driving when the gears are unloaded. The side gears are loaded during vehicle turns. A worn pinion shaft can also cause a snapping or a knocking noise.

BEARING NOISE

The differential and pinion bearings can produce noise when worn or damaged. Bearing noise can be either a whining, or a growling sound.

Pinion bearings have a constant-pitch noise. This noise changes only with vehicle speed. Pinion bearing noise will be higher pitched because it rotates at a faster rate. Drive the vehicle and load the differential. If bearing noise occurs, the rear pinion bearing is the source of the noise. If the bearing noise is heard during a coast, the front pinion bearing is the source.

Worn or damaged differential bearings usually produce a low pitch noise. Differential bearing noise is similar to pinion bearing noise. The pitch of differential bearing noise is also constant and varies only with vehicle speed.

Wheel hub bearings produce noise and vibration when worn or damaged. The noise generally changes when the bearings are loaded. Road test the vehicle. Turn the vehicle sharply to the left and to the right. This will load the bearings and change the noise level. Where axle bearing damage is slight, the noise is usually not noticeable at speeds above 30 mph.

LOW SPEED KNOCK

Low speed knock is generally caused by a worn U-joint or by worn side-gear thrust washers. A worn pinion shaft bore will also cause low speed knock.

VIBRATION

Vibration at the rear of the vehicle is usually caused by a:

- Damaged propeller shaft.
- Missing propeller shaft balance weight(s).
- Worn or out-of-balance wheels.
- Loose wheel lug nuts.
- Worn U-joints, or CV joints.
- Worn rubber coupler between the propeller shaft and the pinion yoke.
- Washers missing from the fasteners that attach the rubber coupler to the pinion yoke.
- Loose/broken springs.

- Damaged axle shaft bearing(s).
- Loose pinion gear nut.
- Excessive pinion yoke run out.
- Bent halfshaft(s).

Check for loose or damaged front-end components or engine/transmission mounts. These components can contribute to what appears to be a rearend vibration. Do not overlook engine accessories, brackets and drive belts.

All driveline components should be examined before starting any repair.

DRIVELINE SNAP

A snap or clunk noise when the vehicle is shifted into gear, can be caused by:

- Cradle-to-body isolator worn or damaged.
- Worn or damaged rubber washer between axle hub nut and axle hub.
- High engine idle speed.
- Transmission shift operation.
- Loose engine/transmission/transfer case mounts.
- Worn U-joints, or CV joints.
- Worn rubber coupler between the propeller shaft and the pinion yoke.
- Worn or broken axle mount isolators.
- Loose pinion gear nut and yoke.
- Excessive ring gear backlash.
- Excessive side gear to case clearance.

The source of a snap or a clunk noise can be determined with the assistance of a helper. Raise the vehicle on a hoist with the wheels free to rotate. Instruct the helper to shift the transmission into gear. Listen for the noise, a mechanics stethoscope is helpful in isolating the source of a noise.

DIAGNOSTIC CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
WHEEL NOISE	1. Wheel loose. 2. Faulty, brinelled wheel bearing.	1. Tighten loose nuts. 2. Replace bearing.
DIFFERENTIAL CRACKED	1. Improper differential side bearing preload. 2. Excessive ring gear backlash.	1. Replace case and inspect gears and bearings for further damage. Set differential bearing preload properly. 2. Replace case and inspect gears and bearings for further damage. Set ring gear

	3. Vehicle overloaded.	backlash properly. 3. Replace case and inspect gears and bearings for further damage. Avoid excessive vehicle weight.
DIFFERENTIAL GEARS SCORED	1. Insufficient lubrication. 2. Improper grade of lubricant. 3. Excessive spinning of one wheel/tire.	1. Replace scored gears. Fill differential with the correct fluid type and quantity. 2. Replace scored gears. Fill differential with the proper fluid type and quantity. 3. Replace scored gears. Inspect all gears, pinion bores, and shaft for damage. Service as necessary.
LOSS OF LUBRICANT	1. Lubricant level too high. 2. Worn axle shaft seals. 3. Cracked axle housing. 4. Worn pinion seal. 5. Worn/scored pinion flange journal. 6. Axle cover not properly sealed.	1. Drain lubricant to the correct level. 2. Replace seals. 3. Repair as necessary. 4. Replace seal. 5. Replace pinion flange and seal. 6. Remove, clean, and re-seal cover.
AXLE OVERHEATING	1. Lubricant level low. 2. Improper grade of lubricant. 3. Bearing preload too high. 4. Insufficient ring gear backlash.	1. Fill differential to correct level. 2. Fill differential with the correct fluid type and quantity. 3. Re-adjust bearing pre-load. 4. Re-adjust ring gear backlash.
GEAR TEETH BROKE	1. Overloading. 2. Ice-spotted pavement. 3. Improper adjustments.	1. Replace gears. Examine other gears and bearings for possible damage. 2. Replace gears and examine remaining parts for damage. 3. Replace gears and examine remaining parts for damage. Ensure ring gear backlash is correct.
AXLE NOISE	1. Insufficient lubricant. 2. Improper ring gear and pinion adjustment.	1. Fill axle with the correct fluid type and quantity. 2. Check ring gear and pinion contact pattern. Adjust backlash or pinion depth.

3. Unmatched ring gear and pinion.

4. Worn teeth on ring gear and/or pinion.

5. Loose pinion bearings.

6. Loose differential bearings.

7. Misaligned or sprung ring gear.

8. Housing not machined properly.

3. Replace gears with a matched ring gear and pinion.

4. Replace ring gear and pinion.

5. Adjust pinion bearing preload.

6. Adjust differential bearing preload.

7. Measure ring gear run-out. Replace components as necessary.

8. Replace housing.

STANDARD PROCEDURE

FLUID DRAIN AND FILL

Fig. 309: Drain And Fill Plug
Courtesy of CHRYSLER LLC

1. With vehicle in neutral, position and raise vehicle on hoist.
2. Remove axle drain plug (1) and drain rear axle fluid into suitable container.
3. Install drain plug (1). Tighten to 35 Nm (25 ft. lbs.).

Fig. 310: Drain And Fill Plug
Courtesy of CHRYSLER LLC

4. Remove rear axle fill plug (2). Fill axle with 1.2L (1.2 qts.) of Mopar® 75W-90 Synthetic Gear AND Axle Lubricant and one 4 oz. bottle of MOPAR® Limited Slip Additive Friction Modifier. Install fill plug and torque to 35 N.m (25 ft. lbs.).

REMOVAL

REMOVAL

NOTE: This procedure requires the compression of the rear suspension to ride height. A drive-on hoist should be used. If a drive-on hoist is not used, screw-style under-hoist jack stands are required to compress the rear suspension, facilitating rear halfshaft removal.

CAUTION: Never grasp halfshaft assembly by the inner or outer boots. Doing so may cause the boot to pucker or crease, reducing the service life of the boot and joint. Avoid over angulating or stroking the C/V joints when handling the halfshaft.

1. With vehicle in neutral, position and raise vehicle on hoist.

Fig. 311: Drain And Fill Plug
Courtesy of CHRYSLER LLC

2. Remove axle drain plug (1) and drain rear axle fluid into suitable container.
3. Install drain plug (1). Do not tighten at this time.
4. Remove the muffler. Refer to **Exhaust System/MUFFLER, Exhaust - Removal** .

Fig. 312: Applying Alignment Index Marks To Rear Axle Flange
Courtesy of CHRYSLER LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

Fig. 313: Propeller Shaft Rear Coupler To Axle Flange
 Courtesy of CHRYSLER LLC

NOTE: If re-using the propeller shaft coupler-to-axle flange fasteners, save the washers.

6. Remove three propeller shaft coupler (2) -to-axle flange (1) fasteners.

Fig. 314: Disengaging Halfshaft Using Suitable Pry Bar
 Courtesy of CHRYSLER LLC

NOTE: Do not pry on the slinger (2).

7. Using suitable pry bar (1) in the location shown on illustration, partially disengage halfshaft(s) from axle assembly.

Fig. 315: Transmission Jack At Rear Axle
 Courtesy of CHRYSLER LLC

8. If a drive-on hoist is used, position transmission jack (1) to rear axle assembly. If a drive-on hoist is not used, compress rear suspension using screw-style under-hoist jack stands (2), then position transmission jack to rear axle assembly.

Fig. 316: Front Mount Bolt Cover
Courtesy of CHRYSLER LLC

9. Remove the front mount bolt cover (1) located at the top of the axle carrier (2).

Fig. 317: Locating Rear Axle Front Mount Bolt
Courtesy of CHRYSLER LLC

NOTE: The nut will turn free at the at the top of the axle carrier, it will need to be held with a deep socket during removal.

10. Remove rear axle front mount bolt (1) and nut (3).

Fig. 318: Locating Right Rear Axle To Crossmember Bolts
 Courtesy of CHRYSLER LLC

11. Remove right rear axle-to-crossmember bolts (1).

Fig. 319: Left Rear Bolt
 Courtesy of CHRYSLER LLC

12. Remove the left rear bolt.

Fig. 320: Lowering Rear Axle Assembly
Courtesy of CHRYSLER LLC

NOTE: Do not pry on the axle halfshaft slinger.

13. Carefully lower rear axle. While lowering axle, separate right halfshaft (1) from axle and support with suitable rope or wire.

Fig. 321: Identifying Rear Axle Assembly, Lt. Side Halfshaft & Hydraulic Jack
Courtesy of CHRYSLER LLC

14. Remove left halfshaft (2).
15. Remove axle assembly from vehicle and transfer to bench.

INSTALLATION

INSTALLATION

Fig. 322: Identifying Rear Axle Assembly, Lt. Side Halfshaft & Hydraulic Jack
 Courtesy of CHRYSLER LLC

NOTE: Use care when installing halfshaft to axle assembly. The halfshaft installation angle should be minimized to avoid damage to seal upon installation.

1. Using new circlip(s), install left halfshaft (2) to rear axle assembly. Do not damage axle seals. Verify proper installation by pulling outward on joint by hand.

Fig. 323: Installing Right Halfshaft Into Axle Using Seal Protector
 Courtesy of CHRYSLER LLC

2. Using Seal Protector 9099 (3) install the right halfshaft (1) into axle (2).

Fig. 324: Applying Alignment Index Marks To Rear Axle Flange
 Courtesy of CHRYSLER LLC

NOTE: To prevent damage or imbalance, washers must be placed on fasteners that attach rubber coupler to the pinion yoke.

NOTE: To prevent damage or imbalance, washers must be installed between fastener heads and the rubber coupler.

3. Raise rear axle assembly into position. Align propeller shaft index marks (3) and start propeller shaft coupler-to-axis bolt/nuts by hand.

Fig. 325: Locating Right Rear Axle To Crossmember Bolts
 Courtesy of CHRYSLER LLC

NOTE: Clean the rear axle-to-crossmember bolts and apply a patch of blue MOPAR® Lock & Seal medium strength thread locker to the rear axle-to-crossmember bolts.

4. Install right rear axle-to-crossmember bolt (1) and tighten to 220 N.m (162 ft. lbs.).

Fig. 326: Left Rear Bolt
Courtesy of CHRYSLER LLC

NOTE: Clean the rear axle-to-crossmember bolts and apply a patch of blue MOPAR® Lock & Seal medium strength thread locker to the rear axle-to-crossmember bolts.

5. Install left rear axle-to-crossmember bolt (1) and tighten to 220 N.m (162 ft. lbs.).

Fig. 327: Locating Rear Axle Front Mount Bolt
Courtesy of CHRYSLER LLC

NOTE: The rubber part of the axle isolator must face toward the cradle.

6. Install rear axle front mount isolator (3) as shown on illustration and torque fastener to 65 N.m (48 ft. lbs.).

Fig. 328: Front Mount Bolt Cover
Courtesy of CHRYSLER LLC

7. Install the front mount bolt cover (1).

Fig. 329: Transmission Jack At Rear Axle
Courtesy of CHRYSLER LLC

8. Again verify halfshaft inner joints are fully engaged to axle assembly.
9. Remove transmission jack (1).
10. If used, remove screw-type under-hoist jack stands (2).

Fig. 330: Propeller Shaft Rear Coupler To Axle Flange
Courtesy of CHRYSLER LLC

NOTE: If re-using original fasteners, apply a patch of blue MOPAR® Lock & Seal medium strength thread locker to the propeller shaft coupler-to-axle flange fasteners. New fasteners have a thread lock patch, and do not require application of blue MOPAR® Lock & Seal medium strength thread locker.

11. Install the propeller shaft coupler-to-axle flange fasteners. Tighten the propeller shaft coupler-to-axle flange fasteners (2) to 122 N.m (89 ft. lbs.).

259477

Fig. 331: Drain And Fill Plug
Courtesy of CHRYSLER LLC

12. Remove rear axle fill plug (2). Fill axle with 1.2L (1.2 qts.) of Mopar® 75W-90 Synthetic Gear and Axle Lubricant and add one 0.03 L (4 oz.) bottle of MOPAR® Limited Slip Additive Friction Modifier. Install fill plug and torque to 35 N.m (25 ft. lbs.).

ADJUSTMENTS

PINION DEPTH

NOTE: Pinion depth measurement is taken with the pinion head and tail bearing cups pressed into the axle housing without the shim.

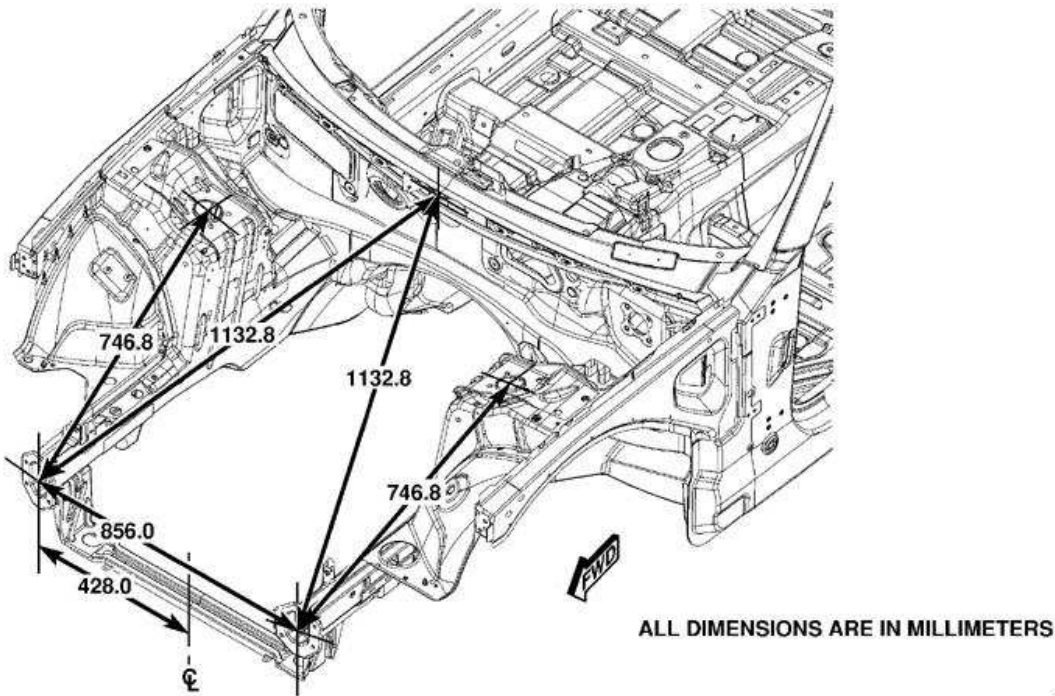

Fig. 332: Installing Pinion Bearing Cups With Pinion Bearing Cup Installer
Courtesy of CHRYSLER LLC

NOTE: Do not attempt to install the inner and outer pinion bearing cups at the same time.

1. If necessary, install the pinion head bearing cup into housing with Pinion Bearing Cup Installer 10148 (1).
2. If necessary, press pinion tail bearing cup into housing with Pinion Bearing Cup Installer 10148 (1).

90938

Fig. 333: Arbor Bar 10149-2
Courtesy of CHRYSLER LLC

3. Install Arbor Bar 10149-2 (1) into the case side bearing bore, then secure Arbor 10149-2 in place with Plate 10149-5 and fastener.

90949

Fig. 334: Installing Pinion Head Bearing & Tail Bearing With Pinion Depth Measurement Tools

Courtesy of CHRYSLER LLC

4. Install the pinion head bearing, tail bearing (3), L-block 6739 (1), and the Pinion Height Block 10149-1 (2).
5. Verify pinion depth measurement tools are set up as shown on illustration.

Fig. 335: Indicator/Scooter Block Setup
Courtesy of CHRYSLER LLC

6. Install Dial Indicator 9524 (1) to Scooter Block D-115-2A (2) (from Pinion Gage Set 6730). Secure with set-screw (3).

ALL DIMENSIONS ARE IN MILLIMETERS

90965

Fig. 336: Zeroing In Dial Indicator 9524 (1) On L-Block
Courtesy of CHRYSLER LLC

7. Zero Dial Indicator 9524 (1) on L-block 6739 (2).

ALL DIMENSIONS ARE IN MILLIMETERS

90981

Fig. 337: Slide Indicator Probe Off Of Height Block And Onto Arbor Bar 10149-2
Courtesy of CHRYSLER LLC

8. Slide indicator probe (1) off of height block and onto Arbor Bar 10149-2 (2). As indicator contacts Arbor Bar 10149-2 (2), indicator needle will rotate clockwise. Continue moving indicator probe to the crest of Arbor Bar 10149-2 and record the highest reading.
9. Rotate Arbor Bar 10149-2 (2) 90°.
10. Repeat steps 7 through 9 and record each measurement until the Arbor Bar 10149-2 has been rotated back to the original location.
11. Average the four measurements taken in steps 7 through 10.
12. Select a shim equal to the average of the measurements, plus 1.5 mm (0.059 in.).

SIDE BEARING PRELOAD ADJUSTMENT

NOTE: **Select the pinion shim before performing this procedure.**

HOLD GUN NOZZLE IN DIRECTION OF ARROW IN ORDER TO EFFECTIVELY SEAL METAL JOINTS.

DO NOT HOLD GUN NOZZLE IN DIRECTION OF ARROW. SEALER APPLIED AS SHOWN IS INEFFECTIVE.

3 METAL THICKNESS

2 METAL THICKNESS

3 METAL THICKNESS

2 METAL THICKNESS

WORK SEAL ON METAL SURFACE TO GET GOOD ADHESIVE. EDGE MUST BE FEATHERED AS SHOWN.

	HIDDEN SEALANT

80866cc6

Fig. 338: Side Bearing Preload Adjustment
Courtesy of CHRYSLER LLC

1. Clean the differential bearing cup bore in the axle housing.
2. Install Dummy Bearing 10149-3 in the axle housing.
3. Clean the differential bearing cup bore in the axle housing cover.

4. Install Dummy Bearing 10149-4 in the axle housing cover.
5. Install the differential into the axle housing.
6. Install the axle housing cover and tighten the bolts to 10 Nm (7 ft. lbs.).
7. Set up the dial indicator (1) to measure endplay on the housing side of the differential (2).
8. From the housing side of the differential, press the differential toward the case cover, then zero the dial indicator (1).
9. From the case cover side, press the differential toward the housing side, and record the measurement.
10. Add 1.33 mm (0.052 in.) to the empty case measurement taken in the previous step and record the results. This is the total dimension of both differential shims when installed.
11. Remove the dial indicator.
12. Remove the axle housing cover.
13. Fully install the pinion.
14. Install the Dummy Bearing 10149-3 in the axle housing, then install the differential carrier into the axle housing.
15. Install Dummy Bearing 10149-4 in the axle housing cover, and install the axle housing cover. Tighten the bolts to 10 Nm (7 ft. lbs.).
16. Set up the dial indicator (1) as before.
17. From the housing side of the differential, press the differential toward the case cover, then zero the dial indicator (1).
18. From the case cover side, press the differential toward the housing side, and record the measurement.
19. Subtract 0.27 mm (0.01 in.) from the measurement found in the previous step. This is the size of the shim that should be installed in the housing cover.
20. Subtract the size of the selected housing cover shim from the measurement found in step 11. This is the size of the shim that should be installed in the housing.
21. Check ring gear backlash. Final ring gear backlash should be 0.21 mm +/- 0.13 mm (0.008 in. +/- 0.005 in.).

Fig. 339: Backlash Shim Correction
 Courtesy of CHRYSLER LLC

22. If backlash measurement is less than 0.08 mm (0.003 in.), it is necessary to decrease the shim thickness on the ring gear (left) side, and increase the thickness on the pinion (right) side.
23. If backlash measurement is greater than 0.34 mm (0.013 in.), it is necessary to increase the shim thickness on the ring gear (right) side, and decrease the thickness on the pinion (left) side.
24. Check the gear contact pattern, and adjust as necessary. Refer to **GEAR CONTACT PATTERN**.

GEAR CONTACT PATTERN

91092

Fig. 340: Gear Tooth Contact Patterns
Courtesy of CHRYSLER LLC

NOTE: The ring gear and pinion teeth contact patterns will show if the pinion depth is correct in the housing. It will also show if the ring gear backlash has been adjusted correctly. The backlash can be adjusted within specifications to achieve desired tooth contact patterns.

1. Install the differential side bearings and pinion bearings.
2. Install the selected differential bearing and pinion shims in the differential housing and cover, and install the bearing cups.
3. Install the differential carrier and pinion in the differential housing.
4. Apply a thin coat of hydrated ferric oxide or equivalent to the drive and coast side of the ring gear teeth.
5. Install the differential housing cover. Tighten the bolts to 28 Nm (20 ft. lbs.).
6. Make a witness mark on the differential carrier.
7. Hold the differential case from freely rotating. This will provide a more distinct contact pattern.
8. Rotate the pinion until the witness mark on the differential case has made one complete revolution in both directions.
9. Note and compare patterns on the ring gear teeth to Gear Tooth Contact Patterns chart and adjust pinion depth and gear backlash as necessary. The areas on the ring gear teeth with the greatest degree of contact against the pinion teeth will push the compound to the areas with the least amount of contact.

BEARING, DIFFERENTIAL SIDE

Removal

REMOVAL

1. Remove the differential case assembly. See Differential and Driveline/Rear Axle/CASE ASSEMBLY, Differential - Removal.

Fig. 360: Removing Differential Bearings From Case
Courtesy of CHRYSLER LLC

2. Remove the Differential Bearings from the case with Puller Press C-293-PA (1), Bearing/Gear Adapter C-293-3 (2) and Adapter Blocks C-293-37 (3).

Installation

INSTALLATION

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Use only a bearing heater/hot plate and follow manufacturer's instructions. Heat components to 100 - 177 Celsius (212° Min. - 350° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

11. Remove the clutch pack (1) and the Belleville spring (2) from the primary differential case half (3).

Assembly

ASSEMBLY

108442

Fig. 374: Clutch Pack
 Courtesy of CHRYSLER LLC

1. Assemble the clutch pack as follows: Friction disc (1), tabbed plate (2), friction disc (3), tabbed plate (4), large friction disc (5), and Belleville spring (6). Verify the friction surface on the large friction disc (5) is facing the tabbed plate (4).

108451

Fig. 375: Identifying Clutch Pack, Belleville Spring & Primary Differential Case Half
 Courtesy of CHRYSLER LLC

NOTE: Verify the raised edge of the Belleville spring (2) is facing up, or away from the clutch pack (1).

2. Install the clutch pack (1) and the Belleville spring (2) into the primary differential case half (3).

108459

Fig. 376: Remove/Install Differential Side Gear
Courtesy of CHRYSLER LLC

3. Install the differential side gear (1) into the primary differential case half (2).

Fig. 377: Splines On Differential Side Gear
Courtesy of CHRYSLER LLC

4. Verify the differential side gear (1) is fully seated in the primary case half (2). Rotate the side gear as necessary to align the splines on all the friction plates with the splines on the differential side gear (1).

Fig. 378: Identifying Secondary Pinion Shafts & Secondary Differential Side Gears
Courtesy of CHRYSLER LLC

5. Install the secondary differential side gears (2), then slightly compress the Belleville spring by pressing down on the differential side gear, and install the secondary (split) pinion shafts (1).

Fig. 379: Remove/Install Primary Differential Pinion Gears
Courtesy of CHRYSLER LLC

6. Install the primary differential pinion gears (1).

108452

Fig. 380: Remove/Install Primary Differential Pinion Gear Shaft
Courtesy of CHRYSLER LLC

NOTE: It may be necessary use the differential side gear to press downward on the four pinions (2) for primary differential pinion gear shaft (1) removal.

7. Install the primary differential pinion gear shaft (1).

10. Install the differential side gear (1).

Fig. 384: Identifying Primary & Secondary Differential Case Halves
 Courtesy of CHRYSLER LLC

11. Assemble the primary (1) and secondary (2) differential case halves.

Fig. 385: Ring Gear Bolts
 Courtesy of CHRYSLER LLC

12. Install the Ring Gear (2), and the Ring Gear Bolts (1). Tighten the ring gear bolts to 185 Nm (136 ft. lbs.).

Installation

INSTALLATION

Fig. 386: Remove/Install Differential Case
Courtesy of CHRYSLER LLC

1. Apply a light coat of gear lubricant to differential bearings and bearing cups.
2. Install the Differential Case (1).

Fig. 387: Removing Case Half Bolts
Courtesy of CHRYSLER LLC

3. Install the Case Half (2) and the Case Half Bolts (1).
4. Verify the turning torque and differential bearing preload are within acceptable limits. If the turning torque and differential bearing preload measurements are not within specifications, or if a new ring and pinion gear have been installed, perform the pinion depth adjustment and differential side bearing preload and backlash adjustment procedures. See **Differential and Driveline/Rear Axle - Adjustments**.
5. Install the Rear Axle Assembly. See **Differential and Driveline/Rear Axle - Installation**

GEAR, RING AND PINION

Removal

GEAR-PINION/RING

1. Remove the Rear Axle Assembly. See **Differential and Driveline/Rear Axle - Removal**.

208922

Fig. 388: Removing Case Half Bolts
 Courtesy of CHRYSLER LLC

2. Remove the Case Half Bolts (1) and remove the Case Half (2).

Fig. 403: Installing Spacer Onto Pinion Shaft
Courtesy of CHRYSLER LLC

6. Install the spacer (1) onto the pinion shaft.
7. Install the pinion into the case.

Fig. 404: Bearing Heater
Courtesy of CHRYSLER LLC

WARNING: Use tongs or welding gloves when handling heated components. Failure to follow these instructions will result in personal injury.

CAUTION: Bearings (1) are installed using a Bearing Heater (2). Use only a bearing heater/hot plate and follow manufacturer's instructions. Heat components to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit). Never use an open flame to heat components. Never leave components on heater for an extended amount of time. If component is discolored after heating, the component has been overheated and must not be used. Failure to follow these instructions will result in component damage.

8. Heat pinion tail bearing (1) to 100 - 149 Celsius (212° Min. - 300° Max Fahrenheit) and install on pinion with tongs or welding gloves.

Fig. 405: Installing Pinion Seal
Courtesy of CHRYSLER LLC

NOTE: Apply a light coating of gear lube to pinion seal.

NOTE: Allow the pinion tail bearing to cool off to room temperature before installing the pinion seal.

9. Use pinion oil seal installer 10146 (1) to install the pinion seal (2).

210014

Fig. 406: Remove/Install Pinion Flange
Courtesy of CHRYSLER LLC

10. Install the pinion flange (2).
11. Install the original pinion nut. Hold the pinion flange with flange holder C-3281 (1) and tighten the pinion nut.
12. Remove and discard the original Pinion Nut.
13. Remove the Pinion Flange.
14. Install the pinion flange (2) and a new pinion flange nut. Tighten the pinion flange nut to 245 Nm (180 ft. lbs.).
15. Use an inch pound torque wrench to measure the turning torque of the pinion.
16. If the turning torque is too high, remove the selected shim, and install a larger shim on the pinion shaft, then verify the turning torque is correct. If the turning torque is too low, remove the selected shim, and install a smaller shim on the pinion, then verify the turning torque is correct.

210026

Fig. 407: Ring Gear Bolts
Courtesy of CHRYSLER LLC

17. Install the Ring Gear (2), and new Ring Gear Bolts (1). Tighten the bolts to 185 Nm (136 ft. lb.).

210036

Fig. 408: Differential Side Bearing Shim
Courtesy of CHRYSLER LLC

18. Measure end play of the differential, and determine the size of the required differential shims to get the correct differential side bearing preload and ring gear backlash. See **Differential and Driveline/Rear Axle - Adjustments**.
19. Install shim (1) in the cover.

210055

Fig. 409: Installing Differential Side Bearing Cup
Courtesy of CHRYSLER LLC

20. Use Differential Bearing Cup Installer 10147 (2) and Universal Installer Handle C-4171 (1) to install the differential side bearing cup (3) into the cover (3).

210063

Fig. 410: Installing Shim Into Case
Courtesy of CHRYSLER LLC

21. Install shim (1) in the case.

210073

Fig. 411: Installing Differential Side Bearing Cup In Case
Courtesy of CHRYSLER LLC

22. Use Differential Bearing Cup Installer 10147 and Universal Installer Handle C-4171 to install the Differential Side Bearing Cup into the Case.
23. Install the Differential in the housing.

210084

Fig. 412: Removing Case Half Bolts
 Courtesy of CHRYSLER LLC

24. Temporarily install the cover (2), and the cover bolts (1).
25. Verify the ring and pinion gear contact pattern is within acceptable limits.
26. Tighten the cover bolts to 28 Nm (20 ft. lbs.).
27. Verify the total turning torque of the differential is within 2.5 to 6.0 Nm (22 - 53 in. lbs.). If necessary, adjust the size of the differential shims to bring the turning torque within specifications.
28. Install the rear axle assembly. See Differential and Driveline/Rear Axle - Installation.

SEAL, AXLE DRIVE SHAFT

Removal

REMOVAL

210107

Fig. 413: Removing Left Side Seal
Courtesy of CHRYSLER LLC

1. Remove halfshaft(s). See **Differential and Driveline/Half Shaft - Removal**
2. Using suitable screwdriver (1), remove axle shaft seal (2).
3. Visually inspect halfshaft seal journal for damage (excessive seal groove, nicks, scratches, etc.). Replace halfshaft if necessary.

Installation

INSTALLATION

210129

Fig. 414: Installing Right Side Seal
Courtesy of CHRYSLER LLC

1. Using Installer 9919 (2) and Handle C-4171 (3), install **NEW** axle shaft seal (1). Lubricate the inside diameter with Mopar® Gear and Axle Lubricant 75W-90 to protect seal during halfshaft installation.
2. Install halfshaft(s). See **Differential and Driveline/Half Shaft - Installation**

210130

Fig. 415: Drain And Fill Plug
Courtesy of CHRYSLER LLC

3. Remove fill plug (2) to check and adjust rear axle fluid level. Top off axle with Mopar® Gear and Axle Lubricant 75W-90. Reinstall fill plug and torque to 35 N.m (25 ft. lbs.) torque.

SEAL, DRIVE PINION

Removal

REMOVAL

1. Remove rear axle assembly from vehicle. Refer to Rear Axle Removal.

210139

Fig. 416: Measuring Rotating Torque At Pinion Flange
Courtesy of CHRYSLER LLC

2. Use a torque wrench calibrated to measure low torque values (1) to measure rotating torque at the pinion flange (2). Record measurement for reuse on assembly.

210147

Fig. 417: Removing/Installing Pinion Flange Nut
Courtesy of CHRYSLER LLC

- Using Flange Wrench C-3281(1) and 41mm socket, remove pinion flange nut and discard.

210163

Fig. 418: Removing Pinion Flange With Puller 1026
Courtesy of CHRYSLER LLC

NOTE: Due to axle imbalance concerns, it is necessary to make sure pinion flange-to-shaft orientation is maintained. If alignment marks are not visible, apply appropriate marks before removing pinion flange.

4. Using Puller 1026 (1), remove pinion flange (2) from pinion shaft.

210174

Fig. 419: Removing Pinion Seal Using A Suitable Seal Removal Tool
 Courtesy of CHRYSLER LLC

5. Using a suitable seal removal tool (1), remove pinion seal (2) and discard.

Installation

INSTALLATION

1. Apply light coating of gear lubricant to the lip of the pinion seal.

210192

Fig. 420: Installing Pinion Seal
Courtesy of CHRYSLER LLC

- Using Installer 10146 (1), install pinion seal until tool bottoms on carrier.

210222

Fig. 421: Installing Pinion Flange
Courtesy of CHRYSLER LLC

3. Install pinion flange into position. Align index marks made during disassembly to maintain assembly balance.
4. Using Installer 6448A (1), lightly tap on pinion flange (2) until enough pinion shaft threads are exposed to install the pinion flange, and start the pinion nut.

Fig. 422: Removing/Installing Pinion Flange Nut
Courtesy of CHRYSLER LLC

5. Install a **new** pinion flange nut. Using Flange Wrench C-3281 (1) and 41mm socket, torque nut to 245 N.m (181 ft. lbs.).

BUZZERS, RELAYS & TIMERS

BUZZERS, RELAYS & TIMERS LOCATION

Component	Location
ACCESSORY DELAY Relay	Power distribution center. See Fig. 75 .
AUTO SHUT DOWN Relay	Totally integrated power module. See Fig. 74 .
BRAKE LAMP Relay	Power distribution center. See Fig. 75 .
DRIVE TRAIN CONTROL Relay	Power distribution center. See Fig. 75 .
FUEL PUMP Relay	Power distribution center. See Fig. 75 .
Headlamp Washer Relay (HID Lamps)	Below right front light housing. See Fig. 47 .
POLICE No. 1 Relay	Fuse/relay block. See Fig. 42 .
POLICE No. 2 Relay	Fuse/relay block. See Fig. 42 .
POLICE No. 3 Relay	Fuse/relay block. See Fig. 42 .
RADIATOR FAN CONTROL Relay	Totally integrated power module. See Fig. 74 .
RADIATOR FAN HIGH/LOW CONTROL Relay	Totally integrated power module. See Fig. 74 .
RADIATOR FAN HIGH Relay	Totally integrated power module. See Fig. 74 .
REAR HEATED SEATS Relay	Power distribution center. See Fig. 75 .
REAR WINDOW DEFOGGER Relay	Power distribution center. See Fig. 75 .
REAR WIPER Relay	Integrated power module. See Fig. 75 .
RUN Relay	Power distribution center. See Fig. 75 .
RUN/START Relay	Totally integrated power module. See Fig. 74 .
STARTER Relay	Totally integrated power module. See Fig. 74 .
TRANSMISSION Relay (NAG1)	Power distribution center. See Fig. 75 .
WIPER HIGH/LOW Relay	Totally integrated power module. See Fig. 74 .
WIPER ON/OFF Relay	Totally integrated power module. See Fig. 74 .

CIRCUIT PROTECTION DEVICES

CIRCUIT PROTECTION DEVICES LOCATION

Component	Location
Circuit Breaker No. 1	Power distribution center. See Fig. 75 .
Circuit Breaker No. 2	Power distribution center. See Fig. 75 .
Circuit Breaker No. 3	Power distribution center. See Fig. 75 .
Fuse Relay Block-Police	Right kick panel. See Fig. 56 .
Integrated Power Module	Right side of engine compartment. See Fig. 3 .
Power Distribution Center (Except Magnum)	Right rear of trunk. See Fig. 34 .
Power Distribution Center (Magnum)	Right rear of trunk. See Fig. 63 .

CONTROL UNITS

CONTROL UNITS LOCATION

Component	Location
Adaptive Cruise Control Module	Left grille. See Fig. 44 .
Analog Clock Module	Top center of dash. See Fig. 20 .
Antilock Brakes Module	Right front of engine compartment. See Fig. 49 .
Brake Module (Trailer Tow)	Left kick panel. See Fig. 55 .
Driver Door Module	Middle of driver door. See Fig. 26 .
Electrohydraulic Control Unit Assembly (NAG1)	Right side of transmission. See Fig. 50 .
Electronic Overhead Module	Overhead console. See Fig. 30 .
Electronic Shift Module	Bottom of steering column. See Fig. 18 .
Front Blower Power Module (ATC)	Center of HVAC unit. See Fig. 38 .
Hands Free Module	Right side of dash. See Fig. 53 .
Heated Seats Module	Below passenger seat. See Fig. 56 .
Interface-Police/Taxi Module	In mini-console. See Fig. 54 .
Memory Seat Module	Below driver seat. See Fig. 55 .
Occupant Restraint Controller Module	In center console. See Fig. 53 .
Park Assist Module	Right rear seat. See Fig. 34 .
Passenger Door Module	Middle of passenger door.
Powertrain Control Module	Right rear of engine compartment. See Fig. 50 .
Satellite Video Module	Audio-video jumper.
Steering Control Module	Steering column. See Fig. 53 .
Tire Pressure Monitoring Module	Behind right rear wheelhouse splash shield. See Fig. 60 .
Totally Integrated Power Module	Right side of engine compartment.
Transmission Control Module (NAG1)	Below steering column. See Fig. 55 .
Video Screen Module	In console.
Wireless Control Module	Steering column.

MOTORS

MOTORS LOCATION

Component	Location
Adjustable Pedals Motor	Adjustable pedals assembly. See Fig. 56 .
Blend Door Actuator-Left	Left side of HVAC unit. See Fig. 15 .
Blend Door Actuator-Right (ATC)	Center of HVAC unit. See Fig. 38 .
Blower Motor	Right side of HVAC unit. See Fig. 14 .
Door Latch-Decklid (LX48)	Deck lid latch. See Fig. 64 .
Door Latch-Left Rear	Rear of left rear door.

Door Latch-Liftgate (LX49)	Liftgate latch.
Door Latch-Right Rear	Rear of right rear door. See Fig. 27 .
Driver Horizontal Seat Adjuster Motor	Below driver seat. See Fig. 24 .
Driver Recliner Seat Adjuster Motor (Except Memory)	Driver seat back.
Driver Recliner Seat Adjuster Motor (Memory)	Below driver seat.
Front Driver Vertical Seat Adjuster Motor	Below driver seat. See Fig. 24 .
Front Passenger Vertical Seat Adjuster Motor	Front passenger seat. See Fig. 57 .
Fuel Pump Module	Top of fuel tank. See Fig. 25 .
Headlamp Washer Motor (HID Lamps)	Right front bumper. See Fig. 47 .
Left Front Express Window Motor (Except Base)	In middle of driver door. See Fig. 26 .
Left Front Window Motor (Base)	In middle of driver door. See Fig. 26 .
Left Rear Window Motor	In middle of left rear door.
Mode Door Actuator	Left side of HVAC unit. See Fig. 15 .
Passenger Seat Horizontal Adjuster Motor	Below passenger seat. See Fig. 57 .
Rear Driver Vertical Seat Adjuster Motor	Rear of driver seat.
Rear Passenger Vertical Seat Adjuster Motor	Below passenger seat. See Fig. 57 .
Recirculation Door Actuator	Right side of HVAC unit. See Fig. 14 .
Right Front Express Window Motor (Except Base)	In middle of passenger door.
Right Front Window Motor (Base)	In middle of passenger door.
Right Rear Window Motor	Middle of right rear door. See Fig. 27 .
Starter AWD (5.7L)	Left rear of engine. See Fig. 12 .
Starter RWD (5.7L)	Right rear of engine. See Fig. 12 .
Starter (2.7L)	Left rear side of engine. See Fig. 6 .
Starter (3.5L)	Left rear side of engine. See Fig. 9 .
Starter (6.1L)	Right rear of engine. See Fig. 40 .
Steering Telescope Motor	Steering column. See Fig. 53 .
Steering Tilt Motor	Steering column. See Fig. 53 .
Sunroof Motor/Module	Rear center of headliner. See Fig. 31 .
Windshield Washer Pump	Right front of engine compartment. See Fig. 47 .
Wiper Motor-Front	Left rear of engine compartment. See Fig. 51 .
Wiper Motor-Rear (LX49)	Rear deck lid. See Fig. 65 .

SENDING UNITS & SENSORS

SENDING UNITS & SENSORS LOCATION

Component	Location
ABS Wheel Speed Sensor-Left Front	Left front wheel well. See Fig. 2 .

ABS Wheel Speed Sensor-Right Front	Right front wheel well. See Fig. 49.
Accelerator Pedal Position Sensor	Adjustable pedal assembly. See Fig. 56.
A/C Pressure Transducer	Left rear of engine compartment. See Fig. 51.
Adjustable Pedals Sensor	Adjustable pedal assembly. See Fig. 55.
Ambient Air Temperature Sensor	Right front of engine compartment. See Fig. 1.
Brake Fluid Level Sensor	Left rear of engine compartment. See Fig. 51.
Camshaft Position Sensor (2.7L & 3.5L)	Top front of engine. See Fig. 7.
Camshaft Position Sensor (5.7L)	Top right front of engine. See Fig. 72.
Camshaft Position Sensor (6.1L)	Top right front of engine.
Crankshaft Position Sensor (2.7L)	Right rear of engine. See Fig. 5.
Crankshaft Position Sensor (3.5L)	Right rear of engine. See Fig. 8.
Crankshaft Position Sensor (5.7L)	Right rear of engine. See Fig. 12.
Crankshaft Position Sensor (6.1L)	Right rear of engine.
Driver Seat Track Position Sensor	Below driver seat. See Fig. 55.
Dynamics Sensor (ESP)	Center console. See Fig. 56.
Engine Coolant Temperature Sensor (2.7L & 3.5L)	Front of engine. See Fig. 7.
Engine Coolant Temperature Sensor (6.1L)	Left front of engine.
Evaporator Temperature Sensor	Center of HVAC unit. See Fig. 38.
Exhaust Gas Recirculation Valve Assembly (2.7L)	Rear of engine. See Fig. 5.
Exhaust Gas Recirculation Valve Assembly (3.5L)	Rear of engine. See Fig. 8.
Exhaust Gas Recirculation Valve Assembly (5.7L)	Right front of engine. See Fig. 11.
Front Washer Fluid Level Sensor	Right front of engine compartment. See Fig. 47.
Fuel Pump Module	Top of fuel tank. See Fig. 25.
Inlet Air Temperature Sensor (2.7L)	Top of engine. See Fig. 6.
Inlet Air Temperature Sensor (3.5L)	Top of engine. See Fig. 9.
Inlet Air Temperature Sensor (5.7L)	Top front of engine. See Fig. 72.
Inlet Air Temperature Sensor (6.1L)	Top front of engine. See Fig. 70.
Input Speed Sensor (2.7L)	Right side of transmission. See Fig. 5.
Input Speed Sensor (3.5L)	Right side of transmission. See Fig. 8.
Knock Sensor No. 1 (2.7L)	Rear of engine. See Fig. 6.
Knock Sensor No. 1 (3.5L)	Left rear of engine. See Fig. 73.
Knock Sensor No. 1 (5.7L)	Rear of engine. See Fig. 13.
Knock Sensor No. 1 (6.1L SRT8)	Lower left rear of engine. See Fig. 41.
Knock Sensor No. 2 (5.7L)	Right rear of engine. See Fig. 12.
Knock Sensor No. 2 (6.1L)	Lower right rear of engine. See Fig. 40.
Left Front Impact Sensor	Left front of engine compartment. See Fig. 2.

Left Side Impact Sensor 1	Left "B" pillar. See Fig. 25 .
Left Side Impact Sensor 2	Rear of left rear door. See Fig. 28 .
Manifold Absolute Pressure Sensor (2.7L)	Top of engine. See Fig. 6 .
Manifold Absolute Pressure Sensor (3.5L)	Top of engine. See Fig. 9 .
Manifold Absolute Pressure Sensor (5.7L)	Top of engine. See Fig. 13 .
Manifold Absolute Pressure Sensor (6.1L)	Top rear of intake manifold. See Fig. 40 .
Oil Pressure Sensor (5.7L)	Right front of engine. See Fig. 72 .
Oil Pressure Sensor (6.1L)	Lower right front of engine. See Fig. 40 .
Oil Temperature Sensor (5.7L)	Right front of engine. See Fig. 72 .
Oil Temperature Sensor (6.1L)	Right rear of engine. See Fig. 40 .
Output Speed Sensor (2.7L)	Right side of transmission. See Fig. 5 .
Output Speed Sensor (3.5L)	Right side of transmission. See Fig. 8 .
Oxygen Sensor 1/1 (2.7L)	Right rear of engine. See Fig. 71 .
Oxygen Sensor 1/1 (3.5L)	Right rear of engine. See Fig. 46 .
Oxygen Sensor 1/1 (5.7L)	Left rear of engine. See Fig. 12 .
Oxygen Sensor 1/1 (6.1L)	Left rear of engine. See Fig. 70 .
Oxygen Sensor 1/2	Left rear of engine. See Fig. 52 .
Oxygen Sensor 2/1 (2.7L)	Left side of engine. See Fig. 5 .
Oxygen Sensor 2/1 (3.5L)	Left side of engine. See Fig. 9 .
Oxygen Sensor 2/1 (5.7L)	Right side of engine. See Fig. 12 .
Oxygen Sensor 2/1 (6.1L)	Left rear of engine. See Fig. 71 .
Oxygen Sensor 2/2	Lower rear of engine. See Fig. 52 .
Park Assist Sensor No. 7	Right rear fascia. See Fig. 37 .
Park Assist Sensor No. 8	Right rear fascia. See Fig. 37 .
Park Assist Sensor No. 9	Left rear fascia. See Fig. 37 .
Park Assist Sensor No. 10	Left rear fascia. See Fig. 37 .
Passenger Seat Track Position Sensor	Right side of passenger seat. See Fig. 56 .
Rain Sensor (Auto Wipers)	Inside rearview mirror. See Fig. 22 .
Rear ABS Wheel Speed Sensor (Magnum)	Right front of cargo pan. See Fig. 29 .
Right Front Impact Sensor	Right front of engine compartment. See Fig. 48 .
Right Front Wheel Speed Sensor (Except ABS)	Right front wheel well. See Fig. 49 .
Right Side Impact Sensor 1	Right "B" pillar. See Fig. 59 .
Right Side Impact Sensor 2	Rear of right rear door. See Fig. 62 .
Shift Lever Position Sensor (Column NAG1)	Steering column.
Sun Sensor	Top center of dash. See Fig. 53 .
Transmission Range Sensor RLE (2.7L)	Right side of transmission. See Fig. 5 .
Transmission Range Sensor RLE (3.5L)	Right side of transmission. See Fig. 8 .

SOLENOIDS & SOLENOID VALVES

SOLENOIDS & SOLENOID VALVES LOCATION

Component	Location
Assembly-Line Pressure Sensor/Variable Force Solenoid	Rear of engine compartment. See Fig. 73 .
Evaporator Purge Solenoid	Right of engine compartment. See Fig. 50 .
Exhaust Gas Recirculation Valve Assembly (2.7L)	Rear of engine. See Fig. 5 .
Exhaust Gas Recirculation Valve Assembly (3.5L)	Rear of engine. See Fig. 8 .
Exhaust Gas Recirculation Valve Assembly (5.7L)	Right front of engine. See Fig. 11 .
Fuel Injector No. 1 (2.7L)	Top right front of engine. See Fig. 69 .
Fuel Injector No. 1 (3.5L)	Top right front of engine.
Fuel Injector No. 1 (5.7L)	Top left front of engine. See Fig. 13 .
Fuel Injector No. 1 (6.1L)	Left side of intake manifold. See Fig. 41 .
Fuel Injector No. 2 (2.7L & 3.5L)	Top left front of engine. See Fig. 6 .
Fuel Injector No. 2 (5.7L)	Top right front of engine. See Fig. 12 .
Fuel Injector No. 2 (6.1L)	Top right front of engine. See Fig. 70 .
Fuel Injector No. 3 (2.7L)	Top right of engine. See Fig. 69 .
Fuel Injector No. 3 (3.5L)	Top right of engine.
Fuel Injector No. 3 (5.7L)	Top left of engine. See Fig. 13 .
Fuel Injector No. 3 (6.1L)	Left side of intake manifold. See Fig. 41 .
Fuel Injector No. 4 (2.7L)	Top left of engine. See Fig. 6 .
Fuel Injector No. 4 (3.5L)	Top left of engine.
Fuel Injector No. 4 (5.7L)	Top right of engine. See Fig. 12 .
Fuel Injector No. 4 (6.1L)	Top right front of engine. See Fig. 70 .
Fuel Injector No. 5 (2.7L)	Top right rear of engine. See Fig. 69 .
Fuel Injector No. 5 (3.5L)	Top right rear of engine.
Fuel Injector No. 5 (5.7L)	Top left rear of engine. See Fig. 13 .
Fuel Injector No. 5 (6.1L)	Left side of intake manifold. See Fig. 41 .
Fuel Injector No. 6 (2.7L)	Top left rear of engine. See Fig. 6 .
Fuel Injector No. 6 (3.5L)	Top left rear of engine.
Fuel Injector No. 6 (5.7L)	Top right rear of engine. See Fig. 12 .
Fuel Injector No. 6 (6.1L)	Top right rear of engine. See Fig. 70 .
Fuel Injector No. 7 (5.7L)	Top left rear of engine. See Fig. 13 .
Fuel Injector No. 7 (6.1L)	Left side of intake manifold. See Fig. 41 .
Fuel Injector No. 8 (5.7L)	Top right rear of engine. See Fig. 12 .
Fuel Injector No. 8 (6.1L)	Top right rear of engine. See Fig. 70 .
Line Pressure Sensor/Variable Force Solenoid (RLE)	Transmission.
Multi Displacement System Solenoid (Cyl 1) (5.7L MDS)	Top center of engine. See Fig. 66 .

Multi Displacement System Solenoid (Cyl 4) (5.7L MDS)	Top center of engine. See Fig. 66 .
Multi Displacement System Solenoid (Cyl 6) (5.7L MDS)	Top center of engine. See Fig. 66 .
Multi Displacement System Solenoid (Cyl 7) (5.7L MDS)	Top center of engine. See Fig. 66 .
Short Runner Valve Solenoid (3.5L)	Top of engine. See Fig. 7 .
Variable Cam Timing Solenoid	Top center of engine. See Fig. 66 .

SWITCHES

SWITCHES LOCATION

Component	Location
Door Latch-Decklid (LX48)	Deck lid latch. See Fig. 64 .
Door Latch-Left Front	Driver door. See Fig. 26 .
Door Latch-Left Rear	Rear of left rear door.
Door Latch-Liftgate	Liftgate latch.
Door Latch-Right Front	Right front door.
Door Latch-Right Rear	Rear of right rear door. See Fig. 27 .
EVAP System Monitor Switch	Right rear of wheel well. See Fig. 62 .
Hood Ajar-Switch	Right side of engine compartment. See Fig. 4 .
Liftgate Release Switch (Magnum)	Left rear liftgate. See Fig. 65 .
Oil Pressure Switch (2.7L)	Rear of engine. See Fig. 71 .
Oil Pressure Switch (3.5L)	Lower left front of engine. See Fig. 73 .
Parking Brake Switch	Base of parking brake. See Fig. 55 .
Stop Lamp Switch	Base of brake pedal. See Fig. 55 .
Transmission Solenoid/Pressure Switch Assembly (2.7L) (RLE)	Top of transmission.
Transmission Solenoid/Pressure Switch Assembly (3.5L) (RLE)	Top of transmission.

MISCELLANEOUS

MISCELLANEOUS LOCATION

Component	Location
A/C Compressor Clutch (2.7L)	Front of engine. See Fig. 6 .
A/C Compressor Clutch (3.5L)	Front of engine.
A/C Compressor Clutch (5.7L)	Front of engine.
A/C Compressor Clutch (6.1L)	Front of engine. See Fig. 41 .
Data Link Connector	Left side of dash, above pedals. See Fig. 53 .
Diode No. 1 (NAG1)	Power distribution center. See Fig. 75 .
Diode No. 2	Power distribution center. See Fig. 75 .

Driver Airbag Squib 1	Steering wheel. See Fig. 17.
Driver Airbag Squib 2	Steering wheel. See Fig. 17.
Driver Seat Belt Pretensioner	Left "B" pillar. See Fig. 25.
Front Blower Motor Resistor Block (MTC)	Center HVAC unit.
Generator (2.7L)	Right front of engine. See Fig. 5.
Generator (3.5L)	Right front of engine. See Fig. 8.
Generator (5.7L)	Right front of engine. See Fig. 72.
Generator (6.1L)	Right front of engine. See Fig. 40.
Global Positioning System Antenna (Navigation)	Behind instrument cluster.
Horn No. 1	Right front of engine compartment. See Fig. 48.
Horn No. 2	Right front of engine compartment. See Fig. 48.
Ignition Capacitor No. 1 (2.7L)	Near breakout for ignition coil no. 5. See Fig. 69.
Ignition Capacitor No. 1 (6.1L)	Rear of left engine head. See Fig. 70.
Ignition Capacitor No. 2 (2.7L & 5.7L)	Top left of engine. See Fig. 6.
Ignition Coil No. 1 (2.7L)	Top right front of engine. See Fig. 69.
Ignition Coil No. 1 (3.5L)	Top right front of engine.
Ignition Coil No. 1 (5.7L)	Top left rear of engine. See Fig. 13.
Ignition Coil No. 1 (6.1L)	Top right rear of engine. See Fig. 40.
Ignition Coil No. 2 (2.7L)	Top left rear of engine. See Fig. 6.
Ignition Coil No. 2 (3.5L)	Top left side of engine. See Fig. 10.
Ignition Coil No. 2 (5.7L)	Top right rear of engine. See Fig. 12.
Ignition Coil No. 2 (6.1L)	Top right front of engine. See Fig. 70.
Ignition Coil No. 3 (2.7L)	Top right of engine. See Fig. 69.
Ignition Coil No. 3 (3.5L)	Top right of engine.
Ignition Coil No. 3 (5.7L)	Top left rear of engine. See Fig. 13.
Ignition Coil No. 3 (6.1L)	Right rear of engine. See Fig. 40.
Ignition Coil No. 4 (2.7L)	Top left rear of engine. See Fig. 6.
Ignition Coil No. 4 (3.5L)	Top left of engine. See Fig. 10.
Ignition Coil No. 4 (5.7L)	Top right of engine. See Fig. 12.
Ignition Coil No. 4 (6.1L)	Top right front of engine. See Fig. 70.
Ignition Coil No. 5 (2.7L)	Top right rear of engine. See Fig. 69.
Ignition Coil No. 5 (3.5L)	Top right rear of engine.
Ignition Coil No. 5 (5.7L)	Top left rear of engine. See Fig. 13.
Ignition Coil No. 5 (6.1L)	Right rear of engine. See Fig. 40.
Ignition Coil No. 6 (2.7L)	Top left rear of engine. See Fig. 6.
Ignition Coil No. 6 (3.5L)	Top left side of engine. See Fig. 10.
Ignition Coil No. 6 (5.7L)	Top right rear of engine. See Fig. 12.

Ignition Coil No. 6 (6.1L)	Top right rear of engine. See Fig. 70.
Ignition Coil No. 7 (5.7L)	Top left rear of engine. See Fig. 13.
Ignition Coil No. 7 (6.1L)	Top right rear of engine. See Fig. 40.
Ignition Coil No. 8 (5.7L)	Top right rear of engine. See Fig. 12.
Ignition Coil No. 8 (6.1L)	Top right rear of engine. See Fig. 70.
Left Side Curtain Airbag	Body, behind left rear seat. See Fig. 28.
Left Side Thorax Airbag	Driver seat.
Park Assist Display (Parktronics)	Rear center of headliner, above backlite. See Fig. 30.
Passenger Airbag Squib	Right side of dash. See Fig. 53.
Passenger Seat Belt Pretensioner	Right "B" pillar. See Fig. 59.
Radio Amplifier	Left of dash. See Fig. 16.
Radio Antenna (Except Magnum)	Upper right backlight. See Fig. 62.
Right Side Curtain Airbag	Body, behind right rear seat. See Fig. 62.
Right Side Thorax Airbag	Driver seat.
Satellite Antenna No. 1	Left rear of cargo area. See Fig. 33.
Satellite Antenna No. 2	Left rear of cargo area. See Fig. 33.
Satellite Radio Antenna Cable No. 1	Rear center of headliner. See Fig. 32.
Satellite Radio Antenna Cable No. 2	Rear center of headliner. See Fig. 32.
Satellite Video Antenna 1	Interior mirror jumper.
Seat Back Heater-Left	Near driver seat back pivot.
Seat Back Heater-Left Rear	Rear seat near left belt. See Fig. 58.
Seat Back Heater-Right	Near passenger seat back pivot. See Fig. 57.
Seat Back Heater-Right Rear	Rear seat near right belt. See Fig. 58.
Seat Cushion Heater-Left	Under driver seat.
Seat Cushion Heater-Right	Under passenger seat. See Fig. 57.
Siren	Left front wheel well. See Fig. 39.
Subwoofer Amplifier (SRT8)	Center rear shelf. See Fig. 62.
Throttle Body (2.7L)	Top of intake manifold. See Fig. 6.
Throttle Body (3.5L)	Top of intake manifold. See Fig. 9.
Throttle Body (5.7L)	Top of intake manifold. See Fig. 13.
Throttle Body (6.1L)	Top of intake manifold. See Fig. 40.
Tire Pressure Transponder-Left Front	Left front side of engine compartment. See Fig. 48.
Tire Pressure Transponder-Right Front	Right front of engine compartment. See Fig. 47.
Tire Pressure Transponder-Right Rear	Right rear wheel well. See Fig. 62.
Zener Diode	Power distribution center. See Fig. 75.

CONNECTORS

CONNECTORS LOCATION

Component	Location
C100 (2.7L & 3.5L) (Black, 14 Pin)	Right side of engine compartment. See Fig. 4 .
C100 (6.1L) (Black, 16 Pin)	Right side of engine compartment. See Fig. 40 .
C101 (5.7L MDS) (Dark Gray, 6 Pin)	Left rear of engine. See Fig. 13 .
C102 (Light Gray/Black, 43 Pin)	Right side of dash. See Fig. 53 .
C103 (LX48) (Dark Gray, 6 Pin)	Right front of engine compartment. See Fig. 47 .
C104 (Black, 43 Pin)	Right side of dash. See Fig. 56 .
C105 (Brown, 43 Pin)	Right side of dash. See Fig. 56 .
C107 (6.1L) (Black, 2 Pin)	Top front of engine. See Fig. 40 .
C200 (Natural/Black, 43 Pin)	Right side of dash. See Fig. 53 .
C202 (Natural, 16 Pin)	Right side of HVAC unit. See Fig. 53 .
C203 (Black, 43 Pin)	Left kick panel. See Fig. 53 .
C204 (Natural, 18 Pin)	Right side of dash. See Fig. 53 .
C205 (Except Base) (Natural, 18 Pin)	Left side of dash. See Fig. 53 .
C207 (Black, 2 Pin)	Right side of dash. See Fig. 53 .
C209 (Yellow, 2 Pin)	Instrument panel to audio/video jumper.
C210 (Satellite Video) (Yellow, 2 Pin)	Audio/video jumper to interior mirror jumper.
C300 (Natural, 24 Pin)	Driver door. See Fig. 55 .
C301 (Natural, 24 Pin)	Passenger door. See Fig. 56 .
C302 (Natural, 10 Pin)	Left rear door. See Fig. 27 .
C303 (Natural, 10 Pin)	Right rear door. See Fig. 59 .
C304 (LX49) (Light Gray, 6 Pin)	Top front of liftgate. See Fig. 65 .
C305 (LX49) Light Gray, 6 Pin	Top front of liftgate. See Fig. 65 .
C306 (Black, 10 Pin)	Right rear body. See Fig. 63 .
C307 (LX48) (Black, 6 Pin)	Left taillight assembly. See Fig. 36 .
C308 (LX48) (Black, 6 Pin)	Right taillight assembly. See Fig. 36 .
C309 (LX49) (Dark Gray, 6 Pin)	Left rear fascia. See Fig. 43 .
C310 (LX49) (Dark Gray, 6 Pin)	Right rear fascia. See Fig. 43 .
C311 (Natural, 10 Pin)	Rear of sunroof. See Fig. 31 .
C313 (Light Gray, 14 Pin)	Below driver seat. See Fig. 67 .
C314 (Light Gray, 14 Pin)	Below passenger seat. See Fig. 56 .
C315 (White, 4 Pin)	Left rear of driver's seat. See Fig. 67 .
C316 (Light Gray, 2 Pin)	Passenger seat. See Fig. 57 .
C317 (Natural, 26 Pin)	Left kick panel. See Fig. 61 .
C319 (Rear Heated Seats) (Light Gray, 12 Pin)	Rear of center console. See Fig. 56 .
C320 (Rear Heated Seats) (Light Gray, 6 Pin)	Under right rear seat. See Fig. 58 .
C321 (Rear Heated Seats) (Green, 2 Pin)	Under center of rear seat. See Fig. 58 .
C322 (Yellow, 4 Pin)	Front seat to seat airbag jumper. See Fig. 55 .
C323 (Yellow, 4 Pin)	Floor, below center console. See Fig. 56 .

C326 (DVD) (White, 24 Pin)

Left rear body. See **Fig. 61.**

GROUND S

GROUND S LOCATION

Component	Location
G100	Left front of engine compartment. See Fig. 2.
G101	Right front of engine compartment. See Fig. 49.
G102	Right of engine compartment. See Fig. 49.
G104 (2.7L)	Right side of engine. See Fig. 5.
G104 (3.5L)	Right side of engine. See Fig. 8.
G104 (5.7L)	Right side of engine. See Fig. 12.
G104 (6.1L)	Top of right cylinder head cover. See Fig. 40.
G105 (2.7L & 3.5L)	Engine, near breakout for ignition coil #5.
G105 (5.7L)	Rear of engine. See Fig. 12.
G105 (6.1L)	Rear of engine. See Fig. 40.
G106 (2.7L)	Left side of engine. See Fig. 6.
G106 (3.5L)	Left side of engine. See Fig. 9.
G106 (5.7L)	Rear of engine. See Fig. 12.
G106 (6.1L)	Left rear of cylinder head. See Fig. 40.
G109 (Except 6.1L)	Right shock tower, near purge solenoid. See Fig. 49.
G109 (6.1L)	Top of right cylinder head cover. See Fig. 40.
G200	Left side of dash, near breakout for ignition switch. See Fig. 53.
G201	Right side of dash. See Fig. 53.
G202	Left of dash, near breakout for cluster C3. See Fig. 53.
G300	Left "B" pillar. See Fig. 55.
G301	Right "B" pillar. See Fig. 56.
G302	Right front of cargo pan. See Fig. 29.
G303	Right rear cargo pan. See Fig. 35.
G304	Next to deck lid latch. (LX48). See Fig. 64.

SPLICES

SPLICES LOCATION

Component	Location
S100 (2.7L)	Left rear of engine. See Fig. 6.
S100 (3.5L)	Left rear of engine. See Fig. 9.
S100 (5.7L)	Right rear of engine. See Fig. 12.

S100 (6.1L)	Rear of engine. See Fig. 40.
S101	Front fascia harness.
S102	Front fascia harness.
S103	Front fascia harness.
S104	Front fascia harness.
S105 (2.7L)	Right rear of engine compartment. See Fig. 5.
S105 (3.5L)	Right rear of engine compartment. See Fig. 8.
S105 (5.7L)	Right rear of engine compartment.
S105 (6.1L)	Right rear of engine compartment. See Fig. 40.
S106 (2.7L)	Right rear of engine compartment. See Fig. 5.
S106 (3.5L)	Right rear of engine compartment. See Fig. 8.
S106 (5.7L)	Right rear of engine. See Fig. 12.
S106 (6.1L)	Right rear of engine compartment. See Fig. 40.
S107 (2.7L)	Top of engine. See Fig. 6.
S107 (5.7L)	Top of engine. See Fig. 12.
S107 (6.1L)	Rear of engine. See Fig. 40.
S108 (6.1L)	Right rear top of engine, next to ignition coil #8. See Fig. 40.
S108 (2.7L)	Rear of engine. See Fig. 6.
S108 (3.5L)	Between breakout for fuel injectors 4 & 6. See Fig. 10.
S108 (5.7L)	Top of engine between fuel injectors 5 & 7.
S109 (3.5L)	Right rear of engine. See Fig. 46.
S109 (6.1L)	Right rear of engine. See Fig. 40.
S110 (2.7L)	Right rear of engine compartment. See Fig. 5.
S110 (3.5L)	Right rear of engine compartment. See Fig. 9.
S110 (5.7L)	Right rear of engine compartment. See Fig. 12.
S110 (6.1L)	Right rear of engine compartment. See Fig. 40.
S111 (2.7L)	Left side of engine. See Fig. 6.
S111 (5.7L)	Right rear side of engine. See Fig. 12.
S111 (6.1L)	Right rear side of engine. See Fig. 40.
S112 (2.7L)	Right rear of engine compartment. See Fig. 5.
S112 (3.5L)	Right rear of engine compartment. See Fig. 8.
S112 (5.7L)	Right rear of engine. See Fig. 12.
S112 (6.1L)	Right rear of engine compartment. See Fig. 40.
S113	Engine harness. See Fig. 8.
S114 (2.7L)	Right rear of engine compartment. See Fig. 5.
S114 (3.5L)	Right rear of engine compartment. See Fig. 8.
S115 (5.7L)	Right side of engine. See Fig. 12.
S115 (6.1L)	Right side of engine. See Fig. 40.
S120	Right front of engine compartment. See Fig.

	47.
S122	Right side of engine compartment. See Fig. 49.
S123	Right front of engine compartment. See Fig. 49.
S124	Right side of engine compartment. See Fig. 49.
S125	Left rear of engine compartment. See Fig. 50.
S126	Right rear of engine compartment. See Fig. 50.
S127	Right side of engine compartment. See Fig. 49.
S128	Front of engine compartment. See Fig. 48.

MODULE PROGRAMMING

The Wireless Ignition Node (WIN) controls the Vehicle Theft Security System (VTSS), Remote Keyless Entry (RKE). When a Powertrain Control Module (PCM) is in need of replacement, perform the following steps in order:

NOTE: The PCM and the WIN should never be replaced at the same time. They should be replaced independently of each other.

1. If applicable, first replace the PCM with the original WIN still connected to the vehicle.
2. Using a scan tool program the new PCM. (This will ensure the transfer of the Secret Key data from the original WIN into the new PCM).
3. Replace the WIN, using the scan tool program the new WIN module. This will transfer the Secret Key data from the PCM into the new WIN.
4. With the scan tool reprogram the key FOBs to the new WIN.
5. Ensure all the customer's keys have been programmed to the new module.

NOTE: If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: Programming the PCM or WIN is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour and then enter the correct PIN. Be certain that all accessories are turned OFF. Also, monitor the battery state and connect a battery charger if necessary.

CAUTION: Read all notes and cautions for programming procedures.

NOTE: Have a unique vehicle PIN readily available before running the routine

CAUTION: If the PCM and WIN are replaced at the same time, the PCM MUST be programmed before the WIN.

NOTE: If the PCM and the WIN are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new WIN.

CAUTION: Read all notes and cautions for programming procedures.

NOTE: If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: A maximum of eight keys can be learned by the WIN. Once a key is learned by a WIN, that key has acquired the Secret Key for that WIN and cannot be transferred to any other WIN or vehicle.

CAUTION: Read all notes and cautions for programming procedures.

CAUTION: If the PCM and WIN are replaced at the same time, the PCM **MUST** be programmed before the WIN.

PROGRAMMING THE SECRET KEY TO THE WIN

The secret key is an ID code that is unique to each WIN. This code is programmed and stored in the WIN, the PCM, and each ignition key transponder chip. When the PCM or WIN is replaced, it is necessary to program the Secret Key Code into the new module using a diagnostic scan tool. Follow the programming steps outlined in the diagnostic scan tool for **PCM REPLACED**, **WIN REPLACED**, or **TIPM REPLACED** under **MISCELLANEOUS FUNCTIONS** for the **WIRELESS CONTROL MODULE** menu item as appropriate.

NOTE: Programming the PCM or WIN is done using a diagnostic scan tool and a PIN to enter secure access mode. If three attempts are made to enter secure access mode using an incorrect PIN, secure access mode will be locked out for one hour. To exit this lockout mode, turn the ignition to the RUN position for one hour and then enter the correct PIN. Be certain that all accessories are turned OFF. Also, monitor the battery state and connect a battery charger if necessary.

PCM/WIN PROGRAMMING

When an PCM and the WIN are replaced at the same time, perform the following steps in order:

1. Program the new WIN.
2. Replace all ignition keys and program them to the new WIN.

PROGRAMMING THE WIN

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.

NOTE: Have a unique vehicle PIN readily available before running the routine

CAUTION: If the PCM and WIN are replaced at the same time, the PCM **MUST** be programmed before the WIN.

3. Select "ECU View."
4. Select "WIN".
5. Select "Miscellaneous Functions."
6. Select "WIN Replaced".
7. Enter the PIN when prompted.
8. Cycle ignition key after the successful routine completion.

NOTE: If the PCM and the WIN are replaced at the same time, all vehicle keys will need to be replaced and programmed to the new WIN.

PROGRAMMING IGNITION KEYS TO THE WIN

Each FOB/K has a unique ID code that is assigned at the time the key is manufactured. When a key is programmed into the WIN, the module learns the transponder ID code and the transponder acquires the unique Secret Key ID code from the WIN.

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.
3. Have a unique vehicle PIN readily available before running the routine.
4. Ignition key should be in RUN position.
5. Select "ECU View".
6. Select "WIN Wireless Control".
7. Select "Miscellaneous Functions."
8. Select "Program Ignition Keys or Key FOBs", Start
9. Enter the PIN when prompted.

10. Verify the correct information.
11. Cycle ignition key after the successful routine completion.

NOTE: If the original keys do not successfully program to the new WIN after the proper procedures are followed correctly, programming new keys will be necessary.

NOTE: A maximum of eight keys can be learned by the WIN. Once a key is learned by a WIN, that key has acquired the Secret Key for that WIN and cannot be transferred to any other WIN or vehicle.

PROGRAMMING THE PCM

CAUTION: Read all notes and cautions for programming procedures.

1. Connect a battery charger to the vehicle.
2. Connect the scan tool.
3. Have a unique vehicle PIN readily available before running the routine.
4. Ignition key should be in RUN position.

CAUTION: If the PCM and WIN are replaced at the same time, the PCM MUST be programmed before the WIN.

5. Select "ECU View".
6. Select "WIN Wireless Control".
7. Select "Miscellaneous Functions."
8. Select "PCM Replaced".
9. Enter the PIN when prompted.
10. Verify the correct information.
11. Cycle ignition key after the successful routine completion.

COMMUNICATION

DESCRIPTION

DESCRIPTION

The primary on-board communication network between the microprocessor-based Electronic Control Modules (ECMs) in this vehicle is the Controller Area Network (CAN) data bus system. A data bus network minimizes redundant wiring connections; and at the same time, reduces wire harness complexity, sensor current loads and controller hardware by allowing each sensing device to be

connected to only one module, (also referred to as a node). Each node reads, then broadcasts its sensor data over the bus for use by all other nodes requiring that data. Each node ignores the messages on the bus that it cannot use.

The CAN bus is a two-wire multiplex system. Multiplexing is any system that enables the transmission of multiple messages over a single channel or circuit. The CAN bus is used for communication between most vehicle nodes. However, in addition to the CAN bus network, certain nodes may also be equipped with a Local Interface Network (LIN) data bus. The LIN data bus is a single wire low-speed (9.6 Kbps) serial link bus used to provide direct communication between a LIN master module and certain switch or sensor inputs.

There are actually three separate CAN bus systems used in the vehicle. They are designated: the CAN-B, the CAN-C and the Diagnostic CAN-C. The CAN-B and CAN-C systems provide on-board communication between all of the nodes that are connected to them. The CAN-C is the faster of the two systems providing near real-time communication (500 Kbps), but is less fault tolerant than the CAN-B system. The CAN-C is used typically for communications between more critical nodes, while the slower (83.3 Kbps), but more fault tolerant CAN-B system is used for communications between less critical nodes. The CAN-B fault tolerance comes from its ability to revert to a single wire communication mode if there is a fault in the bus wiring.

The added speed of the CAN data bus is many times faster than previous data bus systems. This added speed facilitates the addition of more Electronic Control Modules (ECMs) or nodes and the incorporation of many new electrical and electronic features in the vehicle.

The Diagnostic CAN-C bus is also capable of 500 Kbps communication and is sometimes informally referred to as the CAN-D system to differentiate it from the other high speed CAN-C bus. The Diagnostic CAN-C is used exclusively for the transmission of diagnostic information between the Totally Integrated Power Module (TIPM) and a diagnostic scan tool connected to the industry-standard 16-way Data Link Connector (DLC) located beneath the instrument panel on the driver side of the vehicle.

The TIPM is located in the engine compartment near the battery. The central CAN gateway or hub module integral to the TIPM, connects to all three CAN buses. This gateway physically and electrically isolates the CAN buses from each other and coordinates the bi-directional transfer of messages between them.

OPERATION

OPERATION

The Controller Area Network (CAN) data bus allows all electronic modules or nodes connected to the bus to share information with each other. Regardless of whether a message originates from a module on the lower speed CAN-B bus or on the higher speed CAN-C or CAN-D bus, the message structure and layout is similar, which allows the Totally Integrated Power Module (TIPM) to process and transfer messages between the CAN buses. The TIPM also stores a Diagnostic Trouble Code (DTC) for certain bus network faults.

All modules (also referred to as nodes) transmit and receive messages over one of these buses. Data

exchange between nodes is achieved by serial transmission of encoded data messages. Each node can both send and receive serial data simultaneously. Each digital bit of a CAN bus messages carries over the bus as a voltage differential between the two bus circuits which, when strung together, form a message. Each node uses arbitration to sort the message priority if two competing messages are attempting to be broadcast at the same time.

The instrument cluster (also known as the Cab Compartment Node/CCN) is the Local Interface Network (LIN) master module in this vehicle and it gathers information from the compass module, the instrument panel switch bank, the Steering Control Module (SCM) and the Heated Seat Module (HSM) through the LIN data bus. There is also LIN bus communication between the individual Tire Pressure Monitor (TPM) transponders and the Wireless Ignition Node (WIN). Both the CCN and the WIN either act directly upon the information received through the LIN data bus, relay the information to other nodes in the vehicle using electronic messages placed on the CAN bus or both.

The voltage network used to transmit messages requires biasing and termination. Each module on the CAN bus network provides its own biasing and termination. There are two types of nodes used in the CAN bus network. On the CAN-C bus, a dominant node has a 120 Ohm termination resistance while a non-dominant (or recessive) node has about a 2500 to 3000 Ohm (2.5 to 3.0 kilohm) termination resistance. The dominant nodes on the CAN-C bus are the WIN and the Powertrain Control Module (PCM).

The termination resistance of the two dominant nodes are combined in parallel to provide a total of about 60 Ohms. This resistance value may vary somewhat by application, depending upon the number of non-dominant nodes on the CAN-C bus. On the CAN-D bus (or Diagnostic CAN-C) all of the 60 Ohm termination resistance is present in the TIPM.

NOTE: All measurement of termination resistance is done with the vehicle battery disconnected.

NOTE: Termination resistance of a CAN-B node cannot be verified with a Digital Multi-Meter (DMM) or Digital Volt-Ohm Meter (DVOM). The transceiver of each CAN-B node connects to termination resistors internally. When the vehicle battery is disconnected, the internal connections of all CAN-B node transceivers are switched open, disconnecting the termination resistors. Therefore, the total bus resistance measured under these conditions will be extremely high or infinite, which does not accurately reflect the actual termination resistance of the CAN-B bus.

The communication protocol being used for the CAN data bus is a non-proprietary, open standard adopted from the Bosch CAN Specification 2.0b. The CAN-C is the faster of the two primary buses in the CAN bus system, providing near real-time communication (500 Kbps).

The CAN bus nodes are connected in parallel to the two-wire bus using a twisted pair, where the wires are wrapped around each other to provide shielding from unwanted electromagnetic induction, thus preventing interference with the relatively low voltage signals being carried through them. The twisted pairs have between 33 and 50 twists per meter (yard). While the CAN bus is operating (active), one of the bus wires will carry a higher voltage and is referred to as the CAN High or CAN

bus (+) wire, while the other bus wire will carry a lower voltage and is referred to as the CAN Low or CAN bus (-) wire. Refer to the CAN Bus Voltages table.

CAN Bus Voltages (Normal Operation)								
CAN-C Bus Circuits	Sleep	Recessive (Bus Idle)	Dominant (Bus Active)	CAN-L Short to Ground	CAN-H Short to Ground	CAN-L Short to Battery	CAN-H Short to Battery	CAN-H Short to CAN-L
CAN-L (-)	0 V	2.4 - 2.5 V	1.3 - 2.3 V	0 V	0.3 - 0.5V	Battery Voltage	Battery Voltage Less 0.75 V	2.45 V
CAN-H (+)	0 V	2.4 - 2.5 V	2.6 - 3.5 V	0.02 V	0 V	Battery Voltage Less 0.75 V	Battery Voltage	2.45 V
CAN-B Bus Circuits	Key-Off (Bus Asleep)		Key-On (Bus Active)	CAN-L Short to Ground	CAN-H Short to Ground	CAN-L Short to Battery	CAN-H Short to Battery	CAN-H Short to CAN-L
CAN-L (-)	10.99 V		4.65 - 4.98 V	0 V	4.5 - 4.7 V	Battery Voltage	4.5 - 4.7 V	0.3 - 0.7 V
CAN-H (+)	0.0 V		0.39 - 0.46 V	0.3 - 0.7 V	0 V	0.3 - 0.7 V	Battery Voltage	0.3 - 0.7 V
Notes								
All measurements taken between node ground and CAN terminal with a standard DVOM. DVOM displays average network voltage.								
Total resistance of the CAN-C network can also be measured (60 Ohms). Cannot measure total resistance of CAN-B network.								

In order to minimize the potential effects of the Ignition-OFF Draw (IOD), the CAN-B network employs a sleep strategy. However, a network sleep strategy should not be confused with the sleep strategy of the individual nodes on that network, as they may differ. For example: The CAN-C bus network awakes only when the ignition switch is in the ON or START positions; however, the TIPM, which is on the CAN-C bus, may still be awake with the ignition switch in the ACCESSORY or UNLOCK positions. The integrated circuitry of an individual node may be capable of processing certain sensor inputs and outputs without the need to utilize network resources.

The CAN-B bus network remains active until all nodes on that network are ready for sleep. This is determined by the network using tokens in a manner similar to polling. When the last node that is active on the network is ready for sleep and it has already received a token indicating that all other nodes on the bus are ready for sleep, it broadcasts a **bus sleep acknowledgment** message that causes the network to sleep. Once the CAN-B bus network is asleep, any node on the bus can awaken it by transmitting a message on the network. The TIPM keeps either the CAN-B or the CAN-C bus awake for a timed interval after it receives a diagnostic message for that bus over the Diagnostic CAN-C bus.

In the CAN system, available options are configured into the TIPM at the assembly plant, but

additional options can be added in the field using the diagnostic scan tool. The configuration settings are stored in non-volatile memory. The TIPM also has two 64-bit registers, which track each of the **as-built** and **currently responding** nodes on the CAN-B and CAN-C buses. The TIPM stores a Diagnostic Trouble Code (DTC) in one of two caches for any detected active or stored faults in the order in which they occur. One cache stores powertrain (P-Code), chassis (C-Code) and body (B-Code) DTCs, while the second cache is dedicated to storing network (U-Code) DTCs.

If there are intermittent or active faults in the CAN network, a diagnostic scan tool connected to the Diagnostic CAN-C bus through the 16-way Data Link Connector (DLC) may only be able to communicate with the TIPM. To aid in CAN network diagnosis, the TIPM provides CAN-B and CAN-C network status information to the scan tool using certain diagnostic signals. In addition, the transceiver in each node on the CAN-C bus will identify a **bus off hardware failure**, while the transceiver in each node on the CAN-B bus will identify a **general bus hardware failure**. The transceivers for some CAN-B nodes also identifies certain failures for both CAN-B bus signal wires.

MODULE, ANTI-LOCK BRAKE SYSTEM

DESCRIPTION

DESCRIPTION

Fig. 1: Antilock Brake Module (ABM) Integrated Control Unit
Courtesy of CHRYSLER LLC

The Antilock Brake Module (ABM) is a microprocessor-based device which monitors the Antilock Brake System (ABS) during normal braking and controls it when the vehicle is in an ABS stop. The ABM also monitors the Electronic Stability Program (ESP).

The ABM (1) is mounted to the HCU (2) as part of the Integrated Control Unit (ICU). The ABM uses a 47-Way connector on the vehicle wiring harness. The power source for the ABM is through the

ignition switch in the RUN or ON position. The ABM is on the CAN-C bus.

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

OPERATION

OPERATION

The primary functions of the Antilock Brake Module (ABM) are to:

- Monitor the Antilock Brake System (ABS) and Electronic Stability Program (ESP) for proper operation.
- Detect wheel locking or wheel slipping tendencies by monitoring the speed of all four wheels of the vehicle.
- Control fluid modulation to the wheel brakes while the system is in ABS or traction control mode.
- Modulates fluid pressure to the wheel brakes to control vehicle yaw rate in ESP mode.
- Store diagnostic information.
- Provide communication to the scan tool while in diagnostic mode.
- Illuminate the amber TCS/ESP indicator in the instrument cluster.

The ABM constantly monitors the ABS and ESP (if equipped) for proper operation. If the ABM detects a fault, it will turn on the amber TCS/ESP indicator and disable the ABS or ESP if so equipped. The normal base braking system will remain operational at that time.

The ABM continuously monitors the speed of each wheel through the signals generated by the wheel speed sensors to determine if any wheel is beginning to lock. When a wheel locking tendency is detected, the ABM commands the ABM solenoid coils to actuate. The coils then open and close the valves in the HCU that modulate brake fluid pressure in some or all of the hydraulic circuits. The ABM continues to control pressure in individual hydraulic circuits until a locking tendency is no longer present.

REMOVAL

REMOVAL

CAUTION: For Adaptive Cruise Control (ACC) equipped vehicles, the ABM and HCU are not separately serviceable. They must be replaced as an assembly.

2. Disconnect ABM harness connector from antilock brake module (ABM). To do so:
 - a. Depress tabs on each side of connector cover, then
 - b. Pull outward and upward on lower half of cover until it locks into position pointing straight outward (2). Connector can then be pulled straight outward off ABM (1).

NOTE: **DO NOT** remove any brake lines from the ICU fluid ports while performing the following steps. The ABM can be removed and installed without doing so.

INSTALLATION

INSTALLATION

Fig. 10: Solenoid Valve Seal
Courtesy of CHRYSLER LLC

CAUTION: When installing new O-rings or solenoid valve stem seals, do not use any type of lubricant.

1. Clean any debris off the mating surfaces of the HCU and ABM.
2. If the seals (1) on the solenoid valve stems (2) are not new, replace them all. Each of the solenoid valve stem seals must be new to keep out moisture and debris; **do not reuse solenoid valve stem seals** .

Fig. 11: Internal Pump Connector O-Ring

11. Connect battery negative cable (2) to battery post. It is important that this is performed properly.

Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .

12. Perform ABS Verification Test and clear any faults. Refer to **DTC-Based Diagnostics/MODULE, Antilock Brake (ABS) - Standard Procedure** .

MODULE, DOOR

DESCRIPTION

DESCRIPTION

283667

Fig. 19: Identifying Backside Of Front Door Trim Panel With Door Module (Lt/Rt Similar)
Courtesy of CHRYSLER LLC

The door modules control the express up and down feature as well as normal window functions. It is used only on vehicles equipped with the express up feature. If equipped with memory system, the door module controls the memory mirror. The modules are attached to each front door trim panel.

OPERATION

OPERATION

If the vehicle is equipped with the Express Up power window feature there will be a door module on each front door trim panel. The power window switches and motors are directly wired to the modules. If the vehicle is equipped with the Memory System, the exterior power mirrors and switches are also directly wired to the modules along with the rear door window switches. The modules are wired to the accessory delay relay which allows the operation of the windows and mirrors for a given period of time after the ignition is turned off and providing the doors are not opened. The modules communicate with each other and other modules on the vehicle via the CAN-B bus circuit. There are several Diagnostic Trouble Codes (DTC's) the modules will store if there are problems with the power window system or the memory power mirror system.

ANTI-PINCH

The "Anti-Pinch" function is a safety feature that senses obstacles at the top of the glass and anywhere on the seal where it meets the glass to close during the window closing operation. When a front window switch is pressed to the "Auto-Up" position and the closing window traps an object and the sense current passes its limit, the module will stop the motor and drive the window down approximately 200 millimeters. The pinch force is speed dependent which means that if the vehicle is going over 2km per hour the pinch force will be higher than if the vehicle is stopped.

PANIC MODE

If the window switch is held in the "Auto-Up" position and the closing window traps an object, the module will stop the motor and when the switch is released will drive the window in the opposite direction approximately 10 millimeters. If within 8 seconds after the switch was released to the neutral position, the switch is held again to the "Auto-Up" position, the module will enter the second panic mode. During the second panic mode, the module will drive the motor with full (stall) force and stop. If within 8 seconds after the switch is released again to the neutral position, the switch is held again to the "Auto-Up" position, the module will drive the motor again with full (stall) force and stop.

REMOVAL

REMOVAL

Fig. 20: Door Module Location
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Disconnect and isolate the battery negative cable.
2. Remove front door trim panel. Refer to Body/Door - Front/PANEL, Door Trim - Removal .

3. Disconnect electrical harness connectors.
4. Remove mounting fasteners and module.

INSTALLATION

INSTALLATION

Fig. 21: Door Module Location
Courtesy of CHRYSLER LLC

NOTE: A battery reconnect procedure must be performed anytime the battery has been disconnected. Refer to Electrical - Engine Systems/Battery System - Standard Procedure .

1. Position module.
2. Install and tighten mounting fasteners.
3. Connect electrical harness connectors.
4. Install door trim panel. Refer to Body/Door - Front/PANEL, Door Trim - Installation .
5. Connect battery negative cable.

MODULE, PASSIVE ENTRY

DESCRIPTION

DESCRIPTION

2367725

Fig. 22: Passive Entry Module (PEM)
Courtesy of CHRYSLER LLC

The Passive Entry Module (PEM) (1) is the primary component of the Passive Entry (PE) and Keyless Go (KG) systems. Vehicles not equipped with PE or KG do not have a PEM installed. The PEM contains both the Central Processor Unit (CPU) and transceiver of the PE and KG systems, and is sometimes alternately referred to as the PEKG module or receiver. Concealed within the molded black plastic PEM housing is the printed circuit board and the other electronic circuitry of the module.

The PEM is secured with two screws to the substrate on the back of the instrument panel base trim, above the upper glove box opening near the passenger airbag retainer or chute. Two mounting tabs (2) at opposing corners and two connector receptacles (3) are integral to the PEM housing. The connector receptacles contain all of the terminal pins that connect the PEM to the vehicle electrical system through two dedicated take outs and connectors of the instrument panel wire harness.

There are at least two unique hardware versions of the PEM. These versions are required in order to accommodate the two Controller Area Network (CAN) data bus systems possibly found in Chrysler vehicles, CAN-B or CAN-Interior High Speed (IHS). The PEM used for this platform must be able to communicate with other electronic modules in the vehicle using the CAN-B data bus network.

The PEM cannot be adjusted or repaired and, if damaged or ineffective, it must be replaced. The PEM software is flash programmable.

OPERATION

OPERATION

The microprocessor in the Passive Entry Module (PEM) contains the logic circuits and controls all of the features of the Passive Entry (PE) and Keyless Go (KG) systems. The PEM receives battery voltage on a fused B(+) circuit and is grounded at all times through a hard wired remote ground point. These connections allow the PEM to operate regardless of the ignition switch position and with the IOD fuse removed.

The PEM has sufficient driver outputs to power a number of Low Frequency (LF) Radio Frequency (RF) antennas located within the vehicle, which it uses to communicate with up to eight different FOB with Integrated Key (FOBIK) units that have been programmed to the vehicle. The FOBIK units communicate with the PEM using Very High Frequency (VHF) RF communication on a frequency of 434 MegaHertz (MHz) using digital Frequency-Shift Keying (FSK) modulation, and uses faster data rates for the PE functionality only.

The number of antennas and the specific antenna locations are designed to ensure complete vehicle interior coverage. The LF antennas are each numbered and connected to the PEM on dedicated and sequentially numbered circuits. This arrangement allows the PEM to localize the positions of transmitting FOBIK units using a triangulation strategy. See the LC Low Frequency Antenna And Circuit Numbering table.

LC LOW FREQUENCY ANTENNA AND CIRCUIT NUMBERING	
Location	Antenna And Circuit Number
Instrument Panel	3
Rear Seat	2

The location of a valid FOBIK is critical to the PE and KG features that the PEM will allow. The PEM has the ability to distinguish that a FOBIK is inside, outside or within the trunk of the vehicle. Inside of the vehicle is defined as anywhere within the passenger compartment and up to 10 centimeters (4 inches) from the exterior surfaces of the vehicle. Trunk is defined as anywhere within the trunk compartment of the vehicle.

Outside of the vehicle is defined as anywhere within about 10 centimeters (4 inches) and up to about 2 meters (6.5 feet) from the exterior surfaces of the vehicle, but is further differentiated by zones. The PEM identifies the zone in which the valid FOBIK is located as the active zone, which determines which vehicle aperture becomes accessible. The PEM will not respond to an input from a zone that is not active.

When the PEM microprocessor detects a PE input or KG request, the system program logic challenges the FOBIK to identify whether it is a valid key. If a valid key is detected through the response from the FOBIK, then necessary electronic message commands to other electronic modules in the vehicle will be sent by the PEM to enable or disable the vehicle starting system.

The PEM uses On-Board Diagnostics (OBD) and communicates with other modules in the vehicle as well as with a diagnostic scan tool using the Controller Area Network (CAN) data bus. This method of communication is used by the PEM to acquire vehicle configuration data, including customer programmable features. The PEM communicates with the Wireless Ignition Node (WIN) (also known as the Wireless Control Module/WCM or Sentry Key REmote Entry Module/SKREEM), the ElectroMechanical Instrument Cluster (EMIC) (also known as the Cab Compartment Node/CCN), the Powertrain Control Module (PCM) and the Totally Integrated Power Module (TIPM) (also known as the Forward Control Module/FCM) using the CAN data bus.

The PEM microprocessor monitors all of the PE and KG system circuits, then sets active and stored Diagnostic Trouble Codes (DTC) for any monitored system faults it detects. The PEM will also send electronic message requests to the EMIC for the display of certain textual warning messages related

to PE and KG system operation in the Electronic Vehicle Information Center (EVIC).

The hard wired inputs and outputs of the PEM may be diagnosed using conventional diagnostic tools and procedures. Refer to the appropriate wiring information. However, conventional diagnostic methods will not prove conclusive in the diagnosis of the PEM electronic controls or the communication between modules and other devices that provide some features of the PE and KG systems. The most reliable, efficient and accurate means to diagnose the PEM or the electronic controls and communication related to PE or KG system operation requires the use of a diagnostic scan tool. Refer to the appropriate diagnostic information.

REMOVAL

REMOVAL

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 23: Removal/Install Passive Entry Module (PEM)
Courtesy of CHRYSLER LLC

1. Disconnect and isolate the battery negative cable.
2. Remove the glove box from the instrument panel. Refer to **Body/Instrument Panel/GLOVE BOX, Instrument Panel - Removal** .
3. Reach through the glove box opening (5) and above the glove box latch striker (4) to access and disconnect the two instrument panel wire harness connectors (2) from the Passive Entry

Module (PEM) (3) connector receptacles.

4. Remove the two screws (1) that secure the PEM to the instrument panel base trim substrate.
5. Remove the PEM through the glove box opening.

INSTALLATION

INSTALLATION

WARNING: To avoid serious or fatal injury on vehicles equipped with airbags, disable the Supplemental Restraint System (SRS) before attempting any steering wheel, steering column, airbag, seat belt tensioner, impact sensor, or instrument panel component diagnosis or service. Disconnect and isolate the battery negative (ground) cable, then wait two minutes for the system capacitor to discharge before performing further diagnosis or service. This is the only sure way to disable the SRS. Failure to take the proper precautions could result in accidental airbag deployment.

Fig. 24: Removal/Install Passive Entry Module (PEM)
Courtesy of CHRYSLER LLC

1. Reach through the instrument panel glove box opening (5) and above the glove box latch striker (4) to position the Passive Entry Module (PEM) (3) locating holes onto the two locating pins on the instrument panel base trim substrate.
2. Install and tighten the two screws (1) that secure the PEM to the instrument panel base trim substrate. Tighten the screws securely.
3. Reconnect the two instrument panel wire harness connectors (2) to the PEM connector receptacles.
4. Reinstall the glove box into the instrument panel.
5. Reconnect the battery negative cable.

NOTE: If the PEM is being replaced with a new unit, a diagnostic scan tool **MUST** be used to initialize and configure the new PEM. Follow the programming steps outlined in the diagnostic scan tool for Initialize found under Miscellaneous Functions for the PEM/Passive Entry Module menu item.

MODULE, POWERTRAIN CONTROL

DESCRIPTION

DESCRIPTION - PCM

Fig. 25: PCM Location In Vehicle
Courtesy of CHRYSLER LLC

The Powertrain Control Module (PCM) is located in the engine compartment. The PCM is referred to as NGC.

MODES OF OPERATION

As input signals to the Powertrain Control Module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for wide open throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop** .

During Open Loop modes, the PCM receives input signals and responds only according to preset PCM programming. Input from the oxygen (O2S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O2S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel

ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O2S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensors (TPS) and pedal value sensors are monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O2S sensor heater element is energized via the O2S heater drivers (solid state devices) internal to the PCM. These drivers provide a PWM 0-12V signal to heat the O2S heater elements to optimize the O2S sensor signal output. The O2S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The PCM receives inputs from:

- Direct Battery voltage
- Pedal Value Sensors (PVS)
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensors (TPS)
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within approximately 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay located in the IPM.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by actuating ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the PCM receives inputs from:

- Direct Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal)
- Pedal Value Sensors (PVS)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

- The PCM adjusts engine idle speed through the electronic throttle control (ETC) motor and adjusts ignition timing accordingly.
- The PCM operates the A/C compressor clutch through the clutch relay. This is done if A/C has been selected by the vehicle operator and requested by the A/C thermostat.
- When engine has reached operating temperature, the PCM will begin monitoring O2S sensor to control the air/fuel ratio. The system will then leave the warm-up mode and go into closed loop operation.

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)
- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Battery voltage
- Park/neutral switch (gear indicator signal)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the electronic throttle control (ETC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the A/C clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the PCM receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)
- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio.
- The PCM adjusts ignition timing by turning the ground path to the coils on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

ACCELERATION MODE

This is an Open Loop mode. The PCM recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the PCM receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)

- Throttle position sensors (TPS)
- Camshaft position sensor signal
- Park/neutral switch (gear indicator signal)
- Vehicle speed

If the vehicle is under hard deceleration with the proper RPM and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

The PCM adjusts ignition timing by turning the ground path to the coils on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the PCM receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Pedal Value Sensors (PVS)
- Throttle position sensors (TPS)
- Camshaft position sensor signal

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

5V POWER SUPPLIES

The Powertrain Control Module (PCM) supplies two independent regulated 5V power supply circuits; primary and secondary.

IGNITION CIRCUIT SENSE

The ignition switch power feeds to the PCM originate from the Integrated Power Module (IPM) after it determines what position the ignition key is in. The ACC and Run/Start feeds are hard wired from the IPM to the PCM. There is no hard wire Start feed to the PCM, because the IPM indicates via a CAN bus message to the PCM when the key is in the START (Crank) position.

POWER GROUNDS

The Powertrain Control Module (PCM) has 2 main grounds - power grounds for engine functions and power grounds for transmission functions (if equipped with 42RLE). Both of these grounds are referred to as power grounds. All of the high current electrically noisy devices are connected to these grounds. The sensor return comes into the sensor return circuit internal to the module, passes through noise suppression, and is then connected to the power ground internal to the module so as to minimize the effects of the high current and electrically noisy devices on various sensor signals.

The power ground is used to control ground circuits for the following PCM loads:

- Fuel injectors
- Ignition coil(s)
- Certain relays/solenoids
- Certain sensors

SENSOR RETURN

The Sensor Return circuits are internal to the Powertrain Control Module (PCM).

Sensor Return provides a low noise ground reference for all engine control system sensors. Refer to Power Grounds for more information on engine AND transmission PCM power grounds.

OPERATION

OPERATION - PCM

1. Also refer to Modes of Operation.

The PCM operates the fuel system. The PCM is a pre-programmed, dual microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine RPM, manifold absolute pressure, engine coolant temperature, throttle position, pedal value, transmission gear selection (automatic transmission), vehicle speed and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

- A/C select AND request via CAN communication bus
- Auto shutdown (ASD) sense
- Brake switches 1 AND 2
- Direct Battery voltage
- EGR Position sensor
- EVAP purge solenoid current sense
- Camshaft position sensor signal
- Crankshaft position sensor
- CAN C bus communication for internal module communication and data link connection for scan tools
- Engine coolant temperature sensor
- 5 volts (primary)
- 5 volts (secondary)
- Fuel level via CAN communication bus from IPM
- Generator (battery voltage sense) output
- Ignition circuit sense (ACC AND Run/Start via hardwire from Integrated Power Module (IPM) while the Crank indication is via CAN communication bus)
- Intake manifold air temperature sensor
- Evaporative system ESIM vacuum switch (if equipped)
- Manifold absolute pressure (MAP) sensor
- Oil pressure
- Oxygen sensors signals
- Park/neutral switch
- Power ground
- Sensor return
- Signal ground
- Speed control switch states are determined by SCM and transmitted over the bus via CAN bus
- SRV position sensor signal
- Throttle position sensors and Pedal value sensors
- Transmission pressure switch inputs (42RLE)
- Transmission variable line pressure sensor (42RLE)
- Transmission temperature sensor (42RLE)

- Vehicle speed (ABS equipped) via CAN C bus from ABS module
- Vehicle Speed (Non-ABS) from IPM via CAN C and Trans Turbine sensors (with pinion factor)
- A/C clutch relay
- Auto shutdown (ASD) relay coil
- CAN C bus messages for speedometer (non-ABS packages), voltmeter or generator lamp (if equipped), fuel gauge, oil pressure gauge/lamp, engine coolant temperature gauge and speed control indication warning lamp
- CAN bus communication for inter module communication and data link connection for scan tools
- EGR valve control solenoid (if equipped)
- Electronic Throttle Control (ETC) motor
- EVAP Purge solenoid
- Fuel injectors
- Fuel pump relay
- Generator field driver
- Ignition coils
- Malfunction indicator lamp (also known as MIL). Driven through Bus Messages.
- Oxygen sensor heater elements
- Radiator cooling fan relay via CAN bus message to IPM
- Short Runner Valve (SRV) actuator (if equipped)
- Tachometer (if equipped). Driven through Bus Messages.
- Transmission solenoids (42RLE only)
- Transmission power relay

5 VOLT SUPPLIES

Primary 5-volt supply:

- supplies the required 5 volt power source to the Crankshaft Position (CKP) sensor.
- supplies the required 5 volt power source to the oil pressure sensor (if equipped).
- supplies the required 5 volt power source to the Pedal Value Sensor #1.
- supplies a reference voltage for the Throttle Position Sensor (TPS) sensors 1 AND 2.

Secondary 5-volt supply:

- supplies the required 5 volt power source for the Camshaft Position Sensor.
- supplies the 5 volt power source to the EGR position sensor (if equipped).
- supplies a reference voltage for the Manifold Absolute Pressure (MAP) sensor.
- supplies the 5 volt power source to the Pedal Value Sensor #2, SRV Position Feedback sensor (if equipped).

- supplies the 5 volt power source to the transmission variable line pressure sensor (if equipped with 42RLE transmission).

OPERATION - IGNITION CIRCUIT SENSE

When the ignition key is inserted, the position of the key is transmitted via the CAN bus to Integrated Power Module (IPM). When the key position is rotated to the ACC position or Run/Start position, the IPM energizes the Ignition ACC and/or Run/Start feed which will wake up the Powertrain Control Module (PCM) accordingly. These feeds are essentially fused switched battery voltage feeds fabricated by the IPM with relays or solid state devices. There is not Ignition Start feed to the PCM - this is handled by a CAN bus message from IPM to PCM. NOTE: Only on those applications with the 42RLE does the PCM receive an Ignition ACC feed.

STANDARD PROCEDURE

TCM QUICK LEARN - 42RLE Only (Non ABS)

The quick learn procedure requires the use of the appropriate scan tool.

This program allows the electronic transmission system to recalibrate itself. This will provide the proper transmission operation. The quick learn procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Solenoid Pack Replacement
- Clutch Plate and/or Seal Replacement
- Valve Body Replacement or Recondition

To perform the Quick Learn Procedure, the following conditions must be met:

- The brakes must be applied
- The engine speed must be above 500 RPM
- The throttle angle (TPS) must be less than 3 degrees
- The shift lever position must stay in PARK until prompted to shift to overdrive
- The shift lever position must stay in overdrive after the Shift to Overdrive prompt until the scan tool indicates the procedure is complete.
- The calculated oil temperature must be above 60° and below 200°

TCM ADAPTATION - NAG1 Only

The adaptation procedure requires the use of the appropriate scan tool. This program allows the electronic transmission system to re-calibrate itself. This will provide the proper baseline transmission operation. The adaptation procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
 - Transmission Control Module Replacement
 - Clutch Plate and/or Seal Replacement
 - Electrohydraulic Unit Replacement or Recondition
1. With the scan tool, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings.

NOTE: **Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60°C (140°F) and less than 70°C (158°F). Failure to stay within these temperature ranges will void the procedure.**

2. Drive the vehicle until the transmission temperature is in the specified range.
3. Perform 4 to 5 coast downs from 5th to 4th gear and then 4th to 3rd gear.

NOTE: **For Upshift adaptation, the Transmission temperature must be greater than 60°C (140°F) and less than 100°C (212°F). Failure to stay within these temperature ranges will void this procedure.**

4. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times.
5. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever.
6. The TCM will store the adaptives every 10 minutes. After completion of the adaptation procedure make sure the vehicle stays running for at least 10 minutes.
7. It is possible to manually store the adaptives under the 10 minute time frame using the scan tool Store Adaptives procedure.

PCM/ECM REPROGRAMMING - GAS

PCM / TCM FLASH REPROGRAMMING

This procedure will need to be done when one or more of the following situations are true:

1. A vehicle's Powertrain control module (PCM) has been replaced.
2. A diagnostic trouble code (DTC) is set "P1602 - PCM Not Programmed."
3. An updated calibration or software release is available for either the PCM or TCM ECUs.

This procedure assumes that the StarSCAN® and StarMOBILE® devices are configured to your dealership's network with either a wired or wireless connection. The StarSCAN® and StarMOBILE® must also be running at the latest operating system and software release level. For more help on how to network your StarSCAN® or StarMOBILE® reference the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools

> Online Documentation' or at www.dcctools.com, under the Download Center.

Table Of Contents

1. **SECTION 1 - PCM / TCM FLASH PROCEDURE**
2. **REQUIRED TOOLS/EQUIPMENT**
3. **TECH TIPS and INFORMATION**
4. **PARTS REQUIRED**

SECTION 1 - PCM / TCM FLASH PROCEDURE

If using StarSCAN® or StarMOBILE® Desktop Client. Go to **REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client.**

If using StarMOBILE® Standalone Diagnostic Mode. Go To **REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode.**

REPAIR PROCEDURE - Using StarSCAN® or StarMOBILE® Desktop Client

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

1. Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides a continuous charge of 13.2 - 13.5 volts.
2. Connect the StarSCAN® or StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
3. Power on the StarSCAN® or StarMOBILE®. If the StarMOBILE® is being used, launch the StarMOBILE® Desktop Client and connect to the appropriate StarMOBILE® device.
4. Retrieve the old ECU part number. From the tool's Home screen,
 - a. Select "ECU View"
 - b. Select "PCM"
 - c. Select "More Options"
 - d. Select "ECU Flash"
 - e. Record the part number at the top of the Flash PCM screen for later reference.
5. Program the ECU as follows:
 - a. Using the StarSCAN® / StarMOBILE® at the Home screen, select "ECU View"
 - b. Select "PCM"
 - c. Select "More Options"
 - d. Select "ECU Flash"
 - e. Select "Browse for New File" and follow the on screen instructions.
 - f. Highlight the appropriate calibration based on the part number recorded in Step 4e, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

- g. Select "Download to Scantool"
- h. Once the download is complete, select "Close" and then "Back"
- i. Highlight the listed calibration, select "Update Controller" and follow the on screen instructions.
- j. When the PCM update is complete, select "OK"
- k. Verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: **If this flash process is interrupted or aborted, the flash should be restarted.**

6. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to complete the process if the ECU has been replaced.
7. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

REPAIR PROCEDURE - Using StarMOBILE® Standalone Diagnostic Mode

NOTE: **StarMOBILE® Standalone Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.**

NOTE: **StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.**

1. Power on the StarMOBILE®. Launch the StarMOBILE® Desktop Client and connect to the tool.
2. At the Home screen, select "ECU View"
 - a. Select "PCM"
 - b. Select "More Options"
 - c. Select "ECU Flash"
 - d. Select "Browse for New File" and follow the on screen instructions.
 - e. Highlight the appropriate calibration based on the current ECU part number, or by using Year/Model/Engine and appropriate emissions selection for the vehicle being worked on.

NOTE: **If you are not connected to the vehicle, you may also search for flash files by selecting the "Flash Download" button from the Home screen.**

3. From the Flash File List, select the appropriate calibration for the PCM and select "Download to Client"
4. Once the download is complete, hit "OK" and then "Manage Files"

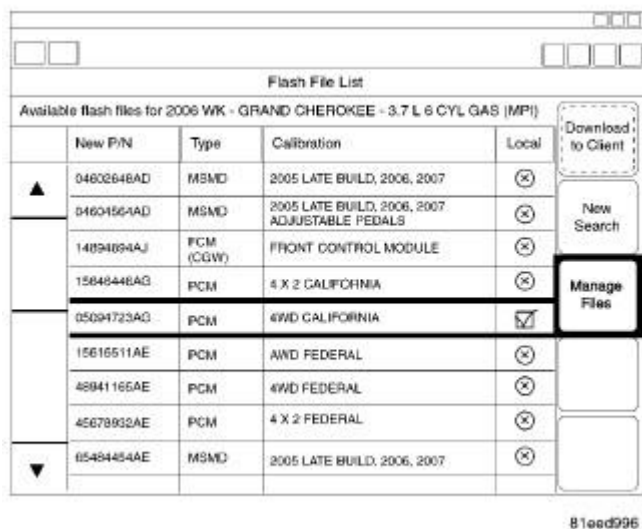

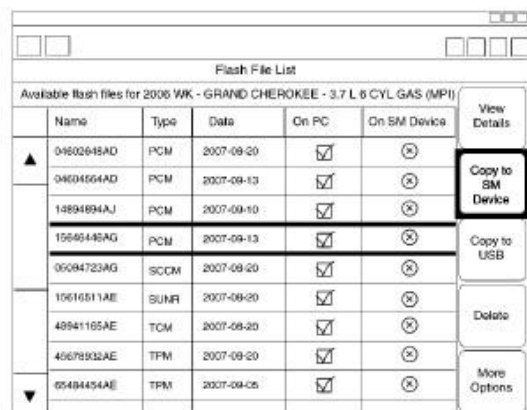

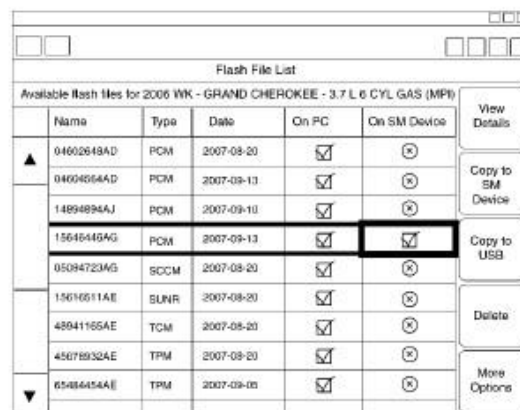

Fig. 26: Flash File List - Manage Files
Courtesy of CHRYSLER LLC

- In the Manage Files screen, highlight the downloaded flash file and select "Copy to SM Device". A green check mark should now appear in the On SM Device column.

Flash File NOT copied to Device

Flash File copied to Device

Fig. 27: Flash File List - Copy to SM Device
Courtesy of CHRYSLER LLC

- Exit the StarMOBILE® Desktop Client application.
- Open the hood of the vehicle and install a battery charger. Verify that the charging rate provides

a continuous charge of 13.2 - 13.5 volts.

8. Connect the StarMOBILE® to the vehicle data link connector located under the steering column and turn the ignition key to the "RUN" position.
9. On the StarMOBILE® device, select "Enter Standalone Diagnostic Mode" (use the right function key).

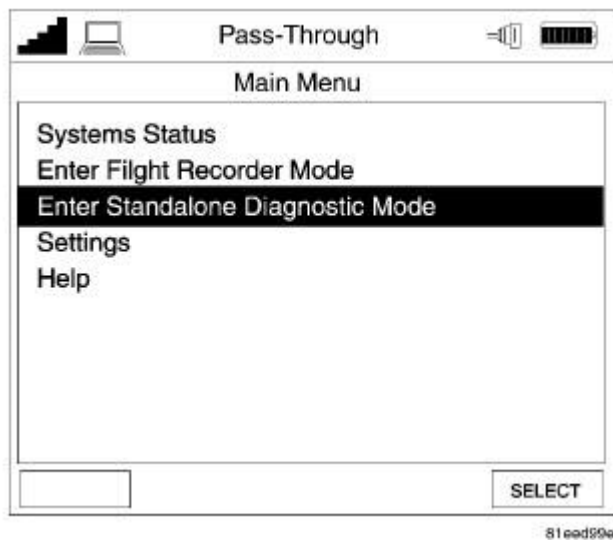

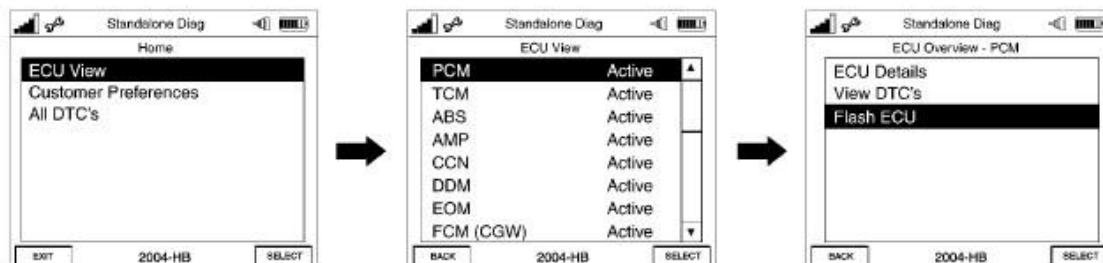

Fig. 28: Pass-Through - Main Menu - Enter Standalone Diagnostic Mode
Courtesy of CHRYSLER LLC

NOTE: If a StarMOBILE® Desktop Client is still associated with the device, you will receive the following error: "Your StarMOBILE® device is currently locked by a PC named 'xxxxxxx' on your network. To remove the lock, close its Desktop Client or reboot this device".

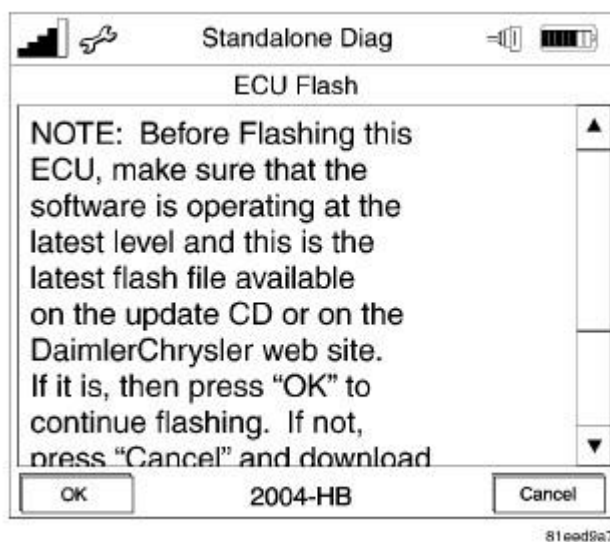

10. Program the ECU as follows:
 - a. Select "ECU View"
 - b. Select "PCM"
 - c. Select "Flash ECU"

81eed3a3

Fig. 29: Standalone Diag - Flash ECU
 Courtesy of CHRYSLER LLC

- d. Record the ECU part number at the very top of the screen for later reference.

81eed3a7

Fig. 30: Standalone Diag - ECU Part Number Note
 Courtesy of CHRYSLER LLC

- e. Highlight the flash file that you want to use. Hit "SELECT" and then "OK". Follow the on screen instructions.

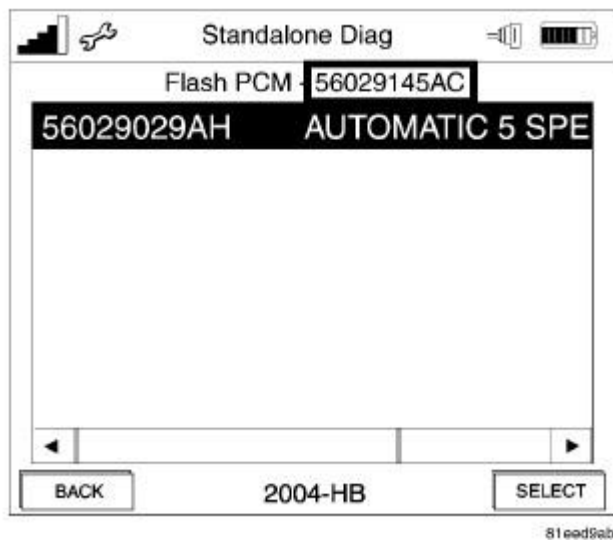

Fig. 31: Standalone Diag - Highlighting Flash File
Courtesy of CHRYSLER LLC

- f. Once the flash is complete, verify that the part number at the top of the Flash PCM screen has updated to the new part number.

NOTE: If this flash process is interrupted or aborted, the flash should be restarted.

11. Continue to **SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES** to complete the process if the ECU has been replaced.
12. Type the necessary information on the "Authorized Modification Label" (p/n 04275086AB) and attach near the VECI label (See **SECTION 3 - AUTHORIZED MODIFICATION LABEL** for details).

SECTION 2 - ADDITIONAL PCM / TCM REPLACEMENT PROCEDURES

Find the PCM/TCM Type for the vehicle, read and write down the steps, and then go to the step by step instructions for additional information on how to perform these procedures. STEP-BY-STEP INSTRUCTIONS .

If a NGC3 or NGC4 PCM was replaced, perform the following additional steps and/or routines:

1. PCM Replaced - if WCM equipped
2. Learn ETC - if ETC equipped
3. Check PCM Odometer
4. Check PCM VIN - if NOT WCM equipped
5. Quicklearn - if EATX equipped

If a GPEC PCM was replaced, perform the following additional steps and/or routines:

1. If the vehicle is equipped with a CVT, ensure that the TCM has the latest software calibration available (if the vehicle is not equipped with a CVT, skip to Step 3).
2. PCM Replaced - if WCM equipped
3. Learn ETC
4. Check PCM Odometer
5. Check PCM VIN - if NOT WCM equipped
6. TCM Quicklearn - if EATX equipped

If a CVT TCM was replaced, perform the following additional steps and/or routines:

1. Initialize CVT

If an EGS TCM was replaced, perform the following additional steps and/or routines:

1. Initialize EGS

STEP-BY-STEP INSTRUCTIONS

Check PCM Odometer

From the "Home" screen, select "ECU View".

- Select "PCM"
- Select "Misc. Functions"
- Select "Check PCM Odometer" and follow the on screen instructions.
- When complete, select "Finish".

Check PCM VIN

From the "Home" screen, select "ECU View"

- Select "PCM"
- Select "Misc. Functions"
- Select "Check PCM VIN" and follow the on screen instructions.
- When complete, select "Finish"

Initialize CVT

From the "Home" screen, select "ECU View"

- Select "TCM"
- Select "Misc. Functions"

- Select "Initialize CVT" and follow the on screen instructions.
- When complete, select "Finish"

Initialize EGS

From the "Home" screen, select "ECU View"

- Select "TCM"
- Select "Misc. Functions"
- Select "Initialize EGS" and follow the on screen instructions.
- When complete, select "Finish"

Learn ETC

From the "Home" screen, select "ECU View"

- Select "PCM"
- Select "Misc. Functions"
- Select "Learn ETC" and follow the on screen instructions.
- When complete, select "Finish"

PCM Replaced

The vehicle pin (Personal Identification Number) will be required to complete the routine. This information may be obtained in three ways:

1. The original selling invoice
2. DealerCONNECT > Parts > Key Codes
3. Contacting the District Manager.

From the "Home" screen, select "ECU View"

- Select "WCM"
- Select "Misc. Functions"
- Select "PCM Replaced" and follow the on screen instructions.
- When complete, select "Finish"

Quicklearn

From the "Home" screen, select "ECU View"

- Select "PCM"
- Select "Misc. Functions"

- Select "Quicklearn" and follow the on screen instructions.
- When complete, select "Finish"

Update CVT TCM

From the "Home" screen:

- Select "ECU View"
- Select "TCM"
- Select "More Options"
- Select "ECU Flash"
- Select "Browse for New File" and follow the on screen instructions.
- Highlight the appropriate calibration.
- Select "Download to Scantool"
- Once the download is complete, select "Close" and then "Back"
- Highlight the listed calibration, select "Update Controller" and follow the on screen instructions.
- When the TCM update is complete, select "OK"
- Verify that the part number at the top of the "Flash TCM" screen has updated to the latest level.

SECTION 3 - AUTHORIZED MODIFICATION LABEL

NOTE: The following step is required by law when reprogramming a PCM and/or TCM.

Type the necessary information on the "Authorized Modification Label" and attach near the VECI label.

The form is titled "Authorized Modification Label" and includes the following sections:

- Header:** "DaimlerChrysler" logo, "AUTHORIZED MODIFICATIONS", and a disclaimer: "THESE MODIFICATIONS HAVE BEEN APPROVED AS APPROPRIATE BY EPA AND CARB."
- Section 1:** "THE FOLLOWING MODIFICATIONS HAVE BEEN MADE:" with a large box for handwritten entries, labeled with a circled "1".
- Section 2:** "CHANGE AUTHORITY" with a box for handwritten entries, labeled with a circled "2".
- Section 3:** "DEALER CODE" with a box for handwritten entries, labeled with a circled "3".
- Section 4:** "DATE" with a box for handwritten entries, labeled with a circled "4".
- Footer:** "80134528"

Fig. 32: Authorized Modification Label
Courtesy of CHRYSLER LLC

1. Powertrain Control / Transmission Control Module Part Numbers (Insert P/Ns) Used
2. Change Authority: TSB XX--XX
3. Dealer Code: XXXXX
4. Date: XX-XX-XX

REQUIRED TOOLS/EQUIPMENT:

REQUIRED TOOLS/EQUIPMENT:

PART NUMBER	StarSCAN®	PART NUMBER	StarMOBILE®
NPN	Battery Charger	NPN	Battery Charger
CH9401	StarSCAN® Tool Kit	CH9801	StarMOBILE® Tool Kit
CH9404	StarSCAN® Vehicle Cable	CH9804	StarMOBILE® Vehicle Cable
-	-	-	TechCONNECT PC or equivalent

TECH TIPS and INFORMATION:

1. StarMOBILE® Standalone Diagnostic Mode is an efficient way to flash ECUs without having direct access to a network connection. It involves first copying the flash file to the StarMOBILE® device which DOES require a network connection. Once the file has been copied to the StarMOBILE® device, it can be used in a Standalone mode to flash the ECU WITHOUT a network connection.
2. To use the StarMOBILE® in Pass-Through Mode requires that your StarMOBILE® is connected to the dealership's network via a wired or wireless connection. For more information on how to use the StarMOBILE in Pass-Through Mode see the StarMOBILE® training tutorials available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Training Aids' link or at www.dcctools.com, under the 'Training Aids' link.
3. StarMOBILE® does not need to be connected to a vehicle when retrieving a flash file for Standalone Mode.
4. Extreme care must be taken when programming a calibration into a generic PCM. Do not randomly select a calibration. Once a calibration is selected and programmed, the controller cannot be reprogrammed to a different calibration. The ECU can only be reprogrammed to a more recent version of that calibration.
5. If the flash process is interrupted or aborted, the flash should be restarted.
6. Due to the PCM / TCM programming procedure, a DTC may be set in other ECUs within the vehicle. Some DTCs may cause the MIL to illuminate. From the "Home" screen select "System View". Then select "All DTCs". Press "Clear All Stored DTCs" if there are any DTCs shown on the list.
7. When replacing a GPEC PCM for a vehicle that is equipped with a CVT, it is extremely important that the PCM and TCM both have the latest software calibrations.
8. Do not allow the battery charger to time out or the charging rate to climb above 13.5 volts during the flash process.
9. The StarSCAN® and StarMOBILE® diagnostic tools fully support Internet connectivity and must be configured for your dealership's network. For help on setting up your StarSCAN® / StarMOBILE® for the dealership's network, refer to the StarSCAN® / StarMOBILE® Quick Start Networking Guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.
10. The operating software in the StarSCAN® and StarMOBILE® must be programmed with the latest software release level. The software level is visible in the blue header at the top of the StarSCAN® and StarMOBILE® Desktop Client screens. For instructions on how to update your

scan tool, refer to the StarSCAN® / StarMOBILE® Software Update guide available on 'DealerCONNECT > Service > StarSCAN® and StarMOBILE® Tools > Online Documentation' or at www.dcctools.com, under the download center.

PARTS REQUIRED

REMOVAL

REMOVAL

Fig. 33: PCM Location In Vehicle
Courtesy of CHRYSLER LLC

NOTE: USE THE SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

To avoid possible voltage spike damage to PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

1. Disconnect and isolate negative battery cable.

Fig. 34: PCM Location
Courtesy of CHRYSLER LLC

2. Remove PCM bracket-to-body mounting bolt.
3. Remove assembly from vehicle.
4. Disconnect electrical connectors from PCM.

Fig. 35: PCM Bracket
Courtesy of CHRYSLER LLC

5. Remove bracket from PCM.

Fig. 36: Rubber Bumper
Courtesy of CHRYSLER LLC

6. Remove rubber bumper from PCM.

INSTALLATION

INSTALLATION

Fig. 37: Rubber Bumper Installed
Courtesy of CHRYSLER LLC

NOTE: USE THE SCAN TOOL TO REPROGRAM THE NEW POWERTRAIN CONTROL MODULE (PCM) WITH THE VEHICLES ORIGINAL IDENTIFICATION NUMBER (VIN) AND THE VEHICLES ORIGINAL MILEAGE. IF THIS STEP IS NOT DONE, A

DIAGNOSTIC TROUBLE CODE (DTC) MAY BE SET.

1. Install rubber bumper to PCM.
2. Check pins in electrical connectors for damage. Repair as necessary.
3. Install electrical connectors to PCM.

Fig. 38: PCM Bracket
Courtesy of CHRYSLER LLC

4. Install mounting bracket to PCM.

Fig. 39: PCM Location
Courtesy of CHRYSLER LLC

5. Install assembly to body. Install bolt and tighten 9 N.m (80 in. lbs.) torque.
6. Connect negative cable to battery.
7. Use the scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage.

MODULE, STEERING COLUMN

DESCRIPTION

DESCRIPTION

Fig. 40: Multi-Function Switch & Circuit Board
Courtesy of CHRYSLER LLC

WARNING: To service any component of the SCCM, the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring and prevent the airbag system from operating properly.

The Steering Control Module (SCM) is the module located in the bottom of the Steering Column Control Module (SCCM), retained by three screws, and is the mating point for all the switches (steering angle sensor, tilt/telescopic switch, multi-function switch, clockspring) located in the SCCM. The steering wheel switches, horn, speed control switches, attach to the steering wheel and interface to the SCM through the SCCM. The SCM is screwed directly to the bottom of the multi-function switch. All the other switches are mounted on top of the multi-function switch.

OPERATION

OPERATION

WARNING: To service any component of the SCCM, the entire assembly must be removed from the column. This must be done due to the clockspring passing through the assembly and into the self docking connector. Failure to remove the assembly could damage the pins of the clockspring

and prevent the airbag system from operating properly. Failure to follow these instructions may result in serious or fatal injury.

The Steering Control Module (SCM) communicates via the Local Interconnect Network (LIN) serial data bus to the steering wheel switches and the horn switch. The SCM communicates across the CAN C and CAN B. This is an ultra-low voltage serial data bus that allows the following components to communicate with the Controller Area Network (CAN) B and C data buses.

FUNCTION	INPUT	OUTPUT
Steering Wheel Switch	Direct to SCM on LIN Bus	SCM output to CAN B BUS
Horn Switch	Direct to SCM on LIN Bus	SCM output to CAN B BUS
Multi Function Switch	Direct input to the SCM.	SCM output to CAN B BUS
Tilt / Telescopic Switch	Direct input to the SCM	SCM output to CAN B BUS
Steering angle sensor	Direct input to the SCM	SCM output to CAN C BUS
Speed Control Switch (steering wheel mounted)	Direct input to the SCM	SCM output to CAN C BUS
Speed Control Switch (Police Package Le / L2)	Direct input to the SCM	SCCM output to CAN C BUS

The SCM changes the LIN communication to CAN communication and also stores Diagnostic Trouble Codes (DTC's) for the switches within the SCCM and on the steering wheel.

For removal and installation, disassembly and assembly of the SCCM:

- Refer to **Steering/Column/MODULE, Steering Column Control - Removal** .
- Refer to **Steering/Column/MODULE, Steering Column Control - Disassembly** .
- Refer to **Steering/Column/MODULE, Steering Column Control - Assembly** .
- Refer to **Steering/Column/MODULE, Steering Column Control - Installation** .

The SCM is not serviceable and if found faulty, it must be replaced as a unit.

MODULE, TRANSMISSION CONTROL

DESCRIPTION

TRANSMISSION CONTROL MODULE - 42RLE

Fig. 41: PCM Location In Vehicle
Courtesy of CHRYSLER LLC

The Transmission Control Module (TCM) is a sub-module within the Powertrain Control Module (PCM). The Powertrain Control Module (PCM) is located in the right rear of the engine compartment, just in front of the windshield.

TRANSMISSION CONTROL MODULE - NAG1

Fig. 42: TCM Location
Courtesy of CHRYSLER LLC

The TCM is located under the left side of the instrument panel for left hand drive vehicles. For right hand drive vehicles, the TCM is located in the mirrored location under the right side of the instrument panel.

The electronic control system consists of various components providing inputs to the transmission control module (TCM). The TCM monitors transmission sensors, shift lever position, and bus messages to determine transmission shift strategy. After shift strategies are determined, the TCM controls the actuation of transmission solenoids, which controls the routing of hydraulic fluid within the transmission, by moving a sequence of four valves to make a shift occur.

The NAG1 electronic transmission has a fully adaptive control system. The system performs its functions based on continuous real-time sensor feedback information. In addition the TCM receives information from the PCM (engine management) and ABS (chassis systems) controllers over the CAN bus. The CAN bus is a high-speed communication bus that allows real time control capability between various controllers. Most messages are sent every 20 milliseconds. This means critical information can be shared between the transmission, engine, and ABS controllers. The CAN bus is a two wire bus with a CAN Bus (+) circuit and a CAN Bus (-) circuit. These circuits are twisted pairs in the harness to reduce the potential of radio and noise interference.

The transmission control system automatically adapts to changes in engine performance, vehicle speed, and transmission temperature variations to provide consistent shift quality. The control system ensures that clutch operation during up-shifting and downshifting is more responsive without increased harshness. The TCM activates the solenoid valves and moves valves in the valve body to achieve the necessary gear changes. The required pressure level is calculated from the load condition, engine speed. Vehicle speed (from ABS module) and transmission oil temperature, matched to the torque to be transmitted. The TCM is located under the left side of the instrument panel for left hand drive vehicles. For right hand drive vehicles, the TCM is located in the mirrored location under the right side of the instrument panel.

OPERATION

TRANSMISSION CONTROL MODULE (TCM)- 42RLE

The TCM controls all electronic operations of the transmission. The TCM receives information regarding vehicle operation from both direct and indirect inputs, and selects the operational mode of the transmission. Direct inputs are hardwired to, and used specifically by the TCM. Indirect inputs are shared with the TCM via the vehicle communication bus.

Some examples of **direct inputs** to the TCM are:

- Battery (B+) voltage
- Ignition "ON" voltage
- Transmission Control Relay (Switched B+)
- Throttle Position Sensor
- Crankshaft Position Sensor
- Transmission Range Sensor

- Pressure Switches
- Transmission Temperature Sensor
- Input Shaft Speed Sensor
- Output Shaft Speed Sensor
- Line Pressure Sensor

Some examples of **indirect inputs** to the TCM are:

- Engine/Body Identification
- Manifold Pressure
- Target Idle
- Torque Reduction Confirmation
- Engine Coolant Temperature
- Ambient/Battery Temperature
- Scan Tool Communication

Based on the information received from these various inputs, the TCM determines the appropriate shift schedule and shift points, depending on the present operating conditions and driver demand. This is possible through the control of various direct and indirect outputs.

Some examples of TCM **direct outputs** are:

- Transmission Control Relay
- Solenoids
- Torque Reduction Request

Some examples of TCM **indirect outputs** are:

- Transmission Temperature (to PCM)
- PRNDL Position (to cluster/CCN)

In addition to monitoring inputs and controlling outputs, the TCM has other important responsibilities and functions:

- Storing and maintaining Clutch Volume Indexes (CVI)
- Storing and selecting appropriate Shift Schedules
- System self-diagnostics
- Diagnostic capabilities (with scan tool)

NOTE: If the TCM has been replaced, the "Quick Learn Procedure" must be performed. See Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure.

BATTERY FEED

A fused, direct battery feed to the TCM is used for continuous power. This battery voltage is necessary to retain memory in the TCM. When the battery (B+) is disconnected, this memory is lost. When the battery (B+) is restored, this memory loss is detected by the TCM and a Diagnostic Trouble Code (DTC) is set.

CLUTCH VOLUME INDEXES (CVI)

- 3 - CLUTCH PACK
- 4 - SEPARATOR PLATE
- 5 - FRICTION DISCS
- 6 - INPUT SHAFT
- 7 - INPUT SPEED SENSOR
- 8 - PISTON AND SEAL

An important function of the TCM is to monitor Clutch Volume Indexes (CVI). CVIs represent the volume of fluid needed to compress a clutch pack.

The TCM monitors gear ratio changes by monitoring the Input and Output Speed Sensors. The Input, or Turbine Speed Sensor sends an electrical signal to the TCM that represents input shaft RPM. The Output Speed Sensor provides the TCM with output shaft speed information.

By comparing the two inputs, the TCM can determine transmission gear position. This is important to the CVI calculation because the TCM determines CVIs by monitoring how long it takes for a gear change to occur .

Gear ratios can be determined by using the Scan Tool and reading the Input/Output Speed Sensor values in the "Monitors" display. Gear ratio can be obtained by dividing the Input Speed Sensor value by the Output Speed Sensor value.

For example, if the input shaft is rotating at 1000 RPM and the output shaft is rotating at 500 RPM, then the TCM can determine that the gear ratio is 2:1. In direct drive (3rd gear), the gear ratio changes to 1:1. The gear ratio changes as clutches are applied and released. By monitoring the length of time it takes for the gear ratio to change following a shift request, the TCM can determine the volume of fluid used to apply or release a friction element.

The volume of transmission fluid needed to apply the friction elements are continuously updated for adaptive controls. As friction material wears, the volume of fluid need to apply the element increases.

Certain mechanical problems within the input clutch assembly can cause inadequate or out-of-range element volumes. Also, defective Input/Output Speed Sensors and wiring can cause these conditions. The following chart identifies the appropriate clutch volumes and when they are monitored/updated:

CLUTCH VOLUMES		
Clutch	When Updated	Proper Clutch Volume
L/R	2-1 or 3-1 downshift	45 to 134
2C	3-2 kickdown shift	25 to 85
OD	2-3 upshift	30 to 100
4C	3-4 upshift	30 to 85
UD	4-3 kickdown shift	30 to 100

SHIFT SCHEDULES

As mentioned earlier, the TCM has programming that allows it to select a variety of shift schedules. Shift schedule selection is dependent on the following:

- Shift lever position
- Throttle position
- Engine load
- Fluid temperature
- Software level

As driving conditions change, the TCM appropriately adjusts the shift schedule. Use the following chart to determine the appropriate operation expected, depending on driving conditions.

Schedule	Condition	Expected Operation
Extreme Cold	Oil temperature below -16° F	- Park, Reverse, Neutral and

		1st and 3rd gear only in D position, 2nd gear only in Manual 2 or L - No EMCC
Super Cold	Oil temperature between -12° F and 10° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - Early 4-3 coastdown shift - High speed 4-2, 3-2, 2-1 kickdown shifts are prevented - Shifts at high throttle openings will be early. - No EMCC
Cold	Oil temperature between 10° F and 36° F	- Shift schedule is the same as Super Cold except that the 2-3 upshifts are not delayed.
Warm	Oil temperature between 40° F and 80° F	- Normal operation (upshift, kickdowns, and coastdowns) - No EMCC
Hot	Oil temperature between 80° F and 240° F	- Normal operation (upshift, kickdowns, and coastdowns) - Normal EMCC operation
Overheat	Oil temperature above 240° F or engine coolant temperature above 244° F	- Delayed 2-3 upshift - Delayed 3-4 upshift - 3rd gear FEMCC from 30-48 mph - 3rd gear PEMCC above 35 mph - Above 25 mph the torque converter will not unlock unless the throttle is closed or if a wide open throttle 2nd PEMCC to 1 kickdown is made

TRANSMISSION CONTROL MODULE - NAG1

The transmission control module (TCM) determines the current operating conditions of the vehicle and controls the shifting process for shift comfort and driving situations. It receives this operating data from sensors and broadcast messages from other modules.

The TCM uses inputs from several sensors that are directly hardwired to the controller and it uses several indirect inputs that are used to control shifts. This information is used to actuate the proper solenoids in the valve body to achieve the desired gear.

The shift lever assembly (SLA) has sensors that are monitored by the TCM to calculate shift lever position. The reverse light switch, an integral part of the SLA, controls the reverse light relay control

circuit. The Brake/Transmission Shift Interlock (BTSI) solenoid and the park lockout solenoid (also part of the SLA) are controlled by the TCM.

The PCM and ABS broadcast messages over the controller area network (CAN) bus for use by the TCM. The TCM uses this information, with other inputs, to determine the transmission operating conditions.

The TCM:

- determines the momentary operating conditions of the vehicle.
- controls all shift processes.
- considers shift comfort and the driving situation.

The TCM controls the solenoid valves for modulating shift pressures and gear changes. Relative to the torque being transmitted, the required pressures are calculated from load conditions, engine RPM, vehicle speed, and ATF temperature.

The following functions are contained in the TCM:

- Shift Program
- Downshift Safety
- Torque Converter Lock-Up Clutch.
- Adaptation.

The TCM continuously checks for electrical problems, mechanical problems, and some hydraulic problems. When a problem is sensed, the TCM stores a diagnostic trouble code (DTC). Some of these codes cause the transmission to go into "Limp-In" or "default" mode. Some DTCs cause permanent Limp-In and others cause temporary Limp-In. The NAG1 defaults in the current gear position if a DTC is detected, then after a key cycle the transmission will go into Limp-in, which is mechanical 2nd gear. Some DTCs may allow the transmission to resume normal operation (recover) if the detected problem goes away. A permanent Limp-In DTC will recover when the key is cycled, but if the same DTC is detected for three key cycles the system will not recover and the DTC must be cleared from the TCM with the appropriate scan tool.

NOTE: **If the TCM has been replaced, the "TCM Adaptation Procedure" must be performed. See Electrical - Electronic Control Modules/Electronic Control Modules/MODULE, Transmission Control - Standard Procedure**

TCM SIGNALS

The TCM registers one part of the input signals by direct inputs, the other part by CAN bus. In addition to the direct control of the actuators, the TCM sends various output signals by CAN bus to other control modules.

Selector Lever Position

A series of sensors in the SLA inform the TCM of the position of the selector lever.

The TCM monitors the SLA for all shift lever positions through five position circuits. The SLA provides a low-current 12-volt signal to the TCM. The TCM compares the on/off signals to programmed combinations to determine the exact position of the shift lever.

ATF Temperature Sensor

The ATF temperature sensor is a positive temperature co-efficient (PTC) thermistor. It measures the temperature of the transmission fluid and is a direct input signal for the TCM. The temperature of the ATF has an influence on the shifttime and resulting shift quality. As the temperature rises, resistance rises, and therefore, the probing voltage is decreasing. Because of its registration, the shifting process can be optimized in all temperature ranges.

The ATF temperature sensor is wired in series with the park/neutral contact. The temperature signal is transmitted to the TCM only when the reed contact of the park/neutral contact is closed because the TCM only reads ATF temperature while in any forward gear, or REVERSE. When the transmission is in PARK or NEUTRAL, the TCM will substitute the engine temperature for the ATF temperature.

Starter Interlock

The TCM monitors a contact switch wired in series with the transmission temperature sensor to determine PARK and NEUTRAL positions. The contact switch is open in PARK and NEUTRAL. The TCM senses transmission temperature as high (switch supply voltage), confirming switch status as open. The TCM then broadcasts a message over CAN bus to confirm switch status. The PCM receives this information and allows operation of the starter circuit.

N2 and N3 Speed Sensors

The N2 and N3 Input Speed Sensors are two Hall-effect speed sensors that are mounted internally in the transmission and are used by the TCM to calculate the transmission's input speed. Since the input speed cannot be measured directly, two of the drive elements are measured. Two input speed sensors were required because both drive elements are not active in all gears.

CAN Bus Indirect Input Signals

A 2.5-volt bias (operating voltage) is present on the CAN bus any time the ignition switch is in the RUN position. Both the TCM and the ABS apply this bias. On this vehicle, the CAN bus is used for module data exchange only. The indirect inputs used on the NAG1 electronic control system are:

- Wheel Speed Sensors.
- Transfer Case Switch Status.
- Brake Switch.
- Engine RPM.
- Engine Temperature.
- Cruise Control Status.

- Gear Limit Request.
- Throttle Position - 0% at idle, 100% at WOT. If open, TCM assumes idle (0% throttle opening).
- Odometer Mileage
- Maximum Effective Torque.
- Engine in Limp-In Mode/Mileage Where DTC Was Set.

BRAKE TRANSMISSION SHIFT INTERLOCK (BTSI)

The BTSI solenoid prevents shifting out of the PARK position until the ignition key is in the RUN position and the brake pedal is pressed. The TCM controls the ground while the ignition switch supplies power to the BTSI solenoid. The PCM monitors the brake switch and broadcasts brake switch status messages over the CAN C bus. If the park brake is depressed and there is power (Run/Start) to SLA, the BTSI solenoid deactivates. The TCM monitors this for the SLA because the SLA does not communicate on the CAN bus.

SHIFT SCHEDULES

The basic shift schedule includes up and downshifts for all five gears. The TCM adapts the shift program according to driving style, accelerator pedal position and deviation of vehicle speed. Influencing factors are:

- Road Conditions.
- Incline, Decline and Altitude.
- Trailer Operation, Loading.
- Engine Coolant Temperature.
- Cruise Control Operation.
- Sporty Driving Style.
- Low and High ATF Temperature.

Upshift To:	1-2	2-3	3-4	4-5
Activated By Solenoid:	1-2/4-5	2-3	3-4	1-2/4-5
Shift Point (at 35.2% of throttle)	29 km/h (18 mph)	48 km/h (30 mph)	68 km/h (42 mph)	85 km/h (53 mph)

Downshift From:	5-4	4-3	3-2	2-1
Activated By Solenoid:	1-2/4-5	3-4	2-3	1-2/4-5
Shift Point	55.7 km/h (34.61 mph)	40.5 km/h (25.17 mph)	24.4 km/h (15.16 mph)	15.1 km/h (9.38 mph)

DOWNSHIFT SAFETY

Selector lever downshifts are not performed if inadmissible high engine RPM is sensed.

ADAPTATION

To equalize tolerances and wear, an automatic adaptation takes place for:

- Shift Time.
- Clutch Filling Time.
- Clutch Filling Pressure.
- Torque Converter Lock-Up Control.

Adaptation data may be stored permanently and to some extent, can be diagnosed.

Driving Style Adaptation

The shift point is modified in steps based on the information from the inputs. The control module looks at inputs such as:

- vehicle acceleration and deceleration (calculated by the TCM).
- rate of change as well as the position of the throttle pedal (fuel injection information from the PCM).
- lateral acceleration (calculated by the TCM).
- gear change frequency (how often the shift occurs).

Based on how aggressive the driver is, the TCM moves up the shift so that the present gear is held a little longer before the next upshift. If the driving style is still aggressive, the shift point is modified up to ten steps. If the driving returns to normal, then the shift point modification also returns to the base position.

This adaptation has no memory. The adaptation to driving style is nothing more than a shift point modification meant to assist an aggressive driver. The shift points are adjusted for the moment and return to base position as soon as the inputs are controlled in a more normal manner.

CONTROLLER MODES OF OPERATION

Permanent Limp-In Mode

When the TCM determines there is a non-recoverable condition present that does not allow proper transmission operation, it places the transmission in permanent Limp-In Mode. When the condition occurs the TCM turns off all solenoids as well as the solenoid supply output circuit. If this occurs while the vehicle is moving, the transmission remains in the current gear position until the ignition is turned off or the shifter is placed in the "P" position. When the shifter has been placed in "P," the transmission only allows 2nd gear operation. If this occurs while the vehicle is not moving, the transmission only allows operation in 2nd gear.

Temporary Limp-In Mode

This mode is the same as the permanent Limp-In Mode except if the condition is no longer present, the system resumes normal operation.

Under Voltage Limp-In Mode

When the TCM detects that system voltage has dropped below 8.5 volts, it disables voltage-dependant diagnostics and places the transmission in the temporary Limp-In Mode. When the TCM senses that the voltage has risen above 9.0 volts, normal transmission operation is resumed.

Hardware Error Mode

When the TCM detects a major internal error, the transmission is placed in the permanent Limp-In Mode and ceases all communication over the CAN bus. When the TCM has entered this mode normal transmission operation does not resume until all DTCs are cleared from the TCM.

Loss of Drive

If the TCM detects a situation that has resulted or may result in a catastrophic engine or transmission problem, the transmission is placed in the neutral position. Improper Ratio, Input Sensor Overspeed or Engine Overspeed DTCs cause the loss of drive.

Controlled Limp-in Mode

When a failure does not require the TCM to shut down the solenoid supply, but the failure is severe enough that the TCM places the transmission into a predefined gear, there are several shift performance concerns. For instance, if the transmission is slipping, the controller tries to place the transmission into 3rd gear and maintain 3rd gear for all forward drive conditions.

STANDARD PROCEDURE

TCM ADAPTATION - NAG1 Only

The adaptation procedure requires the use of the appropriate scan tool. This program allows the electronic transmission system to re-calibrate itself. This will provide the proper baseline transmission operation. The adaptation procedure should be performed if any of the following procedures are performed:

- Transmission Assembly Replacement
- Transmission Control Module Replacement
- Clutch Plate and/or Seal Replacement
- Electrohydraulic Unit Replacement or Recondition

1. With the scan tool, reset the Transmission adaptives. Resetting the adaptives will set the adaptives to factory settings.

NOTE: **Perform the Coast Down Adaptations first. The Transmission Temperature must be greater than 60°C (140°F) and less than 70°C (158°F). Failure to stay within these temperature ranges will void the procedure.**

2. Drive the vehicle until the transmission temperature is in the specified range.

3. Perform 4 to 5 coast downs from 5th to 4th gear and then 4th to 3rd gear.

NOTE: For Upshift adaptation, the Transmission temperature must be greater than 60°C (140°F) and less than 100°C (212°F). Failure to stay within these temperature ranges will void this procedure.

4. From a stop, moderately accelerate the vehicle and obtain all forward gear ranges while keeping the Engine RPM below 1800 RPM. Repeat this procedure 4 to 5 times.
5. Obtaining 5th gear may be difficult at 1800 RPM. Allow the transmission to shift into 5th gear at a higher RPM then lower the RPM to 1800 and perform manual shifts between 4th and 5th gears using the shift lever.
6. The TCM will store the adaptives every 10 minutes. After completion of the adaptation procedure make sure the vehicle stays running for at least 10 minutes.
7. It is possible to manually store the adaptives under the 10 minute time frame using the scan tool Store Adaptives procedure.

RECEIVER, WIRELESS IGNITION NODE

DESCRIPTION

DESCRIPTION

Fig. 44: Node - Wireless Ignition
Courtesy of CHRYSLER LLC

The Wireless Ignition Node (WIN) (1) located behind the instrument panel trim to the right of the steering column and controls/contains the following functions:

- Ignition Switch, can only be replaced as the WIN module. See **Electrical - Electronic Control Modules/Electronic Control Modules/RECEIVER, Wireless Ignition Node - Operation.**

- Remote Keyless Entry (RKE). Refer to **Electrical - Power Systems/Power Locks - Description** .
- Tire Pressure Monitoring (TPM). Refer to **Tires and Wheels/Tire Pressure Monitoring - Description** .
- Brake Transmission Shifter Interlock (BTSI). Refer to **Transmission and Transfer Case/Automatic - NAG1/MECHANISM, Brake Transmission Shift Interlock - Description** .
- Remote Start. Refer to **Electrical - Engine Systems/Starting - Operation** .

OPERATION

OPERATION

Following are brief descriptions of the systems that the WIN controls.

IGNITION SWITCH

The Wireless Ignition Node (WIN) incorporates an integral ignition switch that consists of four rotary positions with three detent positions and one spring-loaded position. The one extreme clockwise position shall be spring-loaded momentary contact **"START"** position. When released from the **"START"** position, the switch shall automatically return to the detent **"ON"** position. The other position include a detent **"ACCESSORY"** position and a detent **"LOCK"** position.

The WIN reads the position of the ignition switch and transmits via vehicle bus. These positions include **"LOCK"** with ignition key-out, **"LOCK"** with ignition key-in, **"ACCESSORY"** , **"RUN"** and **"START"** .

SENTRY KEY IMMOBILIZER SYSTEM (SKIS)

Upon failure of proper Sentry Key Immobilizer (SKIS) communication to the Powertrain Control Module, (PCM), the PCM will shut off fuel after two seconds of run time. The engine will not re-crank on the key cycle during which the failure occurred. A full key down sequence must be performed for the engine to crank again. Refer to **Electrical - Vehicle Theft Security/Vehicle Theft Security - Operation** .

REMOTE KEYLESS ENTRY (RKE)

The Remote Keyless Entry (RKE), transmitter uses radio frequency signals to communicate with the WIN across can bus. Refer to **Electrical - Power Systems/Power Locks - Operation** .

TIRE PRESSURE MONITORING (TPM)

The Tire Pressure Monitoring (TPM) system uses radio and sensor technology to monitor tire air pressure levels. Refer to **Tires and Wheels/Tire Pressure Monitoring - Operation** .

REMOTE START WITH/EXTENDED RANGE ANTENNA

Further information concerning the Remote Start System can be located in, Starting System. Refer to

Electrical - Engine Systems/Starting - Operation .

BRAKE TRANSMISSION SHIFTER INTERLOCK (BTSI)

The Brake Transmission Shifter/Ignition Interlock (BTSI) is controlled by the WIN and prevents the transmission gear shifter from being moved out of PARK without a driver in place. Refer to **Transmission and Transfer Case/Automatic - NAG1/MECHANISM, Brake Transmission Shift Interlock - Operation .**

FOBIK REMOVAL INHIBIT

The key removal inhibit solenoid internal to the WIN prevents the FOB with Integrated Key (FOBIK) from being rotated in the ignition switch to the LOCK position for all vehicles with an automatic transmission unless the transmission shift lever is in the PARK position. The WIN module monitors a hard wired input from a switch integral to the automatic transmission shifter module to control this feature. The key removal inhibit solenoid is electronically disabled internally by the WIN on vehicles with a manual transmission.

KEYLESS GO

The WIN transmits and receives a signal to and from the FOBIK over the Control Area Network (CAN) Data Bus through the Passive Entry Module (PEM) validation in order change ignition states. Refer to **Electrical - Engine Systems/Starting/KEYLESS GO - Operation .**

DIAGNOSIS AND TESTING

FOBIK TRAPPED IN WIN

For more information. Refer to **Electrical/Power Locks/TRANSMITTER, Integrated Key FOB - Diagnosis and Testing .**

REMOVAL

REMOVAL

Fig. 45: Lower Instrument Cluster Trim Screws
Courtesy of CHRYSLER LLC

1. Disconnect the battery negative cable.
2. Remove the lower steering column trim cover and steering column cover reinforcement. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Removal** .
3. Remove the two screws (1) from the lower instrument cluster trim.

Fig. 46: Edge Of Instrument Cluster Trim
Courtesy of CHRYSLER LLC

4. Using a trim stick or equivalent, gently pry (1) along the edge of the trim to remove the instrument cluster trim.

Fig. 47: Wireless Ignition Node Screws
Courtesy of CHRYSLER LLC

5. Remove the 4 screws from the WIN (1).

Fig. 48: Wireless Ignition Node
Courtesy of CHRYSLER LLC

6. Remove the WIN (1) from the rear of the instrument panel bringing it through the opening below the steering column and disconnect the electrical connector (2) from the WIN.

INSTALLATION

INSTALLATION

Fig. 49: Node - Wireless Ignition
Courtesy of CHRYSLER LLC

1. Reconnect the electrical connector (1) to the Wireless Ignition Node (WIN) and position the WIN back into the instrument panel.

Fig. 50: Node - Wireless Ignition
Courtesy of CHRYSLER LLC

2. Install the four screws (1) through the instrument panel into the WIN.
3. Install the instrument panel trim cover. Ensuring that the cover snaps into the securing clips.

Fig. 51: Instrument Panel Lower Screws
Courtesy of CHRYSLER LLC

4. Install the two lower instrument panel screws (1).
5. Install the lower steering column cover reinforcement and the steering column trim cover. Refer to **Body/Instrument Panel/COVER, Steering Column Opening - Installation** .
6. Connect the battery negative cable.
7. Program the WIN following the Module/Programming Order Replacement Guide and Module Programming procedures. See **Electrical - Electronic Control Modules/Electronic Control Modules - Standard Procedure**.

ENGINE

Cooling - Challenger

DESCRIPTION

GASOLINE ENGINE

The cooling system consists of :

- Radiator
- Electric Cooling fan
- Fan shroud
- Radiator pressure cap
- Thermostat
- Coolant recovery container
- Transmission oil cooler (if equipped with an automatic transmission)
- Coolant
- Water pump
- Hoses and hose clamps

OPERATION

GASOLINE ENGINES

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

81381977

Fig. 1: Cooling Flow Diagram With Engine Oil Cooler - 3.5L

- 3 - HEATER CORE
- 4 - CYLINDER HEAD
- 5 - CYLINDER BLOCK
- 6 - WATER PUMP
- 7 - ENGINE OIL COOLER
- 8 - THERMOSTAT

The cooling system also provides a means of heating the passenger compartment and cooling the automatic transmission fluid (if equipped).

Fig. 2: Cooling Flow Diagram - 5.7L/6.1L

- 3 - CYLINDER HEAD
- 4 - CYLINDER BLOCK
- 5 - WATER PUMP
- 6 - THERMOSTAT
- 7 - RADIATOR

The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

DIAGNOSIS AND TESTING

LEAKS

WARNING: Do not remove radiator cap with system hot and under pressure. Serious burns from coolant can occur.

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

ULTRAVIOLET LIGHT METHOD

Fig. 3: Using Black Light To Check For Leaks
Courtesy of CHRYSLER LLC

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light) (1). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until the radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause the additive to glow a bright green color.

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist.

PRESSURE TESTER METHOD

Fig. 4: Identifying Pressure Tester Method
Courtesy of CHRYSLER LLC

The engine should be at normal operating temperature. Recheck the system cold if the cause of coolant loss is not located during the warm engine examination.

WARNING: Hot, pressurized coolant can cause injury by scalding.

Carefully remove the radiator pressure cap from the filler neck and check coolant level. Push down on cap to disengage it from the stop tabs. Wipe the inside of filler neck and examine the lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect the radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on the outside of filler neck. If the cams are damaged, seating of the pressure cap valve and tester seal will be affected.

Attach pressure tester (7700 or an equivalent) (1) to radiator filler neck.

Operate tester pump to apply 124.1 kPa (18 psi) pressure to system. If hoses enlarge excessively or bulge while testing, replace as necessary. Observe the gauge pointer and determine the condition of the cooling system according to the following criteria:

Holds Steady: If the pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test. Refer to **INTERNAL LEAKAGE INSPECTION**.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a Sealer Lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

INTERNAL LEAKAGE INSPECTION

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect the transmission dipstick for water globules and the transmission fluid cooler for leakage.

WARNING: With radiator pressure tester tool installed on radiator, do not allow pressure to exceed 145 kPa (21 psi). Pressure will build up quickly if a combustion leak is present. To release pressure, rock tester from side to side. When removing tester, do not turn tester more than 1/2 turn if system is under pressure.

Operate the engine without the pressure cap on the radiator until the thermostat opens. Attach a Pressure Tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the Pressure Tester. Do this until indicated pressure is within system range of 124.1 kPa (18 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders to isolate compression leak.

If the needle on the dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST - WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock

with system hot and under pressure. Serious burns from coolant can occur.

Drain sufficient coolant to allow thermostat removal. See Cooling/Engine/THERMOSTAT - Removal for 3.5L engine, also see Cooling/Engine/THERMOSTAT - Removal for 5.7L engine. Remove accessory drive belt. See Cooling/Accessory Drive/BELT, Serpentine - Removal.

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of the top of the thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 RPM while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

- Prolonged idle
- Very high ambient temperature
- Slight tail wind at idle
- Slow traffic
- Traffic jams
- High speed or steep grades

TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

- Engine adjustments (incorrect timing)
- Slipping engine accessory drive belt(s)
- Brakes (possibly dragging)
- Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed

- Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to **COOLING SYSTEM DIAGNOSIS CHART** BELOW.

These charts are to be used as a quick-reference only. Refer to **COOLING SYSTEM DIAGNOSIS CHART**.

COOLING SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Has a Diagnostic Trouble Code (DTC) been set indicating a stuck open thermostat? 2. Is the temperature sending unit connected? 3. Is the temperature gauge operating OK? 4. Coolant level low in cold ambient temperatures accompanied with poor heater performance. 5. Improper operation of internal heater doors or heater controls.	1. Refer to <u>Emissions Control - Description</u> . Replace thermostat if necessary. 2. Check the temperature sensor connector. Repair connector if necessary. 3. Check gauge operation. Refer to <u>Electrical/Instrument Cluster - Diagnosis and Testing</u> . Repair as necessary. 4. Check coolant level in the coolant reserve/overflow tank or degas bottle and the radiator. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant service information for WARNINGS and CAUTIONS associated with removing the radiator cap. See WARNINGS and CAUTIONS under <u>Diagnosis and Testing</u> . 5. Inspect heater and repair as necessary. Refer to <u>Heating and Air Conditioning - Diagnosis and Testing</u> .
TEMPERATURE GAUGE READS HIGH OR THE COOLANT WARNING LAMP ILLUMINATES. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM THE COOLING SYSTEM	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to the normal range, determine the cause for overheating and repair. Refer to Possible Causes (2-18).

aggravate these conditions.

2. Is the temperature gauge reading correctly?

3. Is the temperature warning illuminating unnecessarily?

4. Coolant low in coolant reserve/overflow tank and radiator?

5. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following Step 6.

6. Poor seals at the radiator cap.

7. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools.

2. Check gauge. Refer to **Electrical/Instrument Cluster - Diagnosis and Testing** . Repair as necessary.

3. Refer to **Electrical/Instrument Cluster - Diagnosis and Testing** .

4. Check for coolant leaks and repair as necessary. See **Cooling - Diagnosis and Testing**.

5. Tighten cap

6. (a) Check condition of cap and cap seals. Refer to Radiator Cap. Replace cap if necessary.

(b) Check condition of radiator filler neck or degas bottle. If neck is bent or damaged, replace radiator or degas bottle.

7. (a) Check condition of radiator cap and cap seals. Replace cap if necessary. See **CAP, Radiator**.

(b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.

(c) Check condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary.

(d) Check coolant reserve/overflow tank and tanks hoses for blockage. Repair as necessary.

	<p>8. Incorrect coolant concentration</p> <p>9. Coolant not flowing through system</p> <p>10. Radiator or A/C condenser fins are dirty or clogged.</p> <p>11. Radiator core is corroded or plugged.</p> <p>12. Dragging brakes</p> <p>13. Fuel or Ignition system problems.</p> <p>14. Bug screen or cardboard is being used, reducing airflow.</p> <p>15. Thermostat partially or completely shut.</p> <p>16. Cooling fan(s) not operating properly.</p> <p>17. Cylinder head gasket leaking.</p> <p>18. Heater core leaking.</p>	<p>8. Check coolant. Refer to <u>Vehicle Quick Reference/Capacities and Recommended Fluids - Description</u></p> <p>9. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine area of obstruction and repair as necessary.</p> <p>10. Remove insects and debris. See <u>Cooling - Standard Procedure</u>.</p> <p>11. Have radiator re-cored or replaced.</p> <p>12. Check and correct as necessary refer to brake service information.</p> <p>13. Refer to appropriate Electrical & Diagnosis for testing procedures.</p> <p>14. Remove bug screen or cardboard.</p> <p>15. Check thermostat operation and replace as necessary. See <u>Cooling/Engine/THERMOSTAT - Removal</u>.</p> <p>16. Check cooling fan drive operation. Refer to appropriate Diagnostic Information.</p> <p>17. Check for cylinder head gasket leaks. See <u>Cooling - Diagnosis and Testing</u>.</p> <p>18. Check heater core for leaks. Refer to <u>Heating and Air Conditioning - Diagnosis and Testing</u> . Repair as necessary.</p>
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES, OR IS ERRATIC	<p>1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.</p> <p>2. Temperature gauge or engine mounted gauge sensor defective or shorted.</p>	<p>1. During cold weather operation, with the heater in the high position, the gauge reading may drop slightly.</p> <p>2. Check operation of gauge and repair if necessary. Refer to <u>Electrical/Instrument Cluster - Diagnosis and Testing</u> .</p>

	<p>Also, corroded or loose wiring in this circuit.</p> <p>3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running)</p> <p>4. Gauge reading high after restarting a warmed up (hot) engine.</p> <p>5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).</p> <p>6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing a thermostat to open late.</p> <p>7. Water pump impeller loose on shaft.</p> <p>8. Loose accessory drive belt. (water pump slipping)</p> <p>9. Air leak on the suction side of the water pump allows air to build up in cooling system causing thermostat to open late.</p>	<p>3. A normal condition. No correction is necessary. Gauge should return to normal range after vehicle is driven.</p> <p>4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.</p> <p>5. Check and correct coolant leaks. See <u>Cooling - Diagnosis and Testing.</u></p> <p>6. (a) Check for cylinder head gasket leaks. See <u>Cooling - Diagnosis and Testing.</u> (b) Check for coolant in the engine oil. Inspect for white steam emitting from the exhaust system. Repair as necessary.</p> <p>7. Check water pump and replace as necessary. See <u>Cooling/Engine/PUMP, Water - Removal.</u></p> <p>8. Check and correct as necessary. See <u>Cooling/Accessory Drive/BELT, Serpentine - Diagnosis and Testing</u></p> <p>9. Locate leak and repair as necessary.</p>
<p>PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW</p>	<p>1. Pressure relief valve in radiator cap is defective.</p>	<p>1. Check condition of radiator cap and cap seals. See <u>Cooling/Engine/CAP, Radiator - Diagnosis and Testing.</u> Replace cap as necessary.</p>

TANK		
COOLANT LOSS TO THE GROUND WITHOUT PRESSURE CAP BLOWOFF. GAUGE READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. See <u>Cooling - Diagnosis and Testing</u> .
DETONATION OR PRE-IGNITION (NOT CAUSED BY IGNITION SYSTEM). GAUGE MAY OR MAY NOT BE READING HIGH	1. Engine overheating. 2. Freeze point of coolant not correct. Mixture is too rich or too lean.	1. Check reason for overheating and repair as necessary. 2. Check coolant concentration. Refer to <u>Vehicle Quick Reference/Capacities and Recommended Fluids - Description</u> .
HOSE OR HOSES COLLAPSE WHILE ENGINE IS RUNNING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system. - - -	1. (a) Radiator cap relief valve stuck. See <u>Cooling/Engine/CAP, Radiator - Diagnosis and Testing</u> . Replace if necessary (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary. (c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary. (d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
NOISY COOLING FAN	1. Fan blades loose. - 2. Fan blades striking a surrounding object. - 3. Air obstructions at radiator or air conditioning condenser.	1. Replace fan blade assembly. See <u>Cooling/Engine/FAN, Cooling - Removal</u> . 2. Locate point of fan blade contact and repair as necessary. 3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser.
INADEQUATE HEATER PERFORMANCE. THERMOSTAT FAILED IN OPEN POSITION	1. Has a Diagnostic trouble Code (DTC) been set? - 2. Coolant level low - 3. Obstructions in heater hose/fittings - 4. Heater hose kinked	1. Refer to <u>Emissions Control - Description</u> for correct procedures and replace thermostat if necessary 2. See <u>Cooling - Standard Procedure</u> . 3. Remove heater hoses at both ends and check for obstructions 4. Locate kinked area and repair as necessary

	<p>5. Water pump is not pumping water to/through the heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly or the heater core may be plugged. Accessory drive belt may be slipping causing poor water pump operation.</p>	<p>5. See <u>Cooling/Engine/PUMP, Water - Removal</u> for 2.7L engine. See <u>Cooling/Engine/PUMP, Water - Removal</u> for 3.5L engine. See <u>Cooling/Engine/PUMP, Water - Removal</u> for 5.7L/6.1L engine. If a slipping belt is detected. See <u>Cooling/Accessory Drive/BELT, Serpentine - Diagnosis and Testing</u>. If heater core obstruction is detected. Refer to <u>Heating and Air Conditioning/Plumbing/CORE, Heater - Removal</u>.</p>
<p>STEAM IS COMING FROM THE FRONT OF VEHICLE NEAR THE GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE</p>	<p>1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.</p>	<p>1. Occasional steam emitting from this area is normal. No repair is necessary.</p>
<p>COOLANT COLOR</p>	<p>1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.</p>	<p>1. Refer to <u>Vehicle Quick Reference/Capacities and Recommended Fluids - Description</u> Adjust coolant mixture as necessary.</p>
<p>COOLANT LEVEL CHANGES IN COOLANT RESERVE/OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE</p>	<p>1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the MIN. and</p>	<p>1. A normal condition. No repair is necessary.</p>

MAX. marks at normal operating temperature, the level should return to within that range after operation at elevated temperatures.

STANDARD PROCEDURE

DRAINING

2668424

Fig. 5: Radiator Petcock
Courtesy of CHRYSLER LLC

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

NOTE: Typical drain plug shown in illustration.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Remove radiator pressure cap.
2. Raise and secure vehicle.
3. If equipped, remove the underbody splash shield.
4. Loosen radiator petcock.
5. Drain coolant into a clean container.

80b8990c

Fig. 6: Identifying Cylinder Block Drain Plugs
 Courtesy of CHRYSLER LLC

6. If necessary, to perform a complete coolant drain of the engine, remove the drain plug (1) from the engine block.

FILLING - GAS ENGINE

81341984

Fig. 7: Cooling System Bleeding
 Courtesy of CHRYSLER LLC

1 - BLEED VALVE 2 - HOSE

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. In order to maintain the required protection for these components and cooling system performance, only use the appropriate fluid. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Description** when servicing the vehicle. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain a freeze point of -37° C (-35° F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

WARNING: Make sure engine cooling system is cool before removing pressure cap or any hose. severe personal injury may result from escaping hot coolant. The cooling system is pressurized when hot.

NOTE: Cooling system fill procedure is critical to overall cooling system performance.

1. Close radiator draincock. **Hand tighten only.**
2. Install engine block drain plugs, if removed. Coat the threads with Mopar® Thread Sealant with Teflon.

WARNING: When installing drain hose to air bleed valve, route hose away from accessory drive belts, accessory drive pulleys, and electric cooling fan motors.

NOTE: It may be necessary to install a bleed fitting on the 5.7L engine.

3. Attach a 1.5 - 2 m (4 - 6 ft.) long 6.35 mm (1/4 inch.) ID clear hose to bleeder fitting
 - **Bleed Valve Location (2.7L):** Located on the water outlet connector at the front of engine.
 - **Bleed Valve Location (3.5L):** Located on the lower intake manifold, left of center and below the upper intake plenum.
 - **Plug Location (5.7L/6.1L):** Located on the front of the water outlet housing at the front of engine.
4. Route hose (2) away from the accessory drive belt, drive pulleys and electric cooling fan. Place the other end of hose (2) into a clean container. The hose will prevent coolant from contacting the accessory drive belt when bleeding the system during the refilling operation.

NOTE: It is imperative that the cooling system air bleed valve be opened before any coolant is added to the cooling system. Failure to open the bleed valve first will result in an incomplete fill of the system.

5. 5.7L/6.1L ENGINE - Install a threaded and barbed fitting (1/4 - 18 npt) into water pump housing.
6. Attach Tool 8195, Filling Aid Funnel to pressure bottle filler neck.
7. Using hose pinch-off pliers, pinch overflow hose (3) that connects between the two chambers of the coolant bottle (2).
8. Open bleed fitting.

CAUTION: Do not mix coolants. If coolant is used other than specified, a reduction in corrosion protection will occur.

9. Pour the antifreeze mixture. Refer to **Vehicle Quick Reference/Capacities and Recommended Fluids - Description** into the larger section of Filling Aid Funnel (the smaller section of funnel is to allow air to escape). For system capacity. See **Cooling - Specifications**.
10. Slowly fill the cooling system until a steady stream of coolant flows from the hose attached to the bleed valve.
11. Close the bleed valve and continue filling system to the top of the Tool 8195, Filling Aid Funnel.
12. Remove pinch-off pliers from overflow hose.
13. Allow the coolant in Filling Funnel to drain into overflow chamber of the pressure bottle.
14. Remove Tool 8195, Filling Aid Funnel. Install cap on coolant pressure bottle.
15. Remove hose from bleed valve.
16. 5.7L/6.1L ENGINE - Install fitting into thermostat housing. Coat the threads with Mopar® Thread Sealant with Teflon.
17. Start engine and run at 1500 - 2000 RPM for 30 minutes.

NOTE: **The engine cooling system will push any remaining air into the coolant bottle within about an hour of normal driving. As a result, a drop in coolant level in the pressure bottle may occur.**
If the engine cooling system overheats and pushes coolant into the overflow side of the coolant bottle, this coolant will be sucked back into the cooling system ONLY IF THE PRESSURE CAP IS LEFT ON THE BOTTLE. Removing the pressure cap breaks the vacuum path between the two bottle sections and the coolant will not return to cooling system.

18. Shut off engine allow it to cool down for 30 minutes. This permits coolant to be drawn into the pressure chamber.
19. With engine COLD, observe coolant level in pressure chamber. Coolant level should be within MIN and MAX marks. Adjust coolant level as necessary.

NOTE: **The coolant bottle has two chambers. Coolant will normally only be in the inboard of the two. The outboard chamber is only to recover coolant in the event of an overheat or after a recent service fill.**

ADDING ADDITIONAL COOLANT

The use of aluminum cylinder blocks, cylinder heads and water pumps requires special corrosion protection. Only Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (glycol base coolant with corrosion inhibitors called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% distilled water to obtain to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

COOLANT LEVEL CHECK

Fig. 8: Coolant Recovery Container
Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - COOLANT RECOVER CONTAINER PRESSURE CAP
2 - COOLANT RECOVERY CONTAINER
3 - ADD/FULL MARKS |
|--|

NOTE: Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at coolant recovery bottle (2).

The coolant reserve/overflow system provides a quick method for determining coolant level. With engine not running, the coolant level should be between MIN and MAX marks (3). If the coolant level is at or below the MIN mark, fill the recovery bottle with a 50/50 mixture of antifreeze and water ONE QUART AT A TIME. Repeat this procedure until the coolant level is at the FULL mark.

DRAINING

2688424

Fig. 9: Radiator Petcock
Courtesy of CHRYSLER LLC

WARNING: Do not remove cylinder block drain plugs or loosen radiator draincock with system hot and under pressure. Serious burns from coolant can occur.

NOTE: Typical drain plug shown in illustration.

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

1. Remove radiator pressure cap.
2. Raise and secure vehicle.
3. If equipped, remove the underbody splash shield.
4. Loosen radiator petcock.
5. Drain coolant into a clean container.

80b8990c

Fig. 10: Identifying Cylinder Block Drain Plugs
Courtesy of CHRYSLER LLC

6. If necessary, to perform a complete coolant drain of the engine, remove the drain plug (1) from the engine block.

CLEANING/REVERSE FLUSHING

CLEANING

Drain cooling system and refill with water. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty, fill system with water, run engine and drain system. Repeat until water drains clean.

REVERSE FLUSHING

Reverse flushing of cooling system is the forcing of water through the cooling system. This is done using air pressure in the opposite direction of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect radiator hoses from radiator inlet and outlet. Attach a section of radiator hose to radiator bottom outlet fitting and insert flushing gun. Connect a water supply hose and air supply hose to flushing gun.

CAUTION: Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow radiator to fill with water. When radiator is filled, apply air in short blasts. Allow radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE

Drain cooling system. Remove thermostat housing and thermostat. Install thermostat housing. Disconnect radiator upper hose from radiator and attach flushing gun to hose. Disconnect radiator lower hose from water pump and attach a lead-away hose to water pump inlet fitting.

CAUTION: On vehicles equipped with a heater water control valve, be sure heater control valve is closed (heat off). This will prevent coolant flow with scale and other deposits from entering heater core.

Connect water supply hose and air supply hose to flushing gun. Allow engine to fill with water. When engine is filled, apply air in short blasts, allowing system to fill between air blasts. Continue until clean water flows through the lead away hose.

Remove lead away hose, flushing gun, water supply hose and air supply hose. Remove thermostat housing and install thermostat. Install thermostat housing with a replacement gasket. Refer to Thermostat Replacement. Connect radiator hoses. Refill cooling system with correct antifreeze/water mixture. Refer to Refilling the Cooling System.

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: Follow manufacturers instructions when using these products.

ACCESSORY DRIVE

BELT, SERPENTINE

Description

DESCRIPTION

The accessory drive belt is a serpentine type belt. Satisfactory performance of these belts depends on belt condition and proper belt tension.

Diagnosis and Testing

ACCESSORY DRIVE BELT

VISUAL DIAGNOSIS

Fig. 16: Belt Wear Patterns
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - NORMAL CRACKS BELT OK
2 - NOT NORMAL CRACKS REPLACE BELT |
|---|

When diagnosing serpentine accessory drive belts, small cracks (1) that run across the ribbed surface of the belt from rib to rib, are considered normal. These are not a reason to replace the belt. However, cracks (2) running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced. Also replace the belt if it has excessive wear, frayed cords, severe glazing or chunking.

Any belt with bumps, surface coming apart, or any other uneven indications along the flat surface of the belt must be removed and inspected and replaced if necessary.

Refer to **ACCESSORY DRIVE BELT DIAGNOSIS CHART** for further belt diagnosis.

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves. 2. Installation damage	1. Remove foreign objects from pulley grooves. Replace belt. 2. Replace belt
RIB OR BELT WEAR	1. Pulley misaligned 2. Abrasive environment 3. Rusted pulley(s) 4. Sharp or jagged pulley groove tips 5. Belt rubber deteriorated	1. Align pulley(s) 2. Clean pulley(s). Replace belt if necessary 3. Clean rust from pulley(s) 4. Replace pulley. Inspect belt. 5. Replace belt
BELT SLIPS	1. Belt slipping because of insufficient tension 2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol) 3. Driven component bearing failure (seizure) 4. Belt glazed or hardened from heat and excessive slippage	1. Inspect/Replace tensioner if necessary 2. Replace belt and clean pulleys 3. Replace faulty component or bearing 4. Replace belt.
LONGITUDINAL BELT CRACKING	1. Belt has mis-tracked from pulley groove 2. Pulley groove tip has worn away rubber to tensile member	1. Replace belt 2. Replace belt
"GROOVE JUMPING" (Belt does not maintain correct position on pulley)	1. Incorrect belt tension 2. Pulley(s) not within design tolerance 3. Foreign object(s) in grooves 4. Pulley misalignment 5. Belt cord line is broken	1. Inspect/Replace tensioner if necessary 2. Replace pulley(s) 3. Remove foreign objects from grooves 4. Align component 5. Replace belt
BELT BROKEN (Note: Identify and correct problem before new belt is	1. Incorrect belt tension 2. Tensile member damaged	1. Replace Inspect/Replace tensioner if necessary 2. Replace belt

installed)	during belt installation 3. Severe misalignment 4. Bracket, pulley, or bearing failure	3. Align pulley(s) 4. Replace defective component and belt
NOISE (Objectionable squeal, squeak, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension 2. Bearing noise 3. Belt misalignment 4. Belt to pulley mismatch 5. Driven component induced vibration 6. Belt flat surface coming apart	1. Inspect/Replace tensioner if necessary 2. Locate and repair 3. Align belt/pulley(s) 4. Install correct belt 5. Locate defective driven component and repair 6. Replace belt
TENSION SHEETING FABRIC FAILURE (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object 2. Excessive heat causing woven fabric to age 3. Tension sheeting splice has fractured	1. Correct rubbing condition 2. Replace belt 3. Replace belt
CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body)	1. Incorrect belt tension 2. Belt contacting stationary object 3. Pulley(s) out of tolerance 4. Insufficient adhesion between tensile member and rubber matrix	1. Inspect/Replace tensioner if necessary 2. Replace belt 3. Replace pulley 4. Replace belt

Removal

CAUTION: Do not let the tensioner arm snap back to the freearm position, severe damage may occur to the tensioner.

1. Disconnect negative battery cable from battery.
2. Rotate accessory drive belt tensioner (6) counterclockwise until it contacts its stop. Remove accessory drive belt, then slowly rotate the tensioner into the freearm position.

Cleaning

CLEANING

Clean all foreign debris from belt pulley grooves. The belt pulleys must be free of oil, grease, and coolants before installing the drive belt.

Installation

3.5L

Fig. 20: Identifying Accessory Drive Belt Routing - 3.5L

Courtesy of CHRYSLER LLC

1 - IDLER PULLEY
2 - P/S PUMP
3 - A/C COMPRESSOR
4 - CRANKSHAFT
5 - TENSIONER
6 - GENERATOR

1. Check condition of all pulleys.

CAUTION: When installing the serpentine accessory drive belt, the belt **MUST** be routed correctly. If not, the engine may overheat due to the water pump rotating in the wrong direction.

2. Position accessory drive belt around all pulleys except the idler pulley (1). Rotate the tensioner arm (5) until it contacts its stop position. Route the accessory drive belt around the idler (1) and slowly let the tensioner rotate into the belt. Make sure the belt is seated onto all pulleys.

NOTE: **NOTE: ON all engines, the tensioner (5) is equipped with an indexing tang on back of tensioner and an indexing stop on tensioner housing. If a new belt is being installed, tang must be within approximately 6 - 8mm (0.24 - 0.32 in.) of indexing stop (i.e. tang is approximately between the two indexing stops). Belt is considered new if it has been used 15 minutes or less.**

3. With the drive belt installed, inspect the belt wear indicator.

5.7L

Fig. 21: Identifying Accessory Drive Belt Routing - 5.7L
Courtesy of CHRYSLER LLC

1. Position the accessory drive belt (4) over all pulleys except for the water pump pulley (8).
2. Rotate the tensioner (7) **clockwise** and slip the accessory drive belt over the water pump pulley (8).
3. Gently release the tensioner (7).
4. Install the air intake tube between the intake manifold and air filter assembly.

6.1L

3. Install cover (3).
4. Install accessory drive belt. See Cooling/Accessory Drive/BELT, Serpentine - Installation.

TENSIONER, BELT

Description

DESCRIPTION

Fig. 27: Automatic Belt Tensioner
Courtesy of CHRYSLER LLC

Correct drive belt tension is required to ensure optimum performance of the belt (1) driven engine accessories. If specified tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate, and greatly reduced belt life.

Operation

OPERATION

The automatic belt tensioner maintains belt tension by using internal spring pressure, a pivoting arm and pulley to apply force against the drive belt.

Removal

3. Install coolant recovery tube (1).
4. Fill cooling system. See **Cooling - Standard Procedure**.
5. Install coolant recovery container pressure cap (4).

CAP, RADIATOR

Description

DESCRIPTION

Fig. 36: Radiator Pressure Cap - Typical
 Courtesy of CHRYSLER LLC

All cooling systems are equipped with a pressure cap on the radiator. This cap releases pressure at some point within a range of 110-138 kPa (16-20 psi). The pressure relief point (in pounds) is engraved on top of the cap (3).

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap contains a spring-loaded pressure relief valve (4). This valve opens when system pressure reaches the release range of 110-138 kPa (16-20 psi).

A rubber gasket (2) seals the radiator filler neck. This is done to maintain vacuum during coolant cool-down and to prevent leakage when system is under pressure.

Operation

OPERATION

A vent valve in the center of the cap will remain shut as long as the cooling system is pressurized. As the coolant cools, it contracts and creates a vacuum in cooling system. This causes the vacuum valve to open and coolant in reserve/overflow tank to be drawn through connecting hose into radiator. If the vacuum valve is stuck shut, or overflow hose is kinked, radiator hoses will collapse on cool-down.

Diagnosis and Testing

RADIATOR CAP-TO-FILLER NECK SEAL

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool 7700 (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 124 kPa (18 psi) and hold pressure at a minimum of 110 kPa (186psi).

WARNING: The warning words "DO NOT OPEN HOT" on radiator pressure cap, are a safety precaution. When hot, pressure builds up in cooling system. To prevent scalding or injury, radiator cap should not be removed while system is hot and/or under pressure.

Do not remove radiator cap at any time **except** for the following purposes:

1. Check and adjust antifreeze freeze point.
2. Refill system with new antifreeze.
3. Conducting service procedures.
4. Checking for vacuum leaks.

WARNING: If vehicle has been run recently, wait at least 15 minutes before removing radiator cap. With a rag, squeeze radiator upper hose to check if system is under pressure. Place a rag over cap and without pushing cap down, rotate it counter-clockwise to first stop. Allow fluid to escape through the coolant reserve/overflow hose into reserve/overflow tank. Squeeze radiator upper hose to determine when pressure has been released. When coolant and steam stop being pushed into tank and system pressure drops, remove radiator cap completely.

RADIATOR PRESSURE CAP

J9507-3

Fig. 37: Pressure Testing Radiator Pressure Cap-Typical
Courtesy of CHRYSLER LLC

Remove cap (1) from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap (1) on pressure tester 7700 (2) or an equivalent.

Operate tester pump to bring pressure to 124 kPa (18 psi) on gauge. If pressure cap (1) fails to hold pressure of at least 110 kPa (16 psi) replace cap. Refer to the following **CAUTION**.

The pressure cap may test properly while positioned on tool 7700 (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

Cleaning

CLEANING

Use only a mild soap and water to clean the radiator cap. Using any type solvent may cause damage to the seal in the radiator cap.

Inspection

INSPECTION

Hold cap at eye level, right side up. The vent valve at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

COOLANT

Description

DESCRIPTION

GAS ENGINES

WARNING: Antifreeze is an ethylene glycol based coolant and is harmful if swallowed or inhaled. If swallowed, drink two glasses of water and induce vomiting. If inhaled, move to fresh air area. Seek medical attention immediately. Do not store in open or unmarked containers. Wash skin and clothing thoroughly after coming in contact with ethylene glycol. Keep out of reach of children. Dispose of glycol based coolant properly, contact your government agency for location of collection center in your area. Do not open a cooling system when the engine is at operating temperature or hot under pressure, personal injury can result. Avoid radiator cooling fan when engine compartment related service is performed, personal injury can result.

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769), or the equivalent ethylene glycol based coolant with hybrid organic corrosion inhibitors (called HOAT, for Hybrid Organic Additive Technology) is recommended. This coolant offers the best engine cooling without corrosion when mixed with 50% Ethylene Glycol and 50% distilled water to obtain a freeze point of -37°C (-35°F). If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The green coolant **MUST NOT BE MIXED** with the orange or magenta coolants. When replacing

coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Mopar® Antifreeze/Coolant, 5 Year/100,000 Mile Formula (MS-9769) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure. If non-HOAT coolant is introduced into the cooling system in an emergency, it should be replaced with the specified coolant as soon as possible.

DIESEL ENGINE

CAUTION: Use of Propylene Glycol based coolants is not recommended, as they provide less freeze protection and less boiling protection.

The cooling system is designed around the coolant. The coolant must accept heat from engine metal, in the cylinder head area near the exhaust valves and engine block. Then coolant carries the heat to the radiator where the tube/fin radiator can transfer the heat to the air.

The use of aluminum cylinder blocks, cylinder heads, and water pumps requires special corrosion protection. Glysantin G 30-91 Antifreeze/Coolant, 5 Year/150,000 Mile Formula (ASTM D3306), or the equivalent ethylene glycol based coolant. This coolant offers the best engine cooling without corrosion when mixed with 50% coolant and 50% distilled water to obtain a freeze point of -36°C (-34° F). It is dyed purple to distinguish its unique chemistry from traditional green and yellow silicate coolants. If it loses color or becomes contaminated, drain, flush, and replace with fresh properly mixed coolant solution.

The purple coolant **MUST NOT BE MIXED** with the orange, green or magenta coolants. When replacing coolant the complete system flush must be performed before using the replacement coolant.

CAUTION: Glysantin G 30-91 Antifreeze/Coolant, 5 Year/100,000 Mile Formula (ASTM D3306) may not be mixed with any other type of antifreeze. Doing so will reduce the corrosion protection and may result in premature water pump seal failure.

Operation

OPERATION

Coolant flows through the engine block absorbing the heat from the engine, then flows to the radiator where the cooling fins in the radiator transfer the heat from the coolant to the atmosphere. During cold weather the ethylene-glycol or propylene-glycol coolant prevents water present in the cooling system from freezing within temperatures indicated by mixture ratio of coolant to water.

Diagnosis and Testing

COOLANT CONCENTRATION TESTING

Coolant concentration should be checked when any additional coolant was added to system or after a coolant drain, flush and refill. The coolant mixture offers optimum engine cooling and protection against corrosion when mixed to a freeze point of -37°C (-34°F) to -46°C (-50°F). The use of a hydrometer or a refractometer can be used to test coolant concentration.

A hydrometer will test the amount of glycol in a mixture by measuring the specific gravity of the mixture. The higher the concentration of ethylene glycol, the larger the number of balls that will float, and higher the freeze protection (up to a maximum of 60% by volume glycol).

A refractometer Tool 8286. See **Cooling - Special Tools** will test the amount of glycol in a coolant mixture by measuring the amount a beam of light bends as it passes through the fluid.

Some coolant manufactures use other types of glycols into their coolant formulations. Propylene glycol is the most common new coolant. However, propylene glycol based coolants do not provide the same freezing protection and corrosion protection and is not recommended.

CAUTION: Do not mix types of coolant - corrosion protection will be severely reduced.

FAN, COOLING

Removal

REMOVAL

Fig. 38: Radiator Fan Assembly

2 - ELECTRICAL CONNECTOR
3 - UPPER RADIATOR HOSE |
|--|

1. Position fan motor on radiator fan shroud.
2. Install mounting bolts. Tighten to 10 N.m (89 in. lbs.).
3. Position fan blade on motor and install retaining nut. Tighten nut to 25 N.m (221 in. lbs.).

4. Position radiator cooling fan assembly (1) in vehicle.
5. Install cooling fan mounting bolts. Tighten to 6 N.m (50 in. lbs.)
6. Connect cooling fan electrical connector (2).
7. Install upper radiator hose (3).
8. Install the air filter housing. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation** .
9. Fill the cooling system. See **Cooling - Standard Procedure**.
10. Operate engine until it reaches normal operating temperature. Check cooling system and automatic transmission for correct fluid levels.

HEATER, ENGINE BLOCK

Description

ENGINE BLOCK HEATER

Fig. 40: Engine Block Heater 2.7L/3.5L
Courtesy of CHRYSLER LLC

The 3.5L engine block heater (1) is mounted in the cylinder block (2), near the right rear corner. The engine block heater (1) is a dry cylinder type design and is powered by 110 volt AC.

Fig. 41: Engine Block Heater 5.7L/6.1L
Courtesy of CHRYSLER LLC

1 - BLOCK HEATER

The 5.7L and 6.1L engine block heater (1) is mounted in the cylinder block, near the left rear corner. The engine block heater (1) is a dry cylinder type design and is powered by 110 volt AC.

Operation

OPERATION

When power is applied (110 volt AC) to the block heater, the heating element transfers heat through the aluminum engine block and into the coolant without directly penetrating the cooling system.

Diagnosis and Testing

ENGINE BLOCK HEATER

If unit does not operate, trouble can be in either the power cord or the heater element. Test power cord for continuity with a 110-volt voltmeter or 110-volt test light; test heater element continuity with

an ohmmeter or 12-volt test light.

Removal

3.5L

1 - BLOCK HEATER

1. Thoroughly clean cylinder block core hole and block heater seat.
2. Insert block heater assembly (1) into the block.
3. With block heater (1) fully seated, tighten bolt (2) to 2 N.m (17 in. lbs.) torque.
4. Connect power cord (3) to block heater assembly (1).

PUMP, WATER

Description

DESCRIPTION

Fig. 48: Water Pump - 3.5L Engine
Courtesy of CHRYSLER LLC

The 3.5L water pump has a die cast aluminum housing (3) and a plastic swept vane impeller (2) and bolts directly to the rear timing belt cover using a press-in-place gasket (1) for sealing. The water pump is driven by the engine timing belt.

Standard Procedure

COOLANT AIR EVACUATION

Fig. 49: Pressurized Air Operated Vacuum Generator
Courtesy of CHRYSLER LLC

Evacuating or purging air from the cooling system involves the use of a pressurized air operated

vacuum generator. The vacuum created allows for a quick and complete coolant refilling while removing any airlocks present in the system components.

NOTE: To avoid damage to the cooling system, ensure that no component would be susceptible to damage when a vacuum is drawn on the system.

WARNING: ANTIFREEZE IS AN ETHYLENE GLYCOL BASE COOLANT AND IS HARMFUL IF SWALLOWED OR INHALED. IF SWALLOWED, DRINK TWO GLASSES OF WATER AND INDUCE VOMITING. IF INHALED, MOVE TO FRESH AIR AREA. SEEK MEDICAL ATTENTION IMMEDIATELY. DO NOT STORE IN OPEN OR UNMARKED CONTAINERS. WASH SKIN AND CLOTHING THOROUGHLY AFTER COMING IN CONTACT WITH ETHYLENE GLYCOL. KEEP OUT OF REACH OF CHILDREN. DISPOSE OF GLYCOL BASED COOLANT PROPERLY. CONTACT YOUR DEALER OR GOVERNMENT AGENCY FOR LOCATION OF COLLECTION CENTER IN YOUR AREA. DO NOT OPEN A COOLING SYSTEM WHEN THE ENGINE IS AT OPERATING TEMPERATURE OR HOT UNDER PRESSURE; PERSONAL INJURY CAN RESULT. AVOID RADIATOR COOLING FAN WHEN ENGINE COMPARTMENT RELATED SERVICE IS PERFORMED; PERSONAL INJURY CAN RESULT.

WARNING: WEAR APPROPRIATE EYE AND HAND PROTECTION WHEN PERFORMING THIS PROCEDURE.

NOTE: The service area where this procedure is performed should have a minimum shop air requirement of 80 PSI (5.5 bar) and should be equipped with an air dryer system.

NOTE: For best results, the radiator should be empty. The vehicle's heater control should be set to the heat position (ignition may need to be turned to the on position but do not start the motor).

1. Refer to the Chrysler Pentastar Service Equipment (Chrysler PSE) Coolant Refiller #85-15-0650 or equivalent tool's operating manual for specific assembly steps.
2. Choose an appropriate adapter cone that will fit the vehicle's radiator filler neck or reservoir tank.
3. Attach the adapter cone (2) to the vacuum gauge (1).

2321148

Fig. 50: Vacuum Generator/Venturi Ball Valve
Courtesy of CHRYSLER LLC

4. Make sure the vacuum generator/venturi ball valve (3) is closed and attach an airline hose (2) (minimum shop air requirement of 80 PSI/5.5 bar) to the vacuum generator/venturi (1).
5. Position the adaptor cone/vacuum gauge assembly into the radiator filler neck or reservoir tank. Ensure that the adapter cone is sealed properly.

2321125

Fig. 51: Vacuum Generator/Venturi
Courtesy of CHRYSLER LLC

6. Connect the vacuum generator/venturi (2) to the positioned adaptor cone/vacuum gauge assembly (1).
7. Open the vacuum generator/venturi ball valve.

NOTE: Do not bump or move the assembly as it may result in loss of vacuum. Some radiator overflow hoses may need to be clamped off to obtain vacuum.

8. Let the system run until the vacuum gauge shows a good vacuum through the cooling system. Refer to the tool's operating manual for appropriate pressure readings.

NOTE: If a strong vacuum is being created in the system, it is normal to see the radiator hoses have collapsed.

9. Close the vacuum generator/venturi ball valve.

2321184

Fig. 52: Vacuum Generator/Venturi And Air Line
Courtesy of CHRYSLER LLC

10. Disconnect the vacuum generator/venturi and airline from the adaptor cone/vacuum gauge assembly.
11. Wait approximately 20 seconds, if the pressure readings do not move, the system has no leaks. If the pressure readings move, a leak could be present in the system and the cooling system should be checked for leaks and the procedure should be repeated.
12. Place the tool's suction hose into the coolant's container.

NOTE: Ensure there is a sufficient amount of coolant, mixed to the required strength/protection level available for use. For best results and to assist the refilling procedure, place the coolant container at the same height as the radiator filler neck. Always draw more coolant than required. If the coolant level is too low, it will pull air into the cooling system which could result in airlocks in the system.

13. Connect the tool's suction hose (1) to the adaptor cone/vacuum gauge assembly (2).

Fig. 53: Suction Hose Ball Valve
Courtesy of CHRYSLER LLC

14. Open the suction hose's ball valve to begin refilling the cooling system.
15. When the vacuum gauge reads zero, the system is filled.

NOTE: On some remote pressurized tanks, it is recommended to stop filling when the proper level is reached.

16. Close the suction hose's ball valve and remove the suction hose from the adaptor cone/vacuum gauge assembly.
17. Remove the adaptor cone/vacuum gauge assembly from the radiator filler neck or reservoir tank.
18. With heater control unit in the HEAT position, operate engine with container cap in place.
19. After engine has reached normal operating temperature, shut engine off and allow it to cool. When engine is cooling down, coolant will be drawn into the radiator from the pressure container.
20. Add coolant to the recovery bottle/container as necessary. **Only add coolant to the container when the engine is cold. Coolant level in a warm engine will be higher due to thermal expansion.** Add necessary coolant to raise container level to the COLD MINIMUM mark after each cool down period.
21. Once the appropriate coolant level is achieved, attach the radiator cap or reservoir tank cap.

1. Disconnect negative battery cable.
2. Drain cooling system. See Cooling - Standard Procedure.
3. Remove radiator fan assembly. See Cooling/Engine/FAN, Cooling - Removal.
4. Remove accessory drive belt. See Cooling/Accessory Drive/BELT, Serpentine - Removal.
5. Remove thermostat. See Cooling/Engine/THERMOSTAT - Removal.

NOTE: The water pump mounting bolts (2) are different lengths. Note the location of the water pump mounting bolts (2).

6. Remove water pump mounting bolts (2) and remove water pump (1).

Inspection

WATER PUMP

Fig. 57: Water Pump - 5.7L/6.1L
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - WATER PUMP ASSEMBLY
2 - BOLT
3 - DOUBLE ENDED BOLT |
|--|

Inspect and replace the water pump if it has any of the following defects:

1. Damage or cracks on the pump body.

Fig. 58: Thermostat Housing/Coolant Inlet, Fasteners & Weep Hole
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - THERMOSTAT HOUSING/COOLANT INLET
2 - BOLT
3 - NUT
4 - WEEP HOLE |
|--|

- Coolant leaks: If the shaft seal is leaking, this will be evident by traces of thick deposits of dried glycol running down from the pump primary weep passage. A thin black stain below the pump primary weep hole/passage is considered normal operation.

Fig. 59: Weep Passage To Valley Of Block & Drain Hole In Rear Of Block
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - WEEP PASSAGE TO VALLEY OF BLOCK
2 - HOLE IN REAR OF BLOCK |
|--|

- Coolant leaks: If the pump primary weep passage is plugged, coolant may come from the secondary weep passage and collect in the valley of the engine. The coolant will eventually run out the back side of the engine. Leakage from the secondary weep passage may give false indications that core plug(s) may be leaking on the back side of the engine block. If this condition is found, clean the primary weep passage of debris.

NOTE: It is normal for the water pump to weep a small amount of coolant from the primary weep hole (black stain at weep passage). Do not replace the water pump if this condition exists. Replace the water pump if a heavy deposit or a steady flow of engine coolant is evident from the primary weep passage. This indicates a shaft seal failure and pump must be replaced. Coolant may leak from the secondary weep passage and fill the valley of the engine. If this condition is found, clean the primary weep passage of debris. Be sure to perform a thorough analysis before replacing water pump.

- Impeller rubs inside of cylinder block.

5. Excessively loose or rough turning bearing.

10. Lower vehicle.
11. Remove upper radiator hose.

CAUTION: Bolts are installed with threadlocker. Use hand tools to remove the upper radiator mounting bolts.

12. Remove upper radiator mounting brackets (1) and bolts (2).
13. Remove upper condenser mounting bolts.
14. Separate condenser assembly from radiator.
15. Tilt radiator toward engine and remove radiator from vehicle.

Cleaning

CLEANING

Clean radiator fins are necessary for good heat transfer. The radiator and air conditioning fins should be cleaned when an accumulation of debris has occurred. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

Inspection

INSPECTION

Inspect the radiator tanks for cracks, broken or missing fittings also inspect the joint where the tanks seam up to the radiator core for signs of leakage and/or deteriorating seals.

Inspect radiator core for corroded, bent or missing cooling fins. Inspect the core for bent or damaged cooling tubes.

Installation

INSTALLATION

8136a312

Fig. 66: Radiator Mounting Bracket
 Courtesy of CHRYSLER LLC

1. Position the radiator into engine compartment. Seat the radiator assembly lower rubber isolators into the mounting holes in radiator lower support.
2. Install the radiator mounting bracket (1) and bolts (2). Tighten to 12 N.m (106 in. lbs.).
3. Position the condenser on radiator and install upper mounting bolts. Tighten bolts to 6 N.m (50 in. lbs.).
4. Raise the vehicle.

1. Apply thread sealant to sensor threads.
2. Install ECT sensor (3) to engine.
3. Tighten sensor to 11 N.m (98 in. lbs.).
4. Connect electrical connector (2) to ECT sensor (3).
5. Fill the cooling system. See **Cooling - Standard Procedure**.

THERMOSTAT

Description

DESCRIPTION

The engine cooling thermostats are a wax pellet driven, reverse poppet choke type. The thermostats have an air bleed located in the thermostat flange. The air bleed allows internal trapped air during cooling system filling to be released. The thermostat on the 2.7L and 3.5L engines are located on the lower left side of engine, near the front. The thermostat on both engines are on the inlet side of the water pump.

The thermostat on the 5.7L/6.1L engine is located beneath the thermostat housing (1) at the front of the intake manifold.

Fig. 75: Thermostat - Typical
Courtesy of CHRYSLER LLC

1 - VENT VALVE
2 - BYPASS VALVE
3 - THERMOSTAT HOUSING SEAL
4 - MAIN VALVE

The thermostat on the 3.0L Diesel engine is integrated into the thermostat housing located at the front of the right intake manifold and is serviced as an assembly. A rubber seal is used to seal the thermostat housing to the intake manifold. The thermostat contains the following components:

- Main Valve (4) - Controls coolant flow through the radiator
- Bypass Valve (2) - Controls coolant flow through the bypass passage to the inlet side of the water pump
- Vent Valve (1) - Vents the cooling system via a ball valve when it is filled and when the engine is running
- Thermostat Housing Seal (3)

Operation

OPERATION

WARM-UP PHASE

Fig. 76: Warm-Up Phase
 Courtesy of CHRYSLER LLC

Up to a coolant temperature of approximately 87° C (189° F), the main valve is closed and the bypass valve fully open. The flow through the radiator is interrupted and coolant flows through the bypass passage directly to the inlet side of the water pump.

PARTIAL-LOAD PHASE

Fig. 77: Partial-Load Phase
 Courtesy of CHRYSLER LLC

The main valve begins to open at a coolant temperature of 86° C (189° F), and a small amount of coolant flows through the radiator. As the engine temperature increases, the main valve opens further

and the bypass valve gradually closes. More coolant flows through the radiator and less coolant flows through the bypass passage.

FULL-LOAD PHASE

Fig. 78: Full-Load Phase
Courtesy of CHRYSLER LLC

The main valve is fully open at a coolant temperature above 102° C (216° F). The bypass plate seals off the bypass passage. The entire quantity of coolant flows through the radiator.

Diagnosis and Testing

ENGINE COOLANT THERMOSTAT

The thermostat is operated by a wax filled chamber (pellet) which is sealed. When heated coolant reaches a predetermined temperature the wax pellet expands enough to overcome the closing spring and water pump pressure, which forces the valve to open. Coolant leakage into the pellet will cause a thermostat to fail open. Do not attempt to free up a thermostat with a screwdriver.

Thermostat diagnostics is included in powertrain control module's (PCM) programming for on-board diagnosis. The malfunction indicator light (MIL) will illuminate and a diagnostic trouble code (DTC) will be set when an "open too soon" condition occurs. Do not change a thermostat for lack of heater performance or temperature gauge position, unless a DTC is present. For other probable causes. See **Cooling - Diagnosis and Testing**. Thermostat failing shut is the normal long term mode of failure, and normally, only on high mileage vehicles. The temperature gauge will indicate this. See **Cooling - Diagnosis and Testing**.

Removal

3.5L ENGINE

Fig. 79: Lower Radiator Hose And Thermostat Housing
Courtesy of CHRYSLER LLC

-
- 1 - THERMOSTAT
- 2 - RADIATOR HOSE

1. Disconnect negative battery cable.
2. Raise vehicle on hoist.
3. Remove belly pan. Refer to **Body/Exterior/BELLY PAN - Removal** .
4. Drain cooling system. See **Cooling - Standard Procedure**.
5. Lower vehicle on hoist.
6. Remove air box assembly. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Removal** .
7. Disconnect lower radiator hose (2) from thermostat housing (1).
8. Remove thermostat housing bolts.
9. Remove thermostat housing (1), thermostat, and gasket.

NOTE: The OEM thermostat is staked in place at the factory. To ensure proper seating of replacement thermostat, carefully remove the bulged metal from the thermostat housing using a suitable hand held grinder. It is not necessary to restake the replacement thermostat into the thermostat housing.

10. Clean gasket surfaces.

261774

Fig. 80: Thermostat Housing, Radiator Hose & Mounting Bolts
 Courtesy of CHRYSLER LLC

1. Disconnect the negative battery cable.
2. Drain the cooling system until the coolant level is below the thermostat. See **Cooling - Standard Procedure**.
3. Remove the radiator hose (3) from the thermostat housing (1).
4. Remove the thermostat housing mounting bolts (2), thermostat housing (1), and thermostat.

6.1L

Fig. 81: Thermostat - 5.7L/6.1L

- 1 - THERMOSTAT HOUSING
- 2 - THERMOSTAT
- 3 - BOLT

1. Disconnect negative battery cable at battery.
2. Drain cooling system. See **Cooling - Standard Procedure**.
3. Remove radiator hose at thermostat housing (1).

NOTE: **Thermostat o-ring is part of thermostat (2) and is not serviced separately.**

4. Remove thermostat housing mounting bolts (3), thermostat housing (1) and thermostat (2).

Installation

3.5L ENGINE

Fig. 82: Lower Radiator Hose And Thermostat Housing
Courtesy of CHRYSLER LLC

-
- 1 - THERMOSTAT
- 2 - RADIATOR HOSE

1. Position gasket on thermostat and housing (1).
2. Install thermostat housing (1), gasket and mounting bolts onto block. Tighten attaching bolts to 12 N.m (105 in. lbs.).
3. Install radiator hose (2).
4. Install air box assembly. Refer to **Engine/Air Intake System/BODY, Air Cleaner - Installation**
5. Fill cooling system. See **Cooling - Standard Procedure**.

6. Raise vehicle on hoist.
7. Install belly pan. Refer to **Body/Exterior/BELLY PAN - Installation**
8. Connect negative battery cable.

5.7L

261774

Fig. 83: Thermostat Housing, Radiator Hose & Mounting Bolts
Courtesy of CHRYSLER LLC

1. Clean the mating areas of the intake manifold and thermostat housing (1).
2. Install the thermostat into the recessed machined groove on the front cover.
3. Install the housing-to-front cover bolts. Tighten the bolts to 23 N.m (200 in. lbs.).
4. Install the radiator upper hose (3) to the thermostat housing (1).
5. Fill the cooling system. See **Cooling - Standard Procedure**.
6. Connect the negative battery cable.
7. Start and warm the engine. Check for leaks.

6.1L

Fig. 84: Thermostat - 5.7L/6.1L

- | |
|--|
| 1 - THERMOSTAT HOUSING
2 - THERMOSTAT
3 - BOLT |
|--|

1. Clean mating areas of timing chain cover and thermostat housing (1).

NOTE: Install thermostat with the bleed valve located at the 12 o'clock position.

2. Install thermostat (2) (spring side down) into recessed machined groove on timing chain cover with bleed valve located at the 12 o'clock position.
3. Position thermostat housing (1) on timing chain cover.

CAUTION: Thermostat housing must be tightened evenly and thermostat (2) must be centered into recessed groove in timing chain cover. If not, it may result in a cracked thermostat housing (1), damaged timing chain cover threads or coolant leaks.

4. Install two housing-to-timing chain cover bolts (3). Tighten bolts to 13 N.m (112 in. lbs.) torque.
5. Install lower radiator hose on thermostat housing.
6. Lower vehicle.
7. Fill cooling system. See **Cooling - Standard Procedure**.
8. Connect negative battery cable to battery.
9. Start and warm the engine. Check for leaks.

TUBE, HEATER HOSE, SUPPLY

3. Install heater hose onto heater tubes.
4. Install intake manifold. Refer to **Engine/Manifolds/MANIFOLD, Intake - Installation** .
5. Connect negative battery cable.
6. Fill cooling system. See **Cooling - Standard Procedure**.
7. Start vehicle and check for cooling system leaks.

TRANSMISSION

STANDARD PROCEDURE

TRANSMISSION COOLER LINE QUICK CONNECT FITTING DISASSEMBLY/ASSEMBLY

DISCONNECT

81019138

Fig. 91: Oil Cooler Line Quick Connect Fitting - Disassembly
Courtesy of CHRYSLER LLC

- | |
|--|
| <p>1 - QUICK CONNECT FITTING
2 - DUST CAP
3 - OIL COOLER LINE
4 - SPECIAL TOOL 8875A</p> |
|--|

1. Remove dust cap by pulling it straight back off of quick connect fitting.
2. Place disconnect tool 8875A onto transmission cooler line with the fingers of the tool facing the quick connect fitting.
3. Slide disconnect tool down the transmission line and engage the fingers of the tool into the retaining clip. When properly engaged in the clip, the tool will fit flush against the quick connect

fitting.

4. Rotate the disconnect tool 60° to expand the retaining clip.
5. While holding the disconnect tool against the quick connect fitting, pull back on the transmission cooler line to remove.

CONNECT

8101913a

Fig. 92: Oil Cooler Line Quick Connect Fitting - Assembly
Courtesy of CHRYSLER LLC

- | |
|---------------------------|
| 1 - QUICK CONNECT FITTING |
| 2 - CLIP |
| 3 - OIL COOLER LINE |
| 4 - DUST CAP |

1. Align transmission cooler line with quick connect fitting while pushing straight into the fitting.
2. Push in on transmission cooler line until a "click" is heard or felt.
3. Slide dust cap down the transmission cooler line and snap it over the quick connect fitting until it

is fully seated and rotates freely. Dust cap will only snap over quick connect fitting when the transmission cooler line is properly installed.

NOTE: If dust cap will not snap into place, repeat assembly step #2.

TRANSMISSION OIL COOLER REVERSE FLUSHING/CLEANING

TRANSMISSION OIL COOLER REVERSE FLUSHING DESCRIPTION

Reverse flushing of the transmission oil cooling system is the forcing of fluid (ATF+4) in the opposite direction of normal fluid flow through the cooling system. It is necessary to perform this procedure anytime the transmission is serviced to avoid possible contamination of the cooling system. **DO NOT PERFORM THIS PROCEDURE ON ANY VEHICLE THAT DOES NOT USE MOPAR® ATF+4 TRANSMISSION FLUID.**

REVERSE FLUSHING TRANSMISSION OIL COOLER

Fig. 93: Trans Cooler Cleaner Adapter Kit - 9038-1
Courtesy of CHRYSLER LLC

WARNING: WEAR PROTECTIVE EYEWEAR AND APPROPRIATE HEAT RESISTANT GLOVES WHEN PERFORMING THIS PROCEDURE.

NOTE: Refer to the Transmission Cooler Cleaner's operating instructions before starting this procedure.

1. Remove the transmission from the vehicle. Refer to the specific vehicle's transmission removal procedure.
2. Using tool 9038-1, trans cooler cleaner adapter kit (TCCAK) (1), select the proper adapter/fitting for the vehicle you are performing the procedure on.

Fig. 94: Installing Trans Cooler Cleaner To Transmission Oil Cooler
 Courtesy of CHRYSLER LLC

3. Install the selected adapter/fitting to the transmission oil cooler inlet (2) and outlet (1) lines.
4. Connect the red hose (outlet) of the 9038 trans cooler cleaner (TCC) to the transmission oil cooler outlet line (1).
5. Connect the blue hose (inlet) of the 9038 trans cooler cleaner (TCC) to the transmission oil cooler inlet line (2).

Fig. 95: Identifying Trans Cooler Cleaner Filter Screen
 Courtesy of CHRYSLER LLC

6. Before starting the 9038 trans cooler cleaner (TCC), check the filter screen (2) for any debris. If debris is present, clean the filter screen in a parts washer and dry completely.

CAUTION: FILTER SCREEN (2) MUST BE COMPLETELY CLEAN AND DRY BEFORE PROCEEDING. FAILURE TO COMPLY COULD RESULT IN POSSIBLE CONTAMINATION AND DAMAGE TO THE COOLING SYSTEM.

7. Connect a compressed air line (90 to 120 psi recommended) to the air inlet fitting located on the rear of the 9038 trans cooler cleaner (TCC).
8. Power up and pre-heat the 9038 trans cooler cleaner (TCC) machine to 190°F (will take approximately 45 minutes with a full tank of fluid).
9. Refer to the 9038 transmission cooler cleaner's (TCC) owners manual and quick reference card for detailed operating instructions.

NOTE: It is recommended to flush/clean the system in 30 minute intervals.

TRANSMISSION OIL COOLER CLEANING

Fig. 96: Trans Cooler Cleaner Adapter Kit - 9038-1
Courtesy of CHRYSLER LLC

NOTE: Always start the cleaning procedure by reverse flushing the system first.

WARNING: WEAR PROTECTIVE EYEWEAR AND APPROPRIATE HEAT RESISTANT GLOVES WHEN PERFORMING THIS PROCEDURE.

NOTE: Refer to the Transmission Cooler Cleaner's operating instructions before starting this procedure.

1. With the transmission removed from the vehicle. Use tool 9038-1, trans cooler cleaner adapter kit (TCCAK) (1), to select the proper adapter/fitting for the vehicle you are performing the

procedure on.

Fig. 97: Installing Trans Cooler Cleaner To Transmission Oil Cooler
Courtesy of CHRYSLER LLC

2. Install the selected adapter/fitting to the transmission oil cooler inlet (2) and outlet (1) lines.
3. Connect the blue hose (inlet) of the 9038 trans cooler cleaner (TCC) to the transmission oil cooler outlet line (1).
4. Connect the red hose (outlet) of the 9038 trans cooler cleaner (TCC) to the transmission oil cooler inlet line (2).

Fig. 98: Identifying Trans Cooler Cleaner Filter Screen
Courtesy of CHRYSLER LLC

5. Before starting the 9038 trans cooler cleaner (TCC), check the filter screen (2) for any debris. If debris is present, clean the filter screen in a parts washer and dry completely.

CAUTION: FILTER SCREEN (2) MUST BE COMPLETELY CLEAN AND DRY BEFORE PROCEEDING. FAILURE TO COMPLY COULD RESULT IN POSSIBLE CONTAMINATION AND DAMAGE TO THE COOLING SYSTEM.

6. Refer to the 9038 transmission cooler cleaner's (TCC) owners manual and quick reference card for detailed operating instructions.

NOTE: It is recommended to flush/clean the system in 30 minute intervals.

7. Check the filter screen (2) for any debris. If debris is present after the cleaning procedure is complete, clean the filter screen in a parts washer, dry completely, repeat the reverse flush procedure and repeat the cleaning procedure.
8. Install the transmission to the vehicle. Refer to the specific vehicle's transmission installation procedure.

COOLER, TRANSMISSION OIL

Description

DESCRIPTION

Fig. 99: Identifying A/C Condenser & Power Steering Cooler
Courtesy of CHRYSLER LLC

The automatic transmission cooler (2) is located in the front of the radiator and behind the front fascia and is combined with the A/C condenser. The transmission cooler is a heat exchanger that allows heat in the transmission fluid to be transferred to the air passing over the cooler fins.

The Transmission oil cooler/A/C condenser assembly is equipped with quick connect fitting for the

transmission oil cooler lines, a tapping block (3) for the receiver/drier (4) and mounting provisions for the power steering cooler (5).

The transmission oil cooler/AC condenser is service as an assembly. For removal. Refer to **Heating and Air Conditioning/Plumbing/CONDENSER, A/C - Removal** and installation. Refer to **Heating and Air Conditioning/Plumbing/CONDENSER, A/C - Installation** .

TUBES AND HOSES, TRANSMISSION OIL COOLER

Removal

REMOVAL

1. Remove upper radiator closure panels
2. Using Release Tool 8875A, remove transmission cooler lines from transmission cooler. See **Cooling - Standard Procedure**.
3. Raise vehicle on hoist.
4. Remove front transmission cooler lines from the thermal bypass valve block.
5. Remove rear transmission cooler lines from the thermal bypass valve block
6. Remove the transmission cooler lines from the transmission.

Installation

INSTALLATION

1. Install rear transmission cooler lines at transmission. Tighten fittings to 20 N.m (18 ft. lbs.).
2. Install rear transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).
3. Install front transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).
4. Install front transmission cooler lines into transmission cooler. See **Cooling - Standard Procedure**.
5. Lower vehicle.
6. Check transmission fluid level. Refer to **Transmission and Transfer Case/Automatic - 42RLE/FLUID and FILTER - Standard Procedure** , or refer to **Transmission and Transfer Case/Automatic - NAG1/FLUID and FILTER - Standard Procedure** .

VALVE, THERMO BYPASS

Description

DESCRIPTION

818c5a89

Fig. 100: Thermal Bypass Valve
Courtesy of CHRYSLER LLC

The transmission thermal bypass valve is mounted on LH side of the engine at the A/C compressor.

Operation

OPERATION

The air-to-oil transmission cooler system has a thermal bypass valve assembly that controls fluid flow through the cooler. When the transmission fluid is cold (less than operating temperature), the fluid is routed through the cooler bypass valve without flowing through the transmission cooler. When the transmission fluid reaches operating temperatures 71°C (160°F) and above, the thermostat closes off the bypass and allowing fluid to flow through the transmission cooler. The thermal bypass valve is serviced as an assembly.

Removal

REMOVAL

1 - MOUNTING BOLT
2 - THERMAL BYPASS VALVE BLOCK
3 - COOLER LINE FITTING

1. Position thermal bypass valve. Install mounting bolt. Tighten mounting bolt to: 3.5L engine to 26 N.m (19 ft.lbs.) and 5.7L/6.1L engine to 50 N.m (37 ft. lbs.).
2. Install rear transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).
3. Install front transmission cooler lines to thermal bypass valve. Tighten fittings to 20 N.m (18 ft. lbs.).

GENERAL INFORMATION

Engine Overhaul Procedures

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

DESCRIPTION

Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of cleaning, inspection, and assembly processes are included.

ENGINE IDENTIFICATION

Engine may be identified from Vehicle Identification Number (VIN) stamped on a metal tab. Metal tab may be located in different locations depending on manufacturer. Engine identification number or serial number is located on cylinder block. Location varies with each manufacturer.

INSPECTION PROCEDURES

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

GENERAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes

of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Engine components must be inspected to meet manufacturer's specifications and tolerances during overhaul. Proper dimensions and tolerances must be met to obtain proper performance and maximum engine life.

Micrometers, depth gauges and dial indicator are used for checking tolerances during engine overhaul. Magnaflux, Magnaglo, dye-check, ultrasonic and x-ray inspection procedures are used for parts inspection.

MAGNETIC PARTICLE INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Magnaflux & Magnaglo

Magnaflux is an inspection technique used to locate material flaws and stress cracks. Component is subjected to a strong magnetic field. Entire component or a localized area can be magnetized. Component is coated with either a wet or dry material that contains fine magnetic particles.

Cracks which are outlined by the particles cause an interruption of magnetic field. Dry powder method of Magnaflux can be used in normal lighting and crack appears as a bright line.

Fluorescent liquid is used along with a Black light in the Magnaglo Magnaflux system. Darkened room is required for this procedure. The crack will appear as a glowing line. Complete demagnetizing of component upon completion is required on both procedures. Magnetic particle inspection applies to ferrous materials only.

PENETRANT INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Zyglo

The Zyglo process coats material with a fluorescent dye penetrant. Component is often warmed to expand cracks that will be penetrated by the dye. Using darkened room and Black light, component is inspected for cracks. Crack will glow brightly.

Developing solution is often used to enhance results. Parts made of any material, such as aluminum cylinder heads or plastics, may be tested using this process.

Dye Check

Penetrating dye is sprayed on the previously cleaned component. Dye is left on component for 5-45 minutes, depending upon material density. Component is then wiped clean and sprayed with a developing solution. Surface cracks will show up as a bright line.

ULTRASONIC INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

If an expensive part is suspected of internal cracking, ultrasonic testing is used. Sound waves are used for component inspection.

X-RAY INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

This form of inspection is used on highly stressed components. X-ray inspection may be used to detect internal and external flaws in any material.

PRESSURE TESTING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cylinder heads can be tested for cracks using a pressure tester. Pressure testing is performed by plugging all but one of the holes of cylinder head and injecting air or water into the open passage.

Leaks are indicated by the appearance of wet or damp areas when using water. When air is used, it is necessary to spray the head surface with a soap solution. Bubbles will indicate a leak. Cylinder head may also be submerged in water heated to specified temperature to check for cracks created during heat expansion.

CLEANING PROCEDURES

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

GENERAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

All components of an engine do not have the same cleaning requirements. Physical methods include bead blasting and manual removal. Chemical methods include solvent blast, solvent tank, hot tank, cold tank and steam cleaning of components.

BEAD BLASTING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Manual removal of deposits may be required prior to bead blasting, followed by some other cleaning method. Carbon, paint and rust may be removed using bead blasting method. Components must be free of oil and grease prior to bead blasting. Beads will stick to grease or oil soaked areas causing area not to be cleaned.

Use air pressure to remove all trapped residual beads from component after cleaning. After cleaning internal engine parts made of aluminum, wash thoroughly with hot soapy water. Component must be thoroughly cleaned as glass beads will enter engine oil resulting in bearing damage.

CHEMICAL CLEANING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Solvent tank is used for cleaning oily residue from components. Solvent blasting sprays solvent through a siphon gun using compressed air.

The hot tank, using heated caustic solvents, is used for cleaning ferrous materials only. DO NOT clean aluminum parts such as cylinder heads, bearings or other soft metals using the hot tank. After cleaning, flush parts with hot water.

A non-ferrous part will be ruined and caustic solution will be diluted if placed in the hot tank. Always use eye protection and gloves when using the hot tank.

Use of a cold tank is for cleaning aluminum cylinder heads, carburetors and other soft metals. A less caustic and unheated solution is used. Parts may be left in the tank for several hours without damage. After cleaning, flush parts with hot water.

Steam cleaning, with boiling hot water sprayed at high pressure, is recommended as the final cleaning process when using either hot or cold tank cleaning.

COMPONENT CLEANING

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

SHEET METAL PARTS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Examples of sheet metal parts are rocker covers, front and side covers, oil pan and bellhousing dust cover. Glass bead blasting or hot tank may be used for cleaning.

Ensure all mating surfaces are flat. Deformed surfaces should be straightened. Check all sheet metal parts for cracks and dents.

INTAKE & EXHAUST MANIFOLDS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Using solvent cleaning or bead blasting, clean manifolds for inspection. If intake manifold has an exhaust crossover, all carbon deposits must be removed. Inspect manifolds for cracks, burned or eroded areas, corrosion and damage to fasteners.

Exhaust heat and products of combustion cause threads of fasteners to corrode. Replace studs and

bolts as necessary. On "V" type intake manifolds, sheet metal oil shield must be removed for proper cleaning and inspection. Ensure all manifold parting surfaces are flat and free of burrs.

CYLINDER HEAD REPLACEMENT

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Remove intake and exhaust manifolds and valve cover. Cylinder head and camshaft carrier bolts (if equipped) should be removed only when engine is cold. On many aluminum cylinder heads, removal while hot will cause cylinder head warpage. Mark rocker arm or overhead cam components for location.

Remove rocker arm components or overhead cam components. Components must be installed in original location. Individual design rocker arms may utilize shafts, ball-type pedestal mounts or no rocker arms. For all design types, wire components together and identify according to corresponding valve. Remove cylinder head bolts. Note length and location. Some applications require cylinder head bolts be removed in proper sequence to prevent cylinder head damage. See **Fig. 1**. Remove cylinder head.

INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure all surfaces and head bolts are clean. Check that head bolt holes of cylinder block are clean and dry to prevent block damage when bolts are tightened. Clean threads with tap to ensure accurate bolt torque.

Install head gasket on cylinder block. Some manufacturers may recommend sealant be applied to head gasket prior to installation. Note that all holes are aligned. Some gasket applications may be marked so that certain area faces upward. Install cylinder head using care not to damage head gasket. Ensure cylinder head is fully seated on cylinder block.

Some applications require head bolts be coated with sealant prior to installation. This is done if head bolts are exposed to coolant passages. Some applications require head bolts be coated with light coat of engine oil.

Install head bolts. Head bolts should be tightened in proper steps and sequence to specification. See **Fig. 1**. Install remaining components. Tighten all bolts to specification. Adjust valves if required. See VALVE ADJUSTMENT.

NOTE: Some manufacturers require that head bolts be retightened after specified amount of operation. This must be done to prevent head gasket failure.

Fig. 1: Typical Cylinder Head Tightening or Loosening Sequence

VALVE ADJUSTMENT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Engine specifications will indicate valve train clearance and temperature at which adjustment is to be made on most models. In most cases, adjustment will be made with a cold engine. In some cases, both a cold and a hot clearance will be given for maintenance convenience.

On some models, adjustment is not required. Rocker arms are tightened to specification and valve lash is automatically set. On some models with push rod actuated valve train, adjustment is made at push rod end of rocker arm while other models do not require adjustment.

Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge. Adjustment is made by rotating adjusting screw until proper clearance is obtained. Lock nut is then tightened. Engine will be rotated to obtain all valve adjustments to manufacturer's specifications.

Some models require hydraulic lifter to be bled down and clearance measured. Push rods of different length can be used to obtain proper clearance. Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge.

Overhead cam engines designed without rocker arms actuate valves directly on a cam follower. A hardened, removable disc is installed between the cam lobe and lifter. Clearance will be checked between cam heel and adjusting disc in proper sequence using a feeler gauge. Engine will be rotated to obtain all valve adjustments.

On overhead cam engines designed with rocker arms, adjustment is made at valve end of rocker arm. Ensure valve to be adjusted is riding on heel of cam on all engines. Clearance will be checked between tip of rocker arm and tip of valve stem in proper sequence using a feeler gauge. Adjustment is made by rotating adjusting screw until proper clearance is obtained. Lock nut is then tightened. Engine will be rotated to obtain all valve adjustments to manufacturer's specifications.

CYLINDER HEAD OVERHAUL

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

CYLINDER HEAD DISASSEMBLY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Mark valves for location. Using valve spring compressor, compress valve springs. Remove valve locks. Carefully release spring compressor. Remove retainer or rotator, valve spring, spring seat and valve. See **Fig. 2**.

95F12992

Fig. 2: Exploded View of Valve Assemblies

CYLINDER HEAD CLEANING & INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Clean cylinder head and valve components using approved cleaning methods. Inspect cylinder head for cracks, damage or warped gasket surface. Place straightedge across gasket surface. Determine clearance at center of straightedge. Measure across both diagonals, longitudinal center line and across cylinder head at several points. See **Fig. 3**.

On cast iron cylinder heads, if warpage exceeds .003" (.08 mm) in a 6" span, or .006" (.15 mm) over total length, cylinder head must be resurfaced. On most aluminum cylinder heads, if warpage exceeds .002" (.05 mm) in any area, cylinder head must be resurfaced. Warpage specification may vary by manufacturer. If warpage exceeds specification on some cylinder heads, cylinder head must be replaced.

Cylinder head thickness should be measured to determine amount of material which can be removed before replacement is required. Cylinder head thickness must not be less than the manufacturer's specification.

If cylinder head required resurfacing, it may not align properly with intake manifold. On "V" type engines, misalignment is corrected by machining intake manifold surface that contacts cylinder head. Cylinder head may be machined on surface that contacts intake manifold. Using oil stone, remove burrs or scratches from all sealing surfaces.

Fig. 3: Checking Cylinder Head for Warpage

VALVE SPRINGS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Inspect valve springs for corroded or pitted valve spring surfaces which may lead to breakage. Polished spring ends caused by a rotating spring indicate that spring surge has occurred. Replace springs showing evidence of these conditions.

Inspect valve springs for squareness using a 90-degree straightedge. See **Fig. 4**. Replace valve spring if out-of-square exceeds manufacturer's specification.

95H12994

Fig. 4: Checking Valve Spring Squareness

Using vernier caliper, measure free length of all valve springs. Replace springs if not within specification. Using valve spring tester, test valve spring pressure at installed and compressed heights. See **Fig. 5**.

Usually compressed height is installed height minus valve lift. Replace valve spring if not within specification. It is recommended to replace all valve springs when overhauling cylinder head. Valve springs may need to be installed with color coded end or small coils at specified area according to manufacturer.

Fig. 5: Checking Valve Spring Pressure

VALVE GUIDE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Measuring Valve Guide Clearance

Check valve stem-to-guide clearance. Ensure valve stem diameter is within specification. Install valve in valve guide. Install dial indicator assembly on cylinder head with tip resting against valve stem just

above valve guide. See **Fig. 6**.

95J12996

Fig. 6: Measuring Valve Stem-to-Guide Clearance

Lower valve approximately 1/16" below valve seat. Push valve stem against valve guide as far as possible. Adjust dial indicator to zero. Push valve stem in opposite direction and note reading. Clearance must be within specification.

If valve guide clearance exceeds specification, valves with oversize stems may be used and valve guides are reamed to larger size or valve guide must be replaced. On some applications, a false guide is installed, then reamed to proper specification. Valve guide reamer set is used to ream valve guide to obtain proper clearance for new valve.

Reaming Valve Guide

Select proper reamer for size of valve stem. Reamer must be of proper length to provide clean cut through entire length of valve guide. Install reamer in valve guide and rotate to cut valve guide. See **Fig. 7.**

95A12997

Fig. 7: Reaming Valve Guides

Replacing Valve Guide

Replace valve guide if clearance exceeds specification. Valve guides are either pressed, hammered or shrunk in place, depending upon cylinder head design and type of metal used.

Remove valve guide from cylinder head by pressing or tapping on a stepped drift. See **Fig. 8**. Once valve guide is installed, distance from cylinder head to top of valve guide must be checked. This distance must be within specification.

Aluminum heads are often heated before installing valve guide. Valve guide is sometimes cooled in dry ice prior to installation. Combination of a heated cylinder head and cooled valve guide ensures a tight guide fit upon assembly. The new guide must be reamed to specification.

Fig. 8: Typical Valve Guide Remover & Installer

VALVES & VALVE SEATS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve Grinding

Valve stem O.D. should be measured in several areas to indicate amount of wear. Replace valve if not within specification. Valve margin area should be measured to ensure that valve can be ground. See **Fig. 9**.

If valve margin is less than specification, the valves will be burned. Valve must be replaced. Due to minimum margin dimensions during manufacture, some new type valves cannot be reground. Some manufacturers use stellite coated valves that must NOT be machined. Valves can only be lapped into

valve seat.

CAUTION: Some valves are sodium filled. Extreme care must be used when disposing of damaged or worn sodium-filled valves.

Fig. 9: Measuring Valve Head Margin

Resurface valve to proper angle specification using valve grinding machine. Follow manufacturer's instructions for valve grinding machine. Specifications may indicate a different valve face angle than seat angle. Measure valve margin after grinding. Replace valve if not within specification. Valve stem tip can be refinished using valve grinding machine.

Valve Lapping

During valve lapping of recently designed valves, be sure to follow manufacturer's recommendations. Surface hardening and materials used with some valves do not permit lapping. Lapping process will remove excessive amounts of the hardened surface.

Valve lapping is done to ensure adequate sealing between valve face and seat. Use either a hand drill or lapping stick with suction cup attached.

Moisten and attach suction cup to valve. Lubricate valve stem and guide. Apply a thin coat of fine valve grinding compound between valve and seat. Rotate lapping tool between the palms or with hand drill.

Lift valve upward off the seat and change position often. This is done to prevent grooving of valve

seat. Lap valve until a smooth polished seat is obtained. Thoroughly clean grinding compound from components. Valve-to-valve seat concentricity should be checked. See **VALVE SEAT CONCENTRICITY**.

CAUTION: Valve guides must be in good condition and free of carbon deposits prior to valve seat grinding. Some engines contain an induction hardened valve seat. Excessive material removal will damage valve seats.

Valve Seat Grinding

Select coarse stone of correct size and angle for seat to be ground. Ensure stone is true and has a smooth surface. Select correct size pilot for valve guide dimension. Install pilot in valve guide. Lightly lubricate pilot shaft. Install stone on pilot. Move stone off and on the seat approximately 2 times per second during grinding operation.

Select a fine stone to finish grinding operation. Various angle grinding stones are used to center and narrow the valve seat as required. See **Fig. 10**.

95H13000

Fig. 10: Adjusting Valve Seat Width

Valve Seat Replacement

Replacement of valve seat inserts is done by cutting out the old insert and machining an oversize insert bore. Replacement oversize insert is usually cooled and the cylinder head is sometimes warmed. Valve seat is pressed into the head. This operation requires specialized machine shop equipment.

Valve Seat Concentricity

Using dial gauge, install gauge pilot in valve guide. Position gauge arm on the valve seat. Adjust dial indicator to zero. Rotate arm 360 degrees and note reading. Runout should not exceed specification.

To check valve-to-valve seat concentricity, coat valve face lightly with Prussian Blue dye. Install valve and rotate it on valve seat. If pattern is even and entire seat is coated at valve contact point, valve is concentric with the valve seat.

CYLINDER HEAD REASSEMBLY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve Stem Installed Height

Valve stem installed height must be checked when new valves are installed or when valves or valve seats have been ground. Install valve in valve guide. Measure distance from tip of valve stem to spring seat. See **Fig. 11**. Distance must be within specification to allow sufficient clearance for valve operation.

Remove valve and grind valve stem tip if height exceeds specification. Valve tips are surface hardened. DO NOT remove more than .010" (.25 mm) from tip. Chamfer sharp edge of reground valve tip. Recheck valve stem installed height.

95I13001

Fig. 11: Measuring Valve Stem Installed Height

VALVE STEM OIL SEALS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Valve stem oil seals must be installed on valve stem. See **Fig. 2**. Seals are needed due to pressure differential at the ends of valve guides. Atmospheric pressure above intake guide, combined with manifold vacuum below guide, causes oil to be drawn into the cylinder.

Exhaust guides also have pressure differential created by exhaust gas flowing past the guide, creating a low pressure area. This low pressure area draws oil into the exhaust system.

Some manufacturers require that special color code or specified height valve stem oil seal be

installed in designated area.

Replacement (On-Vehicle)

Mark rocker arm or overhead cam components for location. Remove rocker arm components or overhead cam components. Components must be installed in original location. Remove spark plugs. Valve stem oil seals may be replaced by holding valves against seats using air pressure.

Air pressure must be installed in cylinder using an adapter for spark plug hole. An adapter can be constructed by welding air hose connection to spark plug body with porcelain removed.

Rotate engine until piston is at top of stroke. Install adapter in spark plug hole. Apply a minimum of 140 psi (9.8 kg/cm²) line pressure to adapter. Air pressure should hold valve closed. If air pressure does not hold valve closed, check for damaged or bent valve. Cylinder head must be removed for service.

Using valve spring compressor, compress valve springs. Remove valve locks. Carefully release spring compressor. Remove retainer or rotator and valve spring. Remove valve stem oil seal.

If oversize valves have been installed, oversize oil seals must be used. Coat valve stem with engine oil. Install protective sleeve over end of valve stem. Install new oil seal over valve stem and seat on valve guide. Remove protective sleeve. Install spring seat, valve spring and retainer or rotator. Compress spring and install valve locks. Remove spring compressor. Ensure valve locks are fully seated.

Install rocker arms or overhead cam components. Tighten all bolts to specification. Adjust valves if required. Remove adapter. Install spark plugs, valve cover and gasket.

VALVE SPRING INSTALLED HEIGHT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Valve spring installed height should be checked during reassembly. Measure height from lower edge of valve spring to the upper edge. DO NOT include valve spring seat or retainer. Distance must be within specification. If valves and/or seats have been ground, a valve spring shim may be required to correct spring height. See **Fig. 12**.

Fig. 12: Measuring Valve Spring Installed Height

ROCKER ARMS & ASSEMBLIES

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Rocker Studs

Rocker studs are either threaded or pressed in place. Threaded studs are removed by locking 2 nuts on the stud. Unscrew the stud by turning the jam nut. Coat new stud threads with Loctite and install. Tighten to specification.

Pressed-in stud can be removed using a stud puller. Ream stud bore to proper specification and press in a new oversize stud. Pressed-in studs are often replaced by cutting threads in the stud bore to accept a threaded stud.

Rocker Arms & Shafts

Mark rocker arms for location. Remove rocker arm retaining bolts. Remove rocker arms. Inspect

rocker arms, shafts, bushings and pivot balls (if equipped) for excessive wear. Inspect rocker arms for wear in valve stem contact area. Measure rocker arm bushing I.D. Replace bushings if excessively worn.

The rocker arm valve stem contact point may be reground, using special fixture for valve grinding machine. Remove minimum amount of material as possible. Ensure all oil passages are clear. Install rocker arm components in original location. Ensure rocker arm is properly seated in push rod. Tighten bolts to specification. Adjust valves if required. See **VALVE ADJUSTMENT**.

PUSH RODS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Remove rocker arms. Mark push rods for location. Remove push rods. Push rods can be steel or aluminum, solid or hollow. Hollow push rods must be internally cleaned to ensure oil passage to rocker arms is cleaned. Check push rods for damage, such as loose ends on steel tipped aluminum types.

Check push rod for straightness. Roll push rod on a flat surface. Using feeler gauge, check clearance at center. Replace push rod if bent. The push rod can also be supported at each end and rotated. A dial indicator is used to detect a bent area in the push rod.

Lubricate ends of push rod and install push rod in original location. Ensure push rod is properly seated in lifter. Install rocker arm. Tighten bolts to specification. Adjust valves if required. See **VALVE ADJUSTMENT**.

LIFTERS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Hydraulic Lifters

Before replacing a hydraulic lifter for noisy operation, ensure noise is not caused by worn rocker arms

or valve tips. Also ensure sufficient oil pressure exists. Hydraulic lifters must be installed in original location. Remove rocker arm assembly and push rod. Mark components for location. Some applications require intake manifold, cylinder head or lifter cover removal. Remove lifter retainer plate (if used). To remove lifters, use a hydraulic lifter remover or magnet. Different type lifters are used. See **Fig. 13**.

On sticking lifters, disassemble and clean lifter. DO NOT mix lifter components or positions. Parts are select-fitted and are not interchangeable. Inspect all components for wear. Note amount of wear in lifter body-to-camshaft contact area. Surface must have smooth and convex contact face. If wear is apparent, carefully inspect cam lobe.

Inspect push rod contact area and lifter body for scoring or signs of wear. If body is scored, inspect lifter bore for damage and lack of lubrication. On roller type lifters, inspect roller for flaking, pitting, loss of needle bearings and roughness during rotation.

Measure lifter body O.D. in several areas. Measure lifter bore I.D. Ensure components or oil clearance is within specification. Some models offer oversize lifters. Replace lifter if damaged.

If lifter check valve is not operating, obstructions may be preventing it from closing or valve spring may be broken. Clean or replace components as necessary.

Check plunger operation. Plunger should drop to bottom of the body by its own weight when assembled dry. If plunger is not free, soak lifter in solvent to dissolve deposits.

Lifter leak-down test can be performed on lifter. Lifter must be filled with special test oil. New lifters contain special test oil. Using lifter leak-down tester, perform leak-down test following manufacturer's instructions. If leak-down time is not within specifications, replace lifter assembly.

Lifters should be soaked in clean engine oil several hours prior to installation. Coat lifter base, roller (if equipped) and lifter body with ample amount of Molykote or camshaft lubricant. See **Fig. 13**. Install lifter in original location. Install remaining components. Valve lash adjustment is not required on most hydraulic lifters. Preload of hydraulic lifter is automatic. Some models may require adjustment.

NOTE: **Some manufacturers require that a crankcase conditioner be added to engine oil and engine operated for specified amount of time to aid in lifter break-in procedure if new lifters or camshaft are installed.**

FLAT LIFTER

95G14643

ROLLER LIFTER

Fig. 13: Typical Hydraulic Valve Lifter Assemblies

Mechanical Lifters

Lifter assemblies must be installed in original locations. Remove rocker arm assembly and push rod. Mark components for location. Some applications require intake manifold or lifter cover removal. Remove lifter retainer plate (if used). To remove lifters, use lifter remover or magnet.

Inspect push rod contact area and lifter body for scoring or signs of wear. If body is scored, inspect lifter bore for damage and lack of lubrication. Note amount of wear in lifter body-to-camshaft contact area. Surface must have smooth and convex contact face. If wear is apparent, carefully inspect cam lobe.

Coat lifter base, roller (if equipped) and lifter body with ample amount of Molykote or camshaft lubricant. Install lifter in original location. Install remaining components. Tighten bolts to specification. Adjust valves. See [VALVE ADJUSTMENT](#).

PISTONS, CONNECTING RODS & BEARINGS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

RIDGE REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Ridge in cylinder wall must be removed prior to piston removal. Failure to remove ridge prior to removing pistons will cause piston damage in piston ring lands or grooves.

With piston at bottom dead center, place rag in bore to trap metal chips. Install ridge reamer in cylinder bore. Adjust ridge reamer using manufacturer's instructions. Remove ridge using ridge reamer. DO NOT remove an excessive amount of material. Ensure ridge is completely removed.

PISTON & CONNECTING ROD REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Note top of piston. Some pistons may contain a notch, arrow or be marked FRONT. Piston must be installed in proper direction to prevent damage with valve operation.

Check that connecting rod and cap are numbered for cylinder location and which side of cylinder block the number faces. Proper cap and connecting rod must be installed together. Connecting rod cap must be installed on connecting rod in proper direction to ensure bearing lock procedure. Mark connecting rod and cap if necessary. Pistons must be installed in original location.

Remove cap retaining nuts or bolts. Remove bearing cap. Install tubing protectors on connecting rod bolts. This protects cylinder walls from scoring during removal. Ensure proper removal of ridge. Push piston and connecting rod from cylinder. Connecting rod boss can be tapped with a wooden dowel or hammer handle to aid in removal.

PISTON & CONNECTING ROD

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Disassembly

Using ring expander, remove piston rings. Remove piston pin retaining rings (if equipped). Note direction of piston installation on connecting rod. On pressed type piston pins, special fixtures and procedures according to manufacturer must be used to remove piston pins. Follow manufacturer's recommendations to avoid piston distortion or breakage.

Cleaning

Remove all carbon and varnish from piston. Pistons and connecting rods may be cleaned in cold type chemical tank. Using ring groove cleaner, clean all deposits from ring grooves. Ensure all deposits are cleaned from ring grooves to prevent ring breakage or sticking. DO NOT attempt to clean pistons with wire brush.

Inspection

Inspect pistons for nicks, scoring, cracks or damage in ring areas. Connecting rod should be checked for cracks using Magnaflux procedure. Piston diameter must be measured in manufacturer's specified area.

Using telescopic gauge and micrometer, measure piston pin bore of piston in 2 areas, 90 degrees apart. This is done to check diameter and out-of-round.

Install proper bearing cap on connecting rod. Ensure bearing cap is installed in proper location. Tighten bolts or nuts to specification. Using inside micrometer, measure inside diameter in 2 areas, 90 degrees apart.

Connecting rod I.D. and out-of-round must be within specification. Measure piston pin bore I.D. and piston pin O.D. All components must be within specification. Subtract piston pin diameter from piston pin bore in piston and connecting rod to determine proper fit.

Connecting rod length must be measured from center of crankshaft journal inside diameter to center of piston pin bushing using proper caliper. Connecting rods must be the same length. Connecting rods should be checked on an alignment fixture for bent or twisted condition. Replace all components which are damaged or not within specification.

PISTON & CYLINDER BORE FIT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure cylinder is checked for taper, out-of-round and properly honed prior to checking piston and cylinder bore fit. See **CYLINDER BLOCK**. Using dial bore gauge, measure cylinder bore.

Measure piston skirt diameter at 90 degree angle to piston pin at specified area by manufacturer. Subtract piston diameter from cylinder bore diameter to determine piston-to-cylinder clearance. Clearance must be within specification. Mark piston for proper cylinder location.

ASSEMBLING PISTON & CONNECTING ROD

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Install piston on connecting rod for corresponding cylinder. Ensure reference marking on top of piston corresponds with connecting rod and cap number. See **Fig. 14**.

Lubricate piston pin and install in connecting rod. Ensure piston pin retainers are fully seated (if equipped). On pressed type piston pins, follow manufacturer's recommended procedure to avoid distortion or breakage.

Ensure Piston Floats
During Installation Operation

Cylinder Number

FRONT Indicator
Of Piston

Fig. 14: Installing Typical Piston Pin

CHECKING PISTON RING CLEARANCES

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Piston rings must be checked for side clearance and end gap. To check end gap, install piston ring in cylinder in which it is to be installed. Using an inverted piston, push ring to bottom of cylinder in

smallest cylinder diameter.

Using feeler gauge, check ring end gap. See **Fig. 15**. Piston ring end gap must be within specification. Ring breakage will occur if insufficient ring end gap exists.

Some manufacturers permit correcting insufficient ring end gap by using a fine file while other manufacturers recommend using another ring set. Mark rings for proper cylinder installation after checking end gap.

Fig. 15: Checking Piston Ring End Gap

For checking side clearance, install rings on piston. Using feeler gauge, measure clearance between piston ring and piston ring land. Check side clearance in several areas around piston. Side clearance must be within specification.

If side clearance is excessive, piston ring grooves can be machined to accept oversize piston rings (if available). Normal practice is to replace piston.

PISTON & CONNECTING ROD INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cylinders must be honed prior to piston installation. See **CYLINDER HONING** under CYLINDER BLOCK.

Install upper connecting rod bearings. Lubricate upper bearings with engine oil. Install lower bearings in rod caps. Ensure bearing tabs are properly seated. Position piston ring gaps according to manufacturer's recommendations. See **Fig. 16**. Lubricate pistons, rings and cylinder walls.

Fig. 16: Positioning Typical Piston Ring End Gap

Install ring compressor. Use care not to rotate piston rings. Compress rings with ring compressor. Install plastic tubing protectors over connecting rod bolts. Install piston and connecting rod assembly. Ensure piston notch, arrow or FRONT mark is toward front of engine. See **Fig. 17**.

95A14647

Fig. 17: Installing Piston & Connecting Rod Assembly

Carefully tap piston into cylinder until rod bearing is seated on crankshaft journal. Remove protectors. Install rod cap and bearing. Lightly tighten connecting rod bolts. Repeat procedure for remaining cylinders. Check bearing clearance. See **MAIN & CONNECTING ROD BEARING CLEARANCE**.

Once clearance is checked, lubricate journals and bearings. Install bearing caps. Ensure marks are aligned on connecting rod and cap. Tighten rod nuts or bolts to specification. Ensure rod moves freely on crankshaft. Check connecting rod side clearance. See **CONNECTING ROD SIDE CLEARANCE**.

CONNECTING ROD SIDE CLEARANCE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Position connecting rod toward one side of crankshaft as far as possible. Using feeler gauge, measure clearance between side of connecting rod and crankshaft. See **Fig. 18**. Clearance must be within specification.

Check for improper bearing installation, wrong bearing cap or insufficient bearing clearance if side clearance is insufficient. Connecting rod may require machining to obtain proper clearance. Excessive clearance usually indicates excessive wear at crankshaft. Crankshaft must be repaired or replaced.

Fig. 18: Measuring Connecting Rod Side Clearance

MAIN & CONNECTING ROD BEARING CLEARANCE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Plastigage Method

Plastigage method may be used to determine bearing clearance. Plastigage can be used with an engine in service or during reassembly. Plastigage material is oil soluble.

Ensure journals and bearings are free of oil or solvent. Oil or solvent will dissolve material and false reading will be obtained. Install small piece of Plastigage along full length of bearing journal. Install bearing cap in original location. Tighten bolts to specification.

CAUTION: DO NOT rotate crankshaft while Plastigage is installed. Bearing clearance will not be obtained if crankshaft is rotated.

Remove bearing cap. Compare Plastigage width with scale on Plastigage container to determine bearing clearance. See **Fig. 19**. Rotate crankshaft 90 degrees. Repeat procedure. This is done to check journal eccentricity. This procedure can be used to check oil clearance on both connecting rod and main bearings.

95C14649

Fig. 19: Measuring Bearing Clearance

Micrometer & Telescopic Gauge Method

A micrometer is used to determine journal diameter, taper and out-of-round dimensions of the

crankshaft. See **CLEANING & INSPECTION** under CRANKSHAFT & MAIN BEARINGS in this article.

With crankshaft removed, install bearings and caps in original location on cylinder block. Tighten bolts to specification. On connecting rods, install bearings and caps on connecting rods. Install proper connecting rod cap on corresponding rod. Ensure bearing cap is installed in original location. Tighten bolts to specification.

Using a telescopic gauge and micrometer or inside micrometer, measure inside diameter of connecting rod and main bearings bores. Subtract each crankshaft journal diameter from the corresponding inside bearing bore diameter. This is the bearing clearance.

CRANKSHAFT & MAIN BEARINGS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

REMOVAL

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Ensure all main bearing caps are marked for location on cylinder block. Some main bearing caps have an arrow stamped on them. The arrow must face timing belt or timing chain end of engine. Remove main bearing cap bolts. Remove main bearing caps. Carefully remove crankshaft. Use care not to bind crankshaft in cylinder block during removal.

CLEANING & INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Thoroughly clean crankshaft using solvent. Dry with compressed air. Ensure all oil passages are clear and free of sludge, rust, dirt and metal chips.

Inspect crankshaft for scoring and nicks. Inspect crankshaft for cracks using Magnaflux procedure. Inspect rear seal area for grooving or damage. Inspect bolt hole threads for damage. If pilot bearing or bushing is used, check pilot bearing or bushing fit in crankshaft. Inspect crankshaft gear for damaged or cracked teeth. Replace gear if damaged. Ensure oil passage plugs are tight (if equipped).

Using micrometer, measure all journals in 4 areas to determine journal taper, out-of-round and undersize. See **Fig. 20**. Some crankshafts can be reground to the next largest undersize, depending on the amount of wear or damage. Crankshafts with rolled fillet cannot be reground and must be replaced.

A - B = Vertical Taper
C - D = Horizontal Taper
A - C & B - D = Out-Of-Round

Check For Out-Of-Round At Each End Of Journal

95G14650

Fig. 20: Measuring Crankshaft Journals

Crankshaft journal runout should be checked. Install crankshaft in "V" blocks or bench center. Position dial indicator with tip resting on the main bearing journal area. See **Fig. 21**. Rotate crankshaft and note reading. Journal runout must not exceed specification. Repeat procedure on all main bearing journals. Crankshaft must be replaced if runout exceeds specification.

Fig. 21: Measuring Crankshaft Main Bearing Journal Runout

INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Install upper main bearing in cylinder block. Ensure lock tab is properly located in cylinder block. Install bearings in main bearing caps. Ensure all oil passages are aligned. Install rear seal (if removed).

Ensure crankshaft journals are clean. Lubricate upper main bearings with clean engine oil. Carefully install crankshaft. Check each main bearing clearance using Plastigage method. See **MAIN & CONNECTING ROD BEARING CLEARANCE**.

Once clearance is checked, lubricate lower main bearing and journals. Install main bearing caps in original location. Install rear seal in rear main bearing cap (if removed). Some rear main bearing caps require sealant to be applied in corners to prevent oil leakage.

Install and tighten all bolts except thrust bearing cap to specification. Tighten thrust bearing cap bolts finger tight only. Some models require that thrust bearing be aligned. On most applications, crankshaft must be moved rearward then forward. Procedure may vary with manufacturer. Thrust bearing cap is then tightened to specification. Ensure crankshaft rotates freely. Crankshaft end play should be checked. See **CRANKSHAFT END PLAY**.

CRANKSHAFT END PLAY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Dial Indicator Method

Crankshaft end play can be checked using dial indicator. Mount dial indicator on rear of cylinder block. Position dial indicator tip against rear of crankshaft. Ensure tip is resting against flat surface.

Pry crankshaft rearward. Adjust dial indicator to zero. Pry crankshaft forward and note reading. Crankshaft end play must be within specification. If end play is not within specification, check for faulty thrust bearing installation or worn crankshaft. Some applications offer oversize thrust bearings.

Feeler Gauge Method

Crankshaft end play can be checked using feeler gauge. Pry crankshaft rearward. Pry crankshaft forward. Using feeler gauge, measure clearance between crankshaft and thrust bearing surface. See **Fig. 22**.

95I14652

Fig. 22: Checking Crankshaft End Play

Crankshaft end play must be within specification. If end play is not within specification, check for faulty thrust bearing installation or worn crankshaft. Some applications offer oversize thrust bearings.

CYLINDER BLOCK

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Block Cleaning

Only cast cylinder blocks should be hot tank cleaned. Aluminum cylinder blocks should be cleaned using cold tank method. Cylinder block is cleaned in order to remove carbon deposits, gasket residue

and water jacket scale. Remove oil gallery plugs, freeze plugs and cam bearings before cleaning block.

Block Inspection

Visually inspect the block. Check suspected areas for cracks using the Dye Penetrant inspection method. Block may be checked for cracks using the Magnaflux method.

Cracks are most commonly found at the bottom of cylinders, main bearing saddles, near expansion plugs and between cylinders and water jackets. Inspect lifter bores for damage. Inspect all head bolt holes for damaged threads. Threads should be cleaned using tap to ensure proper head bolt torque. Consult machine shop concerning possible welding and machining (if required).

Cylinder Bore Inspection

Inspect bore for scoring or roughness. Cylinder bore is dimensionally checked for out-of-round and taper using dial bore gauge. For determining out-of-round, measure cylinder parallel and perpendicular to the block center line. Difference in the 2 readings is the bore out-of-round. Cylinder bore must be checked at top, middle and bottom of piston travel area.

Bore taper is obtained by measuring bore at the top and bottom. If wear has exceeded allowable limits, block must be honed or bored to next available oversize piston dimension.

Cylinder Honing

Cylinder must be properly honed to allow new piston rings to properly seat. Cross-hatching at correct angle and depth is critical to lubrication of cylinder walls and pistons.

A flexible drive hone and power drill are commonly used. Drive hone must be lubricated during operation. Mix equal parts of kerosene and SAE 20W engine oil for lubrication.

Apply lubrication to cylinder wall. Operate cylinder hone from top to bottom of cylinder using even strokes to produce 45 degree cross-hatch pattern on the cylinder wall. DO NOT allow cylinder hone to extend below cylinder during operation.

Recheck bore dimension after final honing. Wash cylinder wall with hot soapy water to remove abrasive particles. Blow dry with compressed air. Coat cleaned cylinder walls with lubricating oil.

Deck Warpage

Check deck for damage or warped gasket surface. Place a straightedge across gasket surface of the deck. Using feeler gauge, measure clearance at center of straightedge. Measure across width and length of cylinder block at several points.

If warpage exceeds specifications, deck must be resurfaced. If warpage exceeds manufacturer's maximum tolerance for material removal, replace block.

NOTE: Some manufacturers recommend that a total amount of material (cylinder head and cylinder block) can only be removed before components must be replaced.

Deck Height

Distance from crankshaft center line to block deck is called the deck height. Measure and record front and rear main journals of crankshaft. To compute this distance, install crankshaft and retain with center main bearing and cap only. Measure distance from crankshaft journal to block deck, parallel to cylinder center line.

Add one half of main bearing journal diameter to distance from crankshaft journal to block deck. This dimension should be checked at front and rear of cylinder block. Both readings should be the same.

If difference exceeds specification, cylinder block must be repaired or replaced. Deck height and warpage should be corrected at the same time.

Main Bearing Bore & Alignment

For checking main bearing bore, remove all bearings from cylinder block and main bearing caps. Install main bearing caps in original location. Tighten bolts to specification. Using inside micrometer, measure main bearing bore in 2 areas 90 degrees apart. Determine bore size and out-of-round. If diameter is not within specification, block must be align-bored.

For checking alignment, place a straightedge along center line of main bearing saddles. Check for clearance between straightedge and main bearing saddles. Block must be align-bored if clearance exists.

Expansion Plug Removal

Drill hole in center of expansion plug. Remove with screwdriver or punch. Use care not to damage sealing surface.

Expansion Plug Installation

Ensure sealing surface is free of burrs. Coat expansion plug with sealer. Using wooden dowel or pipe of slightly smaller diameter, install expansion plug. Ensure expansion plug is evenly located.

Oil Gallery Plug Removal

Remove threaded oil gallery plugs using appropriate wrench. Soft press-in plugs are removed by drilling into plug and installing a sheet metal screw. Remove plug with slide hammer or pliers.

Oil Gallery Plug Installation

Ensure threads or sealing surface is clean. Coat threaded oil gallery plugs with sealer and install. Replacement soft press-in plugs are installed with a hammer and drift.

CAMSHAFT

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

CLEANING & INSPECTION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Clean camshaft with solvent. Ensure all oil passages are clear. Inspect cam lobes and bearing journals for pitting, flaking or scoring. Using micrometer, measure bearing journal O.D.

Support camshaft at each end with "V" blocks. Position dial indicator with tip resting on center bearing journal. Rotate camshaft and note camshaft runout reading. If reading exceeds specification, replace camshaft.

Check cam lobe lift by measuring base circle of camshaft using micrometer. Measure again at 90-degree angle to tip of cam lobe. Cam lift can be determined by subtracting base circle diameter from tip of cam lobe measurement.

Different lift dimensions are given for intake and exhaust cam lobes. Reading must be within specification. Replace camshaft if cam lobes or bearing journals are not within specification.

Inspect camshaft gear for chipped, eroded or damaged teeth. Replace gear if damaged. On camshafts using thrust plate, measure distance between thrust plate and camshaft shoulder. Replace thrust plate if not within specification.

CAMSHAFT BEARINGS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen

to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Removal & Installation

Remove camshaft rear plug. Camshaft bearing remover is assembled with shoulder resting against bearing to be removed according to manufacturer's instructions. Tighten puller nut until bearing is removed. Remove remaining bearings, leaving front and rear bearings until last. These bearings act as a guide for camshaft bearing remover.

To install new bearings, puller is rearranged to pull bearings toward the center of block. Ensure all lubrication passages of bearing are aligned with cylinder block. Coat new camshaft rear plug with sealant. Install camshaft rear plug. Ensure plug is even in cylinder block.

CAMSHAFT INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Lubricate bearing surfaces and cam lobes with ample amount of Molykote or camshaft lubricant. Carefully install camshaft. Use care not to damage bearing journals during installation. Install thrust plate retaining bolts (if equipped). Tighten bolts to specification. On overhead camshafts, install bearing caps in original location. Tighten bolts to specification. On all applications, check camshaft end play.

CAMSHAFT END PLAY

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Using dial indicator, check camshaft end play. Position dial indicator on front of engine block or cylinder head. Position indicator tip against camshaft. Push camshaft toward rear of cylinder head or engine and adjust indicator to zero.

Move camshaft forward and note reading. Camshaft end play must be within specification. End play may be adjusted by relocating gear, shimming thrust plate or replacing thrust plate depending on each manufacturer.

TIMING CHAINS & BELTS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

TIMING CHAINS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

Timing chains will stretch during operation. Limits are placed upon amount of stretch before replacement is required. Timing chain stretch will alter ignition timing and valve timing.

To check timing chain stretch, rotate crankshaft to eliminate slack from one side of timing chain. Mark reference point on cylinder block. Rotate crankshaft in opposite direction to eliminate slack from remaining side of timing chain. Force other side of chain outward and measure distance between reference point and timing chain. See **Fig. 23**. Replace timing chain and gears if not within specification.

Fig. 23: Measuring Timing Chain Stretch

Timing chains must be installed so timing marks on camshaft gear and crankshaft gear are aligned according to manufacturer. See **Fig. 24**.

95A14654

Fig. 24: Typical Gear Timing Mark Alignment

TIMING BELTS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Cogged tooth belts are commonly used on overhead cam engines. Inspect belt teeth for rounded corners or cracking. Replace belt if it is cracked, damaged, missing teeth or oil soaked.

Used timing belt must be installed in original direction of rotation. Inspect all sprocket teeth for wear. Replace all worn sprockets. Sprockets are marked for timing purposes. Engine is positioned so that crankshaft sprocket mark will be upward. Camshaft sprocket is aligned with reference mark on cylinder head or timing belt cover and then timing belt can be installed. See **Fig. 25**.

Fig. 25: Typical Camshaft Belt Sprocket Alignment

TENSION ADJUSTMENT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

If guide rails are used with spring loaded tensioners, ensure at least half of original rail thickness remains. Spring loaded tensioner should be inspected for damage.

Ensure all timing marks are aligned. Adjust belt tension using manufacturer's recommendations. Belt tension may require checking using tension gauge. See **Fig. 26**.

Fig. 26: Adjusting Typical Timing Belt Tension

TIMING GEARS

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

TIMING GEAR BACKLASH & RUNOUT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

On engines where camshaft gear operates directly on crankshaft gear, gear backlash and runout must be checked. To check backlash, install dial indicator with tip resting on tooth of camshaft gear. Rotate camshaft gear as far as possible. Adjust indicator to zero. Rotate camshaft gear in opposite direction as far as possible and note reading.

To determine timing gear runout, mount dial indicator with tip resting on face edge of camshaft gear. Adjust indicator to zero. Rotate camshaft gear 360 degrees and note reading. If backlash or runout exceeds specification, replace camshaft and/or crankshaft gear.

REAR MAIN OIL SEAL INSTALLATION

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

One-Piece Type Seal

For one-piece type oil seal installation, coat block contact surface of seal with sealer if seal is not factory coated. Ensure seal surface is free of burrs. Lubricate seal lip with engine oil and press seal into place using proper oil seal installer. See **Fig. 27**.

Fig. 27: Installing Typical One-Piece Oil Seal

Rope Type Seal

For rope type rear main oil seal installation, press seal lightly into seat area. Using seal installer, fully seat seal in bearing cap or cylinder block.

Trim seal ends even with cylinder block parting surface. Some applications require sealer to be applied on main bearing cap before installing. See **Fig. 28**.

Fig. 28: Installing Typical Rope Seal

Split-Rubber Type Seal

Follow manufacturer's procedures when installing split-rubber type rear main oil seals. Installation procedures vary with manufacturer and engine type. See **Fig. 29**.

Fig. 29: Installing Typical Split-Rubber Seal

OIL PUMP

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

ROTOR TYPE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Mark oil pump rotor locations before removing. See **Fig. 30**. Remove outer rotor and measure thickness and diameter. Measure inner rotor thickness. Inspect shaft for scoring or wear. Inspect rotors for pitting or damage. Inspect cover for grooving or wear. Replace worn or damaged components.

Measure outer rotor-to-body clearance. Replace pump assembly if clearance exceeds specification. Measure clearance between rotors. See **Fig. 31**. Replace shaft and both rotors if clearance exceeds specification.

Install rotors in pump body. Position straightedge across pump body. Using feeler gauge, measure clearance between rotors and straightedge. Pump cover wear is measured using a straightedge and feeler gauge. Replace pump if clearance exceeds specification.

Fig. 30: Typical Rotor Type Oil Pump

Fig. 31: Measuring Rotor Clearance

GEAR TYPE

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.**

Mark oil pump gear location before removing. See **Fig. 32**. Remove gears from pump body. Inspect gears for pitting or damage. Inspect cover for grooving or wear. Measure gear diameter and length. Measure gear housing cavity depth and diameter. See **Fig. 33**. Replace worn or damaged components.

Pump cover wear is measured using a straightedge and feeler gauge. Replace pump or components if warp or wear exceeds specification, or mating surface of pump cover is scratched or grooved.

Fig. 32: Typical Gear Type Oil Pump

95B14663

Fig. 33: Measuring Oil Pump Gear Cavity

BREAK-IN PROCEDURE

*** PLEASE READ THIS FIRST ***

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the **ENGINES** section for complete overhaul procedures and specifications for the vehicle being repaired.

ENGINE PRE-OILING

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Pre-oil engine prior to operation to prevent engine damage. Lightly oiled oil pump will cavitate unless oil pump cavities are filled with engine oil or petroleum jelly.

Engine pre-oiling can be done using pressure oiler (if available). Connect pressure oiler to cylinder block oil passage such as oil pressure sending unit. Operate pressure oiler long enough to ensure correct amount of oil has filled crankcase. Check oil level while pre-oiling.

If pressure oiler is not available, disconnect ignition system. Remove oil pressure sending unit and replace with oil pressure test gauge. Using starter motor, rotate engine starter until gauge shows normal oil pressure for several seconds. DO NOT crank engine for more than 30 seconds to avoid starter motor damage. Ensure oil pressure has reached the most distant point from the oil pump.

NOTE: If new lifters or camshaft are installed, some manufacturers require that a crankcase conditioner be added to engine oil. The engine should be operated for specified amount of time to aid in lifter break-in procedure.

INITIAL START-UP

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Start engine and operate engine at low speed while checking for coolant, fuel and oil leaks. Stop engine. Recheck coolant and oil level. Adjust if necessary.

CAMSHAFT

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Break-in procedure is required when new or reground camshaft has been installed. Operate and maintain engine speed between 1500-2500 RPM for approximately 30 minutes. Procedure may vary due to manufacturer's recommendations.

PISTON RINGS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Piston rings require a break-in procedure to ensure seating of rings to cylinder walls. Serious damage may occur to rings if correct procedures are not followed.

Extremely high piston ring temperatures are obtained during break-in process. If rings are exposed to excessively high RPM or high cylinder pressures, ring damage can occur. Follow piston ring manufacturer's recommended break-in procedure.

FINAL ADJUSTMENTS

NOTE: Examples used in this article are general in nature and do not necessarily relate to a specific engine or system. Illustrations and procedures have been chosen to guide mechanic through engine overhaul process. Descriptions of processes of cleaning, inspection, assembly and machine shop practice are included.

Always refer to appropriate engine overhaul article, if available, in the ENGINES section for complete overhaul procedures and specifications for the vehicle being repaired.

Check or adjust ignition timing and dwell (if applicable). Adjust valves (if necessary). Adjust idle speed and mixture. Retighten cylinder heads (if required). If cylinder head or block is aluminum, retighten bolts when engine is cold. Follow the engine manufacturer's recommended break-in procedure and maintenance schedule for new engines.

NOTE: Some manufacturers require that head bolts be retightened after specified amount of operation. This must be done to prevent head gasket failure.

ENGINE

Exhaust System - Challenger

DESCRIPTION

DESCRIPTION

Fig. 1: Exhaust System - V8 Dual System
Courtesy of CHRYSLER LLC

The exhaust system consists of:

- Front exhaust pipes (4)
- Resonators (1)
- RH muffler and resonator assembly (4)
- Band clamp (5)
- Isolators (2)
- Ball flange (3)

The LH resonator (1) is serviced as an assembly.

DIAGNOSIS AND TESTING

EXHAUST SYSTEM

CONDITION	POSSIBLE CAUSES	CORRECTION
EXCESSIVE EXHAUST NOISE (UNDER HOOD)	1. Exhaust manifold cracked or broken.	1. Replace manifold.

	2. Manifold to cylinder head leak.	2. Tighten manifold and/or replace gasket.
	3. EGR tube to manifold gasket leakage.	3. Tighten fasteners or replace gasket.
	4. EGR Valve to EGR tube gasket leakage.	4. Tighten fasteners or replace gasket.
	5. Exhaust to manifold leak.	5. Tighten or replace nuts
	6. Pipe and shell noise from front exhaust pipe.	6. Characteristic of single wall pipe.
EXCESSIVE EXHAUST NOISE	1. Leak at exhaust pipe joints.	1. Tighten clamps at leaking joints.
	2. Burned or rusted out muffler assembly or exhaust pipe.	2. Replace muffler and resonator assembly and/or LH rear resonator and tailpipe assembly as necessary.
	3. Burned or rusted out resonator(s).	3. Replace RH muffler and resonator assembly and/or RH resonator and tailpipe as necessary.
	4. Restriction in exhaust system.	4. Remove restriction if possible, or replace components as necessary.
	5. Converter material in muffler or resonators.	5. Replace RH muffler and resonator assembly and/or RH resonator and tailpipe as necessary. Check fuel injection and ignition systems for proper operation.

INSPECTION

INSPECTION

Inspect the exhaust pipes, catalytic converters, muffler, and resonators for cracked joints, broken welds and corrosion damage that would result in a leaking exhaust system. Inspect the clamps, support brackets, and insulators for cracks and corrosion damage.

NOTE: Slip joint band clamps are spot/tack welded to exhaust system. If a band clamp must be replaced, the spot/tack weld must be ground off.

ADJUSTMENTS

ADJUSTMENTS

A misaligned exhaust system is usually indicated by a vibration, rattling noise, or binding of exhaust

system components. These noises are sometimes hard to distinguish from other chassis noises. Inspect exhaust system for broken or loose clamps, heat shields, isolators, and brackets. Replace or tighten as necessary. It is important that exhaust system clearances and alignment be maintained.

Perform the following procedures to align the exhaust system:

1. Loosen clamps and support brackets.
2. Align the exhaust system starting at the front, working rearward.
3. Tighten all clamps and brackets once alignment and clearances are achieved.

CONVERTER, CATALYTIC

DESCRIPTION

DESCRIPTION

89610

Fig. 5: Catalytic Converters
Courtesy of CHRYSLER LLC

- 1 - RH CATALYTIC CONVERTER
- 2 - FLEX JOINT
- 3 - LH CATALYTIC CONVERTER

The close coupled, three-way catalytic converter inlets are connected to the exhaust manifolds by the use of a ball flange. RWD vehicles use a flex joint downstream of the LH and RH catalytic converters. The left (3) and right (1) side converter outlet pipe connects to the exhaust system.

REMOVAL

3. Remove the muffler and resonator assembly. See **Exhaust System/MUFFLER, Exhaust - Removal**.
4. Remove the ball flange nuts.
5. Remove the catalytic converter ball flange nuts.
6. Remove the catalytic converter.

INSPECTION

INSPECTION

WARNING: The normal operating temperature of the exhaust system is very high. Therefore, never attempt to service any part of the exhaust system until it is cooled. Special care should be taken when working near the catalytic converter. The temperature of the converter rises to a high level after a short period of engine operation time.

Check the catalytic converter for a flow restriction. See **Exhaust System - Diagnosis and Testing** for Exhaust System Restriction Check for procedure.

Visually inspect the catalytic converter element by using a borescope or equivalent. Remove oxygen sensor(s) and insert borescope. If borescope is not available, remove converter and inspect element using a flashlight. Inspect element for cracked or melted substrate.

NOTE: Before replacing a catalytic converter, determine the root cause of failure. Most catalytic converter failures are caused by air, fuel or ignition problems. Refer to the appropriate diagnostic service information for test procedures.

1. Install the catalytic converter (3) onto the exhaust manifold ball flange. Finger tighten the nuts.
2. Install the muffler and resonator assembly. See **Exhaust System/MUFFLER, Exhaust - Installation**.
3. Install the bolts and the cross brace. Tighten the bolts to 55 N.m (40 ft. lbs.).
4. Tighten the manifold ball flange nut to 12 N.m (106 in. lbs.).
5. Check the clearance between exhaust module and fuel tank. Clearance is 14mm (.55 in.).
6. Check the clearance at the rear tunnel reinforcement. Clearance is 15 - 20mm (.59 - .78 in.).
7. Adjust the clearance as necessary.
8. Tighten the ball flange nuts to 34 N.m (25 ft. lbs.).
9. Lower the vehicle.
10. Connect the negative battery cable.
11. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

MUFFLER, EXHAUST

DESCRIPTION

DESCRIPTION

813793e2

Fig. 12: Exhaust System - V8 Dual System
Courtesy of CHRYSLER LLC

The exhaust system consists of:

- Front exhaust pipes (4)
- LH Resonator (1)
- Muffler and RH Resonator assembly (4)
- Band clamps (5)
- Isolators (2)
- Ball flange (3)

The LH Resonator (1) is serviced as an assembly.

REMOVAL

REMOVAL

Fig. 13: FRONT EXHAUST CLAMPS

- | |
|--|
| 1 - MUFFLER AND RESONATOR ASSEMBLY
2 - CLAMPS
3 - RH CATALYTIC CONVERTER
4 - LH CATALYTIC CONVERTER |
|--|

1. Raise and support the vehicle.
2. Remove the LH resonator. See **Exhaust System/RESONATOR, Exhaust - Removal.**
3. Remove the catalytic converter-to-exhaust clamps (3).

Fig. 14: EXHAUST PIPE ASSEMBLY
 Courtesy of CHRYSLER LLC

4. Remove the isolators (4).
5. Remove the RH muffler and resonator assembly (2) by twisting/turning while pulling the

assembly out of catalytic converters.

INSTALLATION

INSTALLATION

Fig. 15: EXHAUST PIPE ASSEMBLY
Courtesy of CHRYSLER LLC

1. Position the front exhaust pipe clamps (3) on the RH muffler and resonator assembly (5).
2. Install the RH muffler and resonator assembly (5) onto the catalytic converters.

NOTE: Isolators have an approximately 10° forward angle when installed.

3. Install isolators (4).

Fig. 16: FRONT EXHAUST CLAMPS
Courtesy of CHRYSLER LLC

4. Install the LH resonator. See **Exhaust System/RESONATOR, Exhaust - Installation**.

NOTE: Check for proper alignment and clearance to underbody and engine compartment components before tightening clamps.

5. Tighten the band clamps (2) to 61 N.m (45 ft. lbs.).
6. Install tunnel reinforcement (2) and nuts (1). Tighten nuts to 25 N.m (215 in. lbs.).
7. Check the clearance between the muffler and resonator assembly and the fuel tank. Clearance is 14mm (0.55 in.).
8. Check the clearance at the rear tunnel reinforcement. Clearance is 15 - 20 mm (.59 -.78 in.).
9. The tailpipe should be centered in the the rear fascia opening.
10. Adjust clearance as necessary.
11. Lower the vehicle.
12. Start the engine and inspect for exhaust leaks. Repair exhaust leaks as necessary.

1. Raise and support the vehicle.
2. Remove the left and right front splash shields as necessary. Refer to **Body/Exterior/SHIELD, Splash - Removal**.
3. Remove the belly pan.
4. Remove the mounting fasteners that secures the front fascia assembly (9) to the inside of the front fender.
5. Partially lower the vehicle and remove the push-pin retainers (10) that secure the front fascia assembly to the upper radiator support.
6. Disconnect the Tire Pressure Monitoring (TPM) connector. Refer to **Tires and Wheels/Tire Pressure Monitoring/MODULE, Tire Pressure Monitoring (TPM) - Removal**.
7. Carefully pull the left and front side of the fascia out of the fender mounted fascia mounting brackets.
8. Carefully pull the front fascia assembly forward to disengage the push-pin retainer from the slot

in each side of the fascia and disconnect the fog lamp wire harness connectors, if equipped.

Installation

INSTALLATION

164373

Fig. 8: Identifying Front Fascia Components

1. BOLT, RIGHT FRONT BUMPER EXTENSION	7. EXTENSION, LEFT BUMPER
2. HARNESS, WIRING	8. ENERGY ABSORBER, FRONT BUMPER
3. BOLT, LEFT FRONT BUMPER EXTENSION	9. FASCIA, FRONT
4. FENDER	10. FASTNER, PUSH PIN
5. BRACKET, FASCIA SUPPORT	11. CLIP, ENERGY ABSORBER
6. BEAM ASSEMBLY, FRONT BUMPER	12. EXTENSION, RIGHT BUMPER

1. Place the front fascia assembly in position and connect the fog lamp wire harness connectors, if equipped.
2. Push the left and front side of the fascia in to the fender mounted fascia mounting brackets.
3. Connect the Tire Pressure Monitoring (TPM) connector.
4. If equipped, connect the headlamp washer system hose from washer reservoir.
5. Raise the vehicle.
6. Install the mounting fasteners that secures the front fascia assembly (9) to the inside of the front fender.

7. Install the belly pan.
8. Install the left and right front splash shields as necessary. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
9. Lower the vehicle.

4. FASCIA, REAR	9. BUMPER, REAR
5. CONNECTOR, WIRING HARNESS	-

1. Carefully remove the rear fascia from the vehicle and disconnect the electrical connectors.
2. Carefully pull the left and right side of the rear fascia outward, disengaging the fascia from the fender (2) mounted mounting brackets.
3. Remove the upper fascia push pin retainers (6).
4. Install the mounting fasteners in the wheel wells.
5. Install the lower rear fascia (4) mounting fasteners located under the vehicle.
6. Install the left and right upper fasteners.
7. Install the left and right rear tail lamps. Refer to **Electrical - Lamps and Lighting/Lamps/Lighting - Exterior/LAMP, Tail - Installation** .
8. Install the rear splash shields, as necessary. Refer to **Body/Exterior/SHIELD, Splash - Installation** .
9. Lower the vehicle.

FRAME

WARNING

USE OF HEAT DURING REPAIR

WARNING: Chrysler LLC engineering's position on the use of heat during collision repair is as follows:

- Any body panel or frame component damaged which is to be repaired and reused, must be repaired using the "cold straightening" method. No heat may be used during the straightening process.
- During rough straightening prior to panel replacement, damaged panels or frame components may be heated to assist in body/frame realignment. The application of heat must be constrained to the parts which will be replaced and not allowed to affect any other components.

This "no heat" recommendation is due to the extensive use of high strength and advanced high strength steels in Chrysler LLC products. High-strength materials can be substantially and negatively affected from heat input which will not be obviously known to the repairer or consumer.

Ignoring these recommendations may lead to serious compromises in the ability to protect occupants in a future collision event, reduce the engineered qualities and attributes, or decrease the durability and reliability of the vehicle.

This statement supersedes any previously released information by the Chrysler LLC.

Failure to follow these instructions may result in serious or fatal injury.

WARNINGS

WARNING: Before performing any welding operations disconnect and isolate the negative battery (ground) cable. Disconnect all wire harness connectors from the Occupant Restraint Controller (ORC). Failure to take the proper precautions could result in accidental airbag deployment and other possible damage to the supplemental restraint system circuits and components. Failure to follow these instructions may result in possible serious or fatal injury.

- use eye protection when grinding or welding metal, serious eye injury can result.
- before proceeding with frame repair involving grinding or welding, verify that vehicle fuel system is not leaking or in contact with repair area. Personal injury can result.
- do not allow open flame or heat and metal spatter from arc welding to contact plastic body panels. Fire or explosion can result.
- when welded frame components are replaced, make sure complete penetration weld is achieved during installation. If not, dangerous operating conditions can result.
- stand clear of cables or chains on pulling equipment during frame straightening operations. Personal injury can result.
- do not venture under a hoisted vehicle that is not supported on safety stands. Personal injury can result.
- do not use heat, if frame straightening is required.

Failure to follow these instructions may result in possible serious or fatal injury.

CAUTION: Do not reuse damaged fasteners, quality of repair would be suspect. Failure to use only production fasteners or fasteners of equivalent hardness can result in loosening or failure. Do not drill any holes in the frame that are not specifically outlined in this or other Chrysler procedures as frame rail failure can result.

STANDARD PROCEDURE

STANDARD PROCEDURE - REAR FRAME RAIL REPLACEMENT

2481193

Fig. 11: Rail Terminology
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - COVER PLATE
2 - RAIL, REAR, OUTER
3 - RAIL, REAR, INNER
4 - REINFORCEMENT, REAR RAIL INNER, REAR |
|---|

"Rail, rear, outer" (2) - this portion of the rear rail assembly is not visible as it is gloved inside the "rail, rear, inner" (3) and the "cover plate, rear rail extension" (1). **This rail may not be sectioned!**

"Reinforcement, rear rail inner rear" (4) - welded inside of the "rail, rear, inner" (3) and extends from the end of that rail to the "panel, deck opening lower".

2445897

Fig. 12: Rear Inner Rail
Courtesy of CHRYSLER LLC

"Rail, rear inner" may be sectioned at this location (1), greatly reducing vehicle disruption and repair costs.

This partial replacement procedure presumes that all damage to the "rail, rear inner" is aft of the crossmember (2).

Left side

2481208

Fig. 13: LX/LC Left Rear Rail Cut Locations
Courtesy of CHRYSLER LLC

- | |
|--|
| <p>1 - HOLE</p> <p>2 - 100 mm (4 in.)</p> <p>3 - REINFORCEMENT, REAR RAIL INNER, REAR</p> <p>4 - CUT LOCATION 125 mm (5 in.)</p> |
|--|

The "Reinforcement, Rear Rail Inner, Rear" (3) ends 100 mm (4 in.) (2) forward of round hole (1) on inner face of "Rail, Rear Inner" - recommended cut location is 125 mm (5 in.) (4) from forward edge of the hole (1).

Right Side

2481242

Fig. 14: LX/LC Right Rear Rail Cut Locations
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - 125 mm (5 in.)
2 - HOLE
3 - CUT LOCATION 150 mm (6 in.)
4 - REINFORCEMENT, REAR RAIL INNER, REAR |
|---|

The "Reinforcement, Rear Rail Inner Rear" (4) ends 125 mm (5 in.) (1) forward of round hole (2) on inner face of "rail, rear inner" - recommended cut location (3) is 150 mm (6 in.) from forward edge of hole (2).

The following procedure details key points of the repair. I-CAR training is presumed, and should be followed for best-practice repair procedures.

1. Mount the damaged vehicle onto a structural straightening bench and check/correct any body misalignment utilizing three dimensional measuring equipment.
2. Remove all components in area of repair allowing unimpeded access for cutting and welding operations.
3. Trunk floor should be removed if being replaced, or the necessary welds released and the weld flange bent inboard to provide access to the rail for the butt-joint.
4. Using the round hole in the "Rail, Rear, Inner" as a point of reference, measure 125 mm (5 in.) forward for the left rail, or 150 mm (6 in.) forward for the right rail, and scribe a vertical line on the rail.

5. With the vertical line just made as reference, cut off the damaged "Rail, Rear, Inner" taking care not to damage the "Rail, Rear, Outer", using a reciprocating saw or cut-off wheel, and remove the damaged portion.
6. Utilize the same measuring and cutting process above to remove the replacement portion from the service part.
7. Using a surface conditioning disk, remove all e-coat within 25 mm (1 in.) of the cut location and de-bur the cut edge.
8. If the "Rail, Rear, Outer" was damaged during the cutting operation, MIG-weld the damage and dress the weld.
9. Fabricate 19 mm (0.75 in.) weld backers from the damaged component, or the remains of the service part, and tack in place on the replacement rail section at the butt-joint location.
10. Position and clamp the replacement rail and confirm proper position with measuring equipment.
11. Weld the service part in position using a skip-stitch process.
12. Complete remaining repairs in the damaged area.
13. Clean and dress all welded areas.
14. Apply epoxy primer to the exterior of the rail at the repair location.
15. Apply quality body sealer to all areas previously sealed to duplicate the original appearance. Note that additional sealer may be applied to better protect the exterior exposed seams from road spray.
16. Refinish all exposed surfaces in trunk and on underbody using quality refinish materials.
17. Apply inner panel rust proofing, such as Mopar # 05093981AA, or equivalent, to the rail inner cavity areas in two applications with a 30-minute flash period between the applications. Pay particular attention to areas which have been welded.
18. Reassemble vehicle and complete repairs.

Additional Information

Observe all cautions and warnings per the Chrysler service information. See **Frame and Bumpers/Frame - Warning**.

Reference the Chrysler weld process chart. See **Frame and Bumpers/Frame - Specifications**.

Butt joint should be metal finished without thinning the base rail material or weldment. This is a cosmetic finishing process to disguise the repair and should have the surface coating (paint) duplicated as well.

Restore corrosion protection when complete with all welding operations.

SPECIFICATIONS

WELD PROCESS

CAUTION: All welds should conform to the Chrysler LLC vehicle engineering process standard PS 9472.

These Procedure Specifications are appropriate as of this publication date 8/1/2007. Procedures may be superseded with new specs at a later date.

Always process to the thinner material thickness (TMT)

All persons performing welding must be qualified to weld in all positions.

- NOTE:**
- 1. Must remove Zinc Coating on both sides of metal at the weld zone.
 - 2. MIG Braze welding process requires use of Pulse Arc® or STT® welding machine.
 - 3. Must use Lincoln® product since E 71T-11 product differs from other suppliers.

FRAME DIMENSIONS

Frame dimensions are listed in metric scale then converted to inch scale listed in parenthesis. All dimensions are from center to center of Principal Locating Point (PLP), or from center to center of PLP and fastener location. Vertical dimensions can be taken from the work surface to the locations indicated.

Removal

REMOVAL

Fig. 20: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate negative battery cable (2).
2. Siphon power steering fluid from pump reservoir.
3. Raise and support the vehicle

Fig. 21: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

4. Remove the left and right front wheels (1). Refer to **Tires and Wheels - Removal** .

Fig. 22: TIE ROD ATTACHMENT AT KNUCKLE
 Courtesy of CHRYSLER LLC

5. Remove outer tie rod (2) end nut (1) at each knuckle (3).

Fig. 23: USING PULLER ON OUTER TIE ROD
 Courtesy of CHRYSLER LLC

6. Using Ball Joint Remover 9360 (2), separate outer tie rod (1) from each knuckle.

Fig. 24: LINK BALL JOINT AT STABILIZER BAR
 Courtesy of CHRYSLER LLC

7. On each side of vehicle, remove nut (5) fastening stabilizer link (3) to stabilizer bar (4). Slide link ball joint stem (1) from bar.

Fig. 25: SHOCK ATTACHMENT AT LOWER CONTROL ARM
 Courtesy of CHRYSLER LLC

8. Back off nut (3) from bolt (1) attaching shock clevis bracket (2) to lower control arm (7) until it is flush with end of bolt.
9. Using a brass drift punch, tap the bolt out of the clevis bracket until bolt serrations clear bracket.
10. Remove nut (3) and bolt (1) for clevis bracket and control arm.
11. Install engine support tool 8534B.
12. Remove upper airbox inlet tube.
13. Install left and right engine lift bracket to cylinder head.

Fig. 26: FRONT BELLY PAN
 Courtesy of CHRYSLER LLC

14. Remove the front belly pan.

Fig. 27: HOSE MOUNTING BRACKET TO CRADLE
 Courtesy of CHRYSLER LLC

15. Remove two pressure line retainer bolts (1) from cradle (2).

Fig. 28: INNER TIE ROD BELLOWS HEAT SHIELD
 Courtesy of CHRYSLER LLC

16. Remove mounting screws, then heat shield (3) above each inner tie rod bellows (2).

Fig. 29: AWD GEAR MOUNTING BOLTS
Courtesy of CHRYSLER LLC

17. Remove steering gear upper mounting bolt (4) and nut.
18. Remove steering gear lower mounting bolts (2 and 3).
19. Remove steering gear (1) and support from the exhaust system.

Fig. 30: BALL JOINT ATTACHMENT
Courtesy of CHRYSLER LLC

20. Loosen nut (4) attaching lower control arm ball joint stud to knuckle (3). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

81418486

Fig. 31: USING PULLER ON LOWER BALL JOINT - AWD
 Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Ball Joint Remover 9360, into place past seal boot.

21. Using Ball Joint Remover 9360 (2), separate ball joint stud from knuckle.
22. Remove tool.
23. Remove left and right engine mount nut.
24. Remove nut (1) from end of ball joint stud.

8146140e

Fig. 32: STABILIZER BAR BUSHING AND RETAINER

Courtesy of CHRYSLER LLC

25. On each side of vehicle, remove bolts (2) fastening stabilizer bar isolator retainer (3) in place.
26. Remove stabilizer bar with isolators and retainers from vehicle.
27. Support the engine cradle (special tool 8534B Engine Support Fixture) with a suitable lifting device.
28. Using a grease pencil or equivalent, mark the position of the engine cradle to aid installation.
29. Remove the four engine cradle bolts and lower the cradle.
30. Remove the control arms, if required.

Installation

INSTALLATION

NOTE: Although AWD and RWD upper control arms are similar in appearance, they are not interchangeable.

815aa56e

Fig. 33: ENGINE CRADLE
Courtesy of CHRYSLER LLC

1. Install control arms. Refer to **Front Suspension/Front/ARM, Lower Control - Installation** .
2. To aid installation, raise engine cradle to marked location.
3. Install four engine cradle bolts (4) and raise cradle. Tighten cradle bolts to 185 N.m (136 ft. lbs.).

4. Install stabilizer with isolators and retainers onto cradle. Refer to **Front Suspension/Front/STABILIZER BAR, Front - Installation** .

Fig. 34: STABILIZER BAR BUSHING AND RETAINER
Courtesy of CHRYSLER LLC

5. On each side of vehicle, install bolts (2) fastening stabilizer bar isolator retainer (3) in place. Tighten bolts to 60 N.m (44 ft. lbs.).
6. Tighten engine mount nuts to 60 N.m (44 ft. lbs.).
7. Tighten left and right ball joint nut (4) to 122 N.m (90 ft. lbs.) attaching lower control arm ball joint stud to knuckle (3).

Fig. 35: AWD GEAR MOUNTING BOLTS

Courtesy of CHRYSLER LLC

8. Install steering gear (1) and support from the exhaust system. Refer to **Steering/Gear - Installation**.
9. Install steering gear lower mounting bolts (2 and 3). Tighten to 142 N.m (105 ft. lbs.).
10. Install steering gear upper mounting bolt (4) and nut.

81472b59

Fig. 36: INNER TIE ROD BELLOWS HEAT SHIELD
Courtesy of CHRYSLER LLC

11. Install heat shield (3) and mounting screws above each inner tie rod bellow.

8137b4d1

Fig. 37: HOSE MOUNTING BRACKET TO CRADLE

Courtesy of CHRYSLER LLC

12. Install two pressure line retainer bolts (1) on cradle (2).

Fig. 38: FRONT BELLY PAN
Courtesy of CHRYSLER LLC

13. Install front belly pan.

Fig. 39: SHOCK ATTACHMENT AT LOWER CONTROL ARM
Courtesy of CHRYSLER LLC

14. Install nut (3) and bolt (1) attaching shock clevis bracket (2) to lower control arm (7). Tighten to 174 N.m (128 ft. lbs.).
15. On each side of vehicle, install nut (3) fastening stabilizer link (4) to stabilizer bar (5). Slide link ball joint stem on to bar. Tighten link nut to 81N.m (60 ft. lbs.).

Fig. 40: TIE ROD ATTACHMENT AT KNUCKLE
 Courtesy of CHRYSLER LLC

16. Install outer tie rod (2) end nut (1) at each knuckle (3). Tighten end nut to 86 N.m (63 ft. lbs.).

Fig. 41: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

17. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** .
18. Lower vehicle from hoist.
19. Install power steering fluid into pump reservoir. Refer to **Steering/Pump/FLUID - Standard Procedure** .

8133bb50

Fig. 42: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

20. Connect negative battery cable (2).
21. Perform vehicle alignment. Refer to **Front Suspension/Wheel Alignment - Standard Procedure**.

CROSSMEMBER, REAR

Removal

REMOVAL

8133bb50

Fig. 43: BATTERY AND CABLES

Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 44: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 45: HUB NUT

Courtesy of CHRYSLER LLC

4. On each side of vehicle rear, while a helper applies brakes to keep hub from rotating, remove hub nut (1) from half shaft (2).

Fig. 46: Exhaust System
Courtesy of CHRYSLER LLC

5. Remove rear exhaust system (2) (dual-outlet exhaust shown in illustration).
6. Remove rear axle differential. Refer to **Differential and Driveline/Rear Axle - 215R11 - Removal**.
7. Slide each axle half shaft from hub and bearing and remove from vehicle.

Fig. 47: CABLES AT EQUALIZER
Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect right rear parking brake cable (4) at connector (3) to front parking brake cable (5).
9. Disconnect left rear parking brake cable (1) at equalizer (2). **Leave equalizer on front cable.**

Fig. 48: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3). Remove J-nut from crossmember.

Fig. 49: REAR CALIPER MOUNTING
 Courtesy of CHRYSLER LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
 - b. Remove brake caliper (1) from brake adapter (3) and pads.
 - c. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

Fig. 50: PUSHING BACK PISTONS IN BORE
 Courtesy of CHRYSLER LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 51: ACCESSING REAR CALIPER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 52: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
17. If equipped with SRT8 disc brakes, remove jack from under spring link.

Fig. 53: RELEASE WHEEL SPEED SENSOR CONNECTOR
Courtesy of CHRYSLER LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

Fig. 54: SENSOR CONNECTION TO BODY CONNECTOR
Courtesy of CHRYSLER LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

Fig. 55: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
Courtesy of CHRYSLER LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

Fig. 56: LEFT WSS ROUTING OVER REAR DIFFERENTIAL
 Courtesy of CHRYSLER LLC

20. Unclip left sensor cable (1) from routing clips (2) along rear of crossmember near rear differential (3).

Fig. 57: WSS ROUTING ALONG LEFT TOE LINK
 Courtesy of CHRYSLER LLC

21. Unclip left sensor cable (2) from routing clip (1) above toe link mount on rear crossmember.

Fig. 58: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

22. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 59: Marking Location Of Crossmember Mount To Body
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE |
|--|

23. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using

a marker or crayon. **Do not use a scratch awl to mark location.**

24. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

Fig. 60: JACK POSITIONED BENEATH CROSSMEMBER

Courtesy of CHRYSLER LLC

25. Position under-hoist utility jack or transmission jack (2) under center of rear crossmember (1). Raise jack head to contact crossmember and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 61: FILLER TUBE ASSEMBLY

Courtesy of CHRYSLER LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

26. Remove fuel filler tube. Refer to Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Removal .

Fig. 62: AWD CROSSMEMBER SPACERS
Courtesy of CHRYSLER LLC

NOTE: If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

Fig. 63: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

27. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
28. **Slowly** lower crossmember using jack until crossmember is at a comfortable working level to access link and stabilizer bar fasteners.

Fig. 64: REAR STABILIZER BAR MOUNTING
Courtesy of CHRYSLER LLC

29. On each end, remove bolt (3) and nut fastening stabilizer bar (4) to stabilizer link (2).
30. Remove bolts (1) fastening each stabilizer bar cushion retainer to crossmember.
31. Remove stabilizer bar (4) with cushions and retainers.

Fig. 65: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

32. Remove coil springs and isolators (1, 2 and 5) from spring links.

Fig. 66: CABLES AT CROSSMEMBER BRACKET
Courtesy of CHRYSLER LLC

33. For each parking brake cable, place 13 mm 12-point box wrench (4) over cable strand and completely onto cable retainer (3) as shown at crossmember bracket (1 - left) (2 - right). It may be necessary to wiggle wrench around somewhat to collapse retainer fingers. With wrench in place, pull cable from bracket.

Fig. 67: REAR CABLE ROUTING TO KNUCKLE
 Courtesy of CHRYSLER LLC

34. On each side, remove screw fastening parking brake cable routing guide (1) to crossmember. Remove J-nuts from crossmember.

Fig. 68: SPRING LINK MOUNTING
 Courtesy of CHRYSLER LLC

NOTE: For installation purposes, when removing fasteners for any rear suspension links, it is important to note which bolt fastens what component and in what direction it is installed in.

35. On each side of crossmember, remove bolt and nut (1) fastening spring link (4) to crossmember.

Fig. 69: REAR TOE ADJUSTMENT BOLT NUT
Courtesy of CHRYSLER LLC

36. On each side of crossmember, while holding toe adjustment cam bolt from rotating, remove nut (3) securing toe link at crossmember (1).

Fig. 70: TOE LINK MOUNTING
Courtesy of CHRYSLER LLC

37. On each side of crossmember, slide cam bolt (2) attaching toe link rearward, out of

crossmember and link (1).

Fig. 71: COMPRESSION LINK MOUNTING
Courtesy of CHRYSLER LLC

38. On each side of crossmember, remove bolt and nut (1) mounting link (3) at crossmember.

Fig. 72: CAMBER AND TENSION LINKS
Courtesy of CHRYSLER LLC

39. On each side of crossmember, remove nut and bolt (4) mounting tension link to crossmember (1).
40. On each side of crossmember, remove nut and bolt (2) mounting camber link to crossmember

(1).

41. Carefully lift knuckle with links and parking brake cable attached from rear suspension crossmember.
42. Remove crossmember from jack.

Installation

INSTALLATION

81358d47

Fig. 73: REAR CROSSMEMBER POSITIONED ON JACK
Courtesy of CHRYSLER LLC

1. Install rear crossmember (1) on jack (2) head in same position in which it was removed and secure in place.

Fig. 74: CAMBER AND TENSION LINKS
 Courtesy of CHRYSLER LLC

2. Carefully place one side knuckle with links and parking brake cable attached as an assembly into mounted position on rear suspension crossmember. Install nut and bolt (2) mounting camber link to crossmember (1) to hold assembly in place. **Do not tighten at this time.**
3. Carefully place opposite side knuckle with links and parking brake cable attached as an assembly into mounted position on rear suspension crossmember. Install nut and bolt (2) mounting camber link to crossmember (1) to hold assembly in place. **Do not tighten at this time.**
4. On each side of crossmember, install nut and bolt (4) mounting each tension link to crossmember (1). **Do not tighten at this time.**

Fig. 75: COMPRESSION LINK MOUNTING
Courtesy of CHRYSLER LLC

5. On each side of crossmember, Install bolt and nut (1) mounting each compression link (3) at crossmember. **Do not tighten at this time.**

Fig. 76: TOE LINK MOUNTING
Courtesy of CHRYSLER LLC

6. On each side of crossmember, slide cam bolt (2) attaching toe link through crossmember and link (1) from rear.

Fig. 77: REAR TOE ADJUSTMENT BOLT NUT
Courtesy of CHRYSLER LLC

7. On each side of crossmember, while holding toe adjustment cam bolt from rotating, install cam washer (2) and nut (3) securing toe link at crossmember (1). **Do not tighten at this time.**

Fig. 78: SPRING LINK MOUNTING
Courtesy of CHRYSLER LLC

8. On each side of crossmember, install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten at this time.**

Fig. 79: CABLES AT CROSSMEMBER BRACKET
Courtesy of CHRYSLER LLC

9. On each side of crossmember rear, guide leading end of rear parking brake through

crossmember bracket (1 - left) (2 - right) near equalizer and press cable housing retainer into bracket allowing retainer fingers to lock cable in place.

Fig. 80: REAR CABLE ROUTING TO KNUCKLE
Courtesy of CHRYSLER LLC

10. On each side of crossmember rear, install J-nut for parking brake cable guide.
11. On each side, install screw fastening parking brake cable routing guide (1) to crossmember.

Fig. 81: REAR STABILIZER BAR MOUNTING
Courtesy of CHRYSLER LLC

12. Install stabilizer bar (4) with cushions and retainers on crossmember.

13. Install cushion retainer mounting bolts (1). **Do not tighten at this time.**
14. Install bolt (3) and nut fastening stabilizer bar ends to each stabilizer link (2). **Do not tighten at this time.**
15. Tighten cushion retainer mounting bolts (1) to 60 N.m (44 ft. lbs.).

Fig. 82: Rear Axle-to-Crossmember Bolts
Courtesy of CHRYSLER LLC

CAUTION: Differential mounting bolts (1) must be installed through bushings prior to crossmember installation in vehicle. Bolts cannot be inserted through bushings once crossmember is installed.

16. Transfer differential mounting bolts (1) from original crossmember differential mount bushings to bushings in replacement crossmember. Install bolts from rear. Be sure to insert bolts through correct mount bushings in crossmember depending on rear axle differential (198 mm axle differential shown in illustration).

NOTE: Do not install coil springs on spring links at this time.

Fig. 83: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

17. Raise crossmember to body mounting points. As crossmember is raised, align shocks (3) with pockets in spring links. **Do not install bolts at this time.**

Fig. 84: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

18. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be

installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

Fig. 85: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

19. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

20. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 86: SHOCK MOUNTING - LOWER
Courtesy of CHRYSLER LLC

21. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
22. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 87: AWD CROSSMEMBER SPACERS
Courtesy of CHRYSLER LLC

23. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

Fig. 88: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

24. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
25. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

Fig. 89: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

26. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

27. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 90: SHOCK MOUNTING - LOWER
Courtesy of CHRYSLER LLC

28. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
29. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 91: AWD CROSSMEMBER SPACERS
 Courtesy of CHRYSLER LLC

30. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

Fig. 92: REAR CROSSMEMBER MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

31. Raise left side of crossmember (1) into mounted position. Install left side crossmember

mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 93: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

32. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

Fig. 94: MEASURING TENSION LINK CLEARANCE

Courtesy of CHRYSLER LLC

33. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

Fig. 95: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

34. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 96: JACK POSITIONED BENEATH CROSSMEMBER
 Courtesy of CHRYSLER LLC

35. Remove jack (2) from under rear crossmember.

Fig. 97: FILLER TUBE ASSEMBLY
 Courtesy of CHRYSLER LLC

36. Install fuel filler tube. Refer to **Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Installation** .

Fig. 98: WSS ROUTING ALONG LEFT TOE LINK
 Courtesy of CHRYSLER LLC

37. Clip left rear wheel speed sensor cable (2) to routing clip (1) above toe link mount on rear crossmember.

Fig. 99: LEFT WSS ROUTING OVER REAR DIFFERENTIAL
 Courtesy of CHRYSLER LLC

38. Clip left rear wheel speed sensor cable (1) to routing clips (2) along rear of crossmember near rear differential (3).

Fig. 100: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
 Courtesy of CHRYSLER LLC

39. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

Fig. 101: SENSOR CONNECTION TO BODY CONNECTOR
 Courtesy of CHRYSLER LLC

40. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
41. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

Fig. 102: REAR CALIPER MOUNTING
 Courtesy of CHRYSLER LLC

42. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
 - b. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
 - c. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
 - d. Make sure brake hose is properly routed and will not come in contact with suspension components.
43. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. See **Frame and Bumpers/Frame/CROSSMEMBER - Removal**

Fig. 103: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

44. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
45. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.).
46. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

Fig. 104: CABLES AT EQUALIZER
Courtesy of CHRYSLER LLC

47. Route front parking brake cable with equalizer above rear crossmember.

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

48. Connect left rear parking brake cable (1) to equalizer (2).
49. Connect right rear parking brake cable (4) to connector (3) already attached to front parking brake cable (5).

Fig. 105: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

50. Install J-nut for mounting parking brake cable routing bracket to crossmember.
51. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

Fig. 106: HUB NUT
Courtesy of CHRYSLER LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

52. On each side of vehicle, slide an axle half shaft (2) through hub and bearing and install hub nut (1). **Do not tighten hub nuts at this time.**
53. Install rear axle differential. Refer to **Differential and Driveline/Rear Axle - 215R11 - Installation** .
54. While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).

Fig. 107: Exhaust System

Courtesy of CHRYSLER LLC

55. Install rear exhaust system (2) (dual-outlet exhaust shown in illustration).

Fig. 108: JACK STAND UNDER CONTROL ARM
Courtesy of CHRYSLER LLC

56. Lower vehicle until front tires contact floor but rear is still suspended. Place jack stands under each rear suspension spring link. Place an appropriate wooden block between stand and link to avoid damaging spring link, then lower vehicle until full vehicle weight is supported by suspension.

Fig. 109: CAMBER AND TENSION LINKS
Courtesy of CHRYSLER LLC

- 57. Tighten camber link bolt (2) at crossmember to 85 N.m (63 ft. lbs.).
- 58. Tighten tension link bolt nut (2) at crossmember to 85 N.m (63 ft. lbs.).

Fig. 110: COMPRESSION LINK MOUNTING
Courtesy of CHRYSLER LLC

- 59. Tighten compression link bolt (2) at crossmember to 85 N.m (63 ft. lbs.) torque.

Fig. 111: SPRING LINK MOUNTING
Courtesy of CHRYSLER LLC

- 60. Tighten spring link bolt (1) at crossmember to 108 N.m (80 ft. lbs.).

Fig. 112: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

61. Tighten shock absorber lower mounting bolt nut (4) to 72 N.m (53 ft. lbs.).

Fig. 113: REAR STABILIZER BAR MOUNTING
 Courtesy of CHRYSLER LLC

62. Tighten stabilizer link bolts (3) to 61 N.m (45 ft. lbs.).

Fig. 114: JACK STAND UNDER CONTROL ARM
 Courtesy of CHRYSLER LLC

63. Raise vehicle and remove jack stands (3).

Fig. 115: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

64. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **Tires and Wheels - Installation**.
65. Lower vehicle.

8133bb50

Fig. 116: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

66. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .
67. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
68. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (Refer to 33). Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

8132605a

Fig. 117: REAR TOE ADJUSTMENT BOLT NUT
 Courtesy of CHRYSLER LLC

69. On each side of crossmember, while holding cam bolt from turning, tighten toe link cam bolt nut (2) to 108 N.m (80 ft. lbs.) torque.

ISOLATOR, REAR CROSSMEMBER, DIFFERENTIAL

Removal

REMOVAL

8133bb50

Fig. 118: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 119: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 120: HUB NUT
 Courtesy of CHRYSLER LLC

4. On each side of vehicle rear, while a helper applies brakes to keep hub from rotating, remove hub nut (1) from half shaft (2).

Fig. 121: Exhaust System
 Courtesy of CHRYSLER LLC

5. Remove rear exhaust system (2) (dual-outlet exhaust shown in illustration).
6. Remove rear axle differential. Refer to **Differential and Driveline/Rear Axle - 215R11 - Removal**.
7. Slide each axle half shaft from hub and bearing and remove from vehicle.

Fig. 122: CABLES AT EQUALIZER
 Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) above axle differential.

Fig. 123: FRONT CABLE TO EQUALIZER
Courtesy of CHRYSLER LLC

9. Remove front parking brake cable (3) from equalizer (2).

Fig. 124: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3).

Fig. 125: REAR CALIPER MOUNTING
Courtesy of CHRYSLER LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
- While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
 - Remove brake caliper (1) from brake adapter (3) and pads.
 - Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

Fig. 126: PUSHING BACK PISTONS IN BORE
Courtesy of CHRYSLER LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 127: ACCESSING REAR CALIPER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 128: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
17. If equipped with SRT8 disc brakes, remove jack from under spring link.

Fig. 129: RELEASE WHEEL SPEED SENSOR CONNECTOR
Courtesy of CHRYSLER LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

Fig. 130: SENSOR CONNECTION TO BODY CONNECTOR
Courtesy of CHRYSLER LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

Fig. 131: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
Courtesy of CHRYSLER LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

Fig. 132: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 133: Marking Location Of Crossmember Mount To Body
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE |
|--|

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using

a marker or crayon. **Do not use a scratch awl to mark location.**

22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

Fig. 134: JACK POSITIONED BENEATH CROSSMEMBER

Courtesy of CHRYSLER LLC

23. Position under-hoist utility jack or transmission jack (2) under center of rear crossmember (1). Raise jack head to contact crossmember and secure in place.

Fig. 135: FILLER TUBE ASSEMBLY

Courtesy of CHRYSLER LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Removal.

Fig. 136: AWD CROSSMEMBER SPACERS
Courtesy of CHRYSLER LLC

NOTE: If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

Fig. 137: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack until crossmember is at a comfortable working level.

Fig. 138: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

27. Remove coil springs and isolators (1, 2 and 5) from spring links.

Fig. 139: Rear Axle-to-Crossmember Bolts
Courtesy of CHRYSLER LLC

28. Remove bolt (1) from bushing prior to removal.

Fig. 140: TOOLS ASSEMBLED FOR BUSHING REMOVAL
Courtesy of CHRYSLER LLC

NOTE: Prior to using Special Tool 9520, lubricate Bolt (1) threads to provide ease of use and promote tool longevity.

NOTE: When installing Thrust Bearing (6), be sure to place hardened side toward Bolt head.

29. Assemble tools (See following list) over bushing as shown in illustration.

- (1) Bolt
- (2) Nut
- (3) Washer
- (4) Receiver 9520-4
- (5) Remover 9520-3
- (6) Thrust Bearing

30. While holding Nut (2) from rotating, **using hand tools**, tighten Bolt (1) until Remover (5) comes in contact with bushing and Receiver (4) sets squarely against crossmember.

31. Continue to tighten Bolt (1), pressing bushing out of crossmember.

32. Remove tools with bushing.

Installation

INSTALLATION

Fig. 141: TOOLS ASSEMBLED FOR BUSHING INSTALLATION
 Courtesy of CHRYSLER LLC

NOTE: It is important that tapered end (3) of bushing be installed first into forward end of crossmember to ease installation.

NOTE: When installing Thrust Bearing (7), be sure to place hardened side toward Bolt head.

1. Insert tapered end of NEW bushing (3) into forward end of crossmember bushing bore.
2. Assemble tools (See following list) through crossmember and bushing as shown in illustration.
 - (1) Bolt
 - (2) Disc 9520-1
 - (3) Bushing
 - (4) Nut
 - (5) Washer
 - (6) Installer 9520-2
 - (7) Thrust Bearing
3. Insert Installer (6) into end of bushing and Disc (2) into opposite end of crossmember bushing bore.
4. While holding Nut (4) from rotating, tighten Bolt (1) **using hand tools** , pressing bushing into crossmember. Stop when Installer (6) bottoms against bushing bore.
5. Remove tools.

Fig. 142: Rear Axle-to-Crossmember Bolts
 Courtesy of CHRYSLER LLC

CAUTION: Differential mounting bolts (1) must be installed through bushings prior to crossmember installation in vehicle. Bolts cannot be inserted through bushings once crossmember is installed.

6. Insert differential mounting bolt (1) through mount bushing from rear (198 mm axle differential shown in illustration. Other axles differ, but similar).

NOTE: Do not install coil springs on spring links at this time.

Fig. 143: COIL SPRING AND SHOCK ASSEMBLY

Courtesy of CHRYSLER LLC

7. Raise crossmember to body mounting points. As crossmember is raised, align shocks (3) with pockets in spring links. **Do not install bolts at this time.**

Fig. 144: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

8. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

Fig. 145: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

9. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

10. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 146: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

11. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
12. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 147: AWD CROSSMEMBER SPACERS
 Courtesy of CHRYSLER LLC

13. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

Fig. 148: REAR CROSSMEMBER MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

14. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
15. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

Fig. 149: COIL SPRING AND SHOCK ASSEMBLY
 Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

16. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

17. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 150: SHOCK MOUNTING - LOWER
Courtesy of CHRYSLER LLC

18. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
19. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 151: AWD CROSSMEMBER SPACERS
 Courtesy of CHRYSLER LLC

20. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

Fig. 152: REAR CROSSMEMBER MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

21. Raise left side of crossmember (1) into mounted position. Install left side crossmember

mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 153: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

22. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

Fig. 154: MEASURING TENSION LINK CLEARANCE

Courtesy of CHRYSLER LLC

23. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

Fig. 155: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

24. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

Fig. 156: JACK POSITIONED BENEATH CROSSMEMBER
 Courtesy of CHRYSLER LLC

25. Remove jack (2) from under rear crossmember.

Fig. 157: FILLER TUBE ASSEMBLY
 Courtesy of CHRYSLER LLC

26. Install fuel filler tube. Refer to **Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Installation** .

813b1e23

Fig. 158: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
 Courtesy of CHRYSLER LLC

27. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

813b14c5

Fig. 159: SENSOR CONNECTION TO BODY CONNECTOR
 Courtesy of CHRYSLER LLC

28. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
29. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

Fig. 160: REAR CALIPER MOUNTING
 Courtesy of CHRYSLER LLC

CAUTION: Extreme caution should be taken not to cross-thread caliper guide pin bolts (2) when they are installed.

30. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
 - b. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
 - c. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
 - d. Make sure brake hose is properly routed and will not come in contact with suspension components.
31. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. See **Frame and Bumpers/Frame/ISOLATOR, Rear Crossmember - Removal**

Fig. 161: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

32. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
33. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
34. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

Fig. 162: FRONT CABLE TO EQUALIZER

Courtesy of CHRYSLER LLC

35. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential (once installed).

Fig. 163: CABLES AT EQUALIZER
Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

36. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

Fig. 164: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

37. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

Fig. 165: HUB NUT
Courtesy of CHRYSLER LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

38. On each side of vehicle, slide an axle half shaft (2) through hub and bearing and install hub nut (1). **Do not tighten hub nuts at this time.**
39. Install rear axle differential. Refer to **Differential and Driveline/Rear Axle - 215RII - Installation** .
40. While a helper applies brakes to keep hub from turning, tighten hub nut to 213 N.m (157 ft. lbs.).

Fig. 166: Exhaust System
 Courtesy of CHRYSLER LLC

41. Install rear exhaust system (2) (dual-outlet exhaust shown in illustration).

Fig. 167: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

42. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **Tires and Wheels - Installation**.
43. Lower vehicle.

8133bb50

Fig. 168: BATTERY AND CABLES
 Courtesy of CHRYSLER LLC

44. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .
45. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
46. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

813234c9

Fig. 169: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

47. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).
48. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (Refer to 23).
Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

ISOLATOR, REAR CROSSMEMBER, FRONT MOUNT

Removal

REMOVAL

Fig. 170: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 171: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 172: Exhaust System
 Courtesy of CHRYSLER LLC

4. Remove rear exhaust system (2) (dual-outlet exhaust shown in illustration).

Fig. 173: Alignment Marks - Axle End Shown
 Courtesy of CHRYSLER LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

Fig. 174: Propeller Shaft at Rear Axle
 Courtesy of CHRYSLER LLC

6. Remove three (four if equipped with 215 MM axle) propeller shaft coupler-to-axle flange bolts and nuts.

Fig. 175: PROP SHAFT SUPPORT BY BUNGEE CORD
 Courtesy of CHRYSLER LLC

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown in illustration.

Fig. 176: CABLES AT EQUALIZER
 Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4)

above axle differential.

Fig. 177: FRONT CABLE TO EQUALIZER
Courtesy of CHRYSLER LLC

9. Remove front parking brake cable (3) from equalizer (2).

Fig. 178: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember

front flange (3).

Fig. 179: REAR CALIPER MOUNTING
Courtesy of CHRYSLER LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
 - b. Remove brake caliper (1) from brake adapter (3) and pads.
 - c. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

Fig. 180: PUSHING BACK PISTONS IN BORE

Courtesy of CHRYSLER LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 181: ACCESSING REAR CALIPER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 182: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care not to overextend brake hose when doing this.
17. If equipped with SRT8 disc brakes, remove jack from under spring link.

Fig. 183: RELEASE WHEEL SPEED SENSOR CONNECTOR
Courtesy of CHRYSLER LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

Fig. 184: SENSOR CONNECTION TO BODY CONNECTOR
Courtesy of CHRYSLER LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1) located in luggage compartment floor pan (2).

Fig. 185: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
Courtesy of CHRYSLER LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

Fig. 186: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 187: Marking Location Of Crossmember Mount To Body
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE |
|--|

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using

a marker or crayon. **Do not use a scratch awl to mark location.**

22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

Fig. 188: SUPPORT REAR SUSPENSION USING JACK
Courtesy of CHRYSLER LLC

23. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 189: FILLER TUBE ASSEMBLY
Courtesy of CHRYSLER LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Removal .

Fig. 190: AWD CROSSMEMBER SPACERS
Courtesy of CHRYSLER LLC

NOTE: If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

Fig. 191: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow propeller shaft removal from rear axle differential. **Do not lower jack any further than necessary.** Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.
27. Lower crossmember until crossmember is at a comfortable working level to access bushings. Support rear suspension assembly using jack stands to help stabilize assembly during bushing service.

Fig. 192: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

28. Remove coil springs (2) with isolators (1 and 5) from spring links (4).

Fig. 193: MARKING LOCATION OF FRONT BUSHING
 Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - MARKER OR CRAYON
2 - CROSSMEMBER
3 - BUSHING CAN FLANGE |
|---|

29. As an installation reference, carefully mark location of bushing requiring removal on crossmember (around bushing can flange) using a marker or crayon. **Do not use a scratch awl to mark location.**

Fig. 194: COMPRESSION LINK MOUNTING
 Courtesy of CHRYSLER LLC

30. Remove nut and bolt (1) fastening compression link (3) to crossmember.

Fig. 195: FRONT BUSHING EAR
Courtesy of CHRYSLER LLC

31. Remove travel limiter (2) from bushing inner metal sleeve (1). To do so, use an appropriate grinding tool to remove inner metal sleeve material until limiter can be safely removed.

Fig. 196: INSTALLING SUPPORT 9031-9
Courtesy of CHRYSLER LLC

32. Slide Support (2), Special Tool 9031-9, into end of crossmember (3) surrounding bushing bore as shown in illustration.

33. Snug set-screws (1) securing Support (2) to crossmember.

Fig. 197: INSERTING BRACE 9031-10
Courtesy of CHRYSLER LLC

34. Insert Brace (1), Special Tool 9031-10, between Support 9031-9 (3) and bushing bore flange (2) matching step in Brace to bore flange.

Fig. 198: TIGHTEN SUPPORT 9031-9 SET SCREWS
Courtesy of CHRYSLER LLC

35. Snug set-screws (2) against Brace 9031-10. **Do not overtighten set-screws as they will distort and bend bushing bore flange.**

8138696b

Fig. 199: TOOLS POSITIONED TO REMOVE FRONT BUSHING
Courtesy of CHRYSLER LLC

NOTE: Prior to using Press (1), Special Tool C-4212F Ball Joint Press Installer/Removal, lubricate screw-drive threads to provide ease of use and promote tool longevity.

36. Assemble tools (See following list) over bushing as shown in illustration. Ensure Remover lies between ridges (3) on bushing to properly contact bushing can.
 - (1) Press C-4212F
 - (2) Remover 9031-5A
 - (4) Receiver 9031-8A
37. Tighten Press (1) screw-drive, pressing bushing out of crossmember.
38. Remove all tools.

Installation

INSTALLATION

Fig. 200: FRONT BUSHINGS - LEFT AND RIGHT
Courtesy of CHRYSLER LLC

CAUTION: Prior to bushing installation, inspect the bushing to make sure it is the correct side bushing for the job. Left side bushings have the travel limiter (1) tipped to the right in relationship to the bushing (4) can flange as shown in illustration. Right side bushings have the travel limiter (2) tipped to the left in relationship to the bushing (3) can flange as shown in illustration. Once installed, the travel limiters with face slightly outward from straight-ahead position.

CAUTION: It is very important that bushing be installed in same position as original to maintain vehicle ride quality and bushing longevity. That is why bushing, once installed, needs to closely match reference marks applied upon removal of original bushing.

1. Position bushing on crossmember bushing bore aligning bushing can flange with reference marks applied during removal.

Fig. 201: FRONT BUSHING INSTALLATION
 Courtesy of CHRYSLER LLC

2. Assemble tools (See following list) over bushing and crossmember as shown in illustration.

Fig. 202: INSTALLER POSITIONED ON BUSHING
 Courtesy of CHRYSLER LLC

NOTE: Ensure Installer (3), Special Tool 9031-7A, is positioned that it will clear compression link bracket (1) while bushing is being installed.

- (2) Receiver 9031-6
- (3) Press C-4212F

- (4) Installer 9031-7A
3. Tighten Press (2) screw-drive, pressing bushing into crossmember. Install bushing until bushing can flange contacts surface of crossmember.
 4. Remove tools.
 5. Verify bushing closely lines up with reference marks applied during removal.

Fig. 203: COMPRESSION LINK MOUNTING
Courtesy of CHRYSLER LLC

6. Install bolt and nut as shown in illustration (1) fastening compression link (3) to crossmember.
Do not tighten bolt at this time.

NOTE: **Do not reinstall coil springs on spring links at this time. Install as directed in later steps.**

8131b7b6

Fig. 204: Propeller Shaft at Rear Axle
Courtesy of CHRYSLER LLC

7. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft (1) onto rear axle differential flange (2) and align shock absorbers with pockets in spring links.

8131f4d3

Fig. 205: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

8. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be

installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

Fig. 206: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

9. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

10. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 207: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

11. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
12. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 208: AWD CROSSMEMBER SPACERS
 Courtesy of CHRYSLER LLC

13. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

Fig. 209: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

14. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
15. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

Fig. 210: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

16. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

17. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 211: SHOCK MOUNTING - LOWER
Courtesy of CHRYSLER LLC

18. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
19. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 212: AWD CROSSMEMBER SPACERS
Courtesy of CHRYSLER LLC

20. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

Fig. 213: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

21. Raise left side of crossmember (1) into mounted position. Install left side crossmember

mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 214: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

22. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

Fig. 215: MEASURING TENSION LINK CLEARANCE

Courtesy of CHRYSLER LLC

23. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

Fig. 216: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

24. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

81326804

Fig. 217: SUPPORT REAR SUSPENSION USING JACK
 Courtesy of CHRYSLER LLC

25. Remove jack (3) from under rear axle differential.

813b2bb1

Fig. 218: PROP SHAFT SUPPORT BY BUNGEE CORD
 Courtesy of CHRYSLER LLC

26. Remove bungee cord (1) supporting propeller shaft (2).

8131b7b6

Fig. 219: Propeller Shaft at Rear Axle
Courtesy of CHRYSLER LLC

27. Align propeller shaft index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N.m (60 ft. lbs.).

8133d888

Fig. 220: FILLER TUBE ASSEMBLY
Courtesy of CHRYSLER LLC

28. Install fuel filler tube. Refer to **Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Installation** .

Fig. 221: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
 Courtesy of CHRYSLER LLC

29. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

Fig. 222: SENSOR CONNECTION TO BODY CONNECTOR
 Courtesy of CHRYSLER LLC

30. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
31. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

Fig. 223: REAR CALIPER MOUNTING
 Courtesy of CHRYSLER LLC

32. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
 - b. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
 - c. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
 - d. Make sure brake hose is properly routed and will not come in contact with suspension components.
33. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. See **Frame and Bumpers/Frame/ISOLATOR, Rear Crossmember - Removal**

Fig. 224: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

34. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
35. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
36. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

Fig. 225: FRONT CABLE TO EQUALIZER

Courtesy of CHRYSLER LLC

37. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential (once installed).

Fig. 226: CABLES AT EQUALIZER
Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

38. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

Fig. 227: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

39. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

Fig. 228: Exhaust System
Courtesy of CHRYSLER LLC

40. Install rear exhaust system (2) (dual-outlet exhaust shown in illustration).

Fig. 229: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

41. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **Tires and Wheels - Installation** .
42. Lower vehicle until rear wheels are just above floor level.
43. Apply parking brake lever. Release lever, then reapply.
44. Check to make sure rear wheels will not rotate with lever applied.
45. Lower vehicle.

8133bb50

Fig. 230: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

46. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .
47. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
48. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

Fig. 231: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

49. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).

Fig. 232: COMPRESSION LINK MOUNTING
 Courtesy of CHRYSLER LLC

50. Tighten compression link bolt and nut (1) at crossmember to 85 N.m (63 ft. lbs.).
51. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (Refer to 23). Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

REMOVAL

1. Disconnect and isolate battery negative cable (2) from battery post.
2. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 234: TIRE AND WHEEL MOUNTING

Courtesy of CHRYSLER LLC

3. On each side of vehicle rear, remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 235: Exhaust System
Courtesy of CHRYSLER LLC

4. Remove rear exhaust system (2) (dual-outlet exhaust shown in illustration).

Fig. 236: Alignment Marks - Axle End Shown
Courtesy of CHRYSLER LLC

5. Apply alignment index marks (3) to the propeller shaft rubber coupler (1) and axle flange (2).

8131b7b6

Fig. 237: Propeller Shaft at Rear Axle
Courtesy of CHRYSLER LLC

6. Remove three (four if equipped with 215MM axle) propeller shaft coupler-to-axle flange bolts and nuts.

813b2bb1

Fig. 238: PROP SHAFT SUPPORT BY BUNGEE CORD
Courtesy of CHRYSLER LLC

7. Support propeller shaft (2) using a bungee cord (1). Attach ends of cord to fuel tank straps as shown in illustration.

Fig. 239: CABLES AT EQUALIZER
 Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

8. Disconnect front parking brake cable (5) at connector (3) to right rear parking brake cable (4) above axle differential.

Fig. 240: FRONT CABLE TO EQUALIZER

Courtesy of CHRYSLER LLC

9. Remove front parking brake cable (3) from equalizer (2).

Fig. 241: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

10. Remove screw (2) fastening front parking brake cable (1) routing bracket to rear crossmember front flange (3).

Fig. 242: REAR CALIPER MOUNTING
Courtesy of CHRYSLER LLC

11. If equipped with standard or premium disc brakes, on each rear disc brake:

- a. While holding guide pins from turning, remove disc brake caliper guide pin bolts (2).
- b. Remove brake caliper (1) from brake adapter (3) and pads.
- c. Guide brake caliper up through suspension, following brake hose path. Support caliper above rear suspension using with bungee cord or wire to keep caliper from overextending brake hose when crossmember is lowered.

Fig. 243: PUSHING BACK PISTONS IN BORE
Courtesy of CHRYSLER LLC

CAUTION: When pushing pistons back into caliper bores, use only a trim stick as shown in illustration or other suitable soft tool. Never use a screwdriver or other metal pry bar due to potential damage to braking surface of rotor, caliper, pistons or dust boots.

12. If equipped with SRT8 disc brakes, on each rear disc brake, place trim stick (4) between brake pad (2) and outer edge of rotor (3).
13. If equipped with SRT8 disc brakes, on each rear disc brake, using trim stick, slowly apply pressure against brake pad (2) until both pistons (on that side of caliper) are completely bottomed in bores of caliper half.

NOTE: Repeat above procedure to opposite brake pad (1) and pistons as necessary.

Fig. 244: ACCESSING REAR CALIPER MOUNTING BOLTS
 Courtesy of CHRYSLER LLC

14. If equipped with SRT8 disc brakes, on each rear disc brake, support spring link (1) using a transmission jack (5) or other appropriate jack. Raise spring link just enough to access brake caliper lower mounting bolt (4) from above compression link (2).

Fig. 245: REAR CALIPER MOUNTING - SRT8
 Courtesy of CHRYSLER LLC

15. If equipped with SRT8 disc brakes, on each rear disc brake, remove the lower and upper caliper mounting bolts (1).
16. If equipped with SRT8 disc brakes, on each rear disc brake, remove brake caliper (2) with pads from knuckle and brake rotor. Hang assembly out of way using wire or a bungee cord. Use care

not to overextend brake hose when doing this.

17. If equipped with SRT8 disc brakes, remove jack from under spring link.

Fig. 246: RELEASE WHEEL SPEED SENSOR CONNECTOR
Courtesy of CHRYSLER LLC

NOTE: To remove wheel speed sensor connector from body wiring harness connector, move retaining clip (2) and pull sensor connector outward.

Fig. 247: SENSOR CONNECTION TO BODY CONNECTOR
Courtesy of CHRYSLER LLC

18. Remove wheel speed sensor connectors (3 and 4) from body wiring harness connector (1)

located in luggage compartment floor pan (2).

Fig. 248: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
Courtesy of CHRYSLER LLC

19. Unclip left wheel speed sensor cable (3) from routing clip (1) near body connector.

Fig. 249: SHOCK MOUNTING - LOWER
Courtesy of CHRYSLER LLC

20. On each side of vehicle, remove shock absorber (1) lower mounting bolt (2) and nut (4).

Fig. 250: Marking Location Of Crossmember Mount To Body
 Courtesy of CHRYSLER LLC

- | |
|--|
| 1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE |
|--|

21. Carefully mark location of rear crossmember on body at all four mount (bushing) locations using a marker or crayon. **Do not use a scratch awl to mark location.**
22. Position an extra pair of jack stands under and support forward end of engine cradle to help stabilize vehicle during rear suspension removal/installation.

Fig. 251: SUPPORT REAR SUSPENSION USING JACK

Courtesy of CHRYSLER LLC

23. Position under-hoist utility jack or transmission jack (3) under center of rear axle differential (1). Raise jack head to contact differential and secure in place. **When securing crossmember to jack, be sure not to secure stabilizer bar.**

Fig. 252: FILLER TUBE ASSEMBLY
Courtesy of CHRYSLER LLC

WARNING: Before opening fuel system, review all Warnings and Cautions.

24. Remove fuel filler tube. Refer to **Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Removal** .

Fig. 253: AWD CROSSMEMBER SPACERS
Courtesy of CHRYSLER LLC

NOTE: If equipped with AWD, when removing crossmember mounting bolts in following step, be sure to not to misplace spacers (1) between crossmember mounts (2) and body.

Fig. 254: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

25. Remove both front (3) and both rear (2) mounting bolts fastening crossmember (1) in place.
26. **Slowly** lower crossmember using jack. **Do not lower jack at a fast rate.** Lower just enough to allow propeller shaft removal from rear axle differential. **Do not lower jack any further than**

necessary. Slide propeller shaft out of rear axle differential and allow bungee cord previously installed to support.

27. Lower crossmember until crossmember is at a comfortable working level to access bushings. Support rear suspension assembly using jack stands to help stabilize assembly during bushing service.

Fig. 255: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

28. Remove coil springs (2) with isolators (1 and 5) from spring links (4).

Fig. 256: MARKING LOCATION OF REAR BUSHING
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - BUSHING CAN FLANGE
2 - MARKER OR CRAYON
3 - CROSSMEMBER |
|---|

29. As an installation reference, carefully mark location of bushing requiring removal on crossmember (around bushing can flange) using a marker or crayon. **Do not use a scratch awl to mark location.**

Fig. 257: INSTALLING SUPPORT 9031-11
Courtesy of CHRYSLER LLC

30. Slide Support (2), Special Tool 9031-11, into end of crossmember (3) surrounding bushing bore as shown in illustration.
31. Snug set-screws (1) securing Support (2) to crossmember.

Fig. 258: INSERTING BRACE 9031-12
Courtesy of CHRYSLER LLC

32. Insert Brace (1), Special Tool 9031-12, between Support 9031-11 (3) and bushing bore flange (2) matching angle cut in Brace to bore flange.

Fig. 259: TIGHTEN SUPPORT 9031-11 SET SCREWS
Courtesy of CHRYSLER LLC

33. Snug set-screws (1) against Brace 9031-12. **Do not overtighten set-screws as they will distort and bend bushing bore flange.**

Fig. 260: TOOLS POSITIONED TO REMOVE REAR BUSHING
Courtesy of CHRYSLER LLC

NOTE: Prior to using Press (1), Special Tool C-4212F, lubricate screw-drive threads to provide ease of use and promote tool longevity.

34. Assemble tools (See following list) over bushing as shown in illustration.
 - (1) Press C-4212F
 - (2) Remover 9031-2
 - (3) Receiver 9031-1
35. Tighten Press (1) screw-drive, pressing bushing out of crossmember.
36. Remove all tools.

Installation

INSTALLATION

CAUTION: It is very important that bushing be installed in same position as original to maintain vehicle ride quality and bushing longevity. That is why bushing, once installed, needs to closely match reference marks applied upon removal of original bushing.

Fig. 261: REAR BUSHING INSTALLATION
Courtesy of CHRYSLER LLC

1. Position bushing on crossmember bushing bore aligning bushing can flange (3) with reference marks applied during removal.
2. Assemble tools (See following list) over bushing (3) and crossmember as shown in illustration.
 - (1) Press C-4212F
 - (2) Receiver 9031-3
 - (4) Installer 9031-4
3. Tighten Press (1) screw-drive, pressing bushing into crossmember. Install bushing until bushing can flange contacts surface of crossmember.
4. Remove tools.
5. Verify bushing closely lines up with reference marks applied during removal.

NOTE: **Do not reinstall coil springs on spring links at this time. Install as directed in later steps.**

8131b7b6

Fig. 262: Propeller Shaft at Rear Axle
Courtesy of CHRYSLER LLC

6. Raise crossmember to body mounting points. As crossmember is raised, slide propeller shaft (1) onto rear axle differential flange (2) and align shock absorbers with pockets in spring links.

8131f4d3

Fig. 263: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

7. Continue to raise crossmember (1) with jack until crossmember mounting bolts (2 and 3) can be

installed. Install left side crossmember mounting bolts, but not the right side bolts. It is not necessary to tighten bolts at this point.

Fig. 264: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

8. **Slowly** lower jack allowing right side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

9. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 265: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

10. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
11. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 266: AWD CROSSMEMBER SPACERS
 Courtesy of CHRYSLER LLC

12. If vehicle is equipped with AWD, insert spacers (1) on top of right crossmember mount bushings (2) before crossmember is raised into place.

813114d3

Fig. 267: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

13. Raise right side of crossmember (1) into mounted position. Install right side crossmember mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**
14. Remove both front and rear crossmember mounting bolts (2 and 3) on **left** side of vehicle.

813114d7

Fig. 268: COIL SPRING AND SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

CAUTION: To avoid damaging other components of vehicle, do not lower crossmember any further than necessary to install coil spring (2).

15. **Slowly** lower jack allowing left side of crossmember to drop. **Do not lower jack at a fast rate.** Lower jack just enough to allow spring (2) installation. **Do not lower jack any further than necessary.**

NOTE: Before installing coil spring, make sure isolators (1 and 5) are completely installed on ends of spring.

16. Install coil spring (2) with isolators into spring pocket of spring link fitting the lower isolator to the shape of the pocket, then align top of spring with body mount.

Fig. 269: SHOCK MOUNTING - LOWER
Courtesy of CHRYSLER LLC

17. Carefully raise jack, guiding coil spring and lower end of shock absorber (1) into mounted positions. Once shock absorber (1) lower mounting hole lines up with hole in spring link (3), stop jacking.
18. Install lower shock mounting bolt (2) and nut (4). **Do not tighten at this time.**

Fig. 270: AWD CROSSMEMBER SPACERS
Courtesy of CHRYSLER LLC

19. If vehicle is equipped with AWD, insert spacers (1) on top of left crossmember mount bushings (2) before crossmember is raised into place.

Fig. 271: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

NOTE: There are four crossmember mounting bolts. Rear mounting bolts (2) are longer than front mounting bolts (3). Do not interchange mounting bolts.

20. Raise left side of crossmember (1) into mounted position. Install left side crossmember

mounting bolts (2 and 3). **Snug, but do not fully tighten bolts at this time.**

Fig. 272: Marking Location Of Crossmember Mount To Body
Courtesy of CHRYSLER LLC

1 - BODY
2 - MARKER (OR CRAYON)
3 - CROSSMEMBER BUSHING FLANGE

21. Shift crossmember as necessary to line up mounts (3) with location marks drawn on body (1) before removal.

Fig. 273: MEASURING TENSION LINK CLEARANCE

Courtesy of CHRYSLER LLC

22. Once mounts are lined up with location marks, on both sides of vehicle, measure distance (1) between the tension link (2) and weld flange (3) on body directly in front of it, just outboard of the front mount bushing (4). **This distance must be at least 12 mm to allow proper clearance for suspension movement.** If distance is less than 12 mm on either side of vehicle, shift that side of rear crossmember directly rearward until distance is 12 mm or greater. To do so, loosen 3 mounting bolts slightly, leaving one on opposite side of shift snugged to pivot off of. Shift crossmember rearward and snug loosened bolts. Remeasure opposite side to be sure it still maintains minimum 12 mm distance.

Fig. 274: REAR CROSSMEMBER MOUNTING BOLTS
Courtesy of CHRYSLER LLC

23. Tighten all four crossmember mounting bolts (2 and 3) to 180 N.m (133 ft. lbs.).

81326804

Fig. 275: SUPPORT REAR SUSPENSION USING JACK
 Courtesy of CHRYSLER LLC

24. Remove jack (3) from under rear axle differential.

813b2bb1

Fig. 276: PROP SHAFT SUPPORT BY BUNGEE CORD
 Courtesy of CHRYSLER LLC

25. Remove bungee cord (1) supporting propeller shaft (2).

Fig. 277: Propeller Shaft at Rear Axle
 Courtesy of CHRYSLER LLC

26. Align propeller shaft index marks placed upon removal. Install propeller shaft rear coupler-to-axle flange bolts and nuts by hand. Tighten propeller shaft rear coupler-to-axle flange bolts to 81 N.m (60 ft. lbs.).

Fig. 278: FILLER TUBE ASSEMBLY
 Courtesy of CHRYSLER LLC

27. Install fuel filler tube. Refer to **Fuel System/Fuel Delivery/TUBE, Fuel Tank Filler - Installation** .

813b1e23

Fig. 279: LEFT/RIGHT REAR WHEEL SPEED SENSOR ROUTING
Courtesy of CHRYSLER LLC

28. Clip left rear wheel speed sensor cable (3) to routing clip (1) near body connector.

813b14c5

Fig. 280: SENSOR CONNECTION TO BODY CONNECTOR
Courtesy of CHRYSLER LLC

29. Match left rear wheel speed sensor connector (4) to right sensor connector (3) to make one connector.
30. Insert speed sensor connectors (3 and 4) into body wiring harness connector (1) located in luggage compartment floor pan (2). When installing connector, make sure retaining clip on body connector is properly in place and sensor connector cannot be pulled out.

Fig. 281: REAR CALIPER MOUNTING
Courtesy of CHRYSLER LLC

31. If equipped with standard or premium disc brakes, on each rear disc brake:
 - a. Push caliper guide pins into caliper adapter to clear caliper mounting bosses when installing.
 - b. Guide caliper and brake hose down through rear suspension, then slide caliper over brake pads and onto caliper adapter (3).
 - c. Align caliper mounting holes with guide pins, then install guide pin bolts (2). While holding guide pins from turning, tighten bolts to 31 N.m (23 ft. lbs.) torque.
 - d. Make sure brake hose is properly routed and will not come in contact with suspension components.
32. If equipped with SRT8 disc brakes, at each rear disc brake, support spring link using a transmission jack or other appropriate jack as indicated in removal procedure. See **Frame and Bumpers/Frame/ISOLATOR, Rear Crossmember - Removal**

Fig. 282: REAR CALIPER MOUNTING - SRT8
Courtesy of CHRYSLER LLC

33. If equipped with SRT8 disc brakes, on each rear disc brake, slide caliper with pads (2) over brake rotor and align with knuckle.
34. If equipped with SRT8 disc brakes, on each rear disc brake, install caliper mounting bolts (1). Tighten bolts to 130 N.m (96 ft. lbs.) torque.
35. If equipped with SRT8 disc brakes, on each rear disc brake, remove jack from under spring link.

Fig. 283: FRONT CABLE TO EQUALIZER

Courtesy of CHRYSLER LLC

36. Route parking brake cable above rear crossmember, then slide cable (1, 3) through equalizer (2) above rear axle differential (once installed).

Fig. 284: CABLES AT EQUALIZER
Courtesy of CHRYSLER LLC

NOTE: Due to short travel and low spring tension, it is not necessary to lock-out parking brake lever to service parking brake components.

37. Connect front parking brake cable (5) at connector (3) to right rear parking brake cable (4).

Fig. 285: FRONT CABLE AT LEFT FRONT OF CROSSMEMBER
Courtesy of CHRYSLER LLC

38. Insert front parking brake cable routing bracket locating pin into front flange of crossmember (3), then install screw (2) fastening cable (1) routing bracket to rear crossmember.

Fig. 286: Exhaust System
Courtesy of CHRYSLER LLC

39. Install rear exhaust system (2) (dual-outlet exhaust shown in illustration).

Fig. 287: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

40. Install tire and wheel assemblies (1). Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.). Refer to **Tires and Wheels - Installation** .
41. Lower vehicle until rear wheels are just above floor level.
42. Apply parking brake lever. Release lever, then reapply.
43. Check to make sure rear wheels will not rotate with lever applied.
44. Lower vehicle.

8133bb50

Fig. 288: BATTERY AND CABLES
Courtesy of CHRYSLER LLC

45. Connect battery negative cable (2) to battery post. It is important that this is performed properly. Refer to **Electrical - Engine Systems/Battery System - Standard Procedure** .
46. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
47. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolts.

Fig. 289: SHOCK MOUNTING - LOWER
 Courtesy of CHRYSLER LLC

48. Tighten shock absorber lower mounting bolt nuts (4) to 72 N.m (53 ft. lbs.).
49. Perform wheel alignment, paying special attention to thrust angle. If rear crossmember needs to be shifted to align thrust angle, try to avoid compromising tension link clearance (Refer to 22). Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

ISOLATOR, REAR CROSSMEMBER, SPRING LINK

Removal

REMOVAL

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .
2. Access and remove rear spring on side of repair. Refer to **Differential and Driveline/Rear Axle - 215Rll - Removal** .

Fig. 290: HEADLAMP LEVELING SENSOR
Courtesy of CHRYSLER LLC

3. Export Only - If servicing right side bushing, disconnect headlamp leveling sensor (1) link at spring link (3).

Fig. 291: SPRING LINK MOUNTING
Courtesy of CHRYSLER LLC

4. Remove bolt and nut (1) fastening spring link (4) to crossmember.
5. Position spring link downward, away from bushing in crossmember.

Fig. 292: SPRING LINK BUSHING REMOVAL
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - BUSHING
2 - REMOVER 9032-2
3 - PRESS C-4212F
4 - RECEIVER 9032-1 |
|---|

NOTE: Prior to using Press (3), Special Tool C-4212F, lubricate screw-drive threads to provide ease of use and promote tool longevity.

6. Assemble tools over bushing as shown in illustration (See list). Ensure Receiver, Special Tool 9032-1, sets against crossmember and not welds.
 - (2) Remover 9032-2
 - (3) Press C-4212F
 - (4) Receiver 9032-1
7. Tighten Press screw-drive, pressing bushing out of crossmember.

Installation

INSTALLATION

Fig. 293: SPRING LINK BUSHING INSTALLATION
Courtesy of CHRYSLER LLC

- | |
|---|
| 1 - BUSHING
2 - REMOVER/INSTALLER 9032-2
3 - PRESS C-4212F
4 - RECEIVER 9032-3 |
|---|

1. Position bushing (1) over rear of crossmember bushing bore.
2. Assemble tools over bushing and crossmember as shown in illustration (See list). Ensure Receiver, Special Tool 9032-3, is positioned to avoid welds on rear of crossmember bushing bore.
 - (2) Remover/Installer 9032-2
 - (3) Press C-4212F
 - (4) Receiver 9032-3
3. Tighten Press screw-drive, pressing bushing into crossmember. Install bushing until screw-drive stops, when bushing contacts Receiver on opposite side of crossmember.
4. Remove tools.

Fig. 294: SPRING LINK MOUNTING
Courtesy of CHRYSLER LLC

5. Swing spring link up to bushing in crossmember and install bolt and nut (1) fastening spring link (4) to crossmember. **Do not tighten bolt at this time.**

Fig. 295: HEADLAMP LEVELING SENSOR
Courtesy of CHRYSLER LLC

6. Export Only - If servicing right side bushing, connect headlamp leveling sensor (1) link at spring link (3).
7. Install rear spring as well as all components necessary to access it. Refer to **Differential and Driveline/Rear Axle - 215Rll - Installation** .

8. Lower vehicle.
9. Position vehicle on alignment rack/drive-on lift. Raise vehicle as necessary to access mounting bolt.

Fig. 296: SPRING LINK MOUNTING
Courtesy of CHRYSLER LLC

10. Tighten spring link bolt (1) at crossmember to 108 N.m (80 ft. lbs.).
11. Perform wheel alignment. Refer to **Front Suspension/Wheel Alignment - Standard Procedure** .

SUSPENSION

Front Suspension - Challenger

STANDARD PROCEDURE

LUBRICATION

There are no serviceable lubrication points on the front or rear suspension. The ball joints are sealed-for-life and require no maintenance.

FRONT

DESCRIPTION

FRONT SUSPENSION

The front suspension for both All-Wheel-Drive (AWD) and Rear-Wheel-Drive (RWD) vehicles is a long and short arm design.

Fig. 1: FRONT SUSPENSION - AWD
Courtesy of CHRYSLER LLC

Each side of the AWD front suspension includes the following components:

- Hub And Bearing
- Knuckle (5)
- Lower Control Arm (4)
- Shock Assembly (2)

- Stabilizer Bar and Link (3)
- Upper Control Arm (1)

Fig. 2: FRONT SUSPENSION
Courtesy of CHRYSLER LLC

Each side of the RWD front suspension includes the following components:

- Hub And Bearing
- Knuckle (3)
- Lower Control Arm (5)
- Shock Assembly (1)
- Stabilizer Bar (6) and Link (7)
- Tension Strut (4)
- Upper Control Arm (2)

FRONT SUSPENSION - SRT8

The SRT8 front suspension is very similar to the standard RWD front suspension but some components have been modified for better handling and durability. Most component bushings are increased rate bushings. Service of all front suspension components remain the same as the standard RWD components. When components differ, be sure to use only SRT8 components on SRT8 vehicles.

Fig. 3: FRONT DISC BRAKES
Courtesy of CHRYSLER LLC

The front knuckle (8) for the SRT8 is different from the standard RWD knuckle. Although similar in appearance, the knuckle has been modified to accept the larger 20 inch tire and wheel assembly. Also, the mounting bosses for the disc brake caliper have been moved downward to allow for mounting of the Brembo four-piston disc brake caliper (2).

Although serviced the same, the components of the SRT8 shock assembly are unique to this vehicle. The front shock absorber is manufactured by Bilstein®. It can be easily identified by its color. It is painted yellow. Because the shock absorber is a mono-tube design, it is important to handle it with care and not support the shock by its tubular housing.

The front stabilizer bar diameter has been increased for the SRT8 to the size of that used on Export vehicles, 30 mm. It is serviced in the same manner as the standard RWD bar.

SPECIFICATIONS

ARM, LOWER CONTROL

Removal

REMOVAL

1. Raise and support vehicle. Refer to Vehicle Quick Reference/Hoisting - Standard Procedure

Fig. 7: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Remove belly pan. Refer to Body/Exterior/BELLY PAN - Removal

Fig. 8: FRONT STABILIZER BAR HEAT SHIELD
Courtesy of CHRYSLER LLC

4. Remove screws (1) fastening stabilizer bar heat shield (3) on side of control arm repair.

Fig. 9: FRONT STABILIZER BAR BUSHING RETAINER BOLTS
Courtesy of CHRYSLER LLC

5. Remove bolts (2) fastening stabilizer bar bushing retainer (1) in place on side of control arm repair.

Fig. 10: FRONT STABILIZER BAR BUSHING RETAINER
 Courtesy of CHRYSLER LLC

6. Remove retainer halves (1) (2) from around stabilizer bar bushing (3).

Fig. 11: FRONT STABILIZER BAR BUSHING ON BAR
 Courtesy of CHRYSLER LLC

7. Utilizing slit, remove bushing (1) from stabilizer bar (2).

Fig. 12: CONTROL ARM CRADLE BOLT HEAD
 Courtesy of CHRYSLER LLC

NOTE: In the following step, the lower control arm cradle bolt (3) is accessed through the opening (2) created by removal of the bushing from the stabilizer bar (4).

Fig. 13: WHEEL ALIGNMENT ADJUSTMENT BOLT
 Courtesy of CHRYSLER LLC

CAUTION: If the lower control arm bolt at the engine cradle has a lengthwise grooved shaft (2), it is a special wheel alignment adjustment bolt and the bolt head (1) must not be rotated in the vehicle or damage to the bolt and engine cradle will result. While holding the bolt in place with a wrench, remove the nut, then slide the bolt out of the bushing and cradle taking note of bolt positioning in engine cradle for reassembly purposes. The bolt needs to be installed in the same position as removed to make sure wheel camber and caster return to adjusted position.

Fig. 14: CONTROL ARM CRADLE BOLT NUT
 Courtesy of CHRYSLER LLC

8. Remove bolt and nut (1) securing lower control arm (2) to engine cradle. If bolt has a lengthwise grooved shaft (see above note), remove bolt and nut by holding the bolt in place with a wrench, removing nut, then sliding bolt out of bushing and cradle while taking note of bolt positioning in lower control arm bushing for reassembly purposes.

Fig. 15: LOWER SHOCK MOUNTING BOLT
 Courtesy of CHRYSLER LLC

9. Remove bolt (3) securing shock assembly (1) to lower control arm (4).

8136b7d0

Fig. 16: WHEEL SPEED SENSOR AT FRONT KNUCKLE
 Courtesy of CHRYSLER LLC

10. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
11. Remove wheel speed sensor cable routing clip (2) from brake flex hose routing bracket (5).

8131b3dd

Fig. 17: BALL JOINT ATTACHMENT
 Courtesy of CHRYSLER LLC

12. Loosen nut (5) attaching ball joint stud to lower control arm (4). Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

Fig. 18: USING PULLER ON LOWER CONTROL ARM BALL JOINT
 Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Ball Joint Remover 9360, into place past seal boot.

13. Using Ball Joint Remover 9360 (1), separate ball joint stud (2) from lower control arm.

Fig. 19: BALL JOINT ATTACHMENT
 Courtesy of CHRYSLER LLC

14. Remove nut (5) from end of ball joint stud attaching lower control arm to knuckle.
15. Pry knuckle downward and slide ball joint stud out of lower control arm. Position knuckle

outward, away from lower control arm.

16. Slide lower control arm out of engine cradle and remove from vehicle.

Installation

INSTALLATION

813e6532

Fig. 20: WHEEL ALIGNMENT ADJUSTMENT BOLT
Courtesy of CHRYSLER LLC

NOTE: If installing a lower control arm engine cradle bolt that is a wheel alignment adjustment bolt (1) (lengthwise grooved shaft (2)), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt. See Front Suspension/Wheel Alignment - Standard Procedure.

8137711e

Fig. 21: CONTROL ARM CRADLE BOLT HEAD
Courtesy of CHRYSLER LLC

1. Slide lower control arm (4) into position in engine cradle and install mounting bolt from rear.

Fig. 22: CONTROL ARM CRADLE BOLT NUT
 Courtesy of CHRYSLER LLC

2. Install nut (1) on lower control arm cradle bolt, but **do not tighten at this time** .

Fig. 23: BALL JOINT SEAL BOOT HEIGHT
 Courtesy of CHRYSLER LLC

CAUTION: Before installing knuckle to lower control arm, measure height of ball joint seal boot (1) mounted on knuckle. If seal boot height is above 25.5 mm, any air inside seal boot must be expelled. To do so, follow these steps.

- a. Tip ball joint stud completely to one side.
- b. Using thumb and index finger, gently squeeze seal boot together at center expelling any air. Do not allow grease to be release.
- c. Push down very top of seal boot.
- d. Return ball joint stud to original "centered" position.
- e. Measure ball joint seal boot height (1) making sure it is within specification.
- f. Wipe any grease from ball joint stud.

Fig. 24: BALL JOINT ATTACHMENT
 Courtesy of CHRYSLER LLC

3. Pull knuckle (1) downward and position lower control arm (4) over ball joint stud. Release knuckle, guiding stud into lower control arm. Install NEW nut (5) on ball joint stud attaching lower control arm (4) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

8136b7d0

Fig. 25: WHEEL SPEED SENSOR AT FRONT KNUCKLE
 Courtesy of CHRYSLER LLC

4. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N.m (95 in. lbs.).
5. Attach wheel speed sensor cable and routing clip (2) to brake flex hose routing bracket (5).

8131b410

Fig. 26: LOWER SHOCK MOUNTING BOLT
 Courtesy of CHRYSLER LLC

6. Install lower shock mounting bolt (3) attaching shock assembly (1) to lower control arm (4). **Do not tighten bolt at this time.**

Fig. 27: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

7. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)).
8. Lower vehicle.

CAUTION: Because stabilizer bar is disconnected at cradle it is important to use extra care while moving vehicle to alignment rack/drive-on lift.

9. Position vehicle on an alignment rack/drive-on lift.
10. Tighten lower shock mounting bolt (3) to 174 N.m (128 ft. lbs.).

Fig. 28: WHEEL ALIGNMENT ADJUSTMENT BOLT
 Courtesy of CHRYSLER LLC

11. Perform wheel alignment. See **Front Suspension/Wheel Alignment - Standard Procedure**

CAUTION: If the control arm engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), be sure to only tighten the nut. Do not rotate the bolt head (1) or damage to the bushing will occur.

Fig. 29: CONTROL ARM CRADLE BOLT NUT
Courtesy of CHRYSLER LLC

12. Once camber is found to be within specifications, using a crowfoot wrench, tighten lower control arm cradle bolt nut (1) to 176 N.m (130 ft. lbs.) while holding the bolt stationary.

Fig. 30: FRONT STABILIZER BAR BUSHING ON BAR
Courtesy of CHRYSLER LLC

CAUTION: Because of stabilizer bushing outer shape, it is very important to install bushings in position discussed in following step.

13. Utilizing slit in bushing, install stabilizer bar bushing (1) against locating collar on stabilizer bar (2) as shown in illustration. Make sure slit in bushing is positioned toward rear of vehicle.

Fig. 31: FRONT STABILIZER BAR BUSHING RETAINER
Courtesy of CHRYSLER LLC

14. Install stabilizer bar bushing retainer halves (1) (2) around bushing (3).

Fig. 32: FRONT STABILIZER BAR BUSHING RETAINER BOLTS
Courtesy of CHRYSLER LLC

15. Install bolts (2) securing stabilizer bar bushing retainer halves (1) to cradle. Tighten bolts to 60 N.m (44 ft. lbs.).

Fig. 33: FRONT STABILIZER BAR HEAT SHIELD
Courtesy of CHRYSLER LLC

16. Install stabilizer bar heat shield (3) over stabilizer bar bushing retainer. Install mounting screws (1).
17. Install belly pan. Refer to **Body/Exterior/BELLY PAN - Installation**

ARM, UPPER CONTROL

Removal

REMOVAL

Fig. 34: UPPER SHOCK MOUNTING
 Courtesy of CHRYSLER LLC

1. If removing left upper control arm, remove and reposition coolant recovery container. Refer to **Cooling/Engine/BOTTLE, Coolant Recovery - Removal**.
2. If removing right upper control arm, remove the totally integrated power module (TIPM) from mount and reposition. Refer to **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Removal**
3. If equipped, remove front shock tower cap (1) from top of shock assembly (4).
4. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).

Fig. 35: UPPER CONTROL ARM MOUNTING NUTS
 Courtesy of CHRYSLER LLC

5. Remove nuts (2) from upper control arm mounting bolts (1).
6. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.

Fig. 36: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

7. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 37: WHEEL SPEED SENSOR AT BODY CONNECTOR
 Courtesy of CHRYSLER LLC

8. Disconnect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

Fig. 38: UPPER BALL JOINT MOUNTING
 Courtesy of CHRYSLER LLC

9. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

Fig. 39: USING PULLER ON UPPER BALL JOINT
 Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Ball Joint Remover 9360, into place past seal boot.

10. Using Puller 9360 (2), separate upper ball joint stud (1) from knuckle.

Fig. 40: UPPER BALL JOINT MOUNTING
Courtesy of CHRYSLER LLC

11. Remove nut (4) from end of upper ball joint stud (1).
12. Pull shock assembly (3) downward until studs clear shock tower (2), then pull it outward allowing access to upper control arm mounting bolts.

Fig. 41: UPPER CONTROL ARM MOUNTING
Courtesy of CHRYSLER LLC

13. Remove upper control arm mounting (flag) bolts (1).

14. Remove upper control arm (2) from bracket (3) in shock tower (4).

Installation

INSTALLATION

Fig. 42: UPPER CONTROL ARM MOUNTING
Courtesy of CHRYSLER LLC

1. Slide upper control arm (2) into bracket (3) located in shock tower (4).
2. Install upper control arm mounting (flag) bolts (1) through bracket, arm and tower. Position flags on bolt heads outward, toward wheel opening.

Fig. 43: UPPER BALL JOINT MOUNTING
Courtesy of CHRYSLER LLC

3. Move shock assembly (3) allowing studs to be inserted through shock tower (2) mounting holes.
4. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow-foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

Fig. 44: WHEEL SPEED SENSOR AT BODY CONNECTOR
Courtesy of CHRYSLER LLC

5. Connect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

Fig. 45: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

6. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)).
7. Lower vehicle to curb position.

Fig. 46: UPPER CONTROL ARM MOUNTING NUTS
Courtesy of CHRYSLER LLC

8. Install nuts (2) on upper control arm body mounting bolts (1). Tighten nuts to 75 N.m (55 ft. lbs.).

Fig. 47: UPPER SHOCK MOUNTING

Courtesy of CHRYSLER LLC

9. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N.m (20 ft. lbs.).
10. If equipped, align shock tower cap (1) with shock mounting nuts (2) and snap into place.
11. If installing left upper control arm, install coolant recovery container. Refer to **Cooling/Engine/BOTTLE, Coolant Recovery - Installation**
12. If installing right upper control arm, install the totally integrated power module (TIPM). Refer to **Electrical - Wiring/Power Distribution/MODULE, Totally Integrated Power (TIPM) - Installation**

BALL JOINT, SUSPENSION, LOWER

Description

DESCRIPTION

There are two lower ball joints on this vehicle. One for the lower control arm and the other for the tension strut. The ball joint for the lower control arm is pressed into the knuckle and the ball joint for the tension strut is part of the tension strut. The ball joints are both "sealed for life" components and cannot be maintenance lubricated. **No attempt should ever be made to add any lubrication to these ball joints.**

The ball joint for the lower control arm is a ball joint and seal boot cartridge type and can be replaced as a separate component of the knuckle. The boot cannot be serviced separately. To service this ball joint. See **Front Suspension/Front/KNUCKLE, Steering - Disassembly**.

Neither the ball joint, nor the seal boot for the tension strut can be serviced as a separate component. The entire tension strut must be replaced if either are damaged.

The ball joint connection to the lower control arm and the ball joint connection at the knuckle is achieved by an interference fit created by the tapered stud of the ball joint and a tapered hole in the steering knuckle. The ball joint stud is retained in the steering knuckle using a locking nut.

Diagnosis and Testing

LOWER BALL JOINT

1. Raise vehicle on a drive-on hoist.

NOTE: If a drive-on hoist is not available, use wooden blocks with jack stands to support the lower control arm in the ball joint area. Place the jack stands appropriately and lower the hoist placing weight on the lower control arm. The lower control arms should now be supporting the vehicle weight.

2. Using a jack, lift the front end off the hoist and position a wooden block underneath lower control arm supporting that portion of the vehicles weight.

3. Remove tire and wheel assembly. Refer to **Tires and Wheels - Removal** .
4. Attach a dial indicator as follows:
 - a. Tension Strut - Attach a dial indicator to base of tension strut, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on knuckle near ball joint. Zero dial indicator.
 - b. Lower Control Arm - Attach a dial indicator to base of lower control arm, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on knuckle near ball joint. Zero dial indicator.

NOTE: **Use care when applying the load to the knuckle so as to not damage components of the suspension.**

5. Insert a pry bar and rest it against lower control arm or tension strut (depending on which is being tested) and use lever principle to push knuckle upward until dial indicator no longer moves.
6. Record any ball joint movement. If movement in the lower control arm exceeds 1.5 mm (.059 in.), the ball joint is faulty.
7. If the ball joint for the lower control arm needs replaced, it can be serviced separately. See **Front Suspension/Front/KNUCKLE, Steering - Disassembly**.
8. If the tension strut ball joint needs replaced, the entire tension strut needs to be replaced. See **Front Suspension/Front/STRUT, Tension - Removal**.

Removal

REMOVAL

To service the lower ball joint for the lower control arm, the knuckle must be removed from the vehicle, then the ball joint can be removed. See **Front Suspension/Front/KNUCKLE, Steering - Removal** and **Front Suspension/Front/KNUCKLE, Steering - Disassembly**.

Installation

INSTALLATION

To install the ball joint for the lower control arm. See **Front Suspension/Front/KNUCKLE, Steering - Assembly**.

BALL JOINT, SUSPENSION, UPPER

Description

DESCRIPTION

The upper ball joint is pressed into the upper control arm. The ball joint is a "sealed for life" component and cannot be maintenance lubricated. This ball joint is lubricated for life at the time of assembly. **No attempt should be made to ever add any lubrication to this ball joint.**

Neither the upper ball joint, nor the seal boot can be serviced as a separate component. The entire upper control arm must be replaced if either are damaged.

The ball joint connection at the knuckle is achieved by an interference fit created by the tapered stud of the ball joint and a tapered hole in the steering knuckle. The ball joint stud is retained in the steering knuckle using a locking nut.

Diagnosis and Testing

UPPER BALL JOINT

1. Raise vehicle on a drive-on hoist.

NOTE: If a drive-on hoist is not available, use wooden blocks with jack stands to support the lower control arm in the ball joint area. Place the jack stands appropriately and lower the hoist placing weight on the lower control arm. The lower control arms should now be supporting the vehicle weight.

2. Using a jack, lift the front end off the hoist and position a wooden block underneath lower control arm supporting that corner of the vehicles weight.
3. Remove tire and wheel assembly. Refer to **Tires and Wheels - Removal**
4. Attach a dial indicator to body of upper control arm, then align dial indicator's contact pointer with direction of stud axis and touch machined flat on end of knuckle near ball joint. Zero dial indicator.

NOTE: Use care when applying the load to the knuckle so as to not damage components of suspension.

5. Insert a pry bar and rest it against bottom of upper control arm and use lever principle to push arm upward until dial indicator no longer moves.
6. Record any ball joint movement. If movement in the control arm exceeds 1.5 mm (.059 in.), the ball joint is faulty.
7. If the ball joint needs replaced, the entire upper control arm needs to be replaced. See **Front Suspension/Front/ARM, Upper Control - Removal**

HUB AND BEARING

Description

DESCRIPTION

The front wheel bearing and wheel hub of this vehicle are a one-piece sealed unit or hub and bearing unit type assembly.

Fig. 48: FRONT HUB AND BEARING
Courtesy of CHRYSLER LLC

On Rear-Wheel Drive SRT8 vehicles, the hub and bearing (1) is mounted to the center of the spindle using a retaining nut.

All front hub and bearings have five wheel mounting studs (3) on the hub flange for mounting the wheel to the vehicle. The wheel mounting studs are the only replaceable components of the hub and bearing. Otherwise, the hub and bearing is serviced only as a complete assembly.

A magnetic encoder (2) for the wheel speed sensor is pressed onto the hub and bearing.

Diagnosis and Testing

HUB AND BEARING

NOTE: The hub and bearing is designed for the life of the vehicle and should require no maintenance.

With wheel and brake rotor removed, rotate flanged outer ring of hub. Excessive roughness, lateral play or resistance to rotation may indicate dirt intrusion or bearing failure. If the rear wheel bearings exhibit these conditions during inspection, the hub and bearing assembly should be replaced.

Damaged bearing seals and resulting excessive grease loss may also require bearing replacement. Moderate grease loss from bearing is considered normal and should not require replacement of the hub and bearing assembly.

Removal

REMOVAL

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 49: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Access and remove front brake rotor. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal**

Fig. 50: DUST CAP AND HUB NUT
Courtesy of CHRYSLER LLC

4. Remove dust cap (2). When doing this, avoid damaging internal bore of hub to preserve seal integrity.
5. Remove hub nut (1).
6. Slide hub and bearing off knuckle spindle.

Installation

INSTALLATION

Fig. 51: FRONT HUB AND BEARING

Courtesy of CHRYSLER LLC

NOTE: Prior to installation, inspect magnetic encoder (for wheel speed sensor) (2) for any damage and make sure any metal debris sticking to it is removed.

1. Slide hub and bearing onto knuckle spindle.

Fig. 52: DUST CAP AND HUB NUT
Courtesy of CHRYSLER LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

2. Install hub nut (1) on end of spindle. Tighten hub nut to 250 N.m (184 ft. lbs.) torque.
3. Install brake rotor, then disc brake caliper and adapter assembly. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Installation**

NOTE: Install a new dust cap to preserve seal integrity.

4. Install **new** dust cap (2) on hub and bearing.

Fig. 53: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

5. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) torque.
6. Lower vehicle.

Fig. 54: RESERVOIR FLUID LEVEL MARKINGS
Courtesy of CHRYSLER LLC

7. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
8. Check and adjust brake fluid level in reservoir (1) as necessary.

9. Road test vehicle and make several stops to wear off any foreign material on brakes and to seat brake pads.

KNUCKLE, STEERING

Removal

REMOVAL

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**.

Fig. 55: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 56: WHEEL SPEED SENSOR AT FRONT KNUCKLE
 Courtesy of CHRYSLER LLC

3. Remove screw (3) fastening wheel speed sensor to knuckle (1). Pull sensor head (4) out of knuckle.
4. Remove wheel speed sensor cable routing clip (2) from brake flex hose routing bracket (5).

Fig. 57: FRONT BRAKE FLEX HOSE AT CALIPER
 Courtesy of CHRYSLER LLC

5. Remove screw (3) fastening brake flex hose routing bracket (2) to knuckle (4).
6. Access and remove front brake rotor. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Removal**

Fig. 58: FRONT OUTER TIE ROD
 Courtesy of CHRYSLER LLC

7. Remove nut (1) from outer tie rod end stud.

Fig. 59: USING PULLER ON OUTER TIE ROD
 Courtesy of CHRYSLER LLC

8. Using Ball Joint Remover 9360 (2), separate tie rod stud (1) from knuckle.

Fig. 60: UPPER BALL JOINT MOUNTING
 Courtesy of CHRYSLER LLC

9. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

Fig. 61: USING PULLER ON UPPER BALL JOINT
 Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Ball Joint Remover 9360, into place past seal boot.

10. Using Ball Joint Remover 9360 (2), separate upper ball joint stud (1) from knuckle.

Fig. 62: UPPER BALL JOINT MOUNTING
Courtesy of CHRYSLER LLC

11. Remove nut (4) from end of upper ball joint stud (1).

Fig. 63: BALL JOINT ATTACHMENT
Courtesy of CHRYSLER LLC

12. Loosen nut (3) attaching tension strut (2) ball joint stud to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

8131da87

Fig. 64: USING PULLER ON UPPER BALL JOINT
 Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Ball Joint Remover 9360, into place past seal boot.

13. Using Ball Joint Remover 9360 (1), separate tension strut ball joint stud (2) from knuckle.

8131b3dd

Fig. 65: BALL JOINT ATTACHMENT
 Courtesy of CHRYSLER LLC

14. Remove nut (3) from end of tension strut (2) ball joint stud.
15. Loosen nut (5) attaching ball joint stud to lower control arm (4). Back nut off until nut is even

with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

Fig. 66: USING PULLER ON LOWER CONTROL ARM BALL JOINT
Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Ball Joint Remover 9360, into place past seal boot.

16. Using Ball Joint Remover 9360 (1), separate ball joint stud (2) from lower control arm.

Fig. 67: BALL JOINT ATTACHMENT
Courtesy of CHRYSLER LLC

17. Remove nut (5) from end of ball joint stud attaching lower control arm to knuckle.
18. Remove knuckle from vehicle.

Fig. 68: DUST CAP AND HUB NUT
Courtesy of CHRYSLER LLC

19. If hub and bearing needs to be removed, perform the following:
 - a. Remove dust cap (2). When doing this, avoid damaging internal bore of hub to preserve seal integrity.
 - b. Remove hub nut (1).
 - c. Slide hub and bearing off knuckle spindle.
20. If shield needs to be removed from knuckle, remove 3 mounting screws, then shield.
21. If lower control arm ball joint needs to be removed from knuckle. See **Front Suspension/Front/KNUCKLE, Steering - Disassembly**.

Disassembly

BALL JOINT

NOTE: To perform this procedure, it works best to mount Ball Joint Press C-4212F in a vise.

Fig. 69: TOOLS ASSEMBLED FOR BALL JOINT REMOVAL
 Courtesy of CHRYSLER LLC

1. Place Ball Joint Remover/Installer 9320 (1) into cup area of Ball Joint Press C-4212F (3) as shown in illustration and tighten set screw.
2. Place Ball Joint Remover/Installer 9320-3 (2) onto end of screw-drive of Ball Joint Press C-4212F (3) as shown in illustration.

Fig. 70: BALL JOINT SNAP RING
 Courtesy of CHRYSLER LLC

3. Using a pair of snap-ring pliers (2), remove snap-ring (3) from bottom of ball joint (1).

81357def

Fig. 71: SUPPORT CLAMP POSITIONED OVER BALL JOINT
 Courtesy of CHRYSLER LLC

4. Install halves of Support Clamp (1), Ball Joint Remover/Installer 9320-1 (2) over ball joint (2) and around knuckle surface (3) as shown in illustration. Install and snug Support Clamp (1) screws from underside.

813584e4

Fig. 72: TOOLS POSITIONED FOR BALL JOINT REMOVAL
 Courtesy of CHRYSLER LLC

5. Position knuckle (1) over tools guiding top of ball joint inside of Receiver (6), then hand tighten Press screw-drive (4) until Remover (3) comes into contact with bottom of ball joint (2).

81357def

Fig. 73: SUPPORT CLAMP POSITIONED OVER BALL JOINT
 Courtesy of CHRYSLER LLC

NOTE: When positioning knuckle over tools, make sure Receiver, Ball Joint Remover/Installer 9320-5, sets into recessed area (4) of Support Clamp, Ball Joint Remover/Installer 9320-1.

813584e4

Fig. 74: TOOLS POSITIONED FOR BALL JOINT REMOVAL
 Courtesy of CHRYSLER LLC

6. Tighten Press screw-drive (4) forcing ball joint out of knuckle (1) and into Receiver (6).
7. Loosen screw-drive (4) and remove knuckle (1) from Press. Remove ball joint from Receiver (6).

Fig. 75: SUPPORT CLAMP POSITIONED OVER BALL JOINT
 Courtesy of CHRYSLER LLC

8. Remove Support Clamp (1) from knuckle (3).

Assembly

BALL JOINT

NOTE: To perform this procedure, it works best to mount Ball Joint Press C-4212F in a vise.

Fig. 76: TOOLS ASSEMBLED FOR BALL JOINT INSTALLATION
 Courtesy of CHRYSLER LLC

1. Place Ball Joint Remover/Installer 9320-4 (1) into cup area of Ball Joint Press C-4212F (3) as shown in illustration and tighten set screw.
2. Place Ball Joint Remover/Installer 9320-3, onto end of screw-drive of Ball Joint Press C-4212F (3) as shown in illustration.

Note: This is the reverse of how Remover is installed on screw-drive for removal.

81358659

Fig. 77: START BALL JOINT IN KNUCKLE
Courtesy of CHRYSLER LLC

3. Start NEW ball joint (1) into bore of knuckle (2).

81358ada

Fig. 78: TOOLS POSITIONED FOR BALL JOINT INSTALLATION

Courtesy of CHRYSLER LLC

4. Position knuckle (1) over tools guiding top of ball joint inside of Installer (5) until outside flange of ball joint (4) comes into contact with Installer, then hand tighten Press screw-drive (3) until Remover (2) comes into contact with bottom of knuckle (1).
5. Using hand tools, tighten screw-drive (3), pressing ball joint into knuckle until flange (4) comes to a stop against the knuckle.
6. Loosen screw-drive and remove knuckle from Press.

Fig. 79: BALL JOINT SNAP RING
Courtesy of CHRYSLER LLC

7. Install snap-ring (3) into groove on bottom of ball joint.
8. Inspect ball joint for proper fit. Make sure seal boot is uniform and wire rings are in place.
9. Install knuckle on vehicle. See **Front Suspension/Front/KNUCKLE, Steering - Installation**

Installation

INSTALLATION

Fig. 80: DUST CAP AND HUB NUT
Courtesy of CHRYSLER LLC

NOTE: Always install a new hub nut. The original hub nut is one-time use only and should be discarded when removed.

1. If shield needs to be installed on knuckle, place shield in place and attach to knuckle using 3 screws. Tighten screws to 10 N.m (89 in. lbs.).
2. If hub and bearing needs to be installed on knuckle, perform the following:
 - a. Slide hub and bearing onto knuckle spindle.
 - b. Install hub nut (1) on end of spindle. Tighten hub nut to 250 N.m (184 ft. lbs.).
 - c. Install NEW dust cap (2).

NOTE: Install a new dust cap to preserve seal integrity.

Fig. 81: BALL JOINT SEAL BOOT HEIGHT
Courtesy of CHRYSLER LLC

CAUTION: Before installing knuckle on lower control arm, measure height of ball joint seal boot (1) mounted on knuckle. If seal boot height is above 25.5 mm, any air inside seal boot must be expelled. To do so, follow these steps.

- a. Tip ball joint stud completely to one side.
- b. Using thumb and index finger, gently squeeze seal boot together at center expelling any air. Do not allow grease to be release.
- c. Push down very top of seal boot.
- d. Return ball joint stud to original "centered" position.
- e. Measure ball joint seal boot height (1) making sure it is within specification.
- f. Wipe any grease from ball joint stud.

Fig. 82: BALL JOINT ATTACHMENT
Courtesy of CHRYSLER LLC

3. Place knuckle (1) over lower ball joint studs on vehicle and loosely install NEW nuts by hand.

CAUTION: It is important to tighten nuts as described in following steps to avoid damaging ball stud joints.

4. Completely install NEW nut (5) on ball joint stud attaching lower control arm (4) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).
5. Completely install NEW nut (3) on ball joint stud attaching tension strut (2) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

Fig. 83: UPPER BALL JOINT MOUNTING
 Courtesy of CHRYSLER LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

6. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

Fig. 84: FRONT OUTER TIE ROD
 Courtesy of CHRYSLER LLC

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

7. Place outer tie rod stud through hole in knuckle (2) and install nut (1). Tighten nut by holding stud with a wrench while turning nut with another wrench. Tighten nut using crow foot wrench on torque wrench to 85 N.m (63 ft. lbs.).
8. Install brake rotor, then disc brake caliper and adapter assembly. Refer to **Brakes/Hydraulic/Mechanical/ROTOR, Brake - Installation**

Fig. 85: FRONT BRAKE FLEX HOSE AT CALIPER
Courtesy of CHRYSLER LLC

9. Install screw (3) fastening brake flex hose routing bracket (2) to knuckle (4). Tighten screw to 12 N.m (106 in. lbs.).

8136b7d0

Fig. 86: WHEEL SPEED SENSOR AT FRONT KNUCKLE
 Courtesy of CHRYSLER LLC

10. Install wheel speed sensor head (4) into knuckle and install mounting screw (3). Tighten screw to 11 N.m (95 in. lbs.).
11. Attach wheel speed sensor cable and routing clip (2) to brake flex hose routing bracket (5).

81386065

Fig. 87: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

12. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)).
13. Lower vehicle.

Fig. 88: RESERVOIR FLUID LEVEL MARKINGS
 Courtesy of CHRYSLER LLC

14. Pump brake pedal several times to ensure vehicle has a firm brake pedal before moving vehicle.
15. Check and adjust brake fluid level in reservoir (1) as necessary.
16. Perform wheel alignment. See **Front Suspension/Wheel Alignment - Standard Procedure**

SHOCK ABSORBER, SUSPENSION, COIL-OVER

Removal

REMOVAL

Fig. 89: UPPER SHOCK MOUNTING

Courtesy of CHRYSLER LLC

1. If equipped, remove front shock tower cap (1) from top of shock assembly (4).
2. Remove three nuts (2) fastening shock assembly (4) to shock tower (3).
3. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure** .

Fig. 90: TIRE AND WHEEL MOUNTING

Courtesy of CHRYSLER LLC

4. Remove wheel mounting nuts (3), then tire and wheel assembly (1).

Fig. 91: STABILIZER LINK AT SHOCK ASSEMBLY
Courtesy of CHRYSLER LLC

5. Remove nut (2) fastening stabilizer link (3) to shock assembly (1). Slide link ball joint stem from shock assembly.

Fig. 92: LOWER SHOCK MOUNTING BOLT
Courtesy of CHRYSLER LLC

6. Remove bolt (3) securing shock assembly (1) to lower control arm (4).

Fig. 93: WHEEL SPEED SENSOR AT BODY CONNECTOR
Courtesy of CHRYSLER LLC

7. Disconnect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

Fig. 94: UPPER BALL JOINT MOUNTING
Courtesy of CHRYSLER LLC

8. Loosen nut (4) attaching upper ball joint stud (1) to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

Fig. 95: USING PULLER ON UPPER BALL JOINT
Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while

sliding Ball Joint Remover 9360, into place past seal boot.

9. Using Ball Joint Remover 9360 (2), separate upper ball joint stud (1) from knuckle.

Fig. 96: UPPER BALL JOINT MOUNTING
Courtesy of CHRYSLER LLC

10. Remove nut (4) from end of upper ball joint stud (1).
11. Tip top of knuckle outward using care not to overextend brake flex hose.
12. Remove shock assembly from vehicle.

Disassembly

DISASSEMBLY

The shock assembly must be removed from vehicle for it to be disassembled and assembled.

For shock assembly disassembly and assembly, use of shock Spring Compressor, Pentastar Service Equipment (PSE) tool W-7200, or equivalent, is recommended to compress coil spring. Follow manufacturer's instructions closely.

WARNING: Do not remove shock shaft nut before coil spring is compressed. Coil spring is held under pressure and must be compressed, removing spring tension from upper and lower mounts, before shock removal.

Fig. 97: SHOCK ASSEMBLY IN LOWER HOOKS OF TOOL
 Courtesy of CHRYSLER LLC

1. Position shock assembly coil spring (1) on hooks (2) of Compressor following manufacturers instructions. Install clamp securing shock to lower spring coil.

Fig. 98: UPPER HOOKS POSITIONED
 Courtesy of CHRYSLER LLC

2. Position Compressor upper hooks (1) on upper coil spring (2) following manufacturers instructions. To ease installation, rotate shock as necessary positioning shock in compressor so

that upper spring coil ends (step in upper mount) at straight outward position from Compressor.

3. Compress coil spring until all spring tension is removed from upper mount.

Fig. 99: RETAINING NUT REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

4. Position Strut Nut Wrench 9362 (2) on shock shaft retaining nut. Next, insert 8 mm socket through Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, remove nut from shock shaft using Wrench.
5. Remove clamp from bottom of coil spring and remove shock and lower isolator out through bottom of coil spring.

NOTE: **If upper mount or coil spring needs to be serviced, proceed with next step, otherwise, proceed with step 8.**

Fig. 100: UPPER MOUNT REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

6. Remove upper mount (1) from shock shaft and coil spring.

NOTE: Prior to removing spring from compressor, note location of lower spring coil end in relationship to compressor to ease assembly of components later.

7. Back off Compressor drive, releasing tension from coil spring. Push back compressor upper hooks and remove coil spring from Compressor.

Fig. 101: SHOCK ASSEMBLY EXPLODED VIEW

Courtesy of CHRYSLER LLC

8. Remove jounce bumper (4) from shock shaft by pulling straight up and off.
9. Remove lower isolator (2) from shock body by pulling straight up and off shock shaft.
10. Inspect shock assembly components for following and replace as necessary:
 - Inspect shock (3) for any condition of shaft binding over full stroke of shaft.
 - Inspect upper mount (5) for cracks and distortion and its retaining studs for any sign of damage.
 - Inspect upper spring isolator (5) for severe deterioration.
 - Inspect lower spring isolator (2) for severe deterioration.
 - Inspect dust shield for tears and deterioration.
 - Inspect coil spring (1) for cracks in the coating and corrosion.
 - Inspect jounce bumper (4) for cracks and signs of deterioration.

Assembly

ASSEMBLY

CAUTION: Use care not to damage coil spring coating during spring assembly.
Damage to coating will jeopardize its corrosion protection.

NOTE: Left and right springs must not be interchanged.

NOTE: If coil spring has been removed from spring compressor, proceed with next step, otherwise, proceed with step 4.

Fig. 102: SPRING POSITIONED IN COMPRESSOR

Courtesy of CHRYSLER LLC

1. Place coil spring (**part number tag end upward**) in compressor lower hooks following manufacturers instructions. To ease shock reassembly, rotate coil spring around until upper coil (1) ends at straight outward position from compressor. Proper orientation of spring to upper mount (once installed) is necessary.
2. Position compressor upper hooks over coil spring following manufacturers instructions.
3. Compress coil spring far enough to allow shock installation.

Fig. 103: UPPER MOUNT REMOVAL/INSTALLATION
Courtesy of CHRYSLER LLC

4. If separated, install upper mount (1) onto coil spring (2). Match step in upper isolator to end of spring coil.

Fig. 104: SHOCK ASSEMBLY EXPLODED VIEW
 Courtesy of CHRYSLER LLC

5. Install lower spring isolator (2) on shock body (3).
6. Install jounce bumper (4) on shock shaft, small end first.

Fig. 105: SPRING POSITIONED AGAINST LOWER ISOLATOR
 Courtesy of CHRYSLER LLC

7. Install shock through bottom of coil spring until lower spring isolator (on shock) contacts lower end of coil spring. Match step built into isolator (1) to lower coil end (2).
8. Install clamp to hold shock and coil spring together.

813cf757

Fig. 106: SHOCK ROD RETAINING NUT
 Courtesy of CHRYSLER LLC

9. Install retaining nut (1) on shock shaft (2) as far as possible by hand. Make sure nut is installed far enough for 8 mm socket to grasp hex (2) on end of shaft for tightening.

813cf50c

Fig. 107: RETAINING NUT REMOVAL/INSTALLATION
 Courtesy of CHRYSLER LLC

10. Install Strut Nut Wrench 9362 (2) (on end of a torque wrench), on shock shaft retaining nut. Next, insert 8 mm socket through Wrench onto hex located on end of shock shaft. While holding shock shaft from turning, tighten nut using Wrench to 90 N.m (66 ft. lbs.) torque.
11. Slowly release tension from coil spring by backing off compressor drive fully. As tension is relieved, make sure shock components are properly in place.

12. Remove clamp from lower end of coil spring and shock. Push back spring compressor upper and lower hooks, then remove shock assembly from spring compressor.
13. Install shock assembly on vehicle. See **Front Suspension/Front/SHOCK ABSORBER, Suspension - Installation**.

Installation

INSTALLATION

Fig. 108: UPPER BALL JOINT MOUNTING
Courtesy of CHRYSLER LLC

1. Place shock assembly into front suspension using reverse direction in which it was removed.

CAUTION: It is important to tighten nut as described in following step to avoid damaging ball stud joint.

2. Place upper ball joint stud (1) through hole in top of knuckle and install nut (4). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten nut using crow foot wrench on torque wrench to 47 N.m + 90° turn (35 ft. lbs. + 90° turn).

Fig. 109: WHEEL SPEED SENSOR AT BODY CONNECTOR
 Courtesy of CHRYSLER LLC

3. Connect wheel speed sensor cable routing clip (2) at brake tube bracket (3).

Fig. 110: LOWER SHOCK MOUNTING BOLT
 Courtesy of CHRYSLER LLC

4. Install lower shock mounting bolt (3) attaching shock assembly (1) to lower control arm (4). **Do not tighten bolt at this time.**

Fig. 111: STABILIZER LINK AT SHOCK ASSEMBLY
 Courtesy of CHRYSLER LLC

5. Slide stabilizer link (3) ball joint stem into shock assembly from front. Install nut fastening link (3) to shock assembly (1). Tighten nut by holding ball joint stud while turning nut. Tighten nut using crow foot wrench on torque wrench to 128 N.m (95 ft. lbs.).

Fig. 112: TIRE AND WHEEL MOUNTING
 Courtesy of CHRYSLER LLC

6. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** .
7. Lower vehicle.

Fig. 113: UPPER SHOCK MOUNTING
Courtesy of CHRYSLER LLC

8. Install three nuts (2) fastening shock assembly (4) to shock tower (3). Tighten nuts to 27 N.m (20 ft. lbs.).
9. If equipped, align shock tower cap (1) with shock mounting nuts (2) and snap into place.

STABILIZER BAR, FRONT

Removal

REMOVAL

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**
2. Remove belly pan. Refer to **Body/Exterior/BELLY PAN - Removal** .

Fig. 114: FRONT STABILIZER BAR HEAT SHIELD
Courtesy of CHRYSLER LLC

3. On each side of vehicle, remove screws (1) fastening stabilizer bar heat shield (3). Remove heat shield.

Fig. 115: FRONT STABILIZER BAR BUSHING RETAINER BOLTS
Courtesy of CHRYSLER LLC

4. On each side of vehicle, remove bolts (2) fastening stabilizer bar isolator retainer (1) in place.

Fig. 116: FRONT STABILIZER BAR BUSHING RETAINER
 Courtesy of CHRYSLER LLC

5. On each side of vehicle, remove retainer halves (1) (2) from around stabilizer bar isolator (3).

Fig. 117: FRONT STABILIZER BAR BUSHING ON BAR
 Courtesy of CHRYSLER LLC

6. Utilizing slit, remove each isolator (1) from stabilizer bar (2).

81378e54

Fig. 118: LINK BALL JOINT AT STABILIZER BAR
Courtesy of CHRYSLER LLC

7. On each side of vehicle, remove nut (5) fastening stabilizer link (3) to stabilizer bar (4). Slide link ball joint stem (1) from bar, then remove bar from vehicle.

Installation

INSTALLATION

81378e54

Fig. 119: LINK BALL JOINT AT STABILIZER BAR
Courtesy of CHRYSLER LLC

NOTE: When attaching stabilizer link to stabilizer bar, make sure link ball joint stem is

pointed inboard toward engine cradle.

1. On each side of vehicle, raise stabilizer bar (4) to stabilizer link (3) and slide link ball joint stem (1) through mounting hole in bar. Loosely install nut (5) at this time.

Fig. 120: FRONT STABILIZER BAR BUSHING ON BAR
Courtesy of CHRYSLER LLC

CAUTION: Because of stabilizer isolator outer shape, it is very important to install isolators in position discussed in following step.

2. Utilizing slit in isolator, install each stabilizer bar isolator (1) on bar resting against locating collar (2) as shown in illustration. Make sure slit in isolator is positioned toward rear of vehicle.

Fig. 121: FRONT STABILIZER BAR BUSHING RETAINER
 Courtesy of CHRYSLER LLC

3. On each side of vehicle, install stabilizer bar isolator retainer halves (1) (2) around isolator (3).

Fig. 122: FRONT STABILIZER BAR BUSHING RETAINER BOLTS
 Courtesy of CHRYSLER LLC

4. On each side of vehicle, install bolts (2) securing stabilizer bar isolator retainer halves (1) to cradle. Tighten bolts to 60 N.m (44 ft. lbs.).

Fig. 123: FRONT STABILIZER BAR HEAT SHIELD
Courtesy of CHRYSLER LLC

5. On each side of vehicle, install stabilizer bar heat shield (3) over stabilizer bar isolator retainer. Install mounting screws (1).

Fig. 124: LINK BALL JOINT AT STABILIZER BAR
Courtesy of CHRYSLER LLC

6. While holding stem from rotating at hex (1) or flat (2) tighten stabilizer link nuts at each end of stabilizer bar (4) to 128 N.m (95 ft. lbs.).
7. Install belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .
8. Lower vehicle.

STRUT, TENSION

Removal

REMOVAL

1. Raise and support vehicle. Refer to **Vehicle Quick Reference/Hoisting - Standard Procedure**

Fig. 125: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

2. Remove wheel mounting nuts (3), then tire and wheel assembly (1).
3. Remove belly pan. Refer to **Body/Exterior/BELLY PAN - Removal**

Fig. 126: BALL JOINT ATTACHMENT
Courtesy of CHRYSLER LLC

4. Loosen nut (3) attaching tension strut (2) ball joint stud to knuckle. Back nut off until nut is even with end of stud. **Keeping nut on at this location will help keep end of stud from distorting while using Puller in next step.**

8131daa7

Fig. 127: USING PULLER ON UPPER BALL JOINT
Courtesy of CHRYSLER LLC

CAUTION: In following step, use care not to damage ball joint seal boot while sliding Ball Joint Remover 9360, into place past seal boot.

5. Using Ball Joint Remover 9360 (1) separate tension strut ball joint stud (2) from knuckle.

Fig. 128: BALL JOINT ATTACHMENT
Courtesy of CHRYSLER LLC

6. Remove nut (3) from end of tension strut (2) ball joint stud.
7. Rotate knuckle outward and push ball joint upward, out of knuckle.

Fig. 129: WHEEL ALIGNMENT ADJUSTMENT BOLT
Courtesy of CHRYSLER LLC

CAUTION: If the tension strut bolt at the engine cradle has a lengthwise grooved shaft (2), it is a special wheel alignment adjustment bolt and the bolt head (1) must not be rotated in the vehicle or damage to the bolt and engine cradle will result. While holding the bolt in place with a wrench, remove the nut, then slide the bolt out of the bushing and cradle taking note of bolt positioning in engine cradle for reassembly purposes. The bolt needs to be installed in the same position as removed to make sure wheel camber and caster return to adjusted position.

Fig. 130: TENSION STRUT CRADLE BOLT/NUT
 Courtesy of CHRYSLER LLC

8. Remove nut and bolt (2) securing tension strut (1) to engine cradle (3).
9. Slide tension strut out of cradle bracket and remove from vehicle.

Installation

INSTALLATION

Fig. 131: WHEEL ALIGNMENT ADJUSTMENT BOLT
 Courtesy of CHRYSLER LLC

NOTE: If installing a tension strut engine cradle bolt that is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), make sure to install it in the same position which it was in upon removal. For more details on installation of this special bolt. See Front Suspension/Wheel Alignment - Standard Procedure.

Fig. 132: TENSION STRUT CRADLE BOLT/NUT
 Courtesy of CHRYSLER LLC

1. Slide bushing end of tension strut (1) into cradle bracket (3).
2. Install mounting bolt (2) from front through cradle and bushing.
3. Install nut (2), but **do not tighten at this time** .

Fig. 133: BALL JOINT ATTACHMENT
 Courtesy of CHRYSLER LLC

4. Insert tension strut (2) ball joint stud downward, into knuckle hole.
5. Completely install NEW nut (3) on ball joint stud attaching tension strut (2) to knuckle (1). Tighten nut by holding ball joint stud with a hex wrench while turning nut with a wrench. Tighten

nut using crow foot wrench on torque wrench to 68 N.m + 90° turn (50 ft. lbs. + 90° turn).

Fig. 134: TIRE AND WHEEL MOUNTING
Courtesy of CHRYSLER LLC

6. Install tire and wheel assembly (1). Refer to **Tires and Wheels - Installation** . Tighten wheel mounting nuts (3) to 150 N.m (110 ft. lbs.) (Police - 190 N.m (140 ft. lbs.)).
7. Lower vehicle.
8. Position vehicle on an alignment rack/drive-on lift.

Fig. 135: WHEEL ALIGNMENT ADJUSTMENT BOLT
Courtesy of CHRYSLER LLC

9. Perform wheel alignment. See **Front Suspension/Wheel Alignment - Standard Procedure**

CAUTION: If the tension strut engine cradle bolt is a wheel alignment adjustment bolt (lengthwise grooved shaft (2)), be sure to only tighten the nut. Do not rotate the bolt head (1) or damage to the

bushing will occur.

Fig. 136: TENSION STRUT CRADLE BOLT/NUT
Courtesy of CHRYSLER LLC

10. Once alignment is found to be within specifications, using a crowfoot wrench, tighten tension strut cradle bolt nut (2) to 176 N.m (130 ft. lbs.) while holding the bolt stationary.
11. Install belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .

WHEEL ALIGNMENT

DESCRIPTION

DESCRIPTION

Vehicle wheel alignment is the positioning of all interrelated front and rear suspension angles. These angles affect the handling and steering of the vehicle when it is in motion. Proper wheel alignment is essential for efficient steering, good directional stability, and proper tire wear.

The method of checking a vehicle's front and rear wheel alignment varies depending on the manufacturer and type of equipment used. The manufacturer's instructions should always be followed to ensure accuracy of the alignment, except when Chrysler LLC wheel alignment specifications differ.

On this vehicle, the suspension angles that can be adjusted are as follows:

FRONT:

- Camber (with cradle shift/service adjustment bolt package)
- Caster (with cradle shift/service adjustment bolt package)

- Toe

REAR:

- Toe

Check the wheel alignment and make all wheel alignment adjustments with the vehicle standing at its proper curb height specification. Curb height is the normal riding height of the vehicle. It is measured from a certain point on the vehicle to the ground or a designated area while the vehicle is sitting on a flat, level surface. To properly check curb height. See **Front Suspension/Wheel Alignment - Standard Procedure**.

Typical wheel alignment angles and measurements are described in the following paragraphs.

CAMBER

Fig. 137: Camber
Courtesy of CHRYSLER LLC

1 - WHEELS TILTED OUT AT TOP

2 - WHEELS TILTED IN AT TOP

Camber is the inward or outward tilt of the top of the tire and wheel assembly. Inward tilt (2) is negative camber. Outward tilt (1) is positive camber. Camber is measured in degrees of angle relative to a true vertical line. Camber is a tire wearing angle.

- Excessive negative camber will cause tread wear at the inside of the tire.
- Excessive positive camber will cause tread wear on the outside of the tire.

CROSS CAMBER

Cross camber is the difference between left and right camber. To achieve the cross camber reading, subtract the right side camber reading from the left. For example, if the left camber is $+0.3^\circ$ and the right camber is 0.0° , the cross camber would be $+0.3^\circ$.

CASTER

POSITIVE CASTER

NEGATIVE CASTER

8Dc41ee4

Fig. 138: Caster

Courtesy of CHRYSLER LLC

Caster is the forward or rearward tilt of the steering knuckle in reference to the position of the upper and lower ball joints. Caster is measured in degrees of angle relative to a true vertical center line. This line is viewed from the side of the tire and wheel assembly.

- Forward tilt (upper ball joint ahead of lower) results in a negative caster angle.
- Rearward tilt (upper ball joint trailing lower) results in a positive caster angle.

Although caster does not affect tire wear, a caster imbalance between the two front wheels may cause the vehicle to lead to the side with the least positive caster.

CROSS CASTER

Cross caster is the difference between left and right caster.

TOE

80c41ee2

Fig. 139: Toe
Courtesy of CHRYSLER LLC

1 - TOE-IN
2 - TOE-OUT

Toe is the inward or outward angle of the wheels as viewed from above the vehicle.

- Toe-in (1) is produced when the front edges of the wheels on the same axle are closer together than the rear edges.
- Toe-out (2) is produced when the front edges of the wheels on the same axle are farther apart than the rear edges.

Toe-in and toe-out can occur at the front wheels and the rear wheels.

Toe is measured in degrees or inches. The measurement identifies the amount that the front of the wheels point inward (toe-in) or outward (toe-out). Toe is measured at the spindle height. Zero toe means the front and rear edges of the wheels on the same axle are equally distant.

TOE-OUT ON TURNS

Fig. 140: Toe-Out On Turns
Courtesy of CHRYSLER LLC

1 - TOE-OUT ON TURNS

Toe-out on turns is the relative positioning of the front wheels while steering through a turn. This compensates for each front wheel's turning radius. As the vehicle encounters a turn, the outboard wheel must travel in a larger radius circle than the inboard wheel. The steering system is designed to make each wheel follow its particular radius circle. To accomplish this, the front wheels must progressively toe outward as the steering is turned from center. This eliminates tire scrubbing and undue tire wear when steering a vehicle through a turn.

DYNAMIC TOE PATTERN

Dynamic toe pattern is the inward and outward toe movement of the front and rear tires through the

suspension's jounce and rebound travel. As the vehicle's suspension moves up and down, the toe pattern varies. Toe pattern is critical in controlling the directional stability of the vehicle while in motion. Front and rear dynamic toe pattern is preset by the factory at the time the vehicle is assembled.

It is not necessary to check or adjust front or rear dynamic toe pattern when doing a normal wheel alignment. The only time dynamic toe pattern needs to be checked or adjusted is if the frame of the vehicle has been damaged.

STEERING AXIS INCLINATION (S. A. I.)

Fig. 141: S.A.I. And I.A.
Courtesy of CHRYSLER LLC

1 - S.A.I.
2 - CAMBER
3 - I.A.

Steering axis inclination is the angle between a true vertical line starting at the center of the tire at the road contact point and a line drawn through the center of the upper ball joint (or strut) and the lower ball joint (1). S.A.I. is built into the vehicle and is not an adjustable angle. If SAI is not within specifications, a bent or damaged suspension component may be the cause.

INCLUDED ANGLE (I. A.)

Included angle (3) is the sum of the SAI angle (1) plus or minus the camber angle (2), depending on whether or not the wheel has positive or negative camber. If camber is positive (2), add the camber

angle to the SAI angle. If camber is negative, subtract the camber angle from the SAI angle. Included angle is not adjustable, but can be used to diagnose a frame misalignment or bent suspension component (spindle, strut).

THRUST ANGLE

Fig. 142: Thrust Angle
Courtesy of CHRYSLER LLC

Thrust angle is the averaged direction the rear wheels are pointing in relation to the vehicle's center line. The presence of negative or positive thrust angle causes the rear tires to track improperly to the left or right of the front tires (dog tracking).

- Negative thrust angle means the rear tires are tracking to the left of the front tires.
- Positive thrust angle means the rear tires are tracking to the right of the front tires.

Improper tracking can cause undue tire wear, a lead or pull and a crooked steering wheel. Excessive thrust angle can usually be corrected by adjusting the rear wheel toe so that each wheel has one-half of the total toe measurement.

DIAGNOSIS AND TESTING

SUSPENSION AND STEERING

CONDITION	POSSIBLE CAUSES	CORRECTION
Front End Whine On Turns	1. Defective wheel bearing 2. Incorrect wheel alignment	1. Replace wheel bearing. 2. Check and reset wheel

	3. Worn tires	alignment. 3. Replace tires.
Front End Growl Or Grinding On Turns	1. Defective wheel bearing 2. Engine mount grounding 3. AWD - Worn or broken C/V joint 4. Loose wheel lug nuts 5. Incorrect wheel alignment 6. Worn tires	1. Replace wheel bearing. 2. Check for motor mount hitting frame rail and reposition engine as required. 3. Replace C/V joint. 4. Verify wheel lug nut torque. 5. Check and reset wheel alignment. 6. Replace tires.
Front End Clunk Or Snap On Turns	1. Loose lug nuts 2. Worn or loose tie rod 3. Worn or loose ball joint 4. Worn/loose control arm bushing 5. Loose control arm fasteners 6. Loose stabilizer bar 7. Loose crossmember bolts	1. Tighten wheel lug nuts to specifications. 2. Tighten or replace tie rod end. 3. Tighten or replace ball joint. 4. Replace control arm or bushing. 5. Tighten control arm fasteners to specified torque. 6. Tighten stabilizer bar fasteners to specified torque. 7. Tighten crossmember bolts to specified torque.
Front End Whine With Vehicle Going Straight At A Constant Speed	1. Defective wheel bearing 2. Incorrect wheel alignment 3. Worn tires	1. Replace hub and bearing assembly. 2. Check and reset wheel alignment. 3. Replace tires.
Front End Growl Or Grinding With Vehicle Going Straight At A Constant Speed	1. Engine mount grounding	1. Reposition engine/mount as required.
Front End Clunk When Accelerating Or Decelerating	1. Worn or broken engine mount 2. Loose lug nuts 3. Worn or loose ball joint 4. Worn or loose control arm bushing 5. Loose control arm fasteners 6. Loose crossmember bolts 7. Worn tie rod end	1. Replace engine mount. 2. Tighten wheel lug nuts to specified torque. 3. Replace ball joint/control arm. 4. Replace control arm or bushing. 5. Tighten fasteners to specified torque. 6. Tighten crossmember bolts to specified torque. 7. Replace tie rod end.

Road Wander	<ol style="list-style-type: none"> 1. Incorrect tire pressure 2. Incorrect front or rear wheel toe 3. Worn wheel bearing 4. Worn control arm bushings 5. Excessive friction in steering gear 6. Excessive friction in steering shaft coupling 	<ol style="list-style-type: none"> 1. Inflate tires to recommended pressure. 2. Check and reset wheel toe. 3. Replace hub and bearing. 4. Replace control arm or bushing. 5. Replace steering gear. 6. Replace steering intermediate shaft/coupler.
Lateral Pull	<ol style="list-style-type: none"> 1. Unequal tire pressure 2. Radial tire lead 3. Incorrect front wheel camber 4. Power steering gear imbalance 5. Wheel braking 	<ol style="list-style-type: none"> 1. Inflate all tires to recommended pressure. 2. Perform lead correction procedure. 3. Check and reset front wheel camber. 4. Replace power steering gear. 5. Correct braking condition causing lateral pull.
Excessive Steering Free Play	<ol style="list-style-type: none"> 1. Incorrect steering gear adjustment 2. Worn or loose tie rod ends 3. Loose steering gear mounting bolts 4. Loose or worn steering shaft coupler 	<ol style="list-style-type: none"> 1. Replace steering gear. 2. Replace tie rod ends. 3. Tighten steering gear mounting bolts to specified torque. 4. Replace steering intermediate shaft/coupler.
Excessive Steering Effort	<ol style="list-style-type: none"> 1. Low tire pressure 2. Lack of lubricant in steering gear 3. Low power steering fluid level 4. Loose drive belt 5. Lack of lubricant in ball joints 6. Steering gear malfunction 7. Lack of lubricant in steering shaft coupler 	<ol style="list-style-type: none"> 1. Inflate all tires to recommended pressure. 2. Replace steering gear. 3. Fill power steering fluid reservoir to correct level. Bleed as necessary. 4. Replace adjuster or drive belt. 5. Replace ball joints. 6. Replace steering gear. 7. Replace steering intermediate shaft/coupler.

VEHICLE LEAD/PULL

To assure correct diagnosis, it is important to follow the steps outlined in the order given . Road test the vehicle before and after each step to verify that the lead condition has been corrected. When

evaluating a vehicle, always drive the same road in both directions to get a feel for the effect of road crown and cross wind. A neutral vehicle will exhibit a small amount of drift on both right and left crowned roads (normal crown sensitivity). A vehicle with pronounced lead/pull may have one or more of the following conditions:

1. **UNEQUAL TIRE PRESSURE.** Adjust tire pressure to the pressure stated on door placard. Make sure the tire pressure is equal on all four tires and evaluate the car. Also verify that the tire size and type are correct and match each other. If the car still has a lead condition go to step 2.
2. **TIRE CONICITY.** Excessive tire conicity is one of the more frequent causes of vehicle lead. Cross-switch the front tires and evaluate the car. If the car still leads in the same direction or gets worse, return the front tires to their original position, then go to step 3.
3. **SUSPENSION ALIGNMENT.** Check and record the wheel alignment settings. Non-symmetrical front caster or camber can sometimes cause a lead condition or can be used to fix a lead condition. Adjust the wheel alignment as necessary to preferred settings. See **Front Suspension/Wheel Alignment - Standard Procedure**. If the car still leads, go to step 4.
4. **STEERING GEAR VALVE IMBALANCE.** Steering gear valve imbalance can sometimes cause a vehicle lead. Although there is no quick test or measurement that can be performed to verify a good or bad steering gear valve, generally the steering efforts will feel much lighter in the lead direction and heavier in the opposite direction with an unbalanced valve. Replace the steering gear only as a "last resort" to solve the problem. To replace the steering gear. Refer to **Steering/Gear - Removal** .

STANDARD PROCEDURE

WHEEL ALIGNMENT

PRE-WHEEL ALIGNMENT INSPECTION

Before any attempt is made to change or correct the wheel alignment, the following inspection and necessary corrections must be made to ensure proper alignment.

1. Verify that the fuel tank is full. If the tank is not full, the reduction in weight will affect the curb height of the vehicle and the alignment angles.
2. The vehicle's passenger and luggage compartments should be free of any load that is not factory equipment.
3. Check the tires on the vehicle. All tires must be the same size and in good condition with approximately the same amount of tread wear. Inflate all the tires to the recommended air pressure.
4. Check the wheel and tire assemblies for excessive radial runout.
5. Inspect lower ball joints and all steering linkage for looseness, binding, wear or damage. Repair as necessary.
6. Check suspension fasteners for proper torque and tighten as necessary.
7. Inspect all suspension component rubber bushings for signs of wear or deterioration. Replace any faulty bushings or components before aligning the vehicle.
8. Check the vehicle's curb height to verify it is within specifications. See **Front**

Suspension/Wheel Alignment - Standard Procedure.

WHEEL ALIGNMENT SETUP

1. Position the vehicle on an alignment rack.
2. Install all required alignment equipment on the vehicle per the alignment equipment manufacturer's instructions. On this vehicle, a four-wheel alignment is recommended.

NOTE: Prior to reading the vehicle's alignment readouts, the front and rear of vehicle should be jounced (suspension compressed/released). Induce jounce (rear first, then front) by grasping the center of the bumper and jouncing each end of vehicle an equal number of times. The bumper should always be released when vehicle is at the bottom of the jounce cycle.

3. Read the vehicle's current front and rear alignment settings. Compare the vehicle's current alignment settings to the vehicle specifications for camber, caster and toe-in. See **Front Suspension/Wheel Alignment - Specifications**.
4. If front camber and caster are not within specifications, proceed to CAMBER AND CASTER. If caster and camber are within specifications, proceed to TOE which can be found following CAMBER AND CASTER. Rear camber and caster are not adjustable. If found not to be within specifications, reinspect for damaged suspension or body components and replace as necessary. If rear toe is not within specifications, adjust rear toe before proceeding to adjust front toe.

CAMBER AND CASTER

Camber and caster settings on this vehicle are determined at the time the vehicle is designed, by the location of the vehicle's suspension components. This is referred to as NET BUILD. The result is no required adjustment of camber and caster after the vehicle is built or when servicing the suspension components. Thus, when performing a wheel alignment, caster and camber are not normally considered adjustable angles. Camber and caster should be checked to ensure they meet vehicle specifications.

If individual front camber or caster is found not to meet alignment specifications, each can be adjusted by shifting the engine cradle if cross-camber and cross-caster are within specifications, or by using an available service adjustment bolt package. Always try to shift the cradle first (**if camber and caster are off slightly**) to correct the misalignment before installing an adjustment bolt package. If an adjustment bolt package installation is necessary, inspect the suspension components for any signs of damage or bending first.

CAUTION: Do not attempt to adjust the vehicles wheel alignment by heating, bending or by performing any other modification to the vehicle's front suspension components or body.

ADJUSTMENT BY SHIFTING CRADLE

CAUTION: Always use care when shifting cradle to avoid damaging other components on the vehicle.

Fig. 143: ENGINE CRADLE MOUNTING BOLTS
Courtesy of CHRYSLER LLC

1. Loosen the four bolts (1) fastening the engine cradle (2) to the frame just enough to allow movement of the cradle.
2. Shift cradle as necessary to bring camber or caster into specifications. When shifting cradle, use care not to move other angles (camber or caster) that are within specifications, out of specifications.
3. Tighten the four bolts (1) fastening the engine cradle (2) to the frame to specifications.
4. Jounce the rear, then front of the vehicle an equal amount of times.
5. Measure camber and caster. If camber and caster are within specifications, proceed to TOE. If camber or caster cannot be brought into specifications, perform the ADJUSTMENT BOLT PACKAGE INSTALLATION.

ADJUSTMENT BOLT PACKAGE INSTALLATION

813e6532

Fig. 144: WHEEL ALIGNMENT ADJUSTMENT BOLT
Courtesy of CHRYSLER LLC

The adjustment bolt package contains 2 special bolts (1). These bolts can be identified by the offset grooves cut into the thread (2). These bolts are designed to replace the inboard mounting bolts of the lower control arm and tension strut. Each bolt allows approximately 0.3 degrees of movement. To adjust camber only, use both bolts, one at the tension strut and the other at the lower control arm. To adjust caster only, use one bolt at the tension strut only.

1. Raise the vehicle by the frame until the tires are not supporting the weight of the vehicle.
2. Remove the belly pan as necessary. Refer to **Body/Exterior/BELLY PAN - Removal**
3. Lower control arm bolt only:
 - a. Remove the screws fastening the heat shields covering the stabilizer bar bushing retainers to the cradle. Remove the heat shields.
 - b. Remove the four bolts (two each) fastening the stabilizer bar bushing retainers to the cradle.
 - c. Swing the stabilizer bar rearward and down out of the way of the control arm mounting bolts.

813e6532

Fig. 145: WHEEL ALIGNMENT ADJUSTMENT BOLT
Courtesy of CHRYSLER LLC

CAUTION: Wheel alignment adjustment bolts have offset grooves cut into the

length of the bolt (2). If removing or installing lower control arm or tension strut mounting bolts that have these grooves, **DO NOT ROTATE THE BOLT**. To remove the bolt, hold the bolt head stationary and rotate the nut, then slide the bolt straight out of the bushing. This is necessary to avoid damaging the bat wings in the bushing inner metal or cradle.

4. Hold the head of the control arm or tension strut mounting bolt stationary and remove the nut. Slide the bolt straight out of the bushing and discard.

CAUTION: When installing an adjustment bolt, be sure to install it in the correct direction. Lower control arm bolts must be installed from the rear-forward to avoid contact with the stabilizer bar upon installation. Tension strut bolts must be installed from the front-rearward.

NOTE: The grooves on the adjustment bolts are off-center forcing the bolt to be installed in one of two ways depending on whether more positive or negative camber or caster is necessary. The Bolts must be rotated 180° to achieve either more positive or negative camber or caster. **DO NOT** force the adjustment bolt.

Fig. 146: CAMBER BOLT INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the "bat wings" (c).

5. Camber Adjustment - The adjustment bolts are designed to work in conjunction with "bat wing" holes that are formed into the inner metal of the lower control arm bushing (1) allowing for lower control arm movement approximately 0.3° in either direction.

Fig. 147: CASTER BOLT INSTALLATION
Courtesy of CHRYSLER LLC

NOTE: The original (non-grooved) mounting bolt (3) lies through the center of the hole (1), between the "bat wings" (c).

- To achieve more positive camber, refer to (a) in the illustration. Move the control arm or tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the round hole in the engine cradle and bat wing hole (1) in the bushing inner metal.
- To achieve more negative camber, refer to (b) in the illustration. Move the control arm or

tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the round hole in the engine cradle and bat wing hole (1) in the bushing inner metal.

6. Caster Adjustment - The adjustment bolts are designed to work in conjunction with "bat wings" that are formed into the engine cradle (1) allowing for tension strut movement approximately 0.3° in either direction.
 - To achieve more positive caster, refer to (a) in the illustration. Move the tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in the engine cradle (1) and the round hole in the bushing inner metal.
 - To achieve more negative caster, refer to (b) in the illustration. Move the tension strut in the desired direction, then insert the adjustment bolt (2) with a washer installed through the bat wing hole in the engine cradle (1) and the round hole in the bushing inner metal.
7. Start a NEW nut and a washer (on RWD vehicles) on the end of the mounting bolt by hand, then while holding the head of the bolt stationary, install the nut. **Do not tighten the nut at this time.**
8. Lower the vehicle to curb position. Jounce the rear, then the front of the vehicle an equal amount of times.
9. Using a crowfoot wrench, tighten the adjustment bolt **nut** to 176 N.m (130 ft. lbs.) torque while holding the bolt stationary.
10. Lower control arm adjustment bolt only - Reinstall the stabilizer bar and heat shields.
11. Measure camber and caster. If camber and caster are not within specifications, inspect the suspension components for any signs of damage or bending. If camber and caster (and cross-camber and cross-caster) are within specifications, proceed with TOE to check and adjust toe.
12. Install the belly pan. Refer to **Body/Exterior/BELLY PAN - Installation** .

TOE

CAUTION: If the steering wheel is excessively off-center while driving, outside of Chassis specifications, inadvertent ESP activations may occur on a vehicle so equipped.

1. Center the steering wheel and lock in place using a steering wheel clamp.

NOTE: When performing the toe adjustment procedure, set rear toe to specifications before setting front toe.

2. If rear toe is not within specifications, perform the **REAR TOE** procedure.
3. If front toe is not within specifications, perform the **FRONT TOE** procedure.
4. Remove the steering wheel clamp.
5. Remove the alignment equipment.
6. Road test the vehicle to verify the steering wheel is straight and the vehicle does not wander or pull.

REAR TOE

NOTE: Perform the following procedure to each side of the vehicle as necessary.

Fig. 148: REAR TOE ADJUSTMENT BOLT NUT
Courtesy of CHRYSLER LLC

1. Loosen the cam bolt nut securing the toe link to the rear crossmember (front of rear crossmember) just enough to rotate the cam bolt (1).

Fig. 149: REAR TOE ADJUSTMENT BOLTS
Courtesy of CHRYSLER LLC

NOTE: When adjusting rear toe, the eccentric lobes on the toe adjustment cam bolts and washers are not to be facing downward. The lobes should only

be facing upward or up to 90° to one side or the other from the 12 O'clock position.

2. Rotate the cam bolt head on the opposite side (rear) of the crossmember in either direction until the preferred specification is obtained. See **Front Suspension/Wheel Alignment - Specifications**
3. While holding the cam bolt (1) from turning, tighten the cam bolt nut to specifications.
4. Adjust rear toe on opposite side of vehicle using above procedure as necessary.
5. Once rear toe is set, proceed to FRONT TOE to set the vehicle's front toe.

FRONT TOE

NOTE: Perform the following procedure to each side of the vehicle as necessary.

CAUTION: Do not twist the inner tie rod-to-steering gear boots during front wheel Toe adjustment. Remove the boot clamps (2) at the inner tie rods and make sure the boots move freely on the inner tie rods.

Fig. 150: FRONT OUTER TIE ROD
Courtesy of CHRYSLER LLC

1. Loosen the jam nut (3) at the inner-to-outer tie rod (4-5) connection.

812a8c7d

Fig. 151: FRONT TOE ADJUSTMENT
 Courtesy of CHRYSLER LLC

2. Grasp the inner tie rod at the hex and rotate as necessary to adjust front toe to the preferred toe specification. See **Front Suspension/Wheel Alignment - Specifications**

81206dd3

Fig. 152: FRONT OUTER TIE ROD
 Courtesy of CHRYSLER LLC

3. Tighten the tie rod jam nut (3) to 75 N.m (55 ft. lbs.) torque using care not to lose adjustment.
4. Make sure the inner tie rod-to-steering gear boot is not twisted, then reinstall the boot clamp at the inner tie rod.
5. Adjust front toe on opposite side of vehicle using the above procedure as necessary.

CURB HEIGHT MEASUREMENT

The wheel alignment is to be checked and all alignment adjustments made with the vehicle at its required curb height specification.

Vehicle height is to be checked with the vehicle on a flat, level surface, preferably a vehicle alignment rack. The tires are to be inflated to the recommended pressure. All tires are to be the same size as standard equipment. Vehicle height is checked with the fuel tank full, and no passenger or luggage compartment load.

Vehicle height is not adjustable. If the measurement is not within specifications, inspect the vehicle for bent or weak suspension components. Compare the parts tag on the suspect coil spring(s) to the parts book and the vehicle sales code, checking for a match. Once removed from the vehicle, compare the coil spring height to a correct new or known good coil spring. The heights should vary if the suspect spring is weak.

NOTE: When measuring, the maximum left-to-right differential is not to exceed 12.5 mm (0.5 in.).

812dodb7

Fig. 153: FRONT CURB HEIGHT MEASUREMENT
Courtesy of CHRYSLER LLC

1. Front - On each side of the vehicle, measure the distance (2) from the frame rail just behind the engine cradle rear mount (1) to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.

Fig. 154: REAR CURB HEIGHT MEASUREMENT
Courtesy of CHRYSLER LLC

2. Rear - On each side of the vehicle, measure the distance (2) from the travel limiter (1) attached to the front rear crossmember mount bushing to the floor or alignment rack/lift runway surface. It may be necessary to measure to the bottom of a straight edge, placed from lift runway to runway, to get an accurate measurement.
3. Compare the measurements to the specifications listed in the following CURB HEIGHT SPECIFICATIONS chart.

CURB HEIGHT SPECIFICATIONS

MODEL	FRONT	REAR
SRT8	321 mm \pm 12 mm 12.64 in. \pm 0.47 in	290 mm \pm 12 mm 11.42 in. \pm 0.47 in.

SPECIFICATIONS

WHEEL ALIGNMENT

NOTE: All specifications are given in degrees.

NOTE: All wheel alignments are to be set at curb height. See Front Suspension/Wheel Alignment - Standard Procedure.

BASE (NON-SRT8) - FRONT

FRONT WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE
CAMBER - LEFT	+0.15°	-0.50° to +0.80°
CAMBER - RIGHT	-0.25°	-0.90° to +0.40°

CROSS-CAMBER (Maximum side-to-side difference)	+0.40°	-0.10° to +1.15°
CASTER - LEFT	+8.00°	+7.00° to +9.00°
CASTER - RIGHT	+9.00°	+8.00° to +10.00°
CROSS-CASTER (Maximum side-to-side difference)	-1.00°	-1.60° to -0.40°
TOE - TOTAL **	+0.20°	+0.10° to +0.30°

Notes:

** TOTAL TOE is the sum of both left and right wheel toe settings. TOTAL TOE must be equally split between each wheel on the same axle to ensure the steering wheel is centered after setting toe. Positive toe is toe-in and negative toe is toe-out

BASE (NON-SRT8) - REAR

REAR WHEEL ALIGNMENT	PREFERRED SETTING	ACCEPTABLE RANGE

ENGINE

Fuel System - Challenger

FUEL DELIVERY, GAS

STANDARD PROCEDURE

FUEL SYSTEM PRESSURE RELEASE

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

1. Remove the fuel pump relay from the Power Distribution Center (PDC). Refer to Vehicle Quick Reference/Fuse Locations and Types - Specifications . A relay location label can also be found on the underside of the PDC cover.
2. Start and run the engine until it stalls.
3. Attempt restarting engine until it will no longer run.
4. Turn ignition key to the OFF position.
5. Return fuel pump relay to the Power Distribution Center (PDC).

NOTE: After servicing the fuel system, one or more Diagnostic Trouble Codes (DTC's) may have been stored in the Powertrain Control Module (PCM) memory due to disconnecting the fuel pump module circuit. A diagnostic scan tool must be used to erase a DTC.

DRAINING FUEL TANK

Conventional Procedure

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved

containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

NOTE: Due to a one-way check valve installed into the fuel fill fitting at the tank, the tank cannot be drained at the fuel filler tube.

CAUTION: If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION: If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

Fig. 1: Fuel Supply Line Quick Connect Fitting At Fuel Rail
Courtesy of CHRYSLER LLC

1. Perform the fuel system pressure release procedure. See **Fuel System/Fuel Delivery - Standard Procedure**.

NOTE: Tool number 6539 is used on 5/16" fuel lines while tool number 6631 is used on 3/8" fuel lines.

2. Attach one end of the special test hose 6631 or 6539 at the fuel line quick-connect fitting (1).
3. Attach the opposite end of the special test hose 6631 or 6539 to the Fuel Chief Gas Caddy 320-FC-P30-A or an OSHA approved gas caddy.
4. Using a diagnostic scan tool, activate the fuel pump until the fuel tank has been evacuated.

Alternative Procedure

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

CAUTION: The fuel level of the vehicle must be below 5/8 of a tank before using the "Alternative Procedure". If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION: If the electric fuel pump is not operating, and the fuel level is above 5/8 of a tank, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

CAUTION: If the fuel level sending unit is not operating, and the fuel level cannot be determined the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle.

1. Verify the fuel level is below 5/8 of a tank.
2. Perform the fuel system pressure release procedure. See **Fuel System/Fuel Delivery - Standard Procedure**.
3. Disconnect the negative battery cable.

Fig. 2: Rear Seat Up
Courtesy of CHRYSLER LLC

4. Push the rear lower seat cushion up and back and remove the seat cushion.

Fig. 3: Foam Pad Under Seat
Courtesy of CHRYSLER LLC

5. Fold back the foam pad covering the fuel pump module plastic access covers.

Fig. 4: Module Rubber Access Plug

6. Remove the left side fuel pump module plastic access cover.

Fig. 5: Left Side Module Electrical Connector
Courtesy of CHRYSLER LLC

7. Disconnect the electrical connector from the fuel pump module.

5355

Fig. 6: Tool 9430 Left Side Module
Courtesy of CHRYSLER LLC

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

8. Mark the fuel pump module orientation.
9. Position the lock ring remover/installer 9340 (1) into the notches on the outside edge of the lock ring.
10. Install a 1/2 inch drive breaker bar into the lock ring remover/installer 9340 (1).
11. Rotate the breaker bar counterclockwise and remove the lock ring.

5357

Fig. 7: Fuel Pump Module And 3/8 Inch Hose
Courtesy of CHRYSLER LLC

CAUTION: Do not spill fuel into the interior of the vehicle.

CAUTION: The lower reservoir of the fuel pump module must be drained before removal or fuel can spill into the interior of the vehicle.

12. Lift the fuel pump module up enough to push a 3/8 inch hose into the fuel tank.
13. Attach the opposite end of the hose to the Fuel Chief Gas Caddy 320-FC-P30-A or an OSHA approved gas caddy.
14. Using the Fuel Chief Gas Caddy 320-FC-P30-A or an OSHA approved gas caddy, evacuate the left side of the fuel tank.

Fig. 8: Access Cover - Right Side Module
Courtesy of CHRYSLER LLC

15. Remove the right side auxiliary fuel pump module plastic access cover (1).

Fig. 9: Right Side Auxiliary Fuel Pump Module And Fuel Supply Line
Courtesy of CHRYSLER LLC

16. Disconnect the fuel supply line (2) and the fuel return line at the auxiliary fuel pump module (1).

Fig. 10: Tool 9430 Right Side Module
Courtesy of CHRYSLER LLC

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.

NOTE: Prior to removing the auxiliary fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

17. Mark the auxiliary fuel pump module orientation.

18. Position the lock ring remover/installer 9340 (1) into the notches on the outside edge of the lock ring (2).
19. Install a 1/2 inch drive breaker bar into the lock ring remover/installer 9340 (1).
20. Rotate the breaker bar counterclockwise and remove the lock ring.

5425

Fig. 11: 3/8 Inch Hose
Courtesy of CHRYSLER LLC

CAUTION: Do not spill fuel into the interior of the vehicle.

CAUTION: The lower reservoir of the fuel pump module must be drained before removal or fuel can spill into the interior of the vehicle.

21. Lift the auxiliary fuel pump module up enough to push a 3/8 inch hose (1) into the fuel tank.
22. Attach the opposite end of the hose to the Fuel Chief Gas Caddy 320-FC-P30-A or an OSHA approved gas caddy.
23. Using the Fuel Chief Gas Caddy 320-FC-P30-A or an OSHA approved gas caddy, evacuate the right side of the fuel tank.

FITTING, QUICK CONNECT

Standard Procedure

QUICK CONNECT FITTINGS

Different types of quick-connect fittings are used to attach the various fuel system components, lines and tubes. These are a single-button type, a two-button type, a pinch type, a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Some may require the use of a special tool for disconnection and removal.

DISCONNECTING

81290641

Fig. 19: Single Button Fitting
Courtesy of CHRYSLER LLC

WARNING: The fuel system is under a constant pressure (even with engine off). Before servicing any fuel system hose, fitting or line, fuel system pressure must be released. Refer to FUEL SYSTEM PRESSURE RELEASE.

CAUTION: Before separating a quick-connect fitting, pay attention to what type of fitting is being used . This will prevent unnecessary fitting or fitting latch damage.

CAUTION: The interior components (O-rings, clips) of quick-connect fittings are not serviced separately, but new plastic spacers and latches are available for some types. If service parts are not available, do not attempt to repair the damaged fitting or fuel line (tube). If repair is necessary, replace the complete fuel line (tube) assembly.

1. Perform fuel pressure release procedure. See Fuel System/Fuel Delivery - Standard Procedure.
2. Disconnect negative battery cable from battery.
3. Clean fitting of any foreign material before disassembly.
4. Single-Button Type Fitting is equipped with a single push-button (2) located on the quick-connect fitting.

5309

Fig. 20: Fitting Latches
Courtesy of CHRYSLER LLC

5. The push-button is attached to two internal latches (1). To disconnect, press on push-button with your thumb and unlatch fitting from fuel line. **DO NOT ATTEMPT TO PRY OR PULL UP ON PUSH-BUTTON. LATCHES WILL BE BROKEN.**

80cc704d

Fig. 21: 2-Button Type Fitting
Courtesy of CHRYSLER LLC

6. Perform fuel pressure release procedure. See **Fuel System/Fuel Delivery - Standard Procedure.**

7. Disconnect negative battery cable from battery.
8. Clean fitting of any foreign material before disassembly.
9. Two-Button Type Fitting (1) is equipped with a push-button located on each side of quick-connect fitting (2). Press on both buttons simultaneously for removal.

Fig. 22: Pinch Type Quick-Connect Fitting
Courtesy of CHRYSLER LLC

10. Pinch-Type Fitting (1) is equipped with two finger tabs (2). Pinch both tabs together while pulling hose away from fitting.

Fig. 23: Single-Tab Type Fitting
Courtesy of CHRYSLER LLC

11. Single-Tab Type Fitting (3) is equipped with a single pull tab (1). The tab is removable. After tab is removed, quick-connect fitting can be separated from fuel system component.

Fig. 24: Disconnecting Single-Tab Type Fitting
Courtesy of CHRYSLER LLC

12. Press release tab on side of fitting to release pull tab (1). **If release tab is not pressed prior to releasing pull tab, pull tab will be damaged.**
13. While pressing release tab on side of fitting, use screwdriver (2) to pry up pull tab.
14. Raise pull tab until it separates from quick-connect fitting.

Fig. 25: Typical Two-Tab Type Quick-Connect Fitting
Courtesy of CHRYSLER LLC

15. Two-Tab Type Fitting (2) is equipped with tabs located on both sides of fitting (1). The tabs are supplied for disconnecting quick-connect fitting from component being serviced.

- a. To disconnect quick-connect fitting, squeeze plastic retainer tabs (1) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer.
- b. Pull fitting from fuel system component being serviced.
- c. The plastic retainer will remain on component being serviced after fitting is disconnected. The O-rings and spacer will remain in quick-connect fitting connector body.

5321

Fig. 26: Plastic Retainer Ring Type Fitting
Courtesy of CHRYSLER LLC

16. Plastic Retainer Ring Type Fitting can be identified by the use of a full-round plastic retainer ring (3).
 - a. To release fuel system component from quick-connect fitting, firmly push fitting (2) towards component (1) being serviced while firmly pushing plastic retainer ring (3) into fitting (2). With plastic ring (3) depressed, pull fitting (2) from component (1). **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**
 - b. After disconnection, plastic retainer ring (3) will remain with quick-connect fitting (2) connector body.
 - c. Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

Fig. 27: Latch Clip - Type 1
Courtesy of CHRYSLER LLC

17. **Latch Clips - Type 1:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 (4) is tethered to fuel line and type-2 is not. A special tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
18. Pry up on latch clip with a screwdriver (3).
19. Slide latch clip toward fuel rail while lifting with screwdriver.

Fig. 28: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER LLC

20. Insert fuel line removal tool (1) into fuel line. Use tool to release locking fingers in end of line.
21. With tool (1) still inserted, pull fuel line (2) from fuel rail (3).
22. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.
23. Disconnect quick-connect fitting from fuel system component being serviced.

Fig. 29: Latch Clip - Type 2
Courtesy of CHRYSLER LLC

24. **Latch Clips - Type 2:** Depending on vehicle model and engine, 2 different types of safety latch clips are used. Type-1 is tethered to fuel line and type-2 is not. A tool will be necessary to disconnect fuel line after latch clip is removed. The latch clip may be used on certain fuel line/fuel rail connection, or to join fuel lines together.
25. Type 2: Separate and unlatch small arms on end of clip and swing away from fuel line.
26. Slide latch clip toward fuel rail while lifting with screwdriver.

Fig. 30: Fuel Line Disconnection Using Special Tool
Courtesy of CHRYSLER LLC

27. Insert fuel line removal tool (1) into fuel line (2). Use tool to release locking fingers in end of line.

28. With tool still inserted, pull fuel line (2) from fuel rail (3).
29. After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.
30. Disconnect quick-connect fitting from fuel system component being serviced.

Fig. 31: EVAP Canister Vapor Hose
Courtesy of CHRYSLER LLC

31. **Wing Type:** A special tool will not be necessary to disconnect this type of fitting (2). This line is used on different fuel and emission components. The illustration shows the fitting used on an EVAP canister.
32. Use two fingers to push on fitting wings (2)
33. Pull and disconnect fitting while holding wings.
34. After disconnection, locking fingers will remain within quick-connect fitting.

CONNECTING

1. Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.
2. Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.
3. Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.
4. Continue pushing until a click is felt.
5. Single-tab type fitting: Push new tab down until it locks into place in quick-connect fitting.
6. Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).
7. Latch Clip Equipped: Install latch clip. **If latch clip will not fit, this indicates fuel line is not properly installed. Recheck fuel line connection.**

8. Connect negative cable to battery.
9. Start engine and check for leaks.

MODULE, FUEL PUMP

Description

DESCRIPTION

Fig. 32: Fuel Pump Modules
Courtesy of CHRYSLER LLC

This vehicle uses a saddle type tank that has a reservoir on both sides of the rear drive shaft. The fuel pump is in the module on the left side of the vehicle (2) and the fuel pressure regulator is in the module on the right side of vehicle (1). The fuel outlet is on the right side and supplies fuel to the engine. The fitting on the fuel pump module (left side) is a vapor line fitting that connects to the right side module.

Both modules have fuel level sending cards. There are 2 hoses that connect the modules together, one is the fuel supply line the other is a return or siphon hose. The lines are removed from the fuel pump module when servicing either unit. The ORVR (Onboard Refueling Vapor Recovery) control valve is in the right side module.

Operation

OPERATION

The way the pump works is as follows, fuel enters the reservoir of the driver side module. The fuel pump pumps the fuel through the filter to the passenger side module through a supply line inside tank. The pressure regulator inside the passenger side module regulates the pressure at 58 psi. All unused fuel that is not sent to the engine is fed through a venturi at the bottom of the passenger side

module. This creates a low pressure siphoning effect and draws fuel from the passenger side of the tank and transfers it to the drivers side tank via siphon hose inside the tank. While the vehicle is running the fuel in the passenger side of tank is continuously transferred to the drivers side. Fuel will continue to fill the drivers side tank till it reaches the bridge section and then start to spill over to the passenger side.

As stated above we have two fuel level senders, the reading of these senders are averaged out to give us the fuel gauge reading. When we are diagnosing a sender concern the passenger side reading should never be higher than the Drivers side reading. It is possible, depending on fuel level and driving habit before diagnosing, to spill fuel over to the passenger side that might indeed show a lower resistance value than the driver side.

The fuel gauge gives an indication to the vehicle operator of the level of fuel in the fuel tank. This gauge is controlled by the instrument cluster circuit board based upon cluster programming and a hard wired input received by the cluster from the fuel level sending units on the modules in the fuel tank.

The instrument cluster continually monitors the fuel tank sending units to determine the level of fuel in the fuel tank. The cluster then sends the proper fuel level messages to other electronic modules in the vehicle over the Controller Area Network (CAN) data bus. For further diagnosis of the fuel gauge or the instrument cluster circuitry that controls the gauge. Refer to **Electrical/Instrument Cluster - Diagnosis and Testing** . The fuel gauge is serviced as a unit with the instrument cluster.

The tech needs to order the correct part when replacing, the senders, modules, and tank as all are able to be replaced individually.

Removal

REMOVAL

WARNING: The fuel system is under constant high pressure even with engine off. Until the fuel pressure has been properly released from the system, do not attempt to open the fuel system. Do not smoke or use open flames/sparks when servicing the fuel system. Wear protective clothing and eye protection. Make sure the area in which the vehicle is being serviced is in a well ventilated area and free of flames/sparks. Failure to comply may result in serious or fatal injury.

WARNING: No sparks, open flames or smoking. Risk of poisoning from inhaling and swallowing fuel. Pour fuel only into appropriately marked OSHA approved containers. Wear protective clothing. Risk of injury to eyes and skin from contact with fuel.

1. Perform the fuel pressure release procedure. See **Fuel System/Fuel Delivery - Standard Procedure**.

CAUTION: If the electric fuel pump module is not operating or the fuel level

sending unit is not operating and the fuel level cannot be determined, the fuel tank must be removed prior to draining. If the fuel level is above 5/8 of a tank and the fuel pump module lock-ring is removed, fuel will spill into the interior of the vehicle

2. If required, perform the draining fuel tank procedure. See **Fuel System/Fuel Delivery - Standard Procedure**.
3. Disconnect the negative battery cable.

Fig. 36: Rear Seat Up

4. Push the rear lower seat cushion up and back and remove the seat cushion.

Fig. 37: Foam Pad Under Seat
Courtesy of CHRYSLER LLC

5. Fold back the foam pad covering the fuel pump module plastic access covers.

Fig. 38: Module Rubber Access Plug
Courtesy of CHRYSLER LLC

6. Remove the left side fuel pump module plastic access cover.

Fig. 39: Left Side Module Electrical Connector
Courtesy of CHRYSLER LLC

7. Disconnect the electrical connector from the fuel pump module.

Fig. 40: Tool 9430 Left Side Module
Courtesy of CHRYSLER LLC

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank, note it's location for reassembly.

NOTE: Prior to removing the fuel pump module, use compressed air to remove any accumulated dirt and debris from around fuel tank opening.

8. Mark the fuel pump module orientation.
9. Position the lock-ring remover/installer 9340 (1) into the notches on the outside edge of the

lock-ring.

10. Install a 1/2 inch drive breaker bar into the lock-ring remover/installer 9340 (1).
11. Rotate the breaker bar counterclockwise and remove the lock-ring.

Fig. 41: Module Electrical Connectors
Courtesy of CHRYSLER LLC

12. Raise the fuel pump module up enough to gain access to the lower connections.
13. Disconnect the electrical connectors from under the top of the fuel pump module.
14. Remove the top section of the fuel pump module.

Fig. 42: Fuel Supply Line, Quick Release Tab, And Electrical Connector
Courtesy of CHRYSLER LLC

15. Press the quick connect release tab (3) and remove the fuel supply line (1).
16. Disconnect the lower fuel pump module electrical connector (2).

Fig. 43: Fuel Return Lines
Courtesy of CHRYSLER LLC

17. Disconnect the fuel pump module fuel return lines (1,2).

NOTE: Do not spill fuel into the interior of the vehicle.

18. Tip the fuel pump module on its side to drain the remaining fuel from the bottom reservoir and remove from vehicle.

NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

19. Remove and discard the rubber O-ring seal.

Installation

INSTALLATION

NOTE: Whenever the fuel pump module is serviced, the rubber O-ring seal must be replaced.

1. Install a new rubber O-ring seal.
2. Lower the fuel pump module into the fuel tank allowing enough room to make the lower connections.

Fig. 44: Fuel Return Lines
Courtesy of CHRYSLER LLC

3. Connect the fuel pump module fuel return lines (1,2).

Fig. 45: Fuel Supply Line, Quick Release Tab, And Electrical Connector
Courtesy of CHRYSLER LLC

4. Connect the fuel supply line (1) to the fuel pump module.
5. Connect the lower fuel pump module electrical connector (2).

Fig. 46: Module Electrical Connectors
 Courtesy of CHRYSLER LLC

6. Connect the electrical connectors at the top of the fuel pump module.
7. Join the upper and lower halves of the fuel pump module together.
8. Position the fuel pump module in the fuel tank.

Fig. 47: Left Side Module Electrical Connector
 Courtesy of CHRYSLER LLC

CAUTION: An indexing arrow is located on top of the fuel pump module to clock it's position into the fuel tank. The fuel pump module must be installed in the same position as removed.

9. Align the rubber O-ring seal and lower the fuel pump module into position.

10. Position the lock-ring over top of the fuel pump module.
11. Rotate the fuel pump module until the embossed alignment arrow points to the center alignment mark or the same position as noted during removal. This step must be performed to prevent the float from contacting the side of the fuel tank.

5355

Fig. 48: Tool 9430 Left Side Module
Courtesy of CHRYSLER LLC

12. Install the lock-ring remover/installer 9340 (1) into the notches on the outside edge of the lock-ring.
13. Install a 1/2 inch drive breaker bar into the lock-ring remover/installer 9340 (1).
14. Rotate the breaker bar clockwise until all seven notches of the lock-ring have engaged.

5353

Fig. 49: Left Side Module Electrical Connector
Courtesy of CHRYSLER LLC

15. Connect the electrical connector (1) to the fuel pump module.

Fig. 50: Module Rubber Access Plug
Courtesy of CHRYSLER LLC

16. Install the fuel pump module rubber access plug.

Fig. 51: Foam Pad Under Seat
Courtesy of CHRYSLER LLC

17. Lower the foam pad covering back into place.

Fig. 52: Rear Seat Up
Courtesy of CHRYSLER LLC

18. Push the rear lower seat cushion back and down and install the seat cushion.
19. Connect the negative battery cable.
20. Fill the fuel tank and check for leaks.

RAIL, FUEL

Removal

3.5L

WARNING: Release fuel system pressure before servicing fuel rail. Service vehicles in well ventilated areas and avoid ignition sources. Never smoke while servicing the vehicle.

1. Release fuel system pressure. Refer to **FUEL SYSTEM PRESSURE RELEASE** .
2. Disconnect the negative battery cable.
3. Remove intake manifold plenum. Refer to **Engine/Manifolds/MANIFOLD, Intake - Removal** .
4. Cover intake manifold to prevent foreign material from entering engine.
5. Disconnect fuel supply tube quick connect fitting at the rear of the fuel rail. See **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure**.

80b6d33

Fig. 53: Removing/Installing Fuel Injector Connector
Courtesy of CHRYSLER LLC

6. Disconnect electrical connectors at fuel injectors. Refer to illustration. Push red colored slider away from injector (1). While pushing slider, depress tab (2) and remove connector (3) from injector. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification. If harness is not tagged, note wiring location before removal.

Fig. 54: Injector Electrical Connectors
Courtesy of CHRYSLER LLC

7. Remove mounting bolts on both sides of fuel rail.
8. Lift fuel rail straight up off of cylinder head.
9. Remove retaining clips from fuel injectors at fuel rail.
10. Remove fuel injector from fuel rail.

REMOVAL

Fig. 55: Locating Battery
Courtesy of CHRYSLER LLC

WARNING: The fuel system is under constant pressure even with engine off. Before servicing fuel rail, fuel system pressure must be released. Failure to follow this warning may result in serious or fatal injury.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate rail halves at connector tube. Due to design of tube, it does not use any clamps. Never attempt to install a clamping device of any kind to tube. When removing fuel rail assembly for any reason, be careful not to bend or kink tube.

1. Remove fuel tank filler tube cap.
2. Perform Fuel System Pressure Release Procedure. See **Fuel System/Fuel Delivery - Standard Procedure**.
3. Remove negative battery cable at battery (1).

Fig. 56: MAP SENSOR LOCATION
 Courtesy of CHRYSLER LLC

4. Remove electrical connector from MAP sensor (2) at rear of intake manifold (1).
5. Disconnect vacuum hose from fitting (3) at rear of intake manifold (1).

Fig. 57: Fuel Line At Fuel Rail
 Courtesy of CHRYSLER LLC

6. Disconnect fuel line (1) at fuel rail (2) fitting. See Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure.

7. Disconnect injector electrical connectors.

Fig. 58: FUEL RAIL MOUNTING
Courtesy of CHRYSLER LLC

8. Remove four fuel rail mounting bolts (1).
9. Gently rock and pull **left** side of fuel rail until fuel injectors just start to clear machined holes in intake manifold. Gently rock and pull **right** side of rail until injectors just start to clear intake manifold head holes. Repeat this procedure (left/right) until all injectors have cleared machined holes.
10. Remove fuel rail (with injectors attached) from engine.

Installation

3.5L

Fig. 59: Injector Electrical Connectors
Courtesy of CHRYSLER LLC

1. Lightly lubricate the fuel injector O-rings with a couple drops of clean engine oil.
2. Install retaining clips on fuel injectors.
3. Push injectors into fuel injector rail until clips are in the correct position.
4. Position fuel rail over cylinder heads, and push rail into place. Tighten fuel rail mounting bolts to 28 N.m (250 in. lbs.) torque.
5. Connect the fuel supply tube quick connect fitting to the fuel rail. See **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure**.
6. Connect the electrical connectors to the fuel injectors.
7. Install intake manifold plenum. Refer to **Engine/Manifolds/MANIFOLD, Intake - Installation** .
8. Connect negative cable to battery.
9. Use the scan tool to pressurize the fuel system. Check for leaks.

INSTALLATION

Fig. 60: FUEL RAIL MOUNTING
Courtesy of CHRYSLER LLC

1. Clean out fuel injector machined bores in intake manifold.
2. Apply a small amount of engine oil to each fuel injector O-ring.
3. Position fuel rail/fuel injector assembly to machined injector openings in intake manifold.
4. Guide each injector into intake manifold. Be careful not to tear injector o-rings.
5. Push **right** side of fuel rail down until fuel injectors have bottomed on shoulders. Push **left** fuel rail down until injectors have bottomed on shoulders.
6. Install and tighten four fuel rail mounting bolts (1). Tighten fuel rail mounting bolts to 11 N.m (100 in. lbs.).
7. Connect injector electrical connectors.

Fig. 61: Fuel Line At Fuel Rail
 Courtesy of CHRYSLER LLC

8. Connect fuel line (1) to fuel rail. See **Fuel System/Fuel Delivery/FITTING, Quick Connect - Standard Procedure.**

Fig. 62: MAP SENSOR LOCATION
 Courtesy of CHRYSLER LLC

9. Connect vacuum hose to fitting (3).
10. Connect electrical connector to MAP sensor (2).

11. Install clean air hose to throttle body.

Fig. 63: Locating Battery
Courtesy of CHRYSLER LLC

12. Connect negative battery cable to battery (1).
13. Start engine and check for leaks.

REGULATOR, FUEL PRESSURE

Removal

REMOVAL

Fig. 64: Locating Battery
Courtesy of CHRYSLER LLC

1. Release the fuel pressure, refer to **FUEL SYSTEM PRESSURE RELEASE**.
2. Disconnect negative battery cable from battery (1).

CAUTION: The fuel level of the vehicle must be below 5/8 of a tank before you remove the module lock-rings. If the fuel level is above 5/8 of a tank, fuel can spill into the vehicle.

Fig. 65: Draining Fuel
Courtesy of CHRYSLER LLC

3. Partially drain the tank through the filler tube. Use a hard nylon tube with a 30° cut on the end to push past the check valve.

Fig. 66: Plastic Access Covers
 Courtesy of CHRYSLER LLC

4. Remove the rear lower seat cushion.
5. Fold back the foam pad covering to access the module covers.
6. Remove plastic access covers (1,2) from floor pan.

Fig. 67: Right Side Auxiliary Fuel Pump Module And Fuel Supply Line
 Courtesy of CHRYSLER LLC

7. Disconnect the fuel supply line (2) from module (1).
8. Mark the module orientation.

Fig. 68: Tool 9430 Right Side Module
